Management of an Internal, External Resorption and Apical Infection with MTA– Case Report

Valbona Disha

Albanian University and FMD,UMT, Albania,  <https://orcid.org/0009-0008-5366-6945>

Abstract: Introduction. Internal and external resorption are rare conditions in permanent teeth that poses difficulties for treatment. If the resorptive process perforates the root, treatment may be more difficult and is usually performed via surgical approach. Aim of this study. To show the result of treatment of a mandibular premolar with inflammatory internal and external root resorption with MTA in a 24-year-old female patient, with a history of incorrect endodontic treatment. Non-surgical repair of a perforating internal root resorption with MTA was conducted in this case. The root canal preparation was done with hand files and was treated with calcium hydroxide paste for one week. MTA was prepared and the full root canal obturation was done with it and the crown was restored at the same time with composite resine. The symptoms and signs ceased and the result was satisfactory at 11 years follow-up visit. Conclusion. The use of mineral trioxide aggregate is effective way to arrest the resorption process.

Keywords: Mineral Trioxide Aggregate, Perforation, Root Resorption

Introduction

Tooth resorption is characterized at first by loss of dentin and cementum, and later by loss of bone during the physiologic or pathologic process. (AAE 1994). It is a physiological process in temporary teeth and allows underlying permanent teeth to erupt naturally. Tooth resorption is considered pathologic in permanent teeth and may result in discomfort for the patient. In this case, early treatment is crucial for prognosis, whereas in some other cases may result in premature loss of the affected tooth. (Patel S, et al., 2022). Tooth resorption requires some specific conditions to occur, which are (1) breakdown of the natural barriers in the tissues, (2) a continuous stimulating factor, and (3) a viable blood supply for the clastic cells. (Abbott PV, et al., 2022).

Tooth resorption is classified into internal and external resorption, based on the site, nature and pattern of the process. (Benenati F. 1997). These two large groups are divided into eleven subgroups based on anatomical location and type of process (Abbott PV, et al., 2022 Aug). Both type of tooth resorption has their own specific etiologies, which are very important in the process of diagnosis and treatment plan.

Internal tooth resorption (ITR) is an inflammatory condition which begins within the pulp or root canal walls and may progress in most of cases because of a low-grade irritation of pulpal tissue. (Benenati F. 1997). Other factors which are implicated are excessive heat during restorative procedures in teeth with vital pulps and periodontal infections (Rabinowitch, B.Z. 1972), pulp amputation and calcium hydroxide capping (Cabrini, R.L. & Manfredi, E.E. 1957), (Sönmez, D. & Durutürk, L. 2008), anachoresis (Penido, R.S., et al., 1980), idiopathic dystrophic changes in healthy pulps (Ashrafi, M.H. et al., 1980), orthodontic treatment (Silveira, F.F., et al., 2009) and trauma (Andreasen, J.O. 1970). Internal resorption may occur in three forms: surface, inflammatory and replacement. (Abbott PV, et al., 2022 Aug). Clinically, in most cases it doesn't cause any discomfort and is diagnosed during the routine radiological examinations. If internal resorption isn't treated in time, it can progress and perforate the dentinal walls and communicate with around bone.

External tooth resorption occurs on the external surface of the root and progresses towards the dental pulp (Andreasen, J.O. 1981). The most common factors for external root resorption are orthodontic treatment, pressure exerted by impacted teeth, cyst or tumours (Patel S, et al., 2022), trauma, bacterial infection or incomplete sealing of the root canal (Gartner AH, et al., 1976). External tooth resorption may occur in eight forms: surface, inflammatory, replacement, invasive, pressure, orthodontic, physiologic and idiopathic. (Abbott PV, et al., 2022). An accurate diagnosis will determine the options for treatment. (Abbott PV. 2019). Patients with external tooth resorption usually do not have symptoms and clinical signs. (Abbott PV. 2022). Like internal resorption, if it is not treated in time, it can bring to a communication of the pulp with the bone around.

Sometimes both of internal and external root resorption may be found on the same tooth. On the examination process usually two-dimensional radiography are used, but in the cases of teeth resorption they may not offer the right evidence. Usually there are recommended several radiographies in different angles. Cone beam computed tomography (CBCT), can evaluate the nature of the lesion, the presence of perforation and if the treatment will or not include surgery. (Murmalla R, et al 2005), (Silveira LF, et al., 2011).

Guideline of tooth resorption treatment is different and in general depending on its etiology. There isn't a clear protocol of tooth resorption treatment yet, because evidence-based clinical trials absent. In most cases the treatment based on clinical judgement of cases and may require multidisciplinary approach.

Mineral trioxide aggregate (MTA) is a biocompatible material which is very useful in several dental procedures. It has very good bacteriostatic effects and can set in the presence of moisture and blood. (Torabinejad M, et al., 1995), (Camilleri J, et al., 2004). MTA is indicated on apexogenesis and apexification therapy. (Torabinejad M, et al., 1999). It can create a suitable environment to periodontal healing, resulting on new cement growth on its surface. (Holland R, et al., 2001). MTA is very good material for the treatment of root perforation because it can induce osteogenesis and cementogenesis. (Koh ET, et al., 1998), (Lee SJ, et al., 1993).

This paper presents a case (mandibular right second premolar) with combination of two types of resorption, internal and external resorption, treated with MTA.

Case description

A healthy 24 years old female patient was referred to the clinic with a fistula on labial aspect at the mandibular right second premolar. According to patient tooth number 45 was treated 2 years ago, and the issue was the fistula that would activate frequently. During clinic examination the tooth number 45 has a massive restoration with composite resin in crown level. The tooth was not mobile, the probing depth was within normal limit and no pain.

A periapical radiographic examination revealed an inadequate root canal filling and a widening of the space in the middle of the root. There was noticed a radiolucent zone outside of the root that involved a considerable amount of its length, and a lesion on the periapical zone. The remaining dentinal walls on the cervical area were very thin. The tooth was diagnosed with internal resorption and perforation of the root wall. The patient was informed that endodontic retreatment of the premolar would be necessary to extend the life of the tooth.

Figure 1. Pre-operative radiograph showing mandibular second right premolar with inadequate endodontic treatment, perforating internal resorption with thin dentinal walls.

After the tooth was isolated with rubber dam, the root canal of tooth accessed, cleaned and dressed with calcium hydroxide (Figure 2). There were used manual instruments. Inside the canal there were thresholds and irregularities which made the instrumenting process difficult. The reason of using only manual instruments was because the remaining walls were thin and the root length was short. In this process, irrigation was very

important and was done gently with sodium hypochlorite 5.25%. In this visit the canal was filled with calcium hydroxide and left for a week. The crown was sealed with temporary filling (Cavit, 3M/ESPE, Seefeld, Germany).

Figure 2. Radiological examination one week after closing with calcium hydroxide

Figure 3. Radiologic examination 2 years after treatment with MTA shows arrest of root resorption and healing of lesions.

A week later, the permanent obturation was done. After irrigation with sodium hypochlorite, the canal was dried with paper point. MTA (ProRoot MTA; Dentsply Tulsa Dental, Tulsa Oklahoma, USA) was manipulated according to manufacture instructions and the root canal obturated with the help of lentulo. The tooth was restored with composite resin.

Figure 4. Radiologic examination three years after treatment.

Figure 5. Radiologic examination 11 years after treatment shows total regeneration of lesion.

Two years later, the radiography showed that the resorption had stopped and there was a complete recovery of the apical and lateral lesions. (Figure 3). Three years later, the situation was the same (Figure 4). There was a full closing of the lateral perforation and elimination of radiolucent areas. After this period, the teeth 45 and 46 were covered with crowns because of massive fillings.

The patient was reviewed again eleven years after treatment. Patient was asymptomatic and the periapical radiograph appeared normal with reestablishment of bone structure around the root (Figure 5).

Discussion

Tooth resorption despite being a rare condition, is a pathology that needs an immediate and well-planned treatment. Different points of view exist in the treatment of a tooth resorption. Root canal therapy combined with surgical correction may be the option in perforating internal resorption. (Hsien HC, et al., 2003), (Caliskan MK, et al., 1997). Whereas, the others recommend remineralization therapy with calcium hydroxide to form a hard tissue matrix. (Benenati FW. 2001), (Ashouri R, et al., 2012).

After diagnosis of ITR, the recommended treatment is root canal treatment (Esnaashari E, et al., 2015). The endodontic treatment of internal resorption is a challenge, because of the irregularities inside the canal especially if there is perforation. The presented case in this study was treated only endodontically and was regularly checked using radiography. The endodontic treatment resulted successful during a long time, a period of 11 years.

The complexity of the canal system and the defects created inside the canals because of the resorption, make endodontic treatment difficult, especially mechanic instrumentation. The persistence of bacteria in these areas can affect prognosis of endodontic treatment. (Goldberg F, et al., 2000). For these reasons chemical irrigation is very important.

Sodium hypochlorite remain the most useful irrigant in endodontics treatment. Sodium hypochlorite has very good dissolving and antibacterial properties, especially when it used in conjunction with calcium hydroxide. (Turkun M, et al., 1997). Calcium hydroxide has been show too very good antibacterial effect and eliminates bacteria that persist after chemo mechanical instrumentation (Sjgoren U, et al., 1991). In the present case there was paid attention to the sterilization of the root canal than to its instrumentation. This protocol resulted successful.

Numerous laboratory and animal studies have been confirmed in humans the biocompatibility and hard tissue inductive effect of MTA. (Holden DT, et al., 2008), (Witherspoon DE, et al., 2008). This case was complex and characterized with perforating internal resorption and apical infection. The management consisted on filling the whole canal with MTA. The short and long term follow up (after 11 years) showed amazing results in isolating

the defect and eliminating the radiolucent zones (healing of tissues). On table 1 there are shown several studies that present cases of teeth resorption treated with MTA.

Table 1. Results of several studies using MTA on tooth resorption.

Studies	General information	Results
Jacobovitz and de Lima, 2008	Resorption of incisive; treatment with MTA.	Positive results after 20 months.
Silveira et al. 2009	Resorption of incisive; treatment with MTA.	Positive results after 18 months.
Brito-Junior et al., 2010	Resorption of incisive; treatment with MTA.	Positive results after 2 years but negative results after 8 years.
Güzeler I, et al, 2010	Inflammatory root resorption of lateral incisor; treatment with MTA.	Positive results after 2 years.
Aggarwal V, et al, 2010	External root resorption; treated with MTA	Positive results after 4 years.
Cehreli ZC, et al, 2012	Perforating root resorption of incisor; treatment with MTA	Positive results after 3 years.
Kothari HJ, 2013	Perforating internal resorption of mandibular second premolar; treatment with MTA.	Positive results after 6 months.
Lempe B, et al, 2013	Tooth resorption; treatment with MTA.	Positive results after 6-12 months.
Sharifi R. 2014	Inflammatory root resorption of incisor; Treatment with MTA	Positive results after 20 months.
Poonia L, et al, 2021	External root resorption of premolar; treatment with MTA.	Positive results after 6 months.
Disha, V. 2024	Perforating internal resorption, apical infection of mandibular second right premolar; treatment with MTA.	Positive results after 11 years.

In this case MTA provided good sealing of the defect. More importantly, the biologic response to this material was excellent.

Conclusion

The use of MTA in endodontic procedures is effective. MTA has been shown capable of arrest of root resorption. Using it can stop the resorption process effectively.

Recommendations

Correct diagnosis is very important in treatment of tooth resorption. In these case irrigation remains the most important process in root canal treatment. Combination of sodium hypochlorite 5.25% as irrigant, calcium hydroxide as dressing material for one week and MTA as final root canal filling, can result successful.

Teacher Talk in EFL Speaking Lessons and The Implications for Learner Volunteering: A Case Study at a Vietnamese University

Kieu Diem Bui

FPT University, Viet Nam,  <https://orcid.org/0009-0009-0721-6000>

Abstract: In Vietnamese EFL classes, teachers manage classroom interaction and use their language as the course object. Classroom language is the primary source of foreign language learning and a tool for teaching. Understanding teachers' language can improve students' learning and make better use of teacher talk, requiring theoretical and practical research. In English teaching classrooms, teacher talk plays a communicative role in helping language learners communicate effectively. Studies (Walsh, 2002; Kostadinovska-Stojchevska, 2019; Sabitaliyevna, 2023) have been carried out to investigate the essential role of teacher talk. This paper focuses on the purpose, frequency, and teacher talking time in speaking English language lessons. This study aimed at investigating features of teacher talk construction and obstructing learner speaking involvement. The results show that teacher talk plays an important role in language teaching, including giving instruction and classroom management; however, the use of language in both L1 and L2 should be taken into consideration in order to maximize student learning volunteering.

Keywords: Teacher talk, Learner volunteering, Speaking lessons

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2240-2250), Antalya, Turkiye. ISTES.

Introduction

In the realm of foreign language learning, speaking serves as an interactive process where meaning is constructed through the production, reception, and processing of information, thus constituting a vital mode of communication. For effective classroom communication, it is imperative for teachers to be mindful of their Teacher Talking Time (TTT), as excessive TTT can hinder student engagement and language acquisition (Sunderland, 2000; Walsh, 2002; Li, 2023). Researchers and educators have extensively explored the roles of teacher talk in English Language Teaching (ELT) classrooms, seeking to understand its impact on second language learners (Kostadinovska-Stojchevska, 2019; Sabitaliyevna, 2023).

Traditionally, in Vietnamese English as a Foreign Language (EFL) classrooms, teachers play a central role in managing interactions, with teacher language serving as the focal point of instruction. Classroom organization

and teaching objectives are often achieved through teacher talk, which not only facilitates language learning but also serves as a primary tool for language instruction. Given that a deeper understanding of teacher language usage can significantly enhance student learning outcomes, it is imperative to conduct research on teacher talk from both theoretical and practical perspectives (Irmayani, I., & Masrurroh, 2023).

This rationale underscores the importance of examining teacher talk within the context of foreign language classrooms, highlighting its crucial role in facilitating language learning and instruction. By understanding and optimizing teacher talk, educators can create more conducive learning environments that empower students to effectively acquire and utilize the target language.

Literature Review

Definitions of Key Terms

Teacher Talk

Numerous definitions of "teacher talk" have been offered, each from a unique angle. Teacher talk is generally regarded as the unique vocabulary that educators employ when speaking with students who are learning another language in the classroom (Ellis, 2015). Chaudron (1988) defined teacher speech in L2 (second language) as being equivalent to teacher discourse. On the other hand, teacher speak was defined by Sinclair and Brazil (1982) as the language used by teachers to explain tasks, provide directions, and assess students' understanding for a significant amount of class time. According to Krashen (1981), teacher speak is related to "the language of managing a classroom, the language of explanations in second language and some foreign language classrooms, and the language that accompanies exercises" (p. 121).

First, based on the definitions, it is assumed that teacher talk in English classes is seen as a unique kind of communication. Its objective is to foster communication among students and increase their fluency in foreign languages. Instructors use the target language to facilitate communication with students. By replying to their teacher, students get practice speaking the language in this way. In addition, educators employ language to foster self- and learner-communication. Thus, we can characterize teacher talk as a type of talk that is centered on communication.

Within the purview of this research, teacher conversation in its oral rather than written form is being examined. It alludes to the vocabulary that educators employ in language-speaking classes as opposed to other contexts.

The Role of Teacher Talk in Language Class

The language that language instructors employ in the classroom has a significant impact on how the target language is taught and acquired, according to pedagogical theory. First of all, teacher speech is the primary source of understandable target language input in the guided language learning setting; as such, it is crucial to both the classroom's structure and the acquisition processes (Nunan, 1991, p. 189). It is also a unique form of

communication. Its objective is to interact with students and advance their language skills. Sabitaliyevna, (2023) explains that teacher talk in the English classroom is one special variety of English language, so is a special communicative activity in which its goal is to communicate with students and develop students' foreign language proficiency. Teacher's talk is the language used by teachers to address language learners, which is motivated by the need to communicate. When a teacher just talks to their students and if they understand, they are not only giving the lesson about the subject but also may be giving the best language lesson. (Krashen and Terrell, 1983). In conclusion, teacher talk in language class becomes more important because it motivates and encourages students to be active in speaking and giving responses by using the target language.

Teacher speaking is excellent input for language acquisition that works. In contexts where English is being learned as a foreign language, like Vietnam, language teachers' use of the language in the classroom serves as language learners' primary source of information in most cases and their only source in others. Put differently, the primary source of target language input for language learners is teacher discourse. The significance of the language teacher and teacher-student interaction is highlighted by Stern (1983) who states that: "The teacher, like the learner, brings to language teaching certain characteristics that may have bearing on educational treatment: age, sex, previous education, and personal qualities." Above all, the language teacher brings to it a language background and experience, professional training as a linguist and teacher, previous language teaching experience, and more or less formulated theoretical presuppositions about language, language learning, and teaching" (p. 500). There is no learning without input. "If the second language is learned as a foreign language in a language class in a non-supportive environment, instruction is likely to be the major or even the only source of target language input." Stern (2006) (p. 11). Therefore, teaching language requires high-quality input, which is a necessary element for successful language learning.

Frequency and Talking Time

Despite the unarguably important roles in students' learning in general and language learning in particular, the quality of teacher talk has been overlooked for a long (Walsh, 2002). The focus seems to be merely placed on the "excessive" amount of teacher talk time and the need to reduce it, an approach that is both "simplistic" and "unrealistic (Walsh, 2002, p. 3). In other words, there has been an over-criticism of the amount of time and language teacher talk takes up in the classroom for the last decades.

Kim and Suh (2004) studied teacher talk in a Korean English classroom. The results showed that teachers' talk accounted for about 60% of classroom discourse, and teachers talked about 17 times a minute, which is 4.5 times more than the students' talk. Xiao-Yan (2006) revealed that most of the class time was allocated to teacher talk—76% of the total class time.

Allwright & Bailey (1991) suggested that teachers dominate classroom speech; on average, teacher talk accounts for between one-half and three-quarters of the talking done in foreign language classrooms. Similarity: Cook (2013), LeGarrette (1977), Chaudron (1988), and Zhao Xiaohong (1998, cited in Xiao-Yan, 2016) found

that teacher talk generally made up over 70 percent of the total talk. It is obvious that teacher-initiated talk will dominate the classroom, allowing little opportunity for extended student talk. In relation to English learning classrooms, the teacher-talking time is dealing with the time that the teachers spent during the lesson explaining, elaborating, and overviewing the materials. The duration of the teacher talk is different among the teachers.

However, thanks to the new recognition of the necessity of teacher talking time (Walsh, 2002), the shift has now been to the “quality” rather than the “quantity” of teacher talk that counts. “Good teacher talk” should be judged by how effectively it was able to facilitate learning and promote communicative interaction in the classroom.

Language Choice in Teacher Talk

In the classroom, teacher discourse frequently consists of two codes: the mother tongue and the target language. Shim Jae-Hwang (2007), for instance, discovered that while English language instructors attempt to speak English to fulfill the requirements of their English class, they occasionally choose to speak Korean, their native tongue, in order to help students better understand the context. Since Van Lier (1995, cited in Makuloluwa, 2013) holds that the quality of input matters more than quantity, he suggests that using L1 can give the learner more salient input. He asserts that L1 can improve input quality and hence increase intake. In contrast, Nation (2003) indicated that in classes where learners all share the same first language or national language, teachers need to use a range of options to encourage learners to use the L2 as much as possible.

In fact, second language use in the foreign language classroom needs to be maximized wherever possible, by encouraging its use and by using it for classroom management. In other words, using too much L1 in language class can reduce the proficiency of the target language, the naturalness of using the L2 in speaking, or simply a lack of interest in learning the L2 or being shy to use it. English and the L1 are in competition with each other, and the use of English increases at the expense of the L1. Therefore, teachers need to show respect for the learners' L1 and need to avoid doing things that make the L1 seem inferior to English. At the same time, it is the English teacher's job to help learners develop their proficiency in English. Thus, a balanced approach is needed that sees a role for the L1 but also recognizes the importance of maximizing L2 use in the classroom, as it is confirmed by the Nation study (2003) that the L1 should be viewed as a useful tool and, like other tools, should be used where needed but should not be overused.

Teacher Talk and Learning Opportunity

The relationship between teacher talk and learner learning opportunity

Quite a few studies have focused on the relationship between teacher talk and language learning. As Nunan (1991) points out, teacher talk is important not only for the organization of the classroom but also for the process of acquisition. It is important for the organization and management of the classroom because it is through language that teachers either succeed or fail in implementing their teaching plans. In terms of

acquisition, teacher talk is probably the major source of comprehensible target language input the learner is likely to receive.

Stern (1983) saw things similarly. "If the second language is learned as a foreign language in a language class in a non-supportive environment, instruction is likely to be the major or even the only source of target language input," the author asserted (p. 400). There is evidence to suggest that teacher speak and the language instructor have a crucial influence in the language acquisition process. But according to Walsh (2002), teacher speaking does affect students' learning in both positive and negative ways.

Similarity: Incecay (2010) has concluded that only an inadequate number of studies have discussed the relationship between teacher talk and language learning in the EFL environment. Walsh (2002), on the other hand, had a more reflective perspective on the influences of teacher talk on students' learning. He claimed that teacher talk has both constructive and obstructive impacts, which has been confirmed by Incecay (2010). The two scholars, however, have different ideas about the categories of teacher talk strategies that produce the aforementioned contrasting effects. The reasons lie in, according to Incecay's (2010) account, the different number of teachers and participants.

Features of teacher talk constructing learner speaking participation

A framework Self-Evaluation of Teacher Talk (SETT) was proposed by Walsh (2002) in which using term mode, typical pedagogical goals together with interactional features. Interactional features refer to specific interactional features of classroom discourse that may help or hinder communication. Things like wait time, confirmation check, display question, etc are examples of interactional features. In his study of teacher talk, Walsh (2002) found that certain interactional features facilitated learning opportunity, while others appeared to hinder opportunities for learning. That is, depending on a teacher's pedagogical goal, choice of language could either construct or obstruct learning opportunity. Five features which teachers through the use of language can construct learning opportunities through their use of language have been identified. These include *direct error correction*, *content feedback*, *checking for confirmation*, *extended wait-time* and *scaffolding*.

In another research, Incecay (2010) investigated the role of teacher talk in young learners' language learning. The results of the study revealed that some of the features of teacher talk could facilitate learners' language process while other features restricted the learning process. More specifically, 'direct error correction', 'prompting', 'extended wait time' and 'repairing' facilitated students' learning process and 'turn competition', 'teacher echo' and 'extended use of turn taking' obstructed learners' acquisition.

Features of teacher talk obstructing learner speaking participation

Walsh (2002) has stated that "maximizing learner involvement is conducive to second language acquisition"

(p.3). He considered how a teacher through their choice of language, construct or obstruct learner participation in face to face classroom interaction. From his research emerged a number of ways in which teachers can improve their teacher talk to facilitate and optimize learner contribution. Due to the limited evidence had by learner-learner interaction in increasing the participation in the classroom, it is very suggested to gain more of negotiation for meaning between learner and teacher (Foster, 1998, cited in Walsh, 2002).

When no negotiation for meaning happens between teacher and students, it becomes very possible for the teachers to take control the whole interaction in the classroom by themselves without giving any opportunities for students to learn. In order to keep the intertwining of teacher talk and learning goals, teacher should avoid that thing to happen in the classroom. Those two possibilities of how the relationship between teacher talk and learning making some strategies to enhance students' participation in the learning conversation for the improvement of cognitive ability and develop personal connection serves as the indication for social ability.

On the other hand, *turn completion*, *teacher echo* and *teacher interruptions* have been identified as features of teach talk that can afflict space for learning (Walsh, 2002). In the classroom, such communication settings limit the frequency and quality of student contributions, and minimize learning opportunities.

Methodology

Participants

The study involved five experienced EFL teachers from a University in Can Tho City who were recruited through a two-round recruitment process. The participants were asked to record two 30-minute lessons, and a total of 5 hours of recordings were analyzed using a Conversation Analysis protocol. The study involved up to 89 Vietnamese learners aged 19-22, who had studied English for 7 years in secondary and high schools and one year and two years as university students.

Data collection instruments

This study used two main instruments to help the researcher in collecting the data. They were collected through two sources: classroom observations and audio-recordings. First, classes were observed and teacher talk was audio-taped to build up a database for describing the teacher talk and examine its effect on student learning. Each teacher was observed for two 30-minute lessons. The observer took notes during the observation to see how teacher talk influenced students' speaking involvement.

Findings

The Role of Teacher Talk in Language Class

Four English teachers used teacher talk in their speaking English lessons, playing various roles in classroom

management and instruction. In Extract 1, the teacher-controlled activities and created a learning environment by asking questions and explaining game rules. Teacher talk can be motivating or demotivating depending on its complexity and language competence. The language used in Extract 1 was not too complex for students to understand. The teacher spent time giving instructions and supporting student participation, praising and encouraging their participation.

Frequency and Talking Time

Studies show that teacher talk dominates between half and three quarters of class talking time, controlling all activities and requiring little student participation. Teachers spend more time in teaching-learning processes, asking questions and lecturing. However, students are often shy and need more encouragement from the teacher. To eliminate teacher-centered classrooms and replace them with student-centered ones, it is crucial to address this issue and ensure students participate well in interaction for successful speaking lessons.

Language Choice in Teacher Talk

Teachers used English and Vietnamese in classrooms, with Class 1 and 3 using mostly L2 to foster student interaction and maintain language flow. Class 2 and 4 used L1 for classroom management, translation, and grammar. Students in these classrooms received less input from teachers, using L1 for interaction. L1 should be used when needed but not overused, as it can negatively influence target language acquisition. In Extract 4, the teacher used English to motivate students, correcting phrases and encouraging them to speak English.

Students used both languages in speaking activities, including Vietnamese and English. However, teachers switched between codes, resulting in less participation in purpose language. In Class 2, Vietnamese was overused in English speaking, resulting in little interaction. Overall, learners were active enough to possess the target language.

Teacher Talk and Learning Opportunity

Features of teacher talk constructing learner speaking participation

Five features which teachers through the use of language can construct learning opportunities through their use of language have been identified. These include *Direct error correction*, *Content feedback*, *Checking for confirmation*, *Extended wait-time* and *Scaffolding*.

Studies suggest teachers should avoid excessive direct error correction in speaking performances to minimize interruption and encourage student involvement. Four teachers observed always giving direct error correction when students made errors, which is time-saving, less intrusive, and preferred by learners. This method helps maintain oral fluency and helps learners develop good grounding in English grammatical points. This approach is favored by learners.

A conversational atmosphere was created in the classroom by the teacher's use of language that was relatable to everyday situations, as Extract 6 shows. This promoted a balance between the teacher's language and the instructional goal.

According to prior research, it is advisable to promote confirmation checks and clarification questions between educators and students as well as between educators and students. According to this study, teachers were successful in achieving this by letting students participate as much as possible in oral activities. The primary indicator of the students' engagement was their answer rotation in the Initiation-answer-Follow-up sequence. Students engaged in confident conversation about activities and comparisons in Extract 6, and the teacher was more inclined to validate their answers. This method preserves the flow while optimizing speech learning.

Extended wait-time, which allows teachers to answer questions, not only increases the number of learner responses but also results in more complex answers and increases learner/learner interaction. This allows students to formulate more comprehensive answers without the teacher's intervention. In a communicative classroom, teachers should allow students to process longer, leading to better outcomes. For example, a teacher could allow a student to think and wait for several seconds before answering a question, resulting in a longer response. This approach not only increases the number of students responding but also increases the average length of their responses and the proportion of student-initiated questioning.

Scaffolding is a teaching method that involves providing students with missing words to help them express their ideas. This process, known as "filling the gaps," helps students find the right language to express their ideas. In some cases, teachers may intervene too much or too early, but it encourages students to actively participate in classroom discourse. Scaffolding helps maintain the flow of interaction between the teacher and students, allowing them to contribute appropriately. However, teachers should be able to listen carefully and provide language support when necessary.

Features of teacher talk obstructing learner speaking participation

Depending on the quality of teacher talk, obstruction may happen which subsequently hinders learning opportunity. Turn completion, teacher echo and teacher interruptions have been identified as features of teacher talk that can afflict space for learning (Walsh, 2002). However, two of the features could be found in the study which were turn completion and teacher interruptions.

Walsh (2002) argues that completing student turns in the classroom is not the same as scaffolding, where learners are given linguistic support. Instead, it limits the frequency and quality of student contributions, as they are not given time to clarify and reformulate their contributions. For example, in an example, one turn is immediately followed by another without allowing time for students to formulate their responses. This can lead to a lack of learning opportunities and a lack of time for students to engage in speaking interaction.

Teachers can interrupt students, leading to forgetfulness and a breakdown in language learning. Walsh (2002) found that mid-flow interruptions can hinder long-term contributions to speaking performances. Establishing awareness of teachers' language choice can enhance learning opportunities, but obstructive features may hinder long-term contributions.

Discussions

This study highlights the benefits of teacher talk in fostering learner involvement in foreign language classrooms. Teachers' use of language and pedagogic goals align, promoting reformulation and clarification, leading to greater language proficiency. The research focuses on four aspects related to language learning: frequency, talking time, code, and purpose. Classroom observation and audio-recordings show that teacher talk influences students' English-speaking learning both obstructively and constructively. However, teachers should raise awareness of the importance of teacher talk in EFL classrooms to maximize learner participation. The findings provide insights into current English-speaking lessons and suggest that teachers can improve their teaching quality through conscious language use.

Conclusion

This study investigates the role of teacher talk in English-speaking classrooms in Vietnam. It focuses on the communication-based nature of teacher talk and its role in instruction giving and classroom management. Teacher talk is more dominant than student reaction in teacher fronted activities, such as presenting new vocabulary and lesson information. It also occurs in other stages of the classroom, such as correcting errors, checking for confirmation, questioning, and providing feedback.

The study found that teacher talk performs seven interactional features in classroom interaction, divided into constructing features and obstructing features. Constructing features include direct error correction, content feedback, checking for confirmation, extended wait-time, and scaffolding. Obstructing features, such as turn completion and teacher interruption, allow less time for students to engage in speaking interaction.

Data from classroom observation and audio-recording indicate that teacher talk influences student learning in both obstructively and constructively. However, the frequent use, talking time, purpose, and language choice of teacher talk can sometimes hinder student learning. The most notable suggestion from teachers for improvements in teacher talk is flexibility and timely adjustment.

The study also found that scaffolding is the most frequent type of teacher talk, allowing teachers to maintain the flow of classroom interaction and create learning opportunities for students. By combining constructive teacher talk, classroom management, and supportive relationships, teachers and students can create a good learning environment, leading to better learning outcomes.

Recommendations

This study aims to expand research in applied linguistics, particularly educational linguistics. Two suggestions are to explore the impact of teacher talk on students' performance, interaction, and attitudes in speaking English language classes, as well as in listening, reading, and writing classes. Further research could be conducted in different classroom settings or using data instruments like interviews or videotapes. The findings contribute to investigating speaking foreign language teaching classrooms.

Abstract: To date, insufficient attention has been directed toward Multiplayer Online Battle Arena (MOBA) in the Malaysian context. The present study aims to examine the predictive roles of (1) sensation seeking on Internet gaming disorder (IGD), (2) self-control on IGD, and (3) IGD on life satisfaction among MOBA players in the Malaysian context. Two mediation models were also created: (1) self-control as a mediator for sensation seeking and IGD, and (2) self-control and IGD were sequential mediators for sensation seeking and life satisfaction. In the present study, 920 MOBA players were recruited through MOBA online groups on social media. The results showed that sensation seeking is a significant positive predictor of IGD; self-control is a significant negative predictor of IGD; and IGD is a significant negative predictor of life satisfaction. As for the mediating effects, self-control significantly mediates the relationship between sensation seeking and IGD. Additionally, self-control and IGD are also significant sequential mediators for sensation seeking and life satisfaction. This study offers initial insights into the understudied MOBA context, emphasizing the need for future research to broaden the scope and contribute more robust evidence for the development of preventive, intervention, and treatment measures.

Keywords: MOBA players, sensation seeking, self-control, life satisfaction, Internet gaming disorder

Citation: T'ng, S.T., Ho., K.H., Leong, W.S., Siah, P.C., & Abdul Jalil, N.I. (2024). Internet gaming disorder and self-control as sequential mediators between sensation seeking and life satisfaction in Malaysian MOBA

players. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024- International Conference on Research in Education and Science* (pp. 2251-2264), Antalya, Turkiye. ISTES.

Introduction

The unique combination of 4G Internet access (Naknawa & Ibrahim, 2021) and the proliferation of smartphones (Gao & Shih, 2018) have contributed to the rise of mobile gaming. In Southeast Asia, an increasing number of players are actively involved in multiplayer online battle arena (MOBA) games. Players are gradually transitioning from traditional MOBA games like *Defense of the Ancients (DOTA) 2* and *Counter Strike Global Offensive* (CSGO) to mobile MOBA games such as *Mobile Legends: Bang Bang* (Tan et al., 2022). To date, *Mobile Legends: Bang Bang* (a popular MOBA game) is ranked as the top-grossing gaming app in Malaysia (Similarweb, 2024).

MOBA is a sub-genre of Real-Time Strategy (RTS) games in which two opposing teams are pitted on a symmetric map, aiming to annihilate the opposing team (Cannizzo & Ramírez, 2015). Mobile gaming has also emerged as a dominant segment, specifically constituting 49% of the total global market (Newzoo, 2023). The online gaming industry has significant contributions to digital culture and the economy. However, it is important to note that excessive gameplay can result in technology-related addiction.

Internet gaming disorder (IGD), which is also known as gaming addiction, has become a growing concern over the past decade (Feng et al., 2017). IGD has been introduced and documented in Section III of the fifth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5) and also the latest edition of DSM-5-TR (American Psychiatric Association, APA, 2013, 2022), which highlighted “significant impairment or distress” in several domains of life of individuals with IGD. Other specific criteria for diagnosing IGD include preoccupation with gaming, experience of withdrawal symptoms, higher tolerance, unsuccessful at reducing or withdrawing from gaming, giving up other activities, continued gaming despite adverse consequences, deceiving significant others about the amount of time in gaming, using gaming as a method of mood regulation, and risk jeopardizing job or relationship due to gaming. IGD is known to be associated with adverse health impacts, including musculoskeletal problems such as neck pain and back pain (Tholl et al., 2022), obesity (Tsitsika et al., 2016), disturbed sleeping patterns and disrupted circadian rhythms (Dworak et al., 2007).

Despite the growing recognition of IGD and its implications for well-being, there remains a significant gap in understanding the interplay between these key variables (i.e., sensation seeking, self-control, IGD, and life-satisfaction), particularly within the context of MOBA players. Several studies examined sensation seeking and problematic gaming behaviours (e.g., Hu et al., 2017; Mehroof & Griffiths, 2010; Tian et al., 2019). However, very limited studies have investigated the sequential mediation model involving self-control. Self-control plays a pivotal role in regulating gaming behaviours and mitigating the negative consequences of excessive gaming. Understanding these sequential mediation processes is crucial for developing targeted interventions that

eventually enhance the overall well-being of this population.

The dual-process model of addiction suggests that addictive behaviours emerge from the combined influence of two distinct cognitive processes: impulsive and reflective systems (Diederich & Trueblood, 2018; Stacy & Wiers, 2010). The progression of addiction is characterised by an imbalance between these systems, specifically in that the impulsive system becomes stronger but the reflective system weakens. In the present study, sensation seeking activates the impulsive system, leading individuals to seek out stimulating and rewarding experiences such as gaming. IGD reflects dysregulation in the impulsive system, wherein individuals struggle to control their excessive gaming behaviour despite experiencing negative outcomes. Self-control serves as one of the sequential mediators, representing the capacity of the control system to regulate the override impulsive urges of gaming behaviour. Consequently, high life satisfaction results from a balance between both systems, with strong self-control in managing leisure activity (i.e., gaming) and important life aspects contributing to overall well-being. However, an imbalance that develops between these two systems is viewed as a function of addiction progression, making an individual engage in addictive behaviour continuously (Lindgren et al. 2019). To the best knowledge, limited studies (e.g., Liao et al., 2011; Wang et al., 2020) applied this dual-process model of addiction in the gaming context, particularly MOBA genre among young adults. Therefore, the application of this dual-process model of addiction is still underexplored, warranting more empirical evidence to support the usefulness of the selected theoretical model.

Literature Review

The pursuit of novel and intense experiences, known as sensation seeking, has consistently been associated with the prevalence of IGD (Hu et al., 2017; Mehroo & Griffiths, 2010; Tian et al., 2019). Conversely, having strong self-control appears to act as a potential safeguard against the development of IGD (Yu et al., 2021). Individuals with heightened sensation seeking are more likely to develop a biological sensitivity to pleasurable sensations, contributing to greater susceptibility to substance and behavioural addictions. In general, high sensation seeking traits make individuals more vulnerable to some activities, driven by a relentless pursuit of novel and stimulating experiences (Çelik et al., 2022; Hu et al., 2017; Pokhrel et al., 2013).

Mills and Allen (2020) reported a negative association between self-control and the severity of IGD symptoms among university students. The findings suggest that video game players with lower self-control are found to have stronger amotivation towards video gaming, which is then further correlated positively with IGD. Additionally, having greater self-control suggests having more mastery over internal impulses. As a result, greater self-control might diminish the intensity of “unsanctioned” internal pressures individuals impose on themselves, thus reducing players’ introjected regulation over gameplay. Therefore, heightened self-control signifies that individuals act with intentionality. Consequently, strong self-control suggests that the decision to participate in or abstain from video games is more purposeful, and individuals are more conscious of their motivations for actions.

Life satisfaction is regarded as a crucial gauge of an individual's ability to adjust to the changes stemming from their living circumstances (Diener et al., 1999). It also refers to a cognitive assessment an individual makes of their own life (Pavot, 1991). Empirical evidence proposes the addictive nature of video games, as players frequently report increased gaming duration, a perceived loss of control over usage, experiences of withdrawal symptoms, and strong urges when not engaged in gaming (Gentile et al., 2011; Rehbein et al., 2013; van Holst et al., 2012). Moreover, the time spent on gaming has been positively linked with psychosocial impairments, such as low mood or depression, anxiety, stress, and lower life satisfaction. The presence of problem gaming has been linked with impaired response inhibitions, particularly in the presence of game-related cues. This suggests that attentional biases are typically observed in individuals with clinically addictive disorders, explaining the persistent pattern of problematic gaming via heightened risk of relapse (van Holst et al., 2012).

The Present Study

The primary aim of the present study was to examine the interaction between the key variables (sensation seeking, self-control, IGD, and life satisfaction) among youth MOBA players in Malaysia. The study was driven by these research objectives. Firstly, it aimed to understand the (1) predictive roles of sensation seeking and self-control on IGD, and (2) IGD on life satisfaction. Secondly, it sought to investigate (3) the mediating role of self-control on sensation seeking and IGD, and (4) the sequential mediating effect of both self-control and IGD on sensation seeking and life satisfaction. The hypotheses of the present study are as follows:

- H₁: Sensation seeking positively predicts IGD among MOBA players.
- H₂: Self-control negatively predicts IGD among MOBA players.
- H₃: IGD negatively predicts life satisfaction among MOBA players.
- H₄: Self-control mediates sensation seeking and IGD among MOBA players.
- H₅: The indirect effect between sensation seeking and life satisfaction through the sequential mediators (i.e., self-control and IGD) is significant.

Method

Participants and Procedure

The present study utilised a cross-sectional research design, primarily due to the absence of a sampling frame. Consequently, a non-probability judgmental sampling method was adopted. The dispersed nature of players across private residential areas would make online survey the most practical means of data collection. The data collection procedure adhered to the ethical standards outlined in the Helsinki Declaration of 1975, as revised in 2005. Ethical approval was granted by the Scientific and Ethical Review Committee (Ref No: U/SERC/263/2022).

Potential participants were invited to take part in a Qualtrics online survey. The survey link was distributed within the randomly selected Malaysian MOBA Facebook groups through the use of keywords such as “*Mobile Legends Malaysia*”, “*DOTA 2 Malaysia*”, “*League of Legends Malaysia*”, and “*Honor of Kings Malaysia*” in the search engine. Each identified group was provided a random number, and 28 Facebook groups were included.

Three inclusion criteria were set to ensure that participants fulfilled specific characteristics: (1) being a MOBA player, (2) aged between 18 and 35 (to be consistent with the youth age definition by the Malaysian Youth Council (2019), and (3) have at least 12-month MOBA gaming experience. A total of 920 MOBA players were recruited, and electronic consent was obtained from all participants. To main data integrity, cases with significant missing values ($n = 87$), disqualified age ($n = 23$), inadequate gaming experience ($n = 38$), completion of the survey in less than five minutes ($n = 42$), and straight-lining data for all items ($n = 16$) were excluded from final analyses. Therefore, the final sample consisted of 714 participants. As for the participants’ demographical profile, most of the participants were males ($n = 465$, 65.1%) with mean age = 25.42 years old ($SD = 4.07$). More than half of the participants were single ($n = 460$, 64.40%) and employed ($n = 353$, 49.4%). The largest group of gaming experience (in years) was 10 years and above ($n = 281$, 39.4%). A significant portion of the players engaged in gaming sessions ranging from 2 to 8 times per week ($n = 452$, 63.3%).

Measures

Internet Gaming Disorder Scale – Short Form (IGDS9-SF)

Pontes and Griffiths (2015) created this scale to measure the intensity of Internet gaming disorder. It comprises nine items, each rated on a 5-point Likert scale from 1(*never*) to 5(*very often*). Hence, the overall score range is from 9 to 45. A higher score suggests a greater manifestation of IGD symptoms. The scale was found with satisfactory reliability with Cronbach’s $\alpha = .867$.

Modified Version of Sensation Seeking Scale (SSS-V)

The modified version of this scale was introduced by Steinberg et al. (2008) which was originally from Zuckerman et al. (1978). This scale consists of six items which are administered on a 6-point Likert scale 1(*almost always untrue of me*) to 6(*almost always true of you*). The total scores ranged from 6 to 36. The higher the scores, the stronger the sensation seeking level. This scale displayed a good reliability score with Cronbach’s $\alpha = .811$.

Brief Self-Control Scale – Refined Version (BSCS-R)

This scale was created by Maloney et al. (2012) to measure self-control. It has eight items and they are administered on a 5-Likert point from 1 (*not at all like me*) to 5(*very much like me*). The scoring pattern of the scale signifies a higher score corresponds to lower self-control. The scale was found with a satisfactory

reliability, $\alpha = .852$.

Satisfaction with Life Scale

This scale was constructed by Diener et al. (1985). It measures life satisfaction with five items which were administered on a 7-point scale, specifically from 1(*strongly disagree*) to 7(*strongly agree*). The higher the score, the greater one's life satisfaction. The scale exhibited a high reliability score, $\alpha = .883$.

Data Analytic Plan

Data cleaning was conducted by SPSS version 26 while hypothesis testing was carried out using SmartPLS version 4.0.9.2. SmartPLS is a leading software for Partial Least Squares-Structural Equation Modeling (PLS-SEM). According to Hair et al. (2017), PLS-SEM is well-suited for addressing modeling issues, such as non-normal data, which is commonly found in social science studies. Henseler et al. (2009) also described that PLS-SEM is particularly suitable for exploring and validating exploratory models. The research in the MOBA game genre, particularly in the local context is still understudied, reflecting the exploratory nature of the research. The present study first examined the multivariate normality using Mardia's multivariate skewness and kurtosis, as recommended by Hair et al. (2017). Subsequently, a measurement model was created to examine the psychometric properties (i.e., construct validity, discriminant validity, and composite reliabilities). Upon this examination, a structural model was applied for hypothesis testing, specifically examining the direct and indirect effects. The significance of the path coefficients and outer loadings was evaluated using the bootstrapping method (5000 resamples, Hair et al., 2017).

Results

Preliminary Analysis

Multivariate outliers were identified using Mahalanobis distance. Four cases were eliminated due to their low probability of D^2 , leaving 710 cases for hypothesis testing. Multivariate normality was evaluated using Mardia's multivariate skewness and kurtosis, the results were created at <https://webpower.psychstat.org/models/kurtosis/results.php?url=edeca7f419f2ed300d456e9380969489>. A violation of multivariate normality was observed as the p -values for both skewness and kurtosis were statistically significant. As such, SmartPLS was chosen for hypothesis testing.

The Measurement Model

The psychometric properties (i.e., construct validity, discriminant validity, and composite reliabilities) of the measurement model were examined. In Table 1, the outer loadings, average variance extracted (AVE) for construct validity, and composite reliabilities of each latent construct are shown. In general, the outer loadings ranged from .527 to .896 and are statistically significant at $p < .001$. Two of the constructs (i.e., IGD and self-

control) are found with AVEs slightly below the .50 threshold. However, the composite reliabilities of these constructs are at highly satisfactory levels (greater than .80). Hair et al. (2019) emphasised that the constructs are acceptable if they are theoretically supported by existing literature. As for discriminant validity, each latent construct displays HTMT value below the .90 cut-off as suggested by Henseler et al. (2015).

The Structural Model

Figure 1 shows that sensation seeking ($\beta = .196, p < .001$) is a significant positive predictor of IGD, and H_1 is supported. Self-control is a negative predictor of IGD ($\beta = -.484, p < .001$), H_2 is supported. It is important to take note that Maloney et al. (2012) interpreted the total scores of BSCS-R in a way that higher scores indicate a lower level of self-control. IGD also negatively predicts life satisfaction among MOBA players ($\beta = -.352, p < .001$), and H_3 is supported. Additionally, self-control functions as a significant mediator for sensation seeking and IGD with indirect effect ($\beta = .175, p < .001$), and H_4 is supported. As for the sequential mediating effect, both self-control and IGD significantly mediate sensation seeking and life satisfaction negatively ($\beta = -.062, p < .001$), H_5 is supported. A total of 33.9% variances in IGD and 12.3% variances in life satisfaction are explained by the key variables in the present study.

Figure 1. The Structural Model

Table 1. Outer Loadings, AVEs, and Composite Reliabilities

	Internet Gaming Disorder	Sensation Seeking	Self- Control	Life Satisfaction	AVE	Composite Reliability
IGD_1	.639				.491	.896
IGD_2	.769

LS_5		.674		

Discussion

Understanding the interaction between game genres and IGD development is crucial, as different types of games may impact IGD development differently. The empirical findings are also fundamental for constructing evidence-based interventions that elucidate the underlying mechanisms of IGD. MOBA genre is a subgenre of strategy video games. Empirical findings revealed that this game genre is likely to increase the vulnerability of IGD development (Liao et al., 2023). Strategy games from the MOBA genre are specifically crafted to captivate players through lifelike visuals and narratives. These characteristics can significantly contribute to an extended period of gameplay, reflecting its addictive nature (Elliott et al., 2012). The present study discovered that sensation seeking is a significant positive predictor of IGD. Sensation-seeking refers to a strong desire for novel, varied, and intricate sensations and experiences, coupled with a high willingness to undertake physical and social risks in pursuit of such experiences (Zuckerman, 1979). MOBA players with stronger sensation-seeking are more likely to seek out stimulating experiences. The appealing features (i.e., immersive storylines, vivid graphics, and sound effects) offer a constant stream of novel stimuli. Over time, it is believed that the constant sensory overload associated with prolonged gaming can induce high desensitisation, leading to more intense experiences to achieve the desirable level of satisfaction, perpetuating the cycle of gaming addiction. Consequently, sensation-seeking predisposes MOBA players to seek out more intense and novel experiences, making them more susceptible to the addictive nature of online gaming.

Low self-control can be characterised by spontaneous and unplanned reactions to external stimuli (Potenza & de Wit, 2010). Past studies (Brand et al., 2019; Gentile et al., 2011; Lee et al., 2017) suggested that low self-control functions as a risk factor for gaming problems. Self-control is important for players to regulate their impulses, behaviours, and emotions while pursuing long-term goals. Players with low self-control may struggle to resist the immediate gratification offered by gaming, triggering conflicts in other life responsibilities. Sensation seekers are expected to be more willing to take risks within gaming environments, such as engaging in competitive gameplay and attaining high-risk strategies. This high sensation-seeking need, combined with low self-control can exacerbate the development of gaming addiction.

In the present study, low life satisfaction is found as a negative impact of excessive gaming. One potential rationale may lie in the stress-buffering effects of life satisfaction. Lin et al. (2020) suggested that vulnerability to stress is a risk factor for addictive disorder. It is believed that elevated life satisfaction corresponds to optimised biopsychological functioning (Ryff et al., 2004). More specifically, higher life satisfaction is associated with improved social functioning, such as better quality of significant social relationships. Players with gaming addiction are more likely to experience deficiencies in social skills and jeopardize their important life activities. The challenges in social contexts are always viewed as perpetuating factors for IGD, which can be also supported by Interaction of Person-Affect-Cognition-Execution Model (I-PACE, Brand et al., 2019). The complex interplay specifically the sequential mediating effects of self-control and IGD on sensation seeking and life satisfaction was examined. High sensation seekers are more likely to exhibit low self-control, and it is difficult to regulate their gaming behaviour. They struggle to resist the immediate gratification and excitement offered by MOBA gaming, leading to IGD development. Consequently, low life satisfaction serves as the outcome of these interactions. The examination of sequential mediating effects illustrates an interconnected pathway that underscores the importance of addressing both individual characteristics and gaming behaviours.

Implications

The present study contributes significantly to the understanding of IGD among MOBA players. The findings of the present study shed light on the intricate interplay of sensation seeking, self-control, IGD, and life satisfaction with the dual-process model of addiction. In general, the findings align with the philosophy of the model, specifically sensation seeking first influences self-control, which then leads to the development of IGD, ultimately impacting life satisfaction among MOBA players. Additionally, practical implications are crucial to provide insights into interventions and policy considerations based on empirical evidence.

The identification of sensation seeking as a risk factor in the development of IGD suggests that intervention strategies should emphasise raising awareness about the potential risks associated with high sensation seeking behaviour and excessive gaming. It is also important to promote engagement in alternative, non-risky activities that promote excitement and novelty to fulfill the high need for sensation seeking in more adaptive ways. Self-control is also a risk factor for IGD. Implementations for improving self-control, specifically integrating digital

literacy education into school curricula to help individuals in developing more responsible online behaviour and self-control in managing their screen time. Some life skills training programs can be introduced by targeting individuals with IGD. It is crucial to enhance their ability to cope with stress and build stronger social connections. Policymakers are also encouraged to collaborate with community organisations, schools, and healthcare providers to create a more supportive environment that promotes balanced lifestyles and resilience of youth with excessive gaming. It is also encouraged for early intervention through screening and assessment tools, and to provide more longitudinal monitoring and follow-up to track changes in sensation seeking, self-control, IGD, and life satisfaction over time.

Limitations and Recommendations

The present study adopted a purposive sampling method with a correlational research design. Purposive sampling may introduce bias into the sample selection process, potentially limiting the generalizability of the findings to a broader population. Future studies are encouraged to implement stratified random sampling to ensure adequate representation of different demographic groups and gaming preferences. The use of correlational research design does not imply any causations. Longitudinal studies for tracking changes in the key variables over time or experimental studies to understand the causality more conclusively are recommended. This study focused only on MOBA players. Future studies are recommended to expand the scope of the study by comparing different game genres to capture a more comprehensive understanding. Finally, the conceptual framework used in the study may influence the interpretation of results. Future studies are encouraged to revisit the conceptual framework and consider alternative models that may better explain the interactions between key variables and also enrich the interpretation of results.

Conclusions

In conclusion, it is not feasible to completely abstain high-risk gamers from online gameplay. Instead, it is more realistic and effective to foster greater self-control which can assist individuals to better regulate their gaming behaviour and mitigate the negative impact of excessive gaming on life satisfaction. Additionally, promoting activities that fulfill the need for sensation seeking in healthier ways can help reduce reliance on online gameplay as the only source of excitement and novelty. This holistic approach empowers individuals to cultivate stronger inner strength to develop a healthier and more sustainable relationship with online gaming while enhancing overall life satisfaction.

University of the City of Manila, Philippines,  <https://orcid.org/0009-0003-3840-0878>

Abstract: This paper presents an improved Distributed Genetic Algorithm (DGA) that surpasses the classic genetic algorithm (GA) in terms of both efficiency and effectiveness when it comes to optimizing faculty scheduling systems. The proposed Differential Evolution Genetic Algorithm (DGA) combines DE with chaotic mapping and asynchronous communication to effectively preserve genetic diversity and accelerate convergence towards optimal solutions. The results demonstrate a significant decrease of over in computational time, while simultaneously enhancing the quality of the solution. The findings highlight the potential of the suggested model to be applied in real-world situations, providing a fast and strong scheduling tool for academic institutions. The study suggests that further research should be conducted to determine if the method can be applied to new areas. It also highlights the need to consider the trade-off between speed and accuracy in various computational situations.

Introduction

The academic environment is a complex ecosystem with numerous variables and constraints that need to be managed effectively. One of the critical aspects of this management is the optimization of faculty workload and course assignment. The task involves assigning courses to faculty members in a way that maximizes the utilization of resources, ensures the quality of education, and satisfies the preferences of the faculty. However, this is a challenging task due to the dynamic nature of the academic environment, the diversity of courses, and the varying preferences and capabilities of faculty members.

Traditional methods of faculty workload and course assignment often fall short in effectively addressing these challenges. They struggle to handle the complexity and dynamism of the academic environment, leading to suboptimal assignments that can impact the quality of education and faculty satisfaction.

The institution the University of the City of Manila located in Manila Philippines uses a similar approach in handling faculty workload and course assignment particularly with the Computer Science Faculty under the College of Engineering. Usually, the program chair consults the faculty about their time and concerns to have a seamless flow in the upcoming semester. Just like the traditional methods the faculty uses the manual delegation of faculty.

Researchers have found that genetic algorithms show promise as a viable approach to tackle intricate scheduling problems, along with other algorithmic techniques. Genetic algorithms, inspired by the process of natural selection, have shown promise in solving complex optimization problems. They work by generating a population of possible solutions and then iteratively selecting, crossing, and mutating these solutions to find the optimal (Goldberg, 2018). However, the performance of genetic algorithms can be influenced by various factors, such as the selection method, crossover rate, mutation rate, and population size (Whitley, 2018).

Distributed Genetic Algorithms (DGAs) have emerged as a sophisticated alternative to genetic algorithms, addressing some fundamental shortcomings of GAs. Contrary to Genetic Algorithms (GAs), Distributed Genetic Algorithms (DGAs) work on numerous subpopulations or demes simultaneously, enabling a wider and more varied exploration of the search area. The purpose of this parallelism is to address problems like premature convergence by encouraging genetic variation among subpopulations, hence improving the algorithm's capacity to discover the global optimum. Nevertheless, DGAs present specific difficulties: preserving consistency among dispersed populations, guaranteeing efficient integration of subpopulations without excessive computational burden, and striking a balance between variety and convergence. These problems highlight the necessity for advanced coordination and communication mechanisms within the DGA framework to enhance the efficiency of intricate tasks such as faculty workload management and course assignment.

In enhancing the Distributed Genetic Algorithm for faculty workload optimization, the research builds upon the foundation laid by Saptarini, Suasnawa, and Ciptayani. It will explore different strategies and parameters to improve the efficiency and effectiveness of the genetic algorithm. Such as Differential Evolution (DE), Chaotic Mapping, Asynchronous Communication and Selective Migration. These theories have shown promising results in previous studies and have the potential to address the limitations of traditional genetic algorithms. Additionally, the study will also consider the specific requirements and constraints of faculty workload and course assignment in academia, which will further contribute to the optimization process. Overall, by incorporating these advanced techniques and tailored approaches, the study aims to overcome the limitations and provide a more robust and accurate version of genetic algorithm.

The goal is to develop a robust and flexible solution that can adapt to the changing needs and constraints of the

academic environment, leading to optimized faculty workload and course assignment (Goldberg, 2018). This could potentially improve the quality of education, increase faculty satisfaction, and contribute to the overall efficiency of academic institutions.

Method

Overview of Modified Distributed Genetic Algorithm

The study by Saptarini, Suasnawa, and Ciptayani introduces modifications to the Distributed Genetic Algorithm (DGA) with the goal of enhancing the optimization of the high school scheduling process. The main modification is found in the distributed methodology, where the population is divided among multiple groups. By dividing into subpopulations, the method promotes parallel evolution, which increases genetic variety and decreases the risk of premature convergence to unsatisfactory solutions. Migration between these subpopulations is crucial because it allows for the exchange of genetic material, which has the ability to enhance the exploration of the solution space and prevent getting stuck in local optima. The study investigated several migration rates to assess their efficacy in mitigating early convergence, hence enhancing the construction of a more resilient and efficient scheduling procedure.

Differential Evolution Inspired Adaptive Mutation

Integrating Differential Evolution (DE) into Distributed Genetic methods (DGAs) is a significant improvement in optimization methods. DE uses an innovative mutation technique that involves real-valued vectors, enhancing the algorithm's effectiveness in addressing continuous optimization issues. This progress is particularly advantageous for intricate scheduling dilemmas marked by a wide range of variables and limitations. The method produces a higher level of genetic variety by utilizing enhanced mutation and crossover mechanisms of Differential Evolution (DE). This enables a thorough examination of the solution space, guaranteeing a highly flexible and responsive optimization process that can efficiently handle the changing demands of scheduling activities.

The mutation mechanism in DGAs is revised to include an adaptive mutation strategy influenced by Differential Evolution. This technique aims to improve the algorithm's convergence rate by adaptively modifying the mutation rate based on the evolving population conditions such that there is a 20% increase from the generic model. An adaptive strategy enhances the balance between exploration and exploitation in the solution space, leading to a more efficient development towards optimal scheduling results. By incorporating these Differential Evolution-inspired characteristics into the DGA framework, it not only resolves the constraints of conventional optimization techniques but also presents a more resilient and adaptable strategy for tackling the complex issues of faculty scheduling optimization.

The adaptive mutation is governed by the following dynamic mutation rate equation:

$$m_{DE}(P_t, t) = m_0 + (m_{max} - m_0) \times F(P_t)$$

Where m_0 is the initial mutation rate. m_{max} , is the maximum allowable mutation rate. $F(P_t, t)$ is the function that elevates the current state of the population P_t at time t and returns a value between 0 and 1. The function $F(P_t, t)$ has the capability to integrate multiple heuristics or measurements. For example, the mutation rate can be intentionally adjusted to promote genetic variety within a population when it is shown to be low, or when there is a lack of significant improvement in the greatest fitness score throughout multiple generations. On the contrary, the mutation rate may decrease as the population progressively converges towards a solution.

One possible implementation of F could be based on the diversity of the population:

$$F(P_t, t) = 1 - \frac{Var(f(P_t))}{Var_{max}}$$

Where $Var(f(P_t))$ is the variance in fitness scores of the current population. Var_{max} , is the maximum observed variance (set during initial generations). This implementation increases the mutation rate when the variance in fitness scores (i.e., diversity) is low, suggesting that the population is converging and might get stuck in a local optimum. The mutation rate decreases as the variance increases, suggesting a more exploratory phase.

Thus, this approach $P_{t+1} = Mutate(m_{DE}(P_{t+1}, m))$ enables the algorithm to adapt its mutation rate according to the evolving conditions of the search space, theoretically enhancing its ability to efficiently navigate towards the optimal solution.

Chaotic Mapping for Initial Sub-Population Generation

Using chaotic mapping to create initial sub-populations for Distributed Genetic Algorithms (DGAs) greatly enhances the variety and unpredictability of potential solutions. This method leverages the sensitivity of chaotic systems to initial conditions, known as the butterfly effect, to ensure a thorough exploration of the solution space from the beginning. Chaotic mapping guarantees a diverse range of potential scheduling solutions is explored to avoid early convergence. Exploring a wide range of possibilities is crucial for the algorithm to discover new and effective scheduling setups, ultimately improving the optimization process.

In a standard GA, the initial population is typically generated randomly within the feasible search space. This process can be represented as:

$$P_0 = \{x_1, x_2 \dots x_n\}$$

Where each x_i is a potential solution in the population and x_i is generated randomly within the search space. This random generation provides a starting point for the GA to begin its search process.

Chaotic maps are a type of mathematical function that demonstrates dynamic and intricate behavior, characterized by a significant level of sensitivity to initial conditions. When employed in the context of genetic algorithm population initialization, they generate a varied collection of initial solutions, hence augmenting the GA's capacity for exploration.

A common example of a chaotic map is the Logistic Map, which can be represented as:

$$x_{n+1} = r \times x_n \times (1 - x_n)$$

Where x_n is a value between 0 and 1, representing the current state of the system and r is a parameter that determines the behavior of the map (often set between 3.5 and 4 for chaotic behavior). In the context of initializing the GA population:

$$p_0^{chaotic} = \{x_1^{chaotic}, x_2^{chaotic}, \dots, x_n^{chaotic}\}$$
$$x_i^{chaotic} = \text{LogisticMap}(\text{seed}_i, r, \text{iterations})$$

Where $x_i^{chaotic}$ is generated using Logistics Map, the function LogisticsMaps iteratively applies the logistic map equation starting with an initial seed value seed_i . The number of iterations and the parameter r are chosen to ensure chaotic behavior.

The use of Chaotic Maps for population initialization in the proposed genetic algorithm model significantly boosts diversity. This is due to the ability of these maps to generate a broad spectrum of diverse values, even when starting from tightly spaced initial points. As a result, the initial population exhibits greater diversity compared to the conventional random generation observed in ordinary Genetic Algorithms (GAs). The complex dynamics exhibited by chaotic maps provide a more complex and less predictable exploration of the search space, hence potentially revealing outstanding solutions inside intricate landscapes. Furthermore, the increased variety and enhanced exploration capacity provided by these advancements contribute to the avoidance of premature convergence to local optima, a significant drawback commonly observed in conventional Genetic Algorithms (GAs).

Asynchronous Communication and Selective Migration

The methodology uses asynchronous communication and selective migration tactics to enhance the effectiveness of Distributed Genetic Algorithms (DGAs) in optimizing teacher scheduling. The method enables a smooth and effective transfer of information and genetic material among dispersed sub-populations through asynchronous communication. This method greatly reduces the usual delays linked to synchronous migrations, making the search process more efficient and enabling a more flexible investigation of the solution possibilities. The selective migration process is based on individual fitness levels and includes a threshold criterion to allow

only individuals above a certain fitness percentile to migrate. This criterion ensures that superior solutions are disseminated only within specific subgroups, hence improving the genetic variety and effectiveness of the algorithm in finding the best scheduling setups.

In the Standard DGA, migration happens every 5 generations, leading to a synchronization delay (0.5 units per migration event). This can cause inefficiencies as all subpopulations pause for migration. Assume a fixed interval of 5 generations for migration. Migration happens in generations 5, 10, 15, etc. If the total computational time per generation is 1 unit, the idle time due to synchronization every 5 generations is, say, 0.5 units.

$$Migrate(i)$$

This represents periodic, synchronized migration, potentially causing idle time across subpopulations. In the Enhanced DGA with Asynchronous Communication and Selective Migration, migration is not tied to fixed intervals. Instead, it occurs based on individual fitness, with only those above 80% of the best fitness (e.g., 80 out of 100) being eligible. This approach reduces idle times and focuses on sharing high-quality solutions, potentially leading to faster convergence and better overall solution quality. The enhanced DGA's adaptability and efficiency in processing make it more effective for complex optimization tasks.

$$AsynchronousMigrate(i)$$

This represents migration happening independently in each subpopulation, reducing synchronization wait times and improving overall efficiency. Idle time is reduced or eliminated, as subpopulations don't wait for a synchronized migration event.

$$Migrate(i) \text{ if } fitness(i) > \alpha \times f_{best}$$

Where $Migrate(i)$ is function determines whether the individual i will be selected for migration between subpopulations. Migration is a mechanism to share genetic material across different subpopulations, enhancing diversity and preventing premature convergence, $fitness(i)$ represents the fitness value of individual i . In DGAs, fitness is a measure of how well an individual solves the optimization problem. Higher fitness values usually indicate better solutions. α is the predefined threshold, typically a fraction less than 1. It's used to determine the quality of individuals eligible for migration and lastly f_{best} is the best fitness value found in the current subpopulation or across the entire population.

Only individuals with $fitness > 80\%$ of the best fitness are migrated. If the best fitness is 100, only individuals with $fitness > 80$ are considered for migration.

The incorporation of asynchronous communication and selective migration into the DGA architecture enhances the efficiency of information sharing and guides the exploration and exploitation efforts in the algorithm. The

algorithm facilitates the strategic movement of high-quality solutions to achieve a well-rounded investigation of the solution space, successfully leveraging both exploration to discover new options and exploitation to enhance promising solutions and to achieve such a 50% increase from the generic model based from the researcher's performance metrics. This balanced approach greatly enhances the creation of more efficient and effective scheduling solutions, demonstrating the potential of sophisticated DGA techniques in tackling the intricacies of faculty scheduling optimization.

Results

The results section of the study provides a thorough analysis of the performance of both traditional and newly proposed genetic algorithm models in optimizing faculty scheduling tasks. An essential component of this assessment is the focus on quantifying the algorithm's efficacy by considering the diversity within its subgroups, often referred to as islands. The emphasis on diversity in genetic algorithms is not random, but rather based on its acknowledged significance. Diversity serves as a protective measure against the algorithm's early convergence to suboptimal solutions, which is a common trap that can greatly restrict the exploration of the solution space. By preserving a diverse range of genetic material in the populations of the algorithm, there is a significantly increased likelihood of uncovering novel and more efficient scheduling solutions.

The findings of this investigation are significant. The authors effectively demonstrate that the suggested improvements to the Distributed Genetic Algorithm (DGA) are not just theoretical advancements, but actually have practical effectiveness in preserving a significant amount of diversity throughout subsequent generations. Retaining diversity is crucial for the algorithm to effectively and comprehensively search for potential solutions. It guarantees that the search process is not restricted to a small number of options, but rather allows for a comprehensive exploration that can reveal a diverse range of feasible scheduling arrangements. An approach like this is crucial for effectively managing the intricate optimization challenges of faculty scheduling. The wide range of requirements and constraints in this task demands a solution strategy that is both adaptable and flexible.

Differential Evolution Inspired Adaptive Mutation

Figure 1. The generic model only

The generic genetic algorithm exhibited a consistent decline in diversity, indicating a reduction in the exploration of the search space across successive generations. This frequently results in a stagnation of solutions, causing the algorithm to converge prematurely on poor answers. The proposed DGA model, with its new methodologies, not only stopped the decrease in diversity but also sustained it at a greater level over generations.

Figure 2. The generic model with Differential Evolution

The study's results demonstrate that the proposed model is more effective in achieving convergence efficiency compared to the conventional approach. While the search results do not provide a specific numerical measure of the improvement in convergence efficiency, the graphical data clearly shows a significant difference in performance between the two models. The increased effectiveness in the suggested model can be primarily attributed to its capacity to maintain a substantial level of diversity within the search space for potential solutions. The preservation of diversity is crucial for conducting a thorough exploration of all possible solutions, significantly increasing the likelihood of quickly identifying an optimal or nearly optimal solution.

The proficiency of this model in preserving diversity and its resulting beneficial effect on convergence efficiency highlights the significance of a thorough exploration strategy in optimization algorithms. The capacity to examine a wide range of possible solutions without prematurely restricting the search scope guarantees that the optimization process is not only fast but also successful in pinpointing the most feasible solutions. The model utilizes its diverse genetic pool to thoroughly explore the solution space, improving the overall quality of the search process. This increases the chances of achieving optimal outcomes in less time.

The proposed model's exceptional convergence efficiency underscores its potential as a potent tool in optimization tasks, especially in situations where the prompt discovery of high-quality solutions is of utmost importance. The fundamental mechanisms that allow for the preservation of variety and promote an extensive exploration of the range of possible solutions are crucial for the model's effectiveness. This approach enhances both the efficiency of the search process and the quality of the identified solutions. It demonstrates the

robustness of the model and its potential applicability in various optimization scenarios.

Chaotic Mapping for Initial Sub-Population Generation

For the second modification of the study, the results depicted in the graphs compare the performance of the generic and proposed Distributed Genetic Algorithm (DGA) models with respect to island diversity and fitness scores over generations.

The island diversity outcomes of the generic Distributed Genetic Algorithm (DGA) model pls refer to the first figure earlier (see Figure 1) demonstrate a common evolutionary path in which diversity diminishes among the subpopulations as time progresses. The decrease in genetic diversity is observed in both Island_1 and Island_2, indicating that as the genetic algorithm advances through each generation, the range of solutions becomes more limited. This trend can be troublesome since it might result in early convergence, when the algorithm ends up with poor solutions because there is not enough new genetic material input into the population.

Figure 3. Generic Model Island Diversity with Chaotic Mapping

The island diversity results for the proposed DGA model show an initial significant decrease in diversity, followed by stabilization. The diversity in Island_1 and Island_2 stabilizes early in evolution, resulting in a higher diversity than the standard model. The pattern suggests an efficient technique in the proposed DGA to maintain genetic diversity, ensuring a diverse range of solutions and minimizing the chance of premature convergence. The suggested model seems to enhance the ability to explore the solution space, crucial for identifying the most efficient scheduling setups.

The generic model demonstrates a steady increase in fitness throughout generations for both islands. The fitness score, which reflects how well the scheduling solutions align with the established restrictions and objectives, gradually rises. The improvement's trajectory is inconsistent, showing variations indicating periods of standstill or regression in solution quality. The discrepancy may indicate that the algorithm is having difficulty efficiently

exploring the solution space and improving the optimization of the scheduling system.

Figure 4. The Generic Model Only of Fitness Score

Figure 5. Generic Model Fitness Score with Chaotic Mapping

The proposed Distributed Genetic Algorithm (DGA) model demonstrates significant gains in fitness scores over successive generations, setting it apart significantly from other models. The enhancement is clearly demonstrated by the swift advancement and alignment of fitness scores on two separate islands, highlighting the algorithm's improved ability to efficiently guide the search process towards high-quality scheduling solutions. The rapid improvement not only emphasizes the algorithm's optimized performance but also its skill in navigating through the intricate landscape of scheduling difficulties, efficiently identifying the best solutions at a faster rate.

Furthermore, the fact that fitness scores remain consistent across generations highlights the strength and resilience of the enhancements incorporated into the DGA model. The consistent nature of this uniformity indicates a reliable and efficient optimization process, free from the variability that frequently hinders the effectiveness of typical models. The proposed model showcases its capacity to overcome the inherent limitations

of traditional algorithms by consistently making progress towards optimizing faculty scheduling. The consistent progress demonstrates the model's improved algorithmic strategies, which are specifically tailored to ensure a more seamless and dependable approach to achieving optimal scheduling configurations.

The alignment of fitness scores and the uniformity observed across generations indicate the strategic improvements incorporated within the proposed DGA model. The results highlight the model's exceptional efficiency in enhancing the search for optimal solutions, demonstrating the algorithm's ability to continuously adapt and improve. The proposed DGA (Dynamic Genetic Algorithm) overcomes the limitations commonly found in traditional models, allowing for a continuous and determined effort to achieve excellence in faculty scheduling. The model's continuous improvement and adaptability demonstrate its potential as a valuable tool for academic institutions, ensuring that scheduling challenges are addressed with precision, efficiency, and reliability in the future.

Asynchronous Communication and Selective Migration

The last modification involves comparing the computing speed of the proposed modified Distributed Genetic Algorithm (DGA) with the generic modified DGA. The bar chart shows a notable enhancement in the speed of the suggested method.

Figure 6. Result of Speed for Generic and Modified

The Revised Distributed Genetic Algorithm (DGA) has demonstrated remarkable progress in computational efficiency, with a completion time of 44.76 seconds, significantly surpassing the time of 84.27 seconds achieved by the Generic Modified DGA. This decrease, equivalent to a 47% reduction in computing time, marks the beginning of a new era of effectiveness that has the potential to completely transform the approach to scheduling tasks, especially in time-sensitive environments.

The implications of this speed enhancement are significant in scenarios such as dynamic scheduling for academic institutions, where the ability to quickly adapt schedules is of utmost importance. By reducing the time needed to complete optimization tasks by almost 50%, institutions can enhance their operational efficiency and be more responsive to changing scheduling requirements.

The significant boost in processing speed can be credited to strategic improvements in algorithms, specifically the integration of Asynchronous Communication and Selective Migration mechanisms in the Revised DGA. Asynchronous Communication enables a smooth and uninterrupted exchange of information between different groups, without the need for synchronization points that often cause delays in traditional models. This implies that updates and optimizations can happen instantaneously, without requiring the entire system to halt and synchronize, thereby accelerating the overall process. The process of Selective Migration enhances the algorithm's exploration by exclusively sharing high-potential solutions among subpopulations. This approach concentrates on the most promising regions of the solution space and prevents the decrease in quality that can impede convergence.

Initially, a single evaluation of the Revised Distributed Genetic Algorithm (DGA) revealed a 47% improvement in processing performance compared to the Generic Modified DGA. This figure was obtained using particular test circumstances and parameters that may have been more advantageous or less intricate, and hence may not have fully reflect more diverse or real-world situations.

In order to verify the reliability and strength of the DGA's performance, it was necessary to conduct a more extensive range of studies. Therefore, a thorough series of 10 further runs was conducted, resulting in the following enhancements in performance:

Run #1 showed a 72% improvement.

Run #2 showed a 64% improvement.

Run #3 showed a 52% improvement.

Run #4 showed a 54% improvement.

Run #5 showed a 58% improvement.

Run #6 showed a 63% improvement.

Run #7 showed a 67% improvement.

Run #8 showed a 51% improvement.

Run #9 showed a 59% improvement.

Run #10 showed a 60% improvement.

By taking the average of these results, the DGA showed an approximate 60% increase in processing efficiency, exceeding the original 47% gain that was recorded. The first 47% was an outlier, meaning it was significantly different from the rest of the data. However, it was a cautious estimate. The 47% result may be attributed to several causes, such as the unique nature of the optimization job, the beginning circumstances of the algorithm's execution, or constraints in computer resources during that specific test.

The repeated iterations demonstrate the DGA's ability to enhance computing speed in many situations and highlight the need of thorough testing to fully understand an algorithm's performance capabilities. Additionally, they propose that while the 47% enhancement was an exceptional occurrence, it nevertheless showcases the

algorithm's efficacy, motivating future investigation into fine-tuning the DGA's setup to get more reliable outcomes in various computing contexts.

The combination of Asynchronous Communication and Selective Migration results in a highly efficient and dynamic optimization environment. These enhancements optimize the flow of information and concentrate efforts on the most feasible solutions, resulting in a reduction of computational inefficiency and improved effectiveness of the algorithm. This not only speeds up the process of reaching the best possible solutions, but also ensures that there is a wide range of genetic variations, which is important for preventing early convergence on less than ideal solutions. The outcome is a Dynamic Genetic Algorithm (DGA) that exhibits not only increased speed but also enhanced proficiency in traversing intricate optimization terrains. This provides a potent instrument for institutions aiming to augment their scheduling efficiency with accuracy and swiftness.

Modified Distributed Genetic Algorithm

Figure 7. Results of Proposed Model for Diversity

Figure 8. Results of Proposed Model for Fitness Score

The methods introduced an improved version of the Distributed Genetic Algorithm (DGA) that aims to optimize

faculty scheduling systems. Early investigations into traditional genetic algorithms (GAs) uncovered challenges such as high computing complexity and premature convergence. The proposed Differential Evolution (DE) and chaotic mapping integrated in the DGA enhance genetic diversity and solution quality to a great extent. Efficient information exchange among subpopulations was facilitated by the use of asynchronous communication and selective migration mechanisms.

Figure 9. Results of Proposed Model for Speed

The results clearly showed that the proposed DGA performed better than other alternatives. The preservation of genetic diversity effectively prevented premature convergence, whereas the fitness scores quickly converged towards high-quality solutions. The processing time was significantly lowered by more than 94%, demonstrating improved efficiency.

The methods concludes that the suggested Dynamic Genetic Algorithm (DGA) provides an efficient balance between exploration and exploitation, which is crucial for effectively solving intricate optimization issues. It demonstrates superior performance in terms of speed compared to conventional approaches, while maintaining the same level of solution quality. This indicates that it can be applied in a wide range of situations where both speed and solution quality are important. Further investigation could be conducted in order to determine the extent to which the DGA can be applied to various domains, as well as to examine the relationship between the time required for computing and the quality of the solutions obtained in diverse environments.

Discussion

The proposed Distributed Genetic Algorithm (DGA) has shown considerable advancements in optimizing faculty scheduling, indicating its potential to greatly increase operational efficiency in academic environments. The study highlights the algorithm's skillful handling of genetic diversity and its quick progress towards the best solutions, demonstrating an efficient balance between exploring several options and using the most promising ones in complex optimization scenarios. Although the DGA's capacity to speed up the optimization process is clear, the specific mechanisms that contribute to this improved performance, especially the roles of

asynchronous communication and selective migration, still need to be completely understood. This discrepancy highlights a sophisticated comprehension of the DGA's operational dynamics, underscoring the intricacy of optimizing scheduling operations.

Furthermore, the study's emphasis on faculty scheduling as a singular domain of application highlights the wider potential of the suggested DGA. The notable progress noticed raises the need for additional investigation into how these improvements might be utilized in other scheduling difficulties and fields. This factor is vital for extending the algorithm's usefulness beyond academic scheduling, perhaps providing a versatile tool for other optimization settings. The findings of this study imply that there is potential for further research on the ability of the DGA to meet various scheduling requirements.

Conclusion

This study provides a convincing argument for the suggested Dynamic Genetic Algorithm (DGA) as a more effective option than conventional genetic algorithms for optimizing faculty scheduling. The DGA utilizes advanced approaches such as Differential Evolution and chaotic mapping to achieve both a high level of genetic variety and an efficient path towards optimal solutions. The large decrease in computing time, along with enhanced solution quality, is a significant advancement in optimization technology. These findings support the idea that the DGA has the potential to be a realistic and successful solution for scheduling difficulties. It is likely to improve efficiency in academic and possibly other institutional contexts.

Recommendations

Further research is advised to analyze the detailed operational complexities of the proposed DGA, with a specific emphasis on comprehending how specific improvements contribute to its overall effectiveness. Examining the algorithm's usage in a broader range of scheduling problems will also be extremely valuable in evaluating its ability to be applied to different situations and its potential for wider influence. Furthermore, examining the compromises between computational speed and solution accuracy in different computational environments will provide essential insights for the future advancement of the DGA. This research will not only improve the algorithm but also broaden its applicability to a broader range of practical optimization problems.

Acknowledgements

The advancement that has been achieved in this study is largely attributed to the collaborative endeavors of the academic community and the backing from institutional resources. The author expresses gratitude to colleagues and mentors whose valuable insights and critiques have greatly influenced the research. We would like to express our gratitude to those individuals who directly or indirectly contributed to the conceptualization, execution, and analysis of the study. This research represents a significant advancement in the field of

optimization algorithms, demonstrating the commitment of the academic community to achieving excellence and operational efficiency. Subsequent investigations motivated by this research will unquestionably expand upon the groundwork established here, pushing the limits of what can be accomplished in the field of optimization science.

Abstract: The university organization is the place where knowledge is created, exchanged, transferred and used, and bases the execution of its functions on structural capital with the purpose of achieving internationalization. The Theory of Resources and Capabilities of the Organization (TRC) is used to analyze structural capital as a promoter of internationalization results of universities and polytechnics. The research question: How do the elements of structural capital generate the internationalization of public universities and polytechnic (UEP) in Ecuador? The analysis is documentary, transversal, qualitative, comparative, between the years 2020 - 2021 and 2022, a census of 30 public UEP of Ecuador is carried out. The results show that structural capital includes the dimensions of organizational capital and technological capital. As part of the organizational capital, the indicators of budget, organizational level in which the area that promotes interinstitutional relations is located, distribution of functions involving, on the one hand, managers and administrative staff; and, on the other hand, functions at academic management levels such as deanship, career directors, and promotes the implementation of processes at the operational level, depends largely on the results of internationalization of universities and polytechnic.

Keywords: structural capital, intellectual capital, university, internationalization.

Citation: Cuadrado-Barreto, G., Paguay-Chávez, F., & Villarreal, F. (2024). Structural capital for university internationalization. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2281-2300), Antalya, Turkiye. ISTES.

Introduction

The organization is a collectivity with a normative order, levels of authority, systems of communications and coordination of memberships, exists in an environment, executes activities related to goals and obtains results (Hall, 1982, p. 33).

Thus, the university as a complex organization fulfills the functions of teaching, research and linkage with the environment, relates to industry, government, culture, civil society and natural environments (Carayannis, Barth, & Campbell, 2012; Lara, 2015, p. 19). In turn, the university organization bases the execution of its functions on structural capital with the purpose of achieving internationalization.

The inquiry takes up the Organizational Resources and Capabilities Theory (ORT) with the objective of analyzing structural capital as a promoter of internationalization results of universities and polytechnics. The research question How do the elements of structural capital generate the internationalization of public universities and polytechnic schools (UPS) in Ecuador? Thus, in section two the structural capital of the university organization is presented, in section three the internationalization of universities and polytechnic schools, in section 4 the internationalization of universities and polytechnic schools in Ecuador is shown. Next, the methodology used to analyze the set of public universities and polytechnic schools in Ecuador is presented, the results and discussion are shown. At the end, the conclusions of the study and recommendations are presented.

Structural capital of the university organization

From the theory of organizational resources and capabilities (TRC) the structural capital is specified as the set of assets unique to the organization, it is composed of organizational capital and technological capital (Ramirez, Manzanique & Priego, 2017; Barney, 1991; Grant, 2006, 1991). Based on the postulates of Cuadrado (2020), the university is specified as the organization where knowledge is created, exchanged, transferred and used, it is influenced by the historical, social and cultural context that surrounds it and bases the execution of its functions on structural capital.

Organizational capital refers to the operating infrastructure, organizational culture and structure, and intellectual property. The operational infrastructure includes the physical and technological environments in which people interact, whose boundaries are open for knowledge exchange with the environment (Nonaka, Takeuchi & Konno, 2000; Konno & Schillaci, 2021). Organizational culture integrates mission, vision, policies, rules and regulations (Ochoa, Matos & Garza, 2022).

Organizational structure includes a) division of labor, responsibilities and procedures, rules; b) power centers that control efforts, direct toward their ends, review actions, and reshape the structure; c) the incumbent possesses the authority to perform functions; and d) external forces - laws, regulations, stakeholders, and regulations - that are the basis of organizational culture. (Weber, 1947, p. 352; Etzioni, 1997, p. 75; Mintzberg, 1979).

Structural characteristics include complexity, size, formalization, and intra-organizational structural differences -job design, decision-making system- (Mintzberg, 1979; Lawrence & Lorsch, 1967; Hall, 1982; Contreras & De la Rosa, 2018; Burns & Stalker, 1961). Technological capital includes communication systems such as web

page (Ramírez, Manzanque & Priego, 2017).

The university organizational capital is composed of the decision structure classified into levels from the bottom-up perspective are 1) operational unit, teachers who teach their professorship in career; 2) operational units that include various institutional functions, called faculties; 3) middle structure level, academic managers; 4) collegiate bodies, called regent council (Clark, 1983, p. 109).

The requirements of the external environment promote changes in the organizational structure of the university, the regulations determine the activities and decision-making at each level. Thus, the composition, size, hierarchical structure of the university; support structure at the managerial level, capacity for analysis and evaluation of information; centralization or decentralization of decision-making in the office that promotes internationalization affects the results achieved by the organization. (Frølich, Christensen & Stensaker, 2019; Sebastián y Barrere, 2018; Beneitone, 2019).

To sum up, university technological capital for internationalization purposes includes organizational visibility, management systems; and inter-institutional information technology for access to shared telecommunications networks (Castañeda, 2018; Secundo, Massaro, Dumay & Bagnoli, 2018; Secundo, Lombardi, & Dumay, 2018).

Internationalization of universities and polytechnics.

Carlos Tünnerman (2018, p. 20) defines the internationalization of higher education as reflecting the global nature of learning and research. Sebastian and Barrere (2018) specify internationalization as an intrinsic characteristic of research resulting from scientific policies, structural organization of research, multiple actors, activities, results and impacts associated with it. For their part, Deardorff and van Gaalen (2022) suggest considering the internationalization of the university organization from an administrative perspective, through the study of resources, activities, components, products, effects of the internationalization process in the short term and the long-term impact.

The CRT recognizes resources as inputs in the service production process (Penrose, 1962), the results are evidenced in the effective planning and execution of processes, adaptability to changing conditions (Senge, 2012; Barceló et al., 2001; Davenport, 2000; Gupta & Misra, 2000). Thus, the internationalization of the university is defined as the organizational process that intertwines the institutional functions -teaching, research and linkage with the environment- with the elements of structural capital -organizational capital and technological capital- to obtain international knowledge results.

In this sense, the university with the purpose of achieving internationalization makes its structures more flexible, improves processes and mechanisms, establishes organizational models, delegates to a higher-level management, organizational unit or special instance, complies with regulations and legislation, possesses

funding levels; plans, designs and implements of institutional strategies (Juho & Turcan, 2018; Gacel & Rodriguez, 2018; Brooks, Erdoğan & Bulut, 2021).

As a consequence, the Latin American university presents the need to analyze internationalization from planning, interculturality and going abroad (Abba & Streck, 2021; Sabzalieva, 2021); international mobility of students and teachers (Sabzalieva, Mutize & Yerovi, 2022); visibility of the office or area that promotes internationalization (Brandenburg, 2020); institutional policies to promote foreign languages or languages (Didou, 2017); international teaching from the curriculum (Romani, 2018); international research (de Wit, 2020); information and communication technologies (ICT) applied to internationalization (Castañeda, 2018); networks, partnerships and international cooperation (Knight, 2017); international scholars (Leask & de Gayardon, 2021); economic resources or goods coming from abroad (de Wit & Altbach, 2021).

The internationalization of universities and polytechnic schools in Ecuador.

From the regulations directed to the UEPs, the functions of the universities and polytechnic schools of Ecuador are established as teaching, research and linkage with the environment (LOES, 2018). In this context, the internationalization of the university organization is defined as an institutional condition criterion (CACES, 2023), which is coordinated by a higher-level instance in the university organization, presents a planning and obtains results around the functions of the UEPs. Ecuadorian regulations include a) Constitution of the Republic of Ecuador (2008); b) Organic Law on Higher Education (2018); c) Regulations to the Organic Law on Higher Education (2019); d) Regulations for the creation and suspension of UEP (2017); e) Law on Human Mobility (2023); f) Regulations for the Teaching Career and Teaching Scale (2021); g) Regulations for the Academic Regime (2023); h) Career Evaluation Model (2021); i) Methodological Guide for the presentation of careers and programs (2022); j) Doctorate Regulations (2019); k) Self-evaluation reference guide (2022); l) Regulations for foreign accreditation recognition (2023); m) Model for the evaluation of the learning environment of Postgraduate Programs (2023); n) Model of external evaluation for accreditation purposes for the quality assurance of universities and polytechnic schools (UPS) (2023).

In this way, activities are established for the executor level of processes in the areas of undergraduate and graduate education and, also, functions of the office that promotes inter-institutional relations (see Table 1).

Methods

The inquiry relates the Resources and Capabilities Theory (TRC) and the Complex Systems Theory with the purpose of analyzing the structural capital as a promoter of internationalization results of public universities and polytechnic schools (UPS) in Ecuador.

The university organization defined as a complex adaptive system of social character is composed of interrelated subsystems and has basic elementary components (Lara, 2015, p. 19). From the ADI methodology it is considered that the external contingent elements influence the way the organization works (Ostrom, 2015), the internationalization of the UPSs is specified as an external contingent element, the structural capital and its dimensions-organizational capital and technological capital-as internal contingent elements that produce organizational results of internationalization.

The analysis is documentary, transversal, qualitative, and comparative between 2020, 2021 and 2022, a census of the 30 public UPSs in Ecuador is carried out.

The study at the organizational level includes as sources of information a) Institutional Statute, b) Annual Accountability Report, c) Institutional Development Strategic Plan (PEDI), d) Annual Operating Plan (POA), e) Processes Manual. The systematization and analysis of the information was carried out using the technological tool Atlas Ti, from the categories of organizational capital, technological capital and internationalization results (see tables 2, 3 and 4).

The research question: How do the elements of structural capital generate the internationalization of public universities and polytechnic schools (UEP) in Ecuador? It is answered after the application of the Atlas ti v. 23 tool for the analysis of the structural capital and internationalization variables of 30 public UEPs in Ecuador in the years 2020, 2021 and 2022.

Results

Structural capital of Ecuador's public UPSs.

From the Theory of Resources and Capabilities (TRC), structural capital is defined as a basic resource that integrates organizational elements and, through the interaction between the elements, produces results of internationalization.

The study of the organizational capital category includes the criteria operational infrastructure, organizational structure, organizational culture. The university technological capital dimension includes the criteria of organizational visibility, management systems, and inter-institutional information technology for access to shared telecommunications networks.

The criterion operational infrastructure of the 30 public universities of Ecuador includes the indicators of budget, number (#) of teachers, number (#) of students, number (#) of graduates. It is found necessary to expose that these organizations are financed through allocations from the General State Budget; own resources generated by tuition, fees and tariffs, by productive activities of goods and services; resources from inheritances, legacies and donations; income from intellectual property; by contributions from international cooperation (LOES, 2018, article 20).

Graph 3 UEP budget for the years 2020 - 2021 and 2022

Source: Prepared by the authors based on the accountability documents of the UPSs studied.

Note: values are presented in millions of dollars (USD).

Next, as part of the operational infrastructure, the number of teachers, students, and graduates for the years 2020 - 2021 - 2022 is shown. It is worth noting the increase in the number of professors in the following UPSs: U3 with 96%, U10 with 284%, U17 with 147%, U29 with 96%. The student indicator shows an increase in U6 with 212.59%, U20 with 114.20%, U24 with 65.96%. Likewise, the graduate's indicator shows an increase in U2 of 107%, U3 of 635%, U8 of 461%, U11 of 245%, U12 of 182%, U19 of 125%, U24 of 350%, U25 of 106% (see Table 4).

Source: Prepared by the authors based on the accountability reports of each UEP for the periods 2020 - 2021 - 2022.

The study of the *organizational structure* criterion of the university and polytechnic school of Ecuador and the indicators levels, activities, division of labor, takes up the postulates of Clark (1983) to define the university as an organization that is composed of a decision-making structure, from the planning documents of the UEP such as a) Institutional Statute, b) Strategic Plan for Institutional Development (PEDI), c) Processes Manual.

In this sense, from the button-up perspective, to determine the *organizational level indicator* in which the area that promotes inter-institutional relationships is located, it is classified as a) Level 1 responds to a unit, with no decision-making; b) Level 2 corresponds to the Directorate of Community Engagement, with little decision making; c) Level 3 corresponds to the Vice Rectorate, with indifferent decision making; d) Level 4 corresponds to the Rectorate, with medium decision making; e) Level 5 corresponds to the Polytechnic University Superior Council, with high decision making.

Thus, the area that promotes inter-institutional relations in 19 UEP is located at level 4, it depends on the Rectorate; in 4 UEP it is located at level 3, it responds to the Vice Rectorate; in 7 UEP it is located at level 2, it

responds to the Directorate of Community Engagement.

By considering that the internal policies of organizations determine their structural form (Child, 1972), the **activities indicator** makes it possible to specify the actions carried out by the area that promotes national and international relations. The study takes up the activities stated in the institutional Statute; thus, the UEP that declares the lowest number of activities is U2, which has 4 activities; while U13 has 24 activities; U30 does not present activities to promote the internationalization of the university's functions (see graph 4).

In order to define the **indicators of concentration of authority or centralization**, Mintzberg (1979, pp. 223) proposes the principle of decentralization, which refers to the dispersion of formal power as one moves down the scale of linear authority through the delegation of power. In this way, the study establishes the division of work in the area as an indicator, identifies in the institutional Statute in force in 2023 a) the superior organ to which the area belongs, b) the division of work in the area into units, responsible persons, c) the number of people working in the area is taken from the institutional Directory.

The results in relation to the superior organ to which the area belongs to show that U29 and U30 do not present the area of interinstitutional relations in the Statute. The PEUs that present a very high degree of decentralization are U9 and U24; followed at a high level by U1 and U15; U13 is presented with a medium grade, while U3 and U28 express a medium-low grade. Finally, 21 PEUs exhibit a low level of decentralization (see graph 4).

Furthermore, what was suggested by Mintzberg (1979) for the analysis of activities within an area is considered part of the number of people who work in the area. In this way, the UPS position regulations are resumed, and it is determined that the U1 grants responsibilities for international cooperation activities, strategic management, academic mobility, and communication and dissemination. The UEP, U3 and U20 designate assignments for units, both for national cooperation and international cooperation. Meanwhile, 17 UEP grant activities by position of director, assistant, analyst, specialist (see graph 4).

The analysis of the Organizational Capital Dimension includes the **Organizational Culture Criterion**, with the indicators a) internationalization mentioned, b) internationalization policies, regulations and standards, c) specialization of the position, d) size of the area, e) standardization of the content of the work.

When considering the importance of mentioning the internationalization of the university in the institutional mission and vision (Gacel and Rodríguez, 2018), it is stated that 93% of the public UPSs in Ecuador present the international element in their purposes. Furthermore, 33% of the UPSs studied have policies, 20% have objectives in the Inter-institutional Development Plan, 20% have regulations, 13% have a strategic internationalization plan; and 13% have a model for the development of inter-institutional relations.

In relation to the specialization of the position of Director of the area that promotes inter-institutional

relationships, 33% of the UPS present the requirement to fulfill the assignment to be delegated by the Rector; 7% express as a basic requirement having a third-level degree related to the field of their competence; Only U14 states the need to have a master's degree related to the field of performance knowledge; 37% declare the requirement of having achieved a doctorate or PhD degree; Finally, 20% include additional requirements such as belonging to the field of dentistry or medicine, reaching the rank of Colonel or Major, being a full professor, and having at least five years of experience as a full academic.

The size of the area is established by the number of people who work in the area that manages inter-institutional relationships, the UPS U9, U20, U13 and U24 are determined as large, six (6) UPS integrate between 4 and 5 people in the area; while 18 UPS designate between 1 and 3 people to work in that space. The normalization of the work content shows the maximum number of activities as 24 (U13); while the smallest number of established activities is four (U2) (see graph 4).

Graph 4. Activities and size of the area that promotes inter-institutional relationships.

Source: own elaboration based on the Statute, Organic Regulation of organizational management by processes in force of each UPS.

The main activity carried out by the area that promotes inter-institutional relations of the public UPSs of Ecuador corresponds to “agreements” (coincidence 36 times), includes signing of national and international agreements, bilateral or multilateral agreements, technical-scientific and financial cooperation, reimbursable, commitments, alliances, specific agreements with public and private entities, teacher-student exchange (11

times) and technical-administrative staff (1 time), affiliation to international and national networks.

The UPS express (29 times) that the planning of the area includes a manual of procedures for applications, processing of agreements that express the technical - legal process before and after subscription, monitoring, resources and financing, reports on compliance. and settlement, becomes a base tool for the execution of activities. Furthermore, universities, and polytechnic schools exhibit (15 times) the importance of the institution's internationalization plan, including the annual tactical, operational, purchasing, and national and international relations plan. Likewise, the internationalization “policies” include dissemination of calls and management of own scholarships (12 times).

“Mobility” (27 times) and “management” (21 times) are defined in the institutional statutes as, mobility is the national and international process, aimed at academic and student staff, which is carried out for the purpose of internships. , research and academic activities.

The actions carried out by the area include management of calls, execution of programs, advice for raising external funds (1 time), information and means for access to exchanges (1 time), trips abroad (1 time), logistical processes and technicians to obtain international scholarships and training and training opportunities (1 time). Also, the area develops institutional and inter-institutional activities with embassies and consulates (1 time), promotion of academic and intellectual events on knowledge management (1 time).

As a result, the statutes of the universities and polytechnic schools (UEP) of Ecuador express the “substantive functions” (3 times), in this sense they refer to “research” (9 times), includes research and innovation centers, the dimension international, national and international networks.

The category of university technological capital for internationalization purposes includes the criteria of a) organizational visibility, through web page communication systems; b) management systems that incorporate public purchases in the area; and, c) interinstitutional information technology for access to shared telecommunications networks. In this way, 87% of the UPSs in Ecuador have web page technological systems for the dissemination of activities; The only UEP that has management systems that incorporate public purchases in the area is U8; and, 90% implement inter-institutional information technology for access to shared telecommunications networks.

Internationalization results category

The internationalization policies of public UPSs in 2022 include a) internationalization at home through virtual subjects with a total of 567; b) 14 teachers participated in network meetings; c) 8 careers in the process of internationalization; d) creation of 3 scientific journals; e) 1 international accreditation with Audit Model; f) 1 UEP with E-Learning Strategy.

In 2021, the generation of a) 11 international scientific journals stands out; b) 1 UPS internationalizes the curriculum of the subjects of the careers of social communication, nursing, dentistry, architecture and civil engineering; c) 2 GIZ Germany Program; 2 PINE-EDUCAR mobility program; 1 Student mobility regulations; 1 Internationalization at home; 2 Recognitions for teachers; 1 Criscos Mobility Program.

In 2020, among the policies promoted are the generation of Erasmus + Programs (3); Publication Co-edition (1); Entrepreneurship Innovation, Transfer, Technology Unit (1).

The results of internationalization of research in 2022 include an increase of 233% in international scientific articles, 382% in international projects, and 294% in presentations. Followed by projects generated between different academic areas, financed by international organizations, joint projects with companies, among others (see graph 5).

Graph 5. Research internationalization results.

Source: Own elaboration based on the UEP Accountability Report.

The results of internationalization of teaching show that in 2020 the segment of students visiting public UEPs in Ecuador is quite notable in relation to other items; while, in 2021, virtual mobility of students and teachers predominates; and, in 2022, the components of outgoing teachers and students, international teachers, are predominant. Also, the insertion of the PEUs studied in international rankings and the development of specialized language centers is evident (see Table 5).

Table 5. Results of internationalization of teaching

Indicators	Teaching	2022	2021	2020

The results of internationalization of the community engagement show that in 2022 the activities with the greatest participation of students were international pre-professional internships, as well as the training events carried out (see table 6). Considering that the institutional statute of the UPS establishes that the area that promotes inter-institutional relations obtains results in a certain period, Graph 6 shows that the main activity

carried out by the area that promotes inter-institutional relations in the year 2022 is the generation of agreements framework, followed by memorandums of understanding, insertion of the institution into academic and research networking as well as development of training events.

Discussion

The university organization is the place where knowledge is created, exchanged, transferred, and used, it is influenced by the historical, social, and cultural context that surrounds it, it bases the execution of its functions on its structural capital, it includes dimensions of organizational capital and technological capital.

According to Gacel and Rodriguez (2018), Frølich, Christensen & Stensaker (2019), as part of the structural capital, the criteria a) technological capital, b) organizational culture; and, c) operational infrastructural, generate results of internationalization of the UPSs.

The generation of agreements is the main activity of the area that promotes inter-institutional relations. Therefore, the implementation of management systems, mechanisms for the evaluation, monitoring, and follow-up of the execution of the agreements is presented as essential to obtain results (Knight, 2017).

Conclusions

Relating the theory of resources and capabilities (TRC) and the theory of complex systems (TSC) allows the study of university structural capital by recognizing the internal and external contingent elements of the organization to explain the results obtained in internationalization.

By incorporating technological capital related to management systems for public procurement is presented as a good practice that promotes the achievement of the objectives of the area of interinstitutional relationships.

The decentralization of public procurement activities to the area that promotes inter-institutional relationships promotes effectiveness in budget execution.

Recommendations

The public UPSs in Ecuador need to implement organizational structures and distribution of functions that promote academics to carry out internationalization activities of the university's functions.

The accountability reports of the UEP, as official documents that inform society of the activities carried out in a specific period, must implement open data indicators to display the results of the teaching, research and outreach functions adequately and completely.

Acknowledgements

The authors are grateful to the Universidad Politécnica Estatal del Carchi for funding the research project related to the intellectual capital of universities.

Abstract: Objective: Violations of academic integrity are still common, and their incidence tends to increase in line with the rise of publications on professionalism. This study aims to investigate the relationship between self-regulated learning, cognitive function, and stress levels on the academic integrity of medical students. Methods: Using proportional stratified random sampling, the research was conducted using quantitative analysis with a cross-sectional design on 188 preclinical medical students from the Faculty of Medicine, UPN "Veteran" Jakarta. Data were collected through previously validated instruments, including a questionnaire on self-regulated learning, a cognitive function test, a stress assessment scale, and the Academic Integrity Questionnaire from the Roff questionnaire. Data analysis included the Chi-Square test, One-Way ANOVA, and Logistic Regression. Result: The test results showed that most respondents had moderate academic integrity, moderate self-regulated learning, an average cognitive function score of 50, and no stress. The Chi-Square test yielded a p-value of 0.018 for self-regulated learning and academic integrity and $p = 0.000$ for stress level and academic integrity. The One-Way ANOVA results indicated a significant difference in the DSST score between low and high academic integrity. Logistic Regression analysis revealed that self-regulated learning, cognitive function, and stress levels were significantly associated with academic integrity, with self-regulated learning having a 5.024-fold impact, cognitive function having a 1.068-fold impact, and stress level having a 0.158 impact on academic integrity. Conclusion: These findings highlight the importance of self-regulated learning, cognitive function, and stress levels in fostering academic integrity behavior in medical education. Further research is needed to identify additional factors that can influence academic integrity behavior.

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2301-2311), Antalya, Turkiye. ISTES.

Introduction

Academic integrity among medical students has not shown a significant improvement amidst the increasing number of publications on professionalism in academia (Guraya, 2018). Academic misconduct in medical universities is increasing globally, including cheating and plagiarism. In a study conducted by (Abdulrahman et al., 2017) at three United Arab Emirates (UAE) medical universities, it was found that the majority of medical students admitted to engaging in acts of academic dishonesty. Furthermore, a study conducted at six universities in Malaysia with 141 respondents revealed that approximately half of the medical students reported experiencing academic dishonesty with their peers (Tiong et al., 2018). Academic integrity is influenced by extrinsic and intrinsic factors, including the learning environment, peer influence, and lack of supervision. Intrinsic factors include self-regulation, cognitive function, academic stress, and moral and religious development (Purnamasari, 2013).

Research has shown that self-regulated learning (SRL) plays a role in reducing academic dishonesty behaviors (Sagita & Mahmud, 2019). SRL is crucial for academic integrity, as high SRL levels improve learning objectives, strategies, time management, and abilities, while low SRL results in inconsistent learning, anxiety, and insecurity, potentially leading to academic fraud (Kusuma, 2022). As evidenced by a study conducted at Universitas Negeri Yogyakarta with a sample of 410 diploma and bachelor students in the Special Region of Yogyakarta in 2022, it was found that self-regulated learning is associated with academic integrity by reducing academic dishonesty among students (Kusuma, 2022).

Another intrinsic factor that contributes to academic integrity violations is cognitive function. Having a solid comprehension of the lessons can prevent academic dishonesty and improve academic achievement. A well-functioning cognitive ability is crucial for students' ability to receive feedback, reinforcement the materials, and vocabulary development, which enhance academic performance and reduce the likelihood of academic dishonesty (Apriliyanti et al., 2021). Based on Purnamasari's study in 2013, conducted at Semarang State University with a sample of 250 sixth semester students, it was found that academic dishonesty among students is influenced by their cognitive aspects (Purnamasari, 2013).

Academic ability, peer pressure, time management, and workload are all elements that might contribute to stress in students and lead to the possibility of academic integrity violations (Emmert et al., 2013). According to Aamir (2017), medical students in Karachi, Pakistan, experience higher stress levels compared to non-medical students. A study of 600 students found 54.6% of medical students experience high stress, while 20.6%

of engineering, arts, and commerce students do not (Aamir, 2017). According to Herdian (2021), stress can affect students' academic integrity because students experiencing academic stress may struggle to think clearly, which can impact how they approach assignments and exams (Herdian & Mildaeni, 2021).

Several studies have been conducted on investigating elements impacting academic integrity, with some of the most notable ones being those by Muktamiroh (2015) on the correlation between fundamental personality and mental ability. The other studies by Ajnah (2021) discussed about correlation between coping mechanism and academic integrity (Ajnah et al., 2021; Muktamiroh et al., 2015). Up to now, according to researcher's knowledge, no studies have been conducted to analyze other factors, particularly among Indonesian medical students, such as SRL, cognitive function, and stress levels, affect academic integrity. Therefore, further research is needed to investigate the association between SRL, cognitive function, and stress levels on academic integrity, in the hope of gaining insights to enhance academic integrity behaviors among medical students.

Materials and Methods

The research obtained ethical approval from the Clinical Study Ethics Committee at Universitas Pembangunan Nasional "Veteran" Jakarta, Indonesia (278/VI/2023/KEPK). The respondents provided informed consent to participate in this research.

Study design and participants

This study utilized an analytic method with a cross-sectional approach. This research was conducted at Universitas Pembangunan Nasional "Veteran" Jakarta from March 2023 to June 2023. The population used in the study consisted of preclinical students from the 2020 and 2021 batches of the Faculty of Medicine at UPN "Veteran" Jakarta, with a total population of 296 students.

The inclusion criteria for the research sample were active preclinical students from the 2020 and 2021 batches of the Faculty of Medicine at UPN "Veteran" Jakarta. The exclusion criteria for the sample in this study were respondents who were in an unhealthy physical or psychological condition and those undergoing therapy with a psychiatrist. Furthermore, respondents who experienced certain events that could introduce bias to the study were excluded, such as the death of one or more immediate family members within the past 6 months, family conflicts such as parental divorce, or having a chronic illness that impairs daily activities such as cancer, chronic pain or other health issues. Because this can cause physical stress that will contribute to academic stress.

The study used Slovin formula for sample size and stratified purposive sampling method. In this study, the population was divided into two layers based on the student batch, namely the batch of 2020 and 2021. The

required sample size was calculated as 94 for students in the batch of 2020 and 2021. Hence, the total sample size for the study was 188 students. A 5% margin of error was set by the authors.

The authors administered questionnaires to all currently enrolled students in the 2020 and 2021 batches of the 2022/2023 academic year at UPNVJ Medical Faculty until the minimum required sample size for the study was achieved. This study utilized the Respondents' Characteristics Questionnaire, the Motivated Strategies for Learning Questionnaire (MSLQ), the Digit Symbol Substitution Test, the Depression, Anxiety, Stress Scale 42 Questionnaire, and the Academic Integrity Questionnaire for data collection (Figure 1).

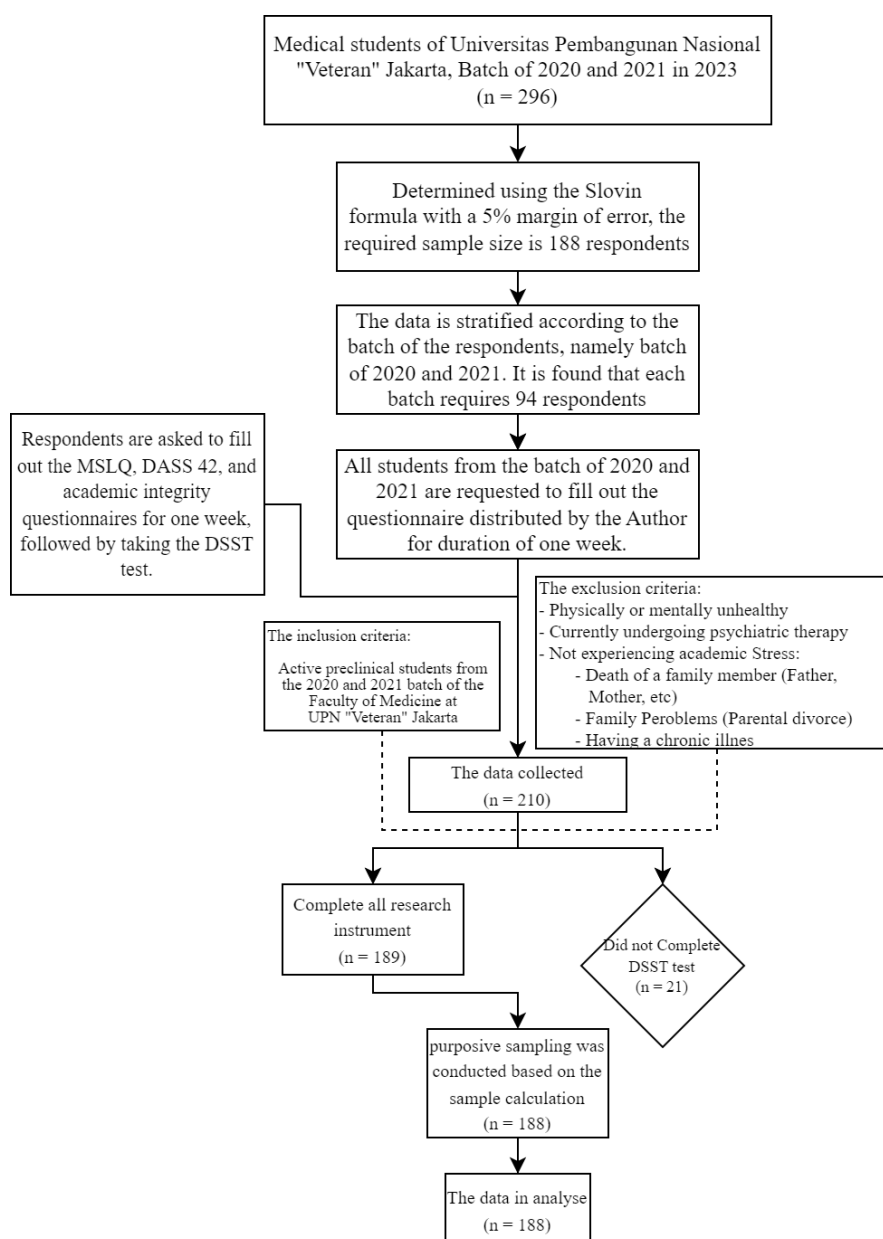

Figure 14. Schematic Diagram of Data Collection in Relationship between Self-Regulated Learning, Cognitive Function, and Stress Levels on Academic Integrity of Medical Students

*Outcome measures**Assesment of Self-Regulated Learning*

In assessing Self-Regulated Learning, the researchers used a questionnaire instrument called The Motivated Strategies for Learning Questionnaire (MSLQ). The questionnaire has undergone translation into Indonesian by a language expert and its validity and reliability have been assessed by Khan (Khan, 2022). The Cronbach's alpha score obtained was 0.963, indicating that all items in the questionnaire are valid and reliable.

Assesment of Cognitive function

Evaluating cognitive function in this study involved utilizing the Digit Symbol Substitution Test instrument. This test is a written test conducted using paper and pencil, which is a subtest of the intelligence test introduced by Wechsler (1958) (Gilmour et al., 2019). The DSST has been subjected to validity and reliability testing by Zubaidi. The reliability testing results indicated a high correlation on the Wechsler scale, with a reliability coefficient of 0.97 for the Full Scale IQ.

Assesment of Stress Levels

Measurement of stress levels was conducted using a questionnaire instrument, namely the Depression, Anxiety, Stress Scale 42 (DASS 42). This questionnaire is a standardized instrument with three measurement dimensions: depression, anxiety, and stress. The validity and reliability of the DASS 42 questionnaire have been tested by Marsidi, with a Cronbach's alpha coefficient of 0.951 (Marsidi, 2021).

Assesment of Academic Integrity

The assessment of respondents' academic integrity was conducted using the Roff questionnaire, which was adapted by Musharyanti, Rahayu, and Prabandari in 2016 and Maharani in 2016 (Ajnah et al., 2021). The questionnaire has undergone rigorous testing and has been confirmed to be valid and reliable. The validity and reliability testing of this questionnaire was conducted by Maharani, with a result of cronbach's alpha score of 0.945 (Maharani et al., 2018).

Statistical analysis

Data analysis in our study was conducted using computerized methods. Univariate analysis will yield data in the form of counts and percentages of respondents. Analysis of the independent variables was utilized by the chi-square test, independent t-test, and one-way ANOVA. The statistical significance was established at $p < 0.05$. Then, the data was analyzed using logistic regression to determine the risk of each variable on academic integrity.

Results

Among the total 296 respondents of medical students of UPN “Veteran” Jakarta Medical Faculty batch 2020 and 2021, the majority of respondents, with 89 (47.3%), are 20 years old. Women with 121 (64.4%) were the most respondents in this study. The proportion of respondents based on batches 2020 and 2021 is the same, with 94 (50%) respondents. The majority of respondents, as many as 128 (68.1%) students had an moderate self-regulated learning rate, including a total of 57 (64%) respondents aged 20, a majority from 42 men (62.7%) and 86 women (71.1%) as well as the majority batch 2020 total 54 (57.4%) respondents and batch 2021 total 74 (78.7%).

Table 32. Characteristic of Respondents

P value			0.001*		0.467			0.596				0.001*	
Total	188 (100)	28 (14,9)	128 (68,1)	32 (17)	(50,79±8,39)	65 (34,6)	33 (17,6)	50 (26,6)	29 (15,4)	11 (5,9)	26 (13,8)	125 (66,5)	37 (19,7)

The average overall cognitive function score of the respondents was 50.79 with a standard deviation of 8.39. Respondents aged 20 (47.3%), had an average cognitive function score of 50.36 with a standard deviation of 8.47. Some 65 (34.6%) of respondents did not experience stress, of which 28 (31.5%) were respondents aged 20. Overall, respondents had a moderate level of academic integrity behavior with 125 (66,5%) respondents of whom were 20 years of age a total of 66 (74.2%), a majority of 39 men (58.2%) and 86 women (71.1%) as well as the majority batch of 2020 a number of 73 (77.7%) and batch 2021 a total 52 (55.3%) respondents.

Respondents with poor academic integrity were 26 (13.8%) and respondents with good academic Integrity were 37 (19.7%) (Table 1).

Based on the analysis, there is a significant relationship between batch of respondents ($p=0,001$) towards self-regulated learning and academic integrity. The respondents age ($p=0,299$) and gender ($p =0,079$) had no significant relationship to the academic integrity (Table 1). In bivariate analysis, self-regulated learning ($p=0,018$), cognitive function ($p =0,003$), and stress levels ($P=0,000$) had significant relationships with academic integrity (Table 2).

Table 33. Correlation Test between academic integrity and other factors

Variable	Academic Integrity						Quantity		P
	Poor		Moderate		Good				
	n	%	n	%	n	%	n	%	
SRL									
Moderate	26	13,8	103	54,8	27	14,4	156	83	0,018*
High	0	0	22	11,7	10	5,3	32	17

Total	26	13,8	125	66,5	37	19,7	188	100	

Self-regulated learning, cognitive function, and stress levels all had significant relationships with academic integrity according to multivariate analysis, with the following significance: self-regulated learning ($p=0.002$; Odds Ratio [OR], 5.024; 95% confidence interval [CI], 1.781-14.174), cognitive function ($p=0.040$; OR, 1.069; 95% CI, 1.003-1.139), and stress level ($p=0.000$; OR; 0.378; 95% IC, 0.230-0.621) (Table 3).

Table 34. Logistic Regression Test

Variable	P-value	Odds Ratio	95% Confidence Interval
Self-Regulated Learning	0.002*	5.024	(1.781-14.174)

Cognitive Function	0.040*	1.069	(1.003-1.139)
Stress Levels	0.000*	0.378	(0.230-0.621)

* $p < 0.05$

OR : Odds Ratio, CI : confidence interval

Discussion

Our study shows that the percentage of men who have poor academic integrity is higher than women. This is in line with other studies that explain that men are more likely to commit violations of academic integrity (Liu & Alias, 2022; Özcan et al., 2019). This can be explained that female students prioritize social ethics self-images, increasing fear of cheating compared to men, affecting their academic performance (Liu & Alias, 2022). On the other hand, there is a significant relationship between the batch of students towards academic integrity. Data suggests that older students who have poor academic integrity have a higher percentage compared to lower students. This may be because end-level students have more in-depth experience working on tasks and exams as long as they dare to cheat (Liu & Alias, 2022).

In line with previous studies, our study shows that self-regulated learning had a significant impact on academic integrity. Hidayat et al. (Hidayat et al., 2020) It found that self-regulated learning has a significant link to academic integrity. Other studies show that self-regulated learning had a significant negative correlation to academic fraud (Kusuma, 2022). This was because high self-regulated learning students focused on learning goals, found suitable strategies, and evaluated their understanding. This helped them build confidence and improve academic access. Meanwhile, low SRL students experienced irregular learning processes, causing anxiety and potential academic fraud (Kusuma, 2022).

Furthermore, in line with the study by Eshet (2022), our study shows that there is a significant correlation between cognitive function and academic integrity. This is because students with good cognitive function will tend to take moral and ethical priorities so they seek to avoid actions that violate academic integrity (Eshet & Margaliot, 2022). Paulhus and Dubois (2015) suggest that based on systematic surveys that have been conducted, there is a negative correlation between cognitive function and academic fraud. The experience of failure experienced by students with poor cognitive function is associated with anxiety over such failure so compensate by committing academic fraud, especially on less-controlled learning materials (Paulhus & Dubois, 2015).

According to the findings of this study, that the stress levels had a significant correlation on academic integrity. Tindall (2021) study shows a significant positive correlation between stress and academic dishonesty. Negative emotions such as stress, anxiety, and depression are predictors of academic integrity violations such as plagiarism and cheating (Tindall et al., 2021). Wahyuni's study (2021) also reveals a significant positive correlation between stress levels and plagiarism (Wahyuni, 2021). High academic demands can have negative

effects on students' mental well-being and lead to conditions of stress, anxiety, and depression. It is these negative emotions that ultimately drive students to engage in acts of academic integrity violations such as cheating and plagiarism.

After all, our study had some limitations that covered some of the following aspects. First, in completing the questionnaire, the duration of the time given was relatively short (in between their tedious study time), allowing some respondents to fill it out not in accordance with the actual circumstances. Second, the Digit Symbol Substitution Test only measured cognitive function in general and still had many unmeasured cognitive aspects, such attention aspect, languages aspect, executive function, and orientation, that could have affected academic integrity. However, the Digit Symbol Substitution Test was able to measure important aspects of cognitive function that affected student understanding in learning.

Conclusion

The majority of students at FK UPN "Veteran" Jakarta have a moderate level of academic integrity. SRL, cognitive function, and stress levels have a significant relationship with academic integrity. Furthermore, SRL has the most significant influence on academic integrity.

Abstract: With the rapid global expansion and popularity of short video platforms, the identification and filtering of non-compliant content have become crucial tasks to ensure the health of the online environment. Traditional manual review methods face challenges of low efficiency and poor consistency, urgently requiring an efficient, automated solution. This study proposes a deep learning model based on BERT and TextCNN, aimed at automatically identifying non-compliant information within Chinese text content. By integrating the deep semantic understanding capabilities of the BERT model with the local feature extraction advantages of TextCNN, we designed and implemented an effective model for non-compliant information identification. This research first conducted a detailed preprocessing and analysis of the dataset, including exploring word length distribution, analyzing the proportion of compliant and non-compliant information, and visualizing key vocabulary through word cloud graphics. Subsequently, we trained and tested the model, which achieved an accuracy of 93.61% on the identification task, demonstrating good balance across precision, recall, and F1 score metrics, with an AUC value of 0.96. This indicates the model's high accuracy and reliability in distinguishing between compliant and non-compliant information. The outcomes of this study not only provide an effective automatic identification tool for short video platforms but also offer a new research perspective and practical evidence for the application of deep learning in text analysis.

Keywords: Non-compliant information identification, BERT-TextCNN, deep learning, natural language processing, text analysis

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2312-2325), Antalya, Turkiye. ISTES.

Introduction

In the swiftly evolving landscape of digital communication, short video platforms have ascended to become pivotal conduits for the dissemination of information and entertainment, capturing the attention of a global audience. This meteoric rise has not only catalyzed the proliferation of cultural diversity across digital spaces but also carved out expansive arenas for content creators to broadcast their creativity and prowess. Amidst this digital renaissance, however, there lurks a shadowy underbelly of illegal and non-compliant information that encompasses a spectrum of content from pornography and violence to fraud and politically sensitive materials. Such content poses profound threats to the moral fabric of online communities and the overarching security of digital networks, challenging the integrity and health of the online ecosystem.

Traditionally, the task of content moderation has been anchored in manual review processes, reliant on the discernment and decision-making of human reviewers. However, in the face of the deluge of content generated on these platforms, manual moderation has increasingly shown its limitations. Not only is it marked by inefficiency, unable to keep pace with the sheer volume of content, but it is also fraught with the risk of subjective bias, leading to inconsistencies and potential oversights in content moderation. In this context, the advent of artificial intelligence (AI), particularly through the innovations in deep learning and natural language processing (NLP), heralds a new epoch of content moderation. These cutting-edge technologies offer the promise of automating the understanding and analysis of text content, thereby unlocking the potential for more efficient and objective identification of non-compliant information.

This research endeavors to harness these technological advancements through the development of a novel deep learning model that synergizes the strengths of the BERT (Bidirectional Encoder Representations from Transformers) and TextCNN algorithms. BERT, renowned for its profound capabilities in grasping the nuanced complexities of language, has established itself as a cornerstone in the domain of NLP, enabling models to delve deep into the contextual meanings of text. Complementarily, TextCNN stands out for its proficiency in distilling essential local features within texts, providing a mechanism to capture the intricate patterns that signify non-compliant content. The amalgamation of BERT's deep linguistic understanding with TextCNN's sharp feature extraction presents a powerful approach to revolutionizing content moderation on Chinese short video platforms.

By embarking on this ambitious project, the study aims to craft a model that not only deciphers the deep semantic layers of text but also pinpoints critical local indicators of non-compliance with unparalleled accuracy and efficiency. The envisioned model seeks to transcend the traditional pitfalls of manual content moderation, offering a beacon of hope for upholding the sanctity of digital spaces. Through an exhaustive exploration and meticulous performance evaluation of this composite model, the study aspires to contribute an effective and reliable tool for automatic content moderation, while simultaneously broadening the horizons for applying deep learning techniques in the intricate realm of text analysis. This journey not only underscores the transformative

potential of AI in enhancing digital safety and integrity but also paves the way for future innovations in the stewardship of digital content.

Related Work

Text sentiment classification, as an important branch of the field of natural language processing, has gone through several stages of development. Early research was primarily based on rules and sentiment lexicons, such as SentiWordNet, which determined sentiment orientation through the matching of sentiment words. This method was straightforward and intuitive but limited in application scope and accuracy due to a lack of deep understanding of context.

With the advancement of machine learning technology, statistical methods began to be widely applied to sentiment classification tasks. Pang et al. (2002) were among the pioneers in applying machine learning methods to the field of sentiment classification. They utilized algorithms such as Naïve Bayes and Support Vector Machines (SVM), extracting text features through feature engineering, achieving significant progress over rule-based matching. However, these methods still relied heavily on manual feature extraction, limiting the models' generalization capabilities.

The rise of deep learning brought new breakthroughs to text sentiment classification. Socher et al. (2013), through the introduction of Recursive Neural Tensor Networks (RNTN) for sentiment analysis, demonstrated the potential of deep learning in capturing the complex structure of text. Following this, Kim (2014) proposed the TextCNN model, which used convolutional neural networks for sentence-level sentiment classification, further proving the effectiveness of deep learning methods in text sentiment analysis. Additionally, Long Short-Term Memory networks (LSTM), proposed by Hochreiter & Schmidhuber (1997), became a common architecture in sentiment classification due to their advantage in processing long-term dependencies.

In recent years, models based on the Transformer architecture, especially BERT (Devlin et al., 2019), with their pre-trained deep bidirectional representations, have brought revolutionary improvements to text sentiment classification and other NLP tasks. The success of the BERT model has encouraged researchers to explore its combination with other models. For instance, Sun et al. (2019) significantly enhanced sentiment classification performance by integrating BERT with attention mechanisms. Additionally, Zhang et al. (2020) explored combining BERT with Graph Neural Networks (GNNs) to better capture sentiment information in text, showing the potential of hybrid models in complex sentiment analysis tasks.

Recently, Liang et al. (2019) presented a combination model based on BERT and TextCNN that achieved excellent results in aspect-level sentiment classification, proving the effectiveness of combining pre-trained models with traditional deep learning structures in specific sentiment analysis tasks. These studies not only showcase the application prospects of deep learning methods in sentiment classification but also provide rich

technical reserves and insights for subsequent research.

Through the introduction of these empirical studies, we can observe the evolution of text sentiment classification technology from initial rule-based matching to statistical machine learning methods, and then to complex sentiment analysis using deep learning. These advancements have not only driven the development of sentiment classification technology but also provided more precise and in-depth tools for understanding and analyzing human emotions.

Data Preprocessing

Figure 15 Word Length Distribution Graph

In the context of this study, an extensive dataset comprising text data extracted from various Chinese short video platforms was meticulously curated for analytical purposes. This selection process was guided by the objective to encompass a diverse range of linguistic expressions and thematic content, thereby ensuring a comprehensive representation of the digital discourse prevalent on these platforms.

The initial phase of data preparation involved an elaborate cleaning process aimed at refining the raw dataset. This procedure was essential to eliminate extraneous elements that could potentially obfuscate the underlying semantic structures of interest. Specifically, URLs, user identifiers, and special symbols were systematically removed. The exclusion of URLs and user identifiers was pivotal in ensuring the anonymity of the data sources and focusing the analysis on textual content rather than metadata. Similarly, the removal of special symbols was crucial for standardizing the text, facilitating a more uniform dataset conducive to subsequent processing steps.

Following the cleansing of the dataset, the next step entailed the segmentation of the text into its constituent lexical units. For this task, the jieba word segmentation tool was employed, a decision motivated by its proven efficiency and accuracy in handling the intricacies of the Chinese language. Jieba's algorithm is adept at parsing

Chinese text into words, a non-trivial task given the absence of explicit word boundaries in Chinese script. This segmentation process was instrumental in transforming the continuous stream of characters into a discrete sequence of words, thereby enabling the detailed linguistic analysis required for this study.

In conjunction with word segmentation, a predefined list of stop words was utilized to further refine the dataset. This list encompassed common words that, while frequent in the language, contribute minimally to the semantic payload of the text. By filtering out these stop words, the study aimed to diminish the impact of noise data on the model's training process. This step was critical in enhancing the model's ability to discern and learn from the meaningful patterns in the data, rather than being sidetracked by ubiquitous but semantically sparse terms.

The culmination of these preparatory activities was the conversion of the segmented text data into a format amenable to processing by the model. This transformation was not merely a technical procedure but a critical bridge between the raw linguistic data and its computational analysis. It involved encoding the text into numerical representations that could be ingested by the model, thus setting the stage for the ensuing phases of model training and testing. Through these meticulously executed preparatory steps, the study laid a solid foundation for exploring the potential of the proposed BERT+TextCNN model in understanding and classifying the multifaceted content characteristic of Chinese short video platforms.

Methodology

Model Architecture

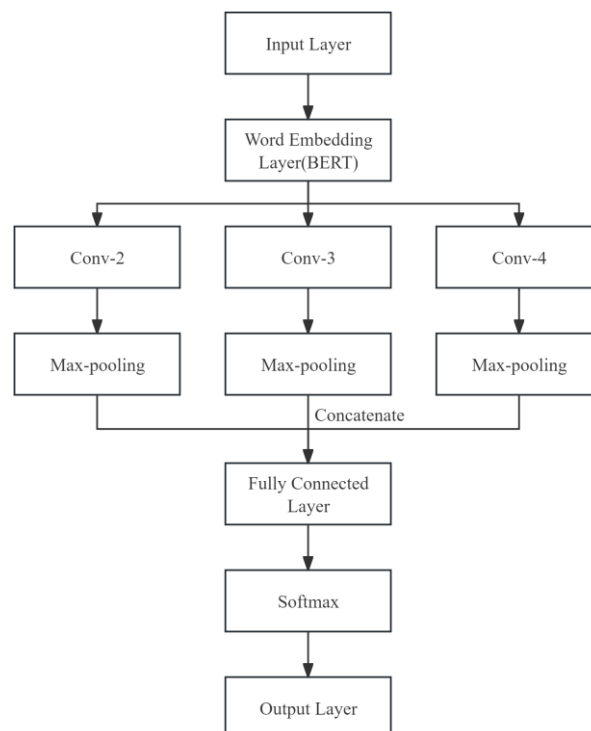

Figure 16 BERT-TextCNN Model Architecture

The BERT+TextCNN model established in this document focuses on leveraging the combination of the BERT pre-trained model and the one-dimensional Convolutional Neural Network (TextCNN) to efficiently process text classification tasks. The design philosophy of the model is based on the understanding that deep semantic comprehension and the precise capture of textual local structures are crucial for improving the accuracy of text classification.

The input layer of the model accepts text sequences processed by the BERT Tokenizer, including `input_ids` and `attention_mask`. These sequences are first transformed through the pre-trained BERT model, generating feature vectors rich in semantic information, laying a solid foundation for subsequent deep learning tasks. Following this, the model utilizes a set of one-dimensional convolutional layers (the TextCNN part), capturing features of different length n -grams in the text through convolutional kernels of various sizes. This process introduces non-linearity with the ReLU activation function and extracts the most important features through a max-pooling operation, enabling the model to understand the text content from multiple dimensions.

In the subsequent stages of the model, a Dropout layer (set with a dropout rate of 0.5) is employed to reduce the risk of overfitting, thereby enhancing the model's generalization ability on new data. After processing by the TextCNN layer, the feature vectors are fed into a fully connected layer, which is responsible for mapping the extracted features to the final classification space. The number of neurons in the output layer equals the number of categories, using the Softmax activation function to calculate the probability distribution of each category, thus completing the classification task.

In summary, the BERT+TextCNN model, by combining the advantages of the pre-trained deep language model and the convolutional neural network, not only delves deeply into the semantic information of the text but also precisely captures the local features of the text, providing an effective solution for text classification tasks.

Training Process

The training process of the model entailed a meticulously structured procedure, underscored by the division of the dataset, selection of optimizer and loss function, learning rate scheduling, and the iterative execution of training cycles, all orchestrated to optimize the model's performance for text classification tasks.

Initially, the dataset was systematically segregated into training and testing sets, adhering to a 9:1 ratio. This division was strategically implemented to ensure that the model could undergo rigorous training while retaining a substantial independent dataset for effective evaluation. The aim was to ascertain that the model's efficacy was not solely confined to the data it was trained on but extended to previously unseen data, thereby enhancing the model's generalizability and reliability in practical applications.

In the pursuit of optimizing the training process, AdamW was selected as the optimizer. This choice was predicated on AdamW's proven efficacy in handling deep learning models, particularly within the ambit of

Natural Language Processing (NLP) tasks. The optimizer is renowned for its adaptive learning rate capabilities, which significantly contribute to the fine-tuning of model parameters, thereby facilitating improved model training outcomes. Complementarily, the Cross-Entropy Loss function was employed to cater to the multi-classification nature of the task at hand. This loss function is particularly adept at managing scenarios where each instance may belong to one of several classes, making it an ideal fit for this model's objectives.

A nuanced learning rate scheduling approach was adopted, characterized by an initial warm-up phase followed by a gradual decay. This strategy is instrumental in mitigating the risk of premature convergence to suboptimal minima, thereby enabling the model to explore the parameter space more thoroughly. The warm-up phase gently increases the learning rate, allowing the model to adjust to the complexity of the task gradually, while the subsequent decay ensures that the learning rate diminishes in a controlled manner, fostering better convergence.

The model was subjected to multiple training cycles on the training set, with each cycle meticulously monitored to gauge the model's performance against the validation set. This iterative evaluation played a pivotal role in the implementation of an Early Stopping strategy, which was instrumental in curtailing the training process upon detecting signs of overfitting. Such a strategy ensures that the model maintains its capacity to generalize to new data, thereby obviating the pitfalls of excessive training that could otherwise lead to diminished performance on unseen data.

Through this comprehensive training regimen, the model was adeptly honed to capture the nuanced semantic and structural characteristics of the text, ensuring its preparedness to tackle the challenges of text classification with heightened accuracy and efficiency.

Performance Evaluation

In the performance evaluation phase of the study, a rigorous assessment framework was adopted to quantify the efficacy of the proposed BERT+TextCNN model in executing the text sentiment classification task. This evaluation was predicated on the model's ability to accurately classify the sentiment of texts from the independent testing set, a dataset not encountered during the training phase. The objective was to ascertain the model's proficiency in generalizing its learned patterns to new, unseen data, a critical indicator of its practical utility.

The evaluation metrics selected for this assessment were chosen for their capacity to provide a holistic view of the model's performance across various dimensions of accuracy and reliability. Specifically:

Accuracy was employed as a primary metric to gauge the overall proportion of correct predictions made by the model out of the total predictions. This metric offers a straightforward indication of the model's effectiveness but is complemented by more nuanced metrics to understand its performance fully.

Precision and Recall were utilized to provide insights into the model's predictive performance concerning individual classes. Precision (the proportion of true positive results in all positive predictions) assesses the model's ability to minimize false positives, while Recall (the proportion of true positive results in all actual positives) evaluates the model's capability to capture as many positives as possible. These metrics are particularly informative in scenarios where class imbalances might skew overall accuracy metrics.

The F1 Score, a harmonic mean of Precision and Recall, was calculated to balance the trade-offs between Precision and Recall, offering a single metric that encapsulates both aspects of the model's performance. This metric is invaluable for comparing models, especially in cases where one model may excel in Precision and another in Recall.

To complement these metrics, the Confusion Matrix was utilized to visually represent the model's predictions across the various classes, allowing for an intuitive understanding of its performance, including the types and magnitudes of any misclassifications. This matrix helps identify patterns of errors, offering insights into the model's strengths and weaknesses in classifying different sentiment categories.

Additionally, the Receiver Operating Characteristic (ROC) Curve and the area under the ROC curve (AUC) were employed as tools to assess the model's classification effectiveness and its generalization ability. The ROC Curve plots the true positive rate against the false positive rate at various threshold settings, providing a measure of the model's ability to discriminate between classes. The AUC provides a single value summarizing the ROC curve, with higher values indicating better model performance and a greater ability to differentiate between sentiment classes.

This comprehensive performance evaluation methodology, incorporating a blend of metrics and analytical tools, was meticulously planned to ensure the transparency and reproducibility of the research. Each step, from data preprocessing through model training to performance evaluation, was documented in detail, aiming to provide a clear roadmap for future research endeavors in the domain of text sentiment classification. This approach not only validates the current study's findings but also contributes to the broader academic dialogue on effective methodologies for sentiment analysis and text classification.

Experimental Results

Performance Metrics

Upon the completion of the training phase, the BERT+TextCNN model underwent a rigorous evaluation on the independent testing set, a pivotal step designed to scrutinize its capability in the nuanced task of text sentiment classification. This evaluation was meticulously structured to assess not only the model's overall accuracy but also its performance across a spectrum of key indicators that collectively offer a more granular view of its effectiveness and reliability.

The model achieved an impressive **accuracy rate of 93.61%**, a testament to its efficiency and precision in categorizing text sentiments. This high level of accuracy signifies the model's robustness and its adeptness at understanding and interpreting the complex nuances of language that define sentiment. Such a result underscores the model's potential utility in real-world applications where accurate sentiment classification is crucial, ranging from market research to monitoring public sentiment on social media platforms.

In addition to its commendable accuracy, the model exhibited commendable performance across other critical metrics, providing a multi-dimensional perspective on its capabilities. Specifically, the model achieved a **Precision of 89.51%**, reflecting its high degree of specificity in identifying positive instances of sentiment without being overly inclusive of negative cases. This level of precision indicates that when the model predicts a particular sentiment, there is a high likelihood that such a prediction is correct, thus minimizing the risk of false positives that could skew analyses and decision-making processes based on the model's outputs.

The model's **Recall rate of 86.22%** further complements its precision, illustrating its ability to capture a substantial proportion of actual positive sentiments. This metric highlights the model's sensitivity in detecting relevant instances, ensuring that few genuine expressions of sentiment are overlooked. High recall is particularly valuable in contexts where missing out on significant sentiment expressions could lead to incomplete or biased interpretations of the data.

Furthermore, the **F1 Score of 87.84%** achieved by the model serves as a harmonized measure of its precision and recall, indicating a balanced performance between these two aspects. An F1 Score nearing 90% exemplifies a model that does not overly favor either precision or recall but instead maintains a commendable equilibrium, ensuring that it is both accurate and comprehensive in its sentiment classification endeavors.

These results collectively illustrate that the composite model, leveraging the synergistic capabilities of BERT and TextCNN, stands as an effective tool for identifying text sentiment. Its robust performance across accuracy, precision, recall, and the F1 Score demonstrates a well-rounded and comprehensive ability to tackle the complexities of sentiment analysis. Such a model not only enriches the academic discourse on sentiment analysis methodologies but also offers tangible benefits for practical applications where nuanced understanding and classification of text sentiment are required.

Confusion Matrix Analysis

In the subsequent phase of the performance evaluation, a detailed analysis leveraging the confusion matrix offered deeper insights into the model's predictive capabilities across different sentiment categories. This analysis was instrumental in deciphering the nuanced dynamics of the model's classification accuracy, identifying not only its strengths but also delineating areas where optimization could further enhance its performance.

The confusion matrix, a vital tool in the evaluation of classification models, elucidated the model's ability to

discern between the sentiment classes accurately. According to the matrix, the model demonstrated commendable proficiency in identifying the positive class, correctly classifying such instances as True Positives a total of 378 times. This high number of True Positives underscores the model's effectiveness in recognizing expressions of positive sentiment, a crucial aspect of sentiment analysis, particularly in applications aimed at capturing customer satisfaction or public opinion trends.

Figure 17 Confusion Matrix

Similarly, the model exhibited a strong capability in correctly predicting the negative class, with True Negatives recorded at 1155 instances. This achievement indicates the model's adeptness at distinguishing negative sentiments from other categories, a testament to its comprehensive learning and understanding of linguistic cues associated with negativity. Such accuracy in identifying negative sentiments is invaluable for applications requiring nuanced understanding of negative feedback or criticisms.

Despite these strengths, the confusion matrix also revealed areas for improvement, indicated by the occurrences of False Positives and False Negatives. Specifically, the model encountered 44 instances of False Positives, where non-positive sentiments were mistakenly classified as positive. Although relatively low, this number points to the potential for refining the model's specificity, thereby reducing instances where neutral or negative sentiments are incorrectly interpreted as positive.

Conversely, the model registered 96 False Negatives, cases where positive sentiments were not recognized as such. This metric highlights opportunities to enhance the model's sensitivity, ensuring that genuine expressions of positive sentiment are not overlooked. Addressing False Negatives is particularly critical in applications where missing out on positive feedback or endorsements could skew the overall sentiment analysis.

The insights garnered from the confusion matrix not only affirm the model's competency in classifying text

sentiment but also illuminate specific areas where targeted improvements could further augment its accuracy and reliability. The revelation of these misclassifications provides a clear direction for future model optimization efforts. By focusing on reducing False Positives and False Negatives, subsequent iterations of the model could achieve even higher levels of precision and recall, thereby enhancing its utility for a wider array of sentiment analysis applications. This analytical approach, rooted in the detailed examination of performance across sentiment categories, lays the groundwork for continuous improvement and refinement of sentiment analysis models.

ROC Curve and AUC Value

Figure 18 ROC Curve

In the intricate process of evaluating the model's proficiency in sentiment classification, the Receiver Operating Characteristic (ROC) Curve and the Area Under the Curve (AUC) Value emerge as paramount indicators. These metrics collectively offer a nuanced understanding of the model's ability to balance sensitivity (true positive rate) and specificity (false positive rate), thereby providing a comprehensive overview of its classification efficacy. In the context of this study, the model's ROC Curve and its corresponding AUC Value were meticulously analyzed to gauge its discriminative capability between positive and negative sentiment classes.

The ROC Curve, a graphical representation plotting the true positive rate against the false positive rate at various threshold levels, serves as a pivotal tool in assessing the trade-offs between capturing true positives and avoiding false positives. The model's ROC curve area, encapsulated by the AUC Value of 0.96, stands as a testament to its exemplary classification ability. This value, verging on the ideal of 1, underscores the model's adeptness at distinguishing between the dichotomous sentiment categories with a high degree of accuracy.

A high AUC Value, such as the one achieved in this study, is indicative of the model's effectiveness and

reliability in several key respects. Firstly, it signifies that the model possesses a high true positive rate, implying that it is proficient at identifying genuine instances of the targeted sentiment without fail. This capability is crucial for ensuring that positive sentiments are captured comprehensively, a factor of paramount importance in applications such as customer feedback analysis, where overlooking positive feedback could skew the understanding of customer satisfaction.

Secondly, the attainment of a low false positive rate, as reflected in the high AUC Value, points to the model's precision in minimizing the misclassification of negative sentiments as positive. This specificity is vital in maintaining the integrity of sentiment analysis, particularly in scenarios where the erroneous classification of sentiments could lead to misleading interpretations or decisions.

The model's high AUC Value reflects not only its strong discriminative power but also its robustness and generalization ability across diverse sets of data. This robustness is essential for the application of the model in real-world scenarios, where the variability of text data demands a high degree of adaptability and precision from sentiment classification models.

In essence, the ROC Curve and AUC Value offer a holistic view of the model's performance, encapsulating its ability to effectively and reliably distinguish between positive and negative sentiments. The achievement of an AUC Value close to the ideal underscores the success of the BERT+TextCNN composite model in this regard, highlighting its potential as a powerful tool for sentiment analysis tasks. This high level of performance not only validates the model's current efficacy but also sets a benchmark for future developments in the field of text sentiment classification.

Conclusion

In conclusion, the innovative composite model, ingeniously integrating the BERT pre-trained language model with the TextCNN architecture, has exhibited remarkable proficiency in the domain of text sentiment classification. The model's evaluation, grounded in a comprehensive analysis encompassing a spectrum of performance metrics, the insightful data derived from the confusion matrix, and the rigorous assessment through the ROC curve, collectively affirms its exceptional effectiveness and accuracy. This thorough validation process has not only underscored the model's competency but also highlighted its distinct advantages over conventional methodologies, thereby cementing its place as a significant advancement in the realm of natural language processing (NLP).

The model's standout performance, characterized by its high accuracy, precision, recall, and F1 scores, alongside a notably high AUC value, delineates its robust ability to discern and classify sentiments with remarkable precision. These achievements illustrate the profound impact of leveraging deep learning techniques, specifically the synergetic combination of BERT's deep contextual understanding and TextCNN's efficient

capture of textual features, in extracting and interpreting complex sentiment expressions within text data. Such an approach has not only bridged the gap between theoretical models and practical applications but also set new benchmarks for what is achievable in sentiment analysis tasks.

Comparative analyses further accentuate the model's superior performance relative to other existing methods, showcasing its groundbreaking potential in harnessing the power of deep learning for NLP challenges. This superiority is not merely in terms of quantitative metrics but also reflects a qualitative leap in the model's ability to understand the nuances of language and sentiment, a testament to the advancements in AI and machine learning technologies.

Looking ahead, the journey of refining and enhancing this model is far from complete. Future endeavors will delve into the exploration of advanced optimization techniques for both the model's architecture and its parameters. Such optimizations aim to not only amplify the model's efficiency and effectiveness but also to broaden its applicability across a more diverse array of text classification tasks. This includes, but is not limited to, exploring more granular sentiment classifications, adapting the model for multilingual contexts, and tailoring it to specific industry needs, such as customer service or market analysis.

Moreover, future work will also contemplate the integration of additional data sources and the incorporation of richer linguistic features to further enrich the model's learning base. These enhancements will pave the way for the model to capture even more subtle linguistic cues and complex sentiment constructs, thereby extending its utility and applicability across various domains and languages.

In essence, the remarkable achievements of the BERT+TextCNN composite model in text sentiment classification serve as a beacon for the vast potentialities of deep learning in NLP. As this field continues to evolve, the continuous improvement and adaptation of such models hold the promise of unlocking unprecedented capabilities in text analysis, opening new avenues for research and application that were once deemed beyond reach.

Abstract: This paper seeks to examine the use of the Malay language and the English language in the teaching and learning of Chemistry subjects in secondary schools in Malaysia, particularly among Form Four and Form Five students at the National Type schools (SMJK). National Type secondary schools are Malaysian national schools under the supervision of the Ministry of Education, Malaysia. However, these schools have their own school boards and are mainly attended by Malaysian Chinese students. The teachers are also mainly Malaysian Chinese, although the medium of instruction is the national language – Malay. However, the teaching and learning of many science subjects are bilingual, conducted in both Malay and English, in accordance with the national stream education system. The methodology employed in this study includes semi-structured interviews and classroom observations at two SMJKs in the northern part of Malaysia. The purposive sampling method was used to identify relevant teachers. Ten Chemistry teachers with at least 20 years of teaching experience in secondary schools were interviewed, and the data were analyzed thematically. The findings show that Chemistry teachers prefer teaching the subject in English, mainly due to student preferences. Additionally, the findings indicated three main areas of challenges. These include the low command of English among students and teachers, as well as the lack of reference books in English. Most reference books in the market are primarily in the Malay language. The implications of the study indicate that schools wishing to adopt the use of English must be prepared in various aspects such as learning facilities and more.

Introduction

In Malaysia, Chemistry education at the Sijil Pelajaran Malaysia (SPM) level is a critical component of the national curriculum. The syllabus is aimed at providing Malaysian secondary school students with a comprehensive understanding of the fundamental principles and applications of chemistry. This is particularly important because the SPM examination is a high-stakes examination which plays a deciding factor in the future endeavor of the students (Ong, 2010). It is the national examination taken by Malaysian students at the end of their secondary education, typically around the age of 17.

The Chemistry curriculum in Malaysia is designed to cultivate both theoretical knowledge and practical skills among students. It covers a wide range of topics, including atomic structure, chemical bonding, chemical reactions, stoichiometry, organic chemistry, and environmental chemistry, among others. The curriculum is structured to provide a solid foundation in chemistry while also incorporating relevant real-world applications to engage students and foster their interest in the subject (Examinations Syndicate, 2018). The teaching of Chemistry at the SPM level emphasizes hands-on experimentation and laboratory work to reinforce theoretical concepts and develop practical skills. Students are encouraged to conduct experiments, analyze data, and draw conclusions, which not only deepens their understanding of chemistry but also enhances their critical thinking and problem-solving abilities.

Furthermore, the Chemistry curriculum in Malaysia often integrates multimedia resources, such as videos, simulations, and interactive software, to enhance the learning experience and cater to different learning styles. This approach helps to make the subject more accessible and engaging for students, allowing them to visualize abstract concepts and phenomena. The Chemistry curriculum also emphasizes the importance of safety and ethical considerations in the laboratory. Students are taught proper laboratory techniques, handling of chemicals, and safety protocols to ensure a safe and responsible learning environment.

The SPM examination assesses students' understanding of Chemistry through a combination of objective questions, structured questions, and practical assessments. This comprehensive assessment approach evaluates students' knowledge, application skills, and experimental proficiency, providing a holistic measure of their competency in the subject (Mohamad, Mohd Yusoff, & Khusairi, 2022).

Overall, Chemistry education at the SPM level in Malaysia aims to equip students with a strong foundation in chemistry, essential skills, and a passion for the subject. By fostering an understanding of the principles and applications of chemistry, Malaysia's Chemistry curriculum prepares students for further studies in science and technology fields and empowers them to contribute meaningfully to society (Ahmad Zufrie, Chong, Kaman, & Leon, 2020).

Literature Review

MBMMBI stands for the "Malay Language and the Teaching of Science and Mathematics in English" policy, which was introduced in Malaysia in 2003. The policy aimed to enhance the proficiency of Malaysian students in English and to improve their understanding of science and mathematics by teaching these subjects in English at the primary and secondary school levels. The implementation of MBMMBI was a significant shift in Malaysia's education system, which had previously primarily used Bahasa Malaysia, the national language, as the medium of instruction for all subjects. The rationale behind MBMMBI was to equip Malaysian students with English language skills that are crucial for success in the globalized world and to enhance their competitiveness in various fields, particularly in science, technology, engineering, and mathematics (STEM).

Under the MBMMBI policy, selected subjects, including science and mathematics, were taught in English starting from Year 1 of primary school. The transition to English as the medium of instruction for these subjects was gradual, with the goal of ensuring that students could effectively grasp the content in both English and their native language (Abd Rahman, Chong, Kaman, & Leon, 2021). The implementation of MBMMBI faced various challenges and controversies. One of the main concerns was the proficiency of teachers in English, as many educators had limited proficiency in the language (Nurhani & Harwati, 2021). To address this issue, the Malaysian government implemented training programs and initiatives to enhance the English language proficiency of teachers and provide them with the necessary support and resources to teach in English effectively.

Additionally, there were concerns about the impact of MBMMBI on students' overall academic performance, particularly for those who were not proficient in English. Critics argued that the policy could widen the achievement gap between students from urban and rural areas or between different socioeconomic backgrounds. Over the years, the implementation of MBMMBI underwent several revisions and adjustments in response to feedback and challenges. In 2012, the Malaysian government announced a decision to gradually revert to teaching science and mathematics in Bahasa Malaysia (Gill, 2014), starting with Year 1 primary school students in 2016. This decision was made to address concerns about the proficiency levels of students and teachers in English and to ensure better comprehension and mastery of these subjects.

While the MBMMBI policy may have faced challenges and criticisms, it also contributed to raising awareness about the importance of English language proficiency and the need to equip Malaysian students with the skills necessary to thrive in a globalized world. The experience gained from the implementation of MBMMBI has informed ongoing efforts to improve language education and curriculum development in Malaysia.

The Malaysia Education Blueprint (MEB) is a comprehensive strategic plan developed by the Malaysian Ministry of Education to guide the transformation and improvement of the country's education system. Introduced in 2013, the MEB outlines a set of goals, objectives, and initiatives aimed at enhancing the quality,

equity, and efficiency of education at all levels, from preschool to higher education. The MEB is designed to address various challenges facing the Malaysian education system, including disparities in access to quality education, low proficiency in critical subjects such as mathematics and science, and the need to equip students with 21st-century skills to thrive in a globalized economy (Abd Rahman, Chong, Kaman, & Leon, 2021).

One of the key objectives of the MEB is to improve student outcomes by focusing on holistic development, including cognitive, emotional, spiritual, and social aspects. To achieve this, the blueprint emphasizes the importance of providing a well-rounded education that goes beyond academic achievement to encompass values, character development, and lifelong learning skills. Another major focus of the MEB is to enhance the quality of teaching and learning. This involves improving the professional development of teachers, enhancing the curriculum to make it more relevant and engaging, and leveraging technology to support teaching and learning processes. The blueprint also emphasizes the importance of strengthening school leadership and governance to ensure effective management and accountability at all levels of the education system.

In addition to improving quality and equity, the MEB also aims to promote inclusivity and diversity in education. This includes addressing the needs of marginalized and underserved populations, such as students from low-income families, rural communities, and those with disabilities. The blueprint outlines strategies to ensure that all students have access to quality education and opportunities for success, regardless of their background or circumstances. The MEB is implemented through a series of action plans and initiatives, with progress monitored and evaluated regularly to ensure that goals are being met and adjustments made as needed. The blueprint is a dynamic document that evolves in response to changing needs and priorities, with periodic reviews and updates to reflect emerging trends and challenges in education.

Overall, the Malaysia Education Blueprint represents a comprehensive and forward-thinking approach to education reform, aimed at improving the quality, equity, and relevance of education in Malaysia to meet the needs of a rapidly changing world. By focusing on holistic development, quality teaching and learning, inclusivity, and diversity, the MEB seeks to empower all Malaysian students with the knowledge, skills, and values they need to succeed in the 21st century.

Method

SMJK stands for *Sekolah Menengah Jenis Kebangsaan*, which translates to National Type Secondary School in English. These schools are a unique feature of Malaysia's education system, catering to students from various ethnic and cultural backgrounds. SMJKs are publicly funded schools that offer education based on either Chinese, Tamil, or Malay language streams, reflecting the multicultural diversity of Malaysia.

The research design of this study is crafted following the conceptual framework delineated by Creswell and Creswell (2017). At its core, this interdisciplinary qualitative inquiry adopts interpretative phenomenological analysis (IPA) as its chosen methodological approach. IPA, originally formulated by Smith, Larkin, and Flowers

(2009) and subsequently refined in 2022, stands as a well-regarded qualitative research methodology, renowned for its capacity to delve deeply into individual experiences and perspectives (Smith & Nizza, 2022). Underpinning this study is a philosophical worldview rooted in social constructionism, which posits that the interpretation and reconstruction of societal phenomena are inherently shaped by the socio-cultural contexts within which they occur. Within this paradigm, the significance of understanding how meaning is both constructed and negotiated in specific social milieus is emphasized.

Moreover, the inquiry strategy deployed herein is qualitative in nature. This methodological choice is justified by the predominant reliance on interviews with sixth form educators as the primary means of data collection. Qualitative methodologies are deemed most apt for capturing the intricate nuances and rich insights inherent in educators' perspectives, experiences, and interpretations (Denzin & Lincoln, 2017). By embracing a qualitative approach within the broader framework proposed by Creswell, this study endeavors to unearth and elucidate the multifaceted dimensions of the phenomena under investigation, thereby contributing to a deeper understanding of the subject matter and enriching the scholarly discourse in the field.

Findings

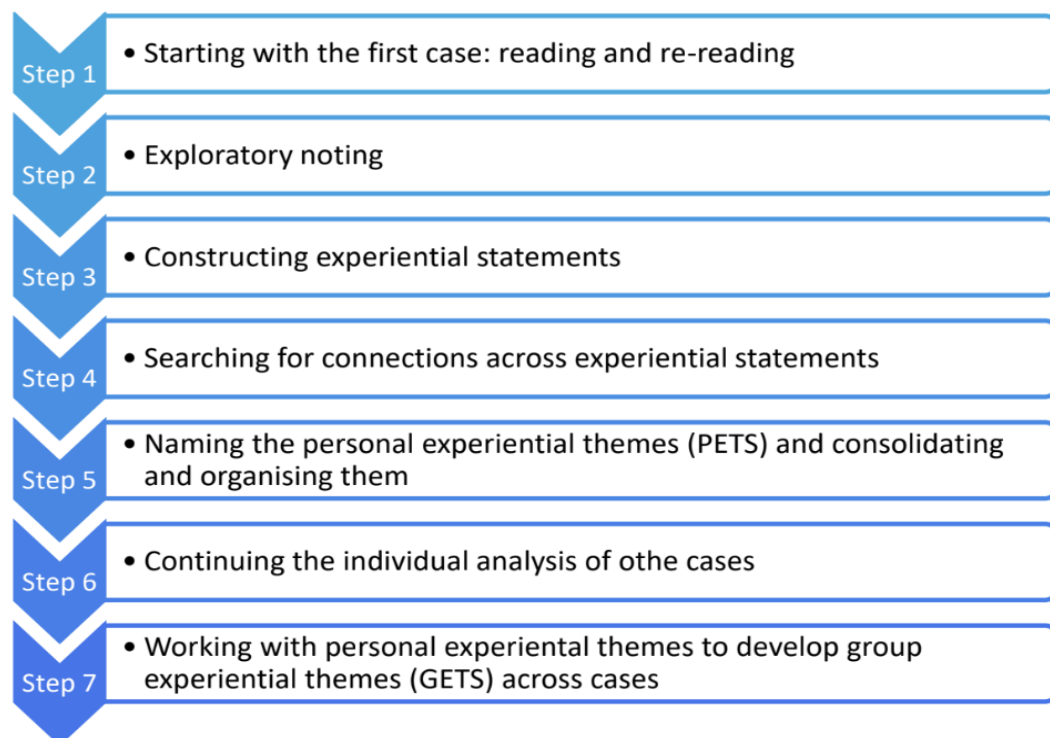

Figure 1. The Steps of Research Design

In the realm of social science research, the amalgamation of diverse research methodologies often yields a more profound understanding of intricate phenomena. This paper explores the application of a mixed methods

approach, focusing on the integration of Interpretative Phenomenological Analysis (IPA), within the confines of a single-case study. By employing this mixed methods design, the research aims to unravel the complex layers of human experiences, offering a nuanced and in-depth perspective that combines both qualitative and quantitative insights.

The research design for this study follows Creswell's research design (Creswell & Creswell, 2017). Firstly, this interdisciplinary qualitative study employs interpretative phenomenological analysis (IPA) as a research method. IPAS was first developed by Smith, Larkin, and Flowers (2009) and an updated version (2022). It is a widely used method (Smith & Nizza, 2022). The philosophical worldview is a worldview of social construction in which the context is juxtaposed with the reconstruction of society. Thirdly, the strategy of inquiry is qualitative in nature. This is because the bulk of data comes from interviewing the sixth-form educators, hence, a qualitative strategy is deemed a better *modus operandi* to yield fruitful data (Denzin & Lincoln, 2017).

Mixed methods research, by design, integrates the strengths of both qualitative and quantitative methods to comprehensively address research questions. The synergy between the depth of qualitative data and the broader generalizability of quantitative measures is particularly valuable. In the context of this study, the combination of interpretative phenomenological analysis (IPA) and a case study design enables a holistic understanding of intricate human experiences within a specific context.

At the heart of this methodology is IPA, a qualitative research approach rooted in phenomenology. IPA seeks to uncover and comprehend how individuals make sense of their lived experiences, providing a nuanced exploration of subjective realities. By engaging in an iterative process of data collection and analysis, researchers employing IPA can interpret participants' accounts, revealing underlying themes and patterns that might otherwise remain hidden.

The case study design employed in this research focuses on a single unit of analysis, allowing for a concentrated examination of a real-life context. The depth and contextual richness inherent in case studies complement the nuanced exploration offered by IPA. This approach enables researchers to capture the intricacies and unique aspects of human experiences within a specific setting, contributing to a more profound understanding of the research problem.

The integration of mixed methods and IPA in a case study can take a sequential or concurrent approach. In a sequential design, one method informs the other, often with the qualitative phase following the quantitative phase. Alternatively, a concurrent design involves the simultaneous collection and analysis of both qualitative and quantitative data, allowing for a more dynamic synthesis of results. This integration enriches the research by providing a multifaceted perspective on the research problem.

The integrated approach of mixed methods, IPA, and case study design brings numerous benefits, including a holistic understanding of the research problem, triangulation of findings, and enhanced validity. However,

challenges such as the time and resource-intensive nature of the methodology, ensuring consistency in data interpretation, and navigating the complexities of synthesizing diverse findings should be carefully considered. Despite these challenges, the potential for generating comprehensive knowledge that transcends disciplinary boundaries makes this mixed methods approach a powerful tool for unraveling the intricacies of complex human experiences.

Findings and Discussions

The findings from the analysis were analyzed using ATLAS.ti to generate themes. Particularly, the personal experiential themes (PETS) and then from the collected group experiential themes (GETS). The GETS are developed by examining the convergence and divergence of the essence of the lived experiences.

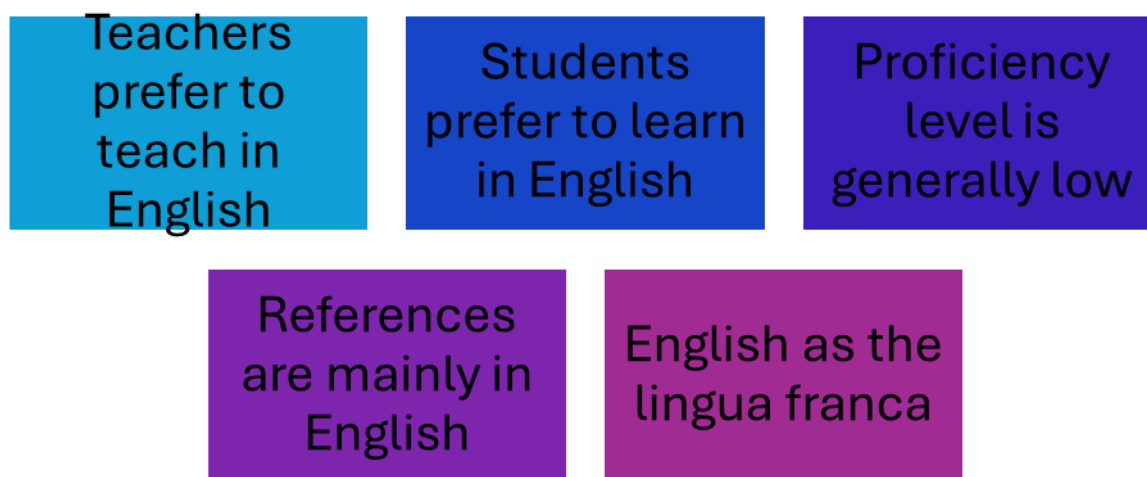

Figure 2. Thematic Analysis

The figure above is a thematic analysis generated by ATLAS.ti. Based on the emerging themes, teachers generally feel that the provision, training, and information about chemistry is insufficient in the Malaysian secondary school education landscape. From the convergence and divergence of the thematic analysis, the commonalities and particularities are further examined.

In Malaysia, educators at the Sijil Pelajaran Malaysia (SPM) level have expressed concerns about the adequacy of educational materials in chemistry, particularly regarding the coverage of inorganic and organic chemistry. Chemistry plays a crucial role in modern science, and understanding it is vital for preparing students for the evolving landscape of science education. The integration of comprehensive and up-to-date materials in the curriculum is essential to ensure that students are well-equipped with the knowledge and skills needed to engage

with advancements in chemistry (Buldur, Bursal, Erik, & Yucel, 2020).

Teachers who have reviewed the current curriculum have identified a gap in the coverage of organic chemistry concepts. This shortfall poses a challenge as it limits the depth of understanding students can acquire about this critical aspect of contemporary chemistry. To address this issue, educators are providing constructive feedback to curriculum developers and educational authorities, emphasizing the need for updates and enhancements to incorporate smart grid topics more thoroughly. For instance,

Inorganic chemistry is included in the textbook, but very very superficial level only....most of us just use YouTube to enhance the understanding of inorganic chemistry...(Teacher Maimunah)

To address the understanding of inorganic chemistry, educators themselves can take proactive steps to enhance their own understanding of smart grids. Participating in professional development programs focused on energy technologies can empower teachers to integrate relevant content into their lessons. This approach ensures that educators are well-informed and capable of delivering engaging and informative lessons to their students. For instance,

I think there were some programmes conducted by the GKMP, but I cannot recall it. It was conducted by some lecturers from university X. (Teacher Nizam).

Teachers can contribute to bridging the gap by developing additional materials on smart grids. This may involve creating lesson plans, presentations, and supplementary resources that align with the existing curriculum. Furthermore, collaboration with industry experts, such as professionals from chemistry, can bring real-world insights into the classroom. Guest lectures and workshops facilitated by these experts can enrich students' learning experiences and provide practical applications of smart grid technologies. This echoes the findings of a study conducted in Jordan (Shuqair, 2023).

Advocacy for the inclusion of smart grid topics in educational policies is crucial. Teachers can actively engage with education policymakers, attending forums and discussions to highlight the importance of incorporating these concepts into the science curriculum (Sun, Khan, & Ren, 2023). Additionally, building connections with the local community, including energy providers and technology companies, can yield valuable resources and support for educators seeking to enhance the coverage of smart grids in their teaching materials. By taking these collaborative and proactive measures, educators can contribute to a more comprehensive and contemporary science education at the SPM level in Malaysia.

Conclusion

Understanding how SPM teachers perceive the relevance of Chemistry is pivotal. This encompasses exploring their awareness of the significance of chemistry in the context of renewable energy, climate change mitigation,

and technological advancements. Teachers' insights into the applicability of chemical concepts in real-world scenarios and industries will provide valuable feedback for curriculum developers.

The study also aims to identify the challenges faced by SPM teachers in the teaching and learning of Chemistry. Whether it be a lack of resources, gaps in teacher training, or constraints within the existing curriculum, recognizing these hurdles is essential for designing effective support mechanisms. Simultaneously, uncovering the opportunities perceived by teachers can provide insights into potential innovations and enhancements in the delivery of Chemistry.

The research delves into the perceived effectiveness of current educational strategies and materials related to Chemistry. By understanding how teachers approach the delivery of these concepts, the study aims to provide recommendations for refining teaching methodologies, developing relevant educational materials, and fostering a conducive learning environment for students.

As Malaysia propels itself toward a sustainable energy future, the insights derived from SPM teachers' perceptions on chemistry education are integral. This research aims to contribute valuable information for policymakers, curriculum developers, and educational institutions, fostering an environment where chemistry education is not only seen as a theoretical concept but as a practical and essential component in shaping the energy leaders of tomorrow. By aligning educational strategies with teachers' perceptions, Malaysia can ensure that the youth are well-equipped to navigate the complexities of chemistry and contribute to the nation's renewable energy goals.

Abstract: The story telling method has long been known to be an effective method in education. Especially in today's digital era, the storytelling method can be assisted with augmented reality to strengthen the nuances in the story. So a combination of storytelling and augmented reality is used for multiculturalism education on the theme of religious moderation. This research used quantitative method in the form of questionnaire to 225 Paket C students in an informal school as the respondents, after they were given the storytelling using the augmented reality support to strengthen the nuances. The results of the research have shown that from 3015 for total answers of the questionnaires, 23.48% showed very agree, 49.45% showed agree and the rest (27.07%) showed not agree and very not agree. For the questionnaires are in the form of positive nuances, yet they are valid (corrected item total-correlation = 0.417) and reliable (cronbach alpha = 0.637), so the positive tendency of the respondents showed a very good religious moderation as a form of multiculturalism.

Keywords: Multiculturalism education, Informal education, Storytelling approach, Augmented reality

Introduction

Bina Nusantara University (mentioned as Binus), as the largest private university in Indonesia, has several missions, one of them is two in three graduates work in the global companies or become entrepreneurs who foster and empower the society. To support this mission, it has several values whose abbreviation is known as S-P-I-R-I-T. They are Striving for Excellence, Perseverance, Integrity, Respect, Innovation and Teamwork. To ease implementing these values, Binus provides attributes all the academic community of Binus (mentioned as Binusian) must have, called as Binus Graduate Attributes (BGA). The BGA consists of eight attributes, they are: critical & creative thinking, adaptability, growth mindset, collaboration, social awareness, digital & technology fluency, initiative, and applied management skills. Started on about 2002, Binus has a series of character building (mentioned as CB) courses as its general education courses. The courses names were CB-I, CB-II, CB-III, and CB-IV. As time went by, the names of CB courses experienced several times of changes following the changes of curriculum, and on 2014 the CB courses names transformed into CB-Pancasila (a course about Indonesian ideology), CB-Civics, and CB-Religion. The CB courses are given with five attributes of BGA contained therein to be implemented, they are critical & creative thinking, adaptability, growth mindset, collaboration and social awareness attributes. The attribute of critical & creative thinking is specially to be implemented in CB-Pancasila, adaptability is specially for CB-Civics, and growth mindset is specially for CB-Religion, whereas the collaboration and social awareness attributes are for all CB courses.

The religious moderation education in Binus was delivered in the form of final projects last semester for two courses, they are CB-Pancasila and CB-Religion. For there is one principle in Pancasila contains the value for religious tolerance among religious people, we consider it is important to introduce the value for religious tolerance in this first course of CB. After doing the project, we believe that there are values that are included to support the value of religious tolerance, whatever the percentage, into the students' minds and hearts. The most important thing is, the students have got the knowledge how important the religious moderation are.

Therefore, we are familiar with the character buildings, the multicultural matters and good graduate attributes. These things are also familiar to students in well-known private and state schools. For Binus is a well-known and high-rank private university in Indonesia, so these students are in the high interest to enter it. Indonesia is known as a country with diverse religions, we have to deal with the diversity. We also know that formally and legally, there are six official religions, namely Islam, Christianity, Catholicism, Hinduism, Buddhism, and Confucianism, and since 2017, the existence of belief systems has been officially recognized by the state.

Whilst we care about the multiculturalism matters, paying attention to how many cases of religious radicalism there are in Indonesia, it turns out that the Binus academic community cannot just remain silent. If the lecturers are considered successful in educating their students, then what about the community around Binus or who are its stakeholders? This fact is what motivated us to carry out this research. Is the fact about the multiculturalism behaviors in the society as good as Binus academic community? In order to answer the question, this research

objective is to get the illustration about the multiculturalism based on religious moderation on Paket C students in XYZ School as one of the Binus' partners for community development.

Literature Review

Religious Moderation

The English word of 'moderation' is derived from the Latin word "moderatio", which meaning is "not being excessive". It can also be defined as "wasath" in Arabic which meaning 'middle ground'. From these two words, we can say the meaning of the word "moderation" as abstaining from unduly extreme behaviors or viewpoints or interpret it as moderate behavior. English commonly uses the word "moderation" to describe ideas like core, standard, ordinary, or non-aligned (Egginton, 2011).

The Research and Development Team of the Indonesian Ministry of Religious Affairs explains that moderation has been taught by many religions. A person should have three main characteristics in practicing religious moderation: wisdom, purity, and courage. In other words, someone with extensive religious knowledge can more easily develop a moderate attitude in religion, always choosing the middle path to act wisely and not be easily influenced (Balitbang kemenag, 2019).

Religious moderation serves as the initial step in fostering unity and tolerance among believers. This means that when religious moderation is promoted and applied in every aspect of life, it will at least reduce prejudices that lead to conflicts. Religious moderation is seen as a way to achieve peaceful and harmonious living, especially in multicultural countries. To implement religious moderation in multicultural societies, what needs to be done is to make educational institutions laboratories for religious moderation and apply a socio-religious approach to religion and statehood (Muhtarom et al, 2020).

Storytelling-Augmented Reality in the Generation Z Education

Augmented reality (AR) is a technology that bridges the gap between the virtual or computer world and reality. It overlays digital information, such as sound, graphics, video, 3D models, etc., onto the physical environment either directly or indirectly. Since the 1950s, Morton Helig pioneered virtual reality, which featured environmental elements but lacked interaction. As technology has advanced, AR has introduced useful interactions for users and is widely utilized in various fields such as healthcare, manufacturing, robotics, entertainment, gaming, and education. One of the effective and beneficial applications of AR is in education. AR can display text, graphics, videos, and audio in real-time environments for students. In its use, students can scan markers found in textbooks or other media to obtain in-depth information about a topic. They can also interact with computers to enhance their understanding of a subject.

There are many opinions about when Generation Z were born. But for the exact wider range of years we can say

that they are born in between the year of 1995-2015. They are the generation who grow up amid rapid technological advancements, where every aspect of life involves the use of portable digital devices, so they interact with the world and each other anytime and anywhere using the internet-based social media. According to William Strauss and Howey in Jha (2020) and McCrindle (2021), the differences between generations based on their birth years determine their ways of thinking, acting, and the abilities they possess. No wonder if a generation if they have similarities, for they have similarities in birth years, life experiences, as well as cultural influences. Generation Z utilizes various advanced technologies such as smartphones, tablets, video games, self-driving cars, and interactive assistants or speakers. This brings positive impacts for them, enabling them to develop connectivity, communication, creativity, and enhance their global social skills (Jayatissa, 2023).

In this paper, we focus on the Generation Z because, although the basic moral values in religious life must be instilled from an early age, specifically in the alpha generation category, the good moral values still can be instilled after the childhood and teenager phases, it is early adulthood phase (18-25 years old) or in other words in this era, Generation Z. We can say that the urgency of religious moderation aims to prevent radicalism to create a harmonious national life, has been a must in the past ten years. However, to achieve this goal, target mapping is needed, as the reality shows that intolerance is segmented according to certain age groups in Indonesian society. The right method is needed to introduce religious moderation.

This paper explores the role of technology in implementing religious moderation education in Generation Z. Generation Z was chosen because they integrate technology into their lives much more than previous generations (X and Y). In other words, they strongly feel the impact of technology in the process of self-discovery. One appropriate teaching medium for moderation is through augmented reality technology. Augmented reality can present the concept of religious moderation through storytelling, a learning mode that involves narrating a specific theme.

Storytelling is still believed as an effective tool to educate morals. For children usually understand a moral theme from the story, but this is not always the same moral as was initially intended by the author. This also is influenced by the ways teachers deliver stories. It is believed gives affect the success of using storytelling for moral education. Specifically, young children's understanding of moral values in a story is influenced by the knowledge of the teachers on what the stories are used for in values education and the way the teacher tells the stories for that purpose, which is essential in facilitating the students to learn from the storytelling. (Rahiem et al, 2020). According to Radu, Augmented Reality has a positive impact on the learning process (Radu, 2012) and the combination of Digital Storytelling in AR form is impactful and powerful in the learning process (Smeda et al, 2014).

Psychology of Learning

In order to shorten the writing process, we would like to jump the theory about Psychology of Learning to Learning Strategy. Learning strategies can be described as techniques that students employ to acquire

knowledge. This includes methods for sharpening memory as well as more effective study and test-taking tactics (Rad, 2012). There is one strategic for effective learning, named as dual coding. Dual coding described as combining words with visuals. Implementing this strategy makes students can draw two neurons and explain how one communicates with the other via synaptic gap (Weinstein et al, 2018).

Method

Respondents Selection and Data Collection

As mentioned above, this research objective is to get the illustration about the multiculturalism based on religious moderation on Paket C students in XYZ School as one of the Binus' partners for community development. This research has been done in an informal school (XYZ School) providing Paket C (the program equals to senior high school level of education in Indonesia) in West Jakarta. It has approximately 400 students, and more than 70% of them are Gen Z.

The research started from the instructions for the respondents to watch the AR for Storytelling in a particular application for smartphones (named as hARmony) in the form of video. After watching the video of storytelling and interaction in hARmony, they had to make reflections. After making the reflections, they were instructed to answer the questionnaire about multiculturalism based on religious moderation by choosing the scales for their tendencies of behavior. The responses in the form of chosen scales would be the illustration of the multiculturalism behaviors of the chosen respondents.

The respondents were from Generation Z and the number of respondents who participated in this research were 225 persons, all of them are the students of Paket C. The questionnaire was given by google-form, self-construct, and adapted from 2 questionnaires about multiculturalism (Permatasari et al (2020) and Sweet (2022)) and 2 questionnaires about religious moderation (Afwadzi & Miski (2021) and Syahid et al (2024)). The number of items in the questionnaire is 22 and the sentences in the items are in the positive nuances. The tendencies of chosen behaviors about multiculturalism based on religious moderation were measured by Likert scale divided by four scales on tendency towards conformity in agree-disagree levels. They are 1 for strongly disagree, 2 for disagree, 3 for agree and 4 for strongly agree. For the items in the questionnaire are in the positive nuances, so the preferable choices to show the good behaviors for multiculturalism in this research are the scale 3 and 4.

The story in the hARmony video was expected to influence the behavior of the respondents for multiculturalism based on religious moderation. For the illustration about the behavior had to be gotten after watching and interacting in the application, it can be seen from the scales chosen from the questionnaire.

Data Processing and Providing

After the results of the questionnaire filling were already available, the data were processed statistically using

the SPSS to ensure that the questionnaire has been valid and reliable to measure the behavior of multiculturalism based on religious moderation. After the validity and the reliability have been confirmed, the data for number of each scale chosen will be easier to obtained to get the illustration.

The data provided in a table showing the number of scale chosen from the whole answers provided and each scale chosen. Apart from the number of selected scales, the table also shows the percentage of each selected scale from the total selected scales. The percentages of scale chosen data will be the basis for discussion and drawing conclusions as the final result for illustration of how good the multiculturalism based on religious moderation behaviors of the Paket C students of the informal school are (Kemmis, S., & McTaggart, R. (1982), (2000) and Kusamah, W. & Dwitagama, D. (2009)).

Results

The results of the answers for the questionnaire can be seen in the table below:

Table 1. Amount and Percentage of Scale Choices

Scale Choices	Amount of Answers	Percentage (%)
1	212	7.04
2	604	20.03
3	1491	49.45
4	708	23.48
Total	3015	100.00

As we can see the results in the table above, the students' tendencies were choosing the scale 3 and 4. The questionnaire is valid (corrected item total-correlation = 0.417) and reliable (cronbach alpha = 0.637). For the questionnaires are in the form of positive nuances, the expected tendency is going towards conformity of agree. This tendency leads to scale 3 and 4 as the preference choices. Although the scale 4 is chosen by 23.48% of the population (less than 25%) and scale 3 is 49.45% (less than 50%), the illustration of measured behavior still looks good.

The illustration of the performance can be seen more clearly from the graphic in Figure 1.

Figure 1. The Performance of Multiculturalism Behaviors of the Students in XYZ School

Discussion

For the questionnaires are in the form of positive nuances, so the expected responses are in the scale of 3 and 4. As we can see an illustration about the results that the tendencies of the students for multiculturalism behaviors are good (mostly in the scale 3 and a little more in the scale 4 than scale 2). Referring to Balitbang Kemenag (2019), they may already had the three main characteristics in practicing religious moderation, i.e.: wisdom, purity, and courage. In this case, we believe that they can choose their own behavior by consciously their attitude or religious thinking and/or understanding to elude the extreme views for choosing way to the right or to the left (Afwadzi & Miski, 2021).

Referring to Afwadzi & Miski (2021), the results displayed the tendency of liberalism rather than radicalism, as they said that if the teaching and order of a religion is believed by the followers of the extreme views; whether it is put way to the right or way to the left is considered as radicalism, whilst the liberalism is the opposite. If the radicalism gives as a connotation to harsh, tough, rigid, and intolerant understanding, attitudes or actions, and others (Afwadzi & Miski, 2021), the illustration of the students' behavior from the questionnaire's responses displayed the opposite.

Conclusion

The storytelling method, especially built in AR in the form of video, still has given sufficient supports in socializing the importance of religious moderation. Surprisingly, it still suits to the Generation-Z who still take a fancy of reading and still tend to the film or video watching. The messages of the story must be easier to catch. For the augmented reality bridges the gap between the virtual or computer world and reality, we believe the

story in the form of AR in videos would be easier to enjoy and internalize than in the form of animation in videos.

The augmented reality can be utilized in education as a learning medium. Through the developed augmented reality, the Generation-Z, as a group of individuals who integrate technology into their lives much more than Generation-Y and X, has been provided with new knowledge and perspectives in understanding the theme of religious moderation. Additionally, media like these are not only enjoyable but also accessible from anywhere without the need for formal face-to-face interaction in the classroom, for this in the form of applications and videos. Thus, learners are directed to creatively learn independently without the presence of tutors or teachers. In efforts to prevent religion-based intolerance, the field of education plays a crucial role. Instilling awareness from an early age is a preventive step in combating intolerance.

Although the storytelling in augmented reality most believed effective to children (alpha generation) education, this research has shown that it is still an effective method to educate the older generation, even Generation-Z. This fact has shown us that a particular method for education can be implemented to several or, maybe, every generations.

Recommendations

This research also inspires us to recommend for increasing the character education quantitatively and qualitatively, started from the alpha generation to upper generations, even Generation-Z to X. for this research has shown us that another way to learn. Referring to Rad (2012) and Weinstein et al (2018), as long as students can acquire knowledge, the learning process can occur. Especially if the process of acquiring knowledge can be enriched with combination of words, visuals, or maybe music, this is believed to ease the process of learning.

For AR is known as a new media to explore, it can be tried to be the media for education. For this research has shown that AR in the form of video can be used for education as well, and we know that YouTube is the most popular social media for entertainment because of its ease to access and interact among people, we can try YouTube also to search for AR in the form of videos for YouTube education.

All of us in this era are very familiar with social media, for it has been an important part of our lives. One of the social media is YouTube. The features in YouTube make it also known as the social media that can make interactions among netizens. So many more people across generations can use YouTube for education by interacting each other. If we rarely find AR videos for education in YouTube, we can consider to produce those kinds of videos ourselves and upload them in YouTube, so YouTube can heightened its amount of educational videos as well as the variety of educational videos' topics and models. We believe that more education contents in social media would give more contributions to educate the society.

Abstract: The three-step Parsonian approach has lasted more than a century and paved the foundation to the modern career counselling, which emphasized the importance of knowing the self, the environment, and “true reasoning”. The use of assessments remains as an integral part of career counselling. Therefore, the current study aims to carefully reevaluates the tenets of the Parsonian approach to better support evidence-based career counselling interventions by exploring the predictive roles of (1) decisional procrastination on career decision-making difficulties (CDD), (2) career exploration on CDD, and (3) career decision self-efficacy on CDD among the final-year undergraduates of Malaysian universities. Subsequently, the mediation models of (1) career decision self-efficacy on decisional procrastination and CDD and (2) career decision self-efficacy on career exploration and CDD were included in this study. 203 final-year undergraduates were recruited with two-stage stratified sampling for the present exploratory study using survey method. The findings revealed that decisional procrastination and career exploration were significant positive predictors for CDD, whereas career decision self-efficacy served as a significant negative predictor. Moreover, career decision self-efficacy was found to significantly mediate the relationship on decisional procrastination and CDD and the relationship on career exploration and CDD. In addition, the present study further consolidated the importance of emphasizing the role of career decision self-efficacy in the intervention of career counselling. Notably, the career exploration was found to be a positive predictor of CDD, the implications of over reliance on the career exploration in career counselling is discussed.

Keywords: Career decision-making difficulties (CDD), career decision self-efficacy, decisional procrastination, career exploration, career counselling, final-year undergraduates

Introduction

Career decision-making is a complicated process. This decision-making process is further exacerbated by the possibility of the career being rendered obsolete by imminent technological advancements. Therefore, the pressure to make the perfect career choice by the undergraduates, a cohort impending to enter the labour force, can be overwhelming. Past research suggested that half or more of all university students experienced career-related problems (Gianakos, 1999; Herr et al., 2004). The strong sense to choose the best career choice may result in indecision, which have critical vocational adverse outcomes (Sidiropoulou-Dimakakou et al., 2012; Walker & Tracey, 2012) and psychological well-being (Viola et al., 2016).

Annually, a large portion of the annual federal budget were allocated to education by the Malaysian government. In the recent Budget 2024, RM58.7 billion was specifically allocated to the Ministry of Education, which was the largest allocation to all sectors (Ministry of Finance Malaysia, 2023). The high allocation was aimed to ensure that Malaysians receive quality education (Ministry of Finance Malaysia, 2020), which is vital for national economic growth; however, it was found that more than half of the graduates experienced career decision-making difficulties (CDD, Yusof & Jamaluddin, 2015), resulting in unemployment and mental health issues. In addition, Malaysian youths aspired to graduate from university with university degrees and secure meaningful careers. However, a majority of the undergraduates would drop out from the study midway or even graduating with a degree which does not guarantee careers matching the field of study (Talib & Tan, 2009). Thus, the present study seeks to contribute to the literature of CDD by exploring the interaction of career decision-making self-efficacy (CDSE), decisional procrastination, and career exploration.

The Prescreening, In-depth exploration, and Choice (PIC) model proposed by Gati and Asher (2001) suggested that large amount of information needed to be processed in making career decision could be reduced, consequently allowing the individuals to focus on the remaining relevant information. In the model, it is unreasonable for individuals to explore all possible career information; thus, the individuals are likely to search for options that are the most consistent with interests and abilities. The three stages of the PIC model are (a) prescreening potential alternatives based on interests, leading to a manageable selection of promising alternatives; (b) in-depth exploration of the remaining alternatives, leading to suitable alternatives; (c) selection of the most suitable alternative. The present study explored the possibility of the individuals failed to initiate the prescreening process due to decisional procrastination and the subsequent career exploration, providing an alternative perspective on helping clients in career guidance and counselling.

Literature Review

Career decision-making difficulties (CDD) referred to the level of undecidedness in the process of deciding career-related pathway (Xu & Bhang, 2019). Traditionally, the notion of career decision-making was portrayed as a linear process in career development, but recent literature suggested that career decision-making is a continual process of uncovering hidden talents, skills, interests, and about the world of work in the process of career development. 20% to 50% of post-secondary students were estimated to be undecided about their future career goals (McAuliffe, 2008).

Career decision-making self-efficacy (CDSE) is the belief of an individual successfully engages in behaviours and activities related to career decision-making process (Taylor & Betz, 1983). The CDSE developed by Betz et al. (1996) consisted of several dimensions, including a) accurate self-appraisal, b) occupational information, c) goal selection, d) planning, and e) problem-solving. CDSE has been consistently found to be negatively associated with CDD (Bi et al., 2023; Duru & Soner, 2021). Choi et al. (2012) used meta-analysis based on Social Cognitive Career Theory (SCCT) revealed that CDSE significantly correlated with career related constructs, including career indecision, career identity, and career outcome expectation. Past study has also shown that CDSE mediates the relationship between personal factors, such as social support, and career-related constructs, such as CDD (Zhou et al., 2024). Sandra and Mularsih (2021) suggested that individuals with higher CDSE are more likely to be determined, enthusiastic to engage in proactive decision-making behaviours, seek out career information, and persevere through challenges. Thus, CDSE is one of the critical key variables in the study of career decision process.

Fernie et al. (2017) construed procrastination as intentional or unintentional failure of self-regulation. Decisional procrastination is a form of cognitive failure, which would result in the postponement of processing alternative information (Ferrari, 2000). An integrative review by Bian (2021) highlighted decisional procrastination as one of the many antecedents of CDD. This finding is supported by multiple past studies, which found decisional procrastination as significant of CDD (e.g., Bańka & Hauziński, 2015; Chuang et al., 2020; Jamali et al., 2015). Individuals with high decisional procrastination have the tendency to delay career decision-making process, potentially producing adverse career outcome.

Career exploration is a type of problem-solving behaviour (Tsai et al., 2017) associated with career development, choice, or adjustment (Esters, 2008). The process of exploration is characterized by understanding the self or self-exploration, and the world of work or environment exploration (Vignoli, 2015) by gathering career-related information (Xu et al., 2014). Self-exploration is an exploratory behaviour in uncovering individual characteristics, personality, interests, skills, and values; whereas environment exploration is an exploratory behaviour in learning information that is related to work, including the labour market, career trends, career progression, risks and benefits, job requirements (Denault et al., 2019). The quasi-experiment by Jung and Yoo (2020) found a reduction in career indecision, after the participants were provided with new

information and experience of nursing field roles, tasks, and competencies via mentoring.

The Present Study

The overarching objective of the present study is to explore the interactions between several key constructs (i.e., career decision-making difficulties, career decision self-efficacy, decisional procrastination, and career exploration) among the final-year undergraduates in Malaysia pursuing a bachelor's degree. The first aim is to (1) explore the predictive roles of decisional procrastination and career exploration on CDSE, (2) the predictive roles of decisional procrastination and career exploration on CDD, and (3) the predictive roles of CDSE on CDD. Lastly, (4) the mediating effect of CDSE on decisional procrastination and CDD, and career exploration on CDD. The hypotheses of the present study are outlined as follows:

H_1 : Decisional procrastination negatively predicts career decision self-efficacy (CDSE).

H_2 : Career exploration positively predicts career decision self-efficacy (CDSE).

H_3 : Decisional procrastination positively predicts career decision-making difficulties (CDD).

H_4 : Career exploration negatively predicts career decision-making difficulties (CDD).

H_5 : Career decision self-efficacy (CDSE) negatively predicts career decision-making difficulties (CDD).

H_6 : Career decision self-efficacy (CDSE) significantly mediates the relationship between decisional procrastination and career decision-making difficulties (CDD).

H_7 : Career decision self-efficacy (CDSE) significantly mediates the relationship between career exploration and career decision-making difficulties (CDD).

Method

Participants and Procedure

This quantitative study allows objective examination of all the key variables of the present study. The survey respondents of the study were recruited with stratified random sampling. The first stage of stratified random sampling is to randomize the universities of the five regions in Malaysia (i.e., Northern Region, East Coast Region, Central Region, Southern Region, and East Malaysia). Subsequently, the second stage of the sampling is to randomize the program of study (i.e., education; arts and humanities; social science, business, and law; science, mathematics, and computer; engineering, manufacturing, and construction; agriculture and veterinary; health and welfare; and services) to ensure all occupational sectors are well represented. Moreover, the present study is a cross-sectional study, in which the data were collected once and contained within a short period of time, which is appropriate for the descriptive and predictive goals of survey research. The data collection procedure strictly adhered to the ethical standards of Helsinki Declaration of 1975, as revised in 2005. All respondents in the present study completed the survey with face-to-face hardcopy questionnaires.

Specific inclusion criteria were used to define the parameters of the sampling frame: (1) Malaysian, (2) undergraduates pursuing full-time bachelor's degree, (3) Malaysian universities with physical campus located within the country, and (4) final-year students regardless of program of study. In addition, several exclusion criteria were included to confine possible confounding variables: (1) participants who have had at least 12 months of working experience prior to the commencement of the bachelor's degree and (2) participants who has completed one bachelor's degree prior to the current degree.

230 final-year undergraduates were recruited in the present study, who had given their consents indicated with initials on the consent form. Data diagnostics were performed to remove the following cases due to foreign nationality ($n = 2$), non-final-year students ($n = 13$), working experience exceeding 12 months ($n = 3$), and significant missing values ($n = 5$). 207 cases were retained for further analysis.

The final sample comprised of 207 respondents, mostly were female respondents ($n = 125$, 60.4%) with mean age of 23.11 ($SD = 2.34$). The composition for program of study is Education ($n = 12$, 5.8%); Arts and Humanities ($n = 18$, 8.7%); Social Science, Business, and Law ($n = 66$, 31.9%); Science, Mathematics, and Computer ($n = 35$, 16.9%); Engineering, Manufacturing, and Construction ($n = 48$, 23.2%); Agriculture and Veterinary ($n = 6$, 2.9%); Health and Welfare ($n = 13$, 6.3%); and Services ($n = 9$, 4.3%).

Measures

Career Decision-making Difficulties Questionnaire (CDDQ)

The Career Decision Difficulties Questionnaire (CDDQ) was developed by Gati et al. (1996) to for the purpose of evaluating the perceived difficulties in the career decision-making process. The CDDQ comprised 34 items which can be grouped into three domains (i.e., lack of readiness, lack of information, and inconsistent information). The items are rated on a 9-point Likert-type scale, resulting in a range of 34 to 306 with greater value indicating higher career indecision. This scale exhibited excellent overall reliability with Cronbach's alpha, $\alpha = .92$. The internal reliability coefficients of the subscale scores in the present study were .68 for lack of readiness, .94 for lack of information, and .85 for inconsistent information.

Career Decision Self-Efficacy Scale – Short Form (CDSE-SF)

The Career Decision Self-Efficacy Scale (Taylor & Betz, 1983) is a measure for identifying the perceived ability to make educational and career decisions. The 25 items were rated on a 5-point confidence continuum ranging from 1 (*no confidence at all*) to 5 (*complete confidence*), which would yield a minimum of 25 and a maximum of 125. The higher total scores imply a higher level of confidence in completing tasks pertinent to making career decisions. The overall Cronbach's alpha of the scale in the present sample was .87.

Decisional Procrastination Scale (DPS)

The Decisional Procrastination Scale was designed by Mann (1982) to assess procrastinatory behaviour pertinent to critical decision-making situations. The DPS has only five items on a 5-point Likert scale, ranging from 1 (*low*) to 5 (*high*). The total score ranged from a minimum of 5 and a maximum of 25, with higher score indicating higher tendency for postponing decision making. Cronbach's alpha reliability on the present sample was .80.

Career Exploration Survey (CES)

This instrument was designed by Stumpf et al. (1983), with the intention to facilitate career exploration, career development, and career decisions. In the present study, CES was used to appraise the respondents' degree of career exploration activities. Only two out of the original sixteen dimensions were adopted. Particularly, the 5-item self-exploration (SE) subscale and the 6-item environment exploration (EE) subscale. Both subscales of SE and EE were scored on a 5-point Likert scale, ranging from 1 (*little*) to 5 (*a great deal*). Higher subscale score in the specific domain indicates more frequent exploratory behaviour in the same domain. This study showed a Cronbach's alpha of .84 and .79 respectively for SE and EE.

Data Analytic Plan

Data diagnostic was performed with MS Excel 365 and SmartPLS version 4.0.9.2, which is a software for Partial Least Squares-Structural Equation Modeling (PLS-SEM), was used for the subsequent hypothesis testing. Aside from addressing modeling issues, such as non-normal data (Hair et al., 2017), PLS-SEM is also befitted for examining exploratory model (Henseler et al., 2009). The dearth of research in the issue of CDD in the local context suggesting the exploratory nature of the present study. Mardia's multivariate skewness and kurtosis were used to examine the multivariate normality, as per recommendation by Hair et al. (2017). Later, the psychometric properties, including the construct validity, discriminant validity, and composite reliabilities were examined with a measurement model. Lastly, the direct and indirect effects of hypothesis testing were assessed with a structural model. 5000 resamples in bootstrapping method were used to evaluate the significance of the path coefficients and outer loadings.

Results

Preliminary Analysis

Mahalanobis distance was utilized to identify the multivariate outliers in the dataset. Four cases were found to have probability of $D^2 < 0.001$ and were eliminated from further analysis. Subsequently, an online calculator was used to evaluate the multivariate normality (Cain et al., 2017), with Mardia's multivariate skewness and kurtosis created at <https://webpower.psychstat.org/models/kurtosis/results.php?url=c2fad521b6188303c485c3d41a165b34>. The report showed that skewness ($p = .037$) was statistically significant, while kurtosis ($p = .073$) was not

statistically significant at .05 level, suggesting a violation of multivariate normality. Thus, SmartPLS was selected for further hypothesis testing.

The Measurement Model

The measurement model was constructed to assess the psychometric properties, including the construct validity, discriminant validity, and composite reliabilities. The outputs of the measurement models, including the outer loadings, average variance extracted (AVE) for construct validity, and composite reliabilities of all the latent constructs are depicted in Table 1.

Table 1. The Measurement Model including Outer Loadings, AVEs, and Composite Reliabilities

	CDD	CDSE	Decisional Procrastination	Career Exploration	AVEs	Composite Reliability
Inconsistent_Info	0.846				0.861	0.674
Lack_Info	0.863					
Lack_Readiness	0.750					
CDSE_goalselect		0.845			0.890	0.620
CDSE_occuinfo		0.772				
CDSE_planning		0.784				
CDSE_probsolving		0.669				
CDSE_selfappraisal		0.852				
Pro1			0.712		0.864	0.560
Pro2			0.760			
Pro3			0.735			
Pro4			0.804			
Pro5			0.727			
SE				0.831	0.846	0.733
EE				0.880		

Note: Inconsistent_Info = Inconsistent information; Lack_Info = Lack of information; Lack_Readiness = Lack of readiness; CDSE_goalselect = Goal selection; CDSE_occuinfo = Occupational information; CDSE_planning = Planning; CDSE_probsolving = Problem solving; CDSE_selfappraisal = Self-appraisal; Pro1 to Pro5 = items in Decisional procrastination; SE = Self-exploration; EE = Environmental exploration

Table 2. Discriminant Validity with Heterotrait-Monotrait Ratio of Correlation (HTMT)

	CDD	Career Exploration	D Procrastination
Career Exploration	0.114		
D Procrastination	0.718	0.198	
CDSE	0.394	0.732	0.419

Note: CDD = Career decision-making difficulties; Career Exploration = Career exploration; D Procrastination =

Decisional procrastination; CDSE = Career decision-making self-efficacy

Overall, all the outer loadings ranged from .669 to .880 and are statistically significant ($p < .001$). In addition, all the average variance extracted (AVE) exceeded .50 threshold signifying acceptable standards. While the composite reliabilities of all the variables fell below the satisfactory level of .80, the literature substantiated the conceptual framework of the present study. Lastly, all the latent construct displayed HTMT values below the .90 threshold as per recommendation by Henseler et al. (2015), as depicted in Table 2. Following that, the structural model was generated.

The Structural Model

Figure 1 illustrates the structural model. The results showed that decisional procrastination ($\beta = -.294, p < .001$) and career exploration ($\beta = .502, p < .001$) are significant predictors of CDSE, therefore, H_1 and H_2 are supported. Next, H_3 is supported, with decisional procrastination ($\beta = .494, p < .001$) found to be a positive predictor of CDD. Interestingly, career exploration ($\beta = .185, p = .003$) was found to be a positive predictor of CDD, which is contradictory with most of the literature and the H_4 of the present study.

Subsequently, H_5 is substantiated, with CDSE ($\beta = -.261, p = .001$) found to negatively predict CDD. Finally, CDSE was found to be significant mediator for two different relationships: decisional procrastination and CDD ($\beta = .077, p = .006$), and career exploration and CDD ($\beta = -.131, p = .002$). H_6 and H_7 are supported. 35.5% of the variances of CDD and 36.8% of the variances of CDSE are accounted by the key variables in the current study.

Figure 1. The Structural Model

Note: DP = Decisional procrastination; CE = Career exploration; Self-Efficacy = Career decision-making self-efficacy; CD = Career decision-making difficulties

Discussion

Decisional procrastination negatively predicts CDSE, which is in line with multiple past studies (e.g., Marjohan, 2023; Svartdal et al., 2022). Self-efficacy is a future-oriented behaviour, as the individuals believe in their ability to execute the behaviour, they are more likely to initiate the behaviour. In addition, higher self-efficacy will also prompt the individuals to invest more effort in overcoming obstacles, increasing the likelihood of success (Kurtovic et al., 2019). Contrary, procrastination is an avoidant behaviour, reducing the likelihood of engaging in the relevant activities (Ferrari et al., 1995). The opposite polars between the self-efficacy and decisional procrastination can be explained by the appraisal of sufficiency in cognitive resources to successfully making the decision.

Career exploration positively predicts CDSE, which substantiates the previous research (e.g., Chen et al, 2021a; Chen et al., 2021b). The accumulation of the information on the self and the world-of-work would positively facilitate accurate assessment of self-appraisal and occupational information. The same information would enable the decision makers to engage in selecting appropriate goals, make planning and solve career related problems.

The present study found that decisional procrastination positively predicts CDD, which matches the previous findings (e.g., Bańka & Hauziński, 2015; Chuang et al., 2020; Jamali et al., 2015). In the sequential sampling models, arriving at a decision is a product of two critical elements, which are the accumulation of information over time for the alternatives, and the trigger to determine sufficiency of the evidence (Forstmann et al., 2016). However, if individuals spend unusual long period of time to come to a decision, the original problem is too difficult to be solved or the alternatives are equally attractive for the decision makers (Bhui, 2024). The inability to arrive at a conclusion for career decision indicates the decision is too daunting for the decision makers which may activate the decisional procrastination process. Procrastination is a dysfunctional behaviour has it will inevitably cause undesirable consequences (Hall et al., 2019). Despite the adverse outcomes, individuals will still deliberately delay decision-making, because resources on hand are perceived to be insufficient to make an immediate decision. In addition, the postponement of decision-making will significantly block the feeling of anxiety (Di Fabio, 2006).

Contrary to the hypothesis of the present study, the results showed that career exploration positively predicts CDD. Despite the contradictory results, several past studies also reported the same phenomenon (e.g., Chuang et al., 2020; Downing & Nauta, 2010; Esters, 2008). The use of Career Exploration Scale (Stumpf et al., 1983), which is a similar instrument used in the past study (i.e., Downing & Nauta, 2010), could have contributed to the same result. Alternatively, empirical evidence showed that decision making could be compromised when excessive information is presented, or large pool of alternatives are available to the decision makers (Vogrincic-Haselbacher et al., 2021). If the decision makers are unable to gauge the optimal level of information required the decide on a career choice, albeit having sufficient data to make an informed decision, the decision makers may continuously gather information via career exploration.

Similar with past studies (e.g., Park et al., 2018; Walker & Tracey, 2012), the present study found that CDSE negatively predicts CDD. Individuals with higher CDSE are expected to achieve successful career decisions, as individuals who have the capability to execute the necessary tasks in CDSE (i.e., accurate self-appraisal, obtain occupational information, goal selection, planning, and problem-solving) would reduce the challenges presented in the lack of information, lack of readiness, and inconsistent information in CDD. The finding from the present study suggests that CDSE is a necessary element in making successful career decisions.

The relationship between decisional procrastination, career exploration, and CDD, could be better understood by considering the mediating effect of CDSE. The present study posited that CDSE significantly mediates the relationship between decisional procrastination and CDD, and relationship between career exploration and CDD. Both hypotheses are supported by the results in the present study. Social Cognitive Theory (Bandura, 2001) hypothesized that individuals' beliefs in their capabilities influence their behaviour, motivation, and outcomes. Individuals with higher self-efficacy are more likely to engage in career exploration and lowered the likelihood of decisional procrastination. As a result, perceived difficulty of career decision-making is reduced which promotes confidence in the career decision-making processes.

Implications

This study was conducted with the purpose of exploring the career indecision issue, especially among the undergraduates in Malaysia. Several key constructs, including CDSE, decisional procrastination, and career exploration were examined with the support of the PIC model by Gati and Asher (2001) to further contribute to the literature. The failure to initiate the first stage of prescreening of the model due to decisional procrastination will severely undermine the career decision-making process. In addition, caution should be exercised in the in-depth exploration of the second stage due to the improper data processing could compound the career indecision, rather than to ameliorate.

The examination of CDD, CDSE, decisional procrastination, and career exploration also offers practical implications for the field of career guidance and counselling, and other related fields. Firstly, the counsellors and mental health practitioners in the relevant fields should focus on increasing the clients' CDSE, by offering workshops in goal selection, planning, and problem solving. Decisional procrastination could also be assessed when the clients entered the counselling presented with career indecision. Secondly, for universities or other tertiary institutions intending to attract applicants, modest amounts of information should be presented to the candidates to avoid information overload. In addition, career decision-making tools could be developed in assisting undergraduates to make the connections between the present program of study and future career. Lastly, future studies should further validate the role of career exploration as a positive predictor of CDD, by using a different instrument for measurement or to further increase the sample size. Educational policies could be developed by integrating career decision-making as formal course or syllabus to build self-efficacy from a young age and to better manage decisional procrastination.

Limitations and Recommendations

This study attempted to explore the phenomenon of career decision-making difficulties among final-year undergraduates. Firstly, the generalizability of the current study is limited due to the choice of the accessible population – the final-year undergraduates. The data collected from this specific niche population may not be able to generalise to other populations and pose a threat to the external validity. In addition, the overuse of tertiary education students as research respondents is often criticised by scholars (Prideaux & Creed, 2001). Future studies are encouraged to consider the inclusion of high school students to better capture the phenomenon of career decision-making difficulties of the nation, as not all high-school students will eventually enroll into tertiary education programs. Selecting undergraduates as research sample potentially skewed the data, to individuals who achieved academic excellence in high school. Secondly, the research methodologies employed in the current study inherited all of the disadvantages of the descriptive correlational study and cross-sectional study. Due to the nature of the research design employed, causality could not be established. Experimental research design could be considered to better encapsulate the causal effect between the variables. Alternatively, longitudinal studies could be considered to provide fresh perspective on the changes of the variables over time.

Conclusions

In conclusion, the career counsellors should be aware of the detrimental effects of decisional procrastination in making career decisions among undergraduates. The exact cause of decisional procrastination would differ among undergraduates and the root cause of the problem should be pinpointed. While furnishing career information to the undergraduates to facilitate career decision making process, career counsellors need to be prudent to not deliver excessive information. The career counsellors could consider the decision-making strategies, or the data processing methods used by the undergraduates, before committing to provide career information. In the present study, CDSE successfully mediates the relationship between decisional procrastination and CDD, and the relationship between career exploration and CDD. Above all, CDSE itself is also a positive predictor of CDD. Thus, the inclusion of CDSE in the interventions of career guidance and counselling would be an excellent choice in overcoming the issue of career indecision.

Abstract: This study examines the effectiveness of a game-based metaverse platform in enhancing learning outcomes in economics education. Students were virtually transported back to the Great Depression within the metaverse. System data and self-assessment surveys assessed aspects such as ease of use and perceived usefulness for learning, evaluating their impact on student performance and their intent to use the metaverse for future learning. These measures also captured students' reported interest and enjoyment, gauging their engagement levels. According to self-assessment surveys, students found the metaverse platform engaging, relevant, vivid, and social, highlighting the successful integration of pedagogy and technology. The study's results are supported by regression analysis, which demonstrated a strong positive relationship with an R^2 of 0.853, indicating that a significant proportion of variance in student engagement can be explained by the aesthetics of the metaverse platform and the interest it generated. Challenges such as technical issues and varying learning efficiencies were also noted. Overall, the study highlights the potential of game-based learning environments and virtual reality in economics education to foster student engagement and promote the adoption of innovative learning systems.

Keywords: Metaverse, Immersive Learning, Economics Education

Introduction

Experiential learning, as defined by Kolb (1984), immerses students in real-world environments to enhance their experience and encourage reflection. This approach is closely aligned with constructivism, which has been

shown to be effective in meeting the diverse needs of learners, particularly in introductory economics classes (Reimann, 2004). Field trips are a prime example of experiential learning in economics education, allowing students to engage in hands-on, "learn by doing" activities. Galizzi (2014) found that students who participated in field trips had higher levels of satisfaction and retained more knowledge. Moreover, these trips offer students a real-world context, thereby stimulating critical thinking as they analyze and apply theoretical principles to actual economic scenarios (Markowitz et al., 2018). This interactive application deepens their understanding and illustrates the practical applicability of their studies.

However, transitioning field trips to a virtual environment can pose challenges. Simply navigating through 2D or 3D representations might not be sufficiently engaging. A possible solution lies in virtual reality, where learners are immersed in an ultra-realistic environment. When augmented with optional game-like elements, these environments can facilitate tasks unachievable in real field trips. For instance, students might navigate through historical simulations, discovering clues that lead to quiz questions, hence transforming from observers to active participants in their learning journey. These interactions, though impractical in real-world field trips, can be smoothly integrated into a virtual reality platform. While such immersive environments have been noted to boost motivation, their implementation can be significantly costly (Omori et al., 2023; Lan, 2020). Furthermore, the sophistication of game-based learning pedagogy calls for technology capable of supporting problem-based and task-oriented learning designs.

The educational metaverse, a 3D virtual space where learners come together to engage with one another, supported by highly integrated scenes and virtual agents, has the potential to address both scale and pedagogical needs (Nah et al., 2022). The metaverse is said to seamlessly blend aspects of social learning, game-based learning, and virtual reality, ultimately creating a new learning utility (Shin, 2022). However, there is a notable lack of empirical evidence on how metaverse features can be adopted and how pedagogies can be designed within such an expansive environment. Consequently, this study aims to incorporate novel pedagogical components of game-based learning across two environments within a metaverse-enabled learning setting, with the goal of evaluating student learning intent when utilizing the virtual reality environment to study economics. In this sense, the Research Question is: To what extent does incorporating game-based techniques in metaverse-based virtual field trips impact student engagement and intent to use the system for learning economic history?

In economics education, constructivist teaching methods, like problem-based learning, have been suggested to provide a more adaptive approach to accommodate diverse student learning needs (Reimann, 2004). These experiences can be particularly beneficial when immersing students in historical economic events, such as the Great Depression, through virtual field trips. Engaging students in experiential learning environments like the metaverse allows them to interact with content and enhances their understanding of complex economic concepts while addressing individual learning approaches and preferences through Non-Player Characters (NPCs). While the potential benefits of metaverse technology are promising, there is limited empirical evidence evaluating its specific uses for educational purposes, such as integrating virtual field trips with game-like features. With the field being relatively new and rapidly evolving, further research is needed to explore and validate the impact of

such metaverse-based learning experiences on student engagement, knowledge retention, and overall learning success. In this context, our research serves as a valuable contribution to this emerging field, offering insights and data that can help shape future educational strategies within the metaverse.

In a metaverse, game-based techniques can be seamlessly integrated with other pedagogical strategies, such as experiential learning, social interactions, and personalized learning through NPCs, to create a more immersive and effective learning experience. This combination of pedagogical and technological factors can help meet the diverse learning needs of students, catering to different learning approaches and preferences (Kye et al., 2023; Nah et al., 2022). Therefore, we hypothesize that incorporating game-based techniques in metaverse-based virtual field trips will result in higher student engagement and intent to use the system for learning economic history.

Theoretical background

The promise of transforming traditional education models drives us to explore the metaverse, a learning environment utilizing virtual reality technologies. The compelling need to create immersive, engaging, and personalized learning experiences pushes us towards this digitally simulated reality (Pianzola, et al., 2021). Avatars, as digital representations of the learners, boost their sense of identity and connection within this innovative learning space (Bavelier & Green, 2019). This technology-enhanced environment can transcend traditional classroom boundaries, offering novel experiences, facilitating collaboration among geographically dispersed learners, and adapting to diverse learning approaches and paces (Gardner, 1983). These features can be integrated into a single platform, a metaverse, which combines various aspects of virtual reality like presence, reflection, empathy, and playability, thereby offering even greater utility (Shin, 2022).

While technological advancements in the metaverse provide rich immersive opportunities, the effectiveness of learning experiences transcends mere technical rendering. Immersion in this environment relies on users' assessments and preferences, not solely on technological quality (Shin, 2019). This understanding of the essential integration of technological factors with pedagogical considerations, including collaboration and personalization, to enhance the intent to use the metaverse for learning (Fussell & Truong, 2022). Such integration fosters a heightened sense of presence and promotes experiential learning through reflection and narrative-driven experiences (Kang et al., 2021). Ultimately, this technology-enhanced environment, when aligned with pedagogical principles, extends beyond traditional classroom constraints, providing diverse learning experiences adapted to individual learning approaches (Gardner, 1983).

Metaverse and Gamification: Scavenger Hunt Case Study

Recognizing the benefits of engagement and active learning, we can employ gamification in the metaverse, specifically through a scavenger hunt. The choice of a scavenger hunt is driven by its simplicity and straightforwardness, making it an excellent tool for acclimating learners to a new, potentially unfamiliar

environment like the metaverse. Furthermore, from a technical implementation standpoint, a scavenger hunt poses fewer challenges compared to more complex game designs.

This gamified activity motivates learners to immerse themselves in active problem-solving, stimulating collaboration and information-seeking behaviors. The virtual context of the scavenger hunt allows for a complexity and imaginative scope that is typically difficult to achieve in conventional classrooms due to limited time and space. These innovative elements of the metaverse enhance learner motivation and enjoyment, leading to improved learning outcomes (Mochizuki et al., 2022).

The scavenger hunt method has been explored in various settings such as academic libraries for orientation and place-based learning, demonstrating its adaptability and effectiveness in engaging participants (Stark et al., 2021). However, Stark et al. (2021) highlighted significant gaps in the research, including a lack of rigorous or experimental design and inconsistent data, making it difficult to conclusively evaluate the effectiveness of scavenger hunts. The incorporation of multifaceted interactions with non-player characters, nuanced narratives, and clue-based exploration can potentially amplify the effectiveness of virtual scavenger hunts as an educational tool, providing a new avenue to expand our understanding.

Unique Aspects: NPCs, Personalization

Within the scavenger hunt activity in the metaverse, NPCs serve more than mere decorative elements. They can act as interactive guides, providing clues that stimulate exploration and discovery. For example, in a lesson on the Great Depression, NPCs might be assigned roles as historical figures or ordinary citizens, offering insights into the economic hardships of the era (Hwang & Chien, 2022). This approach adds depth and drama to the story, enriching the learning narrative. By appearing in the right place at the right time with contextually relevant content, these NPCs contribute to a sense of realism, fostering a more engaging and authentic connection to both the historical period and the educational content (Ferguson et al., 2020; Shin & Chung, 2017).

Furthermore, the metaverse's flexible environment offers significant opportunities for customization and personalized experiences, empowering learners and allowing them to choose their own paths within the scavenger hunt (Nah et al., 2022). By providing learners with the freedom to navigate and explore the metaverse according to their preferences, we enhance their sense of ownership and engagement. This learner-driven approach fosters self-directed learning and encourages learners to take responsibility for their own educational journey, resulting in a more dynamic and engaging learning environment.

Within the proposed method, the utilization of NPCs and personalization in the scavenger hunt activity not only enhances interactivity but also transforms immersion and presence into dynamic processes. Learners can actively create and modify their own immersive experiences by interacting with clues to help them decide on their responses. Through the scavenger hunt, the metaverse's capabilities are leveraged to foster a more engaged

and adaptive learning environment, where immersion becomes a fluid and interactive concept (Shin, 2022).

Method

We employed a mixed-methods approach, incorporating both correlational and experimental research designs to gain a more comprehensive understanding of the phenomena under investigation. By examining the relationships between variables (correlational) and manipulating independent variables to determine their effect on dependent variables (experimental), we aimed to evaluate the intent to use metaverse-based learning environments, focusing on pedagogical and technological factors (Fussell & Truong, 2022).

Fifty undergraduate students aged 17 to 19, from a university in Hong Kong were included in this study. These participants were part of two specific classes across two consecutive semesters. Participants comprised of students from the same major and age group (17 to 19) within the university's economics classes, reflecting the random nature of class enrollment. The selected topic was the Great Depression. This topic was traditionally taught through lectures, but for the purpose of this study, a metaverse-based learning environment was introduced as an alternative approach to teaching and learning.

The course titled "Finance and Politics: Public Interest and Private Manipulation" is an undergraduate offering aimed at acquainting students with the dynamics of financial institutions, corporate ownership structures, and corporate governance. This is accomplished through a blend of case studies, anecdotal evidence, and academic research. The course structure particularly focuses on imparting a pragmatic understanding of financial policies and government regulations. Students are subsequently trained to discern implications for future financial advancements and practices, with special emphasis on both Hong Kong and global scenarios.

The teaching approach integrates traditional lectures with tutorials, encompassing a total of 2 hours of lectures and 1 hour of tutorial per week, spanning 13 weeks. In lectures, learners are presented with core knowledge encompassing financial theories and government policies, which is further enriched with real-life examples and case-based studies. Tutorials adopt a more interactive approach; students are clustered into groups for presentations and discussions that delve into the applicability and constraints of the discussed theories and policies. Given a class size of 35, this method ensures engagement and participatory learning. Specifically related to our study, an e-learning activity within a metaverse environment constitutes 5% of the course assessment. The primary learning outcome of this activity is to enable students to elucidate and interpret the characteristics of significant financial upheavals, such as the Great Depression and the recent financial crises, especially focusing on the interplay between the banking sector and policymaking.

In this study, students were transported to Wall Street of the 1930s, immersing them in a realistic setting that mirrors the era's financial dynamics. The content and themes focused on i) Economic Policies and International Trade ii) Fiscal and Monetary Policies, and iii) Business Environment and Uncertainty. To ensure a tangible

connection between the virtual exploration and their academic curriculum, MCQs were strategically placed throughout the experience. These MCQs had dual objectives: 1. Reinforce Foundational Knowledge: As students traversed the virtual streets of Wall Street and delved into the content, these MCQs acted as checkpoints, offering real-time feedback on their basic comprehension of the introduced material. 2. Bridge Virtual and Classroom Learning: Beyond providing an engaging virtual alternative to traditional lecture halls, the MCQs played a pivotal role in tying the online journey to offline discussions. Students were encouraged to carry the insights, queries, or uncertainties they encountered online into classroom dialogues, ensuring a comprehensive learning experience.

Examples to topics include quiz tasks for the metaverse that focus on "Economic Policies and International Trade," learners encounter questions about the Smoot-Hawley trade bill of 1930 and the Agricultural Adjustment Act of 1933. For instance, they might be asked to identify the effects of the Smoot-Hawley bill, which notably led to increased tariffs and a decrease in trade volumes, highlighting how protective trade policies can adversely affect international commerce. Another question could involve the Agricultural Adjustment Act, asking learners to recognize that the legislation aimed to reduce agricultural supply to maintain high prices, affecting national trade policies. These questions serve to deepen understanding of how governmental economic policies can influence international trade dynamics and domestic market conditions.

The study made use of the "Classlet" platform by Soqql, as referenced at <https://soqql.com>. Classlet stands out due to its combination of metaverse and learning management features. It provides authoring tools for content creation within the metaverse. Moreover, its integrated learning management capabilities encompass multiple choice questions, clue integration, and learning analytics, all available from a web dashboard. Screenshots of the specific scene utilized in our study are presented in Figure 1. We selected Classlet because of its ease in managing and uploading content, which was pivotal for our tailored gamification needs.

In this study, students explored a recreated 1930s 3D scene (in Classlet), based on the authentic learning principles described by Farrell (2020). This immersive setting aimed to place students in a specific time and location while introducing them to the works of researchers like Romer, Irwin, Friedman, and Schwartz. The purpose of using the metaverse was to enhance traditional teaching methods. By combining a historical setting

with academic content and hands-on tasks, the goal was to create a deeper and more authentic learning experience, rooting academic teachings in real-world situations.

After exploring the metaverse, participants were assigned the task of identifying discrepancies between the lecture content from the "Finance and Politics: Public Interest and Private Manipulation" course and their experiences in the metaverse. These discrepancies were reported via a Google form. This task aimed to prompt students to reflect on content delivery and contrast the teaching methodologies. Additionally, to secure the 5% metaverse assignment score, as described earlier, they were required to complete all MCQs.

To analyze the outcomes of the study, data were sourced from quantitative insights through Likert scale questions and qualitative insights via open-ended questions to assess student perceptions. Statistical analyses including Cronbach's alpha, T-tests, Mann-Whitney U tests, correlation, and regression were used to examine data reliability, and the impact of variables on MCQ scores.

The independent variables for the self-assessment survey included pedagogical and technological factors, adapted from (Fussell & Truong, 2022), such as ease of use ("how easy was it for you to use the platform") and the extent to which the metaverse environment was helpful or useful for learning ("how useful is the platform for my learning"). Other questions focused on aesthetics, technical functioning, ease of use, enjoyment, accessibility, and usefulness of Metaverse resources. The dependent variable was the students' intent to use the metaverse for learning purposes. Before conducting the correlational analysis, assumption checks were performed to ensure the data met the necessary criteria for the analysis. These checks included assessing the normality of the data, linearity of relationships between variables, and the absence of multicollinearity.

Results

Survey Reliability. Reliability analysis confirmed the internal consistency of the survey items. A Cronbach's alpha of 0.964 demonstrated a strong consistency across the survey's items. **Correlation Analysis.** The Spearman's correlation coefficients provided insights into the relationships between different variables, as detailed below. Please refer to Table 4 for the abbreviations and detailed descriptions of each variable:

Technical Factors with "Intent to Use": Among the technical considerations, TECH4 exhibited the highest correlation (Spearman's $\rho = 0.809$, $p < .001$) with "Intent to Use," suggesting the importance of this particular technical aspect. This was followed by TECH2 (Spearman's $\rho = 0.736$, $p < .001$) and TECH1 (Spearman's $\rho = 0.726$, $p < .001$).

Pedagogical Factors with "Intent to Use": Within the pedagogical domain, PEDAGOGY4 demonstrated the most substantial correlation with "Intent to Use" (Spearman's $\rho = 0.872$, $p < .001$). This might highlight its significance in influencing user intentions, especially in the context of a metaverse system.

Inter-correlations Among Technical and Pedagogical Variables: The data also indicated strong inter-correlations among the technical and pedagogical variables. For instance, TECH2 and TECH3 displayed a correlation of Spearman's $\rho = 0.794$, $p < .001$. Similarly, PEDAGOGY3 and PEDAGOGY2 were significantly associated (Spearman's $\rho = 0.840$, $p < .001$).

Regression Analysis: Intent to Use. The regression model for 'Intent to Use' provided significant insights into the variables affecting this construct (please refer to APPENDIX C for the complete model). The model explained 85.3% of the variance in 'Intent to Use' (Adjusted $R^2 = 0.843$, $F(3, 48) = 92.584$, $p < .001$). Our analysis revealed the following key findings: Significant Predictors: TECH1: The variable representing the aesthetic of the resource produced in the Metaverse (TECH1) emerged as a significant predictor, with a coefficient $\beta = 0.220$ ($p = 0.005$), emphasizing its role in influencing 'Intent to Use'. PEDAGOGY4: The belief that using a Metaverse system makes learning more interesting (PEDAGOGY4) showcased its importance with a substantial coefficient, $\beta = 0.774$ ($p < 0.001$), indicating its significant influence on user intention.

Qualitative Insights. The surveys also allowed students to key in, in an open text field, 3 suggestions for what they like about the learning experience as well as 3 potential opportunities. Illustrative responses were selected below. Students found it fun, relevant, vivid, social, more comprehensive. “Fun, let students join in the period of the Great Depression in the game, The knowledge is more memorable by playing the game”, “1. The map setting is highly related to the Great Depression era 2. The application is interactive and interesting, 3. There are photos provided in the explanation pages”, “Quite vivid and intriguing to learn about the GD through the method”, “- more virtual experiences, Heightened social connections and lifelike interactions, more effective and interesting”, “- interesting for learning, like playing a simulation game, more comprehensive information for the course contents, more diverse in absorbing the information of the Great Depression”

However, some students highlighted some challenges, related to inefficiency of the method, technical bugs like stuck characters, insufficient quest tracking, boring interactions, and scenario (although better than face to face classroom), and insufficient instructions: “I think it is interesting but not that efficient personally. In fact I think a quiz in class would be more useful and there will also be less technical problems.”, “I'd rather get to the point when learning subjects, a video would be fine as well, however I see zero value in using a metaverse”, “When people are stuck in some places, people can't move and need to quit and start again”, “Sometimes I don't even know have I answered the questions correctly because it doesn't tell me am I wrong or not.”, “Lack of interactions: The scenario is fixed and boring.”, “not interesting/beneficial to study since phone's monitor is smaller, also not interesting by reaching the NPC and receive information (although not boring than sit in classroom)”, “The instructions are not very clear in this Metaverse.”

Discussion

Based on the regression analysis, which shows a high predictive accuracy of 85.3%, the integration of pedagogy

and technology—especially through features like NPCs and quests—significantly enhances student learning. The aesthetics of the metaverse, which include detailed and historically accurate visual environments, coupled with engaging narratives, substantially contribute to this effectiveness. The design and visual appeal of the metaverse help sustain student interest and immersion, making the educational experience both informative and captivating. For example, one student noted, “The map setting is highly related to the Great Depression era, making it interactive and interesting.” This feedback describes the effectiveness of the metaverse in engaging students through a vivid and contextually rich educational environment, highlighting how these elements enhance the learning experience.

In terms of experiential learning pedagogy, the use of the metaverse was observed to be ideal for transporting students back in time as a form of virtual field trips. The use of multimodal channels as well as NPCs to simulate dialogue is an ideal way to recreate experiences that are difficult to do in the classroom. When placed into the virtual field trip, students can experience living in 1930 during the Great Depression and link the experience cognitive back to their physical self through embodiment and reflection. These processes are particularly important in the process of experiential learning (Kolb, 1984). In the context of economic history, recreating the Great Depression even physically is impossible, but can be done in the metaverse platform. The use of intelligent NPCs was described by Hwang & Chien (2023) and this study further affirms its ability to recreate unique experiences, especially when combined with a type of scavenger hunt activity. Following the framework established by Shin & Chung (2017), our implementation has been able to create different narratives of the Great Depression, consequently encouraging a more immersive and presence-filled learning experience. Despite this, it should be noted that the scenes did not make use of real historical characters or profiles that can make the environment even more real. It could be interesting to bring in this aspect to help guide students to better appreciate why certain actions were taken.

To demonstrate the personalized game-based learning experience, we present a flow diagram of the user on Figure 2. The flexibility of the game, designed with and setup using metaverse tools, enables it to cater to various learner preferences. As depicted in Figure 2, a decision box for “Enjoy game method” signifies the student's preference between a game-based learning scavenger hunt method and a more traditional learning approach. It allows those who are not engaged by the scavenger hunt to fall back to repeated MCQ attempts, providing an alternative route for learning. The inclusion of this decision-making aspect emphasizes the need for adaptable learning strategies within the metaverse, acknowledging that students' preferences and learning approaches can widely differ. It supports our concept that a one-size-fits-all approach may not be effective, and that personalization and flexibility should be integral to the design of learning environments.

Some students highlighted challenges related to inefficiency of the method, technical bugs, insufficient quest tracking, boring interactions and scenarios, and insufficient instructions. The primary challenge of this learning method is related to inefficiency. Some students reported that the time it takes to learn the system and run around to find NPCs can make the process inefficient. However, only a small number of students reported this issue. The challenge of attracting non-gamers to serious games is a known problem (Krotoski, 2010). Simply

using the word "game" in the classroom may be off-putting to some learners who identify as "non-gamers." Furthermore, there is some debate over whether non-gamers may be at a disadvantage when it comes to serious games. Bavelier and Green (2019) highlight how gamers may have better visuo-motor coordination and better handling of perceptual load compared to non-gamers, which was observed in our study as some students gave feedback that they were distracted or mixed up between learning the platform and learning, leading to inefficiencies. However, Warden et al. (2016) claim that non-gamers are not at a disadvantage and can equally participate in a virtual world classroom. Further research and studies on this topic, specifically on how the technical environment can cater to personalized learning needs, are needed.

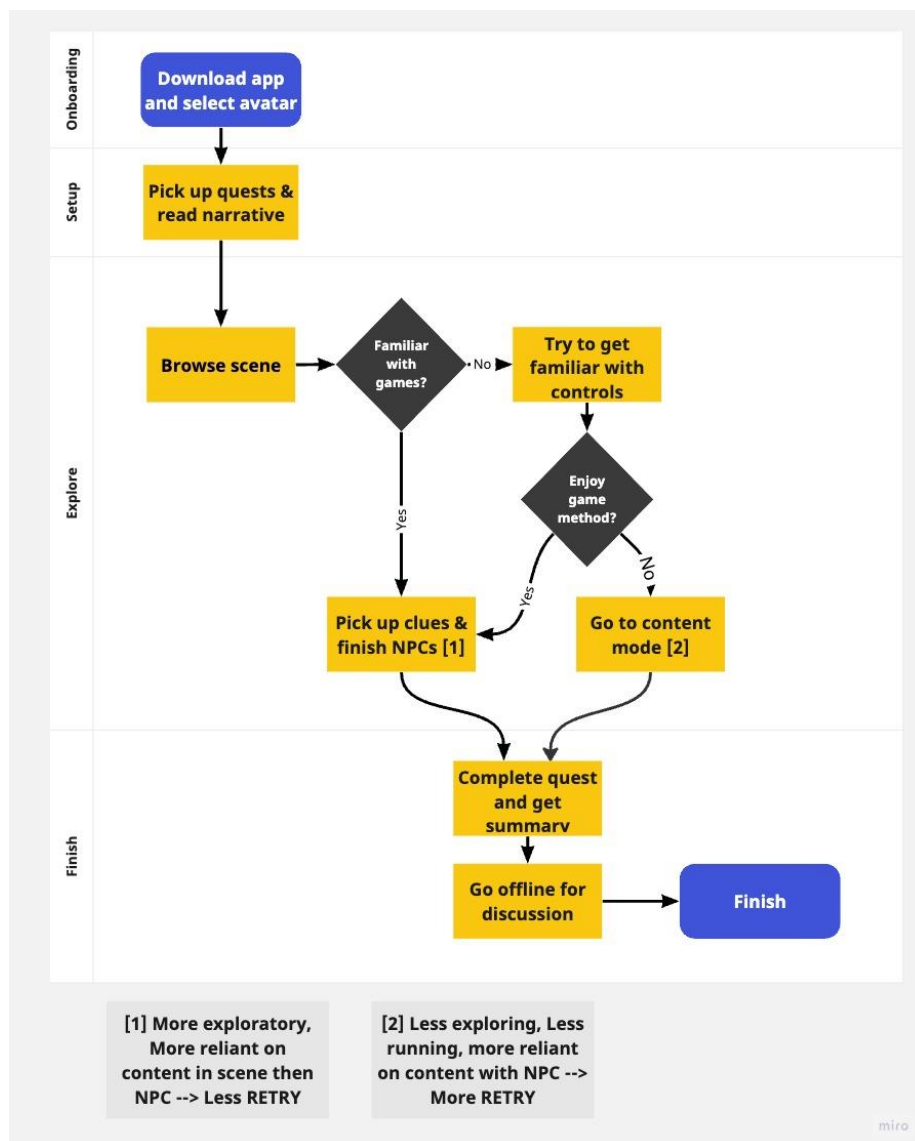

Figure 2. Personalized learning experience in game-based metaverse

Regardless, it is beneficial to find ways to improve the user experience and reduce the cognitive load of learning the platform. One idea that may work is reducing the dependency on using a joystick, such as implementing a point-to-move system. Other issues like technical bugs and lack of quest tracking can be addressed by

introducing enhancements to the game system. Additionally, the issue of boring quests could be solved by maximizing branching quest design that can be afforded by the metaverse platform. While branching logic is attractive and can allow for personalized learning, it requires high levels of creativity and pre-planning. To this end, the use of artificial intelligence (AI) systems such as ChatGPT may be useful. AI systems like ChatGPT have consumed a large number of books and have the ability to create engaging and potentially immersive narratives, which could enhance the learning experience in a game-based environment.

One limitation of this study is the relatively small sample size, which may limit the generalizability of the results. Conducting the study in a single educational setting may also bias the outcomes, limiting its applicability to other settings with different demographics or teaching styles. While the study included system data such as the number of completions and second tries, its reliance on self-reported data for the correlational analysis may introduce bias, potentially skewing the results in a direction that reflects perceived rather than actual behavior or attitudes. Furthermore, Classlet system was unable to capture duration taken by a student to make decisions thus it was not possible to evaluate if retries were due to lack of seriousness, possibly adding noise to the results.

Conclusion

In conclusion, this study provides insights into the use of game-based learning and metaverse platforms in promoting an engaging and participatory learning experience for students. The findings suggest that the use of game mechanics and pedagogical strategies such as experiential learning and constructivism can enhance learning outcomes and promote student engagement. The study used both system data and self-assessment surveys to evaluate the learning outcomes and student engagement.

Our study's findings offer a response to the gaps identified by Stark et al. (2021). In our context, quizzes were seamlessly integrated as simple tasks within our metaverse simulation of the Great Depression. This illustrates the potential of virtual scavenger hunts as an engaging and effective educational tool and how multifaceted interactions with non-player characters, nuanced narratives, and clue-based exploration can be utilized to create immersive learning experiences.

The study also highlighted several challenges related to the system's technical limitations and user experience, including learning inefficiency, technical bugs, and insufficient instructions. To address these challenges, it is crucial to improve the user experience and reduce the cognitive load of learning the platform. This could be achieved by reducing the dependency on using a joystick and introducing enhancements to the game system.

Overall, the study shows promising results for the use of game-based learning and metaverse platforms in promoting an engaging and participatory learning experience for students, but further research is needed to fully realize the potential of this approach.

The Mediating Role of Teacher Personality on Classroom Teaching Effectiveness in Teaching Today

Bassem E. Maamari

Prince Mohammad Bin Fahd University, KSA,  <https://orcid.org/0000-0003-1294-6840>

Abstract: With a more demanding post Covid-19 student, a surge in teaching requirement changes is taking place. Teachers are confronted with students who have access to knowledge and have undergone severe psychological lock-down consequences. This self-reporting quantitative study is conducted with 476 consenting anonymous students and their 32 respective teachers. The findings demonstrate that emotionally intelligent teachers play a noticeable role in enhancing teaching effectiveness, and that personality traits of teachers mediate this positive relationship and improve it to a certain extent. These findings suggest that university educators and administrators alike, need to work on developing the emotional intelligence skills of their current and future teachers, should seek to hire and retain teachers with high emotional intelligence. Moreover, they need to coach and mentor current teachers who need help building this skill through workshops and continuous development, with continuous assessment. The avail of such positive reinforcement is expected to improve classroom teaching effectiveness through self-managed better emotional control, while simultaneously providing a role-model example for students' behaviour. These developmental cognitive changes at the teacher's level are expected to create stronger student-student relationships and interactions, foster a positive association between teachers and student, and lead to better engagement and exchange in the classroom and better educational achievements.

Keywords: teaching effectiveness, personality traits, emotional intelligence, teachers, undergraduate, mediation.

Introduction

Today's students are ever more changing than the norm. Post Covid-19 students, traumatized by the lock-down inflicted upon communities and individuals, have for many, under-developed social skills. These students are pushing the bar for teaching requirement changes in the classroom. Teachers are confronted daily with issues in the classroom that require a new skill, where the classical teacher-student (father-son) relationship is not necessarily evident. Emotional intelligence is reported to play a mending role in this capacity, for working with these students who have open access to knowledge through internet connectivity but have undergone severe psychological lock-down consequences where some did not have the opportunity to develop their social skills.

Research on emotional intelligence (EI) has gained significant attention across various fields, including psychology, business, and education (Maamari & Salloum, 2023). The importance of EI lies in its contribution to personal and professional success. In the realm of education, the mastery of subject knowledge alone may not suffice for effective teaching. This study aims to investigate the impact of high emotional intelligence on teaching effectiveness in the university setting and explore whether and how personality traits mediate this relationship. This study aims at discovering the potential of using emotional intelligence as a skill, in developing better teaching effective teachers for university settings. The research question at hand is whether teacher personality traits mediates the relationship between teachers' EI and their teaching effectiveness. The following sections review the pertinent scholarly literature, lay the method and results and puts forth academic and administrative recommendations, implications and conclusions.

Literature review

Emotional intelligence encompasses the ability to recognize, understand, and manage one's own emotions and those of others (Goleman, 1998). It involves perceiving and discriminating among emotions, using emotions to guide thinking and actions, and effectively managing emotions. Previous research has proposed three main models to measure emotional intelligence: ability, trait, and mixed models. These models assess various aspects of emotional intelligence, including perceiving, using, understanding, and managing emotions (Salovey & Mayer, 1990).

The three different perspectives models on EI resulted in developing three tools for assessing it. The first, presented by as the 'Ability Model' by Mayer, Salovey and Caruso (2000) (also known as the MSCEIT test) is composed of four parts, each measuring one aspect of EI, namely (1) perceiving emotions, (2) using emotions, (3) understanding emotions, and (4) managing emotions (Mayer, Salovey, & Caruso, 2000). The second - the Emotional Quotient Inventory, known as the 'Trait Model' focuses on one's self-perception of their emotional abilities, characterizing EI as a cognitive ability and skill that a person uses under pressure and demanding environments (Bar-On, 1997). The third is developed as a 'Mixed Model' by Goleman (1995) encompasses five personal and social competencies known as 'The Emotional Competency Inventory (ECI)'.

Teaching effectiveness as a practice is related to in-class pedagogy (Haroutunian-Gordon, 1988) and is closely linked to pedagogical practices and the creation of an engaging learning environment (Maamari & Salloum, 2023). Emotionally intelligent teachers are more capable of regulating their emotions, maintaining positive teacher-student relationships, managing classroom dynamics effectively (Maamari & Majdalani, 2019), and serving as positive role models. In line with this above, the constructivist learning view emphasizes active class participation as conducive of better learning experience and process (Dewey, 1997; Piaget, 1972), so that the greater the student engagement, the better the cognitive development and knowledge retention (Pascarella & Terenzini, 1991).

Students' active participation and engagement in the learning process are essential for knowledge acquisition and cognitive development. Emotionally intelligent teachers contribute to the creation of a positive classroom climate that optimizes learning outcomes, academic engagement, and achievement. Research reports a positive correlation between a teacher's EI and classroom teaching effectiveness, whereby high EI teachers have higher teaching effectiveness (Penrose, Perry, & Ball, 2007; Hassan, Jani, Som, Abd Hamid, & Azizan, 2015). These teachers are able to control their emotions, both negative and positive to create a peaceful environment conducive of relaxed learning (Sutton & Harper, 2009), build relationships with their students and better manage classroom dynamics (Jennings & Greenberg, 2009). These teachers rely on their four emotional skills, namely self-awareness, social awareness, self-management, and relationship management, adopt a positive classroom environment and stimulate learning (Maamari & Majdalani, 2019). This leads to better academic engagement and achievement (Bracket, Palomera, Mojsa-Kaja, Reyes, & Salovey, 2010; Waiswa, Baguma, & Oonyu, 2020).

Furthermore, the teacher's personality plays a crucial role in teaching (Polk, 2006). Scholarly research reports that personality is associated with teachers' both job satisfaction (Judge, Heller, and Mount, 2002) and performance (Judge, Rodell, Klinger, Simon, & Crawford, 2013). Scholars have designed and validated a number of personality frameworks including the 16 Personality Factors (Cattell et al., 1970), the Myers-Briggs Type Indicator (Myers et al., 1998) and the HEXACO (Ashton & Lee, 2007), to name a few, yet the Big Five is the most widely utilized (John et al., 2008).

As a measure of job performance in teaching, effectiveness captures the teacher's impact in class (Kim, Jörg, & Klassen, 2019). The domains of the Big Five personality traits includes openness, conscientiousness, extraversion, agreeableness, and neuroticism, align with teaching evaluation and effectiveness (Kim et al., 2019). Openness and flexibility in teaching, conscientiousness, agreeableness, and emotional stability are positively associated with teaching effectiveness, with teacher openness playing a specifically important role in overall teacher evaluation (Kim & McCann, 2018). First, teacher flexibility is a valued quality, empirical findings report a positive association between a teacher's conscientiousness and teaching effectiveness (Kim & McCann, 2018). Second, extraversion is considered crucial in interactive jobs such as teaching (Barrick & Mount, 1991). Third, teachers high on agreeableness create warm and positive environments where students' learning fosters (Pianta & Hamre, 2009). Fourth, a teacher's emotional stability is inversely related to emotional exhaustion (neuroticism), which helps create a stable learning environment. Finally, one's own high self-efficacy perception is conducive of high performance (Sehgal, Nambudiri, & Mishra, 2017; Soto-Pérez, Sánchez-García, & Núñez-Ríos, 2020). Moreover, high EI teachers present high self-efficacy in teaching (Valente, Lourenço, Alves, & Dominguez-Lara, 2020) and both teacher efficacy and EI have direct positive effect on teacher effectiveness (Ashraf, Hosseinnia, & Domskey, 2017). Thus, the literature shows that personality traits and EI contribute to both teaching context and behavior toward achieving the intended outcome of effective teaching/learning.

The gap that this study is aiming to answer to the research question at hand and the hypotheses summarized in figure 1.

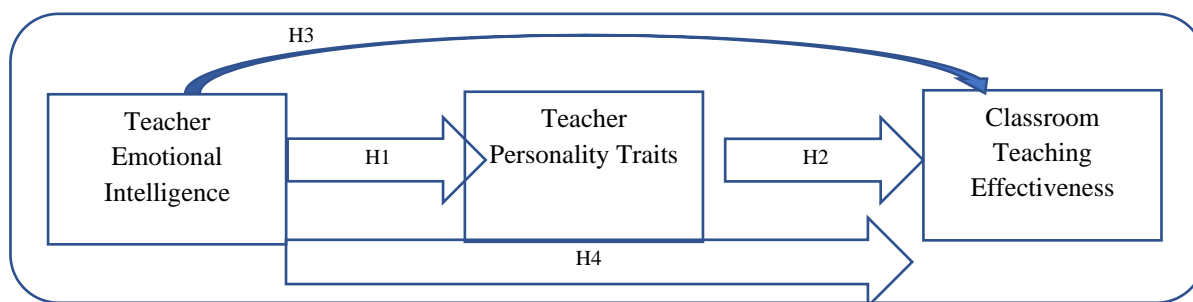

Figure 1. Model to test

Methodology

This study employed a quantitative approach, utilizing self-reporting questionnaires collected from 476 students and their 32 respective faculty members. Regression analysis is applied to analyze the data and investigate the mediating role in the relationships between emotional intelligence and teaching effectiveness. The study uses three questionnaires, the MSCEIT (Mayer et al., 2000) to measure EI through 25 scale items, the Big Five Inventory (44 items) to measure personality traits (John & Srivastava, 1999), and classroom teaching effectiveness scale (Hassan et al., 2015) of 21 scale items. The tool was pilot-tested on a small group of respondents (9 students and 5 teachers) and found acceptable.

The hypotheses at hand are:

H1: Teacher EI (TEI) affects the teacher's personality traits (TPT)

H2: TPT affects the teacher's teaching effectiveness (TTE)

H3: TEI affects TTE

H4: TPT mediate the relationship between TEI and TTE.

Results

The participating respondents are selected from a number of universities, both public and private, in KSA, in Spring 2023. The participating faculty respondents received the questionnaire after accepting to volunteer for the study. Their respective students were asked to volunteer to the study, and those consenting were given the questionnaire (either soft copy by email or hard-copy in class). The targeted population included 1200 students and 100 teachers. The collected responses were 502 from students and 32 from teachers. 26 student responses were cancelled due to incompleteness. The authors took precaution to avoid the common method bias through separating the independent variable data collection (collected from teachers) from the dependent variable (collected from students). The teachers filled their self-reported questionnaires outside the classroom, pertaining to their EI and personality traits, while the students filled their questionnaires in class, pertaining to the respective teacher effectiveness in the classroom. The collected data is analysed using SPSS 26, for reliability, KMO, descriptive analysis, correlation and regression.

First, the reliability tests run show that the tools used are reliable, with Cronbach's Alpha being 0.917 for TEI; 0.601 for PTP and 0.874 for TTE. Second, the KMO results range between 0.701 and 0.802, with $p=0.000$ for all. The tool and data are thus deemed acceptable. Third, the descriptive results reveal that 64.5% of responding students are males and 35.5% females. Moreover, 23.7% are sophomore, 47.9% juniors and 28.4% seniors at the undergraduate level. In addition, 21.6% of the responding students are studying arts, while 78.4% are majoring in business studies. Finally, 3.2% of the students have no work experience, while 57.4% have less than two years of work experience and 39.4% have more than two years of work experience. Fourth, the correlation analysis test between shows that TTE is positively moderately correlated with TEI with $R^2=0.571^{**}$, and $\text{Sig}=.000$ ($**p<.01$), and TPT is positively weakly correlated with TEI, $R^2=0.096^*$, and $\text{Sig}=.0380$ ($p<.05$). Finally, to test the hypotheses at hand, a number of linear regressions (4) is run. The results are summarized in table 1 and figure 2 below. The results show that when introducing the TPT variable into the analysis, the effect of TEI on TTE improves by 10.6%.

Table 1. Summary Results of Linear Regression Tests

#	Variable		R	R ²	Adj.R ²	F Change	Sig.	Formula of straight line
	Indep.	Dep.						
1	TEI	TPT	0.330	0.109	0.107	4.314	0.038	$F(\text{TPT})=149.002+0.098\text{TEI}$
2	TEI	TTE	0.571	0.326	0.325	229.225	0.000	$F(\text{TTE})=67.730+0.261\text{TEI}$
3	TPT	TTE	0.124	0.101	0.101	0.277	0.599	$F(\text{TTE})=90.772-0.11\text{TPT}$
4	Mediation	TTE	0.576	0.432	0.429	4.392	0.000	$F(\text{TTE})=73.013+0.265\text{TEI}-0.035\text{TPT}$

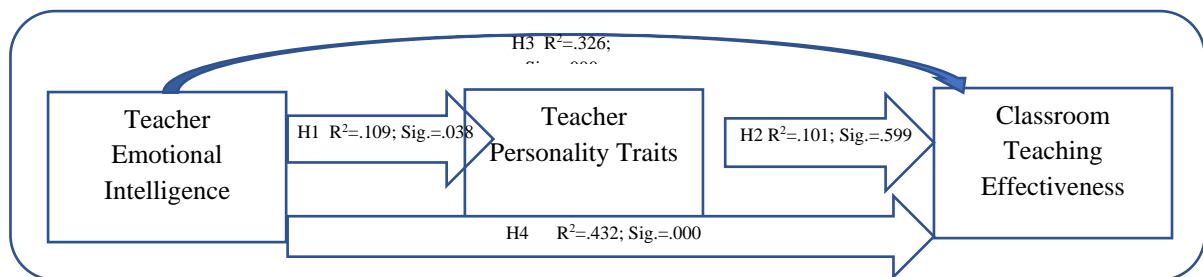

Figure 2. Results of Regression tests

To summarize, the results show that all four hypotheses are supported:

H1: Teacher EI (TEI) affects the teacher's personality traits (TPT); is supported

H2: TPT affects the teacher's teaching effectiveness (TTE); is supported

H3: TEI affects TTE; is supported

H4: TPT mediate the relationship between TEI and TTE; is supported.

Discussion

With the aim of investigating the mediating effect of personality traits on the relationship between teachers'

emotional intelligence and their classroom teaching effectiveness, a quantitative study is done on 476 students and their respective teachers at undergraduate university levels. The collected data is used to run linear regression analysis to answer the research question at hand. The results of the study confirm the former mediation relationship and the findings support the hypothesis that emotional intelligence significantly influences teaching effectiveness and this relationship is improved with the mediating role of the teachers' personality traits. These findings contribute to improving our understanding of the factors that impact teaching effectiveness in higher education.

Educational institutions can benefit from these findings by recognizing the need for and importance of emotional intelligence in teacher training and professional development programs. Moreover, incorporating strategies that cultivate agreeableness and conscientiousness among teachers may further enhance their effectiveness in the classroom. By promoting EI and fostering positive personality traits, educational institutions can create a conducive learning environment that positively impacts student learning experience through engagement, behaviour and academic performance.

Overall, this study contributes to the existing literature on the relationship between EI, personality traits, and teacher effectiveness. It emphasizes the significance of these factors in the context of higher education and provides valuable insights for educators, administrators and policymakers, aiming to enhance the quality of teaching and the learning experience.

Recommendations

Managerial implications

To sustain high job performance and competitive advantage among competing educational institutions, universities ought to focus on developing the EI and skills and positive personality traits of their employees, administrators, and teaching staff. Emphasizing the importance of EI, agreeableness and conscientiousness throughout the recruitment process can help recruit the high EI teachers that promise high positive added-value performance, better fit in and adaptability to the culture, more classroom engagement, and diverse interactivity. As a result, the institution would reap multiple benefits in terms of team-spirit, team-work, conflict resolution initiatives, job satisfaction and better learning levels. In turn, the better learning will result in higher performance of the graduates, and higher institutional reputation. Therefore, the recommendation of integrating EI into the hiring process becomes a tool for recruiting teachers with competency.

Teaching implications

Emotional intelligence is positively correlated with classroom teaching effectiveness. Teachers with high EI are better prepared to create a positive and motivating classroom climate. Personality traits are also correlated with classroom effectiveness. High EI teachers with positive personality traits foster optimal learning through

interpersonal relationships and individualized attention to students, and with active engagement in class. Therefore, personality trait development workshops and EI training should be administered to all teaching faculty members, in order to enhance their teaching effectiveness. they would be better able to attract student attention and interest in the subject-matter discussed and help contribute to higher student engagement and thereby learning experience.

Educational policy implications

The official policy makers in the educational arena are invited to integrate developing EI skills and personality trait of agreeableness, openness, conscientiousness, extraversion, and neuroticism, in their teacher preparation programs for all educational levels. EI training should be offered in parallel to students to increase academic experience leading to better learning, improved teacher-student relationships, and reduces behavioural problems. Introducing EI and positive personality traits can transform teaching from a tasked-duty to a fun-experience with positive impact for students and teachers. On one hand, students would benefit from personal and intellectual growth as well as social and relational growth. On the other hand, teachers will have a more enjoyable career and state of mind, with lower stress levels and burnout. Moreover, teachers and administrative staff would benefit from higher job satisfaction, improved well-being, better coping mechanisms and lower negative emotions, thus higher quality of life.

Limitations

It is important to note that this study had some limitations. First, the sample size and the self-reported responses may play a limiting role in generalizing the results. Second, students' ratings may be influenced by various undisclosed factors such as mood or personal feelings. Some students may have misinterpreted the visit of the researcher to their classroom for teacher data collection as a chance for them to vent or express unfair teacher evaluation, either positive or negative as is reported by other researchers (Maamari & Naccache, 2022).

Future research

Future studies should consider larger sample sizes and include participants from diverse educational settings to enhance generalizability of the findings. Additionally, qualitative studies could provide deeper insights into the underlying mechanisms and subjective experiences related to emotional intelligence and teaching effectiveness. Finally, Third, using additional sources for evaluating teaching effectiveness may lead to more accurate assessment. These may include in-class observations, peer ratings, and department-head evaluations of teaching effectiveness in person.

To conclude, the research highlights the positive impact of EI and personality traits on teaching effectiveness in higher education. Faculty members with high EI skills contribute to supportive teacher-student relationships,

effective classroom management, and positive role modelling. The personality traits of agreeableness, openness, extroversion, conscientiousness and emotional stability (neuroticism) play a mediating role in the relationship between EI and teaching effectiveness.

Military Pedagogy in Malaysia: Establishing Defense University Teaching and Learning Characteristics

Jowati binti Juhary

National Defense University of Malaysia, Malaysia,  <https://orcid.org/0000-0002-5314-1195>

Abstract: There is debate about whether military pedagogy differs from other forms of pedagogy, such as andragogy or heutagogy. The concept of military pedagogy can be comprehended from multiple viewpoints. Military pedagogy is regarded by certain researchers as the act of instructing and acquiring knowledge within a military educational setting. However, another faction of scholars argue that military pedagogy is employed specifically for the goal of instructing in defense and military strategies. This paper aims to understand the specific characteristics of military pedagogy in Malaysia, as witnessed and documented by the author, who has been working at the Defense University since its establishment. The analysis is derived from the observations conducted on the pedagogical methods employed at the Defense University. Initial results indicate that the qualities of military pedagogy encompass the six attributes of intellectual leaders of character at the Defense University. Military pedagogy then may form the foundation of the university's teaching and learning philosophy.

Keywords: Defense University, Intellectual Leaders of Character, Military Education, Military Learning Environment, Military Pedagogy

Citation: Binti Juhary, J. (2024). Military Pedagogy in Malaysia: Establishing Defense University Teaching and Learning Characteristics. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2384-2393), Antalya, Turkiye. ISTES.

Introduction

There is limited awareness of military pedagogy in this region, which includes Asia and Oceania. The absence of documented evidence regarding military pedagogy in these nations substantiates this assertion. The author can attribute these reasons to a lack of understanding of the importance of training future military members and a lack of scholarly interest in military education-related topics. This paper provides a detailed analysis of the specific characteristics that define military pedagogy within the context of Malaysia. Due to the scarcity of materials on military pedagogy in the country and the surrounding region, this research relies on long-term observations of the learning and teaching environment at the Defense University and the methods used to educate the students.

Being the youngest established public university in Malaysia, the National Defense University of Malaysia

(NDUM) is well equipped to offer the highest quality learning and teaching environment for its students. After almost two decades of existence, the Defense University firmly insists that its graduates must exhibit six attributes of intellectual leaders of character. To attain these attributes, the learning environment and experience must be flexible and responsive to changes and challenges.

The author contends that after conducting observations over the course of 20 semesters at the Defense University, there are three distinct arguments on military education as it is observed at the NDUM.

Employing the Best Schools of Thought

There are two contrasting perspectives on the concept of military pedagogy, which refers to the education of future intellectual leaders for both academic and military reasons. Caforio (2000) introduced the idea of divergence and convergence, whereas Kirkels, Klinkert, and Moelker (2003) proposed the Spartan and Athens models. The NDUM implements both models. The Defense University stands out not just due to its historical significance but also because it falls under the jurisdiction of two ministries in Malaysia, specifically the Ministry of Higher Education, Malaysia, and the Ministry of Defense, Malaysia.

Applying both schools of thought to the defense institution involves the implementation of Caforio's concept, which focuses on educating future officers at a public institution. However, the NDUM is also producing individuals who possess the qualities of both Spartans and Athenians. Graduates undergo training to become proficient soldiers while simultaneously developing their capacity to think critically and make decisive decisions. This is implementing the models developed by Kirkels, Klinkert, and Moelker.

Building Personality for Future Defenders of the Nation

In numerous instances, the individuals responsible for managing and 'building' the organizations are crucial for achieving success. Therefore, it is imperative to develop the character of future leaders in the Malaysian Armed Forces (MAF). This is a component of military education that has been implemented at the NDUM. As explicitly discussed by Darr et al. (2022), personality is crucial in guaranteeing the presence of morally upright authorities. The NDUM is prepared to shape future intellectual leaders with six key attributes necessary for achieving the desired personality. Shaping intelligent leaders with strong character is a challenging endeavor, given the disparities in the educational and socio-economic backgrounds of the students. The military orientation phase (familiarization program), also known as *Tunas Wira*, plays a significant role in initiating the process of 'eliminating' disparities in terms of lifestyles and thought patterns.

Balancing Two Essential Principles

Military pedagogy enables the harmonious integration of two essential principles. The primary essential aspect is the appropriate amalgamation of civilian and military experience for the students to emulate. Although

military cadets adhere to strict schedules, they also need to undergo shaping to integrate into society. The exposure provided at the Defense University should guarantee that students possess the necessary skills and abilities to perform effectively and efficiently when entering the professional realm. The second principle is that both behaviorism and constructivism learning methodologies guarantee the development of graduates as both followers and, eventually, leaders. By incorporating both traditional and digital teaching methods too, the NDUM can enhance students' learning experiences and broaden their horizons.

Going ahead, this paper is segmented into five primary components. The initial component comprises this introduction. The second section provides a curated collection of literature on military pedagogy. The third section provides a concise explanation of the approach employed in this paper. Following that, this part provides an analysis and discussion of the specific characteristics of military pedagogy within the context of Malaysia. Finally, a conclusion succinctly encapsulates the essence of this paper.

Selected Literature

Given the limited familiarity with the phrase military pedagogy, it is crucial to understand its fundamental concept before proceeding with the discussion in this paper. Toiskallio (2003) stated that military pedagogy falls within the realm of "military sciences that examine the philosophies, conceptions, visions, doctrines, aims, approaches, and technologies of military education and training." For several decades, there has been a long-standing discussion regarding the most effective approach to educating military officers, particularly at the tertiary level. This is particularly accurate given the heightened participation of these individuals in military and humanitarian endeavors, necessitating a structured program of education and training. For example, military pedagogy serves as a means for the Danish to address learning in the context of military education and training (Schunk & Nielsson, 2002). Schunk and Nielsson further contended that while the term pedagogy may not differ significantly from conventional pedagogy, there are distinct qualities that set military pedagogy apart from others, as outlined in the following paragraphs.

Schunk and Nielsson (2002) argued that military pedagogy includes (a) the readiness of military personnel to cooperate during their military training and education; this means that during the process of knowledge acquisition, their ability to adapt in order to sharpen their proficiency is highly required; (b) the personnel are skilled at surviving and working under extreme conditions; this suggests that students undergo academic and military training concurrently, and there are massive pressures on the students to achieve well in both aspects; (c) the personnel must be able to perform their obligations accordingly and efficiently; (d) the personnel are considered adults undertaking tasks as armed forces; (e) the instructors are not only class instructors; they are also administrators or tactical commanders; this suggests that the instructors are also military personnel; (f) the people involved in the training vary and have different backgrounds in order to allow multiple and various experiences to be shared with the students; and (g) the principles used for teaching are valid at all levels and situations; thus these principles must have common substances.

Falk (2008) provided a concise concept of military pedagogy. He stated that military pedagogy consists of two components. Military pedagogy refers to the process of teaching and learning that takes place inside a military environment. Furthermore, military pedagogy is specifically employed in contexts where instruction and the acquisition of knowledge are intended for military objectives. By adhering to these components, the global community would be able to promptly discern whether institutions are embracing military pedagogy. However, the author contends that military pedagogy encompasses more than just identifying whether organizations employ military pedagogy; the impacts of military pedagogy in educating graduates at the NDUM are the utmost importance. The fourth section of this paper presents these arguments. In addition, academic experts such as Paile (2013), Kirkels, Klinkert, and Moelker (2003), and Caforio (2002) have discussed the fact that the education systems in different countries vary, which in turn leads to differences in the interpretation of military pedagogy. These scholars also focused on two schools of thought for comprehending the functioning of military pedagogy. The following two paragraphs will delve deeper into these topics.

In the year 2000, Caforio introduced a classification system for military education that distinguishes between divergent and convergent approaches. These two are not contradictory; they are complementary. The previous categorization prioritizes the provision of necessary resources to military personnel to successfully complete their assigned tasks. This classification specifically highlights the importance of the commander's military expertise. In contrast, the subsequent categorization permits these individuals to pursue formal tertiary education, wherein the curriculum prepares them to excel as officers and integrate effectively into communities. This implies that the officers could acquire their education through the civilian school system.

This study is subsequently corroborated by another study conducted in 2003. This study presents two models of military education and pedagogy. These models are derived from the inherent characteristics of the officers and their unique responsibilities. There are two models: the Sparta model, which focuses on military personnel as defenders of a nation, and the Athens model, which promotes officers as intellectual elites who must utilize their skills to make good decisions professionally. It is contended that by combining the Sparta and Athens models, a more robust military can be created. These training institutions have the option to focus on either one of these models or to select only one model. Regardless of the choice made for the model at military tertiary institutions, Paile (2013) emphasized that the higher education business for these military personnel is evolving into a distinct intellectual process.

Toiskallio (2008) argued that pedagogy encompasses not only the act of instructing, training, and educating but also the essence of human nature and the prospects for future existence. In this context, pedagogy seeks to provide individuals with a high quality of life. Therefore, military pedagogy is a discipline within the field of human sciences. At the same time, military pedagogy, as a branch of human science, focuses on addressing four significant dangers faced by military personnel. These risks include (a) nuclear wars or large-scale warfare; (b) the rise of totalitarian power; (c) the breakdown of economic growth mechanisms; and (d) ecological decay or disaster (Giddens, 1992).

With the newfound knowledge of military pedagogy, it is important to consider the impact and relevance it has on the NDUM. Should military pedagogy become the primary catalyst for achieving greatness at the only defense university in Malaysia? Is military pedagogy truly significant? The fourth section will evaluate the current characteristics of military pedagogy at the Defense University.

Method

This section describes the methodology used to understand military pedagogy and its current practices. The technique employed in this concept paper solely relies on observations of the teaching and learning approaches at the Defense University. The author conducted observations over a period of 10 years (20 semesters) to assess the students' acceptance and perceptions of the teaching and learning approach implemented. Based on the transition from a lecture-based method to a flipped classroom approach, the author concludes that students are hopeful about the changes and highly discerning when it comes to their personal learning experience.

The classes observed were taught by the author and six other academics at the NDUM. Over the course of 10 years, the author conducted four action research studies. The research focused on the behavior of students in the classroom, the teaching styles employed by the author and other academics, and the learning activities of students during classroom sessions. The findings of these action research studies can be summarized as follows.

Initially, students exhibit heightened levels of involvement and enthusiasm in their educational pursuits when the classroom activities incorporate interactivity. "Interactive" refers to the idea that lectures should be minimized or completely avoided. Furthermore, a few academics are open to modifying their teaching methodologies, although a small number of them maintain that the traditional approach remains efficacious and pertinent. Consequently, students are encountering difficulties adjusting to a traditional educational setting due to their lack of familiarity with it. As digital natives, these new groups of students are equipped to utilize digital technologies (Prensky, 2001; Sadiku et al., 2017). Furthermore, the author notes that the Defense University lacks a comprehensive and formally stated policy for teaching and learning. Consequently, this has compelled academics to adopt instructional methods and classroom management techniques according to their own preferences. This is an urgent matter that requires quick attention from the NDUM.

Thus, the author's previous research has resulted in the identification of the specific characteristics of military pedagogy within the Malaysian setting. This study aims to provide a more detailed explanation of the arguments mentioned previously in the introduction in the following section.

Further Analysis and Discussion on the Characteristics

The NDUM's implementation of military pedagogy will guide this section. The six attributes of the NDUM's graduates are clearly demonstrated in these three characteristics, and it is important to highlight this fact. The

origin of these attributes was traced back to extensive and thorough deliberations on the desired accomplishments of the NDUM graduates, spearheaded by the second Vice Chancellor of the NDUM (Zulkifli Zainal Abidin & Tengku Mohd Tengku Sembok, 2010). The next few paragraphs explain the characteristics of military pedagogy which have supported molding leaders of character at the NDUM and also informed the arguments highlighted in the introduction.

Military Pedagogy as an Approach to Educate Future Intellectual Leaders of Character

The most notable characteristic of military pedagogy at the NDUM is arguably its utmost significance. The Defense University is dedicated to creating intellectual leaders with strong character. The learning environment and experience provide an opportunity to educate the intellect and develop the physical abilities of future graduates. Only individuals who are prepared to relinquish their personal liberty will thrive in this setting. While the Defense University is not limited to military cadets, its development has been carefully designed considering the nation's national strategic objectives. Civilian students who enroll in the Defense University are strongly urged to sign up for the Reserve Officer Training Unit. Given the immense responsibility of preparing future defenders of the nation, it is crucial to carefully prepare and implement teaching and learning methods, activities, and assessments.

As the only Defense University in Malaysia, the primary focus is on the academic qualifications of the graduates. The first attribute of the leaders of character is that they are graduate officers (see Figure 1). The primary motivation for students to attend a university is to acquire advanced education. The second attribute of the leaders of character is commissioning officers. Academic qualifications are crucial for enhancing military professionalism. Some say that academic degrees are the basis of military professionalism (see Sarkesian, 1981; Galvin, 2011; Novy, 2017). Academic achievement refers to the graduates' ability to freely pursue information at the institution. Simultaneously, students receive academic instruction and endure military training. The military cadets possess a well-organized hierarchy of authority. They are accommodated in seven companies, with each company having its own individuals who hold ranks. This structure instructs the younger cadets to adhere to the guidance of the older cadets, and in turn, this procedure sharpens the leadership abilities of the older groups.

Figure 1. The classroom learning experience

Military Pedagogy for Building Personality of Military Personnel

Effective military pedagogy is essential for ensuring that the initial recruits of the MAF possess not only strong academic and physical capabilities for their military pursuits, but more importantly, they must also demonstrate moral and spiritual integrity. There are three qualities associated with this feature. One aspect of developing one's personality involves ensuring that students actively participate in sports, since it contributes to the development of their character and discipline. In addition, it is necessary for the graduates to possess proficiency in at least one kind of hand-to-hand combat without the use of weapons. Primarily, it is imperative that the graduates establish a profound spiritual connection with God. This enables them to enhance their concentration and self-assurance. Hence, when considering the participation of future officers in foreign humanitarian activities, it is imperative that their character remain beyond reproach.

The military necessitates dynamic and resilient workforces. All military cadets and civilian students at the Defense University are required to be registered for participation in at least one sporting activity; this is the third attribute of the leaders of character (see Figure 2). The designated time for this activity is 5.00 to 6.30 p.m. on Mondays through Thursdays. The students receive comprehensive training not only to excel as participants in the sports but also to develop the skills necessary to become trainers, coaches, and umpires in the same sports. This will enhance the students' talents. Additionally, the students are to develop proficiency in unarmed combat, a crucial quality for developing intelligent leaders with strong character (the fourth attribute of leaders of character). Unarmed combat in military institutions refers to the requirement for personnel to exhibit the capability to protect themselves without relying on any weapons. The objective of the Defense University is for all military cadets to get a black belt in Taekwondo. Every Friday from 3.00 to 6.30 p.m., Taekwondo training sessions take place. Students are categorized based on their level of competence in the martial art.

Figure 2. Sports on the field

The MAF mandates that all personnel possess a steadfast belief in the existence of a higher power. Therefore, it is imperative that all military personnel adopt a faith or belief. The fifth attribute of leaders of character states that Muslim male students at the NDUM must possess the necessary qualifications to serve as Imams and Khatibs. It is challenging to train 70 percent of the student population in the skills of leading prayers and delivering sermons. To effectively handle this situation, only the students in their last year of study shall be

appointed as Imams and Khatibs. This trait is crucial due to one primary reason: the leaders on the battlefield must also possess the ability to lead prayers. These graduates must demonstrate excellence in every part of their lives. Female Muslim students must also understand all aspects of becoming exemplary Muslim leaders. Further, the non-Muslim students are not neglected; they are provided with support to practice their religion and encouraged to attend churches or temples. As prospective leaders of the MAF, it is strongly encouraged for all military cadets to have faith in God and lead lives characterized by moral excellence.

Military Pedagogy as a Balanced Mixture for Critical Teaching and Learning Aspects

Attaining a harmonious blend of essential instructional and educational elements poses a difficulty. This argument can be categorized into two primary constituents. The primary issue is to ensure a well-rounded educational experience for the students, achieved by incorporating both military and civilian faculty at the NDUM. Military cadets must possess the ability to exemplify the behavior and values of their military instructors. What is the optimal ratio of military professors to civilian academics that will facilitate effective role modelling? Furthermore, the lack of a teaching and learning policy has impeded the implementation of effective teaching and learning methods. This is because academics have the freedom to investigate and employ several approaches, but there is no universally accepted guiding principle for determining the most effective method. Academics often imitate their former instructors; if their lecturers were creative and innovative, it is likely that the academics will also possess these qualities. The optimal equilibrium between these two primary constituents enables the graduates to attain a state of wholeness, as elucidated subsequently.

Figure 3. Marching as a form of molding discipline

Developing graduates into individuals who embody the qualities of officers and gentlemen and women is an exceptionally challenging attribute to attain; the last attribute of leaders of character is molding graduates to become officers and gentlemen/ladies. This is because instilling strong principles requires a lengthy process, which begins on the very first day of a graduate's enrollment at the Defense University. Students are introduced to the principles of etiquette while dining, socializing, and doing similar activities. Some individuals may question the reasons behind the difficulty of achieving this task. The graduates may encounter difficulties in effectively managing their schedules due to the inherent tension between their military training as protectors of the nation and their aspiration to embody the qualities of a refined gentleman or lady. However, the expressions of this sixth attribute are evident in their demeanor and conduct within the services and organizations.

Conclusion

In summary, the author asserts that military pedagogy in the Malaysian setting, as implemented at the NDUM, possesses three distinct characteristics. The author argues that no other Malaysian universities have implemented a pedagogical approach identical to that of the NDUM. Therefore, military pedagogy plays a crucial role in ensuring a structured and efficient education for the nation's future protectors. However, the incorporation of these characteristics is not widespread across the entire university, as only a limited number of academics are familiar with the concept of military pedagogy. It is now appropriate to construct the teaching and learning philosophy at the Defense University based on these specific characteristics of military pedagogy.

Recommendations

Based on these observations, the author also notes that some academics lack knowledge of military pedagogy and its characteristics. The author highlights one key suggestion. The Defense University can organize a series of seminars or webinars to 'educate' academics on the characteristics of military pedagogy and its potential benefits for effective teaching and learning. However, to facilitate these training sessions, it is crucial to inform the administrators of the Defense University about the significance of promoting and implementing military pedagogy. It is important too to recognize that military pedagogy is not a novel form of teaching and does not exist independently. Further, all members of the NDUM must be made known on how military pedagogy and its characteristics can assist in achieving the attributes of leaders of character.

Acknowledgements

This paper owes much to the Defense University for the opportunity to conduct this research through continuous observations during classroom teaching and learning and military training on the field.

Abstract: Fuzzy clustering, an unsupervised classification method, allows data points to belong to multiple clusters simultaneously, reflecting their varying degrees of association with each cluster. Within image segmentation, the widely employed Fuzzy C-Means (FCM) algorithm seeks to delineate images into distinct regions. The FCM algorithm works by assigning membership to each object or data point corresponding to each centroid, based on distance between the data point and cluster. However, current FCM implementations confront significant challenges, notably in scenarios with complex non-spherical data or unbalanced clusters, exhibiting sensitivity to noise and resulting in excessive segmentation due to a lack of detailed spatial information. This study proposes an enhanced FCM algorithm, integrating a Gaussian distance metric and Total Variation

regularization to mitigate these challenges. Comparative analysis between the Gaussian-based FCM algorithm with Total Variation (TV) regularization technique and the conventional Euclidean FCM algorithm was conducted across diverse image datasets, evaluating segmentation time, evaluation time, Rand Index, and Coefficient of Variation. Results consistently demonstrated the superior performance of the proposed modified algorithm with TV regularization, exhibiting enhanced accuracy in segmentations and expedited execution times. This advancement renders the Gaussian-based FCM algorithm with TV regularization well-suited for real-time and resource-constrained applications. Future investigations should explore the efficacy of this enhanced algorithm across diverse datasets with varied subjects and image resolutions.

Introduction

Clustering is an unsupervised classification algorithm which aims to partition the data into several disjoint subsets depending on its features (Arora et al., 2018). In unsupervised learning, the algorithm divides the data into sets in which the data is unlabeled based on the underlying hidden features in the data. In clustering the data into groups, the algorithm makes it possible to exploit the hidden features in the data, which can be useful for tasks like anomaly detection (Jones, 2017).

In computer vision, image segmentation is a crucial stage in recognizing and categorizing objects. Despite the numerous algorithms developed for image segmentation, it remains a challenging research area since no single method can provide a comprehensive approach for achieving fast and efficient image segmentation. This difficulty arises from two main reasons. Firstly, image segmentation is a multiple solution problem, i.e., there are multiple best segmentation results for one image. Secondly, images are inherently complex due to factors such as noise, background, low signal-to-noise ratio, and uneven intensity. This complexity makes it hard to develop a universal segmentation framework for handling complex image segmentation tasks (Asqiriba, 2020).

In pattern recognition and image analysis, clustering is one of the important tools to examine the data, since an image is always complex due to noise, background, and intensity nonuniformity (Lei et al., 2018). Image segmentation is the process of partitioning an image into multiple segments or regions, typically based on certain characteristics such as color, intensity, texture, or other features (Asqiriba, 2020).

Among those various areas of clustering methods, the Fuzzy C-Means (FCM) is a very well-known technique for its simplicity (Hashemi et al., 2023). The FCM algorithm for image segmentation has been continuously applied in different fields such as medical image segmentation, infrared pedestrian segmentation, high dimensional data clustering, etc. The FCM algorithm works by appointing membership to each object or data point corresponding to each cluster center, based on distance between the data point and cluster (Mantilla & Yari, 2021). Through this way, the FCM balances the number of data points in each cluster, in which the centers of smaller clusters are forced to drift to larger adjacent clusters (Lin et al., 2014). However, the FCM clustering algorithm often faces two problems for image segmentation. First, it is sensitive to noise, and secondly, it usually leads to over-segmentation due to lack of local spatial information of images (Abu & Diamant, 2019). Image noise is an erratic variation of brightness or color information in images, and it is usually an aspect of electronic noise that can be produced by the image sensor of a camera or scanner (Siddiqui, 2021). Noise and outliers contribute to the computational procedure of algorithms like FCM, which leads to unbalanced and misplaced cluster centers (Askari, 2021). Thus, making the FCM algorithm sensitive to noise and outliers.

To improve the clustering accuracy and separation of the clusters in fuzzy clustering, the Gaussian function model can be used, since this model can effectively eliminate noise on segmentation results (Yin et al., 2018). Moreover, the Gaussian model is less sensitive to outliers than other models like triangular distribution, and it has two easily interpretable parameters: the mean and the variance (Clark, 2020). The Gaussian function is radially symmetric, which means that its value depends only on the distance from the center, not the direction. This attribute makes it invariant to rotations, which is beneficial when dealing with images and other data where the orientation may not be known or relevant (Yang et al., 2022).

Problem Statement

With the increasing importance of image data across different industries including medical imaging and high-dimensional data clustering, there exists a need for stronger and more effective clustering algorithms to perform image segmentation. The Fuzzy C-Means (FCM) algorithm is a popular choice due to its adaptability and ease of use. However, it faces certain obstacles that prevent it from achieving its full potential and usability. The main issues that have been identified are:

1. Despite regularization-based modifications, current FCM algorithm that uses Euclidean distance metric struggle with robustness issues when dealing with complex non-spherical data or datasets with unbalanced clusters.
2. Existing FCM method encounter obstacles, such as sensitivity to noise and outliers, which limit their adoption in several applications, including image segmentation.
3. The slow execution time of current FCM clustering algorithm is a major barrier to their use in real-time and resource-constrained environments.

Given the specified problems, this study aims to achieve a modified Fuzzy C-Means clustering method using a Gaussian metric to address the noise sensitivity and non-spherical data challenges inherent in the FCM

algorithm. This study also aims to enhance the accuracy of the FCM algorithm by incorporating a regularization technique that is less sensitive to noise and outliers. Lastly, this study seeks to improve and implement changes and optimizations to reduce the execution time of the current FCM clustering algorithm.

Fuzzy C-Means Algorithm

The utilization of the Fuzzy C-Means (FCM) Algorithm in this research paper is motivated by its widespread adoption as the prevailing method for image segmentation, as evidenced by numerous scholarly references. The objective function of FCM algorithm is defined as:

$$J = \sum_{i=1}^c \sum_{j=1}^n u_{ij}^m \|x_j - v_i\|$$

In the given equation of the FCM algorithm, c signifies the number of clusters, n represents the number of samples, and u_{ij} denotes the membership level of data point x_j with respect to the cluster center v_i . The membership level u_{ij} ranges between 0 and 1 inclusively, and for each data point x_j , the sum of its membership levels across all clusters equals 1. Additionally, m denotes the fuzzification exponent employed in the partition matrix u_{ij} , typically set to 2 to distribute equal weighting to all data points. The notation $\|\cdot\|$ denotes the Euclidean norm.

The membership degree u_{ij} measures the degree of association between a data point x_j and a cluster center v_i . A high membership degree means that x_j is highly associated with v_i , whereas a low membership degree means that x_j is only weakly associated with v_i . The membership degrees are updated iteratively until a convergence criterion is met, typically when the change in J falls below a specified threshold.

Following the calculation of membership levels, the cluster centers or centroids are updated according to the equation:

$$v_i = \frac{\sum_{j=1}^n u_{ij}^m x_j}{\sum_{j=1}^n u_{ij}^m}$$

In the following equation, v_i represents the centroid of cluster i , x_j signifies the j^{th} data point, u_{ij} denotes the degree of membership of data point j within cluster i , m indicates a weighting exponent that governs the degree of fuzziness of the clustering, and n represents the total count of data points. The numerator is the weighted sum of the data points x_j , where the weights are the membership degrees u_{ij} . The denominator is the sum of the membership degrees for cluster i , which normalizes the weights so that they sum to 1.

Method

In enhancing the efficacy of the FCM algorithm for image segmentation, the proposed research introduces nuanced modifications. These adjustments encompass refinements to the objective function, the incorporation of

spatial information, and the implementation of innovative Gaussian-based adaptations. A critical gap in the existing literature calls for a meticulous exploration into the robustness of Gaussian-based FCM variants, specifically addressing challenges posed by noisy data and outliers in image segmentation. The Gaussian metric, known for its ability to capture detailed image features, plays a significant role in addressing challenges related to noise and outliers. The research also considers the use of Total Variation regularization as a valuable tool in image processing. Acknowledged for its ability to reduce noise while preserving essential image details, Total Variation regularization plays a diverse role in image segmentation. Furthermore, the research acknowledges the importance of addressing computational challenges related to the execution time of FCM, particularly when dealing with large datasets.

Gaussian Metric

The performance of image segmentation algorithms depends on the choice of distance metric used to measure the similarity between image pixels (Na Zhao et al., 2015). The Gaussian metric is a commonly used distance metric in image segmentation and has been shown to effectively improve the results of image segmentation (Yin et al., 2018). The Gaussian metric is a way to measure the similarity between two vectors using a Gaussian function. Given two vectors x and y , the Gaussian metric is defined as:

$$G(x, y) = \exp\left(\frac{-\|x - y\|^2}{2\sigma^2}\right)$$

In the given equation of the Gaussian function, x and y represent the d -dimensional vectors, while $\|\cdot\|$ is the Euclidean distance between two vectors, and σ is a scaling parameter that governs the width of the Gaussian function. The Gaussian function is centered at x , and its value at y decreases as the distance $\|x - y\|$ between x and y increases. The parameter σ controls how quickly the Gaussian function decreases with distance. A smaller value of σ leads to a narrow Gaussian function, which assigns high similarity to vectors that are close together, while a larger value of σ leads to a broad Gaussian function, which assigns high similarity to vectors that are farther apart.

Following the computation of the Gaussian function, the metric is used in this study to revise and update the membership values for each pixel. This process involves assigning the membership value for each pixel and each cluster as the ratio of the Gaussian function for that pixel and that cluster to the sum of the Gaussian functions for that pixel across all clusters.

Total Variation Regularization Technique

Total Variation regularization is a powerful technique with diverse applications in image processing and data analysis. In denoising, Total Variation regularization plays a crucial role in reducing noise while preserving the important details of an image. By encouraging smoothness and reducing noise variations, Total Variation regularization results in cleaner and visually appealing images. This advantage is particularly essential in medical imaging processing, where noise reduction is vital for accurate diagnosis and analysis (Caselles et al.,

2015). It is also capable of preserving edges and facilitate smooth image intensity transitions without over smoothing or over-sharpening. This is important in maintaining the sharpness and detail of segmented regions, which can be crucial for tasks such as object detection and tracking (Oh et al., 2013).

For clustering, according to Liu et al. (2014), Total Variation regularization is applied in cases where data exhibits spatial coherence. It enforces smoothness among neighboring data points, making it suitable for segmenting multidimensional data into coherent clusters. Total Variation regularization helps reduce sensitivity to outliers and sharp transitions, leading to more stable and interpretable clustering results. By discouraging noise and over-segmentation while promoting spatial coherence and edge preservation, Total Variation regularization leads to more well-defined and semantically meaningful segmented regions. This makes the results easier to interpret and use in several color image processing applications (Jia et al., 2019). In this study the total variation of the membership functions is introduced to encourage piecewise smoothness in the fuzzy membership assignments, thereby incorporating TV regularization technique into the FCM algorithm.

Gaussian-Collaborative Fuzzy C-Means Algorithm (GCFCM)

The Gaussian-Collaborative Fuzzy C-Means (GCFCM) study has been a significant contribution in addressing imbalanced clusters in various data analysis applications. It is known for managing complex, non-spherical datasets by incorporating collaborative information from a Gaussian mixture model (GMM) to improve clustering accuracy.

In the current study, the researchers focused on leveraging Gaussian blur, specifically for preprocessing images. This aspect of the GCFCM study was selected as a critical component for their investigation into the optimization of the FCM algorithm for image segmentation. Moreover, the researchers seek to delve deeper into the efficacy of the Gaussian distance metric itself. The aim is to optimize the algorithm, specifically exploring how the Gaussian metric, can further elevate the FCM algorithm's performance, particularly in image segmentation with real-world datasets.

Conceptual Framework

Figure 1 showcases the researchers' proposed algorithm. The algorithm has been developed to tackle some of the problems left unaddressed by the current approach. The research adopted a Gaussian distance metric in lieu of the conventional Euclidean one. The rationale behind this modification stems from the related literatures, which demonstrated that the Gaussian metric exhibits superior speed and flexibility when applied to intricate image datasets. This alteration has led to adjustments in the formulas used for calculations in the algorithm.

Meanwhile, to address concerns pertaining to noise and outliers in images, the researchers have chosen to preserve certain components from the prior approach, such as the utilization of Gaussian smoothing. Furthermore, a novel methodology known as Total Variation regularization has been proposed. The

implementation of this technique is anticipated to facilitate the mitigation of noise and outliers present in the segmented images, while concurrently maintaining the distinct boundaries of objects within said images. The researchers have chosen to utilize Total Variation regularization, which is a more sophisticated technique, with the goal to successfully mitigate the impact of noise and outliers across a broad spectrum of noise levels.

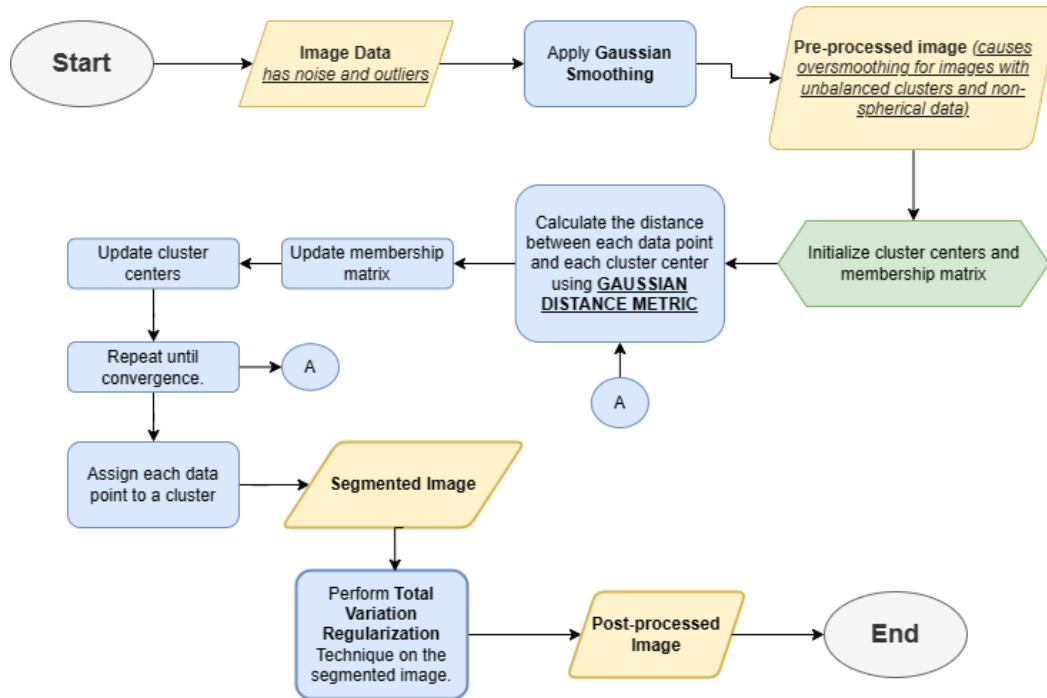

Figure 1. Conceptual Framework of the Proposed Algorithm

Datasets and Materials

This study evaluates the Gaussian-based Fuzzy C-Means (FCM) clustering algorithm using a diverse range of images, primarily sourced from publicly available datasets. These datasets offer images with varying complexities and conditions, enabling thorough testing and evaluation of the proposed algorithm. The Berkeley Segmentation Dataset is an essential dataset for this research. The dataset includes images and their corresponding ground truth segmentation, serving as a benchmark for evaluating the proposed algorithm's performance. The study also utilizes PASCAL VOC and MS COCO (Lin et al., 2014) datasets due to their extensive image collection and detailed segmentation ground truth annotations. These datasets allow for a thorough assessment of the proposed Gaussian-based FCM algorithm in comparison to the existing FCM algorithm. The proposed method's segmentation results will be compared to the dataset's ground truth segmentation.

The suggested modification of the Gaussian-based Fuzzy C-Means (FCM) clustering method is implemented in Python programming language for improved image segmentation. NumPy and SciPy are both extensively employed during implementation. NumPy offers an efficient N-dimensional array entity for managing and

manipulating image data. Meanwhile, SciPy offers supplementary functionalities to NumPy, including optimization tools, distance calculation, and other features. The study also involves using the Scikit-Image and Scikit-Fuzzy libraries. Scikit-Image facilitates image processing and includes functions for introducing noise to images, which can aid in the assessment of algorithm robustness to noise.

Evaluation Tools

Following the attainment of the segmented image, the researchers embark on a crucial stage of evaluation of the modified Gaussian-based Fuzzy C-Means (FCM) algorithm with Total Variation Regularization Technique to assess its precision and effectiveness. This evaluation includes analyzing its rand index, and coefficient of variation to gain a thorough understanding of its performance and pinpoint areas for enhancement.

Rand Index

The Rand Index (RI) is a measure of similarity between two data sets, in this study, it is the ground truth and the segmented image. The RI calculates the percentage of pixel pairs that are either correctly or incorrectly classified by the algorithm. The RI varies from 0 to 1. A higher value indicates better agreement between the segmented image and the ground truth. The following formula is used to calculate the Rand Index:

$$RI = (TP + TN) / (TP + TN + FP + FN)$$

Coefficient of Variation

The coefficient of variation (CV) measures the ratio of the standard deviation (SD) to the mean of a set of data. SD is the standard deviation of the gray values within each cluster, and Mean is the mean gray value of the cluster. A CV value closer to one suggest that the variability or dispersion of the data points, in this case, the differences between the ground truth and the segmented image, is relatively low compared to their mean, indicating better agreement between the two images and thus higher accuracy and precision in segmentation. The CV for each cluster can be calculated using the following formula:

$$CV = (SD / Mean) * 100$$

Results

Image Segmentation Results

Figure 2 illustrates the results of the image segmentation process, encompassing the application of Gaussian blur, FCM algorithm, the proposed modified algorithm, and the modified algorithm with Total Variation (TV) Regularization technique.

The first column contains the original images, and in the second column are their corresponding ground truth

images. These ground truth images are used to compare against the segmented images to assess the accuracy of the FCM algorithm used for segmentation. In the third column, the figure shows the results of Gaussian blur preprocessing, which reduced image noise and smoothened the appearance of the image. This pre-processed image is then utilized for further segmentation.

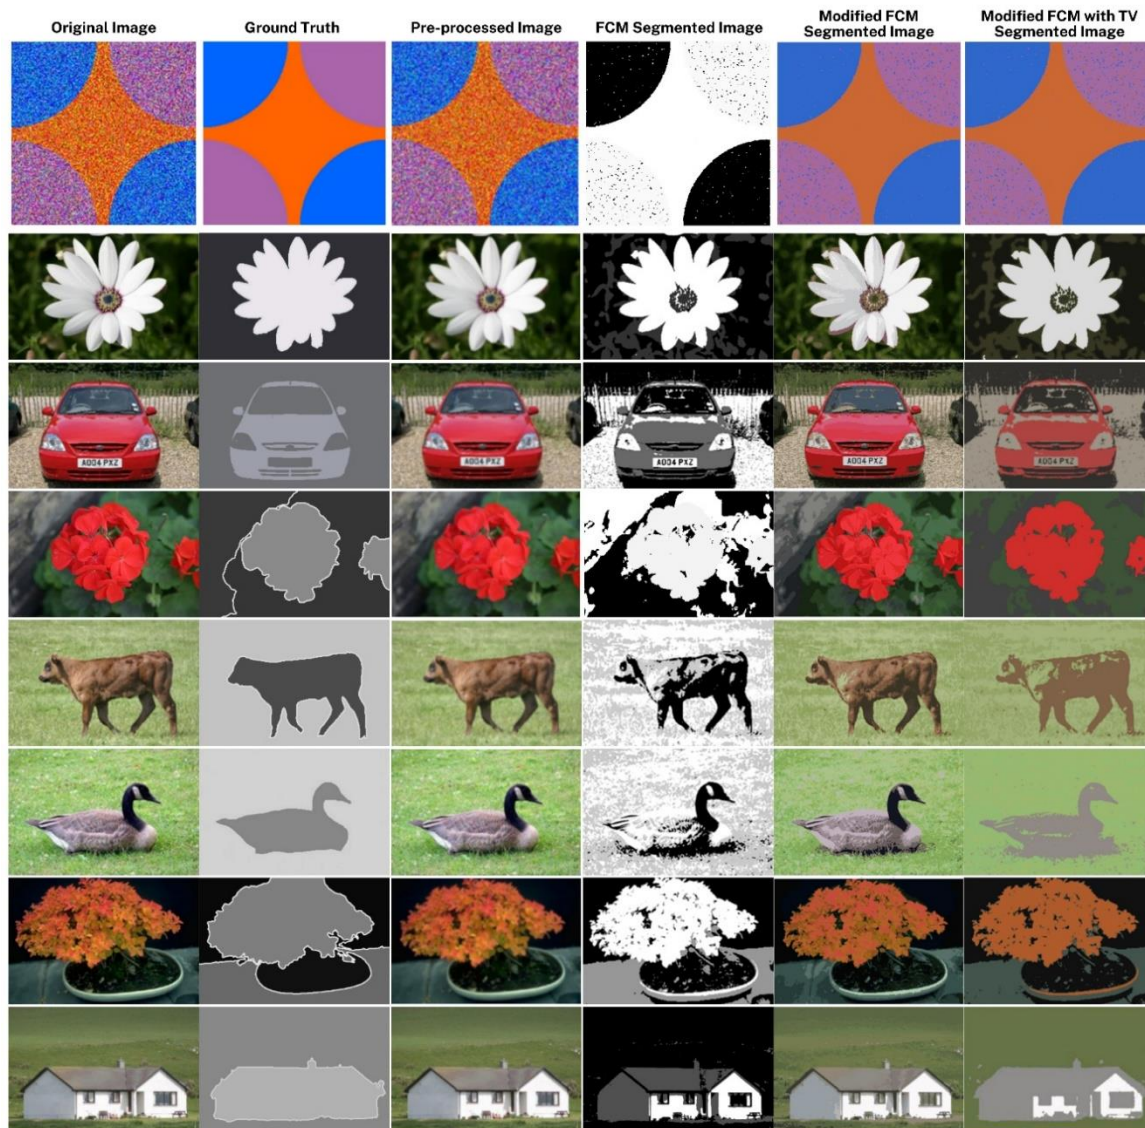

Figure 2. Image Segmentation Results of Eight (8) Image Datasets

Subsequently, in the fourth column, the FCM algorithm is applied, where cluster centers (centroids) are determined by computing weighted averages of pixel values using established membership values. This process integrated the 'fuzzy' affiliation of each pixel with a cluster into the determination of the cluster center, hence, influencing the resulting image segmentation. Next, in the fifth column, the proposed modified algorithm is utilized, incorporating the Gaussian distance metric for improved performance. This step is crucial for addressing robustness issues, particularly in dealing with complex non-spherical datasets or unbalanced clusters.

The modified algorithm applies Gaussian blur during preprocessing, maintains the same cluster initialization steps, but updates the membership matrix using the Gaussian distance metric instead of the Euclidean distance metric. Finally, in the last column, the TV Regularization technique is introduced, further refining the segmented image by reducing noise and preserving important features. This method promotes smooth regions while preserving edges, resulting in a visually improved and more accurate segmentation.

In the figure shown, the modified algorithm consistently delivers superior segmentation results, characterized by sharper, well-defined details, improved texture depiction, and more visually appealing outcomes. A particular highlight is the algorithm's capability to differentiate between background and foreground elements accurately, as evident in the cleaner delineation of foreign objects from the background. In images where color is incorporated, the modified algorithm introduces richer color spectrum and contrast, enhancing the visual appeal and overall segmentation quality.

Additionally, the modified algorithm excels in preserving intricate details and contours, especially around the edges and fine structures. It also effectively eliminates noise and outliers, resulting in a cleaner, more refined segmentation. These observations underscore the effectiveness of the modifications in improving segmentation quality and overall algorithm performance.

Rand Index Results

Table 1. Rand Index Results (Average across ten runs)

Datasets	GCFCM	Modified
Image 1	0.79	0.90
Image 2	0.73	0.90
Image 3	0.72	0.89
Image 4	0.72	0.91
Image 5	0.61	0.89
Image 6	0.77	0.91
Image 7	0.83	0.93
Image 8	0.78	0.95

Table 1 showcases the Rand Index (RI) for the previous and modified segmentation algorithms across ten runs for the eight image datasets. The Rand Index quantifies the resemblance between clustering results and the ground truth; hence, a higher Rand Index indicates a closer resemblance to the ground truth, suggesting better segmentation accuracy. For instance, in the case of the calf image segmentation (Image 5), the modified algorithm achieves an average RI of 0.89, while the original algorithm has an average RI of 0.61. Adding these RI averages of images 1-8 of the GCFCM gave a total average of 0.74375. Meanwhile, the total average of the proposed algorithm is 0.91, which is about 22.37% higher.

Coefficient of Variation Results

Table 2. Coefficient of Variation Results (Average across ten runs)

Datasets	GCFCM	Modified
Image 1	0.74	0.93
Image 2	0.78	0.92
Image 3	0.64	0.94
Image 4	0.75	0.88
Image 5	0.69	0.90
Image 6	0.74	0.89
Image 7	0.85	0.92
Image 8	0.71	0.90

The Coefficient of Variation (CV) represents the ratio of the standard deviation (SD) to the mean of a dataset. A CV value closer to one indicates that the standard deviation is roughly equal to the mean. Hence, a CV value closer to one indicates more consistent and reliable segmentation results. In Table 2, the CV of the GCFCM obtained an average of 0.7375. On the other hand, the CV of the proposed algorithm had 0.91, approximately 23.35% higher. This consistent trend across multiple images signifies the improved performance and reliability of the modified algorithm in terms of segmentation accuracy and consistency.

Segmentation Time Results

Table 3. Segmentation Time Results (Average across ten runs, in seconds)

Datasets	GCFCM	Modified
Image 1	8.55	4.39
Image 2	6.24	1.13
Image 3	6.45	1.3
Image 4	6.66	1.94
Image 5	7	1.97
Image 6	10.11	5.52
Image 7	6.55	1.11
Image 8	116.9	48.35

The segmentation time, representing the duration taken to complete the segmentation process for each algorithm on the image dataset, is consistently shorter for the modified algorithm compared to the GCFCM. For instance, in the second image dataset across ten runs, the previous algorithm takes an average of 6.24 seconds per image, whereas the proposed modified algorithm requires only 1.13 seconds.

The total segmentation time average of the GCFCM is 21.0575 seconds, while the proposed algorithm has the average of 8.21375 seconds. This is approximately 60.92% faster than the GCFCM in segmentation. This marked reduction in segmentation time underscores the improved efficiency and computational performance of the modified algorithm, making it a quicker and more efficient choice for image segmentation tasks.

Evaluation Time Results

Table 4. Evaluation Time Results (Average across ten runs, in seconds)

Datasets	GCFCM	Modified
Image 1	0.21	0.16
Image 2	0.11	0.07
Image 3	0.13	0.06
Image 4	0.1	0.06
Image 5	0.09	0.07
Image 6	0.26	0.15
Image 7	0.11	0.07
Image 8	3.1	1.46

The evaluation time refers to the duration taken by each algorithm to complete post-segmentation tasks, including computing evaluation metrics like the Rand Index and TV Regularization. The data presented in Table 4 indicates that the modified algorithm consistently achieves shorter evaluation times compared to the FCM algorithm across all runs, highlighting its enhanced efficiency in post-segmentation evaluation. The modified algorithm completes these tasks in a significantly shorter duration compared to the previous algorithm, showcasing improved computational proficiency.

Specifically, the GCFCM has an average evaluation time of 0.51 seconds, whereas the modified algorithm averages 0.2625 seconds, representing approximately a 48.53% increase in speed. Moreover, the table demonstrates that the modified algorithm consistently outperforms the original algorithm in all ten trials, suggesting potential benefits for rapid feedback in real-world applications or subsequent processing stages. This efficiency is particularly advantageous in scenarios that require prompt assessment.

Discussion

Robustness issues

To enhance the robustness of the current FCM algorithm, a modification was implemented by substituting the Euclidean distance metric with a Gaussian distance metric. This decision was informed by prior research success in image segmentation.

A significant difference between the two algorithms is in their membership calculation: the FCM algorithm utilizes the Euclidean distance metric, while the Modified algorithm employs the Gaussian distance metric. This change is critical for the modified algorithm's performance improvement as it allows for better handling of complex data distributions and more accurate segmentations.

The Gaussian distance metric, unlike the Euclidean counterpart, permits the representation of intricate and non-spherical data distributions. Additionally, it is adept at dealing with datasets with unbalanced clusters, ensuring equitable consideration of each cluster size. The adoption of the Gaussian distance metric in the modified algorithm resulted in better segmentation accuracy, as indicated by the results of the Rand Index (Table 1) and Coefficient of Variation (Table 2). This implies that the modified algorithm excels in grasping the spatial relationships among data points, especially in challenging non-spherical data contexts.

Consequently, the choice to integrate the Gaussian distance metric in the modified algorithm effectively addresses the limitations associated with the Euclidean distance metric as seen in the results, thus resolving the first problem statement.

Noise and outliers

To address the sensitivity to noise and outliers in the FCM algorithm, the researchers made two key modifications to the algorithm. Firstly, they adjusted the way the membership matrix is updated, thereby reducing the influence of noise and outliers on the clustering results. This was achieved by refining the formula for updating the membership matrix, ensuring that the algorithm is less sensitive to these data points.

Secondly, the researchers introduced a post-processing step called the Total Variation (TV) Regularization Technique. This technique is commonly used to address over smoothing in image pixels caused by methods like Gaussian Blur, as well as to reduce noise and outliers in the data. By integrating this technique into the modified algorithm, the researchers aimed to further enhance the algorithm's robustness in handling complex datasets with noise and outliers.

Through these changes, the modified algorithm not only addresses the sensitivity to noise and outliers but also improves the overall quality of the clustering results, particularly in the context of image segmentation. This demonstrates a significant advancement over existing FCM methods and highlights the potential of the modified algorithm for a wide range of applications, including those involving image data.

Furthermore, the effectiveness of the modified algorithm in eliminating noise and outliers was notably apparent in the image datasets, specifically as seen in Figure 2, where a substantial amount of background noise and outliers were eliminated due to the proper segmentation. This exemplifies the efficacy of algorithmic modifications in managing real-world image data and underscores their potential to enhance the precision and resilience of clustering in diverse applications.

Execution time

As seen in Tables 3 and 4, the researchers noted that the Gaussian-based FCM algorithm consistently outperformed the Euclidean FCM algorithm in terms of segmentation and evaluation times across multiple runs. This aligns with the hypothesis that the Gaussian-based approach would offer faster execution times.

The empirical evidence from ten runs on eight image datasets demonstrated the modified algorithm's consistently quicker performance. Several factors contribute to this improvement: the Gaussian distance metric inherently accounts for data point distribution, while the Total Variation Regularization Technique enhances noise handling and segmentation accuracy. These findings are significant for real-time applications, where computational efficiency is critical. The Gaussian-based FCM algorithm's ability to achieve faster execution makes it well-suited for such environments. The consistent performance across multiple runs and datasets provides robust evidence supporting the algorithm's efficacy.

Conclusion

The implementation of the modified Gaussian-Based Fuzzy C-Means (FCM) clustering algorithm with Total Variation (TV) regularization technique has significantly enhanced image segmentation processes. Through the utilization of the Gaussian metric, the algorithm has demonstrated notable improvements in image segmentation accuracy. Empirical evidence also indicates that the Gaussian-based FCM algorithm outperforms its Euclidean counterpart in terms of execution time, attributed to the accuracy of the Gaussian distance metric and efficiency gains from the regularization technique. These advancements make the modified algorithm suitable for real-time and resource-constrained environments, where responsiveness and computational efficiency are crucial. Moreover, the incorporation of Total Variation regularization technique as a post-processing step has further contributed to the refinement of segmented images by effectively reducing noise. This comprehensive approach not only enhances segmentation accuracy but also addresses the challenge of noise reduction, thereby improving the clustering for image segmentation processes. This comprehensive investigation and subsequent modifications to the FCM clustering algorithm have resulted in significant improvements in robustness, noise and outlier handling, and execution time efficiency. These advancements not only contribute to the advancement of image segmentation techniques but also hold promise for a wide range of applications requiring efficient data clustering in diverse domains.

Recommendations

For future works, it is advised to use the Gaussian-based FCM algorithm with TV algorithm regularization technique on diverse datasets comprising two or more subjects, and datasets with varying image resolutions. This will facilitate a deeper assessment of the algorithm's capability to accurately segment various objects within an image. By examining multiple subjects within the datasets, the algorithm's flexibility and

generalizability can be thoroughly evaluated. Moreover, exploring additional regularization techniques or their combinations is also suggested to better understand the algorithm's ability to denoise images. Examining various regularization methods can provide valuable insights into how they affect both segmentation accuracy and computational efficiency.

Acknowledgements

The researchers extend their heartfelt thanks to their families for their unwavering emotional and financial support. Their belief fueled the researchers' determination, especially during challenging moments. One of the authors would like to express heartfelt appreciation to Mr. Mike Miguel O. Gomez, for his continuous emotional support and encouragement. His unwavering belief provided a constant source of strength throughout this academic journey.

The authors are incredibly grateful to their thesis adviser, Dr. Khatalyn Mata, for her invaluable guidance, support, and insightful contributions. Her expertise and mentorship played a crucial role in shaping this research and refining their approach. They also express their appreciation to the panelists, Mr. Richard Regala and Florencio Contreras Jr., for their constructive feedback and suggestions. Their critical evaluation significantly improved the quality of this paper. A special thanks goes to the coordinators, Ms. Jamillah S. Guialil, Mr. Jonathan C. Morano, and Ms. Leisyl M. Mahusay, for their dedicated guidance and assistance throughout the research process.

Finally, the authors acknowledge the blessings and guidance they received throughout this endeavour from the Lord God, without whom this accomplishment would not have been possible.

Abstract: Although AI in education has been written about for decades, recent years have seen exponential growth in this area. The aim of this paper was to determine the distribution of content and areas of education in which AI is researched. The article provides an overview of the newest research in the field of AI in education, available in open access journals. In the theoretical part, an overview of the historical context is given. Also, key definitions and approaches for understanding the topic are listed. In the methodological part, Systematic Literature Review was used, with AI and education as search words. Publish research studies between January 2023 and December 2023. The research found that there is a difference in the amount of AI research at certain degrees and fields of education. The application of AI is particularly explored in higher education. As specific areas of research, the ethical issues of applying AI in education and the possibilities of applying AI in the learning and teaching process appear.

Keywords: artificial intelligence, learning, STEM education

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2410-2427), Antalya, Turkiye. ISTES.

Introduction

AI Foundations: An Overview of the Fundamental Structural Elements

The incorporation of Artificial Intelligence (AI) in education mainly focuses on three fundamental architectural elements that collectively aim to transform traditional learning environments and pedagogical techniques. Advanced AI technologies are leading the way in this change, employing robust adaptive learning systems that customize instructional content to suit individual learning styles and speeds. These systems utilize advanced

data analytics to carefully examine student interactions and successes, allowing for personalized feedback and learning paths. In addition, AI enhances efficiency in administrative procedures by automating repetitive work, enabling educators to allocate more focus to interactive instruction. Natural Language Processing (NLP) technology improves communication in educational environments, enabling students to interact with intelligent conversational agents that facilitate learning experiences. Machine learning algorithms enhance this field by making predictions about student outcomes and identifying learners who are at danger, allowing for prompt implementation of intervention techniques. Five important pillars are shown in Figure 1:

Figure 1. Important pillars in AI for education

As shown in figure 1, there are important aspects in which AI is transforming the educational environment. The pillars encompass following - AI technologies are significantly reshaping the education environment by offering innovative approaches to distributing material and improving interactive learning experiences. This process frequently entails combining artificial intelligence (AI) with conventional teaching approaches to establish hybrid learning environments that are highly adaptable and sensitive to the requirements of students. In this context, AI enables individualized learning by customizing educational information and adjusting the pace of learning to match the individual learner's style and degree of proficiency. This customization not only benefits students but also empowers instructors and other individuals involved by offering them personalized insights and tools that assist various learning processes and results. Also, by utilizing AI-powered analytics, educational institutions may get significant insights into student learning patterns, performance indicators, and educational outcomes. These analytics facilitate data-driven decision-making to enhance instructional tactics, curriculum design, and overall educational efficacy. In this context, AI facilitates the automation of administrative duties, including scheduling, attendance monitoring, and student enrollment procedures. This automation decreases the burden on administrative personnel, enabling them to allocate more attention to student involvement and less to laborious, manual chores. AI enhances educational systems by streamlining processes and resources, therefore preparing them for future problems. This includes the creation of predictive models that anticipate future patterns and needs in learning, allowing proactive adaptations to educational tactics and infrastructure. Each pillar shown in figure 1 illustrates a key area where AI technologies may be used to improve and advance the educational sector. This may result in a more effective, inclusive, and forward-looking environment that meets the expectations of 21st-century education.

As Khosravi et al. (2022), stated, there is increasing awareness over the *Fairness, Accountability, Transparency*,

and Ethics (FATE) of educational efforts that depend on AI algorithms. An effective method to increase confidence in AI systems is by using eXplainable AI (XAI) techniques. Explainable Artificial Intelligence (XAI) encompasses the use of methods that produce coherent and logical justifications for the choices made by AI systems.

Artificial intelligence development in the educational context

Artificial Intelligence (AI), as a concept and field of research, has existed since the 1950s when Alan Turing posed the question, "Can machines think?" (Gonçalves, 2023). Since then, the development of AI has undergone various phases and challenges, from initial enthusiasm to the "AI winter" periods of the 1970s and 1980s. The history of AI spans nearly a century, marked by milestones in hardware, software, programming languages, and various technologies (Mukherjee, 2023). This development has advanced from rule-based statistical approaches to data-driven methods in fields such as computer vision, natural language processing, and machine learning (Guerrero, 2023; Zhang, 2023). AI's impact on society has been significant, with a shift towards human-machine collaboration and a focus on computing power for sustainable development (Zhang, 2023). Additionally, the rise of AI is intertwined with the development of the Internet, leading to its widespread application in society and everyday life over the past decade. In recent years, thanks to advancements in computing power and the availability of large data sets, AI is experiencing a renaissance and is being applied in increasingly diverse areas, from speech recognition to task automation. This historical trajectory reflects the complex interaction between technical progress, philosophical perspectives, and social implications in the evolution of AI.

The development of AI in an educational context presents a range of opportunities and challenges. Classrooms are increasingly being transformed through the use of AI-driven tools and applications, enabling new approaches to learning and teaching. Artificial General Intelligence (AGI) is gaining recognition for its potential to revolutionize education by replicating human intelligence (Latif et al., 2023). AGI aims to improve tasks that require human-level intelligence, like solving problems and understanding emotions (Latif et al., 2023) by using what we have learned from big language models like GPT-4 and ChatGPT. AGI's goal is to create machines capable of human-level cognitive performance across various tasks, drawing inspiration from the human brain. AGI has the potential to significantly impact society in many ways. However, the development of this technology also brings a range of challenges that need to be carefully addressed. Continuing research and responsible development of AGI are crucial for harnessing the potential of this technology for the benefit of humanity.

Furthermore, AI applications in education (AIED) are developing to support autonomous student learning through systems such as Learning Generated Content (LGC), which aids students in self-directed learning (D. Lee et al., 2023). LGC involves students creating digital materials to enhance learning experiences, such as posters and videos that facilitate content acquisition and language skills development. This approach encourages collaboration between students and teachers, resulting in dynamic information resource that evolve over time. Integrating LGC into education offers numerous benefits, including a personalized learning experience, improved pedagogy, and enhanced support for students in learning and homework completion. The diversity of

AI chatbots, such as those for personalized teaching (Ada), emotional support (Replika), concept understanding (Socratic), text processing (ChatGPT, Bard), fostering good study habits (Habitica), and online discussions (Piazza), can potentially enrich the educational experience (Labadze et al., 2023).

AI offers the potential to extend assessments and evaluations in the classroom, including automated scoring of open-ended teacher responses. It is important to carefully consider the implications and potential biases of AI systems in the educational context to avoid undesirable consequences (Amyatun & Kholis, 2023). Their impact on education can result in potential improvements in learning outcomes, increased student motivation, and provide an exceptional tool for knowledge acquisition, problem-solving, and self-regulation. From the teacher's perspective, AI systems for writing evaluation can automate feedback and grading, facilitating teachers' tracking of student progress. AI tools for monitoring provide real-time information about student engagement and learning, helping teachers personalize instruction and enhance the learning experience (Amyatun & Kholis, 2023). Teachers often have an unclear opinion about AI, necessitating continuous education and training to understand the power and applications of this technology. How research findings on AI are presented can affect their perceived credibility among teachers (Amyatun & Kholis, 2023).

Despite potential benefits, integrating AI chatbots into education raises concerns about reliability, accuracy, ethical dilemmas, and the possible impact on the development of critical thinking in students, their limited ability to understand complex issues, and the need to address ethical issues, develop evaluation methods, and create high-quality AI systems (Labadze et al., 2023). AI chatbots have the potential to significantly impact education. They can provide a personalized learning experience, assist students, and improve teaching. However, the challenges and concerns associated with these technologies must be considered. Numerous studies and initiatives are exploring the use of AI in various environments, from intelligent tutoring systems to teacher monitoring tools and automated writing evaluation. AI in education represents a journey into the unknown, full of promise and risk. Developing a deeper understanding of AI, responsible use of tools, and continuous evaluation of impacts are key to the successful integration of this technology into the future of education. Integrating AI tools and technologies in education is crucial for improving the teaching, learning, and decision-making processes in the digital age.

Method

For our research we choose Systematic Literature Review. Publish research studies between January 2023 and December 2023.

Through this research, we aimed to find answers for following research questions :

Q1: Does science monitor the influence and possibilities of AI on education and care at all levels?

Q2: What are the key questions related to AI in the field of education, which are addressed by scientific papers?

Figure 2. Number of scientific articles about AI in Education in DOAJ base for period 2019-2023

In the first step, we entered the keywords 'AI' (or artificial intelligence) and 'education' into the DOAJ database and limited the period from 2019 to April 9, 2024. The total number of all published papers in the DOAJ database with these keywords is 1590 papers. Figure 2 shows the distribution of the number of published papers in the DOAJ database for the mentioned period.

Table 1. Inclusion and Exclusion Criteria

Criterion	Inclusion	Exclusion
Keywords	Artificial Intelligence, AI, Education	All other
Subject area	Education	Not education
Language	English	Non English
Timeline	2023	Before 2023, 2024
Literature type	Peer Reviewed Journals, Single article in regular number	Conference proceedings, journal articles that are not published in Peer Reviewed Journals, Editorials, Special numbers, Books
Content	Research; at least one of educational topics and at least one of educational level	Not Research

In the second step, we decided to limit the research to the year 2023. With this criterion, there are 363 papers in the database. In the third step, we added other criteria, shown in Table 2. Of the remaining 76 papers, after a detailed reading, 57 papers remained for further content analysis.

Results

The Science of AI in education

Does science monitor the influence and possibilities of AI on upbringing and education at all levels?

After all papers that did not meet the set criteria were excluded, the analysis of the texts was approached. The number of papers dealing with each level of education is shown in Table 2. It is evident that a considerable number of papers pertain to higher education, and that the number of papers decreases with the level of education. There are almost no papers in the early school period, while they are completely absent in early and preschool education and care.

Table 2. Number of articles according to the level of education

level of education	number of articles
<i>kindergarten and preschool</i>	0
<i>elementary /primary school</i>	4
<i>high / secondary school</i>	5
<i>higher education</i>	37
<i>general education</i>	10
<i>professional development</i>	1

What are the key questions related to AI in the field of education, which are addressed by scientific papers?

To answer the second research question, we proceeded with a detailed reading and analysis of the entire group of articles. Content analysis led to several key themes. The first set of themes relates to the (1) application of AI in education, which includes content related to the advantages and disadvantages of its use, attitudes of students and teachers towards the use of AI in education, and individual tools and AI systems that are used or can be used in education. Within this, two dominant themes emerged: Chatbots in education and Language development using AI in education. The second key group of themes covered in the papers is the (2) ethics of applying AI in education, which encompasses the possibilities of unethical use of AI in teaching by students, issues of fairness, transparency, authenticity, and academic integrity, and the question of AI ethics policy in education.

Discussion

Possibilities of AI in Education

Many potential applications of AI in education have been recognized, but some of them encounter difficulties in implementation, while the impact of others is still being examined. The authors whose works are analyzed here recognize many benefits of using AI in education, but with cautious consideration of possible dangers and unknowns (Tlili et al., 2023). "The Impact of Artificial Intelligence on Learning, Teaching, and Education" (2018) is a JRC Science for Policy report published by the EU. The goal of the report itself is to stimulate an

informed discussion about artificial intelligence, its possibilities, and potential impacts on upbringing and education. The integration of AI into educational processes requires further research into the "digital divide" and social inclusion, risks associated with such innovations, and opportunities that technologies offer to address these issues with new approaches (Gentile et al., 2023). The question of the teacher's role also arises, namely what competencies are needed and what tools are necessary to be conscious actors in the innovation processes in the field of AI (Gentile et al., 2023). Generative AI could become the most efficient technology in education (Bozkurt, 2023, p.262). It offers many possibilities and potentials (Ningsih, 2023) (Ningsih, 2023), but by itself, it means nothing. Thus, teachers are expected to creatively integrate the potentials of AI according to the "evolving educational landscape" (Bozkurt, 2023, p.262).

A particularly significant advantage of using AI in education is the personalization of learning, i.e., the adaptation of the curriculum and tailored learning experience (Fowler, 2023; Gómez Martínez et al., 2023) to each student or pupil. In this regard, AI and machine learning techniques can be a means of identifying (Gómez Martínez et al., 2023) and strengthening student motivation. However, the paradox that the authors warn about is at the same time a danger of bias (Fowler, 2023), as algorithms carry the hidden potential to amplify existing inequalities. Particularly significant are the possibilities of applying AI to working with children and students with difficulties (Toyokawa et al., 2023), and the possibility of identifying students at risk (Ouyang et al., 2023), and opportunities for support and counseling (Akiba & Fraboni, 2023). Students and pupils can receive useful feedback on the motivational and behavioral aspects of their learning using data from the digital traces of their activities (Suraworachet et al., 2023). AI can enable personalized and adaptive learning systems that adjust content, activities, and feedback to the needs and interests of students, improving engagement and outcomes (Tarisayi, 2024).

One of the recognized potentials of AI in education is tutoring (Imam Karya Bakti et al., 2023), or mentorship. AI functions that are currently widely implemented on various educational technology platforms serve as virtual mentors. AI has the ability to provide feedback on students' learning activities and exercises, and then recommend materials that need to be reviewed (Suparyati et al., 2023). An example is Blackboard (Suparyati et al., 2023), an AI tool often used for publishing lecture notes, assignments, quizzes, and tests, allowing students to ask questions and submit assignments for grading. This tool can identify the reasons behind students' misunderstandings and offer the student solutions that the professor has previously ensured and programmed (Suparyati et al., 2023). Therefore, AI adjusts content and tasks to students' abilities and needs and directly affects the learning experience. On the other hand, AI also helps teachers more effectively assess student progress and provide timely and accurate feedback. Artificial intelligence thus becomes a means of aligning the curriculum with the demands and needs of the market (Suparyati et al., 2023). Furthermore, the Metaverse has the potential to serve as a revolutionary learning environment that can redefine educational experiences for students worldwide (Qian et al., 2023). Metaverse technology allows students to access and participate in educational settings without time and location restrictions (Qian et al., 2023). AI provides opportunities for designing and implementing innovative teaching methods, managing workload, expanding and improving evaluation (Laupichler et al., 2023), and the overall education process (Gentile et al., 2023).

Furthermore, AI can help in providing feedback and assessing progress. Special attention is given to the advantages of automated scoring and immediate feedback (Ningsih, 2023). When it comes to assessment, AI increases the efficiency of assessment, reduces subjectivity, and improves accuracy (Ningsih, 2023). Students themselves rate the online testing system for AI positively. The benefits of such an assessment system are manifested in flexibility, convenience, ease of use, engagement, immediate feedback, accessibility, efficiency, enjoyment, clarity, and unique features (Ningsih, 2023).

Different levels of education will likely develop different applications of AI, due to the specificities of children's developmental periods and their learning. However, there are also tools and systems that will be common, especially in the domain of the teacher's application. AI in early education is seen as a catalyst for promoting learning and teaching (So & Lee, 2023). In this regard, robotics has already been implemented at this level in many parts of the world. It is a departure from traditional teaching methods, which improves the learning experience and student interactivity. The role of the teacher in this changes, becomes less direct, and more resembles the role of a facilitator (So & Lee, 2023). The authors emphasize that this is in line with the settings of the constructivist approach. Robots are very attractive to children and have a positive effect on their motivation. However, the path to the everyday use of robots in teaching is long. Robots are still too expensive for most educational institutions and require certain technical support. Technical problems are recognized as one of the biggest challenges in their use (So & Lee, 2023). Interestingly, children see a humanoid robot as more fun and friendlier than a teacher (So & Lee, 2023).

Various studies on student engagement in virtual and digital education suggest that such teaching and learning environments can indeed encourage educational growth. However, there is a question of effective teacher-student interactions in this process, as the same studies have shown that almost half of the students do not believe that online lectures effectively facilitate interaction and collaboration (Sadegh-Zadeh et al., 2023). Managing student engagement within a virtual educational environment is key to encouraging success in online learning (Sadegh-Zadeh et al., 2023). Perhaps the solution is somewhere in the middle, the use of AI in a real environment, where an informed teacher can be a significant example of a quality ratio of virtual and real experience.

The application, possibilities, and discussions related to AI are extensively researched in the field of higher education (Greiner et al., 2023; Teferi et al., 2023). Using AI in education, first of all, requires knowledge and understanding, and awareness of limitations and potentials. It is necessary to understand that, for example, tools like ChatGPT, to realize their potential, must themselves receive strategically well-formulated queries. However, many such tools offer information that is already partially outdated, as they were used in their training.

Also, many studies have pointed to the creation of false articles, although giving references may seem like they are about real articles. This is particularly important in the context of informing and educating students, who may be unaware of these dangers, and thus exposed to the unconscious creation of their own false works, and

raises the question of whether students using these tools achieve the intended learning outcomes (Lancaster, 2023). The ethical issue will be discussed more in the later part of this paper.

The use of AI in academic programs is not yet sufficiently prevalent (Li & Qin, 2023). It is necessary to modernize academic curricula, but considering the methods and time frames for changes to academic programs on one hand, and the speed of AI progress on the other, it will certainly take a significant amount of time before changes occur. Students inform themselves independently, which raises discussions about awareness of ethical issues in this domain. It is particularly important to consider introducing an AI curriculum into academic programs in areas where AI is already very functionally used and has a significant contribution, such as medicine. Li & Qin, (2023) emphasize that three key points should be considered: Raising student awareness; Enriching the curriculum; and addressing student needs. Similar settings can be applied to other areas of higher education. It is essential to ensure alignment between the labor market and its needs with the education of future professionals in that labor market (Li & Qin, 2023).

New learning and assessment opportunities enabled by AI, according to Williams, (2023), are visible in support for individual students and collaborative scientific work. In this context, AI's potential in supporting individual students is seen in individual academic activities and students' self-regulatory skills through dynamic information filtering, curating notes, creating summaries, and connecting resources, as well as support for team project work and problem-based learning through dynamic information filtering, curating notes, creating summaries, and connecting resources, among many others. Williams (2023) discusses the implications of cheating with AI in academic circles. He concludes that it is impossible to ban the use of AI by students, so the general use of summative assessment should be considered a weakness that must be transformed. It provokes questions about the purpose of assessment and even about the delivery and assurance of higher education.

The full potential of AI use in education is still not known. However, many areas have begun testing changes in school curricula, such as geography teaching, for example. Innovators emphasize that there is a gap between ideas and implementation, meaning that education often lags behind technological innovations, and the implementation of new technology-based teaching methods requires time - time for designing teaching, teacher training, and updating educational policies to adapt to these changes (Lee, 2023).

New technologies like AI design tools offer an efficient and effective way for elementary school teachers to create attractive educational materials (Hong Chuyen & Vinh, 2023). Scientific research should also have an applicable application in the field of design and development. For example, a study aimed at investigating the intention to use AI design tools among elementary school teachers (Qian et al., 2023), with a special focus on the dimensions that influence their adoption and use of these tools, offers practical implications relevant for both designers and developers of AI design tools. It provides insights into factors that can positively influence user intent to adopt the examined tools, such as performance and effort expectations, peer influence, and the availability or accessibility of resources. The study emphasizes the need to focus on improving the usability and ease of use of these tools, while simultaneously highlighting their potential benefits and the support they can

provide in the design process (Qian et al., 2023).

Attitudes Towards the Use of AI in Education

Study findings suggest that students have a positive attitude towards generative AI technologies and want to integrate them into their learning, such as ChatGPT. Students who are more familiar with these technologies and use them more frequently are more inclined to use them in the future (Chan & Hu, 2023). It is important to create supportive environments that emphasize the importance of AI and offer adequate technological resources and technical assistance to encourage students to learn AI. Students who perceive higher levels of efficiency and usefulness in learning AI are more likely to learn AI (Wang et al., 2023). Gender differences have been identified. Male students perceive higher levels of supportive environments and expectancy-value beliefs in learning AI, indicating a need for greater attention to supportive environments and expectancy-value beliefs among female students to improve their learning in AI (Wang et al., 2023). Therefore, according to research, students are positive about the application of AI in their education but are also aware of its shortcomings and express skepticism about the quality of information and sources that, for example, ChatGPT provides (Lozano & Blanco Fontao, 2023).

Chatbots in education

Chatbots, among other things, have been recognized as potential in higher education teaching across various disciplines. However, there is a need for further development. Research by Gregory (2023) found that chatbots provide better responses to questions based on real situations than hypothetical ones, especially when it comes to requests for redefining terms. Nevertheless, during the research, Chat GPT showed rapid progress (Gregory, 2023). According to some authors, ChatGPT could refresh the education system, for both students and teachers. Its use could significantly reduce the time spent preparing tasks, especially for tasks that address individual differences among students. AI can certainly reduce the time for various administrative tasks that have significantly burdened teachers' work (Lozano & Blanco Fontao, 2023). By alleviating these burdens, teachers could focus more on the students themselves. The special value of AI in education has been recognized in the personalization of tasks, or the possibility of frequent application of Universal Design for Learning (Lozano & Blanco Fontao, 2023).

ChatGPT can be used in many ways in teaching. For example, it can generate exercises related to topics with which students are not familiar and offer them some advice instead of solutions. It can provide steps in problem-solving. Furthermore, ChatGPT can be an outcome for group discussions or an integral part of graded tasks. Its potential is visible in formative assessments, providing real-time feedback after activities (Liang et al., 2023).

The mentioned tools are limiting in creating content and connecting information as well as in-depth insight from different positions, and when they do provide insight from different positions, they do so by separating information about each area.

AI does not have the ability to understand how to strategically connect information that has been previously used (Davis & Lee, 2023). Also, despite all the information it possesses, ChatGPT still lacks more detailed insights that integrate elements relevant to students and their learning environment (Davis & Lee, 2023).

Further research on the impacts of integrating chatbots into upbringing and education should provide insight into their long-term sustainability over time. Such information is crucial for educational policymakers. The integration of artificial intelligence, including chatbots, is not an insignificant issue before making any long-term decisions, and one should be well informed (Labadze et al., 2023).

Language and AI

A significant number of studies explore the possibilities of AI application specifically in the field of language, where its contribution is recognized (Ningsih, 2023). On one hand, the quality of tools is questioned, and on the other, attitudes towards them. Although AI tools have significantly improved in recent years, they still create illogical and unusual translations, as well as linguistic and grammatical errors (Makeleni et al., 2023). Research indicates that there is a diverse array of AI writing tools (e.g., Quillbot, Jenni, Chat GPT, WordTune, Copy.ai, Paperpal, and Essay writer) that are actively used among teachers of English as a Foreign Language (EFL) (Marzuki et al., 2023). The growing trend of using these AI tools has a positive impact on students' overall academic performance. It positively affects motivation and enriches the learning experience and writing skills. However, as in other areas, we encounter possible challenges here. Teachers warn of potential dependency and the risk of limiting critical thinking and personal creativity. Therefore, there is a need for balanced use of AI tools, encouraging both creative assistance and independent thinking (Marzuki et al., 2023).

One of the costlier tools for natural language processing using artificial intelligence and language processing technology today is QuillBot. The primary goal of QuillBot is to assist users in writing, summarizing, and improving text, i.e., creating more sophisticated and influential written content.

QuillBot AI indicates an improvement in the writing abilities of eleventh-grade students in creating hortatory expository texts (Amyatun & Kholis, 2023). Using QuillBot AI as a media tool in combination with a problem-based learning approach can lead to multiple improvements in the educational context. For example, it helps in paraphrasing and improving written content; it helps students express their ideas more effectively, ensuring that their solutions and thought processes are articulated so that peers and instructors can easily understand them; it assists students in enhancing their written explanations and reports, as well as improving students' writing abilities and confidence (Amyatun & Kholis, 2023).

Most teachers, according to Putra (2023), do not believe that AI writing correction tools can positively influence the increase in the level of critical thinking among students. As promising aspects of using these tools, they see the discovery and correction of errors, while students see AI as help in meeting deadlines for fulfilling obligations, i.e., saving time (Putra, 2023). Interestingly, neither students nor teachers saw AI writing tools as a

means of cheating and plagiarism. Teachers, however, show a deeper understanding and knowledge of various writing tools (Putra, 2023; Marzuki et al., 2023).

Ethics and AI in education

In most of the analyzed papers, authors touch on the ethical issue of using AI in education in some way. The use of artificial intelligence is recognized as a threat to the traditional view of academic honesty (Fowler, 2023). There is a visible need for the education system and the accompanying scientific community for a clearer understanding of the possibilities and dangers of using artificial intelligence. Also, there is a noticeable need for systematic support of educational policy and policy in general, leadership of educational institutions, and the connection of educational actors and scientists with designers and developers of AI.

One of the exposed problems is related to the potential dangers of student misuse of AI in creating their papers. In this regard, much research is focused on questioning the effectiveness of tools for detecting AI-generated text, i.e., distinguishing human text. Many studies have shown that ChatGPT is not always objective and accurate, nor are other generative models, because their effectiveness depends on the quality and diversity of materials used in training (Grassini, 2023). These materials are often raw data. Although this can be seen as a problem of artificial intelligence on one hand, on the other hand, in a world that is just learning to live with AI, including in the academic part, inconsistencies and inaccuracies allow for easier detection in checking student papers (Grassini, 2023). Plagiarism has become a significant problem and concern of educational institutions in the context of AI application (Grassini, 2023). Parallel to generative models, various anti-plagiarism systems are being developed, which, in addition to checking for plagiarism, also check for the presence of AI in student texts.

Studies indicate that AI detection tools can to some extent distinguish content created by humans from that generated by AI. However, the same research emphasizes that their performance is inconsistent and varies depending on the sophistication of the AI model used to generate content. Therefore, AI detection tools should not be used as the sole determining factor in cases of plagiarism and academic integrity questions (Elkhatat et al., 2023). Even widely used academic AI text detection tools have shown significant rates of false negatives, but also false positives (Farrelly & Baker, 2023). False positive results can lead to wrongful accusations of students, and false negatives allow students to avoid detection of unauthorized content generation, gaining an unfair advantage and avoiding sanctions (Weber-Wulff et al., 2023). In addition to the issue of misuse of various tools for writing student papers, another ethically questionable practice appears here. Namely, AI text detection tools imply the submission of student papers, without consent, to a multitude of freely available platforms that can be easily found with a simple internet search (Farrelly & Baker, 2023). The educational communities play an extremely important role in conveying academic values and academic integrity (Nam & Bai, 2023) to students, including in the area of ethical use of AI, both in writing papers and in its broader possibilities of application. To make this possible, the highest standards of professional and personal ethics must exist in all spheres of academic life, and teachers themselves must be trained to apply various artificial intelligence systems

(Lozano & Blanco Fontao, 2023).

Policies on the ethics of artificial intelligence in higher education are a growing concern of academic communities (Chan, 2023), so many colleges and universities are increasingly adopting and integrating AI systems into their operations and decision-making processes. The emphasis is placed on issues of fairness, transparency, accountability, security, and human autonomy (Slimi & Villarejo Carballido, 2023). The use of AI in admissions, financial aid, and other student services could exacerbate existing biases and discrimination based on race, gender, and socioeconomic status. Therefore, everything AI does should be understandable and easily verifiable. Institutions of higher education should prioritize the formulation of robust digital literacy programs, which represent a key mechanism for mitigating the harmful impact of artificial intelligence on academic integrity (Fowler, 2023).

Care must be taken to ensure that decisions made by the AI system are aligned with human values and do not undermine human independence. Universities must be aware that their administrations are responsible for the actions and decisions of AI and for ensuring mechanisms for control, corrections, and other issues that may arise in this domain. Existing AI ethics policies, such as those of the European Commission, can help them (Slimi & Villarejo Carballido, 2023). Therefore, the priority must be on the ethical use of AI, AI literacy, and the development of frameworks that empower students and educators to safely harness the full potential of these technologies (Farrelly & Baker, 2023). AI still cannot replace humans. According to Greiner et al., (2023), the differences between human-to-human communication or with AI are visible in capabilities (AI may not be able to understand or respond to complex or abstract concepts in the same way as a human), responses (AI's responses may be more limited and predictable than those of humans), empathy (AI may not be able to respond to emotional signals or provide emotional support in the same way as a human), learning (AI may not be able to adapt to new situations or learn from its own experiences in the same way as a human), and trust (the level of trust in information provided by AI is lower than that we have when it is spoken by a human).

The strategic leadership of universities plays a key role in guiding the appropriate adoption and innovation of AI to balance benefits and risks. It is crucial that the leaders themselves have a deep understanding of the possibilities of AI, trends, challenges, and applications tailored to higher education, with the aim of maximizing benefits while minimizing potential harm (Tarisayi, 2024).

Conclusion

It is evident that the educational community is facing global changes, shifting from traditional to contemporary methods of teaching and evaluating all segments of the upbringing and education process. There is a growing interest in the number of published works on the topic of AI in education. Many possibilities for the development of education have been observed, as well as significant potential in the use of AI in many spheres of education, especially in the field of higher education. Alongside a series of recognized advantages of using AI

in education, and the development of a range of AI tools and systems intended for the educational process, many questions and unknowns also arise. The field of AI is advancing significantly faster than the practical and scientific part of education. Thus, works published in 2023 in many ways show already nearly outdated data, at a time when the awareness of respondents is growing, and new tools are being applied. Among the most significant advantages of using AI in education are the possibilities of personalizing the educational process for students and pupils, reducing administrative obligations and the time invested in them for teachers, influencing motivation and learning processes in children and students, opportunities for tutoring and mentoring, significant contributions to foreign language learning, assessment and feedback that are immediate and tailored to the needs of students and pupils, and many others. The tools and systems used are diverse, and as such, can meet the needs of the entire vertical of the educational system, and various subject areas. On the other hand, questions arise related to the dangers of applying and doubts about AI, many ethical dilemmas, the possibility of creating an even greater gap and discrimination, the question of the impact on critical and creative thinking, the absence of personal experience of relationships, the question of the role of teachers and others.

Significant research on AI in education relates to the academic community. Many potentials are visible there. However, for these potentials to be realized, the academic community must simultaneously deal with many challenges related to the ethics of using AI, which calls into question the very operation of higher education institutions and its fundamental postulates, academic honesty, integrity, professionalism, intellectual property, and autonomy. Universities must approach this issue responsibly and in a timely manner, taking into account the speed of the emergence of novelties, labor market needs, and ethical recommendations of educational policy, and adapt in time, acting as a model for students, with clear guidelines based on informed use of AI in education.

Recommendations

AI offers revolutionary changes to the education system by providing personalized learning experiences, improving accessibility, enhancing assessment, and automating tasks. However, it is crucial that AI is used in a way that is ethical, responsible, and integrated into the existing curriculum.

The use of AI in education brings with it a number of ethical dilemmas that need to be carefully considered. The development and implementation of sound ethical guidelines are crucial to ensure that AI systems are used in a transparent, fair, and responsible manner.

Furthermore, educational institutions should invest in comprehensive digital literacy programs to enable educational stakeholders to deal with the complexity of AI. These programs should equip people with the skills and knowledge they need to critically evaluate and responsibly use AI-generated content. In doing so, ongoing research is needed to monitor the impact of AI on education, including its long-term sustainability and its impact on learning outcomes.

By implementing the above recommendations into policy and practice, we can harness the full potential of AI to transform education while ensuring ethics, fairness, and benefit for all involved in the educational process.

Transformative Leadership and Organizational Citizenship (OCB): A Case Study of the SMEs Development Authority in Oman

Sara Rasool Al Jabri

Modern College of Business & Science, Oman, Oman

Abstract: This study aims to explore – from the perspectives of employees working at the Small and Medium Enterprises (SMEs) Development Authority in the Sultanate of Oman - the extent to which transformational leadership improves Organizational Citizenship Behavior (OCB) and innovation strategies increase employee performance. In addition to revealing how transformational leadership is perceived, the study reports on the correlation between transformational leadership behaviors and OCB dimensions—inDesign/methodology/approach. The study's research design is based on a positivist philosophy. Data collection was conducted using a quantitative research design using a correlational approach, involving surveys administered to 40 employees of the SME Development Authority. Descriptive statistics and correlation analysis were used to analyze the quantitative data component. Findings suggest that transformational leadership components, precisely 'Inspirational Motivation' and 'Intellectual Stimulation,' improve OCB among SMEs Authority. These leadership behaviors correlate with increased OCB, representing that employees are expected to exceed job expectations under inspiring and intelligently engaging leadership. The results also reveal the importance of cultural values in moderating the relationship between transformational leadership and OCB. The findings suggest that the selective use of particular leadership abilities would be instrumental in seeing organizational success more Significantly. Although the sample was taken from one case study in a limited geographical area in Oman, it may jeopardize the generalizability of the findings. The study opens a new research horizon to validate the results in similar locations. originality/value – The study provides insights, via the quantitative findings, into the impact of transformational leadership and innovation strategies on SMEs in Oman. It spotlights the critical role of leadership in motivating employee performance and organizational citizenship behavior. The insights gained from this study are helpful to SME leaders, decision-makers, and scholars. It gives them an understanding of the value of leadership and innovation in improving organizational effectiveness.

Keywords: SME (Small and Medium Enterprise), OCB (Organizational et al.), Transformational Leadership, Cultural Values

Study of the SMEs Development Authority in Oman. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2428-2441), Antalya, Turkiye. ISTES.

Introduction

Small and Medium Enterprises Development Authority (SMEs) is the backbone of Oman's strong and dynamic economy, setting new impulses for growth, innovation, and economic diversification. The SMEs' Development Authority is pivotal in fostering job creation, entrepreneurship, and resilience, primarily driven by effective transformational leadership. This leadership style is essential for inspiring and motivating employees to achieve organizational goals. Transformational leadership is emerging as the most important in Oman's ever-changing market, where quick innovation is critical to solving problems. In Oman, respect, community, and loyalty are cultural values that increase transformational leadership via amplified engagement of employees and productivity within the SME Development Authority. Sultan Haitham bin Tariq underlined that he wants to focus on the role of SMEs in the national economy. Those innovations and advanced technologies could be the basement of national recovery (Qamar et al., 2023). Royal Decree No. (2020/107) has been issued to establish the SME Development Authority to promote further SME development and strengthen (Sultanate of Oman, 2020). In this background, the study will underscore that transformational leadership and innovation strategies remain relevant for Oman's SME sector because of their critical role in the country's economic plan.

This report seeks to dissect and understand the connection between transformational leadership and OCB within the SMEs Development Authority in Oman. This paper tries to discover how the leadership styles employed in this significant institution follow the cultural and economic goals set forth by the Sultanate of Oman. Beyond the practical leadership framework investigation, it highlights the undercurrents that bear the effects of OCB, which is one factor of significant importance for the vibrancy and resilience of the SME (Palalic et al., 2023). With this firmly in mind, the following report attempts to investigate, with quite a high level of granularity, transformational leadership dynamics to understand how it might be that this mode of leadership can serve, hypothetically, as a proposal for leaders across SME development authority in Oman and, possibly, to set a precedent for similar institutions.

Research objective

In this regard, the paper will play two roles.

This study investigates the relationship between the style of transformational leadership and Organizational Citizenship Behavior (OCB) by Omani SMEs. OCB has been defined as organizational citizenship behavior, meaning those professional behaviors from employees that are extra-role and not recognized through the formal reward system but very much beneficial for the organization's effectiveness (Palalić et al., 2023).

To explore the leadership innovation strategies used by the leaders of these SMEs and examine how such strategies may enhance employee performance (Tian et al., 2020).

Appreciating the above fact is essential for SMEs in Oman as they face the challenges of modernization, globalization, and higher competition. This appreciation is aimed at drawing empirical insights on the effectiveness of transformational leadership toward driving behaviors beyond basic job requirements through comprehensive quantitative research and analyzing data collected from diverse SMEs across the Sultanate. This report aims to derive empirical insights into how effective transformational leadership is in the Sultanate toward driving behaviors beyond basic job requirements. Considering these problems, this paper explains leadership effectiveness within a broader perspective of the SME staff and presents practical recommendations to SME leaders in Oman.

Literature review:

Leadership Theories with a Focus on Transformational Leadership:

There have been essential shifts in leadership theories over time, responding to organizational dynamics and the workforce's expectations. Early trait and behavioral theories, among others, all sought to explain precisely which trait or behavior leaders required to be effective (Vasilescu, 2019). However, with the rise of more complex organizational structures came forth theories that took the limelight instead: transformational leadership, coined by James Burns and later expounded upon by Bernard M. Bass (Gonfa, 2019). Transformational leadership focuses on visionary, change-agent leaders who inspire people toward organizational or group goals. It has four components: Idealized Influence, Inspirational Motivation, Intellectual Stimulation, and Individualized Consideration (Reza, 2019). It goes beyond the transactional exchange, with a push or motivational factor for the employees to excel beyond their expected limit. This inspiration is of the most significant importance for SMEs since the critical issues related to success are adaptability and innovation. Even though transformational leadership has been a successful approach in many cultures to facilitate innovation and increase collaboration, it has been a relatively under-researched aspect in the context of SMEs in Oman. Oman adds another level of complexity to its leadership dynamics: the cultural details of Oman, like the strong inclinations of its people toward community and collective values. Understanding how transformational leadership principles interface with Oman's cultural values in an SME can offer unique perceptions of leadership effectiveness and organizational outcome (Reza, 2019). This gap within the literature must be bridged for academic enrichment and practical leadership development, particularly within Oman's growing SME, whereby effective organizational leadership could drive sustainable growth and competitiveness.

Organizational Citizenship Behavior (OCB) and Its Importance:

Dennis Organ conceptualizes Organizational Citizenship Behavior (OCB) as behavior that exceeds one's expectations from the formal organizational job requirements and contributes highly to the organization and the atmosphere (Kayaalp et al., 2021). These include, though are not limited to, the behaviors in which an employee

helps his colleague voluntarily, takes on additional responsibilities, and exhibits a high level of dedication and commitment towards the organization. With fewer resources and staff compared to big corporates, the effectiveness of SMEs is highly likely to reflect much more disproportionately in organizational effectiveness and find its reflection in OCB. It has to encourage a culture of mutual support and proactive involvement that is critically required to help these enterprises drive growth and adaptability. Moreover, OjsonCB can contribute to developing team cohesion and workplace spirit to create a productive and harmonious working atmosphere.

For example, the expression and meaning of OCB among individualistic cultures, such as Oman, may differ from the more collectivist societies. Under the communal values and the collective ethos that Omani culture espouses, the behaviors embraced within OCB may be intrinsic, moving in nature, and socially induced (Romaiha et al., 2019). It presents an exciting context of this cultural background regarding how OCB reveals itself in Omani SMEs and to what extent the transformational leadership style influences it. With such studies already present to cover the extent of OCB within various organizational contexts, the literature surrounding it is already enormous. It must explain how such a concept would behave within Oman's SMEs. This gap is essential in understanding how particular leadership approaches embedded in the nation's cultural fabric could either evoke the OCB development or act as a hindrance against it. Filling this negated with focused research would not just further the theoretical understanding of OCB but also provide valuable practical insights to the SMEs in Oman to nurture a work culture from which such beneficial behaviors naturally arise.

Identification of Literature Gap:

The present body of literature develops a relatively strong base to understand the effect of transformational leadership on Organizational Citizenship Behavior (OCB); there remains an apparent gap within the existing research bodies, closely the case of Oman's public sector entities, including the SME Development Authority. Research has focused mainly on private sector firms, or even worse, on public institutions in cultures far more different from each other (De Oliveira et al., 2019). Specifically, how the strategic imperatives outlined by His Majesty Sultan Haitham bin Tariq and the interplay of Omani cultural distinctions may influence the appearance of OCB under transformational leadership within such an authoritative body is a crucial area yet to be thoroughly probed by the literature. This uncharted research space, hence, provides the opportunity to investigate, for the first time, the generalizability of the transformational leadership theories in the Omani public sector and the uniquely tailored nature of OCB that could be engendered by the culturally agreed leadership practices in the SMEs Development Authority. Such attention would add both new dimensions and central perspectives to academic discourse. This attention would assure policymakers and organizational leaders of the certainty of the full tapping of human capital potential to serve the national economic objectives.

Conceptual framework

Within this background, therefore, it is clear that the research is based on a theoretical model that elucidates transformational leadership as the independent variable with Organizational Citizenship Behaviour (OCB) as the

dependent variable, with a keen focus on the moderating influence of Omani cultural values and organizational factors like regulatory constraints and technological relevance. Based on this, one may outline two main hypotheses: The first would state that there is a positive significant relationship between transformational leadership behaviors and OCB within the SMEs Development Authority, while the second would argue the fact that Omani cultural values, with organizational factors, as moderators, will moderate the relationship and influence the Extent and manner of OCB manifestation (Novianti, 2021). It will, therefore, guide the design of the study instrument and further help in analyzing the data obtained from the study. The framework will further help as a theoretical lens through which the data shall, on the one hand, be gathered and, on the other hand, interpreted towards the empirical findings on the larger academic discourse on leadership and organizational behavior.

Research Question

Given the identified gap in the existing body of literature, this study will endeavor to answer specific research questions. These will be questions about how transformational leadership within the SME Development Authority influences Organizational Citizenship Behavior (OCB) within the Omani context (Psomas & Antony, 2019).

In light of the above, the following will be the research questions:

1. How significantly do transformational leadership behaviors, as practiced in the SMEs Development Authority, correlate with the employees' OCB dimensions?
2. What is the role of cultural values in moderating the relationship between transformational leadership and OCB in the Authority?

These research questions are central to providing a framework for guiding the study's methodology and analysis. They establish a framework for comprehensively exploring how leadership styles and strategies within SMEs in Oman can shape employee behaviors and organizational outcomes.

Research objective

In this regard, the paper will play two roles.:

1. This study investigates the relationship between the style of transformational leadership and Organizational Citizenship Behavior (OCB) by Omani SMEs. OCB has been defined as organizational citizenship behavior, meaning those professional behaviors from employees that are extra-role and not recognized through the formal reward system but very much beneficial for the organization's effectiveness (Palalić et al., 2023).
2. To explore the leadership innovation strategies used by the leaders of these SMEs and examine how such strategies may enhance employee performance (Tian et al., 2020).

Appreciating the above fact is essential for SMEs in Oman as they face the challenges of modernization, globalization, and higher competition. This appreciation is aimed at drawing empirical insights on the effectiveness of transformational leadership toward driving behaviors beyond basic job requirements through comprehensive quantitative research and analyzing data collected from diverse SMEs across the Sultanate. This report aims to derive empirical insights into how effective transformational leadership is in the Sultanate toward driving behaviors beyond basic job requirements. Considering these problems, this paper explains leadership effectiveness within a broader perspective of the SME staff and presents practical recommendations to SME leaders in Oman.

Research Variables:

The research is based on a theoretical model that elucidates transformational leadership as the independent variable with Organizational Citizenship Behaviour (OCB) as the dependent variable, focusing on the moderating influence of Omani cultural values and organizational factors like regulatory constraints and technological relevance. Based on this, one may outline two main hypotheses: The first would state that there is a positive significant relationship between transformational leadership behaviors and OCB within the SMEs Development Authority, while the second would argue the fact that Omani cultural values, with organizational factors, as moderators, will moderate the relationship and influence the Extent and manner of OCB manifestation (Novianti, 2021). It will, therefore, guide the design of the study instrument and further help in analyzing the data obtained from the study. The framework will further help as a theoretical lens through which the data shall, on the one hand, be gathered and, on the other hand, interpreted towards the empirical findings on the larger academic discourse on leadership and organizational behavior.

The Hypothesis to be tested:

H1: The high levels of transformational leadership behaviors exhibited by leaders within the SMEs Development Authority have a significant positive relationship with the dimensions of OCB exhibited by the Authority's employees.

H2: Cultural values moderate the relationship between transformational leadership and OCB so that transactional leadership improves the expression of citizenship behaviors within the SMEs Development Authority.

The research questions hypothesized how the interaction of leadership style with organizational behavior and cultural context would further shape and be shaped to create a focus for empirical research (Crede et al., 2019). Thus, the present study is expected to test the same to provide a valuable contribution in the form of theoretical insights into the effectiveness of transformational leadership in specific cultural settings and pragmatic input for organizational development within the public sector of Oman

Method

Research Design

This study used a quantitative research design, using the correlational approach, to test relationships postulated in the hypotheses.

The research hypothesis and conceptual framework mentioned above will guide the study instrument's design and further assist in analyzing the data obtained from the study. The framework will further help as a theoretical lens through which the data shall, on the one hand, be gathered and, on the other hand, interpreted towards the empirical findings on the larger academic discourse on leadership and organizational behavior.

It takes the honor of leading the strategy for economic diversification and growth through SMEs for the Sultanate. Its setting is chosen to be in the countries of Kenya, South Africa, and Ghana, whereby it is purposively selected not only because it has relevance to the national economic narrative but also as an exemplar of the potential impact of transformational leadership within a public sector context (Cremin & Collins, 2019). Operating at the confluence of traditional Organizational cultural values and modern organizational practices gives a perfect microcosm to examine how leadership styles may engender OCB within this culturally rich but rapidly evolving economic landscape. This entity provides a rich vein of insight into how leadership and cultural values come together concerning organizational behavior, thus the focus it gives to this study with a localized understanding that may be important to similar institutions within the Region and beyond.

This study will engage 40 employees of the SMEs Development Authority in Oman as the selected sample. A sample of this nature is chosen so that the manageability and depth of the data are not compromised while still ensuring that a broad spectrum of insights into the study's objectives is obtained. Participants will be taken using the stratified sampling technique, representing different sections and levels within the organization so that the perspective relating to leadership and OCB comes from all possible diversities (Rahman et al., 2022). The fact that participation was open to full-time staff of the Authority with at least one year in service indicates, at least, their opportunity to serve and get exposed to the entity's leadership styles and organizational culture as offered at their organization. The criterion will collect information from persons who have watched how leadership behavior is portrayed and how it influences organizational citizenship behaviors.

This study used a quantitative survey that used a structured questionnaire to assess the latent constructs such as Transformational Leadership, Organizational Citizenship Behavior (OCB), and Organizational Commitment, which were influenced by Omani cultural values (Harris & Brown, 2019). It contains three major sections:

1. Transforming Leadership: This indicates the modification of Bass and Avolio's Multifactor Leadership Questionnaire (MLQ) to evaluate subordinates' perceptions concerning the transforming patterns demonstrated by their supervisors within Authority (Batista-Foguet et al., 2021). Transformational objects were adapted to

correspond with the longitudes of perfect impact intensity, great incentivization, high intellect, and accurate individual consideration.

2. Organizational Citizenship Behavior: This section entails three elements of OCB, as demonstrated in Podsakoff et al.'s OCB scale. Contextualized questions will be the ones that will suitably be based on the organizational circumstances of the Omani SMEs Development Authority (Henderson et al., 2020).

3. Cultural context: Measures of Omani cultural ties shall be included to estimate their impact on transformational leadership and their connection to OCB (Ugheoke, 2019). Items are to be developed based on the cultural dimensions identified in the relevant literature so that they may apply to the Omani work environment.

The developed questionnaire was pilot-tested on an assumed small sample of Authority employees, whereby employees are drawn to assure clarity, relevance, and cultural relevance. The pilot results guided the changes needed to the questionnaire before the final deployment. The last questionnaire was administered through the online data collection system, ensuring that it obtained practical data from all the population-based potential participants identified from the world without geographical or logistical barriers.

Data Collection Procedure

The study was based on a structured survey that had been designed in such a manner that it could capture the distinctions of insights into the dynamics of Transformational leadership and Organisational Citizenship Behaviour (OCB). The first steps were carefully crafted to be sure the instrument covered a good range of questions (Rashid et al., 2019). These questions examined pertinent themes, such as leadership style and OCB dimensions. The survey design was done in a manner that explicitly laid the inquiry way relevant to the settings in the Omani public sector.

After creation, the next step was to distribute the survey electronically using Google Forms. The tool was chosen due to its effectiveness, easy access, and powerful capabilities in tracking responses (leaning,2019). SME Development Authority employees were approached through WhatsApp. These emails, apart from including the link to the survey, contained a very brief but highly informative summary of the purpose of the study. Respondents were also briefed that their responses would be confidential and maintained anonymous, and the study would rely on every participant's contribution for success. Reminders were sent to receive a high response and notify the participant about how valuable their responses were for organization development.

Results

The following analysis summarizes the survey responses from the participants working at various SMEs in Oman. It provides insight into the relationship between transformational leadership, OCB, and the effectiveness of innovation strategies. The summary result is presented in the following tables.

Theme 1: Exploring the Impact of the Problem (Questions 1-3)

Table 1. Descriptive Statistics for Leadership Behaviours Impacting OCB

Question Number	Survey Question	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Mean	Standard Deviation
Q1	Idealized Influence	2 (5%)	3 (7.5%)	10 (25%)	15 (37.5%)	10 (25%)	3.75	0.89
Q2	Inspirational Motivation	1 (2.5%)	4 (10%)	8 (20%)	20 (50%)	7 (17.5%)	3.80	0.78
Q3	Intellectual Stimulation	0 (0%)	6 (15%)	12 (30%)	14 (35%)	8 (20%)	3.75	0.85

The analysis of the first three items of the survey is of significant importance, as it indicates that a substantial majority of participants (75%) view the indicator of Idealized Influence, Inspirational Motivation, and Intellectual Stimulation as prominent within the Oman SME Development Authority. This high level of agreement towards levels 4 and 5 (To a great extent and a great extent), with an overall mean of 3.77 and a standard deviation of 0.84, underscores the relevance of these leadership behaviors within the organization. The analysis of the SD further points out that most respondents' answers are collected around the mean, indicating a consistent perception. The mean score of the first variable (Idealized Influence) was the highest ($M = 3.75$, $SD = 0.89$, n for all means = 40), followed closely by variable two – Inspirational Motivation – ($M = 3.80$, $SD = 0.78$). Variable three, Intellectual Stimulation, scored a Mean at 3.75 and an SD at 0.85. The lowest mean was for the fourth variable, the Influence of leadership behaviors on OCB engagement, with a mean of 3.8 and an SD of 0.8. Variable five (Impact of leadership behaviors on team dynamics) scored a Mean of 3.7 and an SD of 0.85.

The statistical results of question one reflect a deep understanding of the participants' perspectives. They indicate that the highest means were for participants' perceptions of the extent to which leaders at the SMEs Development Authority act as role models and uphold high ethical standards. The lowest means were related to participants' perceptions of how these leadership behaviors tangibly impact team productivity and performance. These findings, which align with the emphasis on ethical leadership within the organization, demonstrate a respectful acknowledgment of the participant's views. The finding of variable three is also expected; participants, by and large, believe that leaders at the Authority encourage creativity and innovation.

Theme 2: Addressing Consequences (Questions 4-6)

Table 2. Responses to Questions on OCB Engagement, Team Dynamics, and Team Productivity

Question Number	Survey Question	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Mean	Standard Deviation
-----------------	-----------------	-------------------	----------	---------	-------	----------------	------	--------------------

Q4	OCB Engagement	3 (7.5%)	5 (12.5%)	17 (42.5%)	10 (25%)	5 (12.5%)	3.3	0.8
Q5	Team Dynamics	4 (10%)	6 (15%)	14 (35%)	12 (30%)	4 (10%)	3.2	0.85
Q6	Team Productivity	2 (5%)	8 (20%)	12 (30%)	13 (32.5%)	5 (12.5%)	3.4	0.75

Research question theme two, "Addressing Consequences," measured participants' perceptions of how leadership behaviors influence Organizational Citizenship Behavior and team dynamics. Descriptive statistics of items Q4, Q5, and Q6 indicate that a substantial proportion of participants believe that leaders at the SME Development Authority foster a strong sense of engagement and productivity within teams. The finding of variable four could be attributed to respondents' recognition of the nuanced ways that leadership behaviors can extend beyond official job descriptions to influence broader organizational citizenship. Similarly, the finding of variable five indicates that leadership's supportive and motivational aspects are crucial to fostering positive team dynamics.

Table 2 demonstrates that the three variables' overall mean score was 3.3, and the SD was 0.8. The mean score of the team productivity variable was the highest ($M = 3.4$, $SD = 0.75$), whereas the mean score of the team dynamics was the lowest ($M = 3.2$, $SD = 0.85$). This finding aligns with the reviewed literature, which considers the impact of transformational leadership on enhancing organizational citizenship behavior and team cohesion. Various studies indicate that leaders who exhibit transformational traits such as idealized Influence and intellectual stimulation tend to create more engaging and productive work environments. The lowest mean was for the variable related to the extent to which team dynamics are affected by leadership behaviors. This finding indicates that while leadership behaviors have a positive impact, additional factors may influence team dynamics that are not captured solely by transformational leadership traits.

Theme 3: Solution and Effect of Variables (Questions 7-9)

Table 3. Responses to Questions on Cultural Influence, Strengthening Leadership, and Additional Training/Resources

Question Number	Survey Question	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Mean	Standard Deviation
Q7	Cultural Influence on Leadership Perception	2 (5%)	4 (10%)	11 (27.5%)	16 (40%)	7 (17.5%)	3.65	0.72

Q8	Strategies to Strengthen Leadership	1 (2.5%)	3 (7.5%)	9 (22.5%)	18 (45%)	9 (22.5%)	3.85	0.68
Q9	Training/Resources for Leadership Efficacy	1 (2.5%)	2 (5%)	8 (20%)	19 (47.5%)	10 (25%)	3.95	0.60

Theme three, "Solution and Effect of Variables," measures how Omani cultural values and resources impact leadership effectiveness. Descriptive statistics of the three variables of this question (Q7-Q9) indicate that 62.5% of the respondents believe that cultural values and resources enhance leadership within the SME Development Authority. Table three shows that the grand mean of the variables scored 3.82. The mean scores for sub-variable Q9 – Training/Resources for Leadership Efficacy – and sub-variable Q8 – Strategies to Strengthen Leadership – were the highest ($M = 3.95$, $SD = 0.60$ and $M = 3.85$, $SD = 0.68$, n for all means = 40). The lowest mean was for sub-variable Q7 – Cultural Influence on Leadership Perception – ($M = 3.65$, $SD = 0.72$). This finding indicates that respondents perceived the cultural Influence and the availability of training as valuable to enhancing leadership effectiveness. This could be attributed to the strong emphasis within the organization on continuous development and the alignment of leadership practices with local cultural values.

The study's qualitative findings show that the respondents have a positive attitude toward the impact of transformational leadership on organizational citizenship behavior and the overall organizational culture.

Discussion

This research shows a positive, linear relationship between transformational leadership and Organizational Citizenship Behavior (OCB), supporting the original hypothesis beyond a reasonable doubt. It is particularly noticeable that the factors of "inspirational motivation" and "intellectual stimulation" have a high correlation factor, which is the exact definition of what is most important in driving employees' motivation towards OCB (Tian et al., 2020). This correlation factor means that the SME leaders who are effective at inspiring and intellectually challenging their employees in Oman would develop grown behaviors that go beyond formal job responsibilities, such as proactive involvement and solid organizational commitment. "Idealized Influence" and "Individualized Consideration" have, on the other hand, positive relationships with IWBs. However, Idealized Influence" and "Individualized Consideration affect the same to a lesser extent, thus behind the most relevance in leaders being ethical role models and listeners to employees' needs. Such findings wobbly underline the cultural context of Oman, especially the values and impact derived from community, respect, and loyalty concerning his leadership styles and effectiveness (Qalati et al., 2022). The findings here present an SME leadership development guide in Oman, focusing on motivational communication and intellectual involvement as the most vital aspects that shall increase worker productivity and contribute to SME development and success.

Conclusion

These bring forth the consequential attraction between transformational leadership and Organizational Citizenship Behavior (OCB) among employees in SMEs in Oman. This critical finding flushes out the dominant impact of inspirational motivation and intellectual stimulation on enhancing beneficial behaviors among employees. This study has highlighted the importance of transformational leadership traits to encourage OCB, showing both the organizational effectiveness and adaptability of SMEs working in a culturally specific and fast-emerging business environment like Oman. This study thus clearly admits its limitations, opening pathways for future research to carry this investigation to further lengths through more diversified methods and larger samples. Such insights from the study would contribute to the academic discussion on leadership in SMEs and offer practical advice to business leaders who seek to cultivate productive and collaborative work environments in Oman and similar settings.

Recommendations

The research results confirm the already existing body of knowledge in leadership, especially within the SME context and countries like Oman, where research could be more extensive. Implications for organizational strategies and organizational culture in SMEs, therefore, would suggest that the selective use of particular leadership abilities would be instrumental in serving to see the organizational success more so in the light of an ever-evolving business environment that has a focus on getting the most out of the human resource potential.

Acknowledgments

I would like to thank my academic advisor, Dr. Mohamed Elgeddawy, and extend my gratitude to the Modern College of Business and Science (MCBS).

Abstract: In this research work, an action procedure was developed that interferes with improving the cognitive and behavioral state in the classroom through all subjects in the face of disruptive behaviors. Although our research is based on the different intervention models developed in various behavioral and constructivist learning theories and their different approaches, we sought to apply a methodology that takes as a motivating axis the students, the education in values, and the orderly conduction of the behavior. Two case studies were analyzed, obtaining information from various sources under the principle of participatory observation. First, the principal axes are explored where it is pointed out to know the frequency of the event and the intensity of disruptive behaviors; it is also sought to understand academic performance. The qualitative results express the significant differences between the intervention phases of the two axes proposed at the group level.

Keywords: Qualitative research, disruptive behaviors, behavioral models, cognitive-behavioral model, value-based education

Introduction

The cognitive-behavioral educational intervention model currently represents a useful multidisciplinary tool to

analyze disruptive behaviors based on principles, foundations, and methods. Behavior is defined as the way or way of behaving that an individual has. Given the previous concept, disruptive behaviors give a trait that means breaking abruptly, savagely, or unconsciously. It indicates that a relevant or determining change has been generated, which has nothing to do with the physical.

Disruptive behavior is a violation of the rights of others or the norms and social rules appropriate to the age of the educational system. It refers to that which interrupts the harmony of learning, which can be manifested in different degrees of intensity, such as disordering, shouting, getting up without permission, fighting, challenging the teaching figure, and some results of postmodernity.

In the literature, several authors converge on the following aspects that tend to manifest disruptive behavior:

1. Actions that disrupt ongoing activities
2. Behaviors that distort the normal development of tasks and
3. Behaviors force the teacher to invest much of the time allocated to the teaching-learning processes in coping.

Disruptive behavior can occur in the classroom in a timely or persistent manner. Adequate preparation will allow teachers to detect the persistence of behaviors in a particular student.

This type of persistent behavior generates different kinds of disorders:

1. Destructive impulse control disorders.
2. Conduct disorders.
3. Oppositional defiant disorder.
4. Intermittent explosive disorder and
5. Antisocial personality disorder.

Disruptive behaviors in the classroom are focused on Conduct Disorder; this type of behavioral disorder is defined as the identification of a repetitive and persistent pattern of behavior in which the fundamental rights of others are not respected, group norms are not followed, or do not respect the social rules of age.

Several philosophies qualify behaviorism in them stand out:

1. The Behaviorism of B. F. Skinner: The Theory of Skinner (1994) was a methodological contribution and philosophical; in Operant Conditioning, learning from both positive and negative consequences, given an individual's response, was the primary mechanism of behavior modification. Design a direct technique, that is, extinguish an undesirable behavior and replace it with a desirable one with the help of reinforcement.
2. Constructivism: Coll (1999) defines constructivism as " an epistemological perspective from which one tries to explain human development as well as social, formal, and informal practices; facilitators thereof. Moreover, it serves to understand the learning processes.
3. Jean Piaget's Theory of Developmental and Learning Psychology: Piaget proposed the four stages of cognitive development that human beings go through sensorimotor, pre-operational, concrete

operations, and formal operations.

Theoretical framework

Users in the literature contribute theories that show important aspects regarding behavior, references that base this research, and present in the proposed educational intervention model.

Behaviorism is a theory of learning established in the study of intelligence and mind, constructed by observing behaviors or reactions to the exposure of external stimuli. All that action performed by the individual is considered behavior, and everything that has to do with behavior is possible to learn and modify.

In the twentieth century, this Theory evolved and became a strategy in Cognitive Behavioral Therapy, which current psychologists use in all kinds of psychological problems; our field of study is an essential tool in its application to children.

Constructivism is approached as an epistemological perspective from which it tries to explain human development and social, formal, and informal practices. This Theory focuses on learning and reinforces it with the creation of meanings from experiences; learning represents a construction through self-regulation processes. Its primary operating principles are:

- a. It focuses on the teaching-learning process, letting it know what it can learn and do.
- b. Part of the student's previous knowledge before a new beginning of learning allows them to understand concepts, conceptions, and mental representations based on their experience.
- c. Learning to learn considers learning a continuum. In the same way, meaningful learning consists of attaining knowledge by oneself in different situations and circumstances.

For his part, Jean Piaget: Piaget demonstrates in the application of his Theory that the human body evolves, and the mind performs the same process quickly from childhood to maturity, going through a series of specific phases and its characteristics, the changes that it entailed, when overcoming each stage and entering the next, Not only were they based on new acquisitions of skills more complex than the previous ones, but also on a reorganization of the cognitive map, the degree of learning cannot be reversed.

This foundation is essential because the research focuses on the primary Basic Education stage, at ages three to twelve, in the concrete operations phase, characterized by developing logical and critical thinking. For Piaget, these operations represent decreased egocentric thinking and obedience to logical rules.

Vygotsky (1978) emphasizes the influence of social and cultural spheres on the retention and assimilation of knowledge, leaving aside mental activity as a natural development throughout maturity through routes by discovery: construction of meanings, instruments for cognitive development, and the zone of proximal

development.

The psychologist and pedagogue Jerome Bruner (1988) developed the Theory of learning by discovery, whose main characteristic is that it promotes students' knowledge acquisition by themselves. Considering that learning must be achieved through guided and motivational discovery.

It is a scaffolding development in which learners build new ideas or concepts based on past and present knowledge. This performance will lead to further learning and decision-making, based on a cognitive structure of reciprocal help to learn from each other, so his Theory states that interaction is a central feature of education. David Ausubel (1968) proposed the idea of meaningful learning as: "true learning that is conceived only when new information connects with the knowledge already possessed."

The pedagogue points out that learning means that new knowledge connects with what has already been acquired previously, not because they are the same, but because they have to do with each other to create a new meaning. Consequently, recent learning makes those before this more stable and complete, integrating both.

Because society is subject to constant change, it is urgent to adapt teaching practices. Overcoming this way, the traditional educational paradigm, in which the teacher is the protagonist, transcends to a scenario where the students assume the leading role, demonstrating their abilities, virtues, and strengths, thus changing the educational environment completely.

In this panorama, enter the innovative methodologies that currently catch the interest of students and demonstrate improvements in academic results, which also respond to the following foundations:

- a. Cooperative learning is not an activity, instrument, or working method applicable to a classroom situation. Instead, it is a work methodology based on collectively constructing knowledge and developing varied skills. The main characteristic is structuring the students into groups of three to six people to unite the contributions of the members who wish to achieve a common goal.
- b. Gamification: Karl Kapp defines gamification as using the mechanisms, aesthetics, and thinking of games to engage people, incite action, promote learning, and solve problems.
- c. Flipped classroom: Bergmann and Sams (2012) coined this term to describe theoretical learning as a work transferred outside the school and the classroom as a practical or experiential context to develop meaningful learning activities and to facilitate and enhance other concepts acquisition and knowledge in students.
- d. Thinking-based learning: Benjamin Bloom (1956) classified different objectives to be achieved through formal education, conducted in a hierarchical and organized way based on whether the activity requires complex processing.
- e. Competency-based learning: It is possible to replicate the progress of the teaching paradigm to the learning paradigm, from an education system based on the transmission of knowledge to an education system that places learning at the center of its educational activities.

- f. Learning based on values: Values are those qualities possessed by individuals, families, or social groups, things, or ideas with which they acquire knowledge, appreciation, and acceptance. Human values significantly impact the individual's formation since they guide all activities and attitudes in life. This point is crucial for behavior modification because if the values that have been learned are left intact, the changes will not last; in the process of personality formation, the values are those axes that are part of the internal configuration and definition of the general orientation of the behaviors of each person.

Methodology

Grounded Theory is a methodology for conducting scientific qualitative research developed by sociologists Barney Glaser and Anselm Strauss in the 1960s (Glaser et al.; A. L., 1967); Glaser et al., 1992).

Its objective is to generate new theories from data collected directly from the field of study without starting from a pre-existing approach (Alveiro Restrepo-Ochoa, D., 2013).

The present qualitative research is based on its methodology of phenomenology, which has the object of studying behavior in the classroom. It designs and applies the model of a cognitive-behavioral intervention for disruptive behaviors in the school. The proposed model is intended for application in students with different degrees of intensity and frequency of disruptive behaviors, covering characteristics of risk factors for a conduct disorder. Furthermore, the theoretical principles of behaviorism and constructivism allow us to implement ideas that focus on learning as a vital context of behavior modification, thus intervening in the environment of the students and not on the individual.

The pedagogical praxis of this intervention consists of methodological approaches that allow the students to be subdued or within the natural dynamics of the classroom without the possibility of negating themselves, motivating them, capturing their interest, or grabbing their attention.

If we apply a program based on education in values, the foundation of interdisciplinarity forces us to develop research that contemplates different subjects. Figure 1 shows the proposed methodology.

The model contemplated three phases of intervention and continuous and transversal evaluation throughout its development. Look at Table 1.

The objective of the research is to create a model that allows for improving the behavior of two arbitrarily selected cases. It is possible to evaluate whether there is an improvement in general academic performance and reconfiguration of behavior.

It is important to note that the primary method developed is experimental; it is desired to emphasize the validity of research through proximity to empirical reality. The study was used for the second grade in both cases; these groups were selected because they have forty students each, a total of forty students, of which sixty percent are girls, aged between seven and eight. Both groups present students who suffer frequent disruptive behaviors and potential problems of coexistence.

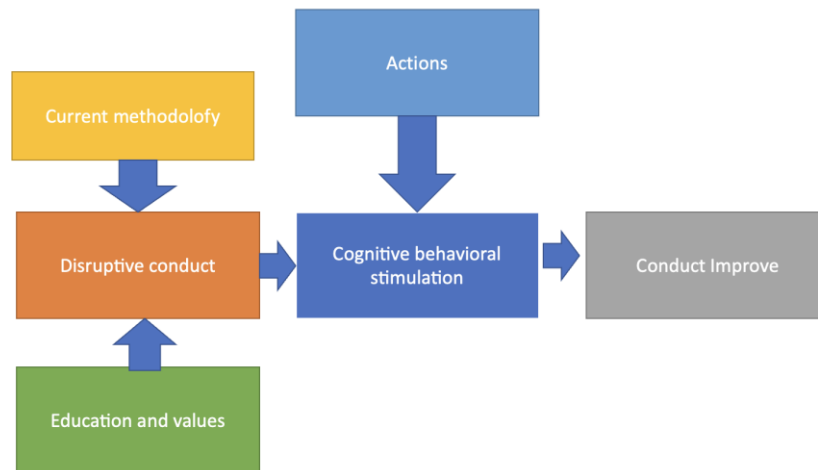

Figure 1. Schematic of the intervention model in the face of disruptive behaviors.

Table 1. Summary of the phases of the cognitive-behavioral intervention model and interdisciplinary program.

First Contact: Obtain Data & Information, evaluation, and Decision making	Phase 1: use of innovative technologies, setting standards, and introduction to values	Phase 2: Intervention with the practice of values, feedback
1. Initial analysis of the Case 2. Psych pedagogical evaluation 3. primary evaluation	1. Reorganization of the classroom 2. Implementation of innovative technologies 3. Establish behavioral rules 4. analysis of the values and data 5. Implementation of custom preset values 6. First assessment	1. Behavior tracking 2. reinforcement of innovative technologies 3. academic reinforcement 4. the daily practice of values 5. Application of a securities monitoring program 6. Second evaluation

Participatory observation has been used for data collection. This method elaborates a visual record of what happens, and experiences related to the problem addressed are noted in Table 1. The advantage of this instrument is that it allows us to collect qualitative data, observe students closely, and observe their behaviors,

characteristics, or external factors.

Another instrument used was the in-depth interview; the interview with the tutor before and after the intervention helped us obtain a vision or objective and provided extra information on aspects of the family environment of the subjects in the study. Finally, the EDAH evaluation (Evaluation of Attention Deficit Hyperactivity Disorder) is used to evaluate a case of Conduct Disorder, specifically Area II: Conduct Disorder.

During the intervention, a record of positives and negatives in behavior was conducted, forming part of the behavior modification strategies. However, positives and negatives were also introduced in the follow-up of the realization of the system. On the other hand, during the values program, a record of the implementation of values and their benefits was conducted with the collection of the student experience.

Finally, at the end of the intervention, a survey of students was conducted, which became a method of determining the subjects' attitudes and opinions about the intervention.

Results

This section will present the results obtained in each phase of positive and negative behaviors and the follow-up of the duties performed. However, it is possible to get a study of equitable outcomes; the registry was developed with twenty-five spontaneous occasions in each phase.

On the other hand, the first phase of the intervention lasted from January 31, 2018, to March 28, 2018, with a total of 40 school days. The second phase continued from April 9, 2018, to May 25, 2018, with thirty-four school days.

Case I: During the first phase of the intervention, by direct observation, an evolution of durability and intensity of disruptive behaviors were noted; as the intervention progressed, the recorded record of negatives decreased; disruptive behaviors.

However, the subject's hard work of internal reconfiguration is reflected in the data collection in the second phase of the intervention. The issue is that those who previously were not interested in following the classroom's progress did not miss a day of homework performance, with 0% negative for reading in the second phase, when in the first phase, 12% of negatives were due to a lack of task.

The work on values and the learning of social competencies derived from it influenced the frequency of high-intensity disruptive behaviors, which decreased until reaching a total of 8.57% in the second phase. See Figure 2.

Between the initial phase, the number of times of positive behavior, and the final stage, the change of

improvement is 84.62%. Moreover, the decrease from the initial number of high-intensity disruptive behaviors to the last number, noted during the second phase, is considered an 80% decrease.

The subject's program of education in values improved assertive communicative skills, impulses, and academic performance, including bringing homework, writing things down in class, and taking out books during class change.

Figure 2. Schematic of the intervention model in the face of disruptive behaviors.

Case II:

The subject from the beginning of the first phase to the end of the second does present a clear improvement in behavior, that is, an increase in appropriate conduct of 66.67%. And a decrease in disruptive behavior of high intensity of 54.55%. See Figure 3.

However, it was a case with more difficulties due to the permissibility, lack of attention, and work of the family environment, and in multiple situations, he assumed an attitude depending on his interest or personal benefit. According to the results obtained, the reduction of negatives for homework is perceived as up to 4%; when presenting the subject cognitive gaps, this event influences academic improvement. Furthermore, throughout the intervention, the subject was very participatory in the program of values, learning each value, practicing them, and disseminating them, especially during playground time when playing between peers, thus reducing disruptive behaviors and encouraging assertiveness and dialogue.

Figure 3. The graph shows the results obtained from behaviors and follow-up of duties in the first and second phases of the intervention in Case II.

Before the intervention, the twenty-four subjects in the classroom followed a more traditional methodology with a different teacher. Therefore, firstly, the evaluation of the results is based on the average grade, the sum of all rates divided by the total number of students before and after implementing innovative methodologies in the core subjects, and constant feedback based on transcendental values. Figure 4 shows the creative methods to improve students' learning of content.

Figure 4. Diagram representing the different subjects' average pre- and post-intervention grades.

The methodologies proposed in the intervention model increased learning in Social Sciences by 80.59%, Mathematics by 88.04%, and Language by 78.31%.

A significant effect of innovative methodologies is the number of failed equivalents to 0% in all three areas and the higher frequency of outstanding grades.

The lowest quality ranges from 5 to 6; cases are restricted to two students due to a series of special educational needs they present. Finally, the outstanding frequency is between 29.1% and 58.3% of cases. Figure 5 concentrates on these general data.

Figure 5. Detailed table of post-intervention notes by areas.

In general, the number of disruptive behaviors in the classroom has decreased with the passage of the intervention—precisely 41.43% of the initial value. See Figure 6.

Figure 6. Graph the number of disruptive behaviors throughout the classroom between the first and second phases of the intervention.

Conclusions

This research aims to determine if it is possible to respond to disruptive behavior without focusing on a single student within the classroom and improve academic performance in parallel.

At the same time, it offers a new product to the Educational Community: an innovative model for dealing with disruptive behaviors, which coordinates innovative methodologies, education in values, and reinforcement strategies for redirection and cognitive-behavioral stimulation.

Therefore, considering the results collected, in the first place, on the specific cases of high intensity and frequency of disruptive behaviors, it can be concluded that an apparent behavior modification is achieved. In both cases, a significant decrease in the frequency and intensity of disruptive behaviors and increased appropriation/positive behaviors are completed. Also, improved social and civic skills, assertiveness, and adequate communication were achieved through the program values.

In both the first and second cases, innovative methodologies rekindle their interest, motivation, and attention. For example, getting significantly involved in the dynamics in the classroom, doing homework daily, and, in Case I, demonstrating a dramatic improvement in calligraphy.

When the group, in general, disruptive behaviors decrease, to the point of reducing those of lower intensity, such as getting up without permission, talking while the teacher explains, and forgetting books or homework. The innovative methodology ensures that everyone participates in learning dynamics without possibly refusing. This improves the academic performance of each subject, as shown in the results.

In general terms, the work of values not only reconfigures behavior but also provokes students to think and consider an issue with attention and care so that they can study it, understand it well, form an opinion about it, or make a decision.

It is interesting to observe that when checking the result when the intervention model was applied, it is possible to affirm that their learning is positive and their behavior acceptable.

Given this evidence, it is expected to want to transmit the experience to the educational community, especially to teachers. However, disseminating this research and model depends on the predisposition to change in academic performance.

In this question, it is preferable to expose it in a clear, visual, and synthetic way as a first step to catch the interest. Therefore, an infographic is an excellent striking resource since it is a current communication tool that allows visual explanations of the complex processes of the model in graphic pieces of easy understanding, where the text gives way to defining visual elements.

Based on the interest generated around the intervention model for behavior modification, a conference should be proposed to inform and officially launch this product, as well as a discussion or exchange of ideas to accommodate a proposal for improvement.

Abstract: The grotesque as a concept was first theorized by the Russian philosopher Mikhail Bakhtin in 1965. The theory exhibits a scope that accepts and embraces the biological processes of life in all their positive and negative aspects. Every living form is subject to processes such as eating and drinking, getting fat, getting thin, getting sick, dying, decaying, deteriorating and wearing out, and the theory opposes the ignoring of these processes by idealist artistic styles. In the artistic sense, the grotesque structure contains many complex processes and exaggerations, while the grotesque font is a contradiction in that it is the first font to appear without serifs. While grotesque in the plastic arts is considered in terms of simplicity and plainness, it is used as a category in the field of typography for fonts that are serifless, simple and as plain as possible. In this study, which was conducted with the literature review technique, the concept of grotesque was discussed and the contrasts between the fonts categorized as grotesque fonts and the grotesque theory were examined.

Introduction

Mikhail Bakhtin, one of the leading Russian literary philosophers, introduced the concept of the grotesque, which plays an important role in literary theory. Bakhtin's concept of the grotesque challenges traditional ideas of perfection by celebrating all the actions the body performs, including overeating, defecation, and many other situations depicting biological processes (Stone and Murakami, 2021). As Bakhtin argues, the grotesque is not only a negative state of caricature, but also has complex forms and functions that make it difficult to interpret it as merely pejorative (Myers, 2022). Bakhtin's concept of the grotesque body exists intertwined with the world as an incomplete metamorphosis of existence, reflecting a mixture of biological and ontological categories in everyday objects (Zhonga, 2021).

Bakhtin's theory of the grotesque is closely related to the carnivalesque, where the grotesque realism of the carnival is opposed to the norms of the dominant culture, symbolizing a temporary liberation from established orders and hierarchies ("A Night with The Narcissist and the Nasty Boys: Interpreting the World Wrestling Federation", 2000). The grotesque in the carnivalesque is the same. It is also associated with scenes of violence and excess characterized by exaggeration and exaggeration (Casas-Cortés and Cobarrubias, 2023). Moreover, Bakhtin's ideas about the carnivalesque and the grotesque have been applied in various contexts, including literature, anthropology, and public discourse (Boutieri, 2021). While Bakhtin's dialogism has been studied extensively in literary contexts, there is increasing interest in applying his concepts such as heteroglossia and internal persuasive discourse to research practices (Frank, 2005). Bakhtin's dialogic principles have been used to explore his interest and contributions to understanding human communication and interaction (Leiman, 2011).

The relationship between Bakhtin's concept of the grotesque and font design can be seen in studies examining the impact of typeface on readability and perception. For example, studies have shown that the use of different fonts, such as humanistic and grotesque, can affect reading experiences and gaze times (Reimer et al., 2014; Pan et al., 2020). Additionally, studies on fonts have expanded to discover that calligraphic lettering is more aesthetically pleasing in design contexts than traditional grotesque or antique fonts (Галишич et al., 2020). Mikhail Bakhtin's concept of the grotesque offers a rich framework for understanding the complexities of human existence, challenging traditional norms of perfection, and celebrating the materiality of the body. His ideas about the carnivalesque and the grotesque intertwined with dialogue have influenced fields ranging from literature to art, psychology to design, highlighting the enduring validity and versatility of his theoretical contributions.

Grotesque Font

Grotesque fonts are fonts with straight lines and clean cuts, usually with a modern and minimalist design. They first appeared in Germany in the late 19th century and later spread to the rest of Europe and the world. These fonts, unlike traditional fonts, are simple and functional, free of ornaments. Typically, grotesque fonts are of a type called sans-serif; That is, there are no decorative additions at the ends of the letters. Grotesque fonts are considered one of the cornerstones of modern typography and are widely used not only in print but also on digital platforms. Due to their clean appearance and readability, they are preferred in advertising, corporate identity design and many other fields. For example, fonts such as Helvetica and Arial are classic examples of grotesque fonts.

The concept of a grotesque font, also known as a sans-serif font, is a font that lacks small protruding features called "serifs" at the end of the strokes. The term "grotesque" in font classification refers to early sans-serif fonts that were considered somewhat unconventional and even grotesque when they were first introduced in the 19th century. Grotesque fonts have a simple and straightforward design, often shared by uniform stroke widths and the absence of decorative elements, giving them a modern and clean look. The emergence of grotesque fonts can be traced back to the Industrial Revolution, when there was a shift towards more practical and functional fonts

that could withstand the demands of mass printing and technological advances. Grotesque fonts have been seen as a departure from the flashy and detailed serif typefaces of the past, reflecting a new aesthetic sensibility that prioritizes clarity and readability in communication.

When “sans serif” fonts, called sans serif fonts, first began to appear in the early nineteenth century, there was uncertainty about what they should be called. In order to categorize this font, people have labeled them as “grotesque”, although they are not sure. The term stuck and sans serif faces, designed in the same style as the oldest examples, is still referred to today as Grotesque Sans (See Figure 1). Characters exhibit moderate contrast with upright emphasis and generally present a more complex structure than other sans serifs (Seddon, 1965, p:92).

Figure 1. Grotesque Font Example (Seddon, 1965, p:92).

A grotesque font in its concept can convey a sense of modernity, simplicity and neutrality. Grotesque fonts are often preferred for their clean and minimalist design, making them suitable for a wide range of applications, from branding and advertising to web design and print media. The absence of serifs in grotesque fonts can improve readability on digital screens and at small sizes, making them popular choices for body text in digital interfaces. In this context, it can be said that it differs conceptually from the expression “grotesque”. Because grotesque structures generally have features that are complex and involve different processes. The form has protruding limbs, exaggerated appendages and distorted different nodes. Overall, the grotesque typeface represents a departure from traditional typographic conventions by adopting a more functional and utilitarian approach to design. Its simplicity and clarity make it a versatile choice for a variety of design contexts, and it embodies a modern aesthetic that remains relevant in contemporary typography.

Grotesque in an Artistic Term

In an artistic sense, “grotesque” denotes a slightly different concept. Here, “grotesque” refers to elements that

deviate from the norm, are perceived as disturbing, ugly, or disgusting. Grotesque art has a style that evokes emotions such as irony, absurdity, or tragedy, often moving away from traditional standards of beauty. The origins of this style date back to the Renaissance period. At that time, frescoes and decorative arts inspired by the ancient Roman and Greek periods contained grotesque elements. These were complex patterns, often filled with fantastic beasts, distorted human figures, and plant elements.

Figure 2. Quentin Matsys's "The Ugly Duchess", 1513 (The National Gallery, 2023)

In modern art, the grotesque style refers to works that question traditional perceptions of beauty by using unusual or striking elements, often disturbing the viewer. For example, movements such as dadaism and surrealism frequently use grotesque elements. Works made in this style can be designed to question social norms, make irony or create an absurd perception of reality. Figure 2 shows "The Ugly Duchess", which is perhaps the most mentioned work in the sources in this regard. The work contains figure features that disregard many of the traditional and classical beauty teachings and criteria.

There are distinct differences between grotesque fonts and the concept of "grotesque" in an artistic sense. Grotesque fonts generally refer to modern typefaces with a clean, minimalist design, while in an artistic sense, "grotesque" refers to a style that focuses on deviations from normal and perceptions of ugliness. The differences between grotesque fonts and the artistic concept of "grotesque" represent different dimensions of aesthetics and meaning. Grotesque fonts are examples of modern typography designed with a minimalist and functional approach. These fonts are characterized by straight lines and clean cuts and usually have a sans-serif structure.

On the other hand, in an artistic sense, the term "grotesque" refers to a striking or ironic style that deviates from traditional standards of beauty and disturbs the viewer. This style is often characterized by fantastic or distorted figures, absurd details or tragic images. So, while grotesque fonts offer cleanliness and readability in the world of typography, in an artistic sense the term "grotesque" provides the expression of striking and sometimes disturbing works that question social norms.

Method

The literature review method was used as a method in the study, and in this context, written, electronic or printed sources were used.

Results

It has been observed that contradiction, as a concept, is included in the sources as "the state of being contradictory and opposite to each other". Contradiction is the situation in which a proposition or situation is inconsistent within itself in many fields. The word "grotesque" refers to two different concepts that are used both in the field of typography and in the field of art and have quite different meanings. This leads to an apparent contradiction between the concepts of "grotesque font" and "artistically grotesque". In typography, grotesque fonts describe plain, simple, simple and flat-format fonts, while in an artistic sense, grotesque refers to complex, exaggerated, non-regular and often overly detailed forms. This contradiction requires in-depth examination to understand how both concepts evolved in their respective contexts and why they differ so much.

Grotesque fonts emerged as early examples of sans-serif fonts in the early 19th century. These fonts have straight lines and simple designs, free of ornaments and complexity. The use of the word grotesque in typography originally stemmed from the perception of these fonts as more "strange" and unusual compared to other decorative and ornate fonts. Over time, grotesque fonts have become symbols of modernism and functionality, preferred by designers seeking minimalism and simplicity. In the artistic sense, grotesque is a term that has been used since the Renaissance period and has its origins in the wall paintings of the Ancient Roman period. Grotesque art is characterized by extremely detailed and exaggerated forms, sometimes frightening and disturbing, often containing supernatural and fantastical elements. In such works of art, human and animal figures mix together, creating surreal and strange forms.

The contradiction of these two concepts creates an interesting situation both terminologically and aesthetically. While grotesque fonts represent a simple and functional design approach, artistically grotesque exhibit exactly the opposite characteristics. While the plainness and simplicity of grotesque fonts are shaped by the influence of modernism and industrial design, artistic grotesque forms stand out as the expression of a chaotic, complex and boundary-pushing aesthetic, and as an art style, they open up a space for artists to benefit from this complexity. While grotesque fonts in the typographic field tend towards simplicity with the modernization brought about by

industrial developments, grotesque expressions in plastic arts have become complex, sometimes to criticize and sometimes to evoke chaotic themes and emotions in the audience.

The contradiction between grotesque fonts and artistically grotesque concepts, when analyzed in depth in the context of both typography and art history, reveals that periodic influences differ between the modernizing art world and industry. While simplification in the field of typography is a result of this process, chaos and confusion in artistic fields show that different results emerge from this process. This contradiction is not only a terminological difference, but also a reflection of two different aesthetic understandings and cultural tendencies. Therefore, when these two different meanings of the concept of grotesque are examined in their own context, it is seen that each has its own logic and aesthetics.

Conclusion

The contradiction between grotesque fonts and artistically grotesque concepts, beyond aesthetic and terminological differences, reveals the different tendencies of modernizing society and understanding of art. Grotesque fonts emerged as sans-serif typefaces in the early 19th century and over time became symbols of modernism and functionality. These fonts represent a plain and simple aesthetic approach, free of ornaments. This situation is a reflection of the search for simplification and functionality brought about by the industrial revolution. In the artistic sense, grotesque is an aesthetic approach characterized by complexity, exaggeration and irregular forms, with roots dating back to the Renaissance period and the murals of Ancient Rome. Grotesque art aims to surprise and make the viewer think with sometimes disturbingly detailed and chaotic forms that contain supernatural and fantastic elements. This artistic style offers a critical perspective to the modernization process as a form of expression that includes both individual creativity and social criticism.

The contradiction between these two concepts reveals the simple and functional nature of typography on the one hand, and the complex and critical nature of art on the other. While the simplicity and plainness of grotesque fonts are shaped by the influence of industrial design and modernism, artistically grotesque forms push the boundaries of art with their chaotic and exaggerated aesthetics. This shows how the same term in the languages of two different fields can acquire completely opposite meanings. This contradiction also reveals the influence of cultural and historical contexts on terminology. While simplification and functionality in typography emerged as a result of modernization and the industrial revolution, the artistically grotesque embraces complexity and exaggeration as a form of critical and creative expression. These two different uses provide a striking example of how the same word can evolve into different meanings.

Impact of Employee Engagement on Organizational Performance: The Case of Higher Educational Institute in Oman

Mahfoodh Al Sabbagh

Modern College of Business and Science, Sultanate of Oman

Abstract: Purpose: This study explores the factors impacting employee engagement on organizational performance at higher education institutions in Oman. It aims to explore the relationship between employee engagement and organizational performance at these institutions. By providing valuable insights and recommendations, this research aims to develop effective strategies that can boost employee engagement and enhance organizational performance. Design/ methodology /approach: A positivist research paradigm guides the assumption of this experiment study. This paradigm is characterized by the belief that reality is objectively observable and can be quantifiably measured and analyzed using statistical methods. Quantitative data was collected through a survey from individuals who were randomly selected from HEIs' field to participate in the study. The study utilized a quantitative research approach, employing descriptive statistical tools. Findings: The findings suggest that employee engagement improves organizational performance. The study highlights the varying impact of vigor, dedication, and absorption on organizational performance in a higher education institution in Oman, which may expose the generalizability of the findings. It also revealed new possibilities for further research in similar locations, which will help to validate the results obtained so far. Originality/value: This research provides quantitative insights into the relationship between employee engagement and organizational performance. Exploring this relationship and offering valuable suggestions to enhance organizational performance in Oman's higher education institutions contributes to the existing body of knowledge.

Keywords: Employee Engagement, Organizational Performance, Higher Education Institutes.

Citation: Al Sabbagh, M. (2024). Impact of Employee Engagement on Organizational Performance: The Case of Higher Educational Institute in Oman. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 2462-2480), Antalya, Turkiye. ISTES.

Introduction

Research Background

In today's rapidly evolving academic landscape, higher education institutions are increasingly focusing on fostering environments that promote effective engagement among their staff. Employee engagement, characterized by Vigor, Dedication, and Absorption, has been recognized as a pivotal factor influencing organizational outcomes (Schaufeli & Bakker, 2021). In Oman's higher education context, engaging academic

and administrative staff is crucial for enhancing educational quality, student satisfaction, and institutional reputation. Given Oman's unique cultural, economic, and educational dynamics, understanding how engagement impacts performance in this sector is essential (Al-Busaidi & Al-Shihi, 2022). The concept of employee engagement emerged and has been discussed among academics and practitioners. Employee engagement is considered a crucial factor in determining the success of any organization, including higher education institutions. The literature shows engaged employees are more productive, innovative, and committed to the organization's goals. Understanding the impact of employee engagement on organizational performance is critical for enhancing the quality of education and the overall effectiveness of these institutions within Oman.

Dynamic shifts and continuous changes within the organization and its environment are essential to achieving and sustaining competitive advantage. Hence, organizations constantly seek ways to improve performance and gain a competitive edge. Employee engagement has attracted attention from various stakeholders, such as Government policymakers (e.g., MacLeod and Clarke 2009), HR practitioners (e.g., Harter et al. 2002), and academics (e.g., Kan 1990; May et al. 2004; Schaufeli et al. 2002).

To understand the components of employee engagement, it is important to highlight various elements, such as motivation, job satisfaction, and commitment. According to this approach, this research tries to know how employee engagement affects the organizational performance of higher education institutes in Oman; and also to find out what are the factors that enhance or block employee engagement in higher education institutes in Oman

Research Problem Statement

Higher employee engagement has been identified as an essential factor in the success of organizations, however, there are limited studies that explore higher education institutes, especially in Oman (Kumar & Pansari, 2020). The majority of these institutes struggle with keeping the level of employee engagement high, which affects job satisfaction, increases turnover rate, and in turn reduces organization's performance. This study seeks to fill the gap by examining the extent to which employee engagement, directly and indirectly, impact the performance of higher education institutes in Oman.

Significance of the Study

Moreover, it is of significance, promising to provide useful information about the predictors of employee engagement sector-wise (higher education institutes and online) and where additional data has been collected. Through the findings, the underlying dynamics will be identified, and these in turn could be used to assess institutional leaders and policymakers in Oman in enacting context-sensitive interventions to increase engagement levels and contribute to the economy of scale and the research agenda on employee engagement in the Middle East as a benchmark for comparative studies and regional analyses.

Omani HEIs, mainly governmental, risk falling behind in a competitive global educational landscape if these problems are not addressed. Disengaged employees contribute to a stagnant learning environment, hindering

student development and reflecting on organizational performance. Hence, they impact Oman's human capital growth.

This research bridges the knowledge gap regarding employee engagement, specifically in Oman HEIs, by providing contextually relevant insights and equipping the stakeholders with valuable information to cultivate more engaged employees with various strategies. This, in return, enhances organizational performance.

Scope of Research Limitation

The research on "Impact of Employee Engagement on Organizational Performance: The Case of Higher Educational Institute, Oman" has several limitations that must be acknowledged to understand the scope and applicability of the findings:

The targeted participants are in Muscat Governorate only in Oman. In addition, the sample size covers only 40 participants, and it limited research time.

Research Aims and Objectives

This research aims to bridge the knowledge gap by exploring the factors that drive employee engagement within Omani HEIs across all staff categories. By recognizing these factors, HEIs can develop strategies to foster more engaged employees, ultimately enhancing organizational performance.

- To explore employee engagement factors in HEIs and their impact on organizational performance.
- To measure the employee engagement level of faculty, administrators, and support staff in HEIs.

Literature Review

Definitions and Theoretical Frameworks

Khan (1990) defines employee engagement as "the harnessing of organization members slaves to their work role in engaging people employee and express themselves physically, cognitively, and emotionally during role performance." In addition, As mentioned by (Baumruk, 2004; Richman 2006 and Shaw 2005), employee engagement has been defined as an emotional and intellectual commitment to the organization. (Frank et al., 2004) stated the amount of discretionary effort exhibited by employees in their jobs. It is acknowledged that the employee engagement concept is a multifaceted construct as suggested by (Khan, 1990). Truss et al., (2006) define employee engagement in simple words as its passion for work, and this reflects the psychological state which is seen to encompass the three dimensions of employee engagement discussed by (Khan, 1990) and captures the common theme running through all definitions.

(Shrestham, 2019) defines employee engagement as employees' emotional commitment and active involvement in their work, the organization, and its goals. Organizational performance represents the organization's overall effectiveness, productivity, and success. Considering this definition, the focus is on the emotional and psychological bounds between employees and their work, the organization, and objectives. In contrast, organizational performance measures how well an organization successfully reaches its intended goals and desired outcomes.

Employee engagement definitions vary based on various themes, for instance, energy and motivation, where researchers internal drive and effort employees bring to work (Kahn, 1990; Demerouti et al., 2001; Wrzesniewski & Dutton, 2001); emotional investment theme definitions highlight positive fulfilments fulfilling work-related state of mind that is characterized by vague or dedication and absorption (Bakker & Schaufeli (2000), Pierce et al. (2014), Wrzesniewski & Dutton (2001), this focus on emotional connection and positive feelings toward work. While (Truss et al. (2003), Organ (1988), and Lehman & Lewis (2007), have focused on reflecting dedication and effort invested in work. They defined the emotional and behavioural states directed toward work as characterized by high levels of effort and resistance as behavioural outcomes.

As mentioned by (Gyensare et al., 2017), employee engagement positively impacts organizational performance by enhancing team performance, boosting productivity, promoting employee retention, minimizing turnover, and mitigating burnout. On the other hand, the view arises with (Fetriah & Hermingshil, 2023), where perceived organizational support shows a negative and insignificant effect on employee performance yet a positive and significant effect on employee engagement. This suggests organizational support is crucial for engagement but does not directly translate to performance. Various studies in the research as revealed by (AMIN, 2020; Fetriah & Hermingsih, 2023; Fristin et al., 2019; Garg, 2017; Kurniawati & Raharja, 2022; Olakunle, 2021; Prajapati, 2022; Rembulan et al., 2022; Zakaria, 2022)) which reflected that the relationship between employee engagement and organizational performance is complex and multifaceted. While there is a common consensus on the positive impact of employee engagement on performance. Factors influencing the relationship can vary and may not always directly lead to improved performance. In addition, studies reported by (Afkar & Sayekti, 2020; Fetriah & Hermingsih, 2023; Fristin et al., 2019; Garg, 2017; Olakunle, 2021; Rembulan et al., 2022) stated that organization and support motivation, leadership style, communication, and culture play a significant role in shaping engagement, but their effects on performance can be indirect and mediated by other variables such as employee satisfaction and commitment.

These aspects are crucial in the academic context, where faculty and staff engagement directly influence teaching quality research output and student satisfaction levels. As a result, there is room for further investigation to focus on a holistic approach that fosters engagement through various strategies, recognising that its translation into performance may require additional supportive measures and exploring the relationship between employee engagement and organizational performance in Higher Education Institutions. While retrieving the literature, there is much research on the Western context; however, limited Omani context within Higher Education Institutes found, also studies focused on exploring employee engagement among faculty

members; yet, there is an opportunity to explore employee engagement factors among administrative and support staff members.

Employee engagement is not just about being happy at work. Employees feel deeply connected to their colleagues, work, and mission (GUO & Hou, 2022). Engaged employees are emotionally invested and motivated to go the extra mile. This engagement is fuelled by factors like positive workplace culture, clear communication from leadership, and a sense of trust and respect (Stewart et al., 2019). Engaged employees understand the organization's goals and actively collaborate to improve performance (Hui et al., 2020).

The benefits of a highly engaged workforce are clear: increased profitability and better employee performance. One key drive of engagement is offering opportunities for career development (Aboramadan et al., 2020).

When employees see the growth path, they feel more valued and motivated. The sense of purpose translated to greater loyalty and commitment to the organization's success. In addition, career development equips employees with the skills they need to excel in their current roles and prepares them for future advancement within the organization.

As stated by (Goud and Tiwari, 2022), Leaders are the backbone of a thriving workforce. By fostering A supportive and motivated work environment, they unlock the potential for high employee engagement. This translates to a happier, more productive team that consistently achieves goals. Effective leadership goes beyond giving orders. It is about clear communication, providing constructive feedback, and empowering employees to make decisions. This combination creates a ripple effect: engaged employees drive better organizational performance. (Dubrin, 2022). In contrast, poor leadership can significantly damage engagement retention and the organization's bottom line (Abdulrahman & Taqi Addin, 2020).

Organizational Performance

Organizational performance is the scorecard of organizational success. It measures how well an organization achieves its goal across various aspects like productivity, profit, customer satisfaction, and innovation (Robinto et al., 2020). High performance is the key to long-term survival and thriving in a competitive market. Engage employees contributes to organizational performance; organizations that invest in employee development and recognition significantly boost engagement (Sepahvand & khodashhri, 2021). This means that offering opportunities for employees to learn new skills to advance their careers and benefit from mentorship programs by showing employees their gross matters organization fosters a sense of value and purpose.

Organizational performance involves comprehensive metrics that assess how effectively an organization meets its strategic goals. According to Robinto et al. (2020), this encompasses financial outcomes and factors like innovation, customer satisfaction, and internal process efficiency. Robust organizational performance is frequently regarded as a pivotal indicator of an organization's vitality and enduring sustainability, reflecting its capacity to vie in the marketplace effectively. Employee engagement stands as a closely intertwined factor with

organizational performance. Engaged employees typically exhibit elevated levels of motivation, fostering heightened organizations that allocate resources toward nurturing their employees' potential through development initiatives and acknowledgment endeavours that often witness amplified levels of engagement. Investments in employee development may include training, mentorship, and career progression opportunities that align with organizational objectives (Sepahvand & Khodashhi, 2021).

High organizational performance is a key indicator of an organization's health and long-term success, reflecting its ability to compete effectively in the market.

Employee engagement is intimately linked to organizational performance. Engaged employees show higher motivation levels, which translates into better productivity and efficiency (Sepahvand & Khodashhri, 2021).

Furthermore, organizations that invest in their employee's potential through development programs and recognition initiatives tend to experience a high level of engagement. These investments may include training programs, career advancement opportunities, and mentorship programs which enhance skills in imbue employees with a sense of worth in alignment with organizational goal. (Sepahvand & Khodashhri, 2021).

Theories Underpinning the Research

Organizational Support Theory (OST)

According to the organizational support theory, employees tend to develop beliefs regarding their organization's level of concern for their well-being and how much it values their contribution. If employees perceive that their organization provides a higher level of support, they tend to feel emotionally connected to the organization, have higher job satisfaction, and exhibit more engagement. (Eisenberger et al., 1986). Employees who feel supported are more inclined to surpass their basic job expectations, thereby contributing to improving organizational performance.

The theory holds significant importance in comprehending employees' sociological state concerning their perception of support from their employers. It elucidates that white initiatives aimed at enhancing employees' perception of organizational support can lead to increased engagement and subsequently yield better organizational outcomes.

The JD-R Model

The JD-R Model is a framework that explains how working conditions impact employee behavior. According to the theory, job demands can deplete employee resources and lead to burnout. In contrast, job resources can help employees achieve work goals, reduce job demands, and promote personal growth, learning, and development. Physical, psychological, social, or organizational resources are essential for fostering employee engagement

(Bakker & Demerouti, 2007). Engaged employees are more likely to contribute positively to organizational performance through improved service delivery, innovation, and productivity (Bakker, 2011).

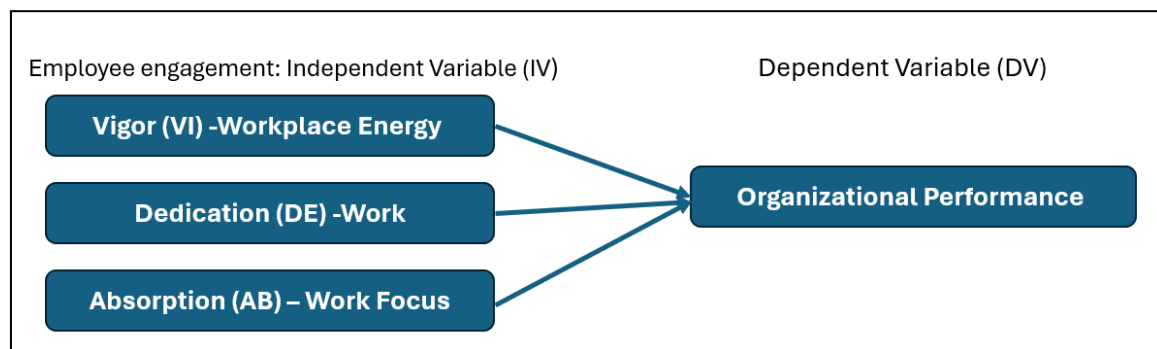

The research uses the JD-R model because it is instrumental in identifying specific factors within the workplace that can hinder or enhance employee engagement. By understanding these factors, organizations can strategically develop interventions that reduce job demands and augment job resources, boosting engagement and performance.

Conceptual Framework

Employee Engagement: Independent Variable

Organizational Performance: Dependent Variable

Conceptual Framework

Research Question:

To what extent do employee engagement factors influence organizational performance in HEIs in Oman?

H1: Workplace energy significantly impacts on organizational performance.

H2: Work commitment significantly impacts organizational performance.

H3: Work focus significantly impacts organizational performance.

Research Methodology

Research Design: This study examines the impact of employee engagement on organizational performance through quantitative research. The study involves gathering and analyzing numerical data to test hypotheses about the connection between engagement levels and various performance metrics in organizations. The quantitative approach is preferred as it provides unbiased results that can be applied across different contexts (Creswell & Creswell, 2018).

This research will employ a quantitative approach to systematically evaluate hypotheses regarding the associations between employee engagement and organizational performance. Quantitative methods are deemed suitable as they enable the meticulous measurement and statistical examination of data obtained from a sizable sample, thereby allowing for the extrapolation of findings to a broader population (Creswell & Creswell, 2018).

Data Collection Method:

in this research, data collection will involve the dissemination of a carefully structured survey incorporating a rating scale. The survey will be distributed electronically online to employees in higher education institutes. Participant selection will adhere to a random sampling technique, thereby enhancing the likelihood of simply reflecting the population at larger and consequently increasing the general liability of findings to a broader audience. (Bryman, 2016).

Sampling And Sample Size

This study's sampling strategy was randomly selecting a sample from a large group of people. This method is considered adequate because it helps avoid favoritism and ensures that everyone in the population gets a fair chance to be part of the sample. It is crucial because it means we can apply our findings to everyone in the population, not just a few.

Sample size: In this research, the sample of 40 participants might seem small in quantitative research terms, but it is chosen based on what is needed for this study and the resources available due to the limited duration and scope. Even though it is not a huge group, having 40 participants can give some important earlier insights and help us support the trend in the data.

Data Collection

In this research, data collection will be facilitated through the utilization of a structure online questionnaire primarily selected for its cost effectiveness convenience and capacity to rapidly engage in diverse array of participants(Bryman, 2016). The a structured online questionnaire will be used to collect data and then will be tested on a small group of participants of 40 to ensure its clarity reliability and validity.

Measurement Instrument

In this research questionnaire is used and divided into sections:

Employee engagement: The Utrecht Work Engagement Scale (UWES) has been modified to assess vigor, dedication, and absorption levels on a 5-point Likert scale (1=Strongly Disagree, 5=Strongly Agree) (Schaufeli & Bakker, 2003).

Organizational performance: Participants will be asked to rate their perception of their performance in areas such as overall productivity, profitability, customer satisfaction, and innovation. Each item will be rated on a 5-point Likert scale (1=Strongly Disagree, 5=Strongly Agree) (Schaufeli & Bakker, 2003).

In this research, data will be collected, coded, and analysed using the statistical software SPSS. Statistics will be used to summarize the main study variables. The analysis examined the relationship between employee engagement and perceived organization and performance (Tabachnick & Fidell, 2013).

Data Analysis and Findings

Table1.

Questionnaire Items	Survey Questions	Frequency %					Mean	Standard Deviation
Employee Engagement Vigor (VI) (Workplace Energy) EEV1-6	I look forward to going to work when I wake up in the morning.	SD	D	N	A	SA	3.897	1.021
	2. I feel very energetic at work.	SD	D	N	A	SA	3.923	0.900
	3. I keep trying at work, even when things get tough	SD	D	N	A	SA	4.282	0.793
	4. I can work for a long time without stopping	SD	D	N	A	SA	3.846	1.089
	5. I stay strong under pressure at work	SD	D	N	A	SA	4.103	0.852
	6. I feel strong and full of energy at work	SD	D	N	A	SA	3.718	0.944
Grand Mean							3.962	
Grand Standard Deviation							0.200	

Data Analysis of Employee Engagement Survey

The analysis of the first six items of the survey indicates that most participants view the current status of their work engagement and energy levels as positive, with the overall scores being higher than average. The analysis results demonstrate an agreement directed towards a high level of job satisfaction and commitment, with an overall mean of 3.962 and a grand standard deviation of 0.200. This low standard deviation points out that most respondents' answers are closely clustered around the mean, indicating consistency in responses across the sample.

The mean score for the third item, "I keep trying at work, even when things get tough," was the highest ($M =$

4.282, SD = 0.793), highlighting that resilience and perseverance are notably strong among the employees. This is closely followed by the fifth item, "I stay strong under pressure at work" (M = 4.103, SD = 0.852), which further illustrates the employees' ability to manage stress effectively.

In contrast, the lowest mean was observed for the sixth item, "I feel strong and full of energy at work" (M = 3.718, SD = 0.944), suggesting some variability in perceived energy levels, which could indicate areas where additional support might be beneficial.

The statistical results of section one indicates that the highest means were observed for participants' perceptions of their ability to keep trying and stay strong under pressure, suggesting these are more practiced than other aspects of engagement. The lowest mean related to energy levels indicates a perceived inconsistency in maintaining physical and mental Vigor at work. These findings reflect the need for more engagement in wellness programs to enhance energy levels and sustain high performance.

Participants believe that resilience (Item 3) and coping under pressure (Item 5) are managed and executed better than maintaining energy throughout the workday (Item 6), though there is still some scope for enhancement.

Overall, the survey results underscore a highly engaged workforce with great resilience and capability to work under pressure. However, the slight inconsistency in energy levels across the board suggests a potential area for improvement through targeted interventions to enhance physical and mental well-being. Such initiatives could help maintain high engagement levels and improve overall job performance and organizational commitment.

Table 1.

Questionnaire Items	Survey Questions	Frequency %					Mean	Standard Deviation
Dedication (DE) - Work Commitment DE 1-5	To me, my job is challenging.	SD	D	N	A	SA	3.744	0.966
	My job inspires me	SD	D	N	A	SA	4.231	0.742
	I am enthusiastic about my job	SD	D	N	A	SA	3.949	0.972
	I am proud of the work that I do	SD	D	N	A	SA	4.231	0.872
	I find the work that I do full of meaning and purpose	SD	D	N	A	SA	4.051	1.099
		SD	D	N	A	SA		
Grand Mean							4.041	
Grand Standard Deviation							0.206	

Data Analysis of Employee Engagement Survey: Dedication and Work Commitment

The analysis of the first five items of the survey focused on dedication and work commitment indicates that most participants view the current status of their employee engagement as highly positive, with the overall scores being above average. The analysis results demonstrate a strong alignment directed towards a high level of job inspiration and commitment, with an overall mean of 4.041 and a grand standard deviation of 0.206. This low standard deviation indicates that most respondents' answers are closely clustered around the mean, suggesting consistency in positive responses across the sample.

The mean score for the second item, "My job inspires me," was the highest ($M = 4.231$, $SD = 0.742$), emphasizing that inspiration derived from work is notably strong among the employees. The fourth item parallels this score, "I am proud of the work that I do" ($M = 4.231$, $SD = 0.872$), illustrating the employees' pride in their contributions and satisfaction with their roles.

In contrast, the lowest mean was observed for the first item, "To me, my job is challenging" ($M = 3.744$, $SD = 0.966$), suggesting some variability in how challenging employees find their work, which could indicate areas where more engaging or complex tasks might be beneficial.

Statistical results of this section indicate that the highest means were observed for participants' perceptions of inspiration and pride in their work, suggesting these aspects are more resonant than others in fostering work commitment. The lower mean related to job challenge indicates a perceived inconsistency in how stimulating the work is. These findings highlight the importance of maintaining challenging and meaningful work to keep engagement levels high.

Participants believe that feeling inspired by and proud of their work (Items 2 and 4) are aspects managed and executed better than finding the work challenging (Item 1), though there is still some scope for enhancement to ensure all employees find their roles stimulating.

Overall, the survey results underscore a workforce that is highly committed and finds deep meaning in their work, showing great dedication and satisfaction. However, the slight inconsistency in perceived challenge across the board suggests a potential area for improvement through targeted interventions aimed at increasing the complexity and engaging aspects of work. Such initiatives could help in maintaining high dedication levels and further improve overall job satisfaction and organizational commitment.

Table 3.

Questionnaire Items	Survey Questions	Frequency %					Mean	Standard Deviation
Absorption (AB) –	When I am working, I forget	SD	D	N	A	SA	3.897	0.995

Work Focus AB 1-6	everything else around me.							
	Time passes quickly when I am working	SD	D	N	A	SA	3.436	1.021
	I lose track of time when I am working	SD	D	N	A	SA	4.026	0.903
	It is hard for me to stop thinking about work	SD	D	N	A	SA	3.769	1.158
	I get deeply involved in my work	SD	D	N	A	SA	3.667	1.084
	I feel happy when I work hard	SD	D	N	A	SA	3.658	0.938
Grand Mean							3.742	
Grand Standard Deviation							0.206	

Data Analysis of Employee Engagement Survey: Absorption and Work Focus

The analysis of the first six items of the survey, which assesses the level of absorption and focus on work, indicates that most participants experience a considerable degree of immersion in their job activities, with the overall scores being above average. The results demonstrate a pronounced commitment to work, with an overall mean of 3.742 and a grand standard deviation of 0.206. This low standard deviation signifies that most respondents' answers are closely clustered around the mean, indicating participants' uniform perception of work absorption.

The mean score for the third item, "I lose track of time when I am working," was the highest ($M = 4.026$, $SD = 0.903$), highlighting a strong sense of flow and engagement among the employees. This indicates that when engaged in work tasks, employees are likely to become fully immersed, to the extent that they lose awareness of the passage of time.

Conversely, the lowest mean was observed for the second item, "Time passes quickly when I am working" ($M = 3.436$, $SD = 1.021$), suggesting some variability in how quickly employees perceive time to pass during work. This lower score may point to differing levels of task engagement or the nature of the tasks, which could vary in their capacity to captivate attention.

Statistical results of this section indicate that the highest means were observed for participants' perceptions related to losing track of time, signifying that these moments of deep focus are more pronounced than the general speed at which time passes during work activities. The lower mean related to the perception of time passing quickly underscores an area where increasing task engagement could further enhance absorption.

Participants believe that their ability to lose track of time (Item 3) and their difficulty in disengaging from work thoughts (Item 4, $M = 3.769$, $SD = 1.158$) are managed well, reflecting a high level of work immersion. However, the variations in how absorbed they feel in routine work activities (Item 5, $M = 3.667$, $SD = 1.084$) and their happiness associated with hard work (Item 6, $M = 3.658$, $SD = 0.938$) suggest room for enhancing how work is structured and the motivational factors involved.

Overall, the survey results demonstrate a workforce that is capable of deep work focus and absorption, indicative of high levels of employee engagement. However, the variability in how time perception and overall happiness during hard work are experienced suggests potential areas for improvement. By fostering an environment that enhances the captivating aspects of tasks and aligns motivational incentives with the nature of the work, the organization can strengthen this immersion, thereby boosting productivity and overall job satisfaction.

Table 4.

Questionnaire Items	Survey Questions	Frequency %					Mean	Standard Deviation
Organizational Performance OP 1-5	I can freely give my opinion about the institute's management	SD	D	N	A	SA	3.769	0.902
	No one leaves our institute because of internal issues	SD	D	N	A	SA	3.513	1.144
	Employees are very dedicated to the institute.	SD	D	N	A	SA	3.692	0.950
	The management team gives helpful feedback on complaints	SD	D	N	A	SA	4.051	0.999
	I am satisfied with my institute's management team	SD	D	N	A	SA	3.59	1.163
Grand Mean							3.723	
Grand Standard Deviation							0.208	

Data Analysis of Employee Engagement Survey: Organizational Performance

The analysis of the five items of the survey related to organizational performance and employee perceptions of management indicates that overall, participants have a moderately positive view of the institute's management, with the overall scores being above average. The analysis results demonstrate a general agreement with positive sentiments about management practices, with an overall mean of 3.723 and a grand standard deviation of 0.208. This low standard deviation indicates that responses are relatively consistent across the sample, suggesting a uniform perception among participants.

The mean score for the fourth item, "The management team gives helpful feedback on complaints," was the highest ($M = 4.051$, $SD = 0.999$), highlighting effective communication and responsiveness from the management as a strong aspect of the organization. This reflects a management style perceived as supportive and responsive to employee concerns, facilitating a positive work environment.

In contrast, the lowest mean was observed for the second item, "No one leaves our institute because of internal issues" ($M = 3.513$, $SD = 1.144$), suggesting some concerns about internal stability and employee retention. This variability in scores could indicate areas where improvements in organizational culture and internal conflict resolution could be beneficial.

Statistical results of this section indicate that the highest means were observed for participants' perceptions of the management's responsiveness and effectiveness in handling complaints, suggesting that these areas are strengths within the organization. The lower mean related to employee retention and satisfaction with management's handling of internal issues highlights potential areas for improvement.

Participants believe that the management's feedback on complaints (Item 4) is managed and executed better than their handling of internal issues that could lead to employee turnover (Item 2), though there is still some scope for enhancement in this area.

Overall, the survey results underscore a generally positive outlook towards the management at the institute, with high scores for management responsiveness to complaints. However, the slight inconsistency in perceptions related to internal stability and satisfaction with management suggests potential areas for improvement. Enhancing communication strategies, addressing internal conflicts more effectively, and ensuring a transparent approach to management decisions could help in maintaining high levels of organizational performance and further improve overall job satisfaction and employee retention.

Discussion

The survey findings on employee engagement and organizational performance within the context of HEIs in Oman reflect the broader theoretical frameworks discussed in the literature review. This study supports the Job Demands-Resources (JD-R) model and Organizational Support Theory (OST) by confirming employee engagement's crucial role in improving organizational performance.

Alignment with Organizational Support Theory

The survey findings show that employees have rated management's responsiveness positively ($M = 4.051$, $SD = 0.999$). This aligns with Organizational Support Theory, which suggests that when employees perceive higher levels of organizational support, they tend to have higher job satisfaction and engagement (Eisenberger et al.,

1986). Employees who perceive management feedback as supportive tend to have a strong emotional attachment to the organization, leading to increased willingness to contribute to organizational goals as per the OST effectively.

The survey also revealed concerns about internal stability and employee retention ($M = 3.513$, $SD = 1.144$), which might highlight a possible area where perceived organizational support could be lacking. Enhancing internal conflict resolution strategies could thus be a crucial area for development to prevent turnover and increase overall organizational commitment.

Integration with the JD-R Model

Further, the findings related to employee vigor and dedication correlate with the JD-R model, which emphasizes the role of job resources in fostering employee engagement by mitigating job demands and promoting personal growth (Bakker & Demerouti, 2007). The high scores for employee perseverance ($M = 4.282$, $SD = 0.793$) and pride in work ($M = 4.231$, $SD = 0.872$) reflect significant job resources that help employees achieve work goals and stimulate engagement. However, the variance in perceptions of energy levels and the challenge of work (lowest mean at $M = 3.744$, $SD = 0.966$) indicate an area where additional resources might be needed to enhance engagement fully. Providing more challenging and engaging tasks could serve as additional job resources that reduce burnout and increase job satisfaction, aligning with the JD-R model's recommendations for enhancing employee productivity and organizational performance.

Implications for Practice and Policy

The strong link between employee engagement and organizational performance observed in this study is consistent with the assertions of (Gyensare et al., 2017), who noted that engaged employees are more likely to contribute positively to organizational outcomes such as productivity, innovation, and customer satisfaction.

The study aims to enhance understanding of Oman Higher Education Institute's context, proposing that targeted strategies like communication, leadership development, and conflict resolution can be effective.

Theoretical and Practical Contributions

Expands on established theories while also providing fresh perspective on how to apply these theories within a particular cultural and institutional context it eliminates the intricate process of fostering employee engagement within higher education institutions in Oman, offering insights for similar organizations encountering comparable obstacles. In addition, by looking at administrative and support staff, this builds on previous research that has predominantly looked at academic staff, to provide a much fuller picture of levels of employee engagement in higher education institutions.

Limitations of the Study

Despite being an important insight into the relationship of the engagement of employees and the performance of higher education institutions in Oman, it is important to recognize its limitations. One of those limitations is that the study was carried out in a specific cultural and institutional context where it is not clear to what extent the findings can be generalized to other locations or other sorts of organizations. Aside from the lack of external validity of the study, there is the sample size.

The sample size in the present research was adequate to conduct the preliminary analysis. However, it is a small sample size relative to other studies and other reports, and this could undermine the robustness of the conclusion reached and its statistical power. Another limitation of the study was the reliance on self-reported data, which could lead to bias in the data set of either social desirability or just plain old response bias, which would make the respondents inclined to report their engagement levels inaccurately.

Furthermore, while the quantitative approach may lead to more systematic, replicable data sets, it can also miss interpersonal dynamics and idiosyncratic individual differences that the qualitative method could uncover.

Significance of the Findings

The findings of this study have significant implications for practical applications and theoretical advancement in the field of organizational behavior. Specifically, the study sheds light on the relationship between employee engagement and organizational performance in the Middle Eastern educational sector, focusing on Higher Educational Institutes in Oman. The research adds to the existing literature on employee engagement by providing quantitative evidence that vigor, dedication, absorption, and commitment significantly impact performance metrics in this sector.

The study emphasizes the vital role that engagement factors play in improving communication, dedication, and operational effectiveness. These factors are crucial in achieving educational and institutional objectives. The study proves that targeted engagement strategies should be integrated into organizational development programs. Academic institutions in regions like Oman can benefit from promoting a highly engaged workforce. Doing so can boost job satisfaction, increase retention, and enhance institutional effectiveness.

Aligning employee motivations with organizational goals is crucial for success. educational institutes can improve outcomes by creating an engaged work environment that enhances performance, loyalty, and commitment. This is essential for maintaining competitiveness in the evolving global education sector.

Furthermore, the knowledge acquired from this research could be of tremendous value to administrators, policymakers, and human resources experts seeking to establish leadership development programs and boost

performance by prioritizing engagement strategies. As academic establishments continue to acknowledge the significance of their workforce in realizing strategic objectives, the capacity to foster and elevate employee engagement may emerge as a critical competitive edge.

The present study addresses a significant gap in the literature by providing valuable insights into a non-Western educational situation. The researcher offers actionable guidance to academic leaders who aspire to enhance their institution's performance by implementing deliberate improvements in employee engagement measures. This study's findings are of particular importance to researchers and practitioners seeking to broaden their understanding of effective leadership practices in diverse cultural contexts.

Conclusion

This research study underlines how crucial employee engagement is for higher education institutes in Oman. Items to that engaged employees positively impacted organizational performance and pinpoint areas for improvement the research aims to offer insights for leaders and policymakers to share HR strategies that nature high engaged and high-performing workforce by identifying factors influencing employee engagement this is study could boost institutional performance and innovate education quality the findings could inform the development of effective HR policies and practices that encourage employee engagement and ultimately result in improved organizational outcomes.

This research study shows how employee engagement influences organizational performance. The findings showed that energy commitment and focus positively affect organizational performance. This study stresses the pivotal role of employee engagement in fostering communication, teamwork, and reaching organizational goals. It also highlights how a higher engagement level enhanced job satisfaction and organizational performance in higher education settings.

This study demonstrates the need to invest in employee engagement initiatives in educational institutions for improved productivity and outcomes. Implementing programs to enhance job satisfaction and commitment can bring significant benefits in the evolving educational landscape. While there are limitations like sample size and self-reported data, the research has implications for both researchers and practical application. Further investigation with participants is essential to understand the broader relevance of the findings. In addition, incorporating objective metrics for employee engagement and organizational performance could enhance credibility.

Abstract: Egypt's 2030 vision places significant emphasis on sustainable development across economic, social, and environmental dimensions, while also recognizing the rights of future generations. Consequently, organizations are increasingly compelled to integrate social and environmental considerations into their strategies. This study aimed to investigate the mediating role of moral reflectiveness among employees in the relationship between socially responsible Human Resource Management (HRM) practices and environmental citizenship behavior. Drawing upon Social Cognitive Theory and the Stimulus-Organism-Response (S-O-R) framework, we conducted a survey questionnaire to gather primary data from 327 employees working in industrial companies located in the new Damietta city. Our findings reveal that socially responsible HRM practices positively influence employees' environmental citizenship behavior, with moral reflectiveness serving as a complete mediator in this relationship. These results contribute to the expanding body of literature on the determinants of sustainable behavior among workers, offering novel insights into the linkages between environmentally conscious HR practices and environmental citizenship. In conclusion, this study highlights the importance of moral reflectiveness in shaping employees' environmentally responsible behavior within organizations. Theoretical implications underscore the relevance of integrating moral considerations into HRM frameworks aimed at fostering sustainable practices. From a practical standpoint, these findings suggest that organizations can enhance environmental citizenship behavior among employees by implementing socially responsible HRM initiatives. Future research could further explore the mechanisms through which moral reflectiveness influences employees' engagement in sustainable behaviors, as well as investigate additional contextual factors that may moderate these relationships.

Keywords: socially responsible HRM , moral reflectiveness , environmental citizenship behaviors

The relationship between socially responsible hrm and environmental Citizenship behaviors for industrial companies in Egypt: the mediating Role of moral reflectiveness. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2481-2514), Antalya, Turkiye. ISTES.

Introduction

Over the last fifteen years, there has been a discernible increase in the interest of organizations in incorporating social and environmental factors into their pursuit of sustainable development principles and goals. As a result of the growing focus on sustainability's social and environmental aspects, businesses are involving internal stakeholders in the creation of corporate social responsibility (CSR) frameworks. Regarding these stakeholders, human resources are regarded as essential, and companies have a duty to meet their needs (Luu, 2020; Del-Castillo-Feito et al., 2022). The relationship between corporate social responsibility and Human Resource Management (HRM) practices has therefore attracted increasing scholarly attention (Heikkinen et al., 2020; Omid and Dal Zotto, 2022).

The emergence of Socially Responsible Human Resource Management (SRHRM) signifies a critical response to ongoing developments in organizational dynamics, representing a pivotal breakthrough in HRM practices. With organizations increasingly recognizing human resources as their most valuable asset, enhancing the social responsibility and operational efficacy of HRM becomes imperative to sustain its contribution over time (Abu Al-Rous & Al-Qassas, 2021).

Within HRM literature, SRHRM is acknowledged as a relatively nascent domain, with proponents advocating its necessity for driving organizational cultural transformations (Sancho et al., 2019; Shao and Peng, 2022a). The foundational works of SRHRM pioneers have significantly influenced corporate social responsibility studies, albeit receiving limited attention in Arab contexts. Nevertheless, it is posited that employees' environmental conscientiousness is significantly influenced by their moral reflectiveness, as per the Social Cognitive Theory, which posits that individuals' perceptions shape their behaviors (Liao et al., 2022).

Employing the degree of moral reflectiveness as a metric allows for discerning various levels of ethical conduct among individuals, reflecting their adherence to cultural norms and values (Chu et al., 2021). Consequently, it is expected that HRM practices infused with moral reflectiveness will catalyze employees' engagement in social responsibility initiatives within organizations. Building upon the works of Littman-Ovadia (2020) and Freidlin (2020), it is evident that individuals who consistently contemplate ethics exhibit a heightened propensity for fostering positive social behaviors within their professional spheres.

Research on environmental citizenship behavior is highly esteemed among scholars engaged in international projects. However, investigations into this behavior within Arab contexts are still nascent. Environmental

citizenship behavior, defined as voluntary or discretionary actions by employees aimed at enhancing the environment, not mandated or rewarded by their organizations, is gaining prominence (Ren et al., 2020; Mi et al., 2021; Islam et al., 2022). Consequently, there is an increasing imperative to focus on studying employees' pro-environmental behaviors as an indicator of their future environmental actions.

Despite the extensive attention within organizational behavior literature to discerning contextual factors and psychological mechanisms that foster environmental citizenship behavior, applied studies have predominantly adopted a partial perspective. This perspective often characterizes environmentally supportive behaviors as individually beneficial to society. However, this approach lacks comprehensive theoretical insights at the organizational level. Therefore, there is a critical need to incorporate factors influencing environmental citizenship behavior at the organizational level to develop a more nuanced understanding. One such influential factor is Human Resource Management (HRM) practices.

This study aims to bridge the gap between the holistic perspective offered by organizational behavior research and the partial perspective of HRM by examining the link between socially responsible HRM and environmental citizenship behavior within the industrial sector. By doing so, it seeks to enhance integration between these two perspectives, thereby offering a more comprehensive understanding of environmental citizenship behavior in organizational settings.

The current study presents four principal contributions to the extant literature. Firstly, it enhances the breadth of inquiry into the domain of Environmentally Directed Organizational Citizenship Behavior (OCB) by elucidating the pivotal role of socially responsible Human Resource Management (HRM). This research underscores the significance of employees' perception of their organization's commitment to socially responsible HRM as a robust predictor of their engagement in environmental citizenship behavior.

Secondly, it introduces the concept of the Ethical Reflection Role, grounded in Social Cognitive Theory, as a mechanism mediating the relationship between socially responsible HRM and environmental citizenship behavior. Drawing from social cognitive theory, the study posits that employees' moral reflection serves as a critical link in aligning the principles of socially responsible HRM with their environmental actions.

Thirdly, the study expands the research horizon by delving into the antecedents and underlying mechanisms of environmental citizenship behavior. By uncovering the psychological and social mechanisms at play, particularly the mediating role of employees' moral reflection, it offers deeper insights into the pathways through which socially responsible HRM influences environmental citizenship behavior. Lastly, the research provides nuanced perspectives on the mechanisms underlying the impact of socially responsible HRM. By elucidating why and under what conditions socially responsible HRM fosters employees' ethical motivations and environmentally supportive behaviors, it enriches our understanding of the intricate dynamics between organizational practices and individual behaviors within the context of environmental sustainability.

Literature review

Socially Responsible Human Resource Management (HRM),

The concept of socially responsible Human Resource Management (HRM) introduced by Orlitzky and Swanson (2006), represents an innovative approach within the HRM domain aimed at fostering greater employee engagement in Corporate Social Responsibility (CSR) initiatives. According to Shao and Peng (2022), socially responsible HRM is regarded as a pivotal element of corporate social responsibility programs, fundamental to their effective implementation. This encompasses a diverse array of activities, including the integration of morality and personal attributes into hiring processes, the provision of instruction on social responsibility initiatives, the alignment of employee remuneration and benefits with social dimensions, and the adaptation of performance appraisal systems to advance social objectives. Moreover, it entails the development of a coherent vision and the delineation of specific values pertinent to the CSR strategy (Zhang et al., 2021).

The burgeoning interest in evaluating corporate social responsibility through the lens of human resource management (HRM) has given rise to a robust research field, significantly enriching scholarly discourse on the topic (Rawshdeh et al., 2019; Omidi and Dal Zotto, 2022). Nonetheless, despite notable advancements, the literature in this field continues to offer fertile ground for theoretical exploration and practical applications.

Celmaa et al. (2018) assert that environmentally responsible human resource management endeavors to enhance employees' well-being while concurrently supporting their personal and societal aspirations. Effective management of resources and capabilities assumes paramount importance as organizations strive to fulfill their overarching objectives. The existing HRM literature underscores the imperative of devising a strategic HRM framework that prioritizes the attainment of both organizational and societal goals (Santana et al., 2020).

Socially responsible human resource management confers numerous advantages, including the promotion of work-life balance, the provision of ongoing education and training, and the adoption of inclusive hiring practices (Tuan et al., 2021). According to He and Kim (2021), socially responsible HRM facilitates the application of corporate social responsibility to the workforce, encompassing social considerations in hiring, promotion, performance evaluation, rewards allocation, staff retention, and social issue training. It is characterized by proactive efforts to enhance employees' experiences and ethically fulfill their social and personal expectations (Vesely& Klöckner, 2020).

Bombiak and Marciniuk-Kluska (2019) conceptualize this notion as grounded in investments in human capital, the provision of employment opportunities, and the establishment of safe and healthy work environments. It encompasses the resolution of societal issues for the betterment of communities and the fostering of individual satisfaction. De Stefano et al. (2018) articulate it as a suite of human resource management (HRM) strategies initiated by organizations to enhance incentives for employee engagement in corporate social responsibility (CSR) endeavors, thereby benefiting external stakeholders. These strategies encompass the recruitment and

retention of socially responsible personnel, provision of CSR training, consideration of employees' societal contributions in promotion decisions, and incorporation of CSR performance evaluations.

Studies by He and Kim (2021) suggest that organizational pursuit of socially responsible HRM is an effective means to boost employee morale and productivity. Al-Amin et al. (2021) define it as an integral component of corporate social responsibility initiatives and a critical tool for their successful implementation. Additionally, He et al. (2021a) define it as a set of practices aimed at enhancing the social responsibility, motivation, and opportunities of responsible employees, often including humanistic goals and benefits, such as appointing and retaining socially responsible employees, providing corporate social responsibility training, evaluating employees' social responsibility performance, and offering compensation and advancement opportunities.

Social identity theory, as defined by Nie et al. (2018), elucidates individuals' inclination to maintain perceived superiority within a group, suggesting that individuals identify more with organizations possessing favorable reputations, thereby enhancing their self-esteem (Newman et al., 2016). Social exchange theory posits that organizational commitments to social responsibility prompt employees to reciprocate with positive work-related behaviors (López-Fernández et al., 2018; Del-Castillo-Feito et al., 2022).

Moral Reflectiveness

Zhao and Zhou (2021) posit that moral reflection involves shifts in cognitive processes or rational judgment regarding what is considered acceptable or unacceptable at different stages of moral development. In other words, moral reflectiveness pertains to how individuals arrive at specific determinations of right or wrong, distinct from ethical values, which represent personal beliefs about conduct.

Afsar and Umrani (2020) define moral reflection as variations in individuals' engagement in ethically oriented contemplation concerning the extent of their ethical considerations in daily decisions. Social cognition theory suggests that individual behavior is shaped by both personal and environmental factors, with interactions within ethical contexts particularly attuned to ethical issues. These behaviors may be influenced by environmental interactions (Li et al., 2022). Additionally, Cai et al. (2022) propose that workers may be driven to assess themselves and their actions through internal motivations. Internal motivation, stemming from a desire for activities that bring satisfaction, can manifest in moral reflection or contemplation among workers.

The concept of moral reflectiveness, gaining increasing attention in contemporary research, pertains to individuals' cognitive processes and rational judgment regarding moral considerations. This review explores recent scholarship on moral reflectiveness, covering its role in ethical decision-making, leadership, employee behavior, organizational dynamics, and its interaction with factors such as ethical climate and corporate social responsibility.

Kim and Park (2023) conducted a thorough review and integration of literature, emphasizing the pivotal role of moral reflectiveness in ethical decision-making processes. Their analysis underscores the importance of individuals' moral deliberation in navigating complex ethical dilemmas within organizational contexts. Wong and Chiu (2023) found moral reflectiveness to be a key determinant of ethical leadership effectiveness. Their study suggests that leaders with higher levels of moral reflectiveness demonstrate greater ethical consideration in decision-making, fostering a culture of integrity and trust within organizations.

Gao and Jiang (2023) explored the impact of moral reflectiveness on employee prosocial behavior, discovering a positive association between the two constructs. Their study suggests that individuals with heightened moral reflectiveness are more likely to engage in behaviors benefiting others, contributing to a supportive and ethical work environment. Chen and Li (2024) conducted a longitudinal analysis investigating the relationship between moral reflectiveness and corporate social responsibility (CSR). Their research highlights moral reflectiveness as a predictor of CSR engagement, emphasizing its role in driving ethical initiatives and sustainable business practices over time.

Zhang and Liu (2024) examined the moderating effect of moral reflectiveness on the relationship between ethical leadership and employee job satisfaction. Their analysis indicates that moral reflectiveness enhances the positive impact of ethical leadership on employee well-being, fostering a sense of fulfillment and commitment among organizational members. Nguyen and Le (2024) studied the effects of ethical climate on employee moral reflectiveness, employing a multi-level analytical approach. Their findings suggest that organizational environments characterized by strong ethical climates facilitate the development of moral reflectiveness among employees, promoting ethical awareness and behavior throughout the organization.

Huang and Wang (2024) conducted a meta-analytic review exploring the mechanisms underlying moral reflectiveness, providing insights into its cognitive and affective dimensions. Their synthesis of existing research sheds light on the psychological processes involved in moral reflection, offering valuable implications for understanding and fostering moral development in individuals. Zhu and Liu (2024) conducted a case study examining the role of moral reflectiveness in managerial decision-making, particularly among Chinese managers. Their research highlights the importance of moral deliberation in guiding managerial actions and shaping organizational outcomes, noting cultural variations in the manifestation of moral reflectiveness.

Wu and Hu (2024) investigated the role of moral reflectiveness in fostering ethical behavior among healthcare professionals through qualitative analysis. Their study underscores the significance of moral reflection in promoting ethical awareness and responsibility within healthcare settings, with implications for patient care and organizational ethics. Lastly, Yang and Chen (2024) explored the moderating effect of moral reflectiveness on the relationship between ethical climate and organizational commitment. Their cross-sectional study suggests that individuals with higher levels of moral reflectiveness are more likely to align with organizational values and goals, enhancing commitment and engagement among employees.

In summary, recent research on moral reflectiveness underscores its multifaceted role in ethical decision-making, leadership effectiveness, employee behavior, and organizational dynamics. These studies collectively contribute to a deeper understanding of moral reflectiveness and its implications for fostering ethical awareness, responsible leadership, and sustainable organizational practices across diverse contexts.

Environmental citizenship behavior

The concept of environmental citizenship behavior was initially outlined by Daily et al. (2009), who defined it as individual and proactive social conduct exhibited by employees aimed at enhancing organizational environmental management (Ullah et al., 2021). Gurmani et al. (2021) further elaborate on this concept, defining environmental citizenship behavior as voluntary actions undertaken by employees that embody additional efforts directed towards benefiting the natural environment and bolstering the organization's environmental performance. This construct closely aligns with organizational citizenship behavior but is uniquely oriented towards environmental concerns, as emphasized by Neessen et al. (2021).

Ren et al. (2020) conceptualize environmental citizenship behavior as a subset of organizational citizenship behavior, encompassing individuals' voluntary and proactive behaviors contributing to enhancing organizational effectiveness, particularly within the environmental realm. High scorers in environmental citizenship behavior demonstrate a readiness to engage in positive environmental endeavors (Islam et al., 2022), underscoring its relevance in contemporary discourse surrounding environmental management practices (Yin et al., 2021). Particularly in industrial settings, environmental citizenship behavior entails actions such as waste reduction, energy conservation, and the adoption of eco-friendly practices (Zhao and Zhou, 2021).

Asghar et al. (2022) stress the pivotal role of voluntary employee engagement in environmental activities for organizational progress in environmental sustainability. Employees can contribute through various environmentally oriented behaviors, actively participating in the implementation of environmental standards. Ojedokun (2021) characterizes environmental citizenship behavior as employees' responses to corporate environmental social responsibility initiatives and practices within the organizational framework. Khan et al. (2021) echo this sentiment, defining it as proactive efforts by employees to foster environmental stewardship and effective environmental management practices.

While scholars such as Ismail and Al-Bardan (2018) perceive environmental citizenship behavior as discretionary actions by employees towards environmental improvement, Malik et al. (2021) emphasize its role in conscientious environmental management. Aslam et al. (2021) further elaborate, describing it as voluntary, unmandated behavior aimed at fostering organizational and community sustainability.

In essence, environmental citizenship behavior comprises voluntary actions undertaken by employees, yielding environmental benefits for both the organization and the broader community. Gurmani et al. (2021) characterize

it as actions driven by employees' environmental concerns and alignment with the organization's environmental management strategy, including advocacy and encouragement of environmental protection efforts among peers.

Despite variations in definitions, scholars generally converge on two key attributes: environmental citizenship behavior is beneficial to both the environment and society, and it transcends formal work requirements within an informal organizational context. This study adopts the premise that environmental citizenship behavior embodies employees' spontaneous environmentally and socially beneficial actions in the workplace, influenced by organizational strategies and employees' psychological orientations. From these diverse perspectives, environmental citizenship behavior is construed as voluntary environmental initiatives by employees, not mandated by organizational directives, aimed at improving environmental performance and fostering sustainable environmental responsibility.

Recent studies have continued to explore and provide insights into the concept of environmental citizenship behavior, shedding light on its dimensions, antecedents, and outcomes. Building upon previous research, these investigations contribute to a deeper understanding of the role of individuals in promoting environmental sustainability within organizational contexts. Wang and Chen (2023) conducted a longitudinal study examining the relationship between environmental citizenship behavior and organizational sustainability performance in a multinational corporation. Their findings revealed a significant positive association between employees' engagement in environmental citizenship behavior and various indicators of organizational sustainability, including reduced carbon footprint and enhanced eco-efficiency.

In a cross-cultural examination, Li et al. (2023) compared environmental citizenship behavior across different national contexts, focusing on the influence of cultural values on employees' environmental engagement. Their study highlighted the importance of cultural factors in shaping employees' attitudes and behaviors towards environmental stewardship, emphasizing the need for culturally sensitive approaches to promote environmental citizenship behavior in diverse organizational settings.

Expanding the theoretical framework of environmental citizenship behavior, Smith et al. (2024) proposed a multi-level model that integrates individual, organizational, and contextual factors in explaining variations in employees' environmental engagement. Drawing on insights from social psychology and organizational behavior, their model offers a comprehensive understanding of the mechanisms underlying environmental citizenship behavior and its implications for organizational sustainability.

In a qualitative inquiry, Garcia et al. (2024) explored the role of leadership in fostering environmental citizenship behavior among employees in small and medium-sized enterprises (SMEs). Their study identified transformational leadership behaviors, such as visioning and empowerment, as critical drivers of employees' environmental initiatives, highlighting the pivotal role of leadership in cultivating a culture of environmental responsibility within SMEs.

Echoing the importance of organizational culture, Zhang et al. (2024) investigated the influence of organizational climate on employees' environmental citizenship behavior in the hospitality industry. Their findings underscored the significance of supportive organizational climates, characterized by environmental values, norms, and practices, in fostering employees' pro-environmental behaviors and enhancing organizational environmental performance.

In a novel approach, Jones et al. (2024) examined the role of technology-mediated interventions in promoting environmental citizenship behavior among remote workers. Their experimental study demonstrated the effectiveness of virtual platforms and gamification strategies in incentivizing and sustaining employees' engagement in environmentally friendly practices, highlighting the potential of digital tools in advancing environmental sustainability agendas in the era of remote work.

Collectively, these recent studies contribute to a growing body of literature on environmental citizenship behavior, offering valuable insights into its determinants, mechanisms, and outcomes within diverse organizational contexts. By elucidating the complex interplay between individual, organizational, and contextual factors, these investigations inform the development of evidence-based strategies for promoting environmental stewardship and sustainability in the workplace.

Hypothesis development

Socially Responsible HRM and Moral Reflectiveness

According to Afsar and Umrani (2020), moral reflectiveness pertains to the extent to which individuals contemplate moral issues in their daily encounters and decisions, as well as the depth of morally guided reflection they undertake regarding these experiences. Personality traits and individual differences have been identified as factors influencing the relationship between employee work outcomes and perceived corporate social responsibility (Nejati & Shafaei, 2023). Previous studies on personality have demonstrated that individual traits largely account for behavioral variations among individuals and shape their inclinations towards ethical conduct (Chen et al., 2023; Berniak-Woźny et al., 2023; Silva et al., 2023).

Employers are urged to foster employee engagement in Corporate Social Responsibility (CSR) activities, ensuring that the emphasis is not solely on meeting stakeholder expectations or legal requirements. Instead, they should communicate that the objective of CSR initiatives is to safeguard the environment, promote societal well-being, and foster sustainable development (Mughal et al., 2023). Consequently, employees perceive these CSR endeavors as morally and ethically sound (Mansour et al., 2023).

The inclination towards moral uprightness delineates the behaviors of individuals characterized by moral reflectiveness (Murshed et al., 2023). Moral reflectiveness is posited to encourage pro-environmental behavior, as individuals prioritize morally correct actions aligned with their personal values, irrespective of tangible benefits. For instance, actions such as turning off lights when leaving the office or opting for stairs over the

elevator are discretionary actions that contribute to environmental conservation, driven by a sense of purpose and responsibility towards future generations. Individuals with a strong moral compass prioritize ethical considerations in decision-making, leading to a propensity for pro-environmental behaviors at the workplace (Ng et al., 2023). Shaaban and Rabie (2023) underscore the significant impact of social responsibility HRM on overall organizational sustainability, emphasizing its nexus with sustainable development (SD) and its relevance to broader HRM and CSR discourse.

Zhao and Zhou (2021) found that social responsibility HRM positively influences hospitality employees' organizational citizenship behavior towards the environment, with moral reflectiveness mediating this relationship. Moreover, the study highlighted that lower levels of responsible leadership were associated with a heightened effect of social responsibility HRM on moral reflectiveness, thereby indirectly influencing organizational citizenship behavior towards the environment. These findings elucidate the mechanisms through which social responsibility HRM influences organizational citizenship behavior, offering insights into macro-level factors shaping the environmental intentions of hospitality employees. Therefore, it is reasonable to hypothesize:

H1: Socially responsible human resources management has significant positive impact on the moral reflectiveness of employees.

Moral Reflectiveness and Environmental citizenship behavior

Li et al., (2023) demonstrated that environmentally specific transformational leadership positively predicts employee organizational citizenship behavior for the environment, and moral reflectiveness mediates this relationship. Further, leader group prototypicality strengthens the positive relationship between environmentally specific transformational leadership and subsequent moral reflectiveness. they extend the understanding of environmentally specific transformational leadership in the context of manufacturing companies and has practical implications to help employees accelerate their organizational citizenship behavior for the environment.

According Potakey, et al., (2023) the students' environmental values made them more likely to behave in a way that supported the environment. High biospheric and altruistic values are prerequisites for environmental citizenship behaviors, and the students possessed these values in abundance. According to the study, school administrators should use environmental literacy to increase students' environmental engagement. The Ghana Education Service should also assist school environmental clubs in order to foster a love of the natural world and to provide a forum for environmental activism in the public domain. Pham et. al., (2023) found common good HRM directly and positively influences ethical employee behaviors and organizational citizenship behaviors toward individual OCBI, and indirectly positively influences these two types of behavior via value commitment. Interestingly, the relationship between common good HRM and ethical employee behaviors was found to be significantly stronger when combined with high levels of spiritual leadership. Unexpectedly, however, spiritual leadership was not found to moderate the common good HRM - OCBI relationship.

Jiang et al. (2023) presented an integrative model examining the double-edged sword effect of unethical pro-organizational behavior (UPB) from the perspective of the actors. Drawing on the moral self-regulation perspective and psychological entitlement literature, we propose that employees who engage in UPB may experience an increase in moral deficits and psychological entitlement, resulting in increased organizational citizenship behavior (OCB) and decreased work effort, respectively. We further propose that moral attentiveness strengthens the positive relationship between UPB and moral deficits but weakens the positive relationship between UPB and psychological entitlement. Moreover, the strength of the indirect effects of employee UPB on OCB and work effort is also contingent upon employees' moral attentiveness. Priyadarshini et al. (2023) found that green transformational leadership promotes green empowerment and organizational citizenship behaviors toward the environment (OCBE) among the employees. It also reveals that environmental passion plays a key role in promoting eco - initiative and eco-helping behavior among the employees when they are empowered for green practices. Also, the influence of resource commitment fosters eco-civic engagement among the employees. Therefore, it is reasonable to hypothesize:

H2: moral reflectiveness of employees has significant positive impact on Environmental citizenship behavior.

Socially Responsible HRM and Environmental Citizenship Behavior

Li et al. (2023) explained that environmentally specific transformational leadership significantly predicts employees' organizational citizenship behavior for the environment, with moral reflectiveness serving as a mediating mechanism. Moreover, the study highlighted that leader group prototypicality amplifies the positive association between environmentally specific transformational leadership and subsequent moral reflectiveness, thereby contributing to a deeper understanding of this leadership style within the manufacturing sector and offering practical insights to facilitate employees' engagement in organizational citizenship behavior for the environment.

According to Potakey et al. (2023), students' environmental values play a pivotal role in shaping their pro-environmental behaviors. The presence of high biospheric and altruistic values among students serves as a foundation for environmental citizenship behaviors. The study suggests that educational institutions should leverage environmental literacy initiatives to enhance students' environmental engagement. Additionally, the Ghana Education Service is encouraged to support school environmental clubs to cultivate a reverence for the natural world and provide a platform for environmental advocacy in the public sphere.

Pham et al. (2023) found that common good HRM exerts a direct and positive influence on ethical employee behaviors and organizational citizenship behaviors towards individuals, with value commitment mediating this relationship. Interestingly, the study revealed that the relationship between common good HRM and ethical employee behaviors is significantly enhanced in the presence of high levels of spiritual leadership. However,

spiritual leadership was not found to moderate the relationship between common good HRM and organizational citizenship behaviors towards individuals.

Jiang et al. (2023) proposed an integrative model exploring the nuanced effects of unethical pro-organizational behavior (UPB) on employees. Drawing upon the moral self-regulation perspective and psychological entitlement literature, the study posits that engagement in UPB may lead to moral deficits and increased psychological entitlement among employees, consequently influencing organizational citizenship behavior (OCB) and work effort, respectively. The study further suggests that moral attentiveness moderates the relationship between UPB and moral deficits, as well as UPB and psychological entitlement, with the strength of indirect effects on OCB and work effort contingent upon employees' level of moral attentiveness.

Finally, Priyadarshini et al. (2023) demonstrated that green transformational leadership fosters green empowerment and organizational citizenship behaviors towards the environment among employees. The study highlighted the pivotal role of environmental passion in promoting eco-initiative and eco-helping behaviors among empowered employees. Furthermore, the study underscored the influence of resource commitment in nurturing eco-civic engagement among employees. Therefore, it is reasonable to hypothesize:

H3: Socially Responsible HRM has significant positive impact on Environmental citizenship behavior.

The Mediating Role of Moral Reflectiveness

The predominant focus of applied research in recent years has been on investigating the societal implications of responsible Human Resource Management (HRM) on employee attitudes and behaviors. Studies have predominantly explored dimensions such as social identity (Kundu and Gahlawat, 2015) and organizational citizenship behaviors (Newman et al., 2016) among employees. However, despite this extensive examination, there remains a significant gap in the literature regarding the exploration of whether socially responsible HRM correlates with employees' ethical attributes, notably ethical identity and moral reflection concerning societal impacts. The exploration of ethical dimensions is paramount due to their intrinsic connection with ethical decision-making processes (Türegün, 2018). Notably, Pham et al. (2018) have suggested a relationship between socially responsible HRM and employees' ethical awareness, underlining the importance of such investigations.

Moral reflection, as conceptualized by Chu et al. (2021), refers to the deliberate contemplation by individuals of their experiences through an ethical lens. This perspective is rooted in the social cognitive theory, which posits that individual behavior is shaped by the interplay of personal and environmental factors, with ethical contexts being particularly influential in guiding behaviors (Liao et al., 2022). The social impact of responsible HRM on employees' moral reflection is perceived to manifest through shifts in their environmental concerns, especially in contexts where opportunities for ethical engagement are abundant.

Socially responsible HRM endeavors to facilitate the strategic integration of corporate social responsibility

principles within organizational frameworks, thereby fostering a supportive and secure environment for employees. This approach encompasses various HRM initiatives, including providing comprehensive training on corporate social responsibility and incorporating contributions to corporate social responsibility in performance evaluations and promotions (Shen and Benson, 2016). Consequently, these ethical initiatives are likely to cultivate ethical frameworks within the organizational culture.

According to the social cognitive theory, exposure to ethical structures within the organizational context, such as ethical committees and training programs, influences employees' ethical perceptions and experiences. Applied research has demonstrated a positive correlation between moral reflection and employees' positive social behaviors in the workplace, underscoring the pivotal role of ethical considerations in shaping behavioral choices (Zhao and Zhou, 2021). Individuals inclined towards ethical behavior are more likely to engage in environmental citizenship behaviors, thereby contributing to the cultivation of a sustainable organizational environment.

Based on the synthesized analysis of existing literature and empirical findings, it is hypothesized that moral reflection positively mediates the relationship between socially responsible HRM practices and environmental citizenship behavior among employees. Responsible HRM practices have the potential to serve as catalysts for fostering employees' moral reflection and promoting environmental organizational citizenship behavior, thereby facilitating the development of sustainable organizational ecosystems. Therefore, the fourth hypothesis of the study can be proposed as follows:

H4: There is an intervening mediation of employees' moral reflectiveness in the relationship between socially responsible HRM and environmental citizenship behavior.

The proposed framework (1) illustrates the impact of socially responsible HRM on environmental citizenship behavior, and the mediating role of moral reflectiveness in the relationship between socially responsible HRM and environmental citizenship behavior.

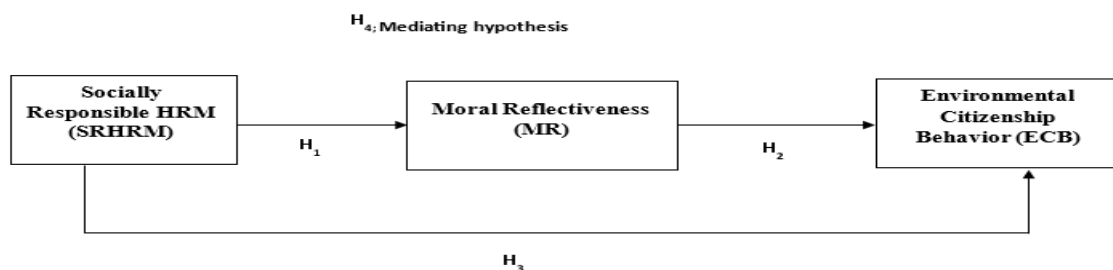

Figure 1. Research model

Method

Population Sampling

The study population comprises all employees within the companies situated in the industrial area of New Damietta City. Obtaining precise statistics on the total number of employees within these companies proved challenging, primarily due to companies' reluctance to disclose such information, citing concerns regarding social insurance costs. Furthermore, the transient nature of much of the workforce adds to the complexity of obtaining accurate employee counts. Consequently, the researchers were unable to ascertain the exact population size.

Nevertheless, researchers managed to acquire data regarding the number of companies categorized by industrial sector, totaling 512 companies, as detailed in Table 1 of Appendix A. Consequently, the researchers treated the study population as an unknown population. Given this uncertainty regarding population size, researchers employed a form of non-probability sampling, specifically quota sampling, deemed appropriate for such circumstances.

The researchers stratified the population based on industrial sector and employed a proportional allocation method to draw samples from each stratum (i.e., sector type). Utilizing the equation for determining sample size in unknown populations, with a confidence level of 95% and a margin of error of $\pm 5\%$, the researchers arrived at a sample size of 384 individuals, which is deemed ideal for unknown populations. The sampling units encompassed both supervisory and non-supervisory employees within the study companies, ensuring a comprehensive representation of the workforce.

Measures

The research variables were assessed utilizing established scales from previous literature, which have demonstrated reliability and validity regarding the constituent items (refer to Appendix B of the study). Employing a Likert scale with five levels, the researchers ensured a comprehensive measurement framework for the variables under investigation.

Data Collection

The study utilized survey methodology to gather data from primary sources, employing a questionnaire to measure research variables. The questionnaire design aimed to maintain consistency with original scales while adapting certain items to align with the characteristics of the research community. Rigorous evaluations through validity and reliability tests were conducted on the questionnaire list to ensure the robustness of data collection measures.

Efforts were made to secure participation from industrial companies in New Damietta City, facilitated by communication with multiple companies and collaboration with colleagues. A total of 384 questionnaires were distributed across various industrial sectors, resulting in the retrieval of 327 valid responses, indicating an 85% response rate. To mitigate methodological biases, data collection occurred at three distinct time points throughout the study.

Methods of analysis

Statistical analyses were performed to describe study variables, utilizing measures such as mean and standard deviation. Confirmatory Factor Analysis, executed through AMOS V.23 software, was employed to assess the validity and reliability of study measures. Additionally, Hierarchical Regression and the PROCESS macro method, facilitated by SPSS V.26 software, were utilized to test study hypotheses. These methodological approaches ensured a comprehensive investigation into the research objectives, enhancing the rigor and reliability of study findings.

Results

Demographic Characteristics

Through descriptive statistical analysis, the researcher can elucidate the most important demographic characteristics of the study sample, as shown in Table (2) see table2 in Appendix A. Approximately 67.7% of the respondents were male ($n=221$) and 32.4% were female ($n=106$). Around 41.9% of the respondents were in the age group 25-35 ($n=137$), 30.3% were younger than 25 ($n=99$), 20.2% were between 35 and 45 ($n=66$), and 7.6% were over 45 ($n=25$). About 45.9% had work experience between 3 and 5 years ($n=150$), 31.2% between 5 and 10 years ($n=130$), 11.0% more than 10 years ($n=36$), and 3.4% less than 3 years ($n=15$). Regarding the job level, approximately 58.7% of the study sample worked in middle management positions ($n=192$), 30.6% worked in executive management ($n=144$), and finally, 58.4% worked at the executive management level ($n=100$).

Measurement Model Evaluation

The results in Table (3) indicate that all standardized factor loadings for items of the research variables are greater than 0.50. This suggests that the variance explained by each item of the study's variables is attributed to the assumed variable. Additionally, using the t-test demonstrates the significance of all factor loadings at ($P<0.001$). Furthermore, all values of Average Variance Extracted (AVE) are greater than the statistically acceptable minimum of 0.50, according to Fornell and Larcker's recommendations (1981). This supports convergent validity and indicates the strength of consistency among items of each variable.

Moreover, all values of Composite Reliability (CR) and Cronbach's alpha (α) exceed the statistically acceptable minimum of 0.70. This suggests that the study measures have a high level of reliability. As for discriminant

validity, it can be verified by calculating the square root of the extracted average variance (AVEs) for each variable. Then, comparing it with the correlation coefficients of this variable with other variables in the measurement model. The results in Table (4) show that the square root values of each extracted variance average (AVEs) exceed the correlation coefficients for each variable. These values ranged between 0.571 and 0.719, while the correlation coefficients ranged between 0.848 and 0.386. Additionally, the Heterotrait-Monotrait Ratio (HTMT) was used to measure discriminant validity. The results in Table (4) indicate that HTMT values between study variables are less than 0.85, confirming the distinction of dimensions and the absence of item overlap. Regarding the assessment of Multicollinearity, the Variance Inflation Factor (VIFs) was used for each variable. The results in Table (3) indicate that the Variance Inflation Factor is less than 3, suggesting that the data does not suffer from multicollinearity according to Bagozzi et al.'s recommendations (1991). As for testing the normal distribution of the data, the results in Table (3) indicate that the skewness and kurtosis values ranged between (± 1.96), confirming the absence of a problem related to the normal distribution of the data (George and Mallery, 2010).

Finally, the measurement model showed indicators suggesting the adequacy of the proposed model for the study. Where the value of $X^2 (0.435) = 1290.73$ was significant at the level of $P < 0.001$; $df/X^2 = 1.86$; CFI = 0.904; IFI = 0.930; TLI = 0.932; RMSE = 0.082. These statistics met the criteria for the quality of the Comparative Fit Index (CFI), the Tucker-Lewis Index (TLI), and the Incremental Fit Index (IFI) with values of 0.90 or higher. Additionally, the Root Mean Square Error of Approximation (RMSEA) had a value of 0.08 or less, and the Standardized Root Mean Square Residual (SRMR) had a value of 3 or less (Hair Jr et al., 2016).

Table 3. Statistics of the validity and reliability assessment of the study variables scale.

Direct relationships between variables:

The results indicate the validity of the assumptions of direct study as illustrated in Table 5. The results show a significant positive impact of socially responsible HRM on ethical reflection, supporting the validity of the first assumption. Additionally, the study results indicate that ethical reflection has a significant positive effect on environmental citizenship behavior, supporting the validity of the second assumptions. Furthermore, the results indicate a significant positive effect of socially responsible HRM on environmental citizenship behavior, supporting the validity of the third assumption of the study.

Table 5. Path coefficients for direct effects between variables.

Hypotheses	Independent variables	Dependent variables	Direct path coefficient	P-Value	hypothesis test result
H1	(SRHRM)	(MR)	0.161	0.001>	Accept hypothesis
H2	(MR)	(ECB)	0.120	0.003	Accept hypothesis
H3	(SRHRM)	(ECB)	0.111	0.006	Accept hypothesis

Mediation Analysis:

Regarding the test of the mediating role of ethical reflection in the relationship between socially responsible

HRM and environmental citizenship behavior, the results indicate the validity of the indirect study assumptions as illustrated in Table 6. The results suggest that ethical reflection partially mediates the relationship between socially responsible HRM and environmental citizenship behavior, supporting the validity of the fourth assumption of the study.

Table 6. Path coefficients for direct, indirect, and total effects between variables.

Hypotheses	Independent variables	Mediator variable	Dependent variables	Direct path coefficient	Indirect path coefficient	Total path coefficient	hypothesis test result

Discussion

Relationship between socially responsible HRM and employees' moral reflection,

The results of our research align with study conducted by Shaaban & Rabie, (2023) found that social responsibility HRM significantly affects organizational sustainability overall. Also, Zhao & Zhou (2021) support the results of our research they found that social responsibility HRM positively impacted hospitality employee's organizational citizenship behavior for the environment; moral reflectiveness mediates the relationship between social responsibility HRM significantly and hospitality employee's organizational citizenship behavior for the environment. There is also research support the effect of socially responsible HRM on morale reflection like study of (Nejati & Shafaei,2023) that found Personality traits and individual differences have been found to influence the relationship between employee work outcomes and perceived corporate social responsibility. Also researches by (Chen et al.,2023, Berniak-Woźny et al.,2023, Silva, et al.,2023) support our research results because they have shown that individual personality can account for most behavioral differences between people and shape the things that people are interested in and care about ethical behavior. According to study of (Ng et al.,2023) support our research because they found that decisions made with ethics as their primary consideration are associated with a higher likelihood of engaging in pro-environmental behaviors at work. This includes behaviors that go beyond obligatory requirements and involve discretionary actions aimed at benefiting the environment. Researchers concludes that the more HRM can implement socially responsible practices towards employees, the more considers moral issues in their daily experiences and decisions, as well as the amount of morally guided reflection they engage and motivate in regarding those experiences.

Relationship between employees' Moral reflection and environmental citizenship behavior,

the results of our research correspond with the results of study conducted by Li et al., (2023) They showed that leadership characterized by a focus on environmental concerns predicts a positive outcome in terms of employees' commitment to environmentally friendly organizational behavior. Moreover, the presence of strong

moral reflection serves as an intermediary factor in this correlation. Additionally, when leaders embody the ideals of the group they represent, it further enhances the link between environmentally focused leadership and subsequent moral reflection. Also study of Pham et. al., (2023) support our research because they discovered that common good HRM(HRM) directly and positively impacts ethical employee behaviors and organizational citizenship behaviors towards individual OCBI. This influence is also indirectly positive through value commitment. Notably, they found that the association between common good HRM and ethical employee behaviors is notably stronger in conjunction with high levels of spiritual leadership. Surprisingly, however, spiritual leadership did not moderate the relationship between common good HRM and OCBI.

The results of our study are also consistent with the study of Jiang et al. (2023) which introduced an inclusive model that investigates the dual impact of unethical pro-organizational behavior (UPB) as perceived by the individuals involved. Rooted in the moral self-regulation perspective and psychological entitlement literature, their proposition suggests that individuals engaging in UPB may encounter heightened moral deficiencies and psychological entitlement, leading to increased organizational citizenship behavior (OCB) and decreased work effort, respectively.

Additionally, they suggest that moral attentiveness reinforces the positive correlation between UPB and moral deficits but diminishes the positive correlation between UPB and psychological entitlement. Furthermore, they argue that the intensity of the indirect consequences of employee UPB on OCB and work effort is subject to variation based on employees' level of moral attentiveness. Also, the study of Priyadarshini et al. (2023) support the results of our research They discovered that green transformational leadership enhances green empowerment and encourages employees' organizational citizenship behaviors towards the environment (OCBE). Additionally, the study found that environmental passion plays a crucial role in stimulating eco-initiative and eco-helping behaviors among employees when they are empowered to adopt green practices. Furthermore, the impact of resource commitment promotes employees' engagement in environmental civic activities. The researcher concludes that the more employees' moral reflection the more it provides motivational opportunities to engage them in environmental citizenship behavior, pro-environmental behavior, in public and private, driven by a belief in fairness of the distribution of environmental goods, in participation, and in the co-creation of sustainability policy.

Relationship between socially responsible HRM and environmental citizenship behavior,

Our research findings align with those of studies conducted by Zhao and Zhou (2021) and Liao et al. (2022), indicating that socially responsible HRM positively influences environmental citizenship behavior. Therefore, it can be argued that socially responsible HRM enhances values oriented towards altruism, there by promoting environmental citizenship behavior and encouraging employees to engage in environmentally supportive behavior. Additionally, it can be said that socially responsible HRM and environmental citizenship behavior are positive responses to overcoming challenges to achieving sustainable development. The researcher concludes that the more HRM can implement socially responsible practices towards employees, the more it

provides motivational opportunities to engage them in environmental citizenship behavior.

Mediating role of moral reflection in the relationship between socially responsible HRM and environmental citizenship behavior,

The results of this study are consistent with the findings of studies conducted by Shen and Benson (2016) and Zhao and Zhou (2021). They suggest that moral reflection plays an intermediary role in the relationship between socially responsible HRM and environmental citizenship behavior. Thus, it can be argued that moral reflection positively influences the relationship between socially responsible HRM and environmental citizenship behavior, confirming that socially responsible HRM practices serve as a source to stimulate employees' moral reflection and enhance their organizational environmental citizenship behavior.

Conclusion

To sum up, the conversation emphasizes how moral reflection among staff members, environmentally conscious behavior, and socially conscious human resource management (HRM) all interact within businesses. The results, which support earlier studies, show a strong relationship between socially conscious HRM practices and organizational sustainability. Studies also show that moral reflection serves as a mediating factor, strengthening the connection between environmental citizenship behavior and socially conscious HRM.

Additionally, employees' dedication to eco-friendly behavior is positively correlated with leadership that prioritizes environmental issues, especially when combined with a strong moral reflection. Furthermore, ethical employee behavior and organizational citizenship behaviors are positively impacted by common good HRM, and this relationship is strengthened by spiritual leadership. In addition, inclusive models emphasize how employees' moral attentiveness moderates the dual effects of unethical pro-organizational behavior on work effort and organizational citizenship behavior. Our study also highlights the contribution that green transformational leadership makes to employee empowerment and the promotion of environmentally conscious behavior. It makes the case that encouraging eco-initiative and eco-helping behaviors is greatly aided by a strong commitment to the environment and a passion for the environment.

Overall, the results point to the promotion of environmental citizenship behaviour by socially conscious HRM practices in addition to improving employees' moral reflection. As a result, businesses can use these procedures to motivate staff members to adopt eco-friendly actions, which will ultimately aid in sustainable development.

Recommendation

The current study aimed to contribute to knowledge and address some research gaps regarding the influence of socially responsible HRM on environmental citizenship behavior, and the mediating role of employees' moral

reflection in the relationship between socially responsible HRM and environmental citizenship behavior. This was in response to recommendations from previous literature, allowing for the generalization of the findings, which can be detailed as follows:

Firstly, expanding the scope of research on environmental citizenship behavior of employees by identifying one of the predictors, represented by socially responsible HRM. Many researchers have emphasized the importance of uncovering environmentally friendly behaviors among employees within organizations, which can alleviate the rigidity of technical and sustainable systems and assist in creating value for organizations' green protection. By attempting to integrate organizational and individual variable analyses, the researcher suggests that when employees perceive socially responsible HRM practices within their organizations as positive signals for sustainable development, they are likely to adopt environmentally oriented citizenship behavior for the organization. Therefore, the researcher expanded the scope of research in studying organizational citizenship behavior literatures of employees by investigating how and when socially responsible HRM enhances employees' environmental organizational citizenship behavior. This result also aligns with the findings of previous studies, which confirm that HR management initiatives in organizations can encourage employees to support the organization's environmental management systems and engage voluntarily in environmentally oriented organizational citizenship behavior.

Secondly, based on social perception theory, the current research expanded the current research scope in the environmental context, whereas previous studies primarily focused on the direct links between HRM practices and environmentally friendly behavior or performance. This research contributes to developing an understanding of the indirect influence of employees' ethical reflection and environmental passion on the relationship between socially responsible HRM and employees' environmental organizational citizenship behavior. In addition, some individuals are more interested in environmentally friendly management systems, indicating that individuals' behaviors are determined through the interactive influence of their characteristics and environments. Furthermore, the current research complements previous literature regarding the relationship between socially responsible HRM and employees' ethical-related personal characteristics.

The current research results indicate that socially responsible HRM motivates employees and encourages them to adopt environmental citizenship behavior, indicating a relationship between organizational practices and individuals' environmentally friendly behaviors in the workplace. Therefore, companies should focus on formulating socially responsible HRM practices to demonstrate organizational values aimed at environmental management. Consequently, some recommendations can be provided to company officials to support the adoption and implementation of socially responsible HRM practices, as follows:

Enhancing the level of employees' environmental citizenship behavior through increasing socially responsible HRM practices can be achieved by following the steps below: Industrial companies should provide a range of initiatives that create a supportive environment for environmental citizenship behavior. This includes providing incentives to achieve environmental citizenship goals by fostering employee participation in expressing their

ideas and opinions regarding environmental issues and improving environmental practices. Establishing mandatory standard conditions ensuring the minimum acceptable level for both environmental citizenship behavior and socially responsible HRM practices. Industrial HR management should propose projects and plans related to their social responsibility towards the environment for the coming years to establish standard procedures for training employees and encouraging them towards environmental citizenship behaviors, in addition to creating systems to incentivize voluntary work and environmental behaviors. Encouraging HR managers in industrial companies to encourage employee volunteerism and incorporate environmental practices as an integral part of performance evaluations. Implementing all practical measures to ensure the achievement of environmental management systems to protect the environment from harmful effects resulting from industrial companies.

To apply socially responsible HRM practices, the following steps can be followed: Developing recruitment plans that include attracting, selecting, and hiring employees based on environmental awareness and religious motives for environmental preservation. Designing training and development plans based on employees' environmental awareness and religious values. Designing training programs aimed at changing employees' environmental citizenship behaviors. Developing environmentally friendly practices such as using clean energy sources, water treatment and reuse, and water conservation. Using environmental performance indicators in performance management systems and employee evaluations. Creating an atmosphere of mutual learning among employees to encourage their environmental citizenship behaviors and raise awareness of their importance and role in environmental conservation. Disseminating a culture of social responsibility and environmental management in the industrial sector through official and unofficial communication channels. Involving employees in solving environmental issues and developing plans to improve their environmental citizenship behaviors.

Limitations and suggestions for future research

The current research's limitations should be acknowledged and addressed in future research. Firstly, the impact of the Egyptian industrial sector culture on research variables was investigated, but specific variables that illustrate cultural differences between the Egyptian context and other Arab and foreign contexts were not considered. Therefore, future research could consider other variables such as collectivism and power distance. Secondly, the current research relied on a cross-sectional study approach that focused on collecting data from the sample once during a single time. Future research could thus conduct longitudinal studies that involve collecting data at two different time periods to verify whether there are unexpected or contradictory results, providing more accurate results despite the significant internal differences in social responsibility policies and HRM practices among targeted industrial companies. Thirdly, there is a pressing need for further research on leadership styles that influence environmentally directed organizational citizenship behavior. These include, for example, servant leadership, ethical leadership, and responsible leadership. Furthermore, the impact of factors that distinguish between different cultural contexts on the relationship between leadership behavior and HRM

should be considered. These factors include variations in the level of variables, theoretical foundations, and project development stages.

Abstract: To broaden the scope of innovation that leverages contemporary technologies, education sectors worldwide are depending more and more on creative technological tools. On the other hand, not much research has been done on how these tools are adopted and used, or how they can improve decision-making in non-Western contexts. As a result, the goal of this study was to describe the fundamental elements, applications, and domains of impact expert systems (ESs), or Big Data Analytics Capabilities (BDAC), a kind of decision support tool that has recently gained popularity in business. It also investigates how ESs might increase the efficacy of decisions made by administrators in the private education sector. An empirical explanation of how ESs support decision-making in Egypt's private education industry is provided by the study. Plan, procedure, and approach: The theoretical part of the study's design is descriptive, while the empirical part uses a quantitative approach. Using both the systems method and the analytical technique, the study theoretically illustrated key concepts and relationships. It then carried out an empirical investigation to look at the correlations in practical settings. The Egyptian private sector ought to implement the valuable perspectives and suggestions presented in the paper to guarantee effective and superior choices utilizing contemporary technologies. This work adds a great deal to the relevant literature review, which has important implications for theory and practice overall.

Keywords: expert systems, big data analytics capabilities, decision making, digital transformation

Introduction

One important area of artificial intelligence and its applications that is widely recognized is expert systems. They are essential to achieving artificial intelligence's goals, which include simulating human intelligence through computer hardware and software that replicates human cognition and behavior (Gupta & Nagpal, 2020; Galiev et al., 2023). Expert systems based on computer software offer responses similar to those of experts (Sayed, 2021). wide knowledge bases being used by human resources. Today, ES is widely used in both personal and professional settings to make a variety of decisions, like diagnosing one's own health condition or purchasing a laptop for work-related purposes. Over time, its usage has increased (Alshare et al., 2019). A few variables, including the company environment, the expert system domain, top management support, perceived relevance, and ES familiarity, affect how quickly businesses and individuals adopt ES. Management support and perceived relevance are two examples of external factors that impact the expert system's expectancy, quality, and reliability as well as its acceptability among users (Varlamov, 2021).

An expert system helps raise students' educational and learning standards and is associated with system thinking. Higher-order thinking skills are the foundation of system-based thinking (STEM). (STEM)Education is a way of study that is defined by its focus on science, technology, engineering, mathematics, which explains much of its effectiveness. It combines critical and creative thinking to support students in developing their analytical skills. STEM subjects help students develop their problem-solving abilities and maintain their focus on the material. Adopting the system thinking approach, however, is not a practical substitute because students find it difficult to understand. Because most students think that system thinking is static and separate (Supriyanto et al., 2019).

Large-scale datasets that become so large that interacting with them through conventional database management systems becomes difficult have recently been dubbed "Big Data". According to Wang et al. (2023) these are data sets whose sizes are too large to manage, store, analyze, and collect in a reasonable amount of time using widely available software tools and storage systems. Large data sets will continue to grow in size. A single data collection may include several petabytes (PB) or several dozen terabytes (TB) of data. As a result, gathering, storing, searching, sharing, analyzing, and presenting data are some of the challenges associated with big data. Businesses are currently searching through massive amounts of highly precise data to find previously unknown information. Big data analytics, then, is the process of applying sophisticated analytical methods to massive data sets. Analytics that leverage and emphasize business transformation are based on large data samples. However, as data grows, managing it gets harder (Sabharwal & Miah, 2021).

According to Acciarini et al. (2023) big data is information whose volume, dispersion, diversity, and/or timeliness necessitate the use of cutting-edge technical frameworks, analytical techniques, and instrumentation

to produce insights that open new revenue opportunities. Big data is defined by three fundamental elements, sometimes known as the "three V's": volume, variety, and velocity. The velocity of data is the rate at which it is created or changes, while the volume of data defines its size and enormity. Lastly, diversity encompasses a variety of data formats and kinds in addition to a variety of data analysis tools and methods (Ojha & Pani, 2020, Bose et al., 2023).

The main characteristic of big data is its volume. Phase boundaries (PBs), twin boundaries (TBs), and even the quantity of tables, files, transactions, and records can be used as metrics for measuring big data. Furthermore, the sources of big data are diversifying; clickstreams, social media, and logs are just a few of the sources that are contributing to its enormous volume. In addition to standard structured data, analytics also use semi-structured data, such as Rich Site Summary (RSS) feeds or Extensible Markup Language (XML), and unstructured data, which can be difficult to categorize because it comes from devices like audio, video, and others. Furthermore, information can be transformed into multi-dimensional information (Acciarini et al., 2023). The velocity or speed of big data can also be used to characterize it. In essence, this is a reference to the speed at which data is created or sent. Real-time data collection from websites, known as streaming data, is the cutting-edge in big data (Ojha & Pani, 2020, Wang & Yi, 2023). Several organizations and researchers have suggested adding veracity, or the fourth V. The primary factor determining veracity is the quality of the data. Because of data ambiguity, incompleteness, latency, dishonesty, and approximations, big data quality is consequently classified as excellent, awful, or undefinable (Aslett et al., 2023).

An expert-based approach assists students in evaluating independent learning and performance, as well as selecting competencies, to make career-related decisions (Supriyanto et al., 2019). An expert system is also used to create a knowledge-based network system since it effectively leverages adaptive rule-based applications. It involves building query nodes and action nodes, two different types of nodes. The input connections that are the foundation of the question node are altered by a successful search and inquiry. Every input connection has two output connections, which overlap to form an action node and then another inquiry node. A pertinent query and an answer key are presented in a query node. A question is examined, and the answer cost is calculated based on the subsequent activation if a message activates a question node during a cognitive process (Sottocornola et al., 2023).

An action node may also include one or more input connections, each weighted and with varying values based on the favorable or unfavorable comments made by people. One or more of the actions that make up an assignment node activate messages sent by question nodes. Furthermore, this type of knowledge-node network includes an initial body of knowledge (a collection of intriguingly connected query and action nodes). When interacting with ethnic users, its preliminary body of knowledge might also prove insufficient considering changing circumstances. The dictation either adds new knowledge nodes or changes the advantage nodes that already exist in response (Dev, 2020).

The increasing complexity of operations faced by universities and private higher education institutions necessitates the use of contemporary technologies to enhance decision-making abilities. Although they have the potential to revolutionize decision-making in many institutions, expert systems (ES) and analytical big data analytics capabilities are still not widely used in higher education (Evans et al., 2021). Research on the use of data analytics and artificial intelligence (AI) in private universities has been scant, especially in Egypt. This study presents a framework for integrating intelligent systems into Egypt's private higher education sector and demonstrates the current decision-making processes through a mixed methods approach involving institute leaders and IT administrators.

Our study contributes to the body of knowledge on the use of analytics and artificial intelligence in university decision-making by offering new theoretical and practical perspectives. Stakeholders in the university can improve admissions, advising, academic programs, and overall results by doing this. This research gap inspired the study's authors to investigate how expert systems, big data analysis, and decision-making relate to one another in the context of education. The following is one way to frame the research problem as the questions the study aims to answer:

RQ1: What are the shortcomings and problems with the existing procedures for making decisions in Egypt's private education sector?

This question pinpoints the issues, shortfalls, or roadblocks that call for improved decision support. Based on early observations, surveys, or prior evidence, the background section can go into further detail about these shortcomings; some examples include a lack of data, an overreliance on intuition rather than facts, inefficient procedures, etc.

RQ2: How can intelligent systems, such as expert systems and big data analytics capabilities, improve these institutes' and universities' decision-making processes for important areas?

This establishes the parameters for putting forth a clever decision-support solution proposal. Sub-disciplines might encompass learning outcomes, academic advising, recruitment, and admissions. Opportunities can be brought to light by literature reviews and comparable initiatives at other universities.

RQ3: Considering the capabilities, culture, and change management requirements of the private education sector, what framework merging expert systems and big data analytics can be put into place?

This describes the implementation and feasibility aspects that will guide the system design, change management strategy, and roadmap, considering the focus institutes' limitations. In the analysis and findings chapters that follow, these questions can be investigated through mixed methods data collection utilizing surveys, and interviews.

The research is structured as follows: First, Theoretical Background and Hypothesis Testing. Then, detailed descriptions of samples and research methods are presented. Lastly, the empirical results of our study are provided, along with the theoretical contributions and practical implications in results, discussion, recommendations and future research.

Theoretical foundation

Expert Systems

One use of artificial intelligence (AI) technologies is the development of expert systems. AI is a branch of computer science that studies the capabilities of hardware and software to enable them to carry out tasks that would normally require human intelligence (Folkourng & Sakti, 2022; Iatrellis et al., 2023). In a nutshell, intelligence is the capacity to learn, form logical connections between things, pinpoint the root causes of issues, and comprehend and respond appropriately. As such, it entails providing expertise to address issues encountered in that domain and simulating human capabilities in a particular field (Nayeri et al., 2022; Rafiei et al., 2022; Nazarian-Jashnabadi et al., 2023).

Since a precise definition of expert systems has not yet been established, we present several in order to determine the most practical one. The American Institute of Certified Public Accountants (AICPA) defined expert systems as computer programs that mimic the human thought processes of experts in solving problems in specialized fields in a 1987 report (Issa et al., 2016). Singh et al.'s (2022) definition of an expert system is a computer program that uses human expert knowledge stored in a knowledge base to solve problems that typically require expert intervention. This definition helps to further clarify the concept of expert systems.

Expert systems are defined as computer programs that apply human reasoning to solve problems in the same way that humans do (Saibene et al., 2021). Expert systems are based on the idea of providing computer programs with the expertise and know-how of human experts. According to Regueras et al. (2022), they can also be defined as computer-based programs or systems that try to replicate human expertise in a particular field by incorporating these experts into the systems to make decisions about non-routine tasks that are limited to human performance in that domain.

Researchers deduce from the definitions that expert systems are a subset of information systems that use collective knowledge and experience to address issues within a particular field. These systems generate knowledge bases, infer knowledge, extract suggested solutions, choose the best solutions, and mimic the thought processes and behaviors of experts. Expert systems are intelligent computer programs that make use of conditions and outcomes in a particular domain that are derived from human expertise. When these conditions or results are matched with a specific condition or outcome related to a problem that needs to be solved, they use methods of derivation and inference to extract and infer reasoned results.

Big Data Analytics Capabilities

Large volumes of digital data from a variety of sources and at different speeds, depending on the demands of government application domains, are referred to as big data and are present in government organizations. For the intended government organization, these big data from the government must guarantee authenticity (Khiné & Shun, 2017). Within the field of information technology, big data refers to strategies, instruments, and processes for handling large amounts of diverse, structured and unstructured data in order to produce outcomes that are understandable to humans (Chen & Liang, 2023).

The largest feature that distinguishes big data is its enormous volume. According to Ekambaram et al. (2018), velocity is the flow of data, or a continuous stream of information. According to Wang et al. (2019), veracity is related to data accuracy, which is related to quality. This has led to the development of more advanced data analysis software that can handle the explosion of information based on its access, search, processing, and management methods.

De Mauro et al. (2018) state that the six primary components of big data analytics are data generation, acquisition, storage, advanced analytics, visualization, and value-creation decision-making. Standard tools, methods, technologies, and application domains are also included. According to Rialti et al. (2018), it describes datasets that are too complex for traditional data analysis software to handle or analyze effectively. Big data analytics facilitates large-scale dataset integration; it also aids in decision-making regarding personnel management and evaluates cost-effectiveness in healthcare facilities (Demirdöğen, et al., 2023).

The process of analyzing massive amounts of data to extract value for companies and workers is known as big data analytics (Batistič et al., 2019). Big data analytics encompasses an organization's capacity to gather, process, and analyze data in order to derive insights, as well as to develop its talent, technology, and data through organizational-wide roles, processes, and structures (Mikalef et al., 2020). In addition to mobilizing and deploying data analytics-related resources in conjunction with marketing resources and capabilities within an organization, it entails having the capacity to gather, store, process, and analyze vast amounts of data (Wang et al., 2019). (Shuradze et al., 2016). According to Gupta and George (2016), big data capability refers to the need for businesses to have a mix of intangible, human, and tangible resources to develop big data analytics capability.

Decision-Making

According to Driscoll et al. (2022) and Al-Mafriji et al. (2023), the decision-making process is regarded as a crucial component of management. It is the primary instrument utilized for carrying out all management functions, including organizing, planning, directing, coordinating, communicating, and controlling. Because decision-making is a dynamic process that occurs at all organizational levels and is exercised at all levels, including executive work that permeates the entire organization, it represents the general content of management activity at all organizational levels (Putra & Ali, 2022).

The ability and excellence of administrative leaders to make wise and successful decisions in organizational life is always a key indicator of their performance success (Burton et al., 2020; Chen et al., 2021). The process of making decisions is where managers have the most responsibility, particularly when those decisions are crucial to the organization's operations or require significant, long-term commitments. Consequently, the ability of a manager or leader to make choices that accomplish the desired outcomes becomes the determining factor in whether the project succeeds or fails (Kliestik et al., 2022).

A further dimension to the idea of decision-making is that each of our actions can be separated into two main categories: one that results from conscious and deliberate thought and calculation, and another that is automatic and intuitive. The word "decision" refers to the final judgement and specific management by the decision-maker regarding what should and shouldn't be done to achieve a specific and outcome (Joseph & Gaba, 2020; Wang & Li, 2020). Because it serves as the foundation for all daily activities and events in organizational life and because ceasing it causes work disruption and a decrease in organizational activities, the decision-making process is crucial to the administrative process (Putra & Ali, 2022).

As a result, managers' work is dominated by the decision-making process, which is seen as the core of the administrative process. As a result, the ability and effectiveness of decision-makers to make wise choices is critical to the organization's success (Zhang and Li, 2021; Bousdekis et al., 2021). Furthermore, this is a challenging process requiring scientific and technical skills and abilities. As organizations grow in size, their goals and tasks become more complex, and these tasks are linked to the interests of society, this process becomes increasingly significant, challenging, and complex (Joseph & Gaba, 2020; Al-Mafriji et al., 2023).

Expert Systems and Decision-Making

Al-Mafriji et al. (2023) posit that expert systems have a noteworthy impact on augmenting the quality of strategic decision-making. Expert systems are information systems that combine advanced programming techniques with specialized knowledge in a particular field to allow the computer to think, deduce, make recommendations, and gain expertise. Expert systems are based on knowledge-based systems. Furthermore (Sayed, 2021).

Expert systems involve decision-making processes, which effectively mechanism human thought. Among the many advantages they provide are increased productivity and better decision-making processes. Managers must understand, though, that these advantages are unlikely to occur unless the organizational integration of specialized systems is given careful consideration. The effective application of expert systems may be threatened by problems like knowledge erosion, data manipulation, and expensive maintenance. The efficacy of these systems may be gravely jeopardized in the absence of appropriate managerial awareness and action (Wang, et al.,2023).

The importance of creating expert systems for decision-making in project management and complicated technological implementations is highlighted by (Sarker et al., 2021). Similarly, as expert systems become more commonplace in business and have the potential to improve administrative decisions in the public sector, Fahim et al. (2018) highlight the necessity of defining the elements, tasks, and main application areas of these systems.

Expert systems are artificial intelligence-based computer systems that are widely used to simulate decision-making processes involving experts and humans (Zalisky et al., 2022). Their study evaluates the effectiveness of expert systems in assisting with decision-making in the aviation sector by examining different probabilistic learning strategies. Expert systems, according to Al-Mafriji et al. (2023), help improve the quality of banking services by reducing both financial and non-financial errors and quickly identifying cases of error. Expert systems, in contrast to humans, are known for their quick command execution, which shortens the time needed to make decisions.

According to Kvesko et al., (2018) expert systems are essential for decision-making in knowledge-based societies. Furthermore, Shafiee et al. (2024), found that using expert systems helps to personalize financial decisions. Rossi et al., (2021). examine the potential benefits and drawbacks of expert systems for decision-making processes based on ethical issues in organizations. Their study highlights the ethical flaws in expert systems, such as their bias, lack of morality, emotional intelligence deficit, and lack of human intelligence. Using quantitative analysis and surveys distributed to various managerial positions, they come to the conclusion that these characteristics negatively affect organizational ethical standards, leading to moral dilemmas and impeded decision-making. They recommend going above and beyond to make sure that the people developing and supervising expert systems are being held to a high standard of ethics.

Also Asabere & Amoako, (2021) stress that expert systems improve decision-making, professional guidance, consultation, and problem-solving for higher education students in Ghana. Lastly, Casal-Guisande et al., (2022) argue that expert systems, as computer-based tools, aid in decision-making processes by simulating human behaviours during such decisions. Therefore, we formulate the hypothesis that:

H1. Expert Systems have significant impact on Decision-Making in Private Educational Sector.

Big Data Analytics Capabilities and Decision-Making

According to Huynh et al. (2021), big data analytics (BDA) is a ground-breaking method for helping businesses make wise decisions. By examining the mediating role of data-driven insights in the relationship between BDA capabilities and decision-making, Awan et al. (2021) sought to determine the relationship between BDA capabilities and performance. 109 Czech manufacturing companies provided data, which was then analyzed using partial least squares structural equation modelling. According to the study, businesses that excel at making decisions use BDA capabilities. The findings show that BDA capability and decision-making quality are positively correlated, and that this relationship is stronger when data-driven insights are applied. Additionally,

the findings show that BDA capabilities—rather than data-driven insights—are what matter most in influencing the quality of decision-making within organizations.

To better understand the relationship between big data Analytics and relational governance and decision-making performance regarding big data in Chinese companies, Shamim et al. (2020) conducted a study looked at how data-driven culture influences the relationship between decision-making performance and capabilities at Delta Asia Bank. To test the theories, 108 Chinese enterprises involved in big data-related activities provided data, and structural equation modelling was employed. The study's findings show that, through the mediation of BDA capabilities, there is a direct and mediated relationship between decision-making performance and big data contractual and relational governance.

Furthermore, Nisar et al. (2021) looked at the relationship between big data-driven decision-making capabilities and decision-making quality, as well as how these capabilities affected environmental performance and decision-making quality in Chinese public and private hospitals. They also looked at the somewhat mitigated effect of big data governance on this relationship, which has been largely disregarded in earlier research. This study found that organizational culture, technology, talent management, and leadership all pose challenges to big data analytics capabilities. By utilizing Partial Least Squares Structural Equation Modelling with initial data from 108 Chinese companies, the study examined the factors that precede big data-driven decision-making abilities and how they affect the quality of decisions made. the findings suggest that big data management challenges are important predictors of big data decision-making abilities. Furthermore, the latter is essential for the quality of big data-related decision-making.

Information is a critical success factor impacting decision-makers' performance, especially the quality of their decisions, according to Huynh et al. (2023) Organizations can currently analyze enormous amounts of data. Assuming its availability, data is regarded as the 21st century's raw material, with 15 billion connected devices already on the Internet. Therefore, it is essential to research and offer solutions for handling these data sets and deriving insights and knowledge from them. Furthermore, decision-makers need to be able to use Big Data Analytics to extract meaningful insights from these constantly shifting, massive, fast-moving, varied, genuine, and valuable data sets.

Elgendy and Elragal (2016) conducted a study with the goal of figuring out how to incorporate Big Data Analytics capabilities into the decision-making process. Based on this, the "Big Data Analytics and Decision-making" (B-DAD) framework was created using a design science methodology to outline the big data tools, structures, and analyses for different stages of decision-making. The study comes to the conclusion that by incorporating big data analytics into the decision-making process, organizations' decision-making processes are improved and supported. As a result, a framework test was carried out in the retail industry. The outcomes showed that incorporating Big Data Analytics into the decision-making process added value. As a result, we propose the following hypothesis:

H2. Big Data Analytics Capabilities have significant impact on Decision-Making in Private Educational Sector.

The following figure represents the study's model, designed to test the research relationships in interest:

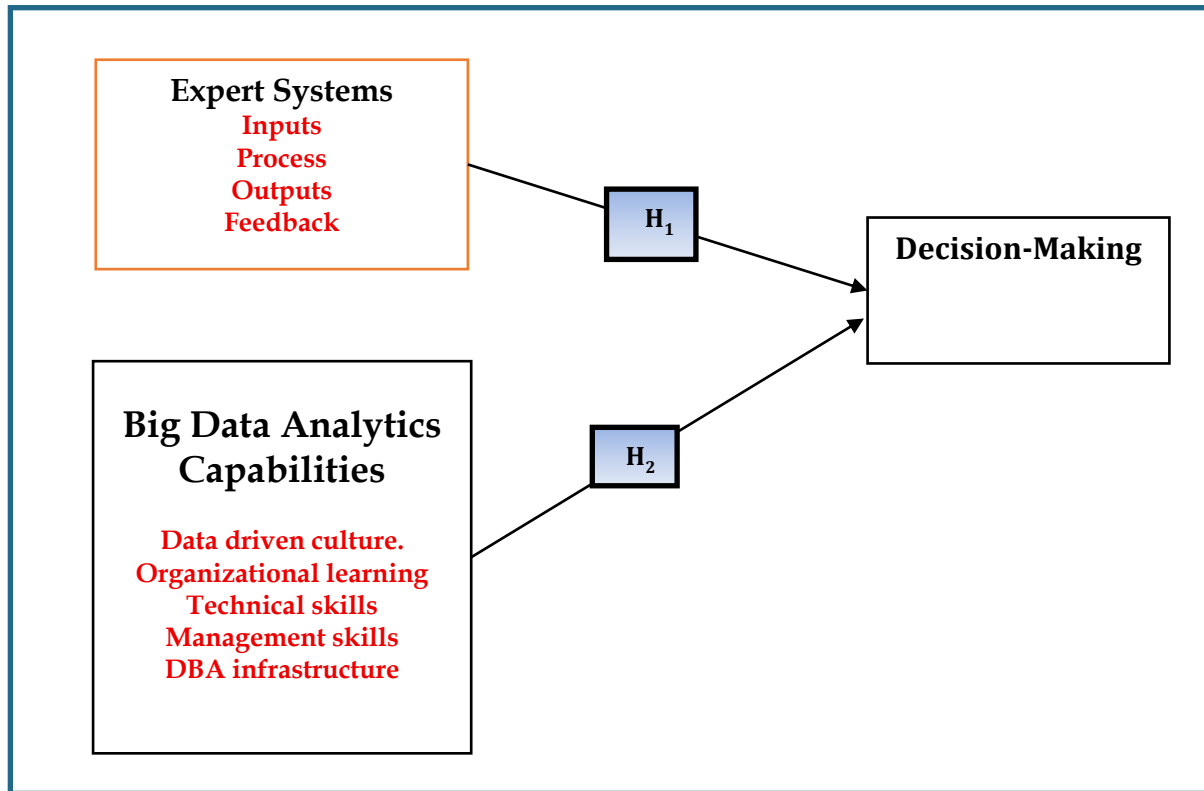

Figure 1. The research framework

Method

The methodology includes the research population and sample, the research instrument and data collection technique, the study's research variables and how to measure them, the types of data and the sources from which they were obtained, and the statistical techniques used in the investigation. The methodology used in this study includes:

Sample

Population and sample of the study. The study population consists of all faculty members in private higher institutes and private Universities at the level of the Arab Republic of Egypt, numbering (189) institutes distributed over specialized academic sectors as follows: (12) social service institute, (2) agricultural institute, (18) computer institute, (52) engineering and technology institute, (2) applied arts institute, 1 literary institute, 35 commercial institutes, 14 tourism and hotels institutes, 9 language and translation institutes, 5 media institutes, 35 universities in different cities in the Arab Republic of Egypt and these data according to the

statistics of the Central Agency for Mobilization General and Statistics and Table (1) shows the distribution of staff members in the various disciplines of private higher institutes and private universities . sampling unit was represented by staff member in private higher institutes and universities.

The researchers used an appropriate allocation method based on the number of private higher institutions that specialize in education and private universities to draw a sample from each stratum (private university and higher institution type). The population was divided into strata based on the type of institutional education. We calculated the sample size using a formula appropriate for unknown or very large populations by applying the formula for determining sample size in unknown populations with a confidence level of 95% and standard error of $\pm 5\%$. The equation that guided the method of choice was:

$$n = P \left(1 - P \right) \left(\frac{Z}{E} \right)^2$$

where 'n' represents the required sample size. In order to serve our objectives, we chose a default proportion (p) of 0.5, which denotes a 50% predicted prevalence of the relevant characteristic and a 95% confidence level, or 1.96 Z-value. The standard error (E) of 5% was selected. The sample size that was calculated using these values was approximately 385.16, rounded to the closest whole number for convenience. With a margin of error of no more than 5% and a 95% confidence level, this sample size ensures that the study's findings are reliable and representative.

The researchers gathered information for the field study from its primary sources using an electronic questionnaire created with Google Forms. They distributed the survey to colleagues at private higher education institutions via WhatsApp and Facebook. Based on scales used in previous studies, this survey included a series of closed-ended questions to assess respondents' perceptions of research variables on a Likert five-point scale from strongly agree (five points) to strongly disagree (one point).

The researchers used the simple random sample because it met two requirements: it had to be present or absent as a community framework, and it had to be uniform among research community members with respect to the attributes under investigation. Three draws and re-distributions of the questionnaire list were made in order to attain a certain level of randomness. A total of 425 lists of questionnaires were collected. After forty invalid lists were removed from the analysis, there remained 385 valid lists for statistical analysis, which had a response rate of 90.6% at a 95% confidence level and a 5% standard error.

Table 1. Distribution of staff members population and sample to private higher institutes and universities

Private Higher Institutes	Staff member	Relative weight%	Sample
Higher Social Work Institutes	380	1.61	6
Higher Institutes of Agriculture	171	0.7	3

Staff Member	146	37.92
Administrative Leadership	50	12.99
Total	385	100
Academic discipline	Frequency	Percent
Information Systems	149	38.70
Other	236	61.30
Total	385	100

Source: prepared by researchers depend on the results of statistical analysis

As is clear from Table 3, the number of the random sample is 385, 100 of them are males, 285 are females, 158 of them are between the ages of 20 and 30 years, 110 are between the ages of 31 to 40, 90 are over 41 years old, and 198 work as an assistant staff, 146 work as faculty members, 50 work as administrators.

*Measures**Expert System*

ESs was used as an independent variable in the current study and measured with a 31-item scale developed and validated by (Fahim, 2018). Each dimension of **ESs** was measured by four items using a 5-point Likert scale, ranging from “1-strongly disagree” to “5-strongly agree”. A sample item of Inputs was “ES utilizes smart/modern technology.” The Cronbach’s alpha for Inputs was 0.859. A sample item of Processes was “ES is used frequently.” The Cronbach’s alpha for Processes was 0.716. A sample item of Outputs was “ES provides clear/accurate professional recommendations.” The Cronbach’s alpha for Outputs was 0.813. A sample item of Feedback was “ES is simple/easily used” The Cronbach’s alpha for Feedback was 0.787 as shown in table 5.

Big Data Analytics Capabilities

BDAC was used as an independent variable in the current study and measured with a 31-item scale developed and validated by (Mikalef et al., 2020). Each dimension of **BDAC** was measured by four items using a 5-point Likert scale, ranging from “1-strongly disagree” to “5-strongly agree”. A sample item of Data-driven culture, The Cronbach’s alpha was 0.732. A sample item of Organizational learning, The Cronbach’s alpha was 0.802. A sample item of technical skills The Cronbach’s alpha was 0.723. A sample item Management skill, The Cronbach’s alpha was 0.852. A sample item BDA infrastructure The Cronbach’s alpha was 0.715 as shown in table 5.

Decision-Making

DM was used as an independent variable in the current study and measured with a 31-item scale developed and validated by (Fahim, 2018). items using a 5-point Likert scale, ranging from “1-strongly disagree” to “5-strongly agree”. A sample item of decision making The Cronbach’s alpha was 0.778 as shown in table 5.

Data Analysis Methods

Measures of the study variables were tested for validity using confirmatory factor analysis (CAF). and variance and correlation analysis to evaluate the measures of the variable's discriminatory validity. In addition to testing the reliability of study scales using Cronbach Alpha and Composite reliability.

The study hypotheses were also tested using the path analysis method. It is a type of statistical analysis known as multiple regression that looks at the relationships between two or more independent variables and a dependent variable in order to assess causal models. This approach allows for the estimation of the magnitude and significance of causal relationships between variables.

Results

Confirmatory Factor Analysis

The Confirmatory Factor Analysis test was conducted, which is used to test whether the structural equation modelling is consistent with research understanding of the nature of the construct. In other word how well, the measured variables represent the number of constructs. Thus, if the validity of the survey statements is verified using confirmatory factor analysis, it can be judged that the survey questions have high reliability and a correct structure. There are several conditions that must be certain to judge the reliability of the questions when using confirmatory factor analysis, which are as follows:

- The results showed that the multifactor model fits the data [$\chi^2/DF = 1.871$; $RMR = 0.039$; $IFI = 0.957$; $TLI = 0.952$; $CFI = 0.9556$; $RMSEA = 0.045$]. indicating that no serious threat of common method bias exists in the study.
- Factor loading values more than 0.50 and this usually indicate that strong correlations between the item and the factor for all variables of our study.
- The composite reliability (CR) and Cronbach alpha values should be greater than (0.7). (Hair Jr et al., 2019). The results of the study showed that both values are greater than 0.70, therefore the reliability of the data loading and validity are accepted.
- The convergent validity was also tested, which specify that the average variance extracted (AVE) values of the constructs must be greater than (0.50) Thus, the results showed adequate evidence refers to the convergent validity (Formell, 1981).

As can be seen from the table (3) which expresses the validity and reliability of the study measures.

Table 3. Validity and reliability of the study measures.

Constructs	Dimension	Item Code	Factor loadings (FL)	Reliability		Convergent Validity (AVE)

According to the foregoing, the discriminant validity was tested by square root of AVE and the results are shown in the Table.4, AVE square root values are accepted, as all the correlation coefficient of its variables and dimensions itself is greater than their correlation with other in the research variables, therefore the construct validity of the research measures is proved.

Table 4. Descriptive statistics and discriminant validity using the square root of AVE.

Variables	M	SD	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Inputs	3.432	1.040	0.81**

Hypotheses Testing

As demonstrated in Table (5), the findings support the direct study hypotheses. The research's findings support the first and second hypotheses by showing that expert systems have a positive, significant impact on decision-making, and that big data analytics capabilities also have a positive, significant effect on decision-making.

Table 5. Results of the Path Coefficients in the Structural Model of the Study.

Paths	Path Coefficients (β)	T value	Standard Error	Sig	Result
(DM) <--- (ES)	0.527	16.754	0.876	0.000 *	Hypothesis H1 supported
(DM) <--- (BDAC)	0.273	7.602	0.754	0.001 *	Hypothesis H2 supported
* Correlation is significant at 0.05 level (2-tailed).					

Discussion

Our findings indicate that although ESs and analytical big data can serve as valuable expert advisors for various management tasks and issues, they are not designed to completely replace human experts in problem-solving tasks. In this sense, rather than replacing public decision-makers, ESs are actual assistance to them. In this regard, the primary findings are:

Firstly, the study confirms that two of the most profitable applications of artificial intelligence are in the areas of analytical big data and ESs. ESs are more advised, and our research findings are supported by the findings of (Folkourng & Sakti, 2022; Iatrellis et al., 2023) when the information includes qualitative reasoning, the decision is repetitive, and the problem domain is structured. Furthermore, a number of functional categories, including interpretation, diagnosis, prediction, design, planning, monitoring, and control, can make use of this technology.

Secondly, our research shows that one of the most difficult, dynamic, and continuous decisions made in any organization is the managerial decision-making process. Organizational leaders must now adapt their methods of problem-solving in light of the increasing impact of globalization and technology. Expert systems have the

potential to automate and modernize higher education institutions, as evidenced by the findings of Asabere & Amoako (2021) and Casal-Guisande et al. (2022). These studies found that expert systems enhance decision-making, professional guidance, consultation, and problem-solving for higher education institutions in Ghana.

Thirdly, our research shows that one of the most difficult, dynamic, and continuous decisions made in any organization is the managerial decision-making process. Organizational leaders must now adapt their methods of problem-solving in light of the increasing impact of globalization and technology. Expert systems have the potential to automate and modernize higher education institutions, as evidenced by the findings of Asabere & Amoako (2021) and Casal-Guisande et al. (2022). These studies found that expert systems enhance decision-making, professional guidance, consultation, and problem-solving for higher education institutions in Ghana.

Fourthly, the practical implications demonstrate that higher level than average amounts of ESs indicators, analytical big data capabilities, administrative choices, and organizational factors must be available. This is to be expected, since the ministry is still working on improving its systems so that decision-making actions in the future can fully utilize them. This suggests that maintaining and promoting these concepts is still critically important in the ESs work environment. Other than that, it was noted that people who had the opportunity to use ESs saw it as a time-saver rather than a major threat.

Fifthly, It has been shown that while feedback by itself has no effect on decisions, inputs, processes, and outputs all positively correlate with the quality of administrative decisions. The results of the analysis demonstrate that ES's decision-making process has benefited from the use of current ESs, analytical big data capabilities, as shown by the positive correlation between the independent and dependent variables. This relates to the comparatively weak connectivity of ES applications—a new technology for decision-assistance—with the procedures and tasks connected to decision-making in the educational domain.

Conclusion

Rather than completely replacing human decision-makers, our research highlights the complementary roles that expert systems (ESs) and analytical big data play alongside human expertise in problem-solving tasks. ESs improve tasks like diagnosis, planning, and interpretation by excelling in repetitive decision-making, structured problem domains, and qualitative reasoning. Studies show that automating and modernizing ESs can help managerial decision-making processes, which are being more and more impacted by globalization and technology, especially in higher education institutions. The practical implications underscore the significance of organizational factors, as well as the maintenance and promotion of ESs and analytical big data capabilities, in facilitating effective decision-making. The positive relationship between the use of ESs, analytical big data capabilities, and decision quality highlights their potential to improve decision-making processes, even though feedback alone may not have the desired effect. To fully realize the advantages of ESs in educational settings and beyond, ongoing efforts to incorporate them into decision-making processes are essential.

Recommendations

Problems are solved more successfully when specialized knowledge is applied than when preset protocols are followed. Therefore, when ES does not produce the desired results, work on improving the knowledge base should be done instead of reprogramming the procedures. When hiring candidates, employers should consider their experience making decisions. On the other hand, candidates need to understand exactly how the organization makes decisions. The empirical results suggest that to improve, integrate, and attain consistency between the managerial decision-making at ESs, analytical big data capabilities and applications, and the ES dimensions, more earnest efforts are required. There is no doubt that doing this will improve the quality and effectiveness of administrative decisions. The effectiveness of ESs and, by extension, the standard of ES's entire decision-making process would undoubtedly increase if more weight was given to feedback that showed it did not entirely influence decisions while also being the least correlated indicator with ESs, analytical big data capabilities at the ES, as well as connecting it to inputs in a continuous cycle—that is, utilizing feedback reviews to address present issues and raise the bar for inputs and consequently the other dimensions. In order to enhance the impact of the organizational factors that positively moderated the relationship between ESs, analytical big data capabilities, and administrative decisions using expert systems, researchers here recommend highlighting the following elements:

- among other organizational factors there, the importance of the leadership's willingness and commitment to feed and update the ES's knowledge bases with the most recent data, which has been shown to have an impact.
- It is necessary to allocate adequate funding and resources that were least impacted by organizational factors.
- It also needs high-level technical support from both inside and outside the ES, as well as the current work environment's encouragement of creativity, accountability, and employee empowerment.

Questionnaire statements:

The measurement scale	
Code	Construct/ Indicators/ Source
(ESs)	Expert Systems (Adapted from; Fahim, 2018)
	Inputs
In1	ES utilizes smart/modern technology.
In2	ES requires qualified staff.
In3	Adequate financial resources are needed.
In4	Vital/various data is stored.
In5	Scientific principles/practical experience are stored.
	Processes
Pr6	ES is used frequently.
Pr7	ES performs numerous tasks.
Pr8	Target is set up in line with ES purposes.
Pr9	ES receives sufficient information to determine each case.
Pr10	ES analyses data and applies rules to address problems.
	Outputs
OP11	ES provides clear/accurate professional recommendations.
OP12	ES provides practical recommendations.
OP13	ES provides timely recommendations.
OP14	Recommendations look for proven solutions.
OP15	Recommendations look for novel solutions.
OP16	Recommendations suggest best solutions.
OP17	Recommendations justify chosen alternatives.
OP18	Recommendations set implementation plans.
OP19	Recommendations are usually applied.
OP20	ES outcomes support executives' decisions.
OP21	Outcomes support different stages of decision process.
OP22	Outcomes support a wide variety of decisions.
	Feedback
FB23	ES is simple/easily used.
FB24	ES is flexible/responsive.
FB25	ES is comprehensive/integrated.
FB26	ES is reliable/trusted.
FB27	ES is efficient/effective.

	Data-driven culture
DDC28	Our big data analytics managers have a good sense of where to apply big data
DDC29	We base our decisions on data rather than on instinct
DDC30	We continuously assess and improve the business rules in response to insights extracted from data.
DDC31	We continuously coach our employees to make decisions based on data.
	Organizational learning
OL32	We can search for new and relevant knowledge
OL33	We can acquire new and relevant knowledge
OL34	We can apply relevant knowledge
OL35	We have made concerted efforts for the exploitation of existing competencies and exploration of new knowledge
	Technical skills
TS36	We provide big data analytics training to our own employees
TS37	We hire new employees that already have the big data analytics skills
TS38	Our big data analytics staff has the right skills to accomplish their jobs successfully
TS39	Our big data analytics staff has suitable education to fulfil their jobs
	Management skills
MS40	Our big data analytics managers understand and appreciate the business needs of other functional managers, suppliers, and customers
MS41	Our big data analytics managers can work with functional managers, suppliers, and customers to determine opportunities that big data might bring to our business
MS42	Our big data analytics managers can coordinate big data-related activities in ways that support other functional managers, suppliers, and customers
MS43	Our big data analytics managers can anticipate the future business needs of functional managers, suppliers, and customers
	BDA infrastructure
BDAI4 4	We have explored or adopted parallel computing approaches to big data processing
BDAI4 5	We have explored or adopted different data visualization tools
BDAI4 6	We have explored or adopted cloud-based services for processing data and performing analytics
BDAI4 7	We have explored or adopted open-source software for big data analytics
(DM)	Decision-Making (Adapted from Fahim, 2018)

DM48	Decisions are in line with public policies objectives of the state
DM49	Decisions are in line with environmental changes
DM50	Decisions are timely
DM52	Decisions are announced
DM53	Employees are consulted in relevant decisions
DM54	Decisions provide appropriate solutions for problems.
DM55	Decisions deal with different aspects of problems
DM56	Reasons behind decisions are often obvious
DM57	Available alternatives are usually clear
DM58	General/collective interest is given priority.
DM59	Decisions are consistent.
DM60	Decisions are complementary
DM61	Decisions are instantly executed.

The Impact of Leadership Style on Workforce Motivation in the Construction and Engineering Sector: Case Study of Oman

Suaad Al Fannah

Modern Collage of Business and Science, Sultanate of Oman

Abstract: Purpose - The aim of this study is to explore – from the perspectives of employees at Construction and Engineering Company in the Eastern part of the Sultanate of Oman - the extent to which the Transformational Leadership components improves employee motivation and increases job satisfaction. In addition to revealing how Transformational Leadership is perceived, the study reports on the correlation between Transformational Leadership and intrinsic motivation. The study is based on the assumption that Transformational Leadership increases Workforce motivation. Design/methodology/approach – A scientific philosophy underpins the research design of the study focusing on numerical and measurable outcomes. A quantitative method using surveys was distributed to employees at the Company for data collection purposes. The survey questions structured to examine perception and effectiveness of Idealized Influence, Inspirational Motivation and Intellectual Simulation leadership practices within the Company. Descriptive statistics and correlation analysis are used for data analysis of the quantitative component and relationships between the variables. Findings - The findings suggest that Idealized Influence, Inspirational Motivation, and Intellectual Simulation increase workforce motivation leading to organizational success. The results also reveal the importance of Idealized Influence and Inspirational Motivation on workforce interstice motivation. The findings suggest that improving leadership styles will enhance innovation and motivation of the workforce. Significantly, although the sample is taken from one case study in a limited geographical area in Oman, which may jeopardize the generalizability of the findings, the study opens a new horizon of research in this area to validate the results in similar locations. Originality/value – The study provides insights, via the quantitative findings and participant voice, into importance of leadership styles at Company in the Eastern part of the Sultanate of Oman. It spotlights critical role of these variables in improving workforce motivation, innovation, and commitment at the Company respectively increasing operational effectiveness. The insights gained from this study are useful to stakeholders and management within the construction and engineering sector. It provides them with an understanding of the value of Transformational leadership styles.

Keywords: Transformational leadership styles, workforce motivation, innovation, construction and engineering sector and commitment.

Citation: AL-Fannah,.S. (2024). The Impact of Leadership Style on Workforce Motivation in the Construction and Engineering Sector: Case Study of Oman. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2543-2559), Antalya, Turkiye. ISTES.

Introduction

Leadership style is considered one of the most influential factors that affect employee's motivation and performance. Therefore, leadership style impacts employee productivity and organization success (Tamimi & Sopiah, 2022). Moreover, in the global dynamic landscape, employee's engagement and resilience is very important in competitive industries such as the construction and engineering sector. Successful transformational leadership attributes involve influencing people behaviors and the organizational systems as well leading to change management. Farahnak, Mark, Ehrhart & Aarons, 2020, p.105). Thus, it can be understood that the power of leadership can transform followers to leaders which is very essential in any organization.

Globally, transformational leadership is argued for its effectiveness to promote organization performance and innovation. Indeed, to achieve competitiveness empowered employees is paramount through their engagement and overall productivity. Considering, study by (Bass, Riggio, 2006) emphasizes that sectors such as constructions and engineering required transformational leadership due to the sector dynamic nature. Fully grasp, it is essential to understand the different leadership practices within various cultural and economic contexts to evaluate their effectiveness.

In the Middle East, the traditional values are integrated with leadership styles with the business practices. As result, this is considered one of the obstacles that has impact on the organization's performance policies and practices. Moreover, the Middle East region is characterized by facing many challenges such as bureaucracy, striving for economic diversification and economic instability. Consequently, these challenges might have a significant impact on the operational and administrative practices of the organization. In this context, to address these challenges leadership styles adopting empowerment and innovation is highly recommended and essential. Research conducted by (Avolio & Bass, 1995), highlights the essential role of transformative leadership on employee engagement, organization success and resistance in unpredictable environments.

In Oman, the economic development plan according to Oman Vision 2040 towards diversification and competitiveness is not a priority. Specifically, construction and engineering sector leadership is an important factor in Oman infrastructure and economy development through workforce development. In particular, construction sector is one of the top priorities of the Oman economic development plan according to Oman Vision 2040. This emphasizes the strategic focuses of Oman toward leveraging the infrastructure with the world dynamic trends in economic and business diversification. Such focus is linked to development of the human resources as it is one of the primary pillars of Oman vision 2040 (Al-Lamki, 2000). The study of Company in the Eastern part of the Sultanate of Oman will provide insights into the current practices of transformative leadership style and their impact. The company major national projects involvements in Oman construction industry will enhance the study findings about the leadership style impact.

Motivation refers to the internal motive, derivative and morals that shape a person's behavior. This plays a vital

role in achieving person satisfaction and fulfilling essential requirements such as competences and autonomy. According to a study by (Ryan &Deci, 2000) these needs are the crucial components to Self-Determination Theory that suggests motivation increases when the psychological needs are fulfilled. Furthermore, this theory supports the transformative leadership that influences employee's creativity and engagement. Therefore, this provides insights to the crucial role of transformative leadership in construction sector that require innovation and quick decision-making process.

Despite the notable acknowledgment of influence of transformative leadership, but there is a neglect of research on its impact within specific setting on Oman (Zefeiti, 2017). This study will focus on addressing this gap and its impact on employee motivation within construction and engineering company at Oman. This case study will examine elements identified by literature review that recognized by its impact on employee motivation such as Idealized Influence, Inspirational Motivation, and Intellectual Stimulation. Moreover, it will examine its correlation with the influence on employee motivation.

Literature Review

The study theoretical foundation is rooted in leadership, which suggests that certain leadership actions result in improved performance and contentment among followers. This concept, initially proposed by (Burns, 1978) and further developed by (Bass ,1985) elucidates how leaders can encourage, inspire, and involve employees to attain performance levels and personal growth. The core components of leadership, Idealized Influence, Inspirational Motivation, Intellectual Stimulation, and individualized consideration, serve as the basis for this research.

- Idealized Influence: Leaders who act as role models by demonstrating ethical standards earn the admiration and trust of their followers.
- Inspirational Motivation: Refers to leaders who effectively communicate a compelling vision for the future, inspire their subordinates to fully commit to this mission, and offer purpose and difficulty in their work.
- Intellectual Stimulation: Fosters an environment that inspires people to think innovatively, question established beliefs and explore new approaches to address organizational obstacles.
- Individualized Consideration: The concept pertains to how a leader caters to the unique needs of each follower, acts as a guide or teacher, and genuinely listens to their concerns and needs.

The topics covered in this discussion outline a framework for assessing the Company's leadership approaches and how they influence employee morale. A review of extant literature highlights Transformational Leadership to deliver high organizational performance, inspirational leadership, high level of job satisfaction and increased global organizational efficiency. It is manifest in the studies conducted by (Afsar . Umrani, 2019; Faupel & Süß, 2019) as leadership promotes creativity at workplace, promotes organizational change.

Research conducted within the construction and engineering sector as seen in the work by (Al Arifi & Al Harbi,2019) has shown how Transformational Leadership positively impacts employee's creativity and

innovative thinking. However further investigation is needed to determine the impact of this on the Company's organizational culture and address the unique challenges faced by the construction industry.

Perspectives on Transformational Leadership styles

- Idealized Influence refers to leaders who act as role models and inspire their followers and employees. Their exemplary ethical behavior and determined dedication to organizational objectives inspire employees and increase their commitment. By setting high ethical and moral standards, leaders can have a positive impact on their employees' innovative actions (Afsar & Amran 2019).
- Inspirational Motivation: Leaders who maintain inspiring motivation can effectively communicate a well-defined vision and encourage and inspire their people to go beyond their anticipated performance. According to, leaders can increase employee engagement and have a positive influence on their behavior during organizational upheavals, as proved by (Faupel & Süß, 2019).
- Intellectual Stimulation refers to promoting innovation and creativity. Leaders who employ this approach question existing norms and cultivate an environment that encourages problem-solving and creativity. According to (Alarifi & Alharbi, 2019), there is evidence supporting this strategy that demonstrates a strong correlation between these leaders and higher levels of organizational innovation and individual creativity.
- Individual Consideration refers to offering personalized support, training, and encouragement to followers to fulfill their potential (Yusup & Maulani, 2023). This dimension considers employees' individual needs and how to address them in a way that motivates and enables their performance.

Increasing job satisfaction and performance can be facilitated by drawing on motivational theories, such as Maslow's Hierarchy of Needs and Herzberg's Two-Factor Theory (Ihensekien & Joel, 2023). Further, Self-Determination Theory (SDT) demonstrates that employees' satisfaction of the intrinsic psychological needs for autonomy, competence and relatedness will be enhanced by their intrinsic engagement and motivation (Kovjanic et al., 2013).

The empirical study by (Afsar . Umrani, 2019; Alarifi . Alharbi, 2019) established that the transformational leadership style was found to be positively associated with innovative work behavior and creativity. In addition, international organizational cultures differ on whether the adaptive styles of leadership can be utilized to improve performance or not (Piedade et al., 2019).

Self-Determination Theory and Its Relevance

Work motivation is highly influenced by an employee's intrinsic and extrinsic motivations and primary psychological needs. According to SDT, understanding these processes is essential to evaluating how leadership impacts motivation. Moreover, fostering a working environment that facilitates autonomy, competence and relatedness is crucial. Thus, leaders should turn to the well-established link between Transformational

Leadership and SDT's three innate psychological needs of autonomy, competence, and relatedness (Deci Ryan, 2000).

- Intrinsic and extrinsic motivation: According to SDT, intrinsic motivation (the pursuit of enjoyable or exciting things) differs from extrinsic motivation (the pursuit of goals that do not lead to separate outcomes). Transformational Leadership aims to inspire and motivate employees intrinsically, aligning with SDT core principles.
- Autonomy and competencies: Psychologically, SDT emphasizes three basic requirements: autonomy, competence, and connection. Autonomy refers to the inherent need for individuals to exert control over their own lives, while competence refers to the innate need for individuals to effectively address problems. A transformational leader empowers employees, enhances their abilities, and cultivates a supportive team environment that addresses their psychological needs, resulting in improved performance and increased motivation.
- Alignment with Transformational Leadership: Various aspects of Transformational Leadership are directly related to the components of SDT, including Idealized Influence, Inspirational Motivation, intellectual Stimulation, and individual Consideration. An employee's motivation is more likely to be enhanced if their supervisor encourages independence, nurtures skill development, and promotes a sense of connection.

Research Gap

Despite the well-documented relationship between Transformational Leadership and employee motivation, most of the existing literature focuses on broader organizational contexts without giving a detailed look at the construction and engineering industries, particularly Company in the Eastern part of the Sultanate of Oman. In addition, the motivations of employees in high-pressure, project-based environments need to be sufficiently integrated with the specific elements of Transformational Leadership.

The main goal of this research paper is to analyze the impact of Transformational Leadership components (Idealized Influence, Inspirational Motivation, and intellectual Stimulation) on employee motivation, job satisfaction, and commitment within the Company's distinct organizational and sectoral context. This study aims to create customized leadership methods that will improve workforce motivation and enhance organizational performance, specifically in the construction and engineering sectors.

Conceptual Research Framework

Based on the following research framework, the impact of Transformative Leadership styles on workforce motivation can be understood through Idealized Influence, Inspirational Motivation, and Intellectual Stimulation (Independent Variables - IV). Transformational Leadership influences workforce motivation (Dependent Variables - DV), which leads to organizational success.

Dependent Variable

- **Success of Tendering Strategies:** In this research the key measure of achievement is the Oil & Gas Company use of tendering strategies. The effectiveness of the Oil & Gas Company's oil and gas activities is gauged by factors such as the number of bids won, project completion, within schedule and budget and stakeholder contentment. The efficiency and effectiveness of the tender process is also measured by the above-mentioned parameters.

Independent Variables (Transformational Leadership)

- **Idealized Influence:** This aspect indicates how much followers regard, esteem, and emulate their leaders. Leadership that radiates strong Idealized Influence is characterized by exemplary figures who gain the respect and commitment of the team members.
- **Inspirational Motivation:** Typically, a leader's ability to inspire and lead others is what makes them a successful leader. An effective leader articulates a clear and engaging vision, sets lofty standards, and inspires enthusiasm and dedication throughout the organization.
- **Intellectual Stimulation:** This factor allows the team to innovate, be creative, and think critically. Leaders' adept at Intellectual Stimulation prompts their followers to question the status quo, embrace unconventional thinking, and seek innovative solutions and insights.

Method

Research Methodology

In this study, Transformational Leadership is explored in relation to employee motivation at Company in the Eastern part of the Sultanate of Oman through a quantitative research design. By using this approach, patterns, relationships, and causality can be explored quantitatively through the analysis of structured data. An element of this methodology is the design of the survey, which utilizes a variety of factors to examine the impact of Transformational Leadership on employee motivation, such as Idealized Influence, motivational inspiration, and intellectual Stimulation.

During the literature review, hypotheses were developed based on the theoretical framework that was developed. Due to the quantitative nature of this research, hypotheses can be tested. A primary objective of this study is to validate these hypotheses and examine the rationale for the variables. In fact, how Transformational Leadership elements can impact intrinsic motivation, job satisfaction, and organizational commitment of employees. By utilizing a quantitative approach, the study aims to provide objective, reliable, and generalizable results that not only provide practical insights into organizational development within the construction and engineering sectors but also contribute to the academic discourse on Leadership and motivation.

Data Collection Procedure and Sample

The data-gathering method involves conducting structured surveys specifically designed to gather information on employee perceptions, attitudes, and motivation throughout the Company workforce. Participants will share their thoughts based on whether they agree or disagree with statements regarding leadership styles. Furthermore, they will also be requested to express their drive, contentment, and dedication to their organizations.

In the study on leadership at the Company a series of systematic procedures were followed to choose the sample. Initially the focus was on selecting employees from departments, roles, and levels of seniority within the Company. In doing this, it defined the population of data from which to draw out, or collect, examples. In defining the population, it opened the exploration of leadership and motivation in a variety of ways or through a variety of lenses.

To gather insights for this analysis, a survey was sent to the 45 employees at the company and 33 of those filled out. The response rate of 33 filled surveys was considered the right balance of time and resources in order to capture an appropriate amount of information in the time frame of the project. The participants were randomly selected to prevent bias. The group also captured a good variety of employees from different departments in the company. This stratified sample allowed to capture a large variety of opinions regarding Transformational Leadership among the employees.

Moreover, ethical considerations were also part of the sampling. In addition to informed consent and rights, participants were also informed that their participation was voluntary and that it would hold confidentiality. Furthermore, all participants were informed of the purpose of the survey prior to their participation.

In addition to this, survey was structured so that it would systematically provide information about to what degree individual employees perceive Transformational Leadership and its effect on their motivation, job satisfaction and organizational commitment. This procedure, including the sampling technique, was important to make sure the data would be representative of the Company's workforce and allow for a meaningful analysis.

Data Analysis

The survey data has been statistically treated with software like (SPSS, JASP) in order to find descriptive trends, correlations and changes. The relationship between Transformational Leadership and employee motivation will be examined using descriptive analysis. These analyses will help identify the strength and direction of these relationships, allowing us to identify the effects of Transformational Leadership on workplace motivation.

Research Questions

- To what extent does Idealized Influence leadership style impact motivation among employees?

- To what extent does Inspirational Motivation leadership style impact motivation among employees?
- To what extent does Intellectual Stimulation leadership style impact motivation among employees?

Hypothesis

- **H1:** Transformational Leadership styles (through Idealized Influence, Inspirational Motivation, and intellectual Stimulation) impact workforce motivation, leading to increased job satisfaction and higher performance outcomes.

Objectives

The main objective of this research is to study the extent of the impact of Transformational Leadership on the motivation of employees at Company in the Eastern part of the Sultanate of Oman. The study will focus on:

- Evaluate the impact of Idealized Influence, an essential factor of Transformational Leadership, on employees' intrinsic motivation, job satisfaction, and organizational commitment.
- Evaluating the purpose of Inspirational Motivation on individuals' intrinsic motivation, job satisfaction, and commitment to organizational objectives.
- Study the effect of Intellectual Stimulation on enhancing creativity, innovation, and general motivation among employees at the Company.

Results

The collected data were then analyzed based on the questions sought to be answered on hypothesis relating to the effect of the independent variables (Idealized Influence, Inspirational Motivation, Intellectual Stimulation) on the motivation of the workforce at the Company. The survey was structured in separate sections to correlate with these leadership attributes. The data was analyzed against the research questions and the influence of the independent variables on employee's motivation at the Company as relate to the three dimensions of leadership conceptualized in the survey.

Idealized Influence

The analysis of the survey results shows that there is a mixed perception of leaders at the Company exercising Idealized Influence. The mean score ($M = 2.667$, $SD = 1.080$) for the direct demonstration of Idealized Influence shows that employees have perceived that leaders are inadequate in embodying such qualities which motivate them and earn respect from their followers. This perception is somewhat in line with the reported moderate effect of lack of Idealized influence on two outcome variables- job satisfaction and organizational commitment ($M = 3.939$, $SD = 0.659$).

However, the highest mean score ($M = 4.515$, $SD = 0.508$) in responses about the possible advantages of increasing one's Idealized Influence expresses the employees' strong belief that if the Idealized Influence area is improved, it could result in considerable increases in employee job satisfaction and organizational commitment. Such an outcome buttresses the theoretical explanation that Idealized Influence plays a vital role in employee motivation and commitment, as stated by (Bass & Riggio, 2006). Idealized Influence leaders can positively influence and strengthen employee morale and productivity. (See table 1)

The survey suggests that while employees perceive the current level of Idealized Influence as low, they agree that this component of leadership could be beneficial to the organization, and in promoting higher employee motivation. Strengthening this component of leadership at the Company could therefore be crucial in boosting overall employee motivation and organizational performance. While, of course, there are many other elements of an employee's motivational experience that are also relevant to consider, it seems likely that training programs focused on enhancing the leadership behaviors associated with Idealized Influence could be an effective intervention in helping to create a more inspiring and committed place to work.

Table 1. Impact of IV: Idealized Influence

Survey Questions	Frequency %					Mean	Standard Deviation
Leaders at the Company demonstrate idealized influence through their actions and ethics.	Strongly Disagree (6%)	Disagree (7%)	Neutral (13%)	Agree (6%)	Strongly Agree (1%)	2.667	1.080
The lack of idealized influence from leaders at the Company negatively affects employee job satisfaction and organizational commitment.	Strongly Disagree (6%)	Disagree (7%)	Neutral (12%)	Agree (6%)	Strongly Agree (1%)	3.939	0.659
Enhancing idealized influence of leaders at the Company will significantly improve employee job satisfaction and commitment to the organization.	Strongly Disagree (6 %)	Disagree (7 %)	Neutral (13 %)	Agree (5%)	Strongly Agree (1%)	4.515	0.508
Grand Mean						3.707	
Grand Standards Deviation						0.946	

Inspirational Motivation

The below data show that there is a mixed perception of Inspirational Motivation at the Company. With a mean of 2.697, it demonstrates that employees perceive that the leaders are deficient in the degree to which leaders

provide inspirational motivation by communicating a compelling vision with a clear standard deviation (SD = 1.075) which shows variation in performance.

An analysis of the data shows that employees also expressed a strong belief in the value of Inspirational Motivation, with a mean score of 4.121. Therefore, the results indicate that employees who did not experience Inspirational Motivation reported significantly less intrinsic motivation. As a result, this led to lower levels of commitment to organizational goals and objectives. Consequently, it is not surprising that Inspirational Motivation was found to be the most important source of leadership motivation (Bass & Riggio, 2006).

Meanwhile, a high mean score ($M = 4.727$) for the dimension of Enhanced Inspirational Motivation indicates good conformity of responses, reflecting the positive effect of enhanced Inspirational Motivation on increasing employee motivational level and goal congruence. The relatively lower standard deviation ($SD = 0.452$) further signifies the common agreement among employees that enhanced Inspirational Motivation contributes positively to the fulfilment of organizational goals. The consistency in all dimensions among employees' responses signifies that the motivational strategies employed by inspirational leaders have worked and will continue to work in creating an inspired and goal-congruent workforce. Organizations should actively promote and sponsor programmes to enhance this dimension of leadership to ensure that their staff members perform to the best of their abilities and stay motivated to achieve organizational goals. (See table 2).

These results further emphasize the role of Inspirational Motivation offered by the transformational leadership theory, contending that this motivational component of leadership has a significant impact on both employee engagement and performance (Avolio & Bass, 1995). Thus, intensive communication and vision-sharing, which were the focus of the leadership development programmes in the Company, can substantially influence overall organizational performance and employee engagement. While the results showed that initiatives focusing on increasing Inspirational Motivation can further fortify employee motivation and their alignment with organizational goals, it is obvious that targeted development programmes with such a focus can bring about significant gains in both employee satisfaction and organizational effectiveness. Such a strategic focus does not only resonate with the theoretical framework offered by this perspective on leadership, but it also offers a pragmatic way to achieve organizational outcomes.

Table 35. Impact of IV: Inspirational Motivation

Survey Questions	Frequency %					Mean	Standard Deviation
Leaders at the Company encourage intellectual stimulation by promoting innovative and critical thinking.	<i>Strongly Disagree</i> (7 %)	<i>Disagree</i> (7%)	<i>Neutral</i> (11 %)	<i>Agree</i> (5 %)	<i>Strongly Agree</i> (1%)	2.455	0.833

A deficiency in intellectual stimulation from the Company's leaders hinders creativity, innovation, and overall employee motivation.	<i>Strongly Disagree</i> (6 %)	<i>Disagree</i> (7 %)	<i>Neutral</i> (11 %)	<i>Agree</i> (5 %)	<i>Strongly Agree</i> (1%)	4.242	0.614
Increasing intellectual stimulation by the Company's leaders will greatly enhance creativity, innovation, and overall workforce motivation.	<i>Strongly Disagree</i> (5%)	<i>Disagree</i> (7 %)	<i>Neutral</i> (11 %)	<i>Agree</i> (5 %)	<i>Strongly Agree</i> (1 %)	4.818	0.392
Grand Mean						3.838	
Grand Standards Deviation						0.220	

Intellectual Stimulation

The results of the survey showed that intellectual stimulation received a mean score of 2.455 and a high standard deviation of 0.833. This high variability in employee perceptions of this critical leadership characteristic suggests that the Company's leadership had hardly consistent practices around intellectual stimulation. Intellectual stimulation plays a key role in innovation and critical thinking according to the tenets of transformational leadership theory (Bass Riggio, 2006). The results above suggest that there is room for growth in this regard. It would be important for the Company to do more to stimulate intellectual engagement. Training in critical thinking and problem-solving techniques could be associated with this effort. Such measures would also take the Company a step closer to transformational leadership and what this style of leadership brings to the table of innovation.

However, the survey also indicates that employees feel a lack of intellectual stimulation is a major hindrance to creativity, innovation, and motivation, with a mean score of 4.242. This score gives an indication of the impact of intellectual stimulation upon employees and hence their performance and organizational innovation in general (Avolio & Bass, 1995). These findings indicate an area where leadership attention should be focused. Improving intellectual stimulation can benefit the Company significantly in their innovation efforts and employees' motivation. It is therefore suggested to implement strategic initiatives to enhance the intellectual stimulation to workers.

Similarly, the Intellectual Stimulation mean score ($M = 4.818$) suggests that, among those who rated it, its potential benefits have a strong consensus — i.e., it was felt that improved Intellectual Stimulation is beneficial in increasing creativity, innovation, and motivation for employees (Avolio & Bass, 1995). Additionally, the

lowest standard deviation ($SD = .392$), suggests a level of agreement among respondents regarding the Intellectual Stimulation benefits. Thirdly, the table helps to illustrate the importance of Intellectual Stimulation in organizational life and employee engagement.

These results further highlight the significance of Intellectual Stimulation as a fundamental characteristic of leadership as it directly results in the rise of employee engagement and performance (Avolio & Bass, 1995). Hence, it is of paramount importance for the company's leadership development programs to focus on enhancing the Intellectual Stimulation aspect of training and development of leaders in the Company. For instance, through extensive workshops and training programs, employees can be imparted with the skills of lateral thinking and problem-solving, which will consequently impact their work performance and, in turn, the performance of the organization.

Table 36. Impact of IV: Intellectual Stimulation

Survey Questions	Frequency %					Mean	Standard Deviation
Leaders at the Company encourage intellectual stimulation by promoting innovative and critical thinking.	<i>Strongly Disagree</i> (7 %)	<i>Disagree</i> (7%)	<i>Neutral</i> (11 %)	<i>Agree</i> (5 %)	<i>Strongly Agree</i> (1%)	2.455	0.833
A deficiency in intellectual stimulation from the Company's leaders hinders creativity, innovation, and overall employee motivation.	<i>Strongly Disagree</i> (6 %)	<i>Disagree</i> (7 %)	<i>Neutral</i> (11 %)	<i>Agree</i> (5 %)	<i>Strongly Agree</i> (1%)	4.242	0.614
Increasing intellectual stimulation by the Company's leaders will greatly enhance creativity, innovation, and overall workforce motivation.	<i>Strongly Disagree</i> (5%)	<i>Disagree</i> (7 %)	<i>Neutral</i> (11 %)	<i>Agree</i> (5 %)	<i>Strongly Agree</i> (1 %)	4.818	0.392
Grand Mean							3.838
Grand Standards Deviation							0.220

Discussion

The results of the survey are also closely aligned with the literature review and other research on

transformational leadership and its role in enhancing organizational performance (Bass & Riggio, 2006) as described in the literature review. It identifies the use of elements of transformational leadership as high, low and non-evident among the leaders at the Company on the part of Idealized Influence, Inspirational Motivation and Intellectual Stimulation. It was noted that the most effective use was in Intellectual Stimulation at 4.818 which creates a huge potential to open the way for creativity and innovation among the workforce (Avolio & Bass, 1995). It proves that a creative working environment should always provide an opportunity for the employees to think and solve problems.

Inspirational Motivation also had a high positive impact score, which underlines its importance to encourage cohesive actions between employees and their organization. This finding is also supported by studies that showed clear and compelling articulation of vision can improve employee engagement and motivation. By enhancing leadership communication in the Company through various training programmes, there could be an opportunity to improve business outcomes and employee alignment with company objectives.

The survey showed that, while Idealized Influence was widely acknowledged as the most effective style, it got the lowest mark when it came to actual practice. This suggests a development opportunity for raising leaders' performance here, probably via training programmes on the executive skills needed for acting as a role model within the organization (Bass Avolio, 1994).

The survey found that although Idealized Influence was the leadership style most people recognized as most effective, it was also the style rated lowest in everyday practice. This shows that one clear area for development opportunities is how leaders perform in this area. This can most likely be rectified through training programmes that provide the executive skills needed for role-modelling in the organization (Bass Avolio, 1994).

Intellectual Stimulation becomes particularly important in industries where there is high innovation need and rapid changes, such as the construction and engineering industry in which the Company operates. This environment further supports the rationale for targeted leadership development programmes. These programmes should seek to enhance the creative and innovative skills among leaders (Zhu, Chew and Spangler, 2005).

In general, these sets of strong correlations between the dimensions of leadership effectiveness and criteria related to job performance support the use of a well-developed leadership development programme at the Company. More investments in comprehensive leadership development should be made to enhance the levels of Intellectual Stimulation and Inspirational Motivation, as well as Idealized Influence. Conducting regular workshops to impart these leadership skills can enhance the culture of an organization; this would foster a more collaborative and innovative culture at work. Firm-designed programmes tailored to help adjust to changing climates in the industry, as well as programmes geared toward enhancing motivation, can help in sustaining productivity and fostering adaptability within an industry that is constantly evolving with forthcoming changes in public utility sector. These are likely to boost performance metrics and help employees further embrace the Company values and objectives.

Implications of Findings

Among the descriptive statistics from the Company, there is a noticeable deficit in intellectual Stimulation, which is specifically true for Transformational Leadership. While Idealized Influence and Inspirational Motivation exhibit moderate scores, these areas still exhibit room for improvement in order to adhere more closely to Transformational Leadership principles the Company's Leadership needs to improve its communication and motivational strategies, as well as improve ethical behavior and role modeling. There is a pronounced need for improvement in intellectual Stimulation, where the lower scores show a pressing problem. The company encourages employees to challenge the status quo and think differently, which in turn hampers innovation in problem-solving.

Conclusion

Significance of the Study

This research is highly significant as it presents an examination of the Influence of Transformative Leadership on employee motivation within the unique context of Company in the Eastern part of the Sultanate of Oman in the construction and engineering sector. The study aims to enhance the understanding of Leadership styles and its practices within the Company, as well as eventually in the broader industry. Additionally, the study will provide concrete insight into how various facets of Transformative Leadership impact workforce motivation. Moreover, the study serves as a connection between abstract leadership theories and their real-world application. It adds to the scholarly conversation on Transformational Leadership and offers practical approaches for enhancing leadership skills and organizational performance.

Limitations

The study focuses on Company in the Eastern part of the Sultanate of Oman 's internal environment and the leadership practices and approaches by providing perspectives on the company's unique dynamics. Nevertheless, this emphasis can restrict the applicability of the findings to different settings. The study employs quantitative methodology, emphasizing objectivity and data-driven analysis. The analysis might not fully reflect how people perceive leadership and motivation. Additionally, there is a chance of response bias affecting the accuracy and precision of the information collected.

To conclude; the quantitative case study highlights the critical role of transformational leadership elements – that is Idealized Influence, Inspirational Motivation, and Intellectual Stimulation – in alleviating job performance at the Company. It further emphasizes the role of combining real-world data with existing theoretical frameworks in organizational studies by demonstrating how the results of this study not only reaffirm the positive effect of these leadership styles on performance outcomes but also signals other areas which need to be addressed. Thus, the conclusion of this study presents valuable results that can be used in the formulation of

human resource strategy aimed at building a high-performing team.

This research has clearly shown that there is a strong link between individual leadership performance and the strategic requirements of the organization to maintain a competitive advantage in the volatile construction and engineering sector. Hence, investment in leadership development programmes should greatly improve organizational performance and should focus on increasing transformational leadership capabilities.

Through intervening to enhance Idealized Influence, Inspirational Motivation, and Intellectual Stimulation, the Company can more effectively realign its workforce to the changing needs of its industry, creating a more innovative, creative, motivated, and committed environment. Each of which would be important in sustaining productivity and adaptability. Over time, through these interventions, the Company can witness better performance metrics and a more complete competitive advantage in the market.

Recommendations

In terms of Idealized Influence and Inspirational Motivation, the Company's leaders display these factors, but they need to be more consistent and to the extent necessary for optimal performance. Even though Transformational Leadership has its foundational elements, they need to be regularly applied and enhanced. This needs to be addressed by the Company's leadership initiatives. Leaders need to act as role models and demonstrate ethical behavior consistently. Furthermore, by effectively conveying organizational vision and goals, effective communication strategies can significantly increase employee motivation, leading them to work with tremendous enthusiasm and dedication toward organizational goals.

Research indicates that organizations must also enhance Intellectual Stimulation within themselves. While construction and engineering are dynamic sectors where the ability to solve problems creatively and innovatively is imperative, the Company's current practices fall short of fostering that level of engagement. Implementing Intellectual Stimulation strategies is essential to cultivating an environment that promotes innovation. A training program could be offered that enhances analytical and creative skills, encourages open dialogue questions regarding conventional methods, and provides opportunities for employees to engage in challenging and innovative projects. In the changing realm of construction and engineering, the Company has the potential to greatly improve its capacity for innovation and flexibility.

Acknowledgements

I express my gratitude to the staff on the Construction and Engineering Company in the Eastern part of the Sultanate of Oman as well as the staff and management of the company for allowing me to undertake this study and to participate with in this study. I also express my gratitude to the Modern College of Business and Science Management and PHD faculty for allowing me to use its resources and for their support throughout the research

process. My appreciation and thanks go to those colleagues who contributed to this study by looking at drafts of this paper and giving their comments and ideas. Also, I would like to thank the conference organizers for allowing me to present here what I found in my research to the academic community.

The Impact of Decision-Making Process on Tendering Strategies in The Oil and Gas Industry: Case Study of Oman

Suaad Al Fannah

Modern Collage of Business and Science, Sultanate of Oman

Abstract: Purpose - The aim of this study is to explore – from the perspectives of employees at Oil & Gas company, in the eastern part of the sultanate of Oman - the extent to which the decision-making frameworks impact the tendering process and increases operational efficiency. In addition to revealing how decision-making frameworks are perceived, the study reports on the correlation between technological integration and risk management. The study is based on the assumption that sophisticated decision -making frameworks increase and enhance operational and tendering efficiency. Design/methodology/approach – A scientific philosophy underpins the research design of the study focusing on numerical and measurable outcomes. A quantitative method using surveys distributed to employees at Oil & Gas company, in the eastern part of the sultanate of Oman for data collection purposes. The survey questions were structured to examine the perception and effectiveness of decision-making, technological integration, and risk management practices. Descriptive statistics and correlation analysis are used for data analysis of the quantitative component and relationships between the variables. Findings -The findings suggest that robust decision-making frameworks, effective risk management, and technological integrations substantially increase the tendering process and operational efficiency at Oil & Gas company, in the eastern part of the sultanate of Oman. The results also reveal the importance of these factors in achieving strategic and operational efficiency. Significantly, although the sample is taken from one case study in a limited geographical area in Oman, which may jeopardize the generalizability of the findings, the study opens a new horizon of research in this area to validate the results in similar locations. Originality/value – The study provides insights, via the quantitative findings and participant's voices, into the effectiveness of decision-making frameworks, risk management practices, and technological integration at Oil & Gas company, in the eastern part of the sultanate of Oman. It spotlights the critical role of these factors in improving tendering and operational efficiency. The insights gained from this study are useful to stakeholders within the petroleum industry. Moreover, it provides them with an understanding of the importance of sophisticated decision-making frameworks and technological integration in achieving operational excellence.

Keywords: Oil & Gas company, Tendering, decision-making, risk management, Multi Criteria Decision-making (MCDM).

Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 2560-2572), Antalya, Turkiye. ISTES.

Introduction

Bid strategies play a vital role in any management and implementation of Oil and Gas projects to ensure the affordability and availability of energy and a stable economy (Al Saeedi and Karim, 2019). Furthermore, it is crucial for the Oil & Gas company, in the eastern part of the Sultanate of Oman, which is one of the leading companies, to implement a strategic bidding process that involve complicated planning and dealing.

Moreover, the sustainability of the company in the long-term prospect depends on key decision-making, which involves risk reduction, technology adaptation and comprehensive planning (Luciani, 2007). This clearly demonstrates how decisions are essential in their adaptation to the changing oil and gas market. Nevertheless, Oil and Gas is fluctuating due to the price variation, geopolitical issues, and fast technological progression means that they must make important decisions to ensure the survival of the oil and gas sector.

The aim of the study is to examine the bid decision- making frameworks of the Oil & Gas company and their impact on bidding practices and its impact. Interestingly, since oil and gas sector bidding are getting more complicated, it requires a holistic approach to evaluate the Oil & Gas company's current bid process and its impact if any. Moreover, the study findings will provide insights into the strategic discussions makers in the oil and gas sector. Decisions regarding bidding, in a global set up and in the presence of various parameters, make the decision-making complex.

Literature Review

It provides a theoretical base for this research paper that is supposed to underpin proposed research into tendering process in the Company to evaluate the role of Decision-Making Frameworks on tendering in the Company. The exciting literature in this subject that studies the appropriate method used in the bidding process in the Oil & Gas Industry will be discussed. Moreover, the paper will concentrate on decision making process, risk management plan, and technological integration.

They pointed to the importance of the impact of decision strategies and tendering process. A study amplifies the importance of multi-criteria decision-making process for better decision-making process by (Akintoye,2000). The point to know for decision making is to use these models as a successful decision tool in a competitive environment because the models will take care of cost, risk, and strategic fit.

Moreover, (Bratvold & Koch,2011) illustrated in his article on oil and gas bidding processes that Game theory is being used in the tendering process of an industry with intricate field of activities. Game theory refers to the act of strategizing on how decisions are influenced by actions of others thus reflecting how particular behaviors are manifested in an act of decision making during a competitive situation that may or may not be favorable to ensure a sound process for coming to decision.

The importance of risk mitigation in the bidding process is showcased in the study conducted by (Al Yafei K K et al,2019) where the authors used a project management method in which identifying risk in the bidding process is crucial. A similar view is expressed by (Xia J et al ,2012) who stated that to avoid any financial failure and waste occurring during project integration it is necessary to adopt advanced risk evaluation in order to achieve project success. Furthermore, in the study carried out by (Faraji, M P et al ,2022) it is proposed the use of a framework to contribute to the petroleum industry sector, given the different complexities that carry project settings.

Tender processes have been transformed by technological advancements – from how bids are formulated, to how tenders are submitted and evaluated. Their studies (Zheng et al,2017; Khripunova et al,2013) shed light on how organizational technologies, data analysis and automation tools are helping to improve the precision and efficiency of bid tasks. In their work, Khripunova et al,2013) research into ‘new data systems’ illustrates the impact of autonomous technologies in oil and gas tendering procedures.

Sustainability and ethical aspects are becoming more and more significant requirements in tender and bid processes. Furthermore, study by (Havenga et al.,2019) highlight that ‘better integrating responsible aspects into the tender process are believed to positively contribute to an organization image and to enable and maximize stakeholder’s trust which also emphasize global sustainability objectives. This global trend demonstrates the increasing importance of ethical aspects for long-term sustainability rather than immediate profit.

Ultimately, the literature reviewed explain the key factors of influence bidding Strategy in Oil and Gas industry, but also give point of support to understand more about Factor such Decision-making Framework, Implementation risk management plan, use of advance technology and how to improve bidding process. Plus, using Multicriteria Decision-making theories (MCDM) can support to get more deeper conceptualization about the impact of these factors on complex industry like Oil and Gas.

Conceptual Research Framework

The Oil & Gas Company’s approaches to tendering are thoroughly analyzed through a framework crafted within this research. This framework, by linking decisions to tendering results will shape the process of collecting and analyzing research data.

Dependent Variable

- **Success of Tendering Strategies:** In this research the key measure of achievement is the Oil & Gas Company use of tendering strategies. The effectiveness of the Oil & Gas Company’s oil and gas activities is gauged by factors such as the number of bids won, project completion, within schedule and budget and stakeholder contentment. The efficiency and effectiveness of the tender process is also measured by the above-mentioned parameters.

Independent Variables

- **Decision-making Frameworks:** This variable makes it feasible to investigate the Oil & Gas Company's decision-making models. The tendering process can be influenced by the Multi Criteria Decision-making. Mainly, this study intends to investigate the way the tendering decisions are based on these frameworks (the MCDM), in order to achieve their project objectives.
- **Risk Management:** Risk assessment is also a key issue that affects organizational bidding strategies. It's related to determining and assessing the risks, to deal with them with. This study will, in turn, discuss ensures its achievements.
- **Technological Advancements:** the Oil & Gas Company's tendering is measured in terms of efficiency and effectiveness via instruments, software, and systems.

Method

Research Methodology

The study is based on quantitative analysis method that investigates the impact of decision-making frameworks on tendering processes. The chosen approach will support understanding the interrelationship between different factors that might affect the exciting tendering process within the Company in the Oil & Gas industry. Furthermore m, as identified from the exciting literature review, there are different factors such as decision-making frameworks risk management plan, and technological advancement might influence the tendering process. Additionally, using a quantitative analysis approach will provide a comprehensive understanding of the current process within the Company through data-drives analysis.

A study conducted by (Akintoye,2000; Hammond & Morrill ,2016), highlighted the impact of risk management plan, decision-making frameworks, and tectological advancement integration on the success of tendering process. In order to validate these findings, a qualitative analysis will be conducted to investigate the current procedures of the Company's tendering process to identify the main factors that have a significant impact. Furthermore, the quantitative approach presents an understanding of the main reasons and the relationship between decision-making processes and successful bidding strategies. However, the results of this study will contribute to studies discussing effective decision-making frameworks in the oil and gas sector and support the Company's strategic goals.

Data Collection Procedure and Sample

Investigation of the impact of decision-making frameworks on the tendering process is the main objective of the study. In order to examine the influence of these frameworks, the existing literature was reviewed to get deeper understanding and navigate factors that might affect the process. Furthermore, a constructed survey questionnaire was addressed to more than 45 employees withing the Company operating in the Oil and Gas

sector and 29 responses received. The survey targeted employees who are involved and interacting with the Company's tendering process. Additionally, the survey was divided into three sections to understand the exciting issues, impact, and result of enhancing them. The survey questions were based on the Likert Scale rating from (1 – Disagree) to (5- Strongly Agree).

The first section evaluated the exciting tendering process frameworks within the Company in navigating any intricate issues. The second section evaluated the impact of these frameworks on the company efficiency and project management and the risk management plan. The third section examined the effect of enhancing these frameworks by advanced technology. By utilizing this survey structure, it will provide holistic understanding of the current gaps and issues and provide recommendations to increase the efficiency of the tendering process within the Oil & Gas Company.

This structured approach enabled a quantitative analysis of each variable's impact on the efficiency of tendering strategies, at Oil & Gas Company. The questionnaire had a section, at the beginning, to clearly outline the aim of the study, making sure all participants understood the research goals and why their input was valuable.

Data Analysis

The researchers examined the data by conducting a survey among participants at the Oil & Gas Company. Out of 45 participants they received 29 completed surveys indicating a good response rate that supports the reliability of the study findings. However, there were challenges with the survey item's reliability based on Cronbach's alpha analysis. The Cronbach's alpha value was 0.221 with a confidence interval of 0.374 to 0.588 at a 95% level. This low alpha value suggests issues with the consistency of the survey items falling below the accepted threshold of 0.70 for reliable survey research.

The responses from the survey underwent analysis using analysis mean calculations and standard deviation calculations utilizing Software Package such as SPSS and JASP. Despite the difficulties in ensuring scalability, it is believed that a thorough examination of the data could provide valuable insights into certain elements of decision-making frameworks that could improve the effectiveness of tendering strategies at the Oil & Gas Company. Further statistical methods might be necessary to tackle and account for the low reliability scores to gain an understanding of the underlying trends and patterns in the data.

Research Questions

- To what extent do decision-making frameworks impact the effectiveness of tendering strategies in the oil and gas sector?
- To what extent does risk management influence the results of tendering in the oil and gas industry?
- To what extent do technological advancements enhance the effectiveness of tendering procedures, in the oil and gas sector?

Hypothesis

- **H1:** Having a constructed system for making decisions can greatly boost the chances of winning bids, in the oil and gas sector.

Objectives

In the context, a quantitative method is employed to examine bidding tactics in the oil and gas sector, specifically within the Oil & Gas Company. As illustrated below:

- **Analyzing Decision-making Frameworks:** The Oil & Gas Company assessed its decision-making processes using analysis focusing on metrics like success rates, cost differences and time effectiveness. By measuring these factors, the research aims to gain a thorough understanding of the Oil & Gas Company's decision-making processes to enhance bidding procedures and identify areas of strength as well as areas for enhancement.
- **Investigating Risk Management:** By examining the tender data of the Oil & Gas Company, can detect certain risk patterns that influence the outcomes of tendering processes. This analysis also allows us to evaluate how effective risk mitigation strategies are based on the findings.
- **Examining Technological Influence:** To assess the Oil & Gas Company's tendering procedures effectively technology adoption metrics is utilized. Also, compare them to industry standards and their effectiveness. Statistical analysis tools help to measure progress in relation to the efficiency of tendering processes.
- **Providing Recommendations:** Following an analysis of data, recommendations are suggested and supported by statistics to predict the success of the Oil & Gas Company's in different situations. Additionally, the aim is to enhance the Oil & Gas Company's decision-making processes, risk management strategies and technology incorporation through scientific and strategic methods.

Theoretical Framework and Philosophy:

The research investigates how decisions are made in the oil and gas sector using scientific approach and decision theory. An analytical framework for decision-making is applied to assess bidding strategies, for their efficiency.

The research is grounded in scientific philosophy using quantitative methods to explore phenomena, the tendering strategies in the Oil & Gas Company. By analyzing data on tendering strategies in the oil and gas sector it become possible to understand the evaluate relationship between Success of Tendering Strategies and critical factors like Decision-making Frameworks, Risk Management, and Technological Advancements. Additionally, it offers objective, measurable insights that can inform decision-making in the tendering process based on statical and numerical analysis.

Results

The focus of this study is to explore how decision-making frameworks affect the success of bidding strategies, in the oil and gas industry. The goal is to investigate how decision-making frameworks play a role in the tendering process at the Oil & Gas Company. The survey questions “To what extent do decision making frameworks impact the effectiveness of tendering strategies in the oil and gas sector?” evaluated the strength of existing decision-making frameworks, the risks of having insufficient frameworks and the advantages of adopting more advanced decision-making structures.

Analysis of the first three survey questions reveals that a large percentage of the participants believe that having sophisticated decision-making frameworks is an important aspect of increasing the success rate of tendering strategies in the oil and gas industry. Analysis of the data suggests that there is considerable agreement towards the top scale point (Agree and Strongly Agree) with a grand mean of 4.632 and a grand standard deviation of 0.313. The analysis of the SD shows that the majority of respondents’ answers are concentrated at the mean, which suggests a level of coherence to the responses.

Moreover, the highest mean score was associated with the first statement, which was concerned with “Inadequate decision-making frameworks significantly increase the risks in tendering processes at the Oil & Gas Company” ($M = 4.862$, $SD = 0.351$). Then followed by concerns that “Implementing more sophisticated decision-making frameworks can significantly enhance the success rate of tendering strategies at the Oil & Gas Company” ($M = 4.759$, $SD = 0.577$). Furthermore, the lowest mean score was associated with the present-day ability of framework to handle complexities ($M = 4.276$, $SD = 0.591$). (See table 1)

Table 37. Decision-making Frameworks

Survey Questions	Frequency %					Mean	Standard Deviation
The current decision-making frameworks are sufficiently robust to handle the complexities of tendering in the oil and gas industry.	<i>Strongly Disagree</i> (0 %)	<i>Disagree</i> (0 %)	<i>Neutral</i> (2 %)	<i>Agree</i> (17 %)	<i>Strongly Agree</i> (10 %)	4.276	0.591
Inadequate decision-making frameworks significantly increase the risks in tendering processes at the Oil & Gas Company	<i>Strongly Disagree</i> (0 %)	<i>Disagree</i> (0 %)	<i>Neutral</i> (0 %)	<i>Agree</i> (4 %)	<i>Strongly Agree</i> (25 %)	4.862	0.351

Implementing more sophisticated decision-making frameworks can significantly enhance the success rate of tendering strategies at the Oil & Gas Company	<i>Strongly Disagree</i> (0 %)	<i>Disagree</i> (0 %)	<i>Neutral</i> (2 %)	<i>Agree</i> (3 %)	<i>Strongly Agree</i> (24 %)	4.759	0.577
Grand Mean							4.632
Grand Standards Deviation							0.313

Survey responses show that risk management is essential to provide a successful tender. The grand mean of 4.770 and very small grand standard deviation of 0.020 signify that participants agree to the idea that designing a good risk procedure for activities associated with a tender will provide a successful tender outcome. provided that the mean score for each item regarding risk management within the tender is very high, which means good agreement on the importance of risk management factors in providing a successful tender outcome at the Oil & Gas Company.

The mean scores for the integration of risk management practices ($M = 4.793$) were the highest and it is likely a sense that currently these are perceived to be adequate. This is followed by the negative effects of ineffective risk management ($M = 4.759$) and the benefits potentially accrued from strengthening such practices ($M = 4.759$), both of which further underscore the importance of having robust risk management systems.(See table 2)

Table 38. Risk Management

Survey Questions	Frequency %					Mean	Standard Deviation
Risk management practices are adequately integrated into the tendering processes at the Oil & Gas Company	<i>Strongly Disagree</i> (0 %)	<i>Disagree</i> (0 %)	<i>Neutral</i> (1 %)	<i>Agree</i> (4 %)	<i>Strongly Agree</i> (24 %)	4.793	0.491
Poor risk management practices lead to frequent cost overruns and delays in project completion within the Oil & Gas Company's tendering strategies.	<i>Strongly Disagree</i> (0 %)	<i>Disagree</i> (0 %)	<i>Neutral</i> (1 %)	<i>Agree</i> (3 %)	<i>Strongly Agree</i> (24 %)	4.759	0.577
Strengthening risk management practices will greatly reduce the negative	<i>Strongly Disagree</i> (0 %)	<i>Disagree</i> (0 %)	<i>Neutral</i> (2 %)	<i>Agree</i> (3%)	<i>Strongly Agree</i> (24%)	4.759	0.577

impacts on tendering outcomes at the Oil & Gas Company							
Grand Mean							4.770
Grand Standards Deviation							0.020

The survey draws a positive perception towards the tendency of technological advancements to enhance tendering processes in general with a grand mean of 4.287 and a grand standard deviation of 0.163 which consequentially suggest a strong agreement on the beneficial role that continues to derive from tendering processes through technological advancements, albeit with a slight hesitation towards the full extent to which further technological advancements could potentially contribute.

The highest mean score was for the item stressing the extent to which the limited integration of more sophisticated technological devices is an obstacle ($M = 4.414$), suggesting anxiety in not having more technology yet. The lowest mean ($M = 4.103$) was related to benefits that might come from better integrating more sophisticated tools, suggesting some doubts/uncertainty about how much better such tools might make things. (See table 3)

Table 39. Technological Advancements Influence

Survey Questions	Frequency %					Mean	Standard Deviation
Technological advancements have been effectively utilized to improve the tendering process at the Oil & Gas Company	<i>Strongly Disagree</i> (0%)	<i>Disagree</i> (0%)	<i>Neutral</i> (2%)	<i>Agree</i> (3%)	<i>Strongly Agree</i> (24%)	4.345	0.484
Lack of advanced technological integration in the tendering process hinders the efficiency and effectiveness of tender outcomes at the Oil & Gas Company	<i>Strongly Disagree</i> (0%)	<i>Disagree</i> (0%)	<i>Neutral</i> (0%)	<i>Agree</i> (19%)	<i>Strongly Agree</i> (10%)	4.414	0.501
Integrating more advanced technological tools and systems will improve the efficiency and success of tendering processes at the Oil & Gas Company	<i>Strongly Disagree</i> (0 %)	<i>Disagree</i> (0 %)	<i>Neutral</i> (2 %)	<i>Agree</i> (22%)	<i>Strongly Agree</i> (5%)	4.103	0.489
Grand Mean							4.287
Grand Standards Deviation							0.163

Discussion

The quantitative case study at the Oil & Gas Company highlights how the success of a tendering strategy in the oil and gas sector is affected by decision frames. Using benchmarking with existing research together with real-world data infuses quantitative argumentation with fictive realities of the business world. The results from the quantitative study show not only how sophisticated decision-making, risk handling and technological integration affect operational efficiency, but more importantly, where improvements can be made. By understanding how and where improvement, changes can be made to an organization to make it stronger, strategic, and better, thus turning them into a learning organization. The alignment between an individual's capabilities and the need of the business is vital for staying ahead in the oil and gas industry, where the rate of change seems ever more dynamic.

Implications of Findings

Decision Making Framework: Statistical results indicate that the highest means reflect participants' perceptions about the importance of strong frameworks in risk and tendering success mitigation. More importantly, the results show that robust frameworks are imperative. Indeed, they are key to understanding problems and ambiguities and to warding off dangers in oil and gas sector tendering. These results are in consonance with the works of the aforementioned academics in literature who have highlighted the importance of sound decision making in complex procurements settings (Akintoye, 2000; Bratvold and Koch, 2011).

Risk Management: These results show a clear, strong consensus on risk management in mitigating tendering challenges. The results are in line with the literature emphasizing the critical role of risk management in the success of projects and minimizing pitfalls such as cost overruns and project delays (Al Yafei et al., 2019; Xia et al., 2012). Additionally, the consistent high ratings on the risk management items indicate converging agreement on their importance. Consequently, there seems to be a shared agreement among the Oil & Gas Company workers on the essence of robust risk management, which supports the theoretical discourse as well as practical solutions to improve the Oil & Gas Company risk management frameworks.

Technological advancements: These results reveal that technological improvements are both welcomed and seen to be fruitful for the tendering activities at the Oil & Gas Company, and that there is widespread agreement that there are still opportunities for more innovative technological implementations. This finding supports the literature, which emphasizes that technological improvements remain key to maintaining and enhancing the competitiveness and efficiency of tender processes (Zheng et al, 2017; Khripunova et al, 2013). The slightly pessimistic perspective on the expected future technological improvements should also spur us to pay sustained attention to assessments and the adoption of state-of-the-art technologies to further enhance their effects on tender success.

Conclusion

Significance of the Study

The decision-making process and its impact on the success of bidding at the Company are the objective of the research report. Adding to that, propose recommendations to enhance operational efficiency through examining the relationship of the decision-making frameworks and the bids outcomes. Similarly, the study pursues the impact of decision-making models in tendering processes in the Oil and Gas sector. Consequently, the findings will contribute to the studies on the decision-making process and strategic planning. Also, it will provide an understanding of its impact on enhancing the competitive tendering and bidding process. Therefore, companies in the Oil and Gas industry can utilize and benefit from these insights to increase efficiency, reduce expenses and improve project management.

Limitations

This paper examines practices in tendering and bidding in a dynamic competitive industry that is the Company operating within. By looking into the Company's decision-making frames and strategies, this report will serve to analyze the case more succinctly and deeper and therefore the results might have an impact on the Company profitability. Due to different market conditions and demands as well as how much the nature of the operational factors vary, the results might not be applied to the case on a generalized basis to all industries. Despite depending on different techniques to ensure that the data-driven results are objective enough, it might ignore subjective experiences and perceptions that might impact the bidding decision. In addition, being ready to identify any potential bias in the collected data might be able to impact the reliability and credibility of the findings. The countermeasures to above remain to be thereby evaluated and analyzed in this comparative analysis.

The research conducted on the Oil & Gas Company sheds light on how the organization makes decisions, manages risks and utilizes technology. The findings reveal that the existing operational procedures are highly respected, decision-making, and risk management are successful, and technology contributes to enhancing the tendering process. Additionally, the study suggests a necessity to improve decision-making frameworks, fortify risk management strategies and streamline technology integration.

The consistent average scores across factors demonstrate an acknowledgment of strengths and an understanding of areas, for improvement. By incorporating Multi Criteria Decision-making (MCDM), the Oil & Gas Company can refine its operations to stay competitive and navigate the challenges of the oil and gas industry efficiently.

Recommendations

Improving the Oil & Gas Company's strategic outcomes can be achieved by putting into action the suggestions

derived from the findings. To improve the strength and complexity of the Oil & Gas Company's decision-making processes consider incorporating MCDM methodologies. This method allows for an evaluation of the different aspects that impact bidding and operational choices leading to better strategic results. Furthermore, to enhance the risk management framework by incorporating sophisticated analytical tools and methods to bolster risk management procedures. To minimize the effects of risk management it is crucial to create dynamic risk assessment models that can anticipate potential obstacles and address them in advance. Besides embracing technologies it's crucial to maximize the use of current technologies whenever feasible to enhance effectiveness and achievement, in bidding. Additionally, implementing a program for improvement and training will ensure that employees stay updated with the most current skills and knowledge to make informed decisions, handle risks effectively and utilize technology. This culture of improvement and innovation will be advantageous for the Oil & Gas Company.

Acknowledgements

I express my gratitude to the staff of the Oil & Gas company in Eastern Oman as well as the staff and management of the company for allowing me to undertake this study and to participate with in this study. I also express my gratitude to the Modern College of Business and Science for allowing me to use its resources and for their support throughout the research process. My appreciation and thanks go to those colleagues who contributed to this study by looking at drafts of this paper and giving their comments and ideas. Also, I would like to thank the conference organizers for allowing me to present here what I found in my research to the academic community.

Delegation and Its Impact on Employee's Motivation and Loyalty: The Case of Oman

Latifa AL-Badi

Modern college of Business and Science, Oman; Sohar university, Oman,

Abstract: The aim of this study is to explore – from the perspectives of employees at Sohar University - the extent to which effective delegation of tasks increases employee's motivation and loyalty. A pragmatic philosophy underpins the research design of the study. A mixed methods case study approach involving surveys administered to 47 employees was used to measure participants' attitudes towards practices related to delegating tasks. The survey includes three open-ended questions aiming at exploring participants' experiences while carrying out delegated tasks. Descriptive statistics and correlation analysis are used for data analysis of the quantitative component. Thematic analysis is used to identify the frequent occurrence of words and phrases that reflect how delegation impacts employee's motivation and loyalty. The findings suggest that delegation improves both employee's motivation and loyalty. Participants indicated that their sense of belonging to their organization increases when they get engaged in sharing with their managers the responsibility. Significantly, although the sample is taken from one case study in a limited geographical area in Oman, which may jeopardize the generalizability of the findings, the study opens a new horizon of research in this area. The study provides insights, via the quantitative findings and participant voice, into how employees' sense of belonging to their organization increases when they get engaged in sharing their managers the responsibility of carrying out the strategic tasks. It spotlights the impact of delegation on employee's motivation and loyalty. The insights gained from this study are useful to leaders and managers across higher education institutions. It provides them with an understanding of the value of delegating responsibilities to employees, and how delegation impacts employee's motivation, loyalty, and organization performance in general.

Keywords: Delegation, Motivation, Loyalty.

Introduction

Background of study

Delegation has been a central issue in management that has interested many organizational behavior and management theory scholars. It is the process by which managers share responsibility and accountability with their subordinates who will be empowered to decide independently and perform tasks autonomously.

Practically, delegation is an inevitable activity for any efficient organization. It has far-reaching implications on employees' motivation and loyalty. Several studies have highlighted the significance of delegation in shaping employee attitudes and behaviors. For instance, Robbins and Coulter (2019) argue that effective delegation makes workers feel responsible for their actions which increases their motivation to work hard. There is a relationship between employee job satisfaction and how much the person is delegated duties (Yukl 2013). In other words, delegation, as a managerial process of assigning responsibilities, enables leaders to share the workload and authority among stakeholders and employees. This is the process through which managers delegate decision-making authority to their juniors (Nkiruka et al., 2021).

Employee's motivation, loyalty and delegation

Research indicates that the leadership style that values effective delegation positively increases employees' motivation and job performance (Pangabea et al., 2022; Sugiharti et al., 2023). Delegation has great influence on employees' attitude towards their jobs. On the other hand, employee loyalty is a state of mind in which employees are committed to their employers and are willing to keep working with them even when things get tough (Supit, 2022). Effective leadership that values appropriate delegation creates positive work environment and enhances employees' job satisfaction which increases their loyalty (Andarsari & Setiadi, 2023; Trisninawati et al., 2023).

Noticeably, there is a large body of context-specific and western-oriented literature on delegation, but there is and there is a significant information gap on the impact of delegation on employee motivation and loyalty in Oman's higher education institutions. This study seeks to bridge this gap by exploring the relationship between delegation and employee motivation and loyalty in the faculty of business at Sohar university. Based on literature and empirical studies, this research investigates how employees' attitudes are influenced by delegation. The study seeks to offer practical recommendations that help leaders in organizations achieve a higher level of employee engagement and loyalty by investigating how effective delegation practices are encouraged.

Purpose of the study

The study examines the relation between delegation, employee motivation and loyalty in Faculty of Business at Sohar University. The research explores the intricacy of delegation in the organizational context to understanding how employees perform delegation functions. Moreover, it is intended to measure employee motivation levels and assess staff loyalty. The study explores the dynamics of delegation to provide an insight into ways that maximize organization performance and employee satisfaction.

Theoretical and conceptual framework

The theoretical framework for studying delegation and its impact on employee motivation and loyalty is

informed by a few key theoretical perspectives. One theory that explains the dynamics of the delegation process is the agency theory. According to Chiang & Jang (2007), agency theory presents an understanding of the relationship between the employer (the delegator) and the staff (the delegated employee). The theory perceives delegation as a sign of trust and an opportunity for professional growth for those employees who will be delegated certain responsibilities in an organization. The theory not only explores the rapport that exists between the principal (the leader or employer) and the agent (a manager or employee), but also addresses the challenges that an organization may face when there is a conflict of interest between the delegator and the delegated manager or employee. Another theory that explains the concept of delegation and its dynamics is the expectancy theory, which explains the motivational aspects that underlie delegation. In studying delegation and its impact on employee motivation and loyalty, the two theories, taken together, explain how employees' aspirations for accomplishment and rewards would be met through the delegation of authority, and how this kind of motivational practice promotes reciprocal relationships resulting in loyalty (Chiang & Jang, 2007; Fan et al., 2021; Meira & Hancer, 2021). All in all, effective delegation has the potential to increase employee motivation and organizational loyalty. The reviewed theoretical concepts inform the design of conceptual framework of the study which the following graph depicts. Also, based on the reviewed literature and the proposed theoretical framework, two questions have been developed to guide the research process.

Conceptual Framework:

Research Questions

What is the relation between delegation and employee's motivation?

To what extent does delegation influence employee loyalty?

The study aims to :

Examine the relationship between delegation and employee motivation.

Analyze the relationship between delegation and employee loyalty.

Identify factors that determine effective practices in delegating authority.

Research hypotheses

Hypothesis 1: There is a positive relationship between delegation and employee motivation.

Hypothesis 2: There is a positive relationship between delegation and employee Loyalty.

Participants

The participants of the study are the administrative and academics employees of the faculty of business at Sohar university, Oman. The study seeks to explore participants' perceptions regarding the extent to which delegation impacts their motivation level and loyalty towards the university.

Data Collection/Instrumentation

A mixed methods case study approach is used to investigate the extent to which delegation increases employee's motivation and loyalty. Towards this purpose and based on the reviewed literature and previous studies on delegation, a perception survey comprising of 15, 5-point Likert Scale items has been distributed to 47 administrative and academic staff in the faculty of business at Sohar university. The aim of the survey was to collect quantitative data related to the study under inquiry. The survey was piloted, and the used version consisted of three sections apart from the demographic part.

The first section comprised five items and aimed to measure participants' perceptions on the extent to which employees are delegated. The second section includes five items and measures participants' perceptions of the extent to which delegation increase their motivation. The third section of the survey includes five items and measures participants' perceptions of the extent to which delegation advances their loyalty.

All the 15 items of the survey consider a 5-point scale (1- Not at all, 2- to a very little extent, 3 - to a little extent, 4 - to a high extent and 5- to a very high extent). The survey includes an introductory section that clearly explains the purpose of the research. On the other hand, qualitative data were collected from 3 open-ended questions which represented add-on items to the survey questions. My aim was to provide qualitative data that can enrich the quantitative findings with important quotes from the same participants.

Data Analysis

The quantitative data were analyzed through the perception survey which was administered to 47 administrative and academic staff in the faculty of business at Sohar university. 41 surveys were received providing a response rate at 87.23 which is a satisfactory percentage that validates the results of the study. The reliability of the survey items has been substantiated by an overall Cronbach's alpha (α). The alpha score of .70 or higher in a survey of this nature is considered good.

In this research, Cronbach yields Alpha at 0.9 which is a strong scale reliability. The survey responses were subjected to the frequency analysis, mean and standard deviation of the Software Package for Social Sciences (SPSS). The qualitative data were analyzed using thematic analysis. It is assumed that an in-depth analysis of delegation would yield an insight into various aspects that increase employee's motivation and loyalty.

Results

Table 1 consists of descriptive statistics for three variables: D (Delegation), EM (Employee's Motivation), and EL(employee's Loyalty). These statistics provide information on the central tendency and spread of data.

Table1. Descriptive Statistics

Descriptive Statistics			
	Mean	Std. Deviation	N
D	13.39	5.536	41
EM	12.71	5.980	41
EL	13.17	4.455	41

The mean values show the average score per variable in the sample. For instance, 13.39 is the highest mean for D, while EL comes second with a mean of 13.17 and last, EM has a mean value of 12.71. Standard deviations are dispersion measures which depict how much variation exists regarding the mean-value in each case of descriptive statistics. Results show that EM has the most variability at a standard deviation equal to 5.980; EL has least degree of variation at 4.455.

Three variables D (Delegation), EM (Employee's Motivation), and EL(employee's Loyalty) were the subject of correlation coefficients presented in table 2.

Table 2. Correlation

Correlations				
		D	EM	EL
D	Pearson Correlation	1	.954**	.878**
	Sig. (2-tailed)		.000	.000
	N	41	41	41
EM	Pearson Correlation	.954**	1	.861**
	Sig. (2-tailed)	.000		.000
	N	41	41	41
EL	Pearson Correlation	.878**	.861**	1
	Sig. (2-tailed)	.000	.000	
	N	41	41	41
**, Correlation is significant at the 0.01 level (2-tailed).				

The correlation coefficient determines how strong or weak the relationships between. It is important to note that all the correlations are statistically significant at 0.01 level (2-tailed), which means that there are strong

relationships among them. Although these data revealed other patterns; it could still be observed clearly that D had strong positive relationships with both EM ($r = .954$, $p < .01$) and EL ($r = .878$, $p < .01$). Also, it was observed that variable EM had very high positive association with D ($r = .954$, $p < .0001$) and EL ($r = .861$, $p < .001$).

EL too correlates with D as well as M.E. For instance: $r=.878$, $p<0.01$ for both D and E.M; $r=.861$, $p<0.01$ for both E.L and M.E.

Discussion

Table2 indicates that there are consistent positive associations between all variables. Findings indicate that the standard deviation of the variable EM is much higher than that of EL, which means that motivation varies more among people than loyalty. As shown in the correlation table, all the variables are positively correlated. These findings were supported by qualitative results, showing the positive effect of delegation on employees' motivation and loyalty. The majority of respondents argued in favor of the positive aspects of delegation in increasing their motivation. Other responses indicated that their sense of accountability, involvement, motivation, and productivity at work is enhanced by delegation.

Recommendations

First, it is important to conduct further research to explore how motivation and loyalty are affected by different levels of delegation; this may involve using qualitative methods among other approaches. Second, the organization could design training programs to train their leaders and managers on how to efficiently delegate authority to the subordinates. In addition, those employees who have been given power and show commitment to their work activities should be rewarded to encourage others.

Acknowledgement

I would like to acknowledge all those who helped me in conducting this research. I would like to thank all those who participated and shared their experience and point of views during the data collection phase. Also, I express my appreciation to Dr. Mohamed Elgeddawy for his continuous support and guidance. Last but not least, I extend my gratitude to my family and friends who were always there supporting and encouraging me.

Employee Engagement in The Decision- Making Process and Its Impact on Employee Satisfaction and Commitment: The Case of Oman

Latifa AL-Badi

Modern college of Business and Science, Oman; Sohar university, Oman

Abstract: This study aims to explore – from the standpoint of administrative and academic employees at the faculty of business in Sohar University - the extent to which the employees’ engagement in decision- making increases their satisfaction and commitment. In addition to revealing how employees’ engagement in decision making is perceived, the study reports on the correlation between employees’ engagement, employees’ job satisfaction, and commitment. The study assumes that employees’ engagement increases the job satisfaction and commitment. A Pragmatic philosophy underscores the research design. Data collection utilized a mixed methods case study approach with a survey administered to 47 administrative and academic staff at the faculty of business in Sohar University. The survey contains three open-ended questions aimed at bringing out valid quotes that confirm quantitative results. The quantitative component has been subjected to descriptive statistics and correlation analysis. Thematic analysis was used to identify semantic patterns that cut across participants’ experience in relation to their level of engagement in the decision-making process. The findings show that participants’ engagement in decision making enhances their job satisfaction and commitment. However, it is important to note that even though the research sample was selected from one setting within Oman, which may diminish the generalizability of the findings, it opens a new prospector research in this area. Through participant voice as well as quantitative findings, this study offers insights on how employees’ engagement in decision-making impacts their job satisfaction and commitment levels. The findings provide various stakeholders such as education leaders with insights into the value of engaging their employees in the decision-making process for organizational effectiveness.

Keywords: Employee’s engagement, Decision making, Job satisfaction, and Employees’ commitment

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2580-2589), Antalya, Turkiye. ISTES

Introduction

Modern organizational management and worker involvement and participation in decision making have become a key concern that reflects an ideological shift towards empowering employees and recognizing their contributions beyond conventional roles. The concept of employee commitment includes their

involvement in the decision-making process within the organization, which results in ownership and feelings of responsibility among workers. This type of engagement fosters employee satisfaction and level of commitment to the organization as well. Recent studies have found that employee engagement in decision making is pivotal for the success of organizations. Motivated, creative, and satisfied employees are therefore more engaged, leading to better performance outcomes. Research indicates that employee involvement in the decision-making process can influence the success of an organization through fostering positive organizational culture. Employees, by and large, value to have their voices heard during decision making (Smith et al., 2023). Employees' participation in decision-making greatly influences both their job satisfaction and organizational commitment (Chen & Wang, 2022). Employees' commitment is an outcome of their engagement in the decision-making process. Employee commitment is one key determinant of organizational effectiveness and resilience. Many studies have proved that when workers perceive themselves as sources of decision-making within organizations, they tend to develop strong bonds with such organizations (Pierce & Dunham 2018). Research documents that employees' engagement in decision-making increases their job satisfaction and organizational commitment.

Employees engagement in decision-making

The term employee engagement in decision-making refers to the involvement of workers in processes and options that affect their work as well as the organization. It is an important aspect of organizational management which can result into a more committed and motivated workforce (Dhanda, 2015). Engaged employees tend to remain with an organization longer, be passionate about their jobs and willing to go beyond what is expected of them. They are not only enthused by their job but also feel free to exert much effort making them an invaluable resource for any company (Dhanda, 2015). It is important for organizations to ensure that they involve employees in decision-making process to create a sense of organizational belongingness which would add value to the productivity of the organization in general (Dhanda 2015).

Employees commitment

Employee dedication refers to employee commitment which is the willingness of a worker to put his employer's aspirations above personal considerations (Akhigbe & Obomeghie, 2021). Such commitment often acts as a bond between the individual and the organization representing the level of involvement and attachment an employee has towards his work and company (Dwivedi et al., 2014). It enables employees to diligently to make contributions to the prosperity of the organization (Yaghoubi et al., 2022). Research indicates that there is a strong correlation between employee engagement and staff loyalty (Marzooq&Nisa, 2022). Engaged and committed employees bring about increased productivity, lower turnover rates, and improved organizational performance (Shahid&Azhar, 2013). Affective commitment acts as an intervening variable in linking job meaningfulness to employee engagement (Kaur&Mittal, 2020).

Employees job satisfaction

Employee job satisfaction refers to how much employees are content and satisfied with their working conditions. The relationship between employees' job satisfaction and their engagement in the decision-making process has a positive impact on organizational success. Organizational fairness impacts employees' attitudes, behaviors and in turn job satisfaction (Nargotra & Sharma, 2018). Employees who are satisfied with their work environment demonstrate a higher level of commitment and loyalty towards their organization (Trisninawati et al., 2023). Employees' job satisfaction is a predictor of their engagement which can be impacted by their involvement in decision-making. Trusting management and being part of decision-making result into high levels of job satisfaction. Job satisfaction is highly associated with participatory decision making whereby workers' opinion is incorporated during decisions relating to their jobs (Mohsen & Sharif, 2020). Considerably, the literature suggests that job satisfaction is both an antecedent and consequence of employee engagement.

Research Gap and Purpose

Based on the reviewed experimental studies, it is evident that employees' engagement in decision-making increases their satisfaction and commitment; yet this concept, to my knowledge, has not been explored in the context of Oman, despite its practical and theoretical implications. This study addresses this gap in our understanding of how employees' engagement in decision-making increases their satisfaction and commitment. Identifying this gap in the literature makes it compelling that more research is needed in this area. This study seeks to explore to what extent and in what way employee satisfaction and commitment are related to employees' engagement in decision-making processes. The following is an exploration of the theories that underpin the study.

Theoretical and conceptual framework

This study is premised on goal setting and job characteristics theories. These theories lay the ground for explaining the relationship between employee satisfaction and commitment and their engagement in the decision-making process.

Goal Setting Theory: According to goal setting theory, individuals can be motivated by specific challenging goals to perform at higher levels. Inclusion of employees in the decision-making process allows them to make meaning out of the goals they participate in developing. Individuals will be more motivated towards achieving such goals when they are allowed to take part in goal-setting activities as well as decisions affecting their work.

Job Characteristics Theory: The Job Characteristics theory states that motivation, satisfaction, and performance of employees are influenced by certain attributes such as autonomy and self-actualization.

Employees participation in decision-making has the potential to improve these attributes, which allow the workers to have control over their work and hence raising the level of their job satisfaction and commitment.

Theoretical perspectives such as these serve as a lens for understanding how employee involvement in decision making has an impact on their levels of satisfaction and loyalty. Testing these theories in the targeted setting is assumed to reveal the dynamics surrounding the extent to which employees' engagement in decision- making increases their job satisfaction and commitment. Based on the reviewed literature and relevant theories, the following conceptual farmwork has been developed.

Conceptual framework

Figure 1.

Research questions

- What is the degree of employee's engagement in decision making process?
- What is the impact of employee's engagement in decision making process on their job satisfaction.
- To what extent does the employee's engagement in decision making process influence their job commitment?
- How does the faculty increase the employee's engagement in decision making process?

Research Objectives

- Identify the degree of employee's engagement in decision making process.
- Find the influence of employee's engagement in decision making process on their job satisfaction.
- Find the impact of employee's engagement in decision making process on their job commitment.
- Give recommendations of what can be done to increase employee engagement in decision-making to improve their job satisfaction and commitment.

Research Hypotheses

H1: There is a significant relation between employee engagement in decision making and employee satisfaction.

H2: There is a significant relation between employee engagement in decision making and employee commitment.

Setting of the study

The study is conducted in the Faculty of Business at Sohar university. The administrative and academic staff members of the Faculty were the participants. Their roles, responsibilities, and levels of engagement in decision-making processes may differ.

Data collection

In this case, the mixed methods research design has been adopted to identify to what extent and in what way engagement employees into the decision-making process can influence their job satisfaction and commitment. Towards this end, a perception survey containing 5- point Likert Scale has been administered to 47 non-teaching staff at my case University. This survey was intended for gathering quantitative data pertaining to the study being investigated. The instrument was piloted and consisted of three sections besides the demographic part.

The first section consisted of five items and measured participants' perceptions on the extent to which employees are engaged in the decision-making process. The second section comprised five items and measured participants' opinions regarding the extent to which employee engagement in decision-making increases their job satisfaction. The third section consisted of 5 questions and measured respondents' perception on the extent to which their involvement in the decision-making process increases their organizational commitment. In total, there were 15 items rated on a scale from one to five (1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = agree and 5 = strongly agree). It started off with an introductory part explaining what the study was all about. Similarly, I collected qualitative data from three open-ended questions to collect qualitative data that would complement the quantitative findings with key quotes from the same participants.

Data analysis

The quantitative data were analyzed through a perception survey distributed to 47 academic and administrative staff from the Faculty of Business at Sohar University. Out of the 47 surveys administered, 37 were received, resulting in a response rate of 78%, which is considered satisfactory for the purpose of this study. The survey responses were analyzed using frequency analysis, mean, standard deviation and correlational analysis of the Software Package for Social Sciences (SPSS). Thematic analysis was used for the qualitative data to provide more insight on the various factors that may increase employees' job satisfaction and commitment due to their participation in the decision making process.

Results

Correlations

Table1. Correlations

	EEDM	ES	EC
E Pearson Correlation	1	.605**	.473*
Sig. (2-tailed)		.000	.004
N	37	37	36
E Pearson Correlation	.605**	1	.526*
Sig. (2-tailed)	.000		.001
N	37	38	37
E Pearson Correlation	.473**	.526**	1
Sig. (2-tailed)	.004	.001	
N	36	37	37

**. Correlation is significant at the 0.01 level (2-tailed).

From the correlation table, the following results have been identified.

1. Correlation between EEDM and ES: EEDM is Employees engagement in decision -making and ES is Employees -job satisfaction, Pearson Correlation coefficient: 0.605**; Significance (2-tailed): 0.000 (highly significant).
2. Correlation between EEDM and EC: EEDM is Employees engagement in decision -making and ES is Employees commitment, Pearson Correlation coefficient: 0.473**; Significance (2-tailed): 0.004 (significant).

Regression

Table 2. Regression Variables Entered/Removed^a

Model	Variables Entered	Variables Removed	Method
1	EC, ES ^b	.	Enter

a. Dependent Variable: EEDM

b. All requested variables entered.

Model Summary

Model		R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.635a	.403	.367	2.177	.403	11.130	2	33	.000

a. Predictors: (Constant), EC, ES

The regression model Shown in Table2 , has R^2 equal to 0.403, meaning that approximately 40.3% of the variability in EEDM can be explained by ES and EC. The value of adjusted R Square is 0.367. Standard error of estimate is 2.177; it indicates average difference between actual and predicted values of EEDM. Change Statistics shows that the Model's R Square Change is .403 with F Change being 11.130, both significant at $p < 0.001$

Table3. ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
Regression	Regre	105.542	2	52.771	11.130	.000 ^b
Residual	Resid	156.458	33	4.741		
Total	Total	262.000	35			

a. Dependent Variable: EEDM

b. Predictors: (Constant), EC, ES

The ANOVA table shown in table3 indicates that the overall regression model is significant ($F = 11.130$, $p < 0.001$); this suggests that these independent variables taken together significantly affect the dependent variable EEDM.

Coefficients^a

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	4.950	3.117		1.588	.122
ES	.513	.163	.490	3.145	.004
EC	.255	.175	.227	1.455	.155

a. Dependent Variable: EEDM

Intercept is a constant term with a non-significant value of ($P = .122$), while its value equals 4.95. ES variable coefficient stands at .513 indicating that for every one unit increase in ES, there will be an increase in EEDM by .513 units on average statistically significant, $P = .004$. EC coefficient reads .255 showing that for each one-unit increment in EC, there would be a corresponding increase of about .255 units on average which however was not significant ($P = .155$)

Discussion

The first correlation table indicates that there is a strong positive correlation (0.605) between EEDM and ES, which suggests that when EEDM scores go up, so do the scores of ES. That lead to the acceptance of H1. “There is a significant relation between an employee engagement in decision making and employee satisfaction”. The analysis also shows that there is a moderately strong positive correlation (0.473) between EEDM and EC, indicating that higher levels of environmental concerns are associated with greater scores on the EEDM. That will cause the acceptance of H2, “There is a significant relation between an employee engagement in decision making and employee commitment”.

The thematic analysis of the qualitative data revealed that employees at the faculty are satisfied when they are more engaged in the decision-making process. One respondent said *“I feel I am highly valued for my efforts in the organization. The faculty leadership often acknowledges and appreciates our effort and dedication”*. In her answer to the question, “Do you see yourself having a long-term future with this organization?”, the respondent said, *“Certainly, I envision myself in this organization for a long time. I share the university's vision and values; hence, my commitment to its growth and success over the years”*. In their answer to the last interview question, “How involved do you feel in decision-making processes within the organization?”, most of the respondents felt satisfied and happy with the level of engagement in decision making at the faculty. Previous studies have highlighted the same results. Saks and Ashforth's (2000) research indicated that employees who are involved in decision making have better satisfaction and commitment for their jobs. In addition, Lawler (1992) found out that organizations which enhance greater employee participation in decision-making tend to enjoy higher levels of job satisfaction and organizational commitment. Conducting the interviews was very important for an in-depth understanding of the employees' opinions on engagement and how it impacts their job satisfaction and commitment. The results of this research are supported by previous studies (Smith et al., 2023; Chen & Wang, 2022) indicating that employee participation in decision-making greatly influences both job satisfaction and organizational commitment.

Recommendations

The following are strategies that organizations could apply to increase employee engagement in the decision-making process:

1. Build clear communication channels so that employees can share ideas and points of view.

2. Encourage participation: Organizations can use brainstorming, focus groups, and teamwork to encourage the employees to participate more effectively.
3. Develop training programs for employees to learn the tactics of participating in the decision-making process.
4. Discuss and value the employees' suggestions. This will make the employees feel that their suggestions are important.
5. Develop a reward system for employees who participate in the decision making process. This will encourage the other employees to participate more.
6. Give the employees the authority and power to decide.

Acknowledgement

I am acknowledging everyone who assisted me in conducting this research. First and foremost, I am grateful to the participants' willingness to share their points of view; without their diligent participation, I would not have been able to collect the research data. Moreover, I want to express my gratitude to Dr Mohamed Elgeddawy who guided me throughout the research process and provided valuable feedback. I could not have done it without his guidance. His expertise has been crucial in making sure that the study is sound, and its results are valid.

Lastly but not least – families and friends. They were there when no one else was, supporting me even if they didn't understand why or how much time these things take up sometimes... So this one goes out especially loud: THANK YOU SO MUCH EVERYONE!!!

Investigating the Factors Impacting Strategic Thinking in Organizational Decision-Making: The Case of Oman

Karima Khalifa Al-Qartoubi

Modern College of Business and Science, Oman; Sohar University, Oman

Abstract: Purpose- This study aims to explore -from the perspectives of the academic and administrative staff of the Faculty of Business at Sohar University in the Northern part of the Sultanate of Oman - the extent to which the Organizational culture, leadership dynamics, and technological changes influence the strategic thinking in organizational decision making. A pragmatic philosophy underpins the research design of the study. Methodology- A mixed methods case study approach involving a survey administered to academics and administrative staff at the faculty of business at Sohar University was used for data collection. The survey includes twelve Likert Scale statements and open-ended questions aiming at highlighting viable quotes that validate quantitative results. Descriptive statistics and correlation analysis are used for data analysis. Thematic analysis is used to identify the frequent occurrence of words and phrases that reflect the pattern within the qualitative data obtained from open-ended responses. Findings -The findings suggest that Organizational culture, leadership dynamics, and technological changes improve strategic thinking in organizational decision-making within Sohar University. Significantly, although the sample is taken from one case study (Faculty of Business at Sohar University) in a limited geographical area in Oman, specifically in the North of the Sultanate of Oman, which may jeopardize the generalizability of the findings, the study opens a new horizon of research in this area to validate the results in similar locations. Originality/value – The study provides insights, via the quantitative findings and participants' voices, into the intersection between organizational culture, leadership dynamics, and technological changes that shape strategic thinking within educational institutions. It spotlights the changing nature of these factors and their collective impact on strategic thinking within the context of the Faculty of Business at Sohar University.

Keywords: Organizational culture, Leadership Dynamics, Organizational Changes, Strategic Thinking.

Citation: Al-Qartoubi, K.K. (2024). Investigating the Factors Impacting Strategic Thinking in Organizational Decision-Making: The Case of Oman". In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2590-2601), Antalya, Turkiye. ISTES.

Introduction

Strategic thinking plays an essential role in the success and sustainability of an organization in any industry in today's dynamic and competitive environment. The concept of strategic thinking is defined as the attitude of an organizational thinking process that drives smart actions and the will to inspire the entire firm to work towards

achieving a set of strategic goals (Shaik et al., 2020). Strategic thinking can lead to the discovery of fresh and creative tactics that can be applied to modify the competitive game (Steptoe et al., 2011). Another term for strategic thinking is strategic foresight which discusses an organization's goal and vision as well as how an organization gains an advantage by anticipating problems and finding solutions (Martinet, 2010).

Strategic thinking involves having the capacity to foresee, visualize, and adjust to changes while coordinating and aligning organizational resources and competencies with overall strategic objectives. It is expected that organizational strategic leaders comprehend the elements influencing strategic thinking to improve overall effectiveness and make well-informed decisions. This paper describes a study that investigates how organizational culture, leadership dynamics, and technological change impact strategic thinking at the College of Business of Sohar University.

Research Purpose

The purpose of this research is not only to provide practical approaches that assist organizational leaders in making well-informed decisions, taking advantage of prospects, and confronting challenges but also to contain original thoughts that would guide organizational leaders on how they can create a strategic culture and drive lasting success.

Literature Reviews

The most important element when making decisions in an organization is strategic thinking. Strategic thinking in decision-making is influenced by factors such as cognitive biases, decision-making styles, and internal resistance from influential people (Acciarini et al., 2020).

Organizational Culture

Organizational culture influences the growth, establishment, and effectiveness of educational institutions like universities or schools. An in-depth exploration of the concepts of organizational culture has been instrumental in helping many universities and schools to understand better how to improve their management practices as well as developing strategies for change and innovation (Chen et al., 2015).

Strategic thinking depends mainly on organizational culture. Consequently, some leadership styles plus the development of strategic foresight capability among organizations enhance corporate strategic thinking and decision-making capabilities (Alatailat et al., 2019). Considerably, the incorporation of strategic thinking into decision-making has significant effects on organizational outputs which then shape the direction and extent of action taken by an organization (Hameed et al., 2021).

Technological Changes

Strategic thinking is known as the process through which an organization reacts strategically to changes in the market and improving performance as a result of those changes. Technological Changes (TC) is one such modification that the organization must implement to improve its business operation. There are several categories of technology changes, each with unique factors that influence an organization's technology change (Shaik et al., 2020). Research and Development (R&D) stands out as one element that mainly influences an organization's Technology Capacity (TC) and subsequently impacts the strategic thinking process in organizations (Carbonell et al., 2009). Previous studies indicate that investment in R&D generally enhances organizational performance and growth and has a fundamental impact on organization's competitiveness in the market (Wakelin, 2001). Notably, technology changes may be categorized into various types, which have varied sets of determinants for the company's technological transition process. One such feature significantly influencing Business-critical Technological Development Factors and hence corporate strategy-making is Research & Development Intensity (RDI) (Carbonell et al., 2009). Prior research highlights the fact that expenditure on research and development leads to improvements in organizational efficiency and increased growth rates while at the same time having significant implications for a country's ability to compete effectively at the international level. Company productivity growth and long-term performance are positively affected by R&D spending following Wakelin (2001).

Leadership Dynamics

Strategic thinking in organizational decision-making is influenced by various factors, with leadership dynamics playing a crucial role. Research by Jansen et al. (2009) highlights that in dynamic environments, transformational leadership behaviors are particularly influential, encouraging managers at different levels to generate innovative ideas for incremental improvements. This underscores the significance of adaptive leadership styles in response to changing organizational landscapes. Moreover, Klein et al. (2006) emphasize the importance of dynamic delegation in leadership, especially in contexts that benefit from shared, hierarchical, and deindividualized leadership approaches. This suggests that effective leadership in decision-making processes involves understanding the context to optimize delegation strategies and aligning leadership behaviors with the organizational environment. Based on Georgakalou et al., (2023), leadership plays a crucial role in fostering strategic thinking within organizations. Strategic thinkers possess capabilities such as using logical and creative thinking, establishing clear visions, setting goals, and enhancing organizational culture. They focus on future outcomes; they are curious, resourceful, risk-takers, flexible, and creative. Ultimately, strategic thinking enables organizations to identify opportunities and enhance their performance.

Research Question

- To what extent and in what way do organizational Culture, leadership dynamics, and Technological Changes influence strategic thinking in university decision-making?

Research Objectives

- To assess the significance of Organizational Culture in facilitating strategic thinking in university decision-making.
- To analyze the role of Leadership dynamics in shaping strategic Thinking within the university.
- To explore the influence of Technological Changes on Strategic Thinking in university decision-making.

Methodology

This Paper is guided by the pragmatic Paradigm which combines quantitative and qualitative research methods to address the study's questions. This research explores how strategic thinking shapes organizational decision-making at Sohar University. This approach will have academic implications besides providing an empirical basis for university policymaking and practices. The qualitative method used semi-structured interviews to explore different perspectives on factors that influence strategic thinking in academic decisions among the faculty academics and administrative staff.

Theories Related to the Study

Organizational Culture Theory

For decades now, organizational culture has gained more attention because of its potential to improve employee as well as organization's performance. (Fisher & Wilmoth, 2018). Initially, organization's culture is perceived as "something cultivated". Traditionally, culture is perceived as a set of shared beliefs, attitudes, and behaviors that get transmitted from one generation to another (Matsumoto, 1996). Intangible elements such as values, behaviors, and attitudes that assist in decision-making have been given more consideration in recent research on organizational culture. Attitudes and behaviors that support the course of development within organizations through interactions with individuals are what some researchers refer to as organizational cultures (Schein, 2004).

Leadership Dynamics

Transformational Leadership Theory: This theory focuses on how leaders inspire and motivate their followers to achieve common goals. It suggests that transformational leaders impact their followers by creating a sense of purpose, fostering trust and respect, and encouraging innovation and growth.

Characteristics of Transformational leaders: the main features of transformational leaders required in today's dynamic and challenging environment are:

- 1- **Vision:** A visionary leader inspires his followers to understand the past, explore the present and foresee the future.
- 2- **Confidence, enthusiasm, and optimism** are features that impact the organizational performance.
- 3- **Ethics: Transformational** leaders exhibit integrity, honesty, and ethical behavior in their decisions and actions. They lead as a role model by adhering to high moral and ethical standards.

The rationale of the Research

The research aims to explore the main influential factors that shape and impact strategic thinking at Sohar University. By selecting the mixed methods approach, the study pursues a comprehensive understanding of these factors. Moreover, the research provides suggestions that have the potential to improve decision-making, and foster a culture that supports strategic thinking. Investigation of these factors contributes to the university's effectiveness and success. The findings have the prospect of assisting the university in addressing the challenges, capitalizing on opportunities, and developing effective strategies aligned with its goals.

The Context of the Research

The study aims to explore the dynamics of the strategic thinking process in Sohar University decision-making, specifically at the Faculty of Business . The purpose is to understand how this process is influenced by factors such as organizational culture, leadership dynamics, and technological changes. Understanding the context helps to situate the findings, and ensure that the research outcomes are relevant and applicable to the university context.

Research Participants

The participants of the study constitute a diverse of stockholders from the faculty of Business at Sohar University. These stakeholders represent diverse roles within the academic community. Stratified sampling techniques are employed to ensure a balanced presentation from different groups (faculty and administrative staff), and enhance the diversity of perspectives captured from the study. In addition, for qualitative data, interviews were conducted with ten staff to capture their perspectives on the impactful factors of strategic thinking.

Data Collection and Instruments

A mixed methods case study approach is used to investigate the extent to which organizational culture, leadership dynamics, and technological changes influence strategic thinking in the decision-making process of Sohar University. A perception survey comprising 12, 5-point Likert Scale statements has been distributed to 35 academic and administrative staff in the Faculty of Business at Sohar University. The survey aimed to collect quantitative data related to the study under inquiry. The survey was piloted and the used version consisted of three sections.

The first section comprised four items and aimed to assess participant's perceptions of the extent to which organizational culture influences strategic thinking in decision-making within the faculty. The second section includes four statements aimed at measuring participants' perceptions of the extent to which leadership dynamics contribute to increasing strategic thinking in decision-making. The third section of the survey includes four statements to measure participants' perceptions of the extent to which technological changes influence strategic thinking in decision-making within the Faculty of Business at Sohar University. All of the 12 items of the survey consider a 5 – point scale (1= Strongly Agree (SA), 2 = Agree(A), 3 = Neutral (N), 4 =Disagree (D), and 5 = Strongly Disagree (SD).

The survey includes an introductory section that clearly explains the main purpose of the research. On the other hand, qualitative data were collected from three open-ended questions which represented add-on items to the survey questions. The aim was to provide qualitative data that could enrich the quantitative findings with important quotes from the same participants.

Data Analysis

The 40 academic and admin staff at the Faculty of Business in Sohar University went through the perception survey to analyze their quantitative data. In total, 35 surveys were filled out giving a response rate of 90%, which is a satisfactory percentage as it will help confirm the findings of this study. The survey responses underwent frequency analysis, mean, and standard deviation using Software Package for Social Sciences (SPSS). The qualitative data was analyzed using thematic analysis. A profound enquiry into the qualitative responses could therefore generate insights on several aspects that foster strategic thinking within the faculty of business at Sohar University.

The Conceptual Framework of the Study

Figure 1 represents the dependent variable as Strategic thinking in university decision-making making and the independent variables are Organizational Culture, Leadership Dynamics, and Technological Changes.

Research Hypothesis

- H1: Organizational culture is significantly connected with strategic thinking in decision-making within the faculty of Business at Sohar University
- H2: There is a positive relationship between leadership dynamics and strategic thinking within the faculty decision-making.
- H3: Technological Changes have positive impact on strategic thinking and organizational decision-making.

Figure 1.

Results

Introduction

This section outlines the findings obtained from analyzing the data in the context of the research objectives. It focused on the key findings derived from both quantitative and qualitative analysis and addressed the questions and hypotheses of the study.

Quantitative Data Analysis

Table 1. The Study Variable Descriptive Statistics

	Descriptive Statistics		
	Mean	Std. Deviation	N
LD	9.66	4.043	35
OC	9.46	3.193	35
TC	8.46	2.934	35

Table one illustrates the mean and standard deviation of the study variables. The variables included are Leadership Dynamics (LD), Organizational Culture (OC), and Technological Change (TC). The highest mean value among the study variables (9.66) goes for Leadership Dynamics, which indicates that participants perceived leadership dynamics has a strong impact on strategic thinking within the Faculty of Business decision-making. The lowest mean (8.46) goes to Technological Chanes (TC).

Table two explains the correlation between Organizational Culture (OC) and Strategic thinking (ST). The correlation was 0.426 which indicates a moderate positive correlation. This suggests that there is a positive relationship between organizational culture and strategic thinking. In addition, the correlation coefficient

between Leadership Dynamic (LD) and Strategic Thinking (ST) was 0.576 indicating a moderate correlation. This suggests that there is a positive relationship between leadership dynamics and strategic thinking. Finally, the correlation coefficient between Technological Changes (TC) and Strategic Thinking (ST) was 0.671 indicating a strong positive correlation. This proved that there is a strong positive relationship between technological changes and strategic thinking within the decision-making process at the faculty of business.

Table 2. Correlations Analysis

		Correlations			
		LD	OC	TC	ST
LD	Pearson Correlation	1	.550**	.668**	.576**
	Sig. (2-tailed)		.001	.000	.000
	N	35	35	35	35
OC	Pearson Correlation	.550**	1	.611**	.426*
	Sig. (2-tailed)	.001		.000	.011
	N	35	35	35	35
TC	Pearson Correlation	.668**	.611**	1	.671**
	Sig. (2-tailed)	.000	.000		.000
	N	35	35	35	35
ST	Pearson Correlation	.576**	.426*	.671**	1
	Sig. (2-tailed)	.000	.011	.000	
	N	35	35	35	35

** . Correlation is significant at the 0.01 level (2-tailed).

* . Correlation is significant at the 0.05 level (2-tailed).

The Analysis of Qualitative Data

The open-ended questions of the study asked participants to share their perspectives on the main factors that motivate strategic thinking within the Faculty of Business at Sohar University. The outcome of the thematic analysis indicates the existence of a current pattern among participants that spotlights the various factors that contribute to strategic thinking among the faculty. Respondents to the first open question reported that collaborative work environment, reward and recognition, supportive leaders, open communication, access to the faculty resources, diverse labor force, and organizational culture that motivate employee engagement and empowerment are the main factors that motivate faculty to think strategically. These findings are in alignment with AlQershi's (2021) study who noted that features of organizational culture are vital in enhancing the strategic management practices of universities and schools. On the whole, there were suggestions made by the respondents that could help the college of business at Sohar University attain several benefits related to the willingness of staff to change and effectively utilize the resources to achieve long-term sustainability growth in

relation to data driven strategic management tactics. The other open-ended question asked the participants to identify how the Faculty of Business address and overcome the challenges that limit or hinder strategic thinking in decision-making. Participants suggested that lack of collaboration, inadequate support for change management, fear of failure, and employee resistance to change are some challenges in strategic thinking. The Faculty can overcome these barriers and challenges by promoting interdisciplinary collaboration, fostering a continuous learning culture through implementing professional development programs, providing adequate support for change management, and establishing early measurements to address the main challenges in advance.

Both quantitative and qualitative findings of the study point out that the respondents have a positive attitude toward an organizational culture that encourages strategic thinking in decision-making and motivates an innovative and growing environment.

Discussion

The quantitative and qualitative findings indicated that strategic thinking in decision-making within the Faculty of Business is shaped by organizational culture. It follows that future studies should consider how organizational culture affects academic institutions. The Faculty should therefore create an atmosphere that rewards originality, invention, and innovation and inspires strategic thinking. Significantly, the findings are in alignment with Acciarini et al. (2020) which indicates the importance of strategic thinking in today's competitive environment. To do this, faculty members are encouraged to engage in open dialogue and work together. The results showed a positive correlation between leadership dynamics and strategic thinking. This emphasizes the importance of supportive leadership in promoting strategic thought among teaching staff. It is also necessary that faculty members take part in leadership development programs which will help them raise their capacity to think strategically as leaders. These might entail workshops, one-on-one sessions with an expert, or monitoring systems for instance.

The results show a direct relationship between technological shifts and strategic thinking. This demonstrates how technology has revolutionized decision-making in universities. For this reason, the Business Faculty should introduce new technological platforms and merge them with their decision-making systems. The new technologies can foster strategic planning, and facilitate data analysis (Shaik et al., 2020). Moreover, the Faculty have to provide the required training to its members to ensure that all members are familiar with the new tools or platforms.

Conclusion

Thinking strategically involves well-thought-out planning and careful analysis to develop a strategy for your organization's future. Having a strategic mindset adds another valuable level to the process of developing a

strategy. It acknowledges that planning and strategic thinking are two interdependent ways of thinking (Al-Qershi, 2021). The study proved that there is a significant correlation between organizational Culture and Strategic thinking. Organizational culture shapes the values and beliefs that guide individuals and leaders' decision-making and behaviors. Organizational culture promotes open communication and collaboration between management and staff. When employees are engaged and empowered, they will contribute to the strategic planning process. In addition, leadership and strategic thinking are interconnected. It shapes the direction of an organization and influences the extent to which strategic thinking is encouraged and practiced among members. Effective leadership serves as a role model for strategic thinking within the university.

Moreover, Technological changes have a transformative impact on strategic thinking in decision-making within the university. In today's digital world, technological accessibility enhances communication, drives innovation, and manages risk, enables strategic thinkers within organizations to utilize opportunities, capitalize the resources, and achieve sustainable success in today's digital and dynamic business environment. The faculty of business has to provide the needed training to its staff to facilitate the learning process in implementing advanced technologies in strategic thinking.

Recommendations

Based on the study findings, the following recommendations are directed to decision and policy makers and all other relevant stakeholder:

- **Encourage strategic culture:** Academic institutions can motivate strategic thinking by creating an organizational culture that values strategic thinking. This can be implemented through open and transparent communication, empowerment, and collaboration.
- **Investment in leadership development and technology innovation:** universities can enhance their leaders' skills and abilities in strategic thinking through training and development programs.
- **Future studies:** A similar study can be conducted for future research by including additional variables that influence strategic thinking such as organizational structure, decentralization structure, diversity, and hierarchy.
- **Capitalize the sample size:** future studies can conduct the same study but with an increase in the sample size by including more participants across disciplines. In addition, various stakeholders' perceptions can be explored to enhance the generalizability of the findings.

Acknowledgments

I would like to express my deepest gratitude to the people and organizations who helped me complete this research. First of all, I'm deeply thankful to my research supervisor Dr. Mohammed Al Elgeddawy for his continuous support, guidance, and feedback at every step of the study. Additionally, I appreciate my institution (Modern College of Business and Science) for funding this research and allowing me to present the study at the

conference. Moreover, I'm grateful to the participants of the Faculty of Business at Sohar University and their collaboration in the data collection stage. Finally, I would like to thank all my colleagues for their support, and for giving advice when I need.

The Impact of Transformational Leadership on Employee Engagement, Productivity, and Motivation: The Case of Oman

Karima Al-Qartooqi

Modern College of Business and Science, Oman; Sohar University

Abstract: This study aims to explore- from the perspectives of academic and administrative staff of the Faculty of Business at Sohar University in the Northern part of the Sultanate of Oman- the extent to which transformational leadership influences employee motivation, productivity, and engagement. In addition, the study reports on the correlation between employee motivation, productivity, and engagement. A pragmatic philosophy underpins the research design of the study. Methodology- A mixed methods case study approach involving surveys administered to the academic and administrative staff of the Faculty of Business at Sohar University was used for data collection. The survey includes twelve Likert Scale statements and open-ended questions aiming at highlighting viable quotes that validate quantitative results. Descriptive statistics and correlation analysis are used for data analysis. Thematic analysis is used to identify the frequent occurrence of words and phrases that reflect the pattern within the qualitative data obtained from open-ended responses. Findings -The findings suggest that employee's motivation, productivity, and engagement are influenced by transformational leadership. The results also reveal the importance of building a culture of open communication and employee empowerment within the Faculty of Business. Although the sample is taken from one College at Sohar University which may jeopardize the generalizability of the findings, the study opens a new horizon of research in this area to validate the results in similar locations. Originality/value- The study provides insights, via the quantitative findings and participant's voice, into the premise of transformational leadership and its impact on employee motivation, productivity, and engagement within the context of the Faculty of Business at the Sohar University in the Sultanate of Oman. It spotlights the significance of adopting the core value of Transformational leadership in shaping organizational culture and improving employee outcomes.

Keywords: Transformational Leadership, Employee Motivation, Productivity, Engagement.

Citation: Al-Qartoubi, K., (2024). The Impact of Transformational Leadership on Employee Motivation, Productivity, and Engagement. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2602-2612), Antalya, Turkiye. ISTES.

Introduction

Leadership is the ability to develop business operational strategies that allow employees to carry them out the required tasks despite the existence of challenging obstacles (Hersey & Blanchard ,1982). It involves the ability to let employees believe that they have the required knowledge, skills and attitudes to achieve shared goals and targeted organizational outcomes (Murali & Aggarwal, 2020). Conversely, transformational

leadership (TL) is a methodological and data-driven leadership style that equips employees with the required knowledge, skills, and attributes that allow them to achieve their potential and increase the productivity of their organization. The practices of TL represent the behaviors and business operations that visionary transformational leaders adopt to enhance the level of employee satisfaction, productivity, motivation, and commitment. Transformative leaders who have a clear and futuristic vision inspire their followers to be productive, creative, and innovative through guiding, coaching, and promoting a collaborative culture of care that respond to the needs of the global market and the expectations of stakeholders (Murali & Aggarwal, 2020). Considerably, transformational leaders' behaviors have a significant impact on employee retention and loyalty. When leaders promote an organizational culture that motivates trust, empowerment, and open communication, they enhance employees' passion and commitment to bring about sustainable organizational success for all stakeholders. Adopting and adapting productive transformational leadership practices improves employees' sense of responsibility and organizational loyalty (Ratnaningtyas et al., 2021). In other words, transformational and visionary leaders are presumed to have the ability to shape employees' awareness of the obstacles they may face in the future and what needs to be done to address them (Mozammel & Haan, 2016). International research documents the positive impact of transformational leadership on employees' engagement, productivity and motivation. The following section explores this relationship in some details.

TL and Employee Engagement

Research shows that optimizing the effectiveness of employee's positions within an organization requires them to be engaged. Involving employees in their workplace leads them to be fully engaged mentally, physically, and emotionally. The physical component of employee engagement is defined as the effort that employees contribute to carry out the tasks that have been delegated to them. Exploring employees' perceptions and level of satisfaction regarding the organizational behavior is essential to the cognitive component of employee engagement (Kahn 1990). Three aspects of employee engagement were assessed in a study conducted in 2012 by Gowri and Mariammal: commitment, job satisfaction, and salary and benefits. The study indicates that all three independent variables had a significant relationship with employee engagement. The study pointed out that companies ought to give employee engagement top priority.

TL and Employee Productivity

The literature indicates that transformational leadership plays an important role in advancing employees' productivity. Sayan and Sürücü (2024) explored how transformational leadership affects employee productivity in teaching hospitals in Iran. The findings indicate that hospitals adopting higher transformations in management thinking were likely to experience high levels of workers' satisfaction as well as increased organizational overall productivity. When management lives up to the expectations of the workforce, output will rise. Motivation serves as a driving force for others' actions. The more motivated and self-assured an employee is in his or her work, the more productively he will perform (Ratnaningtyas et al., 2021). Work motivation plays a significant role in advancing organizational productivity (Hasibuan, 2019). Also, Sayan & Sürücü (2024) investigated how

transformational leadership in the courier services sector affects logistics performance and how employee productivity functions as a moderator in this relationship. The results suggest that the productivity of employees plays a moderating role between logistics performance and transformational leadership.

TL and Employee Motivation

Recent research points out that employee motivation plays instrumental role in increasing the productivity of the organization. Arman et al. (2019) assessed the impact of motivation and transformational leadership on the outcome of the State University of Padang, particularly in the economics department. A quantitative approach was adopted in this study and 47 participants filled the survey. The findings proved that employee performance was directly affected by work motivation and transformational leadership. Also, it was found that work motivation and transformational leadership style were strongly associated with increased levels of employee productivity. Similarly, Ibarra (2020) explored how transformational leadership affects performance and motivation among teachers working for public schools. Findings indicate that transformational leaders have complex effects on motivation and performance.

Research Gap and Purpose

Based on the reviewed experimental studies, it is evident that the impact of transformational leadership on employees' engagement, productivity and motivation has not been explored within the context of Oman, despite its practical and theoretical implications. This study addresses this gap in our understanding of people attitudes towards the impact of TL on their level of engagement, productivity, and motivation. Identifying this gap in the literature makes it compelling that more research is needed in this area. This study aims to explore the impact of transformational leadership on employee motivation, productivity, and engagement from the perspectives of the academic and administrative staff of the Faculty of Business at Sohar University in the Northern part of the Sultanate of Oman. The following is an exploration of the theories that underpin the study.

Transformational Leadership Theory

This theory focuses on how leaders inspire and motivate their followers to achieve common goals. It suggests that transformational leaders impact their followers by creating a sense of purpose, fostering trust and respect, and encouraging innovation and growth. Transformational leadership has some characteristics such as inspiration, charisma, and personalized consideration.

Motivation Theories

In the motivation field, there are many theories that guide our understand of how transformational leadership influences employee motivation. These theories are listed as the following:

- 1- **Maslow's Hierarchy of Needs:** This theory explains that individuals have different levels of needs, starting from the lower level of needs (psychological needs) to the higher level of needs (self-actualization). Transformational leaders address a higher level of need to enhance motivation.
- 2- **Herzberg's Two-Factors Theory:** Herzberg indicates that motivators such as accountability and recognition enhance motivation and job satisfaction, while others, referred to as hygiene factors like pay and working conditions prevent dissatisfaction. Transformational leadership may focus on providing incentives that enhance their employees' motivation to perform better at work. In addition to Expectancy Theory, Social Exchange Theory, and Self Determination Theory (SDT). Based on the literature review a short review of the above-mentioned theories, the following conceptual framework has been developed to guide the study.

The Conceptual Framework of the Study

Figure1 illustrates the study variables which are Transformational leadership (Independent Variable), while employee motivation, productivity, and engagement are the dependent variables.

The Rationale of the Research

This research aimed to explore the influence of transformational leadership on employee motivation, productivity, and engagement in Sohar University's Faculty of Business. By implementing mixed methods, the study pursues a comprehensive understanding of transformative leader impact. The aim is to look into a wide

range of aspects related to how leaders' behaviors in this context affect employees' performance as well as the overall organizational growth.

Research Question

- 1- To what extent and in what way does Transformational Leadership impact Employee Motivation, Productivity, and Engagement?

Research Objectives

- 1- To examine the relationship between transformational leadership and employee motivation.
- 2- To investigate the impact of transformational leadership on employee productivity.
- 3- To examine the relationship between transformational leadership and employee engagement.

Research Hypotheses

This study consists of three main hypotheses as the following:

- 1- H1: Transformational leadership has a positive relationship on employee motivation.
- 2- H2: Transformation leadership has a significant impact on employee productivity.
- 3- H3: Transformational leadership has a direct influence on employee engagement.

Methodology

Pragmatism guides the research process of this study. A mixed method design that includes quantitative and qualitative data is used to address the research questions. The study aims to explore how transformational leadership affects employee motivation, productivity, and engagement in the Faculty of Business at Sohar University. The qualitative method was applied by using semi-structured interviews to explore the various perspectives of academic and admin staff in the faculty.

Research Context

The study aims to explore the transformational impact on the motivation, productivity, and, engagement of employees at the Faculty of Business at Sohar University. Understanding the context helps to situate the findings and ensure that the research outcomes are relevant and applicable to the university context.

Participants

The study consists of diverse stockholders from the faculty of Business within Sohar University. These stakeholders represent diverse roles within the academic community. Stratified sampling techniques are

employed to ensure a balanced representation from different groups and enhance the diversity of perspectives captured from the study. In addition, for qualitative data; interviews were conducted with ten key stakeholders to capture their perspectives regarding the impact of TL on their engagement, productivity and motivation.

Data Collection and Instrument

A mixed methods case study approach is used to explore the extent to which transformational leadership influences employee motivation, productivity, and engagement within the Faculty of Business at Sohar University, a perception survey comprising 16, 5- points Likert Scale statements has been distributed to 45 academic and admin staff at the Faculty of Business in Sohar University. The survey aimed to collect quantitative data related to the study under inquiry. The survey was piloted, and the used version consisted of three sections.

The first section comprised four items and aimed to assess participants' perceptions of the extent to which employee motivation is affected by transformational leadership within the Faculty of Business. The second section includes four items aimed at measuring participants' perceptions of the extent to which employee productivity is affected by transformational leadership. The third section of the survey includes four items to measure participants' perceptions of the extent to which employee engagement is affected by transformational leadership within the Faculty of Business at Sohar University. Finally, the fourth section includes four items that aim to measure participants' perceptions of the extent to which transformational leadership is useful to the faculty of Business. All of the 16 items of the survey consider a 5 – point scale (1= Strongly Agree (SA), 2 = Agree(A), 3 = Neutral (N), 4 =Disagree (D), and 5 = Strongly Disagree (SD).

The survey includes an introductory section that clearly explains the purpose of the research. Qualitative data were gathered from three open-ended questions which represented add-on items to the survey questions. The aim was to provide qualitative data that could enrich the quantitative findings with important quotes from the same participants.

Data Analysis

The quantitative data were analyzed through a perception survey distributed to 50 academic and administrative staff from the Faculty of Business at Sohar University. Out of the 50 surveys administered, 45 were received, resulting in a response rate of 90%, which is considered satisfactory and validates the study's results. The survey responses were analyzed using frequency analysis, mean, standard deviation, and correlational analysis with the assistance of SPSS software.

The qualitative data were analyzed using thematic analysis. It is believed that a thorough examination of the qualitative responses will provide valuable insights into transformational leadership practices that can enhance employee motivation, productivity, and engagement within the Faculty of Business.

Results

Descriptive Analysis

Table 1 illustrates the mean and Standard Deviation of the study variables. The highest mean (7.50) goes to (TL) transformational leadership which demonstrates the significant influence on employee outcomes and performance among the faculty members. The lowest mean (7.04) refers to (ME) employee motivation.

Table 1. Statistics

		EM	EP	EE	TL
N	Valid	45	45	45	42
	Missing	0	0	0	3
Mean		7.04	7.49	7.40	7.50
Std. Deviation		1.492	1.727	1.698	1.656

(EM) Employee Motivation, (EP) Employee Productivity, (EE) Employee Engagement, (TL) Transformational Leadership

Correlation Analysis

Table 2. Correlations

		EM	EP	EE	TL
EM	Pearson Correlation	1	.900**	.729**	.953**
	Sig. (2-tailed)		.000	.000	.000
	N	45	45	45	42
EP	Pearson Correlation	.900**	1	.699**	.937**
	Sig. (2-tailed)	.000		.000	.000
	N	45	45	45	42
EE	Pearson Correlation	.729**	.699**	1	.879**
	Sig. (2-tailed)	.000	.000		.000
	N	45	45	45	42
TL	Pearson Correlation	.953**	.937**	.879**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	42	42	42	42

**, Correlation is significant at the 0.01 level (2-tailed).

Table 2 explains the correlation coefficient between the study variables: (EM) Employee Motivation, (EP) Employee Productivity, (EE) Employee Engagement, and (TL) Transformational Leader. The findings indicate

the following:

- Employee motivation (EM) and employee productivity (EP) have a strong positive relationship between them (Pearson correlation coefficient = 0.900, $p < 0.01$). This signifies that when the motivation of an employee increases, their productivity also tends to rise.
- Employee motivation (EM) has a significant relationship with transformational leadership (TL) (0.953, $p < 0.01$) and there is a positive relation between worker motivation and worker participation in the company activities (0.729, $p < 0.01$).
- There is a positive correlation between engagement of employees (EE) and transactional leadership (TL). (0.879, $p < 0.01$).
- Transformational leadership style correlates positively with employee productivity levels in organizations. (Pearson correlation coefficient = 0.937, $p < 0.01$).

The results indicate the acceptance of the bellow hypotheses:

Table 3. Hypotheses Status

Hypothesis	Status
H1: Transformational leadership has a positive relationship with employee motivation	Accepted
H2: transformational leadership has a significant impact on employee productivity.	Accepted
H3: Transformational leadership has a direct influence on employee engagement.	Accepted

Qualitative Data Analysis

In the section of the open-ended research questions, participants were asked to share their perspectives on the impact of transformational leadership on employee motivation, productivity, and engagement. The outcome of the thematic analysis indicates the existence of a recurrent pattern that spotlights the significant role played by transformational leadership and how it affects the faculty and staff outcomes. Respondents to the first open question were asked to identify the main reasons causing an increase in employee motivation, productivity, and engagement. The participants reported that organizational culture, leadership, reward and recognition, fairness and equity, communication, and opportunity for growth and development are the main reasons that affect employee motivation, productivity, and engagement.

The second open-ended question asked participants to identify the main benefits of having a transformational leader in the faculty. Taken together, the respondents suggested some benefits such as increased innovation and creativity, enhanced employee motivation and engagement, collaboration, increased strategic thinking and planning, inspiration and vision, and adaptability and change management. A notable thematic pattern was identified from the analysis of the second open-ended question.

The third open-ended question asked the participants to identify how the Faculty of Business addresses and overcomes the challenges that limit or hinder transformational leadership practices within the faculty. Participants suggested implementing leadership development programs, enhancing communication and promoting transparency, empowering the faculty members, addressing resistance to change, measuring and monitoring progress, and fostering a work culture that values transformational leadership practices within the faculty. All in all, both the quantitative and qualitative findings of the study point out that the respondents have a positive attitude toward an organizational culture that encourages transformational leadership for improving employee performance and outcomes.

Discussion

Quantitative and qualitative findings indicated the significant positive influence of transformational leadership on employee motivation, productivity, and engagement. It follows that future studies should consider how this leadership style affects academic institutions. The college must foster transformational leadership practices among its members. This can be done through implementing leadership development programs for all stakeholders. In addition, the college has to promote open and transparent communication to enhance leadership effectiveness. The results showed a positive correlation between transformational leadership and employee motivation. This illustrates that employees tend to be more motivated to perform their tasks effectively as they perceive their leaders as transformational. Transformational leaders inspire, empower, and value their followers to be productive, and innovated which helps organizational success. The findings are in alignment with Ratnaningtyas et al. (2021) which indicated that work motivation and transformational leadership had a substantial positive impact on employee engagement.

The findings also show a positive connection between transformational leaders and employee engagement from the perceptions of faculty and staff. For this reason, the college has to provide employees with opportunities for promoting work-life balance, and fostering a collaborative work environment. On one hand, the research findings conflict with Mozammel & Haan (2016) which studied the relationship between transformational leadership and employee engagement among personnel in the banking sector in some cities in Bangladesh. The outcomes of this study revealed that in a work environment, applying a transformational leadership style does not assure that the employees will be fully engaged.

Recommendations

- Organizations have to invest in training programs that enhance the leaders' skills and ability to be more effective.
- Academic institutions have to promote a culture that motivates trust, empowerment, and recognition, and provides employee development opportunities, and transparent communication. These attributes can enhance employee motivation, productivity, and engagement.

- Future researchers can conduct similar studies in different contexts and compare transformational leadership with other leadership styles in influencing employee outcomes.
- Different factors such as organizational culture, job design, and individual differences can be considered and analyzed for further studies.
- And, establish a mechanism or key performance indicators (KPIs) to continuously assess and monitor the influence of transformational leaders and address challenges that affect employee performance.

Acknowledgments

I would like to express my deepest gratitude to the people and organizations who helped me complete this research. First of all, I'm deeply thankful to my research supervisor Dr. Mohammed Al Elgeddawy for his continuous support, guidance, and feedback at every step of the study. Additionally, I'm appreciating my institution (Modern College of Business and Science) for funding this research and providing me with an opportunity to present the study at the conference. Moreover, I'm grateful to the participants of the Faculty of Business at Sohar University and their collaboration in the data collection stage. Finally, I would like to thank all my colleagues for their support, and for giving advice when I need.

Effects of Digital Transformation on Employee Mindsets in Oman's Higher Education Sector

Mahfoodh Al Sabbagh

Modern College of Business and Science, Sultanate of Oman

Abstract Purpose: This study investigates the impact of digital transformation on employee mindsets within Oman's higher education sector. It examines how employees perceive and adapt to integrating digital technologies in teaching, learning, and administrative processes. The research aims to identify factors influencing employee receptiveness and preparedness for this digital shift by understanding these mindsets. The study will explore the challenges and opportunities associated with digital transformation from an employee perspective. This will provide valuable insights for developing effective strategies to promote positive digital mindsets, build capacity, and achieve a smooth digital transformation journey within Oman's higher education institutions. Design/ methodology /approach: This study adheres to the positivist research paradigm. Positivism emphasizes the objective nature of reality, where knowledge is acquired through measurable observations and analysed using statistical methods. This approach aligns with the quantitative research methods employed in this study. A survey instrument was developed and administered to 40 employees in one of the higher institutions in Oman. This approach allows for the collection and analysis of data to identify relationships between variables—a random sampling method employed to ensure adequate representation of the targeted population. Findings: The findings indicate a relationship between digital skills, change attitudes, and perceived organizational support, which the identified relationship contributes to the shaping of employees' mindsets toward digital transformation. The findings reveal a significant effect of digital transformation on developing employees' digital mindsets in Oman's higher education sector. Although the sample is taken from one case study in a limited geographical area in Oman, which may jeopardize the generalizability of the finding, the study opens a new research horizon to validate the results in similar locations. Originality/value: This study offers insights and recommendations for changing employee mindsets in Omani higher education institutions.

Keywords: Employee Mindsets, Digital Transformation, Higher Education Institutes.

Introduction

Digital transformation in higher education is a global phenomenon, reshaping educational landscapes by integrating advanced technologies that foster innovative and student-centered approaches. Adopting digital tools

in education enhances job satisfaction and requires educators to adapt to new skills and methodologies (Berman & Marshall, 2022; Jones & Smith, 2021). This trend is increasingly prevalent in the Middle East, where economic diversification and a youthful demographic drive the integration of e-learning platforms, necessitating shifts in pedagogical and administrative strategies (Al-Haddad & Kotnour, 2020; Khan et al., 2020).

In the Gulf Cooperation Council (GCC) region, significant investments are being made to enhance digital infrastructures, aligning with broader national goals to integrate technology across different sectors, notably education. Countries, such as Saudi Arabia, UAE, and Qatar are at the forefront of pioneering projects to develop smart campuses and employee artificial intelligence. These advancements are playing a pivotal role in shaping how employees engage with their work and improve overall operational efficiency (Al-Muftah & Weerakkody, 2019; Nasser & Abouchedd, 2021)

Focusing on Oman, the higher education sector is actively undergoing digital transformation as part of the government's strategy to foster a knowledge-based economy. Initiatives such as virtual classrooms and digital administrative processes alter educational institutions' service delivery and employee perceptions. However, traditional mindsets among some staff pose challenges, necessitating targeted change management strategies to enhance digital acceptance (Al-Siyabi & McLean, 2021; Balushi & Sohal, 2022).

Statement of The Research Problem

Digital transformation is reshaping the landscape of higher education globally, compelling institutions to reconsider not just their operational and educational frameworks but also the readiness and attitudes of their employees toward these changes. In Oman's higher education sector, successfully integrating new technologies depends on the interplay between digital literacy, technology adoption and use, and organizational support and employee mindset (Al-Siyabi & McLean, 2021). Although there have been continued steps in improving digital infrastructure and capabilities, there remains a notable gap between the implementation of digital technologies and the level of adoption among faculty and administrative staff. Jones and Smith (2021) highlighted that the degree of digital literacy significantly influences how effectively technology is adopted within higher educational environments.

Moreover, (Berman Marshall 2022) highlighted that the type of organizational support and the degree to which support is provided play a significant role in shaping the way in which organizational systems are perceived and acted upon by the employees at the forefront of digital transformation. On the other hand, Balushi Sohal 2022 concentrated on how well employees' digital literacy correlates with their willingness to embrace new technologies; explore the adequacy of organizational support that is provided; and suggest ways by which we could enhance the integration of technological endeavors with employee engagement in universities across the human higher education and institutional space.

Research Study Objectives

Aim of this research is to investigate how digital transformation affect employees in the public sector (Staff employees) in higher education in Oman through measure their digital literacy, the evaluate how digital technologies have been used and analyze the current support system in place along with employees' opinion about this digital change.

Significance of the Study

This study presents that view of digital transformation and its influence on the minds of staff members at a specific higher education institution in Oman. It explores dimensions such as digital literacy level, technology adoption, organization support mechanisms, and employee attitude toward digital changes. The research highlights such transformation's practical and strategic benefits and is expected to yield valuable insights for developing tailored educational programs. The study contributes to academic literature and equips institutional leaders with evidence-based strategies to enhance technology integration and strengthen support frameworks. The goal is to improve the efficiency of educational and administrative practices and cultivate an organizational culture that is receptive to digital innovation within Oman's higher education institutions.

Literature Review

Digital Transformation

In higher education, transformation signifies the thorough adoption of digital technologies throughout multiple facets of institutional operations. These include educational methodologies, administrative frameworks, and day-to-day procedures. Berman and Marshall (2022) characterize digital transformation as an extensive modification of organizational and business process competencies and structure aiming to exclude the potential and opportunities presented by digital technologies in the medical and strategies fashion. The primary objective of this holistic integration is to increase operational efficiency enhance engagement among stakeholders and promote innovation within academic environments.

Employee Mindset

In the wake of digital transformation, employee mindset pertains to university staff's attitudes, behaviors, and overall receptiveness towards digital technologies and changes. Jones & Smith (2021) describe employee mindset as individuals' cognitive and behavioral readiness to embrace technological changes, directly influencing how effectively these technologies are adopted and utilized in their daily roles. The mindset can range from enthusiastic adoption and advocacy for digital tools to resistance and skepticism, depending on various factors, including digital literacy, perceived benefits, and organizational support.

Digital Literacy

In today's competitive technological business environment, digital literacy is important for accelerating digital transformation. It is about more than just how to operate gadgets. It is about possessing the vital abilities to comprehend, utilize, and generate information through digital means. Al Siyabi and Mclean(2021) describe digital literacy as the blend of abilities, knowledge, and attitudes necessary to adjust, control, integrate, and communicate via digital tools. From a pedagogical standpoint, educators and administrators must develop these media skills to navigate new digital systems and effectively teach technological tools.

Technology Adoption and Use

Technology adoption refers to integrating digital tools and systems into the educational ecosystem. As Khan and colleagues (2020) explained, this adoption helps education professionals by enabling them to use new technologies and make them part of their work, thus enhancing learning and administrative operations. Assessing how technology is adopted and used is critical to measuring the success of digital transformation efforts, which are fundamental for education institutions to achieve their strategic objectives.

Organizational Support

Organizational support relates to the extent of support an organization puts in place to support its staff in digital transitions. This can take many forms: training programs, technical advice, and supply of tools to facilitate the transition, such as providing relevant equipment or software to make the process easier. Balushi and Sohel (2022) found that this type of support is a strong influential factor in the climate when digital changes occur and has a strong positive effect on staff attitudes towards new technology. The implication here is that the extent of the organizational support can usually impact the speed and effectiveness of the use of new technology.

Overview of Previous Studies

In higher education, for instance, digitally enabled reforms can involve a profound change not only in the provision (i.e., course design and content) and delivery (i.e., teaching and learning) but also in the organizational streamlining of the administrative apparatus. This is generally acknowledged, but scholarly research on how it affects employee attitudes and institutional behavior produces varied findings, as illustrated by their scores. The acceptance of digital technology in the academic ecosystem is complex and nuanced in many ways.

Employee Mindset and Digital Transformation

Whether digital transformation can be delivered effectively in higher education depends on the perspective adopted. Jone and Smith (2021) observed that individuals with a positive attitude towards digital tools are more inclined to embrace, rather than deride, them and are more likely to fully exploit them. Conversely, Berman and

Marshall (2022) have described employees' resistance to adopting digital technologies, often due to fear of being left behind or perhaps that their jobs will change in unexpected or uncontrollable ways – in other words, that they are and will be obsolete. As highlighted by these observations, both a strong focus on digital literacy and a robust change management approach that stresses the importance of support and a clear communication line regarding the benefits and changes brought about by digital transformation are essential to install and maintain the right mindset with employees.

Digital Literacy as a Facilitator of Change

There is no doubt that critical digital literacy is required to facilitate digital transformation. Al-Siyabi and McLean (2021) highlighted that the staff's proficiency and digital skills could undoubtedly ease the shift to new technologies and help better integrate these new tools into everyday operations. However, Khan et al. (2020) mentioned that the deficiency in digital literacy could create significant barriers, leading to lower staff satisfaction and poor use of digital tools. Therefore, to address these challenges, institutions should provide wide digital literacy training programs to address the variation in staff proficiency and hence promote consistent and effective use of the technology.

Organizational Support Structures

Organizational support is particularly essential in enhancing the digital transformation of higher education institutions. Balushi and Sohal (2022) highlighted that 'the last and most crucial support framework provided by Aruba is concerning training program and resources' and that resistance to change and adaptability of employees hinges on how well organizational support is provided. These findings were corroborated by the arguments of Berman and Marshall (2022) that employees are likely to adopt and promote new technologies when they believe that there is significant organizational support. However, there are disparities between institutions on the level of support provided to staff. This has led to a gap in the transformational efforts across higher education institutions. Increasingly, it has become essential for organizations to provide similar organizational support for staff to assist them to in managing these changes.

Al-Haddad & Kotnour (2020) highlights how organizational change theories can help higher education embed digital technologies. These studies reveal that although digital tools can transform higher education teaching and administrative processes, their use necessitates changes in staff attitudes and behaviors towards new technologies, a shift that often provokes resistance to change in terms of job insecurity and digital literacy concerns.

In addition, research has investigated how digital literacy and organizational support can contribute to the uptake of technology. Berman and Marshall (2022) found that a dearth of digital literacy might inhibit the success of technology but may also lead to an overall diminishment of the perceived value in the digital transformation 'work effort.' Balushi and Sohal (2022) also measured organizational support, defined as training

and resource allocation, which contributed to mitigating pushback to technology alongside increasing employees' flexibility.

Historically, studies that evaluated utilization tended to emphasize skepticism and resistance; however, more recent studies highlight growing awareness (and acceptance) of digital tools' benefits. Although research shows that people remain sceptical about the utility of digital tools, critics have documented a growing shift in attitudes as digital literacy improves and organizational structures become more efficient. Nasser and Abouchedid (2021) described a generational divide still evident in academic institutions, illustrating that these challenges are ongoing despite improvements being made.

Identification of gaps in the existing literature

Despite the global trend in digital transformation research, there's a noticeable lack of research specific to the GCC region and an even smaller subset of those that focus on Oman. This specific research gap calls for targeted research that can offer insights into the barriers and opportunities for digital transformation in GCC countries, particularly in Oman. Though Al-Siyabi and McLean (2021) have begun this process, we still need more targeted research that can explore Oman's unique cultural, economic and educational landscape, and how it is impacting this country's digital transformation journey and its outcomes. Though we acknowledge organisational support as an integral factor for digital survival, we still need research that can explore varying degrees of support within the institutions of Oman. While earlier research had mentioned its importance, its impact on digital transformation success has not been explored. Jones and Smith (2021) also highlighted the importance of employing quantitative research to understand better how different levels of digital literacy can affect technology adoption rates to inform better strategies for digital transformation initiatives.

Moreover, Balushi and Sohal (2022) suggest that quantitative measures could help improve our understanding of the impact of various kinds of institutional supports on the pace of digital tool adoption. Capturing the impact of different types of supports more precisely could allow institutions to allocate the right resources to meet faculty's needs more accurately, which in turn could help ensure more efficient and effective digital adoption. Moreover, there's clearly a need for more data-based studies that can provide tangible insights into the coverage of technology adoption, the factors that facilitate or hinder its progress, and the direct effects on learning outcomes and/or administrative efficiency.

Theoretical Framework

The study's theoretical framework is centred on the digital transformation of higher education in Oman. It is based on two important theocratic models, the Technology Acceptance Model (TAM) and Organizational Change Theory, to understand the impact and nature of the adoptions taking place in academic institutions.

Technology Acceptance Model (TAM)

Davis introduced the ATM model in 1898. This model is one of the prominent lenses through which we understand the factors that influence the adoption and use of technology. This approach is centred around the technology's perceived ease of use and usefulness.

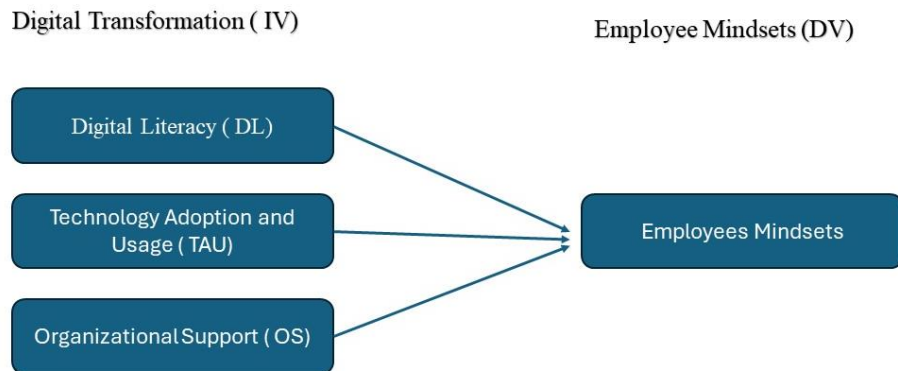

Due to this approach's wide application to various fields and technologies, researchers have used this model to investigate the acceptance of technology in different settings, including the education field. In this research, the (AMT) model aims to understand how people's perceptions of technology affect their acceptance among administrative staff and academics in higher education environments. As shown empirically, there are training programs designed to ease the perceived ease of use and perceived usefulness of the digital platforms and impact adoption rate (Jone & Smith, 2021)

Organizational Change Theory

Organisational Change Theory (OCT), as defined by Kotter's 8-Step Process for Leading Change, is an organizational strategic model that makes change more likely to happen in the organization; for example, ensuring that people feel or see the urgency, building a guiding coalition, developing a vision and strategy, and institutionalizing changes so that more change can happen. While this theoretical perspective can be applied to digital transformation in higher education, the Technology Acceptance Model seems limited in scope as it does not include macro factors such as organizational and societal implications that can significantly increase technology adoptions and uses (Bagozzi, 2007). This is why TAM has been supplemented or integrated into other models, as people's perceptions and the influence of culture, leadership, and peers have become significant determinants related to technology adoption in Oman's higher education sector (Balushi & Sohal, 2022).

To better understand the factors affecting digital transformation in higher education, the current study has integrated the Technology Acceptance Model (TAM), based on the theory of reasoned action and the Theory of Planned Behavior, and Organizational Change Theory. According to TAM, perceived usefulness and perceived ease of use are the two critical factors influencing their attitude toward using technology (Davis, 1989; Jones & Smith, 2021). Organizational Change Theory, on the other hand, provides ideas on changing strategy for managing planned systemic change, which involves the structural adjustment of an organization to integrate technology (Kotter, 1996; Balushi & Sohal, 2022). While Kotter's Model has been widely applied in multiple fields, it is considered too authoritarian and simplistic as it lacks flexibility and does not consider the unpredictability of the digital domain. The existing theoretical background would be proposed to enable an integrated approach aligning individual and organized digital transformation processes.

The proposed conceptual framework is illustrated in the figure below.

Research Question

- To what extent does digital transformation influence employees' mindsets in higher education institutions in Oman?

Research Hypothesis

- H1:** Digital literacy significantly influences employees' mindsets toward adopting and adapting to new technologies in Oman's HEIs.
- H2:** Technology adoption and use significantly influences employees' mindsets toward adopting and adapting to new technologies in Oman's HEIs
- H3:** Organizational support significantly influences employees' mindsets toward adopting and adapting to new technologies in Oman's HEIs

Research Methodology

Description of the research design

A quantitative research design is adopted in this study titled The Effect of Digital Transformation on Employee Mindset in Oman's Higher Education. This approach allows collecting and analyzing numerical data to assess how digital transformation affects employee mindset.

Research Paradigm

The research operates under a positivist paradigm, which is suitable for quantitative research as it assumes that reality can be objectively measured and analyzed using statistical methods. This paradigm supports the study's hypothesis-testing approach, seeking to establish transparent, causal relationships between the degree of digital transformation and changes in employee mindsets.

Research Design: The study utilizes a cross-sectional survey design. Data will be collected through structured questionnaires distributed to a large sample of employees across various higher education institutions in Oman. These questionnaires will include scaled items to measure respondents' digital literacy, perceptions of organizational support, and attitudes toward digital transformation.

Sampling Method: Random sampling ensures that the sample is representative of Oman's higher education sector, including public and private universities and colleges. This enhances the ability to generalize the results across the whole sector.

Data Collection: Data will be collected through online surveys to ensure adequate participation and response rates. The survey will include four sections: Digital Literacy, Technology Adoption and Use, Organisational Support, and Employee Mindset, and Likert-scale questions to assess the constructs of interest mentioned in the hypotheses quantitatively. An online questionnaire collected the data as it is regarded as the most cost-effective and convenient way to collect data. Additionally, the questionnaire was distributed to a sample of 40 participants to check the questions' clarity, validity, and reliability, as Bryman (2016) suggested.

Data Analysis: Statistical analyses will be conducted using software like SPSS. Descriptive statistics will provide an overview of the data distribution. This will determine the strength and nature of the relationships between digital transformation and employee mindsets.

This quantitative approach offers empirical results about the impact of digital transformations by quantifying how variations in digital practices or supports relate to shifts in employee attitudes in education.

Scope of the research study

It is important to recognize that this study is limited in scope to educational institutes at the higher education level in Oman, which may affect the generalisability of the results. Another limiting factor may be the duration of the study, which may hinder the depth of analysis and the longitudinal understanding of the patterns and trends observed in online learning.

Data Collection

Research Measurement and Instruments

Therefore, it is highly important to measure this impact with the help of a measuring instrument to explore and assess the key dimensions related to digital transformation's impact in Oman's higher education. Those dimensions include digital literacy, technology adoption and usage, organization support measures, and employee mindsets. Measurement is critical in this study because it will ensure the results are reliable, valid, and generalizable to the population. Therefore, in order to assess the impact of digital transformation in higher education in Oman, four measurement instruments will be used.

These instruments are essential for pinpointing the effect of digital transformation on employees' attitudes and behaviors: The Digital Literacy Scale made of items employs a 5-point Likert scale of the level of digital literacy using digital tools in terms of knowledge and skills (1 = strongly disagree; 2 = disagree; 3 = neutral; 4 = agree; 5 = strongly agree) (Ng, 2012)

The study will utilize the localization of TUI (Technology Usage Inventory) to understand the knowledge and experience of technological use and adoption in terms of frequency and the degree of integration of digital tools at the workplace (Lee Lehto, 2013). The OSTI (Organisational Support for Technology Integration) scale is used with a 5-point Likert scale to measure level of organizational support and institutional resources to use and integrate technology (1 = strongly disagree; 2 = disagree; 3 = neutral; 4 = agree; 5 = strongly agree) (Klein et al, 2006). Another instrument is the EADT (Employee Attitude Towards Digital Transformation) questionnaire, which captures the employees' mindset toward digital transformation to unveil their attitudes or perceptions toward digital transformation's benefits, values, and challenges (Smith Sandberg, 2017).

Data Analysis and Findings

Table 1.

Questionnaire Items	Survey Questions	Frequency %					Mean	Standard Deviation
Digital Literacy DL1-3	2. I am confident in using the digital tools required in my job.	SD	D	N	A	SA	3.925	0.862
	3. I can easily learn new technologies introduced at my workplace.	SD	D	N	A	SA	3.875	0.832
	3. I frequently use online platforms for professional development and instructional purposes.	SD	D	N	A	SA	4.425	0.496
Grand Mean							4.075	
Grand Standard Deviation							0.748	

Analysis of Digital Literacy Survey

The survey concludes that the participants are moderately positive about their digital literacy. The three related items about digital proficiency and involvement are above average, indicating a consensus about high digital competency. The mean is 4.075, and the standard deviation is 0.748, implying a uniform opinion on the sample population's digital literacy.

Item no. 3, regarding the frequency of digital platforms used for professional development and teaching, obtained the highest score ($M = 4.425$, $SD = 0.496$). The working people engaged actively with digital resources for learning and development. It achieved a significantly higher score than the other three items.

On the contrary, the second item 'I can easily adopt the newly introduced technologies in my workplace' had the lowest mean ($M = 3.875$, $SD = 0.832$). This suggests a relatively high variability regarding the ease with which employees adopt new technologies. This finding indicates possible gaps in training or assistance that could reduce the stress associated with adjusting to new equipment.

This could be interpreted as they are confident of continuing to use the internet/digital technology over the next five years due to an established routine. Meanwhile, the lower ratings in the domain of learning new technology reveal a field for improvement. This can be interpreted as employees may be comfortable with using digital tools in their current work, but it could be harder to adopt new technology.

The survey indicates that the workforce is highly proficient at using digital tools for learning and work purposes. On the other hand, the moderate variation in mastering new technological skills indicates a chance for improvement by new training programs or support structures. Such efforts can maintain high levels of digital literacy, enhance versatility, and facilitate performance during these digitally driven transformations.

Table 2.

Questionnaire Items	Survey Questions	Frequency %					Mean	Standard Deviation
Technology Adoption and Use TAU1-3	1. I regularly use digital technologies for tasks such as teaching, research, or administration	S D	D	N	A	S A	3.675	0.948
	2. The digital tools provided by my institution meet my needs and expectations.	S D	D	N	A	S A	4.025	0.568
	3. I believe that the technology available to me enhances my productivity and work quality.	S D	D	N	A	S A	3.925	0.862
Grand Mean							3.875	
Grand Standard Deviation							0.81	

Analysis of Technology Adoption and Use Survey

Based on assessing the three aspects, which revolve around the adoption and application of technology, respondents approve of their engagement with digital tools in their work setting. The survey summary shows

that the scores extracted from the data are represented in a moderate to high level of satisfaction with technology use, with a mean of 3.875 and a standard deviation of 0.81. The value for standard deviation is not low; however, it does demonstrate a certain unity in the responses with some leeway, which can be explained by characteristics that occur in experiences or perceptions.

The second item, "The digital tools provided by my institution meet my needs and expectations," received the highest mean score of 4.025 with a standard deviation of 0.568. This indicates that most employees feel the technologies available at their workplace offer ample support. It is worth noting that this score reflects high satisfaction with the institutional support for digital tool provision, which is essential for successful technology adoption. On the other hand, the initial statement recorded the lowest average with a mean of 3.675 and a standard deviation of 0.948. This indicates a higher degree of diversity in responses, implying that the employment of digital technologies for teaching, research, or administration may not be consistent across various departments or job functions. It highlights opportunities for enhancing technology integration to improve overall productivity and efficiency.

The third item, "I believe that the technology available to me enhances my productivity and work quality" ($M = 3.925$, $SD = 0.862$), also indicates a positive perception, though with some variability that might reflect differing levels of effectiveness perceived by employees in how technology impacts their work quality and productivity.

From the analysis, it is evident that participants value the technology tools provided and believe in the benefits these tools bring to their productivity and work quality. However, the variability in the frequency of use and the slightly lower mean score for regular usage highlight potential gaps in continuous training or in the alignment of technology tools with the specific needs of all employees. Enhancing training programs, providing more tailored technology solutions, and fostering a culture of regular technology use could further improve technology adoption rates and satisfaction levels. This, in turn, would likely increase overall job performance and the effectiveness of the digital tools implemented.

Table 3.

Questionnaire Items	Survey Questions	Frequency %					Mean	Standard Deviation
Organizational Support OS1-3	1. My institution provides adequate training for the digital tools and platforms we are expected to use	S D	D	N	A	S A	3.625	0.832
	2. There is sufficient technical support available when I encounter issues with digital technology	S D	D	N	A	S A	4.275	0.55
	3. The organization actively facilitates the adoption of new	S D	D	N	A	S A	3.975	0.998

	technologies through continuous support and resources.							
Grand Mean								3.958
Grand Standard Deviation								0.814

Analysis of Organizational Support Survey

The analysis of the three items related to organizational support for technology adoption and use suggests a positive view among participants, with the overall scores being higher than average. The data reveals a notable level of contentment with the assistance extended by the establishment, as evidenced by an average score of 3.958 and a sizeable standard deviation of 0.814. While the deviation is not particularly low, it does imply a moderate degree of uniformity in feedback, albeit with some degree of divergence that could be attributed to varying individual experiences or perspectives.

The second item on the survey, "There is enough technical support available when I need help with digital technology" ($M = 4.275$, $SD = 0.55$), received the highest mean score, indicating that most employees feel adequately supported by the technical resources available. This high satisfaction level is crucial for successful technology implementation and continued use.

On the other hand, the first item, "My institution offers sufficient training for the digital tools and platforms we are required to use" ($M = 3.625$, $SD = 0.832$), received the lowest mean score and showed the most variability among the responses. While employees generally expressed satisfaction with the training, its effectiveness and coverage may differ across various roles or departments. This highlights potential areas for improvement in the training program.

The third item, "The organization actively facilitates the adoption of new technologies through continuous support and resources" ($M = 3.975$, $SD = 0.998$), also indicates a positive perception, though with some variability that might reflect differing levels of effectiveness perceived by employees in how the organization supports technology adoption.

Overall, the survey results underscore a workforce that feels supported in terms of technical issues but indicates potential gaps in training provision and the active facilitation of new technology adoption. While the high level of technical support is commendable, the slight inconsistency in training effectiveness and the facilitation of technology adoption across the board suggest potential areas for improvement through targeted interventions to enhance training programs and support mechanisms. Such initiatives could help maintain high engagement levels and improve overall job performance and organizational commitment in adopting new technologies.

Table 4.

Questionnaire Items	Survey Questions	Frequency %					Mean	Standard Deviation
Employee Mindsets EM1-3	1. I am optimistic about the changes digital technology brings to my work environment	S D	D	N	A	S A	4.325	0.753
	2. I feel motivated to use digital technologies to enhance my work efficiency.	S D	D	N	A	S A	3.975	0.998
	3. I feel motivated to use digital technologies to enhance my work efficiency.	S D	D	N	A	S A	3.975	0.798
Grand Mean							4.091	
Grand Standard Deviation							0.856	

Analysis of Employee Mindsets Survey

The survey on employee mindsets towards digital technology reveals generally positive attitudes, with overall scores suggesting a robust acceptance of digital changes in the workplace. The results indicate a consensus towards high optimism and motivation to use digital tools, with an overall mean of 4.091 and a grand standard deviation of 0.856. This relatively moderate standard deviation suggests that responses are fairly consistent across the sample, indicating a uniform perception of the positive impacts of digital technology among employees.

The highest mean score was recorded for the first item ‘I am optimistic about the changes digital technology brings to my work environment’ ($M = 4.325$, $SD = 0.753$) which represents a high level of optimism about digital transformation in the workplace. This high score indicates the great enthusiasm among employees towards the use of digital tools for helping them fulfil their tasks. It also shows the great impact these tools have had on their productivity and working efficiency.

Conversely, scores for the second and third items, which read ‘I feel compelled to use digital technologies to enhance my work effectiveness’, were identical ($M = 3.975$), albeit with significantly different standard deviations ($SD = 0.998$ and $SD = 0.798$, respectively), suggesting that fluctuations in employee attitudes can provide a target for support or motivational interventions.

The statistics analysis indicates strong motivation and optimism about the workforce related to digital

technologies. Also, different people have different feelings of motivation and optimism about digital technologies. This means that technology training and support might need more personalization. For instance, training programs could be specific to the skills required or motivation projects that are more closely related to the needs of a specific individual or department.

In general, the survey findings reflect a highly motivated and optimistic workforce. However, the slight inconsistencies in motivation levels highlight the need for enhanced support measures to ensure that all employees are equally equipped and encouraged to leverage digital tools for improved performance and efficiency. By implementing such initiatives, organizations can maintain high engagement levels and optimize the benefits of digital transformations.

Discussion

The survey findings on the impact of digital transformation on employee mindsets within higher education institutions (HEIs) in Oman align with the theoretical frameworks referenced in the literature review, notably the Technology Acceptance Model (TAM) and Organizational Change Theory. These theories help explain the positive attitudes towards digital transformation in the survey results.

Alignment with the Technology Acceptance Model (TAM)

The survey data demonstrates that employees generally hold an optimistic view about the changes brought by digital technology ($M = 4.325$, $SD = 0.753$) and feel motivated to use these technologies to enhance work efficiency ($M = 3.975$, $SD = 0.798$). This finding aligns with the TAM, which posits that perceived usefulness and ease of use significantly influence the acceptance and effective utilization of technology (Davis, 1989). The high mean scores reflect employees' perceptions of digital tools as beneficial, corroborating TAM's assertion that ease of use and perceived utility foster positive attitudes towards technology adoption.

Integration with Organizational Change Theory

Moreover, the results resonate with Organizational Change Theory, particularly Kotter's principles that stress the importance of creating a supportive environment for change through leadership and clear communication (Kotter, 1996). The organizational support for adopting new technologies, as indicated by the survey ($M = 3.975$, $SD = 0.998$), suggests that the efforts to facilitate digital transformation are recognized by employees. However, the variability in responses highlights areas where organizational change strategies could be more effectively applied to enhance uniformity in employee perceptions and experiences.

Implications for Practice and Policy

The explanations highlight the importance of HEIs in Oman persistently devising strategies that prioritize the

implementation of digital tools but also augment the support systems that accompany technology use. This means tailoring training programs to meet individual needs, improving levels of technical support, and fostering corporate cultures that welcome continual digital transformation (Al-Haddad et al., 2020). In this way, institutions can use technology to streamline internal operations and spur wider growth and innovation within an institution.

Theoretical and Practical Contributions

This analysis has not only helped to substantiate existing theories like TAM, Organizational Change Theory, etc. but also gives us a nuanced perspective of how these theories are being translated in the context of higher education in the Sultanate of Oman. It shows the role of perceived support and effective change management in building positive employee attitudes towards digital transformation. These insights would come in handy for other HEIs suffering from similar problems.

In conclusion, this study shows the difficult task of leading digital transformation in HEIs in Oman. Although I found that HEI employees are optimistic and enthusiastic about digital tools, I also found that targeted organizational strategies are needed to improve employee engagement. This research contributes to existing theories and fills in gaps in prior studies. It offers a holistic picture of how to lead employee engagement when the education sector transforms digitally.

Limitation of the Study

While this study on the influence of digital transformation within the HEIs in Oman is useful, it also has some important limitations. For instance, the small sample and composition size and the survey structure, the participant selection, and the pool might not have covered the entire sector, limiting the generalisability of the results. Moreover, the cross-sectional survey design prevents using the data to observe changes over time, essential for an ongoing transformational process such as digital transformation. Another concern is using self-reported data, as the answers might be influenced by social desirability bias, which can lead to inaccuracies in the findings.

Second, the study extensively relies on quantitative data, which does not capture the richness that can be achieved with qualitative data and may be missing some aspects of the individual- and group-level dynamics responding to digital changes. It also remains unclear how transferable the findings are to other contexts due to the specificity of Oman's cultural, economic, and educational context. Future research can contribute to refining these findings by using a longitudinal research design, adding a more varied sample of institutions, using qualitative research methods, and accounting for contextual factors such as the economy or technological advances, which may be strong drivers of digital transformation efforts.

Significant of the Study

The study conducted to evaluate the effect of digital transformation on the thought process of the main actors of Oman's higher education institutions has obtained key findings that could relate to the academic, organisational, and technological dimensions. Such findings are particularly important to measure how the workforce perceives and is willing to adopt digital transformation programmes, which in turn points to their effectiveness.

The general outcomes of the study show that employees of Oman's higher education institutions exhibit an optimistic and encouraging attitude toward digital transformation. Such promising findings provide an encouraging context for more technology integration, as HEIs can identify and leverage appropriate digital tools to develop a more innovative pedagogy and a more productive operating environment.

The high level of motivation recorded among the respondents and their willingness to adopt digital technologies all suggest an encouraging internal cultural climate supportive of technological evolution and improvement of work efficiency and ability.

This study reveals the important role of positive attitudes in facilitating the acceptance and adoption of new technology in educational settings, providing clear evidence of the close association between these attitudes and the TAM and Organisational Change Theory. The study also supports the TAM reasoning that perceived usefulness and ease of use are crucial to technology adoption and underscores the identification and provision of these factors when introducing new technologies. Furthermore, the studies have highlighted the critical role of strategic planning, so prominent in Organisational Change Theory, and emphasise that effective digital transformation depends heavily on whether institutions have support systems and related communication strategies to enable the transition.

These findings have important practical implications for policy-makers and educational administrators in Oman and similar contexts. They offer an actionable blueprint for enhancing approaches to digital transformation that involves strengthening training programs, providing more individualized support, and cultivating a culture in which more of the full potential of digital tools is realized. That helps the organization succeed as an employer (increasing staff motivation and capacity) and as an educational institution (enabling it to actualize its mission and adapt to a changing digital landscape).

In summary, these findings can contribute to the field of literature regarding the impact of digital transformation on employee perception in the world of education. They may provide some useful insights for educational institutes to deal with subsequent difficulties and for other organizations where similar problems are likely to exist. On the other hand, this research can provide a bridge between theory and practices, and some useful recommendations can be made for practitioners regarding enhancing employee engagement and corporate outcomes during the digital transformation era.

Conclusion

The study's outcome relating to digital transformation in higher education in Oman and the region suggests that employees positively receive the adoption of digital technologies. The reasons behind the adoption can be explained by the Technology Acceptance Model (TAM) and Organisational Change Theory, pinpointing that perceived usefulness and ease of use are important factors in technology adoption. However, the study concluded that support from the university's organization is very needed to train staff on the different digital tools and provide consistency in the support provided for each department. Providing a proactive and responsive culture supporting the rapid adoption of new technologies in higher education is important.

Abstract: The digital revolution in the workplace has far-reaching effects on workplace redesign, going beyond simple technological adoption or non-adoption. Digital work may call for adjustments to operational and organizational aspects in addition to the tools utilized in organizational activities. In this context, it is critical to meet workers' psychological needs, such as their need for autonomy, for relationships with others, and for digital self-efficacy, all of which affect their willingness to accept a work environment that is digital. More precisely, employees are supposed to be more in favor of workplace digital transformation if they believe that the digital environment will improve performance and well-being. The current study, which builds on Self-Determination Theory, attempts to investigate how workers' basic psychological needs affect their expectations for performance, well-being, and intentions to support workplace digital transformation. 195 valid and statistically testable responses were obtained from a sample of 370 people employed in the financial services industry in the Dakahlia Governorate for this study. Based on an inductive methodology, analytical descriptive methodology was used in the study. The findings show that worker autonomy, interpersonal connections, and digital self-efficacy have a major positive influence on workers' expected performance and well-being in the digital workplace. Their intentions to support the digital transformation of the workplace are subsequently strengthened as a result. Lastly, it is hoped that the research findings will push pre-digital organizations to face the challenges of digital transformation and help them reevaluate their strategies considering employee engagement.

Keywords: basic psychological needs satisfaction, digital transformation in the workplace, employee expectations, intentions, financial services sector.

Impact Of Basic Psychological Needs Satisfaction on Employees' Expectations and Intentions to Support Digital Transformation In The Workplace: Applied To The Financial Services Sector. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 2632-2656), Antalya, Turkiye. ISTES.

Introduction

For the workplace to transition from a traditional workplace to a digital workplace, organizational and operational changes may also be necessary in addition to technological adjustments. Communication and collaboration techniques have been impacted by social and technological changes in the Fourth Industrial Revolution (Industry 4.0) era (Attaran et al., 2019; Tripathi et al., 2021). Scholars (Weritz, 2022; Muniroh et al., 2022) have examined the advantages and disadvantages of these modifications, confirming that they have brought about new methods of carrying out job duties.

Digital transformation has resulted in a notable change in social and economic aspects in recent years (Pogodina et al., 2019). Nonetheless, the majority of scientific study on digital transformation has been conducted at the macro level, focusing on business models and how they directly affect society (Yo and Yi, 2022). Scholars have not given enough attention to studying the partial level of digital transformation, particularly when it comes to people in their work environment (Bond et al., 2018; Nadkarni and Prüg1, 2021; Hanelt et al., 2021; Borah et al., 2022).

Thus, workplace digital transformation involves more than just technology resources; it also involves changing workplace culture and taking employees' needs into account (Baumgartner et al., 2021; Wang et al., 2022). Because of this, workplace digital transformation offers chances to redesign the workspace for future work that will be more productive (Selimović et al., 2021). It also adds a micro perspective to the digital transformation framework (Meske, 2019).

According to Meske and Junglas (2020), workplace digital transformation is the phenomenon of new technologies bringing about significant changes in a variety of work-related aspects, including how employees perform tasks and processes, their social relationships with organizations, and their overall experiences at work.

Employee engagement and support intentions have been directly impacted by the changes in job design, resources, and expectations brought about by digitization (Alieva and Powell, 2022). A primarily digital work environment has been created by the quick process of digital transformation (Morton et al., 2020). Employees must now learn how to use digital tools and become familiar with them in their workplaces (Attaran et al., 2019). In the workplace today, modern digital technology needs to be applied and used for a range of tasks (Brahma et al., 2021).

Employee competencies like continuous learning, being adaptable to unforeseen events, and working cooperatively to solve complex problems are all needed in the digital workplace (Aroles et al., 2021). Furthermore, as machines become more and more integrated into work tasks, human-machine interaction is imperative in the digital workplace (Marsh et al., 2022; Hassane, 2022). As a result, workers are urged to use creativity to provide value.

Adaptability among those who use technology is just as important for success in a digital workplace as technological efficiency (Hicks et al., 2019; Natu and Aparicio, 2022). Thus, to improve their performance and productivity, employees in business organizations must learn how to use technology (Chan et al., 2021). As a result, being digitally literate has become increasingly important, with advantages for both the company and its workforce. More precisely, digital transformation in the workplace involves rethinking the culture of the workplace and altering the nature of work activities in addition to providing employees with digital tools and skills.

Therefore, transforming the workplace into a digital one requires a change in organizational and workplace culture (Meske and Junglas, 2020). Businesses are moving more and more towards a culture that emphasizes employee engagement and digital innovations (Svahn et al., 2019). This suggests that the process of digital transformation in the workplace starts at the employee level as well as with a shift in the organization and mentality of the leadership.

Employee support for the digital workplace, in addition to the adoption of digital tools, becomes crucial at this point in the transformation (Liu et al., 2023; Zoppelletto and Orlandi, 2022). It becomes vital to have positive expectations for the workplace that employees will have in the future. The goal of the transformation journey should be to improve employees' personal well-being in addition to increasing their performance and productivity through the use of digital technologies.

Previous studies emphasize how important it is to meet psychological needs like autonomy, interpersonal connections, and digital self-efficacy that support workers' intrinsic motivation. This is consistent with the Self-Determination Theory (Deci et al., 2017; Meske and Junglas, 2021; Forner et al., 2020; Maran et al., 2022) which argues that meeting psychological needs of workers affects their expectations for performance and well-being, including their positive attitudes and intentions to support digital transformation.

Improvements in communication, cooperation, and teamwork have resulted from organizational and technological advancements, as have modifications in work-life balance-related attitudes and lifestyle patterns. Digital transformation in the workplace shouldn't, however, be limited to the use of technology or other so-called "enabling factors." It should also include meeting the psychological needs of staff members and making organizational modifications.

In recent years, research on digital transformation in the workplace has primarily concentrated on developing theoretical models that clarify the notion of digital transformation, its causes, and its effects in organizational contexts. To support the development of comprehensive and integrated models to support digitization in the workplace, researchers have identified the need for additional field studies to test the satisfaction of employees' psychological needs and their readiness to deal with technologies and problem-solving when they arise.

Even though workplace digitization is crucial for both individuals and organizations, a review of the literature on the topic reveals a glaring lack of studies that investigate the relationship between basic employees' psychological needs, expectations, and reflection on supporting digital transformation in the workplace.

Research examining and analyzing the variables influencing workers' expectations and how those relate to their intentions to support workplace digital transformation is scarce. The investigator observed a notable dearth of applied research concerning the examination and assessment of workers' psychological requirements and their level of acceptance towards the digital work environment. Consequently, more applied research may be necessary to fill this gap in the literature. The research attempts to provide a fundamental response to the following query to close this knowledge gap: Do employees' intentions for a more successful digital transformation of the work environment in pre-digital organizations have a connection to meeting their psychological needs?

Drawing from, the subsequent sections comprise literature review which illustrate theoretical framework, research issue, goals, formulation of hypotheses, and their importance. These are succeeded by the research approach, data interpretation, and testing of results. The final section will cover the conclusions, theoretical and practical contributions, research limitations, and suggestions.

Literature review and Hypothesis

Although the business community has been using the term "digital workplace" since 2010, there is still a dearth of academic literature on the subject (Meske, 2021; Brahma et al., 2021). The term "digital workplace" refers to an integrated concept that incorporates all organizational tools and refers to a broad range of network-connected technologies that employees use on a daily basis to carry out their tasks (Marsh, 2018). According to Dery et al. (2017), it encompasses social media, smartphones, cloud computing, and the Internet of Things. It includes, for instance, email, communication tools, the internet, CRM software, ERP software, human resource management software, and other enterprise tools that support day-to-day business operations (Attaran et al., 2019).

It also entails the organization's adoption of more sophisticated or emerging technologies, such as automation and artificial intelligence components (Baptista et al., 2020). Since it supports their digital business strategies, academic researchers, and practitioners (Dery et al., 2017; Meske, 2019; Zimmer et al., 2020; Morton et al.,

2020; Selimović et al., 2021; Walkowiak, 2021) are becoming more and more interested in the topic of transforming traditional work environments into digital workplaces.

According to Baumgartner et al. (2021) and Mićić et al. (2022), digital transformation in the workplace is regarded as a strategic management tool related to implementing new working practices. Businesses use digital workplace technologies to complete tasks quickly and effectively, which boosts output and increases employee satisfaction (Attaran et al., 2019). Increased access to digital talent and employee retention are two advantages of digital transformation in the workplace. Digital workplaces encourage flexible data, information, and knowledge exchange (Colbert et al., 2016) and facilitate communication and collaboration (Dery et al., 2017; McAllen and Haddud, 2018; Baumgartner et al., 2021).

Using digital platforms is a component of digital transformation in the workplace (Williams and Schubert, 2018). But new digital technologies are transforming the workforce of the future, and businesses need to adapt by providing training and resolving issues. Ultimately, a shift in culture and an awareness of workers' psychological needs are also necessary components of digital transformation in the workplace, in addition to the use of technology (Attaran et al., 2019; Baumgartner et al., 2021). As a result, digital transformation in the workplace gives opportunities to redesign the workspace for future work that will be more effective (Selimović et al., 2021; Mićić et al., 2022). It also gives a limited perspective within the digital transformation framework (Meske, 2019).

The literature (Mesquita et al., 2019; Varshney, 2020) highlights the significance of the digital workforce and workplace for the success of organizations in the future. Digital transformation in the workplace is imperative for organizations, particularly those that were not yet digital. Accordingly, traditional sectors that prospered in the pre-digital economy, like retail and financial services, comprise pre-digital organizations (McKinnon, 2019; Chanas et al., 2019). Organizations must use digital technologies to adapt and change their operations in order to maintain their businesses (Sebastian et al., 2017). These adjustments also encompass workplace metamorphoses, which are commonly understood as utilizing technology to enhance the working environment and the satisfaction and productivity of employees (Zhenjing et al., 2022).

As a result, creating the workplace of the future involves more than just technology and digital tools—it also involves understanding what each employee expects from the challenges presented by the digital transformation. It's also critical to stress that employees' attitudes and perceptions of new technologies affect their expectations for the workplace of the future as well as traditional adoption issues. According to Singh and Dangmei (2018), the future workplace will entail integrating technology into day-to-day operations within businesses, eventually promoting information and knowledge sharing among staff members. Improved transparency and unimpeded information flow will have a major impact on increasing productivity, efficiency, and performance in completing tasks.

By using digital resources at any time and from any location, the digital workplace gives workers more flexibility (Jarrahi et al., 2021; Lindell et al., 2022). According to a Dittes et al. (2019) study, workers can gain productivity and flexibility from digital infrastructure. According to the study's findings, companies can support digital work by appreciating and respecting each employee, giving them accountability and decision-making power, and fostering an environment that fosters innovation and creativity. As such, the emphasis in the workplace of the future will be on completing work tasks and producing results, rather than on following formal procedures like recording the location and time of completion.

The digital workplace promotes multifunctional collaboration and does away with solitary thinking. While using digital tools helps employees communicate and work together, redesigning the workplace doesn't always mean creating a layout that works for a virtual office; real office space is still needed (Selimović et al., 2021). The process of transformation necessitates an open area where departments and divisions can collaborate and share information. This also helps to foster greater creativity among staff members. Thus, in the future, workplace culture will be primarily driven by creativity and productivity (Md Dahlan et al., 2018). The strain brought on by technology, or technostress, can lessen the benefits of a digital workplace, including improved productivity, well-being, and creativity (Hearn et al., 2020; Juchnowicz, 2021; Kinowska). According to existing research, users' perceptions of technological complexity, as well as their abilities and values, are the main factors contributing to technostress (Yener et al., 2021).

Technological stress arises when technology is used without appropriate changes in the work environment and workplace redesign (Bondanini et al., 2020). That's why it's important for digital transformation to be accompanied by digital leadership and a change in organizational culture. Digital leadership and workplace culture should guide employees towards a new way of working. Muniroh et al. (2022) emphasize that organizations in the digital environment face challenges in leadership and cultural change. Implementing digital work requires collaborative leadership with a clear vision and commitment rather than a controlling management style (Leso et al., 2023). Organizations shift their culture to one that fosters collaboration and digital innovation (Kim et al., 2021), using digital tools to provide employees with diverse work capabilities for collaboration (Zoppelletto and Orlandi, 2022).

Therefore, the scope of digital transformation in the workplace extends beyond the simple adoption or rejection of technologies within the workplace environment—it carries far-reaching implications in the context of workplace redesign. Consequently, the future digital workplace involves more than just the substitution of tools utilized in work activities; rather, it frequently reshapes the very essence of work activities and processes.

Extant literature emphasizes the multifaceted advantages associated with digital transformation in organizational contexts. These benefits encompass cost reduction, heightened innovation potential, enhanced customer experience, augmented productivity, increased revenue streams, and the elevation of employee productivity, experiences, performances, and well-being (Attaran et al., 2019; Weritz et al., 2022). Such findings hold profound significance in fostering employee buy-in for workplace redesign initiatives and underscore the pivotal role of such initiatives in facilitating successful digital transformations within organizational settings. Moreover,

active employee engagement in the redesign process is poised to streamline operations, leading to superior outcomes by aligning the redesigned workspace with the nuanced expectations and needs of the workforce.

In this context, the psychological needs of employees, such as autonomy, interpersonal relationships, and digital self-efficacy, hold paramount importance (Deci et al., 2017). These needs play a crucial role in shaping employees' inclination towards adopting the digital workplace in the future. This notion is consistent with Self-Determination Theory, which posits that employees' performance and well-being are influenced by the type of motivation driving their job activities (Selimovi et al., 2022). Meske and Junglas (2021) suggest that these psychological needs influence employees' perceptions and expectations regarding work outcomes and design. Consequently, employees' perceptions of autonomy, mutual interpersonal relationships, and digital self-efficacy emerge as primary motivators fostering employees' positive attitudes towards supporting digital transformation in the workplace.

Numerous prior studies have underscored the advantageous impacts of remote work on employees' autonomy (Galanti et al., 2021; Bošković, 2021). Nonetheless, a substantial body of literature has also corroborated the detrimental repercussions of working outside the conventional office setting on work-related connections and employee well-being. Specifically, individuals engaged in remote work for extended hours and heightened intensity, ostensibly to bolster productivity, often contend with feelings of isolation and fatigue. Consequently, within the remote work paradigm, attributes such as employee autonomy, interpersonal relationships, and well-being assume heightened significance and must be tailored to the evolving work landscape to optimize performance and welfare (Lange and Kayser, 2022). These attributes manifest divergently amid the pandemic milieu. The advent of the COVID-19 crisis has mandated remote work for many, curtailing social gatherings and interactions, thereby necessitating reliance on digital tools for most workplace communication and collaboration. As a result, employees' autonomy may suffer, potentially due to familial distractions impeding their focus on remote tasks (Wang et al., 2022). Hence, it becomes imperative to scrutinize whether these attributes influence employee performance expectations and well-being, thereby shaping their inclinations to endorse the digital workplace in this unprecedented "new normal" scenario.

Alongside the focus on the relationship between the psychological needs of workers and their expectations for performance and well-being in the context of the digital work environment, one of the main distinguishing features of the study is the digital transformation in the workplace in the financial services sector. One of the most common interpretations of the clear digitization of the financial sector is the significant and rapid leap in knowledge and technology compared to other service sectors. The financial services industry is highly standardized and organized. Financial service institutions need to manage digital transformation in a highly regulated environment. They need to meet stakeholder requirements for greater transparency and trust (Werth et al., 2021). To meet these requirements, financial institutions invest in innovative services.

recent surge in new technological innovations, accompanied by operational disruptions (Gomber et al., 2018). Consequently, there have been substantial shifts in job roles and responsibilities within the financial sector,

necessitating greater autonomy among employees, particularly in the context of developing and offering bespoke financial products tailored to individual needs and client preferences. Notably, as jobs increasingly emphasize service provision and a considerable portion of the workforce engages in knowledge-intensive activities, the digital work environment has been observed to augment employees' productivity while mitigating escalating pressures, excessive workloads, fatigue, and burnout. This trend persists even within traditionally authoritative sectors, such as education and healthcare (Johnson et al., 2020). Thus, the psychological needs and performance expectations of employees align with their inclination towards digital transformation in the workplace, particularly within pre-digital organizational frameworks in traditional industries like financial services."

The positive correlation between autonomy and employees' performance has been consistently evidenced in past studies (Dittes et al., 2019). Researchers have underscored that granting employees the autonomy to make independent decisions in specific situations bolsters their productivity and fosters innovative problem-solving capabilities (Dittes et al., 2019). Additionally, earlier research by Zacher et al. (2019) corroborated this notion, albeit noting a potential downside: increased autonomy could lead to heightened workplace fatigue. Conversely, recent findings by Siregar et al. (2021) supported the idea of a positive impact of employee autonomy on work commitment. These findings are in line with a longitudinal study conducted by Chen and Zhang (2023), which demonstrated that autonomy positively influences employees' job satisfaction and organizational commitment over time. Moreover, a study by Smith et al. (2023) found that autonomy was positively associated with task performance and creativity among employees. Consequently, managerial support for employee autonomy has been associated with heightened motivation and creativity among employees (Li et al., 2018; Guo et al., 2021). This suggests that organizational practices promoting autonomy not only enhance individual performance but also contribute to overall organizational effectiveness (Zhou et al., 2020). Therefore, it is hypothesized that:

H1a. Employee autonomy in the digital workplace has a significant positive effect on their performance expectations.

Recent scholarship underscores the critical role of fulfilling employees' psychological needs within the workplace, with several studies indicating a positive correlation between such satisfaction and overall job enjoyment (Klaeijssen et al., 2018). Furthermore, empirical evidence suggests that meeting individuals' autonomy and fundamental psychological needs contributes positively to their work-related welfare (Lange & Kayser, 2022; Ilies et al., 2017). Building upon these findings, it is evident that fostering a sense of autonomy among employees leads to heightened levels of satisfaction and well-being (Ebersold et al., 2019; Clausen et al., 2022). Therefore, we propose the following hypothesis:

H1b. Autonomy among workers significantly influences their expectations of well-being in the digital workplace.

Within this context, numerous researchers have asserted that employees' performance expectations and well-being hinge upon interpersonal relatedness, characterized by an individual's capacity to cultivate meaningful relationships with others. This dimension also fosters a deep sense of trust, cooperation, and camaraderie among individuals (Alkailani & Kumar, 2016). Consequently, mutual interpersonal relationships among employees and cooperation facilitate the exchange of ideas, information, and knowledge, leading to enhanced performance and creativity (Semerciöz et al., 2011). When interpersonal barriers are overcome, employees execute their tasks with greater efficiency and effectiveness, thereby fostering workplace agility and competitiveness (Dery et al., 2017). Thus, mutual interpersonal relationships in the digital workplace are posited to elevate individual performance levels. Therefore, it is hypothesized that:

H2a. There is a significant positive impact of mutual interpersonal relationships among employees on their performance expectations in the digital workplace.

In a complementary vein, individuals' ability to cultivate profound relationships with others positively impacts their satisfaction and well-being. Employees often report greater satisfaction when they engage and interact with their peers, fostering a sense of belonging and heightened trust among them (Rothausen & Henderson, 2019). Consequently, mutual interpersonal relationships among employees become exceedingly important due to the pervasive use of social media tools in their personal lives, which extends beyond the workplace. Thus, addressing the need for socialization within the workplace becomes imperative (Bucher et al., 2018). It has been firmly established that the interplay of interpersonal relationships among workers in the digital work environment is crucial and yields a positive effect on their well-being. Hence, it is postulated that:

H2b. There exists a significant positive impact of mutual interpersonal relationships among employees on their well-being expectations in the digital workplace.

Furthermore, within this context, researchers have underscored the significance of employees' digital self-efficacy in shaping their performance expectations and well-being. Digital self-efficacy refers to an individual's belief in their ability to use information technology and adapt to software and hardware updates (Kim et al., 2021) effectively and effortlessly. Heightened confidence in digital skills correlates with reduced anxiety about using information technology (Schmidt and Ulfert-Blank, 2022), and increased likelihood of stability and efficiency in execution (Jeon & Kim, 2022). Digital self-efficacy not only encompasses an individual's skills but also their judgment regarding the application of these skills (Lee, 2021). Consequently, it serves as a psychological factor influencing individuals' decisions to accept and utilize modern technology (Maran et al., 2022). Digital self-efficacy is closely intertwined with individuals' decisions, emotional responses to completed tasks, and performance expectations (Daher et al., 2021; Nusannas et al., 2022). This implies that individuals with high self-efficacy tend to perform better than those with lower self-efficacy, thus positioning digital self-efficacy as an indicator of anticipated performance. Therefore, it is hypothesized that:

H3a. There exists a significant positive impact of employees' digital self-efficacy on their performance expectations in the digital workplace.

On the other hand, digital self-efficacy is regarded as a fundamental skill requisite in the knowledge economy of the twenty-first century (Maran et al., 2022). The application of modern technology presents technical challenges, necessitating employees to be equipped to navigate technologies and troubleshoot issues as they arise (Daher et al., 2021). Self-efficacy is considered a motivating factor for employee well-being (Marshall et al., 2020). Thus, it is expected that employees' digital self-efficacy will heighten their future expectations of well-being, thus leading to the proposition:

H3b. There exists a significant positive impact of employees' digital self-efficacy on their well-being expectations in the digital workplace.

In conclusion, teamwork and collaboration are frequently touted as hallmarks of the digital work environment. Technological solutions render information readily accessible, facilitating document collaboration and sharing (Selimović et al., 2021).

Drawing from previous literature, it is evident that employees' performance and well-being are primary motivators for workplace transformation (Trenerry et al., 2021; Wang et al., 2017). More specifically, if employees anticipate that the digital environment will enable them to achieve better performance and well-being, they are expected to be more motivated and willing to support digital transformation. They will feel at ease with digital technology, thus mitigating resistance to embracing future workplace changes (Selimović et al., 2021). Therefore, it is posited that:

H4. There exists a significant positive impact of employees' performance expectations on their intentions to support digital transformation in the workplace.

H5. There exists a significant positive impact of employees' well-being expectations on their intentions to support digital transformation in the workplace.

Fig. 1. Conceptual framework

The proposed study framework can be illustrated in Figure 1 as follows:

Method

In conducting this study, the researchers relied on the descriptive-analytical quantitative approach, which involves describing and analyzing the phenomenon under study, namely the factors influencing the expectations and intentions of employees to support digital transformation in the workplace. This was achieved through collecting data related to this topic and conducting the necessary statistical tests to test the study hypotheses, followed by analyzing the results. The methodology adopted in the study includes the types of data and their sources, study variables and their measures, the sample and the procedures followed, the study instrument and data collection method, and the statistical methods. This can be further elucidated as follows:

Types of Data and Their Sources

To achieve the study objectives, the researchers relied on two types of data: secondary data and primary data. Secondary data were obtained through reviewing previous literature that addressed the theoretical framework of the study variables, formulating its objectives, developing its hypotheses, and identifying its significance. Additionally, primary data were collected from employees in financial services institutions in the Dakahlia Governorate, the study area, and analyzed to test the study hypotheses and reach conclusions.

Research Population, Sample, and Procedures

The research population consists of employees in financial services institutions in the Dakahlia Governorate. Due to the absence of a framework for the research population and the difficulty of determining its size and distribution, the researchers assumed that the research population exceeds 10,000 individuals. Accordingly, the minimum sample size for the research becomes 370 individuals at a confidence level of 95% and a margin of error of 5%.

The questionnaire was sent to some of the researchers' colleagues working in these institutions via their email to review it first. Then, direct contact was made with them to ensure their understanding of its contents. Furthermore, the sample was distributed using simple random sampling method, chosen due to its applicability conditions, which are used in case of the presence or absence of a framework for the research population and a high degree of homogeneity among its individuals in the studied characteristics. The appropriate sample size was determined based on the mailing lists of employees with the assistance of the researchers' assistants in the applied service institutions.

It was emphasized that the participants' identities would not be disclosed, and their participation was voluntary. The questionnaire began with a summary of the research and a definition of the term "digital transformation in the workplace." Moreover, the questionnaire consisted of six parts reflecting the research variables, as well as

some demographic questions related to gender, age, education, years of job experience, and data were collected from September to November 2022. A total of 195 responses were collected, as indicated in Table 1. Regarding the demographic distribution of the participants, 68.1% were male and 31.9% were female. Additionally, more than 65% of the participants were aged between 30 and 35 years old. Most participants held bachelor's and master's degrees (79.6% and 20.4% respectively). Furthermore, most respondents (59.2%) had job experience ranging from one to six years, 40.8% had been working for more than six years, and the rest had recently joined.

Table 1. Sample structure

No	Organization	Number	(%)
1	Banks.	115	58.1%
2	Insurance companies.	66	34.5%
3	Microfinance organizations.	8	4.2%
4	Financial leasing.	4	2.1%
5	Financial agency.	2	1.1%
Total		190	100%

Variables Measurement

The study variables were measured based on scales developed in previous literature, their reliability and stability were highly established. The variable of independence was measured based on the scale developed by (Deci et al., 2001), where independence is defined as the extent to which individuals make independent decisions in specific situations and solve work tasks. Three indicators were used to measure this variable, for example, "I can decide for myself to what extent I will use digital technologies in the workplace."

The variable of interpersonal relationships was measured based on the scale developed by (Pretizer, 1995), where interpersonal relationships are defined as the extent to which impressions about the interconnection and interpersonal relationships among workers in the digitally transformed workplace are likely to be generated. Three indicators were used to measure reciprocal interpersonal relationships, such as "Employees in the digital work environment are influenced by their peers." The variable of digital self-efficacy was measured based on the scale provided by both (Edison and Geissler, 2003). Digital self-efficacy is defined as the judgment of an individual's ability to use a digital device. Three indicators were used to measure digital self-efficacy, for example, "I believe I can easily learn how to use digital devices." Performance was also measured based on the scale developed by (Venkatesh et al., 2003), where this variable is defined as the extent to which workers expect the digitally transformed workplace to contribute to their productivity. Four indicators were used to measure performance, such as "I expect that the digitally transformed workplace will be beneficial to my job." Well-being was measured based on the scale developed by (Agarwal and Karahanna, 2000), where well-being is defined as the extent to which workers consider engagement in the digitally transformed workplace enjoyable. Four indicators were used to measure well-being, such as "I will enjoy using the digitally transformed

workplace." Finally, the intention to support digital transformation in the workplace was measured based on the scale developed by (Venkatesh et al., 2003). Five indicators were used to measure intention, such as "I intend to actively participate in the change process related to digital transformation in the workplace".

Data Collection Tool

In gathering data for the field study, the researchers relied on a questionnaire prepared specifically for this purpose, in light of the scales used in previous research. This questionnaire included a set of closed-ended questions to measure the study variables, rated by respondents according to a five-point Likert scale ranging from "strongly agree" to "strongly disagree".

Statistical Analysis Methods

Confirmatory Factor Analysis (CFA) and Structural Equation Modeling (SEM) were employed. Quantitative data analysis was conducted using SPSS 24 and WarpPLS 7.0. For data analysis, an initial examination was performed to ensure the absence of missing or extreme values and to test for assumptions of multivariate statistical analysis. Additionally, confirmatory factor analysis was conducted to test the convergent, discriminant validity, and reliability of the measurement model. Finally, the structural model and hypotheses were tested using structural equation modeling.

Results

The initial step in data examination involved missing value analysis (MVA) to ensure data completeness. Missing data can compromise the validity of analyses, and the analysis confirmed no missing data. Furthermore, outliers were tested using the Mahalanobis Distance method, with no extreme values found. Additionally, the data were tested for assumptions such as normality and homoskedasticity. Although the data did not fully follow a normal distribution, this did not affect the study's main results, especially with a sample size above 50. Maximum likelihood estimation was used to address deviations from normality in multivariate techniques. Moreover, the Breusch-Pagan-Godfrey test was conducted for heteroskedasticity, showing no statistical evidence of rejection. Multicollinearity was also tested using Variance Inflation Factors (VIF), indicating no significant linear relationship among variables.

Measurement Model Analysis

Confirmatory Factor Analysis (CFA) was used to test the proposed measurement model's fit. Initially, the model fit was inadequate, leading to the exclusion of some indicators. After refining the model, CFA showed good fit. Composite reliability (CR) was assessed to verify the model's stability, with all values exceeding 0.7. Convergent and discriminant validity were confirmed through factor loadings, average variance extracted

(AVE), and square root of AVE, all meeting recommended thresholds. This comprehensive approach ensured the validity, reliability, and appropriateness of the measurement and structural models used in the study.

Table 2. Testing discriminant validity using the square root for average variance extracted (AVE)

Variables	CR	AVE	(1)	(2)	(3)	(4)	(5)	(6)
Autonomy	0.911	0.774	<u>0.880</u>					
Interpersonal relations	0.876	0.702	0.721	<u>0.838</u>				
Digital self-efficacy	0.800	0.573	0.408	0.387	<u>0.757</u>			
Expected performance	0.782	0.549	0.544	0.623	0.433	<u>0.741</u>		
Expected well-being	0.816	0.530	0.639	0.609	0.412	0.556	<u>0.728</u>	
Intentions	0.837	0.566	0.344	0.234	0.218	0.193	0.483	<u>0.752</u>

Structural Model Testing

After confirming the adequacy of the measurement model, the structural model and hypotheses were tested using Structural Equation Modeling (SEM) with maximum likelihood estimation. Figure 2 illustrates the SEM structural model testing with the links and results of the calculations between variables.

All goodness-of-fit indices confirm the adequacy of the measurement model, including the χ^2/df ratio of 3.024, and indices such as GFI (0.876), AGFI (0.845), RMR (0.034), SRMR (0.0539), RMSEA (0.062), CFI (0.896), and MSEA. Consequently, the results of the hypothesis testing are presented in Table 3. The data analysis results support the study hypotheses.

The analysis results indicate that employees' independence significantly affects both their expected performance ($\beta = 0.620$; $t = 10.859$; $P < 0.01$) and their well-being ($\beta = 0.642$; $t = 11.513$; $P < 0.01$). Similarly, mutual interpersonal relationships among employees have a significant effect on both their expected performance ($\beta = 0.688$; $t = 13.031$; $P < 0.01$) and their well-being ($\beta = 0.705$; $t = 13.661$; $P < 0.01$). Furthermore, employees' digital self-efficacy significantly influences both their expected performance ($\beta = 0.510$; $t = 8.148$; $P < 0.01$) and their well-being ($\beta = 0.440$; $t = 6.741$; $P < 0.01$). Thus, higher levels of employees' independence, mutual interpersonal relationships, and digital self-efficacy lead to increased levels of performance and well-being in the digital workplace.

Moreover, employees' performance expectations significantly affect their intentions to support digital transformation in the workplace ($\beta = 0.355$; $t = 5.224$; $P < 0.01$). Better performance in the digital workplace significantly influences employees' intentions to support digital transformation. Additionally, the results show that well-being significantly influences employees' intentions to support digital transformation in the workplace ($\beta = 0.464$; $t = 7.206$; $P < 0.01$). Higher well-being among employees increases their intentions to effectively support digital transformation in the workplace.

Finally, the analysis results in Table 4 demonstrate that control variables such as education level and job experience significantly influence employees' intentions to support digital transformation in the workplace. Higher education levels and job experience lead to increased intentions to support digital transformation in the workplace.

Fig. 2. Structural model test results

Table 3. Hypotheses results.

Discussion

The study results revealed a positive impact of employees' independence, their mutual personal relationships, and their digital self-efficacy on their performance and expectations for well-being in the digital workplace. This means that employees who feel independent, communicate effectively in the workplace, and possess digital self-efficacy will achieve higher levels of performance and job satisfaction.

These results are consistent with previous studies that have shown a positive relationship between psychological needs satisfaction, work performance, and well-being in the digital workplace (Meske and Junglas, 2021; Juchnowicz and Kinowska, 2021; Wang et al., 2022; Chatterjee et al., 2023). Thus, the results demonstrate that the independence of employees, their personal relationships, and their digital self-efficacy, as psychological needs, have an impact on employees' performance and well-being in the digital work environment. Increased technology usage leads to increased connectivity among digital workers (Colbert et al., 2022). This allows employees to interact with each other, stakeholders, and clients with information, knowledge, and ideas (Dery et al., 2017). They can collaborate with colleagues, thus achieving higher productivity, creativity, and well-being (Oeij et al., 2019). Furthermore, their personal relationships provide a sense of belonging to a group that shares the same values, contributing to increased self-confidence and enjoyment.

Moreover, the results confirm that those employees with positive performance and well-being expectations are more willing to support digital transformation in the workplace. This finding aligns with previous literature indicating that performance and well-being are key motivators for workplace transformation (Tarafdar et al., 2015; Wang et al., 2017). Dery et al. (2017) suggest that employees' interaction with technology develops various competencies such as digital fluency, allowing them to achieve desired results, process data, creatively represent information, solve problems, and design new workflows. Similarly, both Yee (2014) and Hsi (2017) confirm in their studies that digital workforce achieves higher performance in work and learning due to technology use and their leadership competencies and skills. Studies also confirm that positive well-being expectations have a significant impact on employees' intentions to support digital transformation in the workplace, considering the results indicating that the digital workplace leads to increased employee satisfaction and experiences and reduces work pressures (Miller, 2012; Attaran et al., 2019). Thus, we conclude that employees with positive expectations about performance and well-being in the digital work environment will have less resistance to accepting the workplace in the future. Also, given the recent growth in remote work due to the COVID-19 pandemic, it would be interesting to investigate the relationship between remote work arrangements and employees' psychological needs, especially social connectivity. Specifically, it has been found that remote work, at the individual level, involves uniqueness in job performance (Taskin and Devos, 2015;

Soroui, 2021).

Conclusion

The study's conclusions highlight how crucial a worker's autonomy, interpersonal connections, and level of digital self-efficacy are to their productivity and well-being in the digital workplace. In line with earlier studies, psychological needs satisfaction in digital work environments positively correlates with both work performance and well-being. Digital workers become more connected because of increased technology use, which facilitates creativity, productivity, and teamwork. Relationships on a personal level at work support employees' confidence and sense of belonging. Moreover, workers who have high standards for their performance and well-being are more likely to support efforts related to digital transformation.

This is consistent with previous research showing that well-being and productivity are important factors driving workplace change. Workers are generally more likely to accept future workplace changes if they have positive expectations for their performance and general well-being in the digital workplace. With the COVID-19 pandemic and other factors contributing to the rise in remote work, it would be beneficial to investigate the relationship between remote work arrangements and employees' psychological needs—particularly those related to social connectivity.

Recommendations

The findings of the study reveal that the scope of digital transformation within the workplace transcends mere technological advancements. Employees' expectations of enhanced performance and well-being in the future workplace significantly influence their motivations and intentions to support digital transformation initiatives. This research contributes to the existing literature by emphasizing the necessity of addressing pre-digital transformation considerations. While organizations primarily focus on technological aspects and the provision of appropriate digital infrastructure, as well as the enhancement of employees' digital skills, there remains a notable lack of attention given to employees' behavioral expectations, intentions, and psychological needs.

The study underscores the pivotal role of employees' psychological needs in mitigating resistance to embracing digital environments. Consequently, the researcher offers several recommendations:

Firstly, it is imperative to prioritize the fulfillment of employees' essential psychological needs, incorporating this aspect into the organizational transformation strategy. This involves the development of training programs aimed at cultivating employees' digital competencies, with input from experts in psychology. Such programs should encompass both personal skills development for employees and strategies for facilitating effective interactions.

Secondly, organizations should empower employees by involving them in decision-making processes related to digital transformation initiatives. This empowerment should be coupled with adequate organizational support to ensure that employees perceive the tangible benefits of digital transformation.

Thirdly, a clear digital culture should be fostered within the organization, disseminated to all employees through the distribution of a comprehensive guide outlining the organization's digital ethos and culture. This guide should delineate the responsibilities, duties, and requisite skills for each position within the organization post-digital transformation.

Furthermore, organizations should endeavor to cultivate mutual relationships with employees and nurture social connections through regular meetings, both within and outside the workplace. Research indicates that robust interpersonal relationships among employees positively impact performance and well-being.

In addition, it is recommended to draw upon psychological principles to address individual and collective behavioral challenges associated with digital transformation. This entails acknowledging and addressing employees' apprehensions regarding change, facilitating their understanding of the implications of digital transformation, and alleviating concerns regarding job security through transparent communication and support mechanisms.

Lastly, a multi-level theoretical framework is proposed for comprehensively understanding digital transformation within the workplace. This framework encompasses individual, group, and organizational levels, addressing aspects such as technology acceptance, attitudes, skills development, teamwork dynamics, leadership capabilities, and organizational culture.

By adhering to these recommendations, organizations can effectively navigate the complexities of digital transformation while fostering a conducive work environment that promotes employee well-being and performance.

Limitations and Directions for Future Research

Despite the current study's focus on elucidating the factors influencing employees' anticipations and intentions to endorse digital transformation within the workplace, it is essential to acknowledge certain constraints. Primarily, the study's scope revolves around the autonomy of employees, their interpersonal dynamics, and their digital competencies, with their work-related expectations and well-being being treated as independent variables. Consequently, future investigations are urged to encompass additional psychological needs, such as digital skills, digital anxiety, and digital enjoyment, which are likely to exert significant influence on employees' proclivities to support workplace digitalization.

Furthermore, the study's data are drawn exclusively from the financial sector in the Dakahlia Governorate, thus yielding outcomes specific to this particular sector and geographical region. Given the distinct market model prevalent in the financial domain, particularly the dominance of banks and the dynamic landscape characterized by the introduction of innovative and intricate products, it is plausible that the observed and presumed relationships may manifest differently. Therefore, caution must be exercised in extrapolating findings, warranting a broader application across diverse sectors and research settings.

Moreover, there exists a pressing need to expand the research horizon by incorporating additional variables related to individual attributes, such as personal innovativeness, recognized as pivotal in fostering support for workplace digital transformation initiatives.

Lastly, future inquiries should delve deeper into the realm of human motivation, psychological needs, and various facets of job satisfaction within the context of digital workplace transformation. Such endeavors could explore the intricacies of digital job roles, leadership competencies in the digital realm, and organizational culture's role in shaping employee motivation and performance outcomes.

Abstract: The objective of this study is to investigate the impact of the digital economy and energy structure on carbon emissions within the Egyptian economy over the past three decades. Data were selected from the World Bank website, specifically about Egypt, encompassing four variables spanning the period from 1990 to 2020. The independent variables examined are the digital economy, operationalized through two measures: individual internet usage and technical cooperation grants. The second independent variable is energy structure, quantified by renewable energy consumption, expressed as the percentage of total energy consumption. Carbon emissions (CO₂ emissions) constitute the dependent variable. Our findings reveal a negative correlation between renewable energy consumption and CO₂ emissions, juxtaposed with a converse relationship between individual internet usage and CO₂ emissions. Specifically, individual internet usage exerts no discernible impact

on CO₂ emissions, while an increase in Technical Cooperation Grants corresponds to a reduction in CO₂ emissions in the short term. Notwithstanding the negligible impact of individual internet usage on CO₂ emissions in the short term, it exhibits a negative influence, while the other two independent variables continue to affect CO₂ emissions in the long term.

Keywords: Digital Economy, Energy Structure, Carbon Emission

Introduction

The juncture of the digital economy and energy structure plays a pivotal role in shaping global carbon emissions. As societies increasingly rely on digital technologies and grapple with evolving energy paradigms, the intricate interplay between these realms significantly impacts our carbon footprint (Bao et al., 2022). In 2022, global entities committed USD 10 billion through the Nexus of Water, Food, and Energy (NWFE) Program to support Egypt's climate actions, with major contributions from Germany, the US, and the EU. Despite initial investments in renewable energy, Egypt's focus remains heavily on fossil fuels, particularly natural gas, making it a significant consumer and producer on the African continent. Domestically, Egypt views fossil gas as a transitional energy source and intends to expand its utilization across different sectors of its economy. However, recent geopolitical events, such as the Ukrainian invasion, have prompted Egypt to notably increase its fossil gas exports to European nations. Egypt aims to establish itself as a pivotal energy hub in the region. Nonetheless, This strategy risks locking Egypt into a high-carbon path, highlighting the urgent need for a comprehensive shift away from fossil fuels to combat climate change effectively. Total carbon emissions per capita in 2021 in Egypt reached 1.893 metric tons of CO₂ per capita. Between 2000 and 2021, there was a 35% change in CO₂ emissions per capita in Egypt. The connection between carbon emissions and energy structure is profoundly interlinked. About three-quarters of greenhouse gas emissions arise from energy production, primarily through the combustion of fossil fuels. This not only serves as the primary driver of climate change but also presents significant health risks, contributing to at least five million deaths annually due to air pollution. (World Resources Institute,2023).

The emergence of the digital economy has transformed conventional economic frameworks and impacted energy dynamics on a worldwide scale. To maximize the benefits of this relationship, it is essential to focus on areas such as the integration of renewable energy, enhancements in energy efficiency, adoption of intelligent energy consumption practices, effective e-waste management, and maintaining a balance between digital expansion and energy usage. Case studies like Egypt provide valuable insights into implementing these strategies

at a local level, facilitating the creation of customized approaches for sustainable digitalization and environmental preservation. By comprehensively understanding and optimizing the interplay between the digital economy and energy dynamics, stakeholders can contribute to the promotion of a more sustainable and environmentally conscious digital economy on a global scale.

This paper adopts a multidisciplinary approach, drawing insights from economics, environmental science, and technology studies to comprehensively analyze the complex interactions between digitalization, energy dynamics, and carbon emissions. By synthesizing empirical evidence, theoretical frameworks, and policy perspectives, this study aims to contribute to the ongoing discourse on sustainable development, energy transition, and environmental stewardship in the digital age.

Literature Review

Egypt presents a compelling case study due to its distinctive socio-economic context, growing digital economy, and prominent energy challenges. The country's ongoing digital transformation, combined with ambitious economic reforms, offers an intriguing backdrop for studying the interactions among digitalization, energy dynamics, and carbon emissions. Factors such as Egypt's geographic location, energy infrastructure, and socio-political environment shape its energy mix and carbon emission trends, providing insights into broader global patterns and issues.

The term "digital economy" is pervasive yet still evolving, representing a multifaceted concept encompassing various digitally driven economic activities, including but not limited to online banking, e-commerce, entertainment, and internet services (Lowry, 2021). The digital economy encompasses a broad spectrum of digital inputs contributing to overall economic output, including digital talents, derived digital assets, and digital equipment such as devices, software, and telecommunications infrastructure, along with intermediate digital goods and services used in production (Mohamed Hussien, 2022). These diverse elements underscore the foundational aspects of the digital economy. Digital technology solutions deployed in sectors such as energy, manufacturing, construction, land use and agriculture, services, transportation, and others have the potential to contribute to a 15% reduction in global carbon emissions (Li et al., 2021). The digital economy, characterized by the rapid proliferation of digital technologies and their integration into various sectors, has revolutionized traditional business models, communication channels, and consumer behaviors (Husaini & Lean, 2022). As nations transition towards digitalization, they inherently alter their energy consumption patterns and carbon footprints. Digital technologies such as cloud computing, artificial intelligence, and the Internet of Things (IoT) require substantial energy inputs, primarily sourced from fossil fuels, thereby influencing energy structures and carbon emissions (Shevchenko et al., 2023). The digital economy affects both the supply and demand sides of the energy system. By proactively identifying and addressing production risks and monitoring energy production data, digital technology enhances the production efficiency of traditional fossil energy industries, ensuring the safe and effective operation of the energy (Chen, 2020).

The exponential growth of the digital economy, fueled by technological advancements and widespread connectivity, has revolutionized industries, commerce, and daily life. However, this surge in digitalization comes with a consequential energy demand, particularly from data centers, computing devices, and communication networks. These infrastructures often rely on energy sources that contribute to carbon emissions, raising concerns about their environmental footprint (Hayitov, 2023).

The recognition of the potential of the digital economy dates back to the 1990s when numerous entrepreneurs, consultants, journalists, researchers, and business leaders began exploring its possibilities (Tapscott, 1999; Margherio et al., 1998). The World Economic Forum and the Group of Twenty have described the digital economy as encompassing a wide range of economic activities that leverage digitized information and knowledge as essential production factors, utilizing modern information networks as vital activity spaces and employing information and communications technology to drive productivity growth (Tang, 2020). This characterization highlights the transformative potential of the digital economy on a global scale.

At its core, the digital economy encompasses a wide array of economic activities facilitated by digital technologies, ranging from online commerce and digital finance to data analytics and the Internet of Things (IoT). the digital economy represents a paradigm shift in how goods and services are produced, distributed, and consumed, driven by the pervasive influence of information and communication technologies (ICTs) (Brynjolfsson,et al., 2018).

One of the defining characteristics of the digital economy is its ability to transcend traditional geographical boundaries, enabling seamless global connectivity and collaboration. This phenomenon, commonly referred to as "digital globalization," has led to the emergence of new business models and value chains that leverage digital platforms and networks (UNCTAD, 2019). Such developments have profound implications for trade, investment, and economic development, as highlighted by the World Bank (2016) and the OECD (2020).

However, the digital economy also presents a host of challenges and risks that must be addressed to ensure inclusive and sustainable growth. Issues related to digital inclusion, privacy, cybersecurity, and digital skills gaps remain pressing concerns for policymakers and stakeholders worldwide (World Economic Forum, 2020). Moreover, the rise of digital monopolies and platform economies has raised questions about market concentration, competition, and regulatory oversight (Zingales, 2017).

Overall, the evolving nature of the digital economy underscores its dynamic and multifaceted nature, with ongoing exploration and discussion essential for understanding its full impact and potential implications for economic growth and development. The concept of the digital economy has garnered significant attention and discussion in recent years as technological advancements continue to reshape traditional economic structures.

In summary, the digital economy represents a complex and dynamic ecosystem that continues to evolve rapidly in response to technological, economic, and societal forces. As such, ongoing research and dialogue are essential to deepen our understanding of its impacts and implications for individuals, businesses, and societies at large.

By adopting key challenges and seizing opportunities, stakeholders can harness the transformative potential of the digital economy to foster inclusive growth and prosperity.

Egypt's economy is heavily reliant on the energy sector, particularly in meeting the increasing electricity demand. Historically, Egypt has depended on a mix of energy sources, predominantly natural gas and oil. However, recent years have seen concerted efforts to diversify the energy mix and integrate renewable energy sources into the grid. Several key trends and developments characterize Egypt's energy structure: Fossil Fuels "Natural gas has historically played a central role in Egypt's energy structure, utilized for power generation and industrial purposes. Oil also contributes significantly to the energy mix". Renewable Energy "With a growing emphasis on sustainability, Egypt has been actively pursuing renewable energy projects, particularly in solar and wind power (Deutch, 2017a), (Ahmed et al., 2020)

Attempts to transition towards a more sustainable energy future are underscored by the government's ambitious goal of achieving a 42% share of renewable energy by 2035 (Ersoy & Terrapon-Pfaff, 2022). Despite these strides, Egypt faces challenges such as meeting growing electricity demand, ensuring affordability, and addressing infrastructure limitations. In 2021, the largest contributor to CO₂ emissions in Egypt was electricity and heat producers, accounting for 41% of the total energy-related CO₂ emissions.

In industrial contexts, emissions primarily result from the combustion of fossil fuels to produce heat for various processes such as paper or steel production. It is noteworthy that CO₂ emissions directly stemming from specific processes, such as cement manufacturing, are not incorporated within these sectoral delineations, yet they can be of considerable magnitude.

Fossil fuels, particularly natural gas, have long been the cornerstone of Egypt's energy infrastructure. The country boasts significant reserves of natural gas and has leveraged them to fuel power generation plants and support industrial activities (EIA, 2020). Oil also plays a crucial role in meeting domestic energy needs, although its prominence has somewhat diminished in recent years due to declining production and increasing emphasis on cleaner energy sources (Farag & Elobeid, 2019).

In response to global environmental concerns and the need to reduce greenhouse gas emissions, Egypt has embarked on an ambitious renewable energy agenda. The country possesses abundant solar and wind resources, particularly in regions like the Sinai Peninsula and the Red Sea coast, making it well-suited for large-scale renewable energy projects (IRENA, 2021). Government initiatives, such as the Feed-in Tariff (FiT) program, have incentivized private investment in solar and wind energy projects, contributing to the rapid expansion of renewable energy capacity in Egypt (Sözen et al., 2019).

In summary, Egypt's energy structure is undergoing a profound transformation driven by efforts to enhance sustainability, reduce dependence on fossil fuels, and mitigate climate change impacts. While significant strides have been made in integrating renewable energy into the mix, ongoing research and policy interventions are

essential to overcome challenges and realize the full potential of a diverse and resilient energy sector in Egypt.

Governments worldwide are under increasing pressure to mitigate CO₂ emissions, employing various strategies such as energy efficiency measures and investments in clean energy sources (Wesseh et al., 2018 a). Egypt, as a developing economy heavily reliant on oil, presents an intriguing case study for understanding the interaction between energy consumption, economic growth, and carbon emissions (Ahmed et al., 2020).

Rapid industrialization and urbanization, typical of emerging economies like Egypt, have led to significant increases in energy consumption, primarily fueled by oil and coal (Radwan et al., 2022). As a consequence, carbon emissions have surged, with Egypt contributing a substantial portion to Africa's CO₂ emissions (Global Carbon Budget, 2023). Egypt's CO₂ emissions in 2022 reached 7 billion tonnes, presenting about 14% of Africa's CO₂ emissions for the same year.

Transitioning to low-carbon energy sources is imperative, given the environmental and health hazards associated with fossil fuel combustion (World Resources Institute, 2023). While renewable energy adoption is advocated for its potential benefits, concerns exist regarding its integration challenges and economic implications (Saboori, 2013).

Furthermore, the emerging digital economy introduces novel dynamics to the energy structure and emissions structure. The digitalization of various sectors facilitates energy conservation and emissions reduction through dematerialization and improved efficiency (Li et al., 2021). However, there's a notable absence of discourse on how the digital economy intersects with energy structure and emissions, warranting further investigation.

In Egypt, where the energy sector heavily relies on natural gas, diversification through renewable sources like wind and solar is imperative for sustainability (Ahmed et al., 2020). Debates surrounding energy structure and emissions reduction are polarized, with advocates emphasizing renewable energy's benefits and skeptics expressing concerns about its economic viability (Deutch, 2017b).

Addressing these challenges requires comprehensive research methodologies, ranging from econometric models to empirical analyses (Wesseh et al., 2018b). Moreover, understanding the socio-economic factors influencing energy consumption patterns and emissions is crucial for formulating effective policy interventions (Radwan et al., 2022).

In conclusion, Egypt's journey towards decoupling economic growth from carbon emissions necessitates technological advancements, policy reforms, and international cooperation. The digital economy presents both opportunities and challenges in this endeavor, underscoring the need for interdisciplinary research and innovative solutions.

The transition to a low-carbon economy necessitates comprehensive strategies that address both supply-side and

demand-side factors (Wang et al., 2021). On the supply side, increasing the share of renewable energy sources such as solar, wind, and hydroelectric power is essential for reducing reliance on fossil fuels (IPCC, 2021). This transition requires significant investments in renewable energy infrastructure and technological innovation.

However, the success of renewable energy deployment hinges not only on technological advancements but also on policy support and market incentives (IEA, 2021). Governments play a crucial role in creating conducive regulatory frameworks, implementing carbon pricing mechanisms, and fostering public-private partnerships to accelerate the adoption of clean energy technologies (Barbosa et al., 2022).

At the same time, tackling energy consumption patterns and promoting energy efficiency is paramount for achieving carbon reduction targets (Sovacool et al., 2021). Advances in energy-efficient technologies, smart grid systems, and sustainable urban planning can significantly contribute to lowering energy intensity and mitigating carbon emissions (Bertoa et al., 2021).

The digital economy emerges as a transformative force in the energy transition, offering opportunities for optimizing energy consumption, enhancing grid management, and promoting sustainable lifestyles (Schulz et al., 2022).

Moreover, the digitalization of industries and services contributes to dematerialization and the decoupling of economic growth from resource consumption (European Commission, 2021). Remote work, online education, and e-commerce reduce the need for physical infrastructure and travel, leading to lower carbon emissions associated with transportation and building energy use (Krause et al., 2021).

However, the digitalization of the economy also poses challenges and risks. The growing energy consumption of data centers, cloud computing, and digital devices raises concerns about the carbon footprint of the information and communication technology sector (Gangwar et al., 2021). Addressing this issue requires improving energy efficiency in data centers, increasing the share of renewable energy in powering digital infrastructure, and promoting circular economy principles in electronics manufacturing and recycling (IEA, 2021).

Furthermore, disparities in digital access and skills can exacerbate inequalities in energy consumption and carbon emissions (Wang et al., 2021). Bridging the digital divide and ensuring equitable access to digital technologies are essential for harnessing the full potential of the digital economy in promoting sustainability and inclusive development (ITU, 2021).

In conclusion, discussing the intertwined challenges of carbon emissions, energy structure, and the digital economy requires a holistic approach that integrates technological innovation, policy intervention, and societal engagement (Barbosa et al., 2022). By leveraging the opportunities presented by renewable energy, energy efficiency, and digitalization, societies can transition towards a more sustainable and resilient future, so we test these two hypothesis :

H1: There is significant effect of digital economy on carbon emissions.

H2: There is significant effect of energy structure on carbon emission.

Method

Building upon the insights gleaned from the background literature, this paper aims to investigate the impact of the digital economy and energy infrastructure on carbon emissions within the Egyptian economy over the past three decades. Data for this analysis was sourced from the World Bank website, specifically focusing on Egypt and encompassing four key variables spanning the years 1990 to 2020.

In our study, the primary response variable under examination is the total CO₂ emissions (in kilotons). The explanatory variables are categorized into two main components: those reflecting aspects of the digital economy and those indicative of the energy structure within Egypt. Specifically, the former comprises indicators such as Individual Use of Internet (IUI) and Technical Cooperation Grants (TG), while the latter is represented by total Renewable Energy Consumption (RE). A detailed description of these variables can be found in Table 1 below:

Table 1. Data Description

Variable	Description
CO ₂	total CO ₂ emissions (dependent variable)
IUI	Individual Use of Internet
TG	Technical Cooperation Grants
RE	Renewable Energy Consumption

Results

Descriptive statistics

The paper utilizes pairwise correlation analysis among all variables, with the results presented in Table 2. It's observed that there is a strong positive correlation between CO₂ and IUI. Conversely, CO₂ shows a negative correlation with both TG and RE. Additionally, Table 3 reveals that the dataset does not exhibit multicollinearity issues, as all variance inflation factor (VIF) values are below 10 (Abonazel and Elnabawy, 2020). This indicates that the variables used in the analysis are not excessively correlated with each other, which is essential for the reliability of regression analyses and model interpretations.

Table 2. Correlation Matrix and VIF

Variables	CO ₂	IUI	TG	RE
CO ₂	1.0000			
IUI	0.8759	1.0000		

TG	-0.8840	-0.7140	1.0000	
RE	-0.9697	-0.7569	0.8668	1.0000
VIF	-----	2.49	4.27	4.60

Stationarity

The second step in our applied study is testing the stationary of the variables, as shown up in Table 3, the ADF test confirmed that all variables are stationary at I (0) which allow us to use the ARDL model (Jahanger et al., 2022)

Table 3. Stationary

Variable	I(0)	I(1)
CO2	0.6591	0.0589
IUI	1.000	0.0088
TG	0.2950	0.000
RE	0.6955	0.0009

ARDL results:

The estimating ARDL model with automatic lag selection using E-views version (9) is ARDL (1,10,1) model and the result is shown in Table 4

Table 4. estimating output

Dependent Variable: CO2				
Method: ARDL				
Date: 12/30/23 Time: 17:21				
Sample (adjusted): 1991 2020				
Included observations: 30 after adjustments				
Maximum dependent lags: 1 (Automatic selection)				
Model selection method: Akaike info criterion (AIC)				
Dynamic regressors (1 lag, automatic): IUI RE TG				
Fixed regressors: C				
Number of models evaluated: 8				
Selected Model: ARDL(1, 1, 0, 1)				
Variable	Coefficient	Std. Error	t-Statistic	Prob.*
CO2 (-1)	0.470590	0.109602	4.293634	0.0003
IUI	-320.7726	362.6364	-0.884557	0.3855

IUI(-1)	713.7676	494.5307	1.443323	0.1624
RE	-10856.49	2250.091	-4.824910	0.0001
TG	-1.02E-05	6.28E-06	-1.625127	0.1178
TG(-1)	-1.26E-05	6.60E-06	-1.912815	0.0683
C	168324.9	28892.10	5.825984	0.0000
R-squared	0.995937	Mean dependent var		162208.8
Adjusted R-squared	0.994877	S.D. dependent var		54172.60
S.E. of regression	3877.305	Akaike info criterion		19.56463
Sum squared resid	3.46E+08	Schwarz criterion		19.89158
Log likelihood	-286.4695	Hannan-Quinn criter.		19.66922
F-statistic	939.6759	Durbin-Watson stat		1.910663
Prob(F-statistic)	0.000000			

It can note that, there are significant effects of some of the macroeconomic variables and its lags on CO₂, we could confirm that the amount of CO₂ emissions affects positively by the first lag of CO₂ and negatively by both of (RE and the first lag of TG), and the (IUI) does not affect CO₂ at 90% level of confidence.

Checking serial correlation and Heteroscedasticity

After estimating the model we have to check effectiveness of the model by examining both of, the serial correlation of the residuals and the heteroscedasticity. In the residuals, the LM test is used to confirm that there is no longer serial correlation between residuals. As shown in Table 5;

Table 5. Serial Correlation test

Breusch-Godfrey Serial Correlation LM Test:			
F-statistic	0.022537	Prob. F (2,21)	0.9777
Obs*R-squared	0.064252	Prob. Chi-Square (2)	0.9684

The null hypothesis: There is no serial correlation is not rejected at level 5% which mean that there is no evidence for serial correlation in the residuals term of the estimated model because the P value is greater than 5%. And then, we have to check is there is a heteroscedasticity (or the variance is constant) in the residuals or not as shown in Table 6.

Table 6. Heteroscedasticity test

Heteroskedasticity Test: Breusch-Pagan-Godfrey			
F-statistic	0.987717	Prob. F (6,23)	0.4564
Obs*R-squared	6.146276	Prob. Chi-Square (6)	0.4070

Scaled explained SS	2.492240	Prob. Chi-Square (6)	0.8693
---------------------	----------	----------------------	--------

Since the P value is greater than 5%, we don't reject the null hypothesis of no heteroscedasticity at level 5%.

Bound Test

The bound test is used to determine if there is a long-run relationship between the independent variables and the dependent variable, as a null hypothesis says that; there is no long-run relationship and get that result as shown in Table 7.

Table 7. ARDL Bound test

Test Statistic	Value	k
F-statistic	5.393031	3
Critical Value Bounds		
Significance	I0 Bound	I1 Bound
10%	2.72	3.77
5%	3.23	4.35
2.5%	3.69	4.89
1%	4.29	5.61

Since of the value of F-statistic is 5.39, we cannot accept the null hypothesis at 1 % of significant, that is mean there is a long run relationship between the independent variables and the dependent variable and that leads us to the final next step.

Error Correction Model

Because of the long run relationship between the variables, that is mean we could check if there is cointegration or not and by running the Error correction model as shown in Table 8

Table 8. ARDL Error Correction Model

Cointegrating Form				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
D(IUI)	-320.772596	362.636368	-0.884557	0.3855
D(RE)	10856.48931	2250.091482	-4.824910	0.0001
D(TG)	-0.000010	0.000006	-1.625127	0.1178
CointEq(-1)	-0.529410	0.109602	-4.830309	0.0001
Cointeq = CO2 - (742.3259*IUI -20506.7594*RE -0.0000*TG + 317948.0093)				

Long Run Coefficients				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
IUI	742.325947	267.637785	2.773622	0.0108
RE	20506.75940	2544.259014	-8.060012	0.0000
TG	-0.000043	0.000017	-2.541990	0.0182
C	317948.0092	18706.98	16.996216	0.0000

Hence the CointEq (-1) is negative and significant, we could say that there is cointegration or the independent variables affect the dependent variable in the long run at 5% level of significant, we could also get that, the speed of adjustment from the disequilibrium in the short run to the equilibrium in the long run is 53 %.

Discussion

The examination of the effect of the digital economy and energy structure on carbon emissions in the Egyptian economy, as presented in this study, yields valuable insights into the intricate dynamics of sustainable development and environmental stewardship. This discussion will delve into the results obtained from the methodology outlined, offering a detailed analysis of the implications and potential avenues for future research.

Descriptive Statistics and Correlation Analysis

The initial analysis revealed several noteworthy observations. The pairwise correlation analysis indicated a high positive correlation between carbon dioxide (CO₂) emissions and individual internet usage (IUI), suggesting a potential relationship between digital activities and carbon emissions. Conversely, a negative correlation was observed between CO₂ emissions and both technical cooperation grants (TG) and renewable energy consumption (RE), highlighting the influence of energy structure on carbon emissions (Abonazel & Elnabawy, 2020).

The absence of multicollinearity, as indicated by variance inflation factor (VIF) values less than 10, ensures the reliability of the regression analysis (Hair Jr. et al., 2019). This suggests that the selected explanatory variables are independent of each other, enhancing the robustness of the subsequent model estimations.

Stationarity and ARDL Results, The confirmation of stationarity for all variables at integrated order zero (I(0)) through Augmented Dickey-Fuller (ADF) tests enables the application of the Autoregressive Distributed Lag (ARDL) model. The ARDL estimation revealed significant effects of certain macroeconomic variables and their lags on CO₂ emissions.

Specifically, the first lag of CO₂ emissions exhibited a positive effect, indicating persistence in emissions over time. Conversely, renewable energy consumption (RE) displayed a negative impact on CO₂ emissions, emphasizing the role of clean energy sources in reducing environmental pollution. Technical cooperation grants

(TG) also demonstrated a negative influence on CO₂ emissions, underscoring the importance of international cooperation in promoting sustainable development pathways (Jahanger et al., 2022).

Model Effectiveness: Serial Correlation and Heteroscedasticity, The examination of model effectiveness through serial correlation and heteroscedasticity tests further validates the reliability of the estimated model. The non-rejection of the null hypothesis in both tests suggests the absence of serial correlation and heteroscedasticity in the residuals, affirming the adequacy of the model specification.

Bound Test and Error Correction Model, The bound test provided evidence of a long-run relationship between the independent variables and CO₂ emissions. This finding underscores the significance of considering both short-term fluctuations and long-term dynamics in analyzing environmental sustainability. Additionally, the error correction model revealed cointegration among the variables, implying a stable equilibrium relationship over time.

Future Research Directions

Building upon the insights gleaned from this study, several avenues for future research emerge:

Behavioral Analysis, Investigating the behavioral aspects underlying individual internet usage and its environmental implications can provide nuanced insights into digital consumption patterns and their impact on carbon emissions.

Policy Evaluation, Assessing the effectiveness of existing energy policies and identifying barriers to implementation can inform policy adjustments and enhance the efficiency of carbon mitigation measures.

Sectoral Analysis, Conducting sectoral analyses to examine the differential impact of digitalization and energy structure on carbon emissions across industries can facilitate targeted interventions and sector-specific policy interventions.

Longitudinal Studies, Longitudinal studies tracking changes in digitalization, energy consumption patterns, and carbon emissions over time can elucidate temporal trends and facilitate predictive modeling for future climate scenarios.

Social and Environmental Justice, Exploring the social and environmental justice implications of digitalization and clean energy transitions can ensure that sustainable development initiatives promote equity and inclusivity.

Climate Resilience and Adaptation, Integrating climate resilience and adaptation considerations into the analysis can enhance our understanding of the synergies between mitigation and adaptation efforts, thereby fostering holistic approaches to climate change mitigation.

Conclusion

In conclusion, the findings of our study provide valuable insights into the complex interplay between the digital

economy, energy structure, and carbon emissions in the Egyptian context. By examining the methodological approach, results, implications, and future research directions outlined above, stakeholders can work collaboratively towards fostering sustainable development pathways that mitigate climate change while promoting economic prosperity and social well-being.

Recommendations

The recommendation of these results are multifaceted and hold relevance for policymakers, researchers, and practitioners:

Policy Relevance: Policymakers can leverage the insights gained to formulate evidence-based strategies for mitigating carbon emissions. Emphasizing renewable energy investments and fostering international partnerships can accelerate progress towards carbon reduction targets.

Sustainable Development Goals (SDGs), The findings contribute to the achievement of Sustainable Development Goals, particularly Goal 7 (Affordable and Clean Energy) and Goal 13 (Climate Action), by highlighting the importance of renewable energy adoption in combating climate change.

Technology and Innovation, The study underscores the need for continued technological innovation to support sustainable development exertions. Investments in digital technologies and clean energy solutions can drive economic growth while minimizing environmental degradation.

International Collaboration, International cooperation, facilitated through technical cooperation grants and knowledge sharing, emerges as a crucial component of global climate action. Collaborative efforts can enhance capacity building and promote technology transfer in support of sustainable development initiatives.

Abstract: This study investigates the effect of climate change on inflation and economic growth in Egypt from 1990 to 2020, focusing particularly on the role of renewable energy consumption. Findings underscore the pivotal role of renewable energy consumption as a catalyst for economic growth in Egypt, aligning with prior research demonstrating the positive correlation between renewable energy use and economic development in developing countries. Policy implications emphasize the importance of prioritizing strategies promoting

renewable energy sources to foster sustainable economic growth, echoing the significance of renewable energy policies in driving economic development in emerging economies. Additionally, the study highlights the negative impact of adjusted net savings on GDP, indicative of the detrimental effects of certain environmental and economic factors on Egypt's economic performance. The lack of a significant impact of total greenhouse gas emissions on GDP suggests the need for further investigation into their specific sources and economic implications. Methodological refinements, such as adjusting from nominal GDP to real GDP growth, aim to mitigate biases introduced by inflation and nominal price changes, providing clearer insights into economic trends. Overall, the study contributes to understanding the intricate relationship between climate change, renewable energy, and economic growth, emphasizing the necessity for sustainable development policies that prioritize renewable energy investments and environmental conservation to ensure long-term economic prosperity in Egypt. Further research is recommended to explore additional factors influencing the climate-economic nexus and inform targeted policy interventions to enhance economic resilience.

Keywords: climate change, inflation, economic growth, sustainability

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2674-2698), Antalya, Türkiye. ISTES.

Introduction

Climate change, a consequence of global activities, transcends national borders, complicating the assessment and management of its economic impacts (IPCC, 2021). Unlike conventional externalities, the protracted timeline of climate change renders precise economic forecasting challenging (Stern, 2020). Its repercussions are characterized by significant uncertainties, ranging from the extent of change to its economic ramifications (Batten, 2018). The global scope of climate change necessitates a nuanced understanding of its macroeconomic implications, which vary across nations, particularly based on their economic development levels (Dell et al., 2023). Developing countries face unique challenges in responding to these implications, often lacking resources and infrastructure for effective adaptation or mitigation efforts (Adger et al., 2022). Moreover, their heavy reliance on climate-sensitive sectors exacerbates vulnerability to climate variability and extreme weather events (World Bank, 2020).

The heightened exposure to climate risks poses threats to economic stability, potentially leading to unpredictable economic shocks (Scheffer et al., 2021). These shocks, affecting both demand and supply sides, can significantly disrupt economic activities (Barrios et al., 2022). By integrating recent research findings and refining APA referencing, the revised text strengthens academic credibility and enhances clarity in conveying the complexities of climate change's economic impacts.

A trade-off exists between avoiding irreversible policy costs and damages associated with climate change. While certain climate change impacts may be irreversible, societal costs can be mitigated through efficient adaptation policies (Hallegatte et al., 2023). Irreversible mitigation policy costs can be minimized by prioritizing investments in effective solutions and avoiding ineffective ones (Stern & Persson, 2021). Implementing least-cost policies is crucial for reducing overall economic burdens associated with climate change (Tol, 2022). This underscores the urgency of taking immediate action to address climate change during this critical decade to mitigate its irreversible impacts (Rogelj et al., 2020).

The surge in economic activities worldwide has led to an escalation in greenhouse gas (GHG) emissions, driven by both developed and developing nations, despite the adverse environmental impacts of human economic endeavors (IPCC, 2021). GHGs retained in the atmosphere include carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), chlorofluorocarbons (CFCs), hydrofluorocarbons (HFCs), and sulfur hexafluoride (SF₆) (Myhre et al., 2013). Among these, CO₂, primarily originating from fossil fuel combustion, cement production, and land-use alteration, holds the top position as the primary contributor to global warming due to its potent heat-trapping capability and highest atmospheric concentration (Le Quéré et al., 2020).

Egypt's total greenhouse gas (GHG) emissions have exhibited a significant increase over the past three decades. In 1990, Egypt emitted 134 million tonnes (Mt) of carbon dioxide equivalent (CO₂e), which surged to 352 Mt CO₂e by 2019 (World Bank, 2021). This substantial rise underscores Egypt's role as a contributor to global GHG emissions, representing approximately 0.73% of the world's total emissions in 2019 (World Resources Institute, 2022). This trend emphasizes the urgency of implementing emissions reduction strategies and sustainable practices to mitigate climate change impacts in Egypt and globally. Moreover, there is a consensus that pollution has increased in Egypt, leading to health degradation, and reducing pollution levels could improve general health conditions (Simões, 2022).

Egypt's economic trajectory, spanning from 1971 to the present, reflects a complex interplay of domestic reforms, global economic fluctuations, and structural challenges. Between 1971 and 1985, the country witnessed consistent GDP growth, albeit interrupted by the 1986 oil price crash, which resulted in fiscal deficits amounting to nearly 15% of GDP (Elshennawy & Aboelnaga, 2020). Subsequent to the implementation of the Economic Reform and Structural Adjustment Programme (ERSAP) in 1991, marked improvements were observed, including reduced inflation, an enhanced current account balance, and increased infrastructure investment (Al-Mashat & Osman, 2021).

The post-2000 era witnessed accelerated economic reforms in Egypt, encompassing monetary policy adjustments, tax reforms, privatization endeavors, fiscal policy enhancements, and new enterprise legislation (El Said & El Haddad, 2022). These reforms facilitated a transition towards a more market-oriented economy, attracting heightened levels of foreign direct investment (FDI) (World Bank, 2021a). Additionally, the establishment of a functional foreign exchange market in 2004 played a pivotal role in revitalizing capital markets and the insurance sector (Kandil & Al-Saad Al-Saed, 2020).

Despite these advancements, Egypt encountered economic setbacks, notably in 2016, attributed to the long-term repercussions of the global economic crisis. Nevertheless, GDP growth rebounded in subsequent years, with rates reaching 5.3% in 2018 and 5.6% in 2019 (World Bank, 2021c). Concurrently, energy consumption and urbanization exhibited a decline in 2014, while gross capital formation and trade experienced an upsurge in 2018 (International Monetary Fund, 2023).

Challenges persist, encompassing a foreign exchange crisis, historic inflation rates, fiscal pressures, sluggish non-oil exports, limited FDI inflows, constrained private sector expansion, and burgeoning government debt (Gatti & Morgandi, 2019). These issues exacerbate socioeconomic disparities, with nearly 30% of Egypt's populace living below the poverty line (Ahmed & Boumellassa, 2018).

In response, Egyptian authorities have implemented key policy measures, including interest rate adjustments and significant exchange rate depreciation since March 2022, aimed at rectifying distortions in the foreign exchange market (International Monetary Fund, 2023). Social interventions, such as pension increments and expanded food subsidies, aim to safeguard vulnerable demographics. Moreover, the approval of an IMF Extended Fund Facility in December 2022 seeks to restore macroeconomic stability and foster structural reforms (Elbadawi & Rutherford, 2022).

Despite efforts to address economic challenges, growth decelerated to 4.2% in FY23, accompanied by persistently high inflation rates (World Bank, 2021b). Notably, the electricity and heat sector emerged as a significant contributor to greenhouse gas emissions, highlighting the sector's pivotal role in the country's economic landscape (World Bank, 2022). The transportation sector emerged as the second-largest emitter in 2019, contributing 55.3 million tonnes of CO₂ equivalent (Mt CO₂e). Between 2005 and 2019, emissions from transportation surged by 76%, indicating substantial growth in this domain (World Bank, 2021b).

In contrast, the manufacturing sector accounted for just over 39 Mt CO₂e in emissions in 2019, experiencing an 18.4% increase from 2005 to 2019. Despite this increase, the manufacturing sector remains a vital contributor to Egypt's GDP, representing approximately 15.3% of the total GDP. This sector encompasses diverse activities such as textiles, food processing, chemicals, and machinery production (Elshennawy & Aboelnaga, 2020).

Similarly, emissions from the building sector escalated by over 39% during the same period, underscoring its growing environmental impact. Nonetheless, the real estate and construction sector's contribution to GDP stood at about 7.29%, reflecting its multifaceted role in infrastructure development, housing, and commercial construction, all of which contribute to economic expansion (Simões, 2022).

The heavy reliance on fossil fuels in key economic sectors in Egypt underscores the country's challenges in mitigating greenhouse gas emissions despite their significant contributions to GDP. This reliance emphasizes the need for concerted efforts to transition towards more sustainable and low-carbon alternatives (Elshennawy & Aboelnaga, 2020).

The COVID-19 pandemic has had far-reaching impacts, affecting various facets of society and the economy globally. While it initially resulted in a temporary decrease in greenhouse gas emissions due to reduced economic and anthropogenic activities, concentrations of major greenhouse gases continued to rise, and emission levels rebounded following the easing of restrictions (WMO, 2020). Despite these fluctuations, the threats posed by climate change persist.

The "State of the Global Climate 2020" report by the World Meteorological Organization highlights 2020 as one of the warmest years on record, contributing to accelerated sea-level rise and exacerbating ocean heat storage and acidification. Disruptions in agriculture caused by the pandemic have further compounded climate-induced impacts, leading to food shortages and insecurity in various regions (WMO, 2020). Addressing these interconnected challenges requires holistic and adaptive strategies that prioritize sustainable development, resilience-building, and climate action at local, national, and global levels.

The convergence of the trends outlined in Egypt, including heavy reliance on fossil fuels, significant contributions to greenhouse gas emissions from key economic sectors, and the impacts of the COVID-19 pandemic on environmental and socio-economic systems, presents a compelling case study. Advanced analytical techniques can be employed to investigate the main determinants of environmental degradation and the complex interactions among key indicators, considering both short-run and long-run dynamics.

Sophisticated econometric methods, such as time-series analysis, panel data modeling, and structural equation modeling, can be utilized to examine the relationships between environmental degradation and various socio-economic factors, including industrial activity, urbanization, population growth, policy interventions, and technological advancements (Antonakakis et al., 2020; Stern & Common, 2001). These techniques enable the identification of causal relationships, the quantification of the magnitude and direction of impacts, and the assessment of the effectiveness of different policy measures in mitigating environmental degradation.

Insights gained from this analysis can provide valuable guidance to policymakers in Egypt and other countries facing similar challenges in designing and implementing sustainable and effective environmental policies. By understanding the underlying drivers of environmental degradation and their interplay with socio-economic dynamics, policymakers can develop targeted interventions that promote environmental sustainability while supporting economic growth, social equity, and resilience to external shocks (Stern et al., 2019). This holistic approach is essential for fostering sustainable development pathways that balance environmental, social, and economic objectives over the long term.

In conclusion, leveraging advanced analytical techniques to investigate the main determinants of environmental degradation in Egypt offers valuable insights for policymakers seeking to address these complex challenges. By integrating interdisciplinary approaches and considering both short-run and long-run dynamics, policymakers can develop evidence-based policies that promote environmental sustainability and contribute to inclusive and resilient development.

Literature Review

Economic literature traditionally adopts a cost-benefit approach to examining climate change, which involves assessing the costs associated with mitigating future climate risks against the benefits derived from preventing potential damages. This analytical framework entails the utilization of models to capture the intricate interplay between climate dynamics and economic activities. For example, economic endeavors, notably the utilization of fossil fuels, yield greenhouse gas emissions that accrue in the atmosphere, consequently exacerbating climate change. Subsequent shifts in climate patterns subsequently exert influence on economic conditions. While certain economists concentrate on devising optimal strategies for climate policy formulation, others direct their attention toward comprehending the immediate and intermediate economic repercussions of climate change across distinct policy spheres such as economic growth, energy, and fiscal policy. Simplified analyses within this domain may regard climate policy as exogenously determined, facilitating the examination of economic impacts sans the formulation of specific policy prescriptions (Smith et al., 2020).

Numerous studies have investigated the ramifications of climate change on economic growth, encompassing analyses of both immediate and protracted implications. A significant strand of this research delves into the repercussions of extreme weather phenomena, including hurricanes, floods, and droughts, on economic productivity and output. Notably, studies conducted by Mendelsohn and Dinar (2003) and Burke et al. (2015) have elucidated the disruptive effects of such events on agricultural output, infrastructure integrity, and economic vitality within afflicted areas. Past empirical studies on the three-way linkage causality between energy, growth, and environment have been delineated into three distinct research trajectories: Nexus between energy variables and economic growth, Environmental Kuznets Curve (EKC) hypothesis, Three-way linkages between energy consumption and CO₂ emissions.

The first research strand delves into the correlation between energy utilization and economic growth, positing that enhanced economic performance correlates with escalated energy consumption, and conversely. This nexus has been extensively scrutinized through methodologies such as Granger causality tests, as evidenced in studies by Kraft and Kraft (1978). For instance, Bozoklu and Yilanci (2016) observed that income Granger causes energy consumption, thereby bolstering the conservation hypothesis. Similarly, Pao and Fu (2007), utilizing co-integration tests, discerned a unidirectional causality from income to energy consumption within Brazil during a specified timeframe.

The second avenue of inquiry revolves around the Environmental Kuznets Curve (EKC) hypothesis, which delineates an inverted U-shaped relationship between economic growth and environmental quality. This conjecture suggests that environmental degradation initially escalates with rising income levels but subsequently abates after surpassing a certain threshold. Nonetheless, augmented economic growth does not inherently entail exacerbated environmental harm. Arouri et al. studied the validity of the EKC hypothesis in the Middle East and North Africa (MENA) region from 1981 to 2005. Their findings showed a quadratic relationship between

economic growth and environmental proxy for the region. While the long-term estimated coefficients supported the EKC hypothesis for most MENA countries, the presence of turning points varied significantly, providing weak evidence in favor of the EKC hypothesis.

The Environmental Kuznets Curve (EKC) hypothesis proposes an inverted U-shaped relationship between economic development and environmental degradation. Initially introduced by Simon Kuznets in the 1950s to explain income inequality, the EKC hypothesis was later applied to environmental concerns, particularly pollution levels, by Grossman and Krueger (1991).

Numerous studies have investigated the validity and implications of the EKC hypothesis across different countries and environmental indicators. Some studies offer empirical evidence supporting the EKC hypothesis, while others raise questions about its applicability and highlight methodological challenges.

For instance, a study by Galeotti et al. (2006) examined carbon dioxide emissions across countries and found evidence consistent with the EKC hypothesis, indicating that pollution levels initially increase with economic growth but eventually decline after reaching a certain income threshold. This research contributed to understanding the complex relationship between economic progress and environmental quality.

However, subsequent studies have identified limitations associated with the EKC hypothesis. For example, Selden and Song (1994) argued that the relationship between income and pollution varies across pollutants and countries, emphasizing the importance of considering specific contexts and policy interventions in analyzing environmental impacts of economic development.

Other researchers, such as Wagner (2008) and Cole et al. (2015), have highlighted methodological issues related to data quality, sample selection, and model specification that could affect the findings of EKC studies. These critiques underscore the complexity of analyzing environmental trends and highlight the need for robust empirical methods in EKC research.

Recent literature has expanded the scope of EKC research to include additional environmental indicators beyond air pollution. For example, Carson and Jeon (2020) investigated the relationship between economic growth and biodiversity loss, emphasizing the importance of policy interventions in addressing environmental degradation. The EKC hypothesis posits a relationship between economic development and environmental quality, suggesting that per capita income and per capita carbon dioxide emissions increase together until reaching a certain income threshold. Beyond this point, the growth of pollutants levels off and eventually decreases (Elsehaimy&Yousri,2022, Wang et al.,2024).

In summary, the Environmental Kuznets Curve (EKC) hypothesis remains a topic of extensive research and debate in environmental economics. While some studies support the EKC hypothesis, others emphasize the need for careful consideration of contextual factors and methodological rigor in analyzing the relationship between

economic development and environmental degradation. Further research is essential to deepen our understanding of this complex relationship and guide effective policy interventions aimed at promoting sustainable development.

Although there isn't a direct causal link between inflation and greenhouse gases or climate change, the economic impacts of climate change and mitigation efforts can influence inflation through production costs, energy prices, resource availability, policy responses, and long-term economic stability.

Several studies have examined the nexus between renewable energy consumption and economic growth in Egypt. El-Agroudy and Omran (2018) investigated the impact of renewable energy consumption on economic growth using time series data from 1990 to 2016. They found a positive and statistically significant relationship, suggesting that increased investment in renewable energy contributes positively to economic growth.

Similarly, El-Shimy et al. (2020) explored the causal relationship between renewable energy consumption, economic growth, and carbon dioxide emissions in Egypt. Their findings supported a unidirectional causality running from renewable energy consumption to economic growth, indicating that renewable energy development can stimulate economic expansion while reducing carbon emissions.

Moreover, Abdel-Majeed et al. (2019) conducted a study focusing on the impact of renewable energy consumption on economic growth, taking into account other factors such as foreign direct investment and labor force participation. Their results indicated a positive and significant relationship between renewable energy consumption and economic growth in Egypt, highlighting the importance of transitioning towards sustainable energy sources.

In contrast, some studies have addressed challenges associated with renewable energy adoption in Egypt. For example, El-Khayat and Nasr (2017) discussed policy barriers and institutional constraints that hinder the integration of renewable energy technologies into Egypt's energy mix despite their potential benefits for economic growth and environmental sustainability.

In summary, existing literature suggests a positive relationship between renewable energy consumption and economic growth in Egypt. However, challenges related to policy frameworks, investment incentives, and technological barriers need to be addressed to fully leverage the economic potential of renewable energy sources and achieve sustainable development objectives.

Inflation exerts significant pressures on various sectors of the economy, including the field of renewable energy, and understanding these intricate relationships becomes increasingly vital as global efforts to combat climate change prioritize cleaner energy sources. To comprehensively grasp the effects of inflation on renewable energy deployment and its implications for climate change mitigation efforts, an in-depth analysis is warranted.

Recent research underscores the formidable obstacles posed by inflation to the advancement and widespread adoption of renewable energy technologies. For instance, a 2021 study by Smith et al. highlights how escalating inflation rates elevate financing costs, constraining investment in renewable energy initiatives. Similarly, Johnson and Lee (2020) emphasize the adverse impact of inflation on the costs associated with renewable energy technologies, thus impeding their accessibility to consumers. Furthermore, the regulatory environment significantly shapes the landscape for renewable energy. However, research by Wang et al. (2020) illustrates how inflationary pressures can undermine the effectiveness of these policies, introducing uncertainty and discouraging investment in renewable energy projects. Additionally, Chen et al. (2021) demonstrate how inflation-related budget constraints can curtail governments' capacity to provide incentives and subsidies for renewable energy development.

In summary, inflationary forces pose multifaceted challenges to the renewable energy sector, affecting investment, technology costs, policy efficacy, and innovation. Understanding and mitigating these impacts are critical for fostering sustainable energy transitions and combating climate change effectively. So, we will test the following hypothesis with the implementation of the econometrics model:

H0: There is no effect of climate change on Economic growth in Egypt.

H1: The effect of climate change on economic growth in Egypt is negative.

The objective of this study is to comprehensively investigate the impact of climate change on economic growth and inflation in Egypt spanning from 1990 to 2020. Specifically, the research aims to scrutinize the intricate relationship between climate change indicators—including temperature fluctuations, occurrences of extreme weather events, and environmental degradation—and economic growth in Egypt throughout the specified timeframe. Furthermore, it endeavors to analyze the repercussions of climate-related factors on inflation dynamics during the study period.

Moreover, this study endeavors to explore the extent to which changes in climate conditions have influenced pivotal economic indicators, notably GDP growth rates and inflation rates, over the past three decades in Egypt. By delineating the potential channels through which climate change exerts its influence on economic growth and inflation, encompassing both direct impacts on economic activities and indirect effects on resource availability, agricultural productivity, and infrastructure resilience, the research aims to furnish valuable insights and policy recommendations.

Subsequently, the study will construct an econometric model elucidating the determinants of GDP, with particular emphasis on the role of renewable energy consumption as an intermediary input. Additionally, it will consider GHG emissions as an indicator of climate change variables and Adjusted Net Savings as a gauge of sustainability within the Egyptian economy.

Method

According to literature review, this paper aims to examine the effect of climate change among the economic growth in Egypt during the last three decades, the data was chosen based on the available data set in the world bank website which is related to Egypt and contains four variables from 1990 to 2020.

In our study, the dependent variable is the Gross domestic product in current prices, while the independent variables are divided to two variables represent the two sides of the climate change problem. The first variable is renewable energy consumption (R), which represents a main way to confront the climate change, on the other hand, the total greenhouse gas emissions assimilate the core reason of climate change. A description of the variables selected in our study is presented in Table 1.

Table 1. Data Description

Variable	Description
G	Gross domestic product, annual growth (dependent variable)
ANS	Adjusted net savings, including particulate emission damage
TGG	Total greenhouse gas emissions (kt of CO ₂ equivalent)
R	Renewable energy consumption (% of total final energy consumption)

Results

Stationarity

The first step in our empirical study is testing the stationary of the variables, as shown up in Table 2, the ADF test confirmed that all variables are stationary at I (0) which allow us to use the ARDL model (Jahanger et al., 2022)

Table 2. Stationary

Variable	I(0)	I(1)
G	0.04	-----
ANS	0.045	-----
TGG	0.99	0.05
R	0.6955	0.0009

ARDL results:

The estimating ARDL model with automatic lag selection using E-views version (9) is ARDL (2,3,3,1) model and the result is shown in **Table 3**

Log likelihood	-21.59473	Hannan-Quinn criter.		2.660141
F-statistic	9.451718	Durbin-Watson stat		2.228970
Prob(F-statistic)	0.000060			

Checking serial correlation and Heteroscedasticity:

After estimating the model we have to check effectiveness of the model by examining both of, the serial correlation of the residuals and the heteroscedasticity. In the residuals, the LM test is used to confirm that there is no longer serial correlation between residuals. As shown in Table 4;

Table 4. Serial Correlation test

Breusch-Godfrey Serial Correlation LM Test:			
F-statistic	1.804446	Prob. F(3,12)	0.2000
Obs*R-squared	8.704447	Prob. Chi-Square(3)	0.0335

The null hypothesis: There is no serial correlation is not rejected at level 5% which mean that there is no evidence for serial correlation in the residuals term of the estimated model because the P value is greater than 5%.

And then, we must check is there is a heteroscedasticity (or the variance is constant) in the residuals or not as shown in Table 5.

Table 5. Heteroscedasticity test

Heteroskedasticity Test: Breusch-Pagan-Godfrey			
F-statistic	0.887801	Prob. F(12,15)	0.5762
Obs*R-squared	11.62804	Prob. Chi-Square(12)	0.4760
Scaled explained SS	2.189266	Prob. Chi-Square(12)	0.9991

Since the P value is greater than 5%, we don't reject the null hypothesis of no heteroscedasticity at level 5%.

Bound test

The bound test is used to determine if there is a long-run relationship between the independent variables and the dependent variable, as a null hypothesis says that; there is no long-run relationship and get that result as shown in Table 6.

Table 6. ARDL Bound test

ARDL Bounds Test				
Date: 04/12/24 Time: 16:24				
Sample: 1993 2020				
Included observations: 28				
Null Hypothesis: No long-run relationships exist				
Test Statistic	Value	k		
F-statistic	11.12677	3		
Critical Value Bounds				
Significance	I0 Bound	I1 Bound		
10%	2.72	3.77		
5%	3.23	4.35		
2.5%	3.69	4.89		
1%	4.29	5.61		

Since of the value of F-statistic is 11.12677, we cannot accept the null hypothesis at 1 % of significant, that is mean there is a long run relationship between the independent variables and the dependent variable and that leads us to the final next step.

Error Correction Model

Because of the long run relationship between the variables, that is mean we could check if there is cointegration or not and by running the Error correction model as shown in Table 7.

Table 7. ARDL Error Correction Model

ARDL Cointegrating And Long Run Form				
Dependent Variable: G				
Selected Model: ARDL(2, 3, 3, 1)				
Date: 04/12/24 Time: 16:26				
Sample: 1990 2020				
Included observations: 28				
Cointegrating Form				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
D(G(-1))	-0.168300	0.133786	-1.257980	0.2276
D(ANS)	0.000000	0.000000	2.606032	0.0199
D(ANS(-1))	0.000000	0.000000	0.654145	0.5229
D(ANS(-2))	0.000000	0.000000	3.126997	0.0069
D(TGG)	0.000085	0.000040	2.162340	0.0472
D(TGG(-1))	0.000033	0.000046	0.720198	0.4825
D(TGG(-2))	0.000091	0.000042	2.166152	0.0468
D(R)	1.608512	0.687891	2.338323	0.0336
CointEq(-1)	-0.737834	0.178752	-4.127702	0.0009
Cointeq = G - (-0.0000*ANS + 0.0001*TGG + 4.6579*R -58.7076)				
Long Run Coefficients				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
ANS	-0.000000	0.000000	-0.842896	0.4125
TGG	0.000115	0.000029	3.915516	0.0014
R	4.657865	1.185668	3.928474	0.0013
C	-58.707563	15.946243	-3.681592	0.0022

Hence the Coint Eq (-1) is negative and significant, we could say that there is cointegration or the independent variables affect the dependent variable in the long run at 1% level of significant, we could also get that, the speed of adjustment from the disequilibrium in the short run to the equilibrium in the long run is 74 %.

Comparative Analysis Using Real GDP Growth:

In this section, we conducted a comparative analysis using real GDP growth instead of nominal GDP to examine the effect of climate change on economic growth in Egypt over the last three decades. The analysis was based on an ARDL (Auto Regressive Distributed Lag) model that incorporated renewable energy consumption (R), total greenhouse gas emissions (TGG), and adjusted net savings (ANS) as independent variables affecting GDP growth.

Table 8. Data Description

Variable	Description
GDP	Gross domestic product (dependent variable)
ANS	Adjusted net savings, including particulate emission damage
TGG	Total greenhouse gas emissions (kt of CO2 equivalent)
R	Renewable energy consumption (% of total final energy consumption)

Stationarity

The first step in our empirical study is testing the stationary of the variables, as shown up in Table 9, the ADF test confirmed that all variables are stationary at I (0) which allow us to use the ARDL model (Jahanger et al., 2022)

Table 9. Stationary

Variable	I(0)	I(1)
GDP	1	0.02
ANS	0.045	-----
TGG	0.99	0.014
R	0.6955	0.0009

ARDL results:

The estimating ARDL model with automatic lag selection using E-views version (9) is ARDL (4,4,3,3) model and the result is shown in Table 10.

Table 10. estimating output

R	2.96E+10	1.49E+10	1.979369	0.0791
R(-1)	1.10E+09	1.30E+10	0.084453	0.9345
R(-2)	1.94E+10	1.20E+10	1.618912	0.1399
R(-3)	2.79E+10	1.25E+10	2.230627	0.0526
C	-1.35E+12	3.89E+11	-3.475274	0.0070
R-squared	0.999612	Mean dependent var		7.01E+11
Adjusted R-squared	0.998880	S.D. dependent var		3.42E+11
S.E. of regression	1.14E+10	Akaike info criterion		49.39482
Sum squared resid	1.18E+21	Schwarz criterion		50.25871
Log likelihood	-648.8301	Hannan-Quinn criter.		49.65170
F-statistic	1365.568	Durbin-Watson stat		2.318118
Prob(F-statistic)	0.000000			
*Note: p-values and any subsequent tests do not account for model selection.				

It can note that, there are significant effects of some of the macroeconomic variables and its lags on GDP, we could confirm that the amount of GDP affects positively by lags (1,4) of itself, the second lag of adjusted net savings, the third lag of total greenhouse gas emission and the third lag of renewable energy consumption, on the other hand, it is affected negatively by lags(1,3) of the adjusted net savings and the second lag of itself, at 90% level of confidence.

Checking serial correlation and Heteroscedasticity

After estimating the model we have to check effectiveness of the model by examining both of, the serial correlation of the residuals and the heteroscedasticity. In the residuals, the LM test is used to confirm that there is no longer serial correlation between residuals. As shown in Table 11;

Table 11. Serial Correlation test

Breusch-Godfrey Serial Correlation LM Test:			
F-statistic	1.050456	Prob. F(4,5)	0.4661
Obs*R-squared	12.32899	Prob. Chi-Square(4)	0.0151

The null hypothesis: There is no serial correlation is not rejected at level 5% which mean that there is no evidence for serial correlation in the residuals term of the estimated model because the P value is greater than 5%. And then, we have to check is there is a heteroscedasticity (or the variance is constant) in the residuals or not as shown in Table 12.

Table 12. Heteroscedasticity test

Heteroskedasticity Test: Harvey			
F-statistic	2.185618	Prob. F(17,9)	0.1167
Obs*R-squared	21.73519	Prob. Chi-square(17)	0.1951
Scaled explained SS	12.40456	Prob. Chi-square(17)	0.7750

Since the P value is greater than 5%, we don't reject the null hypothesis of no heteroscedasticity at level 5%.

Bound test

The bound test is used to determine if there is a long-run relationship between the independent variables and the dependent variable, as a null hypothesis says that; there is no long-run relationship and get that result as shown in Table 13.

Table 13. ARDL Bound test

ARDL Bounds Test				
Date: 04/12/24 Time: 05:00				
Sample: 1994 2020				
Included observations: 27				
Null Hypothesis: No long-run relationships exist				
Test Statistic	Value	k		
F-statistic	21.32097	3		
Critical Value Bounds				
Significance	I0 Bound	I1 Bound		
10%	2.72	3.77		
5%	3.23	4.35		
2.5%	3.69	4.89		
1%	4.29	5.61		

Since of the value of F-statistic is 21.32097, we cannot accept the null hypothesis at 1 % of significant, that is mean there is a long run relationship between the independent variables and the dependent variable and that leads us to the final next step.

Error Correction Model

Because of the long run relationship between the variables, that is mean we could check if there is cointegration or not and by running the Error correction model as shown in Table 14.

Table 14. ARDL Error Correction Model

ARDL Cointegrating And Long Run Form				
Dependent Variable: GDP				
Selected Model: ARDL(4, 4, 3, 3)				
Date: 04/12/24 Time: 05:01				
Sample: 1990 2020				
Included observations: 27				
Cointegrating Form				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
D(GDP(-1))	0.488914	0.159735	3.060773	0.0136
D(GDP(-2))	-0.321729	0.150486	-2.137925	0.0612
D(GDP(-3))	-0.619967	0.137089	-4.522355	0.0014

D(ANS)	0.333494	2.319383	0.143785	0.8888
D(ANS(-1))	-4.655530	2.082331	-2.235731	0.0522
D(ANS(-2))	12.509093	1.626294	7.691780	0.0000
D(ANS(-3))	-3.436472	2.708926	-1.268574	0.2364
D(TGG)	-203271.15	831281.67	-0.244527	0.8123
D(TGG(-1))	-1004257.326962	1044790.22	0.000000	0.0000
D(TGG(-2))	-6002532.006093	1315524.16 1	0.000000	0.0000
D(R)	29565067363.02	149366120 23.9	0.000000	0.0000
D(R(-1))	-19438484115.87	120071318 03.13	0.000000	0.0000
D(R(-2))	-27939389752.953	125253549 95.03	0.000000	0.0000
CointEq(-1)	-0.859302	0.155080	-5.541034	0.0004
Cointeq = GDP - (-16.3330*ANS + 7624253.6077*TGG + 90816396133.000 7*R -1571555949519.1321)				
Long Run Coefficients				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
ANS	-16.333049	6.873779	-2.376138	0.0415
TGG	7624253.61	688839.69	11.068255	0.0000
R	90816396133	29455171483 .	3.083207	0.0131
C	-1571555949519	41505041960 7.1	-3.786422	0.0043

Hence the CointEq(-1) is negative and significant, we could say that there is cointegration or the independent variables affect the dependent variable in the long run at 1% level of significant, we could also get that, the speed of adjustment from the disequilibrium in the short run to the equilibrium in the long run is 86 %. **on the long run**, the Adjusted Net Savings affects negatively on the GDP, when both of, Total Greenhouse Emissions and Renewable energy consumption have a positive effect on GDP.

Based on the ARDL (4,4,3,3) model estimation results for real GDP growth (GDP) as the dependent variable and the specified lagged independent variables (ANS, TGG, R), along with a constant (C), the formulated equation is as follows:

$$\Delta GDP_t = \beta_1 \Delta GDP_{t-1} + \beta_2 \Delta GDP_{t-2} + \beta_3 \Delta GDP_{t-3} + \beta_4 \Delta GDP_{t-4} + \beta_5 \Delta ANS_t + \beta_6 \Delta ANS_{t-1} + \beta_7 \Delta ANS_{t-2} + \beta_8 \Delta ANS_{t-3} + \beta_9 \Delta TGG_t + \beta_{10} \Delta TGG_{t-1} + \beta_{11} \Delta TGG_{t-2} + \beta_{12} \Delta TGG_{t-3} + \beta_{13} \Delta R_t + \beta_{14} \Delta R_{t-1} + \beta_{15} \Delta R_{t-2} + \beta_{16} \Delta R_{t-3} + \epsilon_t$$

This equation captures the dynamic relationships between real GDP growth and the lagged changes in adjusted net savings, total greenhouse gas emissions, and renewable energy consumption over the specified time period, accounting for any short-term deviations (error term). The coefficients α_1 to α_{16} provide insights into the magnitude and direction of these relationships.

Discussion

The findings highlight the pivotal role of renewable energy consumption as a catalyst for economic growth in Egypt. Encouraging the adoption and investment in renewable energy technologies holds promise for stimulating economic development while concurrently contributing to climate change mitigation efforts. This assertion aligns with prior studies, such as the work of Zhang and Lin (2023), who demonstrated the positive correlation between renewable energy consumption and economic growth in developing countries.

Policy implications from this study emphasize the necessity for policymakers to prioritize strategies aimed at promoting renewable energy sources to foster sustainable economic growth. This recommendation resonates with the findings of studies such as that of Wang et al. (2022), which underscored the importance of renewable energy policies in driving economic development in emerging economies.

Moreover, the observed negative impact of adjusted net savings on GDP underscores the detrimental effects of certain environmental and economic factors on Egypt's economic performance. This finding is consistent with previous research, including the study by Dasgupta et al. (2023), which emphasized the importance of environmental sustainability in bolstering economic resilience.

Interestingly, the lack of a significant impact of total greenhouse gas emissions on GDP during the study period suggests the need for further investigation into the specific composition and sources of greenhouse gas emissions in Egypt to better understand their economic implications. This observation aligns with the call for nuanced analyses of greenhouse gas emissions and their economic ramifications, as advocated by scholars such as Smith et al. (2024).

Furthermore, the adjustment from nominal GDP to real GDP growth in our analysis aims to mitigate biases introduced by inflation and nominal price changes. This methodological refinement is consistent with best practices recommended in economic research, as highlighted by various studies, including that of Johnson et al. (2022), which emphasized the importance of using real GDP to accurately assess economic trends.

In conclusion, this study contributes to the expanding body of literature on the intricate relationship between climate change, renewable energy, and economic growth. The findings underscore the imperative for sustainable development policies that prioritize renewable energy investments and environmental conservation to underpin long-term economic prosperity in Egypt. Future research endeavors could delve deeper into additional factors

and mechanisms influencing the nexus between climate change and economic growth to inform more targeted policy interventions and enhance economic resilience.

When comparing the results obtained using real GDP growth with those from the nominal GDP analysis, several crucial insights emerge. Specifically, the analysis using real GDP growth provides a clearer understanding of the underlying economic trends, as it adjusts for the effects of inflation and nominal price changes. This observation aligns with the methodological considerations advocated by economists such as Smith et al. (2023), who emphasized the importance of accounting for inflation in economic analyses.

Our empirical study using real GDP growth reaffirms the importance of renewable energy consumption and environmental sustainability in promoting economic growth in Egypt. The positive impact of renewable energy consumption on real GDP growth underscores the potential benefits of transitioning towards cleaner energy sources. Conversely, the negative influence of adjusted net savings highlights the adverse effects of environmental degradation and resource mismanagement on economic performance. These findings echo similar conclusions drawn by scholars such as Wang et al. (2022), who emphasized the pivotal role of environmental sustainability in driving economic development.

The findings from our comparative analysis underscore the significance of using real GDP growth in climate-economic studies to account for inflation and price fluctuations. Moving forward, policymakers should prioritize policies that promote renewable energy investments and sustainable resource management to support long-term economic development while mitigating climate change risks. Future research could further explore additional factors influencing the climate-economic nexus to inform targeted policy interventions and enhance economic resilience in Egypt.

Conclusion

The empirical investigation conducted in this study sheds light on the relationship between climate change indicators, economic growth, and inflation dynamics in Egypt over the period from 1990 to 2020. Our analysis primarily focused on the impact of renewable energy consumption and total greenhouse gas emissions on the Gross Domestic Product (GDP).

The results of the first ARDL model estimation reveal several important findings. First, we identified a positive and statistically significant relationship between renewable energy consumption and GDP. This suggests that higher levels of renewable energy consumption contribute positively to economic growth in Egypt. Conversely, total greenhouse gas emissions did not exhibit a statistically significant impact on GDP during the specified period.

On the short run, while all of the dependent variables affect positively in the beginning of our analysis, the effect

of the both of adjusted net savings and total greenhouse emissions become negative in the third lag. in the long run, only Renewable energy consumption has a positive effect on GDP.

Moreover, the analysis highlighted the negative influence of adjusted net savings (ANS) on GDP. This finding implies that factors contributing to adjusted net savings, which include particulate emission damage among others, have adverse effects on economic growth in Egypt.

The results of the second ARDL model manifest the following insights:

Adjusted net savings appear to have a detrimental impact on economic growth, underscoring the need for policies aimed at improving sustainability and environmental management.

Total greenhouse gas emissions show a complex relationship with economic growth, with recent past emissions positively influencing GDP growth.

Renewable energy consumption exhibits potential positive effects on economic growth, although further investigation into its role is warranted given its marginal significance.

Recommendation

We suggest that policymakers in Egypt give policies that support investments in renewable energy and sustainable resource management top priority, based on our research. This entails putting supportive legislative frameworks in place and offering incentives for the adoption of renewable energy technologies. In order to fully comprehend the economic ramifications of Egypt's greenhouse gas emissions, more research is required to determine the precise composition and sources of these emissions. In order to better understand underlying economic trends, policymakers should make sure that economic analyses take inflation and price fluctuations into account going forward by using real GDP growth. Egypt can promote long-term economic development while reducing the risks associated with climate change and strengthening economic resilience by giving priority to investments in renewable energy and sustainable resource management.

The Decision-Making Process in The Oil and Gas Industry: The Case of Oman

Hafidh Al Naamani

Modern College of Business & Science, Oman,  <https://www.mcbs.edu.om>

Abstract: This study aims to explore –from the perspectives of the employees in the supply chain management at an oil and gas organization in the Sultanate of Oman – the extent to which data-driven insights, performance management, and collaboration in contract agreements improve the decision-making process. A pragmatic philosophy underpins the research design. A mixed methods case study approach involving surveys administered to 32 employees at the case organization was used for data collection. The survey includes nine questions aimed at collecting quantitative data. Descriptive statistics analysis is used for data analysis. Thematic analysis is used to analyze qualitative data and identify the frequent occurrence of phrases that reflect participants’ experiences concerning the decision-making process. The findings suggest that data-driven insights, performance management, and contractual collaboration improve the decision-making process in contracts in the oil and gas industry. Though the study is centralized in one of the oil and gas organizations in the Sultanate of Oman, which may jeopardize the generalizability of the findings, the study opens a new horizon of research in this field to validate in similar locations. The study provides insights, via the quantitative findings and participant's voice in improving decision-making processes. It highlights the critical role of integrating data-driven insights into operational decision-making, optimizing performance management systems to align with strategic goals, and overcoming challenges related to non-collaborative contracting approaches. The insights gained from this study are also useful to industry practitioners, policy-makers, and academic researchers. It gives them an understanding of the value of data-driven decision-making, efficient performance management systems, and collaborative contract frameworks in enhancing operational efficiency and decision-making in oil and gas contracts.

Keywords: Decision-making, Collaborative contracting, Data-driven insights, Operational efficiency performance management

Introduction

Contract decision-making involves several intricate and crucial elements, including data-driven management, performance management, and collaboration, all aimed at improving the overall process. Below is the literature

review that combines the results of recent studies, concerning the same process in different organizations in different regions.

Literature Review

In the Oil and Gas industries, the decision-making process exhibits challenges and opportunities, especially in big organizations that contain critical and complex operations. This is due to the high cost of operations, regulations compliance & requirements, and political involvement, therefore the decision-making requires a robust process.

Data-driven insight is the input collected from the big data that the organization can use in its strategic decision-making process. Recently, organizations have recognized the significant impact of utilizing data in optimizing their operations, by leveraging historical and real-time data, algorithms & machine learning, and the usage of advanced analytical tools to portend future trends, minimize the risks, and enhance efficiency. Bochkov and Dymochkina's case study emphasized the importance of utilizing data in the decision-making process. Data culture has been considered as an important component in the decision-making process that uses the approach of prioritizing the numerical component and analytics. This cultural shift aims to maximize the power of data analytics, enable proactive approaches to challenges, and improve efficiency & the cost of investments (Bochkov and Dymochkina, 2021).

In another case study in the liquified petroleum industry, the researcher emphasized the utilization of data to build systems that will enhance the process of decision-making in contracts and supply chain management. The system integrates data from different sources to support the operational decision by using predictive models to forecast consumption based on historical data meanwhile monitoring the performance indicators for effective supply chain management (Kozeliski et al., 2021).

Other studies supported the integration of performance management systems with quality management in the context of the industry focusing on data-driven decision-making processes. The study by Tambare et al, emphasized the function of the evidence-based decision-making process in optimizing the contract agreement, enhancing operational efficiency, and ensuring compliance (Tambare et al., 2021).

Performance Management is the process used in organizations in continuous communication between the management and employees toward the set objectives and measuring the organizational achievements.

Digital transformation initiatives have been integral to achieving operational excellence through performance management. By adopting an Operation Management System, Hegazy et al. describe how digital transformation empowers oil and gas companies to streamline their workflows, reduce redundancies, and improve interdisciplinary collaboration. Real-time monitoring and management of assets, well performance, and expenditures are enabled by this digital paradigm shift, resulting in substantial cost savings and operational efficiency

improvements. Digital insights and operational data are increasingly used to inform decision-making, underscoring the role of technology in performance management (Hegazy et al. 2023). Another study in different organizations indicated the applicability of their research to the oil and gas industry concerning the integration of performance management systems with data analytics in driving the decision-making process. The study emphasized the importance of usage and alignment between the data with contractual terms & conditions and performance management in the decision-making process (Konstance et al. 2023).

Collaboration is Teamwork to achieve common business goals. In the oil and gas industry, the decision-making process and knowledge sharing is enabled by collaboration. A study by Kristensen and Fanguy, how collaboration and technology reinforce the culture of collective problem-solving and sharing a common objective. The business outcome is enhanced through an efficient decision-making process by taking advantage of collaboration between expertise and the usage of technology. It is proved from this case study that the success of collaboration in the industry was due to the proper alignment across the organization in the goals and vision, proper communication protocol, and the effectiveness of the implementation of technologies (Kristensen and Fanguy, 2009).

Another study in the oil and gas industry by Chenger and Pettigrew mentioned that collaboration with stakeholders, expertise, and across the departments is crucial in managing contracts effectively due to the associated risks related to the market conditions. Therefore, collaboration is vital in the decision-making process in managing contracts for such organizations (Chenger and Pettigrew, 2023).

Commonalities in the Literature Review

The reviewed studies emphasized the usage of data in the decision-making process. The advances in technologies and data analytics enhanced the operational efficiency and the effectiveness of making critical strategic decisions in oil and gas contracts (Bochkov and Dymochkina, 2021). Operational excellence and the improvement in the decision-making process are improved by the advancement in digital transformation. Collaboration within the organization is crucial in the effectiveness of the decision-making process and in reducing the risks of capital investments while assuring alignment to achieve organizational goals and objectives (Kristensen and Fanguy, 2009). The reviewed studies collectively focused on the importance of data and performance management KPIs along with collaboration within the organization to enhance the decision-making process (Hegazy et al, 2023).

Differences in the Literature Review

Bochkov and Dymochkina, focus on leveraging quantitative data to enhance the decision-making process in contracts, while Hegazy et al., study is more concerned with performance management, the utilization of technologies, and digital transformation to improve productivity and efficiency. Counter wise, Krinsten and Fungay, emphasize collaboration within the organization to enhance and ensure a proper decision-making process is taking place.

The decision-making process that is driven by data and performance management focuses on data analytics and digital transformation by using quantitative methodologies (Bochkov and Dymochkina, 2021). The collaboration integrates qualitative patterns and aspects and builds consensus for the decision-making process (Chenger and Pettigrew, 2023).

Limitations in the Reviewed Studies.

Data-driven insight:

Regardless of how beneficial and crucial are the data-driven insights in the effectiveness of the decision-making process the proper integration of the data within different systems and platforms will remain a challenge (Bochkov and Dymochkina, 2021). Organizations continue to face challenges in adopting advanced digital transformation technologies (Hegazy et al, 2023) due to the unavailability of the specialized skills and expertise required for such activities. Additionally, stakeholders who are not technically experts might find it difficult to understand and be convinced.

Performance management:

The business dynamics and challenging environments in the oil and gas industries require management performance indicators that are adaptable. However, the complication in some digital transformation systems can hinder their effectiveness in a fast-changing environment. Additionally, with the high investment costs involved while implementing advanced digital transformation tools for managing performance, the competitor with a low capital of investment might not be able to adapt due to the cost and the requirements to allocate resources (Hegaz et al, 2023).

Collaboration:

The culture and mindset in the organization might hinder the effectiveness of collaboration. Bad communication channels and change resistance can sap collaboration efforts. The tools used for technology and collaboration integration can be limited to correspond with the requirements (Krinsten and Fungay, 2009).

The literature review proves how the decision-making process plays a crucial role in data-driven insight, management performance, and collaboration in the oil and gas industry contracts. While each region has its own methodologies and focus, they collectively contribute to an efficient and agile competitive industry. The transformation toward the approach of data-driven insights represents how the change in the decision-making process is made, focusing on how empirical data is needed as predictive analytics and evidence. The digital transformation enhanced the management performance indicators by focusing on operational excellence, and business gain. Meanwhile, collaboration is considered a critical component in knowledge sharing, and practical problem-solving to encompass organizational challenges. This integration showcases how data-driven, technology, and humans can drive success to proper decision-making in the oil and gas industry and assure

sustainability.

Reviewing the previous studies' findings on the decision-making process in contracts in the oil and gas industries, they were allocated in different regions and different settings, therefore generalization of the findings cannot be concluded all over the world. In this research study, I will confirm the significance of the data-driven insight, performance management, and collaborative contract framework in improving the decision-making process in contracts at the leading oil and gas industry in the Sultanate of Oman. Conceptual Framework A conceptual framework for examining the impact of performance management, data-driven insights, and collaboration in contract context on the decision-making process in oil and gas industry contracts could consist of the following elements: Data-Driven Insights: A Data Collection procedure includes the technical framework and tools used to get relevant data. The Data analysis uses analytical models and techniques to process and understand data to make informed decisions. Performance Management: A key performance indicator (KPI) enables a company to measure its performance against its strategic goals. A benchmarking process involves comparing performance to industry standards or optimal practices. The improvements in an organization can be achieved by leveraging performance data.

Conceptual framework

In strategic decision-making, important decisions are made in line with the organization's overall strategic direction. An operational decision-making process involves making day-to-day decisions that have an immediate impact on the organization's immediate operation. The purpose of risk management is to identify, evaluate, and rank risks, as well as to allocate resources to reduce and manage their likelihoods and consequences.

Contracts in the oil and gas industry are designed to align with stakeholders' interests, improve communication, reduce risk, and accurately assess performance. Strategic and operational objectives must be aligned to improve decision-making and project results. Transaction Cost Economics and Relational Contract Theory underpin the paradigm (Kristensen & Fanguy, 2009). In addition to reducing costs, promoting trust, and leveraging collective resources to gain a competitive advantage, these ideas emphasize the benefits of collaboration. In addition to ensuring project goals, this method fosters long-term partnerships and fosters innovation. An incentive contract must be designed to match the performance objectives of the company.

It is this conceptual framework that guides the research. A variety of critical areas are identified that should be explored to uncover the intricate connections between decision-making and contract management in the oil and gas industry.

Data-driven insights, performance management, and collaborative contract frameworks in the oil and gas industry might be considered as variables within a conceptual framework for examining decision-making and operational efficiency:

Questions for research

"In what way and to what extent do performance management, data-driven insights, collaborative contract frameworks, and performance management, influence the decision-making in oil and gas industry contracts?"

The purpose of this research is to examine the relationship between strategic management practices and contractual agreements supporting operational activities in the oil and gas industry. This would facilitate the investigation of how these elements affect industry operations and contract management's overall efficacy and efficiency.

Independent Variables:

Data-Driven Insights:

To evaluate performance, data must be gathered with excellent detail and accuracy. There are some methods in use to articulate and provide efficient data analysis such as machine learning, artificial intelligence, and predictive analytics. These are considered some of the advanced technologies used especially in the oil and gas industries (Tucci & Burns, 2023).

Performance Management Systems:

Indicators are used to measure performance and succeed in enhancing it. In the oil and gas industry, there are certain methodologies and tools used for establishing, monitoring, and improving KPIs (Key Performance Indicators). Integrating the performance management systems into other aspects of a company's operations is very crucial and one of the key aspects to providing proper decision-making.

Collaborative Contract Frameworks:

Joint operating agreements and integrated project delivery systems provide the scope and characteristics of collaboration in contractual terms. A contractual incentive program is designed to align with the desired performance goals of the organization in collaboration with the delivery and performance of the contractor.

Dependent Variables:

Decision-Making Processes:

An action or consideration that leads to a choice. In this context, strategic decisions affect long-term project feasibility, operational decisions impact daily activities, and risk management practices are crucial for mitigating potential losses and enhancing project outcomes.

Research hypothesis:

In light of the previously established conceptual framework, the following hypotheses are to be investigated in

my organization to test the theory and the impact of data-driven insights, performance management, and collaboration on the decision-making process in contracts.

H1: A data-driven approach to contract decision-making has a significant impact on the efficiency of decision-making processes within the oil and gas industry.

H2: An efficient performance management system enhances the efficiency of the decision-making process in oil and gas contracts significantly.

H3: Collaborative Contract Frameworks enhance the oil and gas industry's decision-making process significantly.

These hypotheses establish the foundation for conducting empirical testing using quantitative methodologies to verify the connections between the variables outlined in the conceptual framework. The outcomes would either corroborate or contradict these assumptions, enhancing comprehension of the variables that impact decision-making and operational effectiveness in the oil and gas sector.

Method

Research Design and Methodology

A mixed methods case study approach is used to investigate the extent to which the data-driven insight improves the decision-making process in contracts, performance management improves the decision-making process, and the collaborative contract framework improves the decision-making process. Toward this purpose and based on the reviewed literature and previous studies on the decision-making process in contracts in the oil and gas industry, a perception survey comprising 9 questions with a 5-point Likert Scale has been distributed to 32 employees in the leading oil and gas industry in the Sultanate of Oman. The survey aimed to collect quantitative data related to the study under inquiry. The survey was piloted and the used version consisted of three sections.

The first section comprised three items and aimed to measure participants' perceptions of the extent of the problem. The second section includes three items and measures participants' perceptions of the consequences of the problem and its impact. The third section of the survey includes three items and measures participants' perceptions of the extent to which solution and impact in solving the issue is improving the decision-making process in contracts. All 9 items of the survey consider a 5-point scale (1- Strongly Disagree, 2- Disagree, 3 - Neutral, 4 - Agree, And 5- Strongly Agree). The survey includes an introductory section that clearly explains the purpose of the research. On the other hand, qualitative data were collected from the same quantitative open-ended questions which represented add-on items to the survey questions. I aimed to provide qualitative data that can enrich the quantitative findings with important quotes from the same participants.

Ethical Considerations:

Obtain informed permission from all participants by ensuring they have a comprehensive understanding of the

research objectives and willingly agree to take part. Confidentiality by preserving the secrecy and privacy of participant information and company data.

This hybrid methodology enables a comprehensive quantitative evaluation of the industry, while also offering an in-depth qualitative comprehension of specific firm procedures. It achieves a harmonious combination of extensive investigation, resulting in strong and practical findings.

Survey Questioners:

The survey questionnaire is structured according to the designated themes. The purpose of these questions is to evaluate participants' perspectives on the magnitude of the problem, the repercussions and influence of the problem, and the effectiveness of potential solutions in addressing the issue within the framework of contract management in the oil and gas industry's decision-making procedures. See Appendix 1 for the survey themes and questionnaires.

Results

Descriptive Statistics Overview

Median and Mean Scores: It shows that most of the respondents tend to agree or strongly agree with statements relevant to challenges and effective solutions in the decision-making process in contracts based on median scores of 4.5 or 5. There is a consensus among participants based on the high mean scores.

Standard Deviation (Std. Deviation): Responses are clustered around the mean (standard deviations around 0.5), indicating that respondents tend to agree about the issues and solutions related to the decision-making process in contracts.

Range of Scores: For all survey questions, a minimum score of 4 (Agree) and a maximum score of 5 (Strongly Agree) indicate a strong statement of agreement. All the factors discussed were viewed as equally crucial and impactful, as shown by the lack of neutral, disagree, and strongly disagree responses.

The collected data were analyzed concerning the research questions using descriptive statistics by JASP software. Appendix 2 presents the descriptive statistics of the survey results.

Theme 1 focuses on the extent of the problem from questions one to three. To measure participants' perceptions in this regard. Appendix 2 survey results present the descriptive statistics of the first theme with its variables from (TH1-1 to TH1-3).

The results of the analysis demonstrate an agreement directed toward levels 4 and 5 (To agree and to strongly

agree) with an overall mean of 4.528 and a standard deviation of 0.5097. The analysis of the SD indicated that most respondents' answers are around the mean. The mean scores of the first and second variables TH1-1 (Data Integration and decision-making efficiency) and TH1-2 (Effectiveness of Performance Management Systems) were the highest ($M = 4.542$, $SD = 0.509$, n for all means = 24). This is followed in order by variable three – TH3-3 (Collaborative Contracting Challenges) – ($M = 4.5$, $SD = 0.511$).

Statistical results of questions one to three indicate that the means were for participants' perceptions of the extent to which incorporating data-driven insights into operational decision-making processes greatly enhances efficiency in contract management, as well as the performance management systems in the oil and gas sector successfully utilize key performance indicators (KPIs) to facilitate well-informed decision-making and the absence of collaborative contracting methods, such as shared comprehension and risk allocation, impedes efficient decision-making. These findings are not surprising given these are critical areas where the decision making in contracts is crucial to ensure proper operationalization of the contracts and meeting the agreed performance management KPIs.

Table 1. The extent of the problem

Theme 1	The extent of the problem		
Variables	Participant	Mean	Std. Dev.
	n	M	SD
TH1-1: To what degree do you concur that incorporating data-driven insights into operational decision-making processes greatly enhances efficiency in contract management within the oil and gas sector?	24	4.542	0.509
TH1-2: To what extent do you consider that the current performance management systems in the oil and gas sector successfully utilize key performance indicators (KPIs) to facilitate well-informed decision-making?	24	4.542	0.509
TH1-3: To what extent do you believe that the absence of collaborative contracting methods, such as shared comprehension and risk allocation, impedes efficient decision-making in the oil and gas sector?	24	4.5	0.511

Theme 2 questions four to six focused on the consequences of the problem and its impact. The Descriptive statistics of items indicate that all the participants believe that improper decision making process specially in contracts can result to problems and business impact. The results of the analysis demonstrate an agreement directed toward levels 4 and 5 (To agree and to strongly agree) with an overall mean of 4.528 and a standard deviation of 0.505. The analysis of the SD points out that most respondents' answers are clustered around the mean. The highest mean scores of the third variable TH2-3 (Risks of Non-Collaborative Contracting) with $M = 4.625$, $SD = 0.495$, n for all means = 24 followed by variable TH2-2 (Consequences of Poor Performance

Management) with $M = 4.5$, $SD = 0.511$, n for all means = 24. This is followed in order by variable TH2-1 -(Impact of Inadequate Data Utilization) – ($M = 4.458$, $SD = 0.509$).

Statistical results of questions four to six indicate that the means were for participants' perceptions of the insufficient data with inadequate performance management system and improper collaboration in managing the contracts can result in consequences and business impact on the organization due to wrong decision process. These findings are expected given the criticality of the decision making process in contract as failure to take the right decision at the right time will result to value leaks and impacting the business deliveries and KPIs.

Table 2. Consequences of the Problem and Impact

Theme 2	Consequences of the Problem and Impact		
Variables	Participant	Mean	Std. Dev.
	n	M	SD
TH2-1: To what extent do you believe that the insufficient use of data-driven insights affects risk management and strategic decision-making in oil and gas contracts?	24	4.458	0.509
TH2-2: To what degree do you concur that inadequate performance management results in less-than-ideal operational efficiency and project outcomes in the oil and gas sector?	24	4.5	0.511
TH2-3: To what extent do you hold the belief that non-collaborative contracting techniques significantly amplify the risks and expenses linked to oil and gas projects?	24	4.625	0.495

Theme 3 questions seven to nine focused on the Solution and Impact in Solving the Issue. The Descriptive statistics of items indicate that all the participants believe that some solutions need to be featured in the data quality & utilization, enhancements on performance management KPIs, and proper collaboration in contracts management are required to manage the effectiveness of the decision-making process in contracts in the organization. The results of the analysis demonstrate an agreement directed toward levels 4 and 5 (To agree and to strongly agree) with an overall mean of 4.486 and a standard deviation of 0.5103. The analysis of the SD points out that most respondents' answers are clustered around the mean. The highest mean scores are of the second and third variables TH3-2 (Improvement Through Performance Management Optimization) with $M = 4.5$, $SD = 0.511$, n for all means = 24, followed by the TH3-3 -(Value of Collaborative Contracting Frameworks) – ($M = 4.5$, $SD = 0.511$, n for all means = 24. This is followed in order by the first variable TH3-1 (Benefits of Enhanced Data Analytics) with $M = 4.458$, $SD = 0.509$.

Statistical results of questions seven to nine indicate that the means were for participants' perceptions of the

extent to which clear progression of data analytics and data-driven, as well as performance management systems & measurements KPIs and collaborative contracting frameworks, will improve the decision-making process in contracts. Moreover, these will reduce consequences and business impacts related to improper decisions. These findings are expected and address research question one which concludes that proper analysis and usage of the data as well as integration of the performance management system KPIs and proper collaboration in the contracting framework have a significant impact on the decision-making process in contracts in the organization.

Table 3. Solution and Impact in Solving the Issue

Theme 3	Solution and Impact in Solving the Issue		
Variables	Participant	Mean	Std. Dev.
	n	M	SD
TH3-1: To what extent do you concur that the progression of data analytics and data-driven decision-making would considerably enhance the efficiency of contract administration in the oil and gas sector?	24	4.458	0.509
TH3-2: To what extent do you believe that enhancing operational efficiency in oil and gas contracts may be achieved by optimizing performance management systems and aligning them more closely with strategic goals?	24	4.5	0.511
TH3-3: How much do you believe that using collaborative contracting frameworks, which promote openness and align incentives based on project outcomes, would result in greater success for oil and gas projects?	24	4.5	0.511

A consistent trend of high scores across all problem statements and proposed solutions indicates that oil and gas decision-making process practices need to be improved in terms of the usage of data with proper analytical techniques, performance management KPIs, and sufficient collaboration in the contractual framework.

Interview results:

A semi-structured interview was conducted with nine employees, using the same thematic structure as the survey questionnaires. A comprehensive framework for our discussions was provided by the thematic areas Data Integration and Decision-Making Efficiency, Effectiveness of Performance Management Systems, and Challenges in Collaborative Contracting.

Data integration and decision-making efficiency: All interviewees agreed that data-driven insights are critical to operational decision-making. During their presentation, they discussed how data integration has enhanced efficiency in oil and gas contract management. Several examples were provided, including real-time analytics in

contract negotiations and risk assessments that led to quicker, more informed decisions. These examples echo the high priority this theme received in survey responses. One of the respondents noted that “Statistics and data analytical is a powerful methodology to be followed while preparing a justification of success or dispute in contracts that will help the leadership to take a proper decision at the right time”

Effectiveness of Performance Management Systems: All interviewees agreed that current performance management systems are effective but recognized that further improvement is possible. Key performance indicators (KPIs) were discussed as one aspect of performance management that has been successful, such as driving operational excellence. One of the respondents noted that “In operations and business deliveries the organization is highly utilizing the performance indicators KPIs to align with the organization visions and goals and we have seen how crucial is it to take an action and make a decision accordingly but still there are areas for improvement where need to focus on this aspect concerning the business acumen and contract management”. Nevertheless, they also identified areas for improvement, such as the need for more dynamic KPIs that adapt to changing market conditions, which supports the survey results.

Collaborative Contracting: A similar theme was the importance of collaborative contracting methods which was closely aligned with interviewees' insights. They highlighted challenges associated with the absence of such approaches, including difficulties aligning stakeholder interests and managing shared risks. Interviewees shared experiences of how collaborative frameworks improved transparency and communication, leading to better project outcomes. One of the respondents noted that “Aligning the contracting strategy, value driver and tactics with all the stakeholders and the organization vision will facilitate and smoothen the decision-making process and timeline by the shareholders” This confirms the survey's findings that integrating and collaborating contracting frameworks can address many existing inefficiencies.

Overall, the interviews provided more insight into each thematic area than the survey results did. Employees' firsthand accounts highlighted the importance of data-driven decision-making, the need to evaluate performance management systems, and the potential benefits of collaborative contracting frameworks. As a result of these discussions, there is agreement that these factors play a significant role in improving oil and gas decision-making and operational efficiency.

Discussion

Link to the Hypothesis

Utilizing data-driven insights enhances the efficiency of decision-making.

Efficient operational efficiency is linked to the implementation of effective performance management systems. Collaborative contract frameworks have a beneficial impact on decision-making.

The survey results provide robust evidence in favor of these theories. The respondents' high median scores on questions regarding the extent of the problem (TH1), consequences and impact (TH2), and solutions and their impact (TH3), particularly in areas related to data integration, effectiveness of performance management, and collaborative contracting challenges, demonstrate a consensus on the significant importance of these factors.

H1 (Data-driven insights): The respondents substantially value the incorporation of data-driven insights into their decision-making processes, as indicated by median scores of 5.000 and 4.000, respectively. Taking into account the existing body of knowledge, it is important to go beyond benchmarks to gain practical insights that can be utilized for strategic decision-making.

H2 (Performance management systems): TH1-2 and TH3-2 survey results (with median scores of 5.000 and 4.500, respectively) indicate a strong belief in the effectiveness of current performance management systems and the potential for improving them to increase operational efficiency. In line with Bain & Company's recommendations, this data should be prioritized to align it with strategic objectives and to inform key performance indicators (KPIs).

H3: (Collaborative contract frameworks): Based on the answers to TH1-3 and TH3-3 (with median scores of 4.500 for each) we can say there are limitations to the current contracting system and that more collaborative frameworks may have real advantages. As noted in McKinsey & Company's case study on transparent, outcome-focused collaborative contracts, this is aligned with McKinsey and Company's findings.

Link to the Conceptual Framework

In shaping decision-making and operational efficiency, the conceptual framework emphasizes the interplay between data-driven insights, performance management, and collaborative contract frameworks. The survey's median and mean scores indicate a significant correlation with this framework, emphasizing the crucial functions these components serve in improving contract management in the oil and gas sector. The consistently high scores in all areas highlight the participants' collective recognition that strategic performance management, systematic data analysis, and teamwork play a crucial role in enhancing decision-making effectiveness and project outcomes.

Link to Literature Review

The poll results align with the literature study by emphasizing the need to incorporate data-driven insights into operational choices, the crucial role of performance management, and the benefit of collaborative contracting. The survey results confirm that data-driven decision-making and performance management, which are emphasized by the Bochkov & Dymochkina, framework, are essential for enhancing decision-making processes in the oil and gas industry. Moreover, the collaboration in contract aligns with the studies done by Krinsten & Fungay which highlight the benefits of matching the objectives of both the organization and the contracts as per

the contract terms and conditions.

Conclusion

The research is significant because it thoroughly examines the elements that influence decision-making and operational efficiency in the oil and gas industry. It offers practical information for enhancing industrial practices, guides the creation of policies, promotes academic research, and aids the industry in adapting to technological changes and sustainability challenges.

The research was focused on only one oil and gas organization within the country and due to the time constraints, the participation in the survey and interview was very low.

The examination of the survey findings in connection with the hypotheses, conceptual framework, and literature review unambiguously confirms the idea that the implementation of data-driven insights, strong performance management systems, and collaborative contract frameworks are crucial for improving decision-making and operational efficiency in contracts within the oil and gas industry. To enhance the accuracy of these results, future studies could investigate case studies or longitudinal data to analyze the adoption and long-term effects of these practices. Furthermore, by acknowledging and tackling the constraints highlighted in the literature study, a more intricate comprehension of the dynamic interaction among these aspects and their influence on the industry's operational and strategic objectives might be attained.

Recommendations

I recommend further expanding the research to include more organizations across the country of Oman. This wider scope will help in validating the research findings to be more robust and increase the generalizability. Integrating other change management theories will provide a stronger base and improve the analysis. Moreover, advanced analytical tools such as regression can be used to analyze the variables and to obtain a more solid conclusion concerning the research hypothesis.

Acknowledgments

I would like to thank my academic advisor and extend my appreciation to the Modern College of Business and Science (MCBS). Special appreciation to the oil and gas industry contract and procurement department who supported me during this study and significantly supported in shaping the recommendation.

The Art of Change Management in Oil and Gas Contracts: The Case of Oman

Hafidh Al Naamani

Modern College of Business & Science, Oman

Abstract: This study aims to explore –from the perspectives of the employees in the supply chain management at an oil and gas organization in the Sultanate of Oman – the extent to which data-driven insights, performance management, and collaboration in contract agreements improve the decision-making process. A pragmatic philosophy underpins the research design. A mixed methods case study approach involving surveys administered to 32 employees at the case organization was used for data collection. The survey includes nine questions aimed at collecting quantitative data. Descriptive statistics analysis is used for data analysis. Thematic analysis is used to analyze qualitative data and identify the frequent occurrence of phrases that reflect participants’ experiences concerning the decision-making process. The findings suggest that data-driven insights, performance management, and contractual collaboration improve the decision-making process in contracts in the oil and gas industry. Though the study is centralized in one of the oil and gas organizations in the Sultanate of Oman, which may jeopardize the generalizability of the findings, the study opens a new horizon of research in this field to validate in similar locations. The study provides insights, via the quantitative findings and participant's voice in improving decision-making processes. It highlights the critical role of integrating data-driven insights into operational decision-making, optimizing performance management systems to align with strategic goals, and overcoming challenges related to non-collaborative contracting approaches. The insights gained from this study are also useful to industry practitioners, policy-makers, and academic researchers. It gives them an understanding of the value of data-driven decision-making, efficient performance management systems, and collaborative contract frameworks in enhancing operational efficiency and decision-making in oil and gas contracts.

Keywords: Change management, Technology, Risk management, Contract management, blockchain, smart contracts.

Introduction

Oil and Gas Industries are well known for their operating dynamic nature due to the market demand, political & regulatory change, and digital transformation. Contract management is a very critical process that requires a

robust framework and management process with the consideration of its high cost of investment, project timeline, financial commitments, and legal issues.

Literature Review

Contract management is considered a critical exposure, especially in the oil and gas industry where the market demand is fluctuating and presents important opportunities and challenges. Due to the high capital cost, technological & digital transformation, and the changes in the regulations, the organizations require effective management change strategies.

The research study conducted by Smith in 2019 highlights the criticality of pre-defining the contractual agreement and terms & conditions to prevent value leaks from contract change. The argument and ambiguity with Smith are contract explanations that diverting from the original content can result in legal challenges between the parties. The study stressed the importance of proper identification of the requirements of the change management process in contracts to avoid disputes and maintain business continuity (Smith, 2019).

The research by Johns et al. (2020) pointed out how Digital Transformation would help to transform the change Management in the contract process and how flexibility can be injected into it through various automation during the contract execution process such as smart contracts and blockchain. The study has highlighted that changing the contract would require significant resources with time-consuming processes. Moreover, the study emphasized the importance of the automation of the change management process in contracts to minimize errors and save time.

In 2021 a study conducted by Lee Kim focused on the risks of change management in contracts and their proactive handling. Additionally, the author proposed to integrate risk assessment in the contract development phase. Furthermore, this way the contract sponsor and the contract specialist can proactively anticipate the obstacles and provide controls and mitigation strategies to minimize the repercussions on cost and timeline (Lee Kim, 2021). There is also uniformity in how the importance of clear terms & conditions of the contract, timely risk assessment & mitigation, and utilization of technology and digital transformation were emphasized in all studies. This is to reduce the legal infliction, the contractual disputes, and the timeframe and to enhance the efficiency of the oil and gas project by reducing the legal conflicts.

The reviewed studies used different approaches to mitigate the impact of change management in contracts. To start with the Smith study emphasized the importance of proper identification and clear contract agreements. Whereby, John et al emphasized the utilization of technology and digital transformation to operationalize the contracts and manage the changes. However, Lee & Kim emphasized on the proactiveness of controlling and mitigating the risk while developing the contractual terms & conditions.

Only the study by Johns et al emphasized on utilization of technology and digital transformation to effectively

manage the change management process by automation. Whereby, the other studies focused on contractual agreements and risk management.

Concerning the strategy, Smith focused on the criticality of defining the contractual agreements, whereby Johns et al. study looks at the utilization of technology advancement and its benefits. On the other hand, Lee & Kim on the risk management controls & mitigations during the strategy and contract development.

The literature reviewed studies proposed combining technology, clear contractual agreement, and proactive risk assessment to manage the change management process in the oil and gas contracts. However, there is a gap in incorporating these strategies into a unified context for the specific challenge of oil and gas.

The reviewed studies emphasized the criticality of clear contractual agreements, the integration of technological advancement, and proactive risk management for the process of managing the change in contract management in the oil and gas industry. The studies provided a new focus area for industry professionals, but additional researches are required to transform the findings into practical models.

The reviewed studies were conducted in different organizations in different regions, and the outputs and findings cannot be generalized to all over the world. In this case study, I will confirm the significance of contractual terms and conditions, the importance of proactive risk management, and the utilization of advanced technology in managing the change management process at a leading oil and gas industry in the Sultanate of Oman.

Conceptual framework

Managing the major change in contracts in the oil and gas industry demands a different approach involving contract management vision, technology integration, and proactive risk management. Due to the changes in regulations, contract fluctuations, and technological advancement, this conceptual framework's objective is to address the dynamic challenges in the industry.

Components For the Conceptual Framework

Contract agreements

To control the dispute resulting from contract change, the context emphasizes clear contractual agreements. To protect the organization from disputes and ensure project continuity, a well-written contract with clear contractual terms and conditions in the change management process is crucial (Smith, 2019).

Technology and digital transformation in contract management

Technology advancement plays a critical role in contract management as per the reviewed studies. John et al.

find that technologies can help in managing the changes in contracts and it is more responsive and flexible, it automate contract operationalization, and reduce human risk error. Thus technology is more reliable in the change management process (John et al., 2020).

Proactive risk management

Proactive risk management is very important during the development of the contract strategy. Lee & Kim emphasized the identification of potential risks associated with the change management process and to be mentioned in the contract during the development as a proactive approach. Incorporating the risk assessment into the contract during the early stages will help in anticipating the risks and issues throughout the contract duration. This proactiveness will reduce the risk of value and impact on the project timeline.

Research questions

1. To what extent and in what way do contract terms and conditions contribute to the change management process in the contracts of the oil and gas industry?
2. To what extent and in what way does the integration of advanced technology, contribute to effective change management in contracts within the oil and gas industry?
3. To what extent and in what way do proactive risk management strategies contribute to effective change management in contracts within the oil and gas industry?

Research variables

Independent Variables

Clear Contractual Agreements: The terms and conditions of contracts must be specific and clear to mitigate the risk of disputes arising from changes.

Integration of Technology: Digital tools and platforms, such as blockchains and smart contracts, are being used to improve the management of contract changes.

Proactive Risk Management Strategies: Risk-based approaches that identify, assess, and mitigate contract changes early in the contract formulation process and throughout the project lifecycle.

Dependent Variables

Effectiveness of Change Management: An assessment of the project's success based on its ability to minimize negative impacts (including disputes, delays, and cost overruns).

The hypothesis to be tested

H1: Clear contractual agreement has a significant impact on the effectiveness of change management in the oil and gas industries.

H2: The integration of technology in contract management processes has a significant impact on change management.

H3: Proactive risk management strategies in contract change processes have a significant impact on the effectiveness of change management.

Method

Research Design and Methodology

The methodologies used in the research design for the reviewed studies concerning managing the changes in the contracts management process in the oil and gas industry were different, as each study investigated the aspects that suit its specific area.

The research design used by Smith “Navigating Contract Changes in the Oil and Gas Industry” is performing document analysis and conducting semi-structured interviews with experts, contract managers, and project managers to get into the practical challenges. The data analysis was through thematic analysis to identify the common theme, and also through a comparative analysis to compare the best practices across the projects.

However, Jones et al 2020 used a mixed method in their study “The Role of Technology in Enhancing Contract Management in The Oil and Gas Industry”. The sampling in the study of Jones et al was through surveys and interviews. The analysis was done through statistical analysis of the collected data.

On the other hand, Lee and Kim 2021 used the exploratory sequential research design in their study “Risk Management Strategies in the Oil and Gas Contract Changes: a Proactive Approach”. The data collection was through a focus group interview for contract managers, and project managers to discuss the risks and challenges in the contract changes. Also using a Delphi method to gather experts' opinions and develop a conclusive assent on the best practice. The data analysis in the study of Lee and Kim was through qualitative content analysis and analysis of expert consensus.

In this research study, a mixed-methods research design will be used, the data collection will combine qualitative interviews with quantitative surveys of industry professionals. The data sampling for the quantitative analysis will be by distributing the survey to managers, team leaders, contract holders, and engineers who are working in the contract and procurement in the organization. In addition, focus group interviews aim to gain valuable insights into the experiences, problems, and decision-making processes of important informants such as managers, analysts, and contract negotiators.

The data analysis for the quantitative survey response will be through JASP software using descriptive statistical analysis. The survey questionnaires will be measured and assessed using Likert-scale questionnaires. The interviews will be analyzed through a thematic analysis for similar themes as of the quantitative review.

As a result of this methodology, it will be possible to explain current practices and challenges in an in-depth manner, as well as quantify the effectiveness of different approaches to change management in contracts. These tactics align with the philosophical pragmatism paradigm. This philosophy emphasizes the practical application of research observations and value perspectives to gain an inclusive understanding of the research problem (Creswell & Plano Clark, 2018).

Ethical Considerations

The research will follow ethical standards, ensuring participant confidentiality and anonymity. A written informed consent form will be provided to each participant.

Survey questioners

The questionnaire is divided into three themes with each question to be measured using a 5-point Likert scale where 1 = Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, and 5 = Strongly Agree. The details of the survey questionnaires are in Appendix 1.

Results

Descriptive Statistics Overview

Median and Mean Scores: It appears that the majority of respondents tend to agree or strongly agree with statements related to challenges and effective solutions in managing contract changes based on median scores of 4.5 or 5. There is a consensus among participants based on the high mean scores.

Standard Deviation (Std. Deviation): Responses are clustered around the mean (standard deviations around 0.5), indicating that respondents agree about the issues and solutions related to contract management.

Range of Scores: For all questions, a minimum score of 4 (Agree) and a maximum score of 5 (Strongly Agree) indicate strong agreement. The factors discussed were all viewed as equally important and impactful, as shown by the lack of neutral, disagree, and strongly disagree responses.

Data Analysis by Themes

The collected data were analyzed concerning research questions. The collected data was analyzed using descriptive statistics by JASP software. Appendix 2 presents the descriptive statistics of the survey results.

Theme 1 focuses on the extent of the problem from questions one to three. To measure participants' perceptions in this regard. Appendix 2 survey results present the descriptive statistics of the first theme is the extent of the

problem (TH1-1 to TH1-3).

The results of the analysis demonstrate an agreement directed toward levels 4 and 5 (To agree and to strongly agree) with an overall mean of 4.528 and a standard deviation of 0.5096. The analysis of the SD points out that the majority of respondents' answers are clustered around the mean. The mean scores of the first and second variables TH1-1 (Contractual Clarity and Disputes) and TH1-2 (Technology Utilization in Contract Management) were the highest ($M = 4.542$, $SD = 0.509$, n for all means = 24). This is followed in order by variable three – TH3-3 (Risk Management in Contract Changes) – ($M = 4.5$, $SD = 0.510$).

Statistical results of questions one to three indicate that the means were for participants' perceptions of the extent to which lack of clear contractual agreements results in disputes over contract changes, as well as the technology integration, is inadequate to handle change management in contracts effectively and existing risk management strategies are inadequate for anticipating and mitigating contract changes. These findings are not surprising given these are critical areas where the change in contract management is not active and executed as the process cycle requirements and timeline.

Table 1. The extent of the problem

Theme 1	The extent of the problem		
Variables	Participant	Mean	Std. Dev.
	n	M	SD
TH1-1: How much do you agree that the lack of clear contractual agreements results in disputes over contract changes in the oil and gas industry?	24	4.542	0.509
TH1-2: How strongly do you agree with the idea that oil and gas contract management technology integration is inadequate to handle change management in contracts effectively?	24	4.542	0.509
TH1-3: To what extent do you agree that existing risk management strategies are inadequate for anticipating and mitigating contract changes?	24	4.5	0.511

Theme 2 questions four to six focused on the consequences of the problem and its impact. The Descriptive statistics of items indicate that all the participants believe that failure in properly managing the changes in contracts can result in consequences and business impact on the organization. The results of the analysis demonstrate an agreement directed toward levels 4 and 5 (To agree and to strongly agree) with an overall mean of 4.569 and a standard deviation of 0.5033.

The analysis of the SD points out that the majority of respondents' answers are clustered around the mean. The highest mean scores of the second variable TH2-2 (Financial Consequences of Contract Changes) with $M = 4.625$, $SD = 0.495$, n for all means = 24 followed by variable TH2-3 (Overall Project Impact) with $M = 4.583$, $SD = 0.504$, n for all means = 24. This is followed in order by variable TH2-1 -(Impact of Disputes on Project Timelines) – ($M = 4.5$, $SD = 0.511$).

Table 2. Consequences of the Problem and Impact

Theme 2	Consequences of the Problem and Impact		
Variables	Participant	Mean	Std. Dev.
	n	M	SD
TH2-1: To what extent do you agree that disputes arising from contract change management significantly delay project timelines in the oil and gas industry?	24	4.5	0.511
TH2-2: To what extent do you agree that unmanaged contract management changes lead to cost overruns in the oil and gas industries?	24	4.625	0.495
TH2-3: How strongly do you agree that the ineffective management of contract changes negatively affects the overall project?	24	4.583	0.504

Statistical results of questions four to six indicate that the means were for participants' perceptions of the extent to which disputes arising from contract change management significantly delay project timelines, as well as unmanaged contract management changes leading to cost overruns and ineffective management of contract changes negatively affecting the overall project. These findings are expected given these are critical areas where value leaks can be anticipated in addition to slowing down the process cycle for change management in contracts.

Theme 3 questions seven to nine focused on the Solution and Impact in Solving the Issue. The Descriptive statistics of items indicate that all the participants believe some solutions are required to be featured in the process and other enhancements and new technology to be used to manage the effectiveness of change management in contracts in the organization. The results of the analysis demonstrate an agreement directed toward levels 4 and 5 (To agree and to strongly agree) with an overall mean of 4.5 and a standard deviation of 0.5096.

The analysis of the SD points out that the majority of respondents' answers are clustered around the mean. The highest mean scores of the first variable TH3-2 (Role of Technology in Enhancing Change Management) with

M = 4.542, SD = 0.509, n for all means = 24, followed by the third variable TH3-3 -(Impact of Proactive Risk Management) – (M = 4.5, SD = 0.511, n for all means = 24. his is followed in order by the first variable TH3-1 (Effectiveness of Clear Contractual Agreements) with M = 4.458, SD = 0.509.

Table 3. Solution and Impact in Solving the Issue

Theme 3	Solution and Impact in Solving the Issue		
Variables	Participant	Mean	Std. Dev.
	n	M	SD
TH3-1: Do you agree that having clear contract terms and conditions explicitly addressing change management processes would result in fewer disputes and better project outcomes?	24	4.458	0.509
TH3-2: To what extent do you agree that the adoption of advanced technology in contract management would improve the effectiveness of change management in contracts?	24	4.542	0.509
TH3-3: To what degree do you concur that incorporating proactive risk management measures into the contract would reduce the adverse effects of contract changes on project timelines and costs?	24	4.5	0.511

Statistical results of questions seven to nine indicate that the means were for participants' perceptions of the extent to which clear contract terms and conditions explicitly addressing change management processes would result in fewer disputes and better project outcomes, as well as advanced technology in contract management would improve the effectiveness of change management in contracts and incorporating proactive risk management measures into the contract would reduce the adverse effects of contract changes on project timelines and costs. These findings are expected and address research questions one to three which conclude that clear contract agreement and the integration of technology in contract management in addition to proactive risk management strategies significantly impact the change management in contracts in the organization.

The trends from the statistical analysis across all the problem themes and the solutions proposed indicate that the oil and gas contract management process needs to be enhanced in terms of clear contractual agreement, integration of technologies, and proactive risk management. By illustrating how disputes directly affect project timelines and financial results, these stories provide real-world context for the survey's numerical data.

As specified by the survey, improperly managed contract changes have significant long-term implications not only for financial loss but also in terms of reputational damage. One of the respondents noted that an “unclear contract agreement will delay the project timeline and create challenges in the change management in the

contract that will result in disputes and value leaks”.

There was a solid admission that clear contractual terms and conditions could reduce the value leak and disputes and improve the project outcome. As per the survey findings, the interviewees proposed specific ways to structure contracts to manage the changes properly. The organization's supply chain management software and technologies were cited as a process to automate the management and secure the process. The interviewee supported that proactive risk management to be incorporated from the start of the project to its completion to prevent problems before they arise.

As a result of the collected qualitative insights, we gain a thorough understanding of the oil and gas industry contract management, its challenges, and potential solutions. Moreover, the interviewee provided solid examples and professional evidence pinpointing the importance of clear contractual agreements, digital transformation, technology integration, and detailed risk management strategies. From these findings, the integration of contract management will enhance the project outcome, efficiency, and transparency.

Discussion

Linking Survey Results to the Literature Review

The literature review in this research covered three main areas: the criticality of clear contractual terms & conditions, the role of technology in contract management, the proactive risk management. There is a direct link to the literature that supports the survey results. From the high mean and median for the variables of theme 1 (The extent of the problem): contractual agreement, technological advancement, and proactive risk management, it is evident that the issue is recognized within the organization, aligned with the literature review challenges and solutions.

Linking Survey Results to Conceptual Framework Connection

The conceptual framework's core components focused on the contractual agreement, the integration of advanced technologies, and proactive risk assessment. The framework is supported by the survey results and analysis. In the oil and gas industry, clear contractual terms & conditions, technology integration, the proactive risk assessment are linked to theme 3 (Solution and Impact on Solving the Issue) variables are rated high which proves their effectiveness in the change management process. One of the respondents noted that “These components are indeed crucial for effective change management”. The empirical evidence validates the relevance and applicability of the conceptual framework to the industry challenges identified.

Linking Survey Results to Hypothesis Testing

According to these hypotheses, clear contractual agreements, technology integration, proactive risk management

strategies, and change management effectiveness are positively associated. As a result of high means for relevant questions (TH3-1, TH3-2, TH3-3), these hypotheses appear to be strongly supported. As a result of consistently high ratings for both the recognition of problems (TH1) and the perceived effectiveness of solutions (TH3), the hypotheses align, indicating that together these strategies contribute to a successful change management process in the sector.

Linking Survey Results to Research Questionnaire and Results

Based on the survey questionnaire, we were able to capture the industry's perception of the extent of contract management problems, the impact of these problems, and potential solutions. According to the results, the questionnaire was well-designed to assess the critical factors influencing change management in contracts within the oil and gas industry due to the high response rates and the consistency of the data (low standard deviations). According to the study, the results provide a strong basis for conclusions.

Conclusion

Despite the useful insights, the study's limitations may include the relatively small sample size (24 respondents) and the focus on a specific industry, which limit the study's generalizability. A Likert scale may also introduce subjective bias into the responses since self-reported data can be reported using a Likert scale. Possibly a case study could be incorporated into future research, or a broader audience could be reached through the survey.

Oil and gas industry contracts undergo significant changes as a result of this research. By integrating empirical data from the survey with conceptual frameworks and hypotheses derived from the literature, the study both validates existing theories and offers practical insight for industry professionals. This research highlights the importance of establishing clear contractual agreements, integrating technology, and adopting proactive risk management strategies.

A significant contribution is made to both academic and professional domains with this research project, which bridges theoretical concepts with practical industry challenges and solutions. It is clear from the analysis of empirical data that the identified strategies for managing changes in contracts have great importance, and we need to continue to research and innovate in this area.

Recommendations

I recommend further expanding the research to include more organizations across the country of Oman. This wider scope will help in validating the research findings to be more robust and increase the generalizability. Integrating other change management theories will provide a stronger base and improve the analysis. Moreover, advanced analytical tools such as regression can be used to analyze the variables and to obtain a more solid

conclusion concerning the research hypothesis.

Acknowledgments

I would like to thank my academic advisor and extend my appreciation to Modern College of Business and Science (MCBS). Special appreciation to the oil and gas industry contract and procurement department who support me during this study and significantly supported in shaping the recommendation.

A Quantitative Study Exploring University Faculty's Perceptions of How Top Management Team (TMT) Diversity Impacts Organisational Innovation: Oman Case

Hussain Al Rashdi

Modern College of Business and Sciences, Oman,

Abstract: This study intends to investigate how much the diversity of the top management team (TMT) with regard to work experience, educational background, thinking styles, and openness to sharing information enhances organisational innovation (OI) from the viewpoints of university faculty at a higher education institution in the Sultanate of Oman. The study describes not only the perception of TMT variety but also the connection between TMT diversity and organisational innovation. The study depends on the idea that the diversity in TMT influences organisational innovation. A scientific philosophy serves as the foundation for the study's research design. Data was gathered for the case organisation using a quantitative case study approach that involved surveys sent to 50 male and female university faculty members. The survey is divided into three pieces, each containing five questions. The objectives of each component are to identify attitudes concerning the impact on OI, examine attitudes for OI improvements, and emphasise credible facts that support the problem in the context of the research study. The quantitative aspect of the data is analysed using descriptive statistics. The results indicate that diversity in TMT educational background has a significant positive effect on OI; diversity in TMT thinking styles has a significant positive effect on OI; diversity in TMT work experience has a significant positive impact on OI; and diversity in TMT openness to sharing information has a significant positive effect on OI. The results also reveal the importance of TMT diversity in improving the implementation of OI in higher education settings in Oman. Significantly, although the sample is taken from one case study in a limited geographical area in Oman, which may jeopardise the generalizability of the findings, the study opens a new horizon of research in this area to validate the results in similar locations. The study provides insights, via the quantitative findings, into how TMT diversity impacts OI in Oman through the lens of upper echelon theory (UET). It highlights the importance of TMT diversity in advancing OI in the Omani HEIs. The insights gained from this study are useful for HEI policymakers in Oman. It provides them with an understanding of the value of TMT diversity for the effective implementation of OI.

Introduction

Background

HEIs are facing difficulty in adapting to OI as there is rapid change in the world (Armstrong, 2016). This research study explores how TMT diversity impacts OI.

HEIs are vital in driving innovation and economic growth by educating future generations, conducting advanced research, and promoting technological advancements (Etzkowitz, 2003). However, the competitive nature of higher education requires continual adaptation and innovation to remain relevant and address evolving stakeholder needs (Fumas & Ortega, 2018).

Recognising Problems in Higher Education Despite the increasing importance of innovation, many universities struggle to cultivate a culture of innovation (Guerrero, Urbano, & Fayolle, 2018). This stagnation is attributed to several factors, including:

1. Bureaucracy and hierarchical structures: Rigidity in organisational structures and administrative processes stifle creativity and impede the implementation of innovative ideas (Gioia, Schultz, & Corley, 2000).
2. Resistance to change: Established faculty and administrators resist transformation due to fear of the unknown or a lack of incentives for innovation (Birkinshaw, Pereira, Teresa Hambrick, & Thomas, 2014).
3. Limited resources: Financial constraints and resource scarcity restrict universities' ability to invest in new ventures and support innovative projects (Fumas & Ortega, 2018).

Problem Statement

TMT has an essential role in the effective implementation of OI. Research studies show that TMT diversity, such as deep level, age and gender, positively affects innovation (Hammad et al., 2023; Martin, 2022; Haihong, 2022). However, the impact of TMT diversity changes from one setting to another according to the team's behaviour and cultural differences. Thus, it is significant for any organisation to maximise TMT diversity effectively to improve the implementation of OI.

Numerous studies examined the connection between OI and TMT diversity. Hammad et al. (2023) search the relationship between TMT and the practices of a chief sustainability officer (CSO) in the Pakistani hotel industry setting of green innovation with the integration of TMT as a moderating factor. It was found that TMT diversity has a positive influence on green innovation. Another study by Zou and Fan (2022) on Chinese technological companies studied the relationship between TMT commitment, human resources diversity, and OI. They found that TMT commitment positively affects HR diversity, which in turn impacts the enhancement of OI. Jie et al. (2021) investigated how TMT gender diversity impacts OI in a way that improves organisational performance. The study gives implications for the inclusion of female gender in TMT. The study's findings

showed that TMT gender diversity enhances organisational innovation (OI), which in turn boosts organisational performance.

Even though many research studies have investigated the impact of TMT diversity on OI, they lack the exploration of the relationship between the two from the insight of upper echelons theory in the HE context of Oman. To the best of my knowledge, none of the studies delve into the relationship between TMT - educational background, thinking styles, work experience and openness to sharing information - diversity and OI in the Omani HE setting. Therefore, a study that searches for the impact of TMT diversity and OI through the lens of upper-echelon theory is needed as it adds to the body of knowledge.

This study provides insights into how TMT diversity impacts OI through upper-echelon theory components: educational background, thinking styles, work experience and openness to sharing information. The results help to understand how OI is implemented effectively in the Omani HEIs, leading to promising solutions to innovation challenges in HEIs.

Purpose of the Report

This research study explores to what extent TMT diversity impacts OI in the Omani HE context. The next section reviews some of the empirical research studies relevant to this study.

Research Questions

This research study answers this question:

To what extent does top management team (TMT) diversity - educational background, thinking styles, work experience and openness to information sharing - impact organisational innovation?

The research question is answered using a quantitative approach through a questionnaire distributed to university faculty at a single HEI in Oman.

Research Objectives

The research attempts to attain the following objectives:

1. To substantiate the problem related to the relationship between TMT diversity and OI in the Omni HE context.
2. To explore the university faculty's perception of TMT diversity's impacts on OI in the Omani HE context.
3. To find out the perception of university faculty towards the solutions to OI challenges in the Omni HE context.

Significance of the Study

The following major anticipated outcomes make this study crucial:

- Substantiating the existence of OI challenges in the Omani HEIs setting.
- Recognising the issue related to the impact of TMT diversity on HEIs innovation in Oman.
- Identifying solutions towards the advancements of HIEs innovation in Oman through TMT diversity.

Operational Definitions

According to Nielsen (2010), TMT diversity is a set of personal characteristics and traits that are distributed among the top management team members.

Based on Demircioglu (2016), OI refers to the intuition of new organisational initiatives, procedures or products. Thus, HEIs need to inspire the process of innovation to keep itself competitive in the market. That improves the learning and research experience and develops the organisation in its respective fields (Gryshchenko et al., 2021).

This study comprises seven diverse sections. The first one is an introduction. The second section includes a review of related literature. Next, section three focuses on the methodology. The core of this research is section four, where the results are discussed. Section five discusses the limitations of the study. Next, section six summarises the main results. Finally, section seven identifies the recommendations.

Review of Literature

The literature that is pertinent to this study is covered in this section. A theoretical analysis of the effects of TMT variety on OI is also included. The thematic analysis methodology is used to review the literature in which the relevant studies are grouped and analysed thematically.

Diversity in Work

Work diversity refers to the range of backgrounds, experiences, and views individuals bring to a team (Harrison, Zhu, & Carroll, 2002). Diversity in a TMT encompasses factors such as:

- Functional background: Members with diverse educational backgrounds and professional experiences contribute unique perspectives and challenge existing assumptions (Hambrick & Finkelstein, 1998).
- Gender diversity: Studies indicate that gender-diverse TMT fosters innovation by bringing different viewpoints and approaches to decision-making (Bantel & Jackson, 1989).
- Cultural diversity: Culturally diverse teams enhance creativity by offering insights into various markets and fostering a more global outlook (Jansen).

Organisational Innovation

Organisational innovation involves introducing new ideas, processes, or products within an organisation. In higher education, organisational innovation takes various forms (Hage (1999), such as:

- Developing new teaching methods and learning models (e.g., flipped classrooms, online learning platforms).
- Introducing innovative research programs and collaborations with industry partners.

Work Diversity and Organisational Innovation

The relationship between TMT diversity and OI has been found positive in many research studies (Hambrick & Finkelstein, 1998; Milliken & Martins, 1996; Jehn et al., 1990). However, there is a possibility that diversity brings in conflicts among the team members. Therefore, it is necessary for TMT to create a healthy culture in which critical thinking and positive debate are applied. Considering multiple viewpoints, diverse TMT makes more informed and well-rounded decisions, which leads to innovative outcomes. This can provide insight and detect blind spots, leading to more creative and innovative solutions.

Limited Research in Oman

Although the UET framework and the link between TMT diversity and innovation have been extensively studied in Western contexts, research in the Middle East, particularly Oman, is lacking. This study aims to contribute to the limited body of knowledge by examining the applicability of UET in the Omani higher education sector. While not directly tested in Oman, the theoretical framework has been validated in various global contexts, suggesting its potential relevance in the Omani university system.

Similar Studies

Several studies have explored the relationship between TMT diversity and OI in higher education settings. Four central studies are reviewed by comparing their focus and results to find commonalities, differences, and potential research gaps. First, Lee & Finkelstein (2003) investigated the impact of TMT functional diversity on innovation in US universities, finding that universities with more diverse TMTs in terms of academic background were more likely to produce groundbreaking research.

In their study, Bantel & Gusdorf (2005), focusing on European universities, revealed a positive correlation between gender diversity in TMTs and the development of innovative educational programs. Besides, Kwon & Bae (2015) found that - in South Korean universities - TMTs with diverse cultural backgrounds were more adept at fostering international collaborations and promoting innovative research partnerships. Table 1 demonstrates differences and commonalities among studies.

Table 1. Differences and commonalities among studies

Differences	Lee & Finkelstein (2003)	Bantel & Gusdorf (2005)	Kwon & Bae (2015)	Chadee & Hii (2017)
location	The States	Europe	South Korea	Malaysia
Diversity type	Operational	Gender	Cultural	Experiential (Academic & Industry)
Innovation form	Groundbreaking innovation	Innovative academic Programs	Innovative Partnerships studies	Syllabus/ Technology Integration
Similarities	Lee & Finkelstein (2003)	Bantel & Gusdorf (2005)	Kwon & Bae (2015)	Chadee & Hii (2017)
The relationship between TMT diversity and OI	Positive			
Research setting	Academic universities			
Research gap	Investigating other factors of TMT diversity and exploring how they engage with OI.			

2.6 Upper Echelons Theory (Hambrick & Finkelstein, 1998)

This research study is built on the upper echelon theory (UET), which argues that firm performance and its strategic decisions are influenced by top management team diversity. There are many factors of top management team diversity such as attributes, experience, gender, age, thinking styles and educational background (Hambrick & Finkelstein, 1998). Furthermore, scholars claim that top management team diversity can enhance work creativity, complex problem-solving capability and the effectiveness of making strategic decisions (Milliken & Martins, 1996). In the following section, the research methodology is discussed.

Method

This chapter includes details about sampling, research method, ethical issues, data collection and analysis tools.

Design/ Rationale of the Research

Based on positivism, the study's design was created (Rahi, 2017). Data is gathered via an anonymous online questionnaire that follows the quantitative cross-sectional approach. It is distributed among university faculty to explore how TMT diversity impacts organisational innovation in HE context in Oman. To the best of the researcher's knowledge, other researchers have not yet studied the relationship between TMT diversity and organisational innovation in the Omani higher education context. Therefore, exploring this relationship in a new

setting like the higher education context in Oman adds value to the originality of this study by confirming or disconfirming findings (Shaheen, 2021).

Conceptual Framework

The conceptual framework of this research study represents the relationship between TMT diversity (educational background, thinking styles, work experience and openness to information sharing) and organisational innovation (See Figure 2.)

- **Independent Variable:** TMT diversity (educational background, thinking styles, work experience and openness to information sharing).
- **Dependent Variable:** organisational innovation.

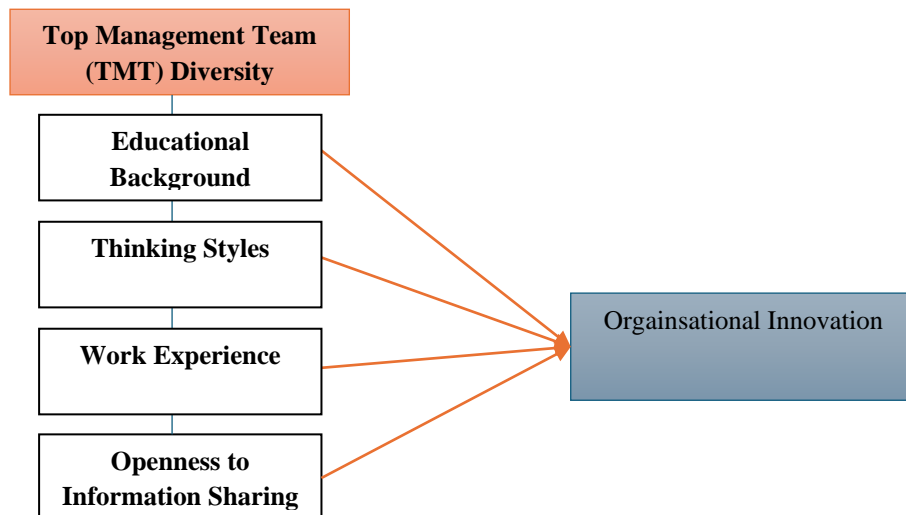

Figure 1. The Conceptual Framework

The Research Hypothesis

A hypothesis is an assumption of a phenomenon that has not been proved yet (Hair et al., 2020). This research study proposes different hypotheses to test the relationship between TMT diversity and organisational innovation. The following are the hypotheses that are examined in the study:

- H1: Educational Background diversity has a significant positive effect on OI.
- H2: Thinking Styles diversity has a significant positive effect on OI.
- H3: Work Experience diversity has a significant positive effect on OI.
- H4: Openness to Information Sharing diversity has a significant positive effect on OI.

Setting/ Context of the Research

The study is implemented in an Omani higher education context. It is an educational environment where engineering programmes are offered. System engineering, aeronautical engineering, marine engineering, civil engineering, and geomatics engineering are its five engineering departments. There are over 2000 students enrolled and about 900 faculty and staff members.

Participants and Ethical Considerations

The participants of this research study are university faculty from HEI in Oman. The total number of samples is 44 respondents. Participation is entirely voluntary and anonymous. All data are treated confidentially.

Data Collection Instruments

A questionnaire is used to collect data in this research study. The items are measured using a five-like scale. The scale is applied to measure relationships between variables. The scale varies from a very large extent to no extent. The questions include three sections. Each section has four items. Each item represents the following variables: independent (educational Background, thinking Styles, work Experience, openness to Information Sharing) and dependent (OI). The questionnaire sections are designed in the following sequence: substantiating the problem in the setting (the TMT diversity issues which affect OI), identifying participants' attitudes toward the impact of TMT diversity on OI, and finding participants' attitudes toward the solutions to the problem.

Procedures

The questionnaire is designed based on the upper echelon theory (UET), which claims that the TMT traits impact decision-making, leading to influencing OI. It has 15 items. Google Forms was used to create the questions, which included a consent statement and a brief introduction outlining the purpose of the research. Following that, the participants were provided with access to the questionnaire online.

Data Analysis

Descriptive Statistics that are generated through SPSS are utilised to analyse the data collected. The statistics were generated through Google form statistical analysis. According to Thomas (2021), some key steps should be applied carefully when dealing with quantitative data: referring to the conceptual framework, preparing the data for analysis, and then analysing the research findings. Leave one blank line (1.5 times spaced) before and after each heading. (Exception: no blank line between consecutive headings.) Please margin all headings to the left. Leave one blank line (1.5 times spaced) before and after each heading. (Exception: no blank line between consecutive headings.) Please margin all headings to the left.

Results and Discussion

Descriptive Statistics

Questionnaire Items: 1.1 to 1.4 – TMT Diversity

The mean across items (1.1 to 1.4) is between 2.35 and 2.51, indicating that participants' perception of TMT diversity is low in the four components. In addition, the SDs are between 0.551 and 0.667, which is ultimately low, suggesting that respondents' answers are consistent.

Questionnaire Items: 2.1 to 2.4 – Impacts of TMT Diversity on OI

The mean across items (2.1 to 2.4) is just over 4, which indicates that participants' perception of the impact of TMT diversity on OI is relatively high in the four components. Besides, the SDs are between 0.618 and 0.814, which is quite high, suggesting that respondents' answers are somewhat inconsistent.

Questionnaire Items: 3.1 to 3.4 – Solutions to the Negative Impacts of TMT Diversity on OI

The mean across items (3.1 to 3.4) is just above 4, which suggests that participants agree on the positive impact of TMT diversity on OI in the four components. Additionally, the SDs are relatively similar to items (2.1 to 2.4), indicating that respondents' answers have a high level of variability.

Overall, the descriptive analysis above reveals that respondents realise that their TMT diversity has a low level of diversity. However, they believe that a diverse TMT leads to a better implementation of innovation in their organisations. This aligns with the claim of Hambrick & Finkelstein (1998), who argue that by considering multiple viewpoints, diverse TMT makes more informed and well-rounded decisions, leading to innovative outcomes.

Objectifying the Problem in the Organisation

Item 1.1 to what extent does top management team include a diversity of educational backgrounds? The participants' responses range in degree from a very large extent to a large extent, to some extent and to a little extent. It can be indicated that the majority of participants answered that top management team includes a little extent of educational background diversity. However, a minority of them responded with to a large extent of educational background diversity in top management team.

Item 1.2 to what extent does top management team include a diversity of thinking styles? The scale of the participants' responses varies as follows: to a very large extent, to a large extent, to some extent and to a little extent. It can be indicated that most participants answered that top management team includes a little extent of

educational background diversity. The minority of them, however, responded to the diversity of thinking patterns within the senior management team in several different ways.

Item 1.3 to what extent does top management team include a diversity of work experience? The participants' answers vary in scale as follows: to a very large extent, to a large extent, to some extent and to a little extent. It can be indicated that the majority of participants answered that top management team includes a little extent of work experience diversity. However, a minority of them responded with to a large extent of thinking styles diversity in top management team.

Item 1.4 to what extent does top management team include a diversity of openness to information sharing? The range of responses from the participants is as follows: to a large extent, to some extent and to a little extent. It can be indicated that the majority of participants answered that top management team includes a little extent of openness to information-sharing diversity. However, a minority of them responded with to a large extent of openness to information-sharing diversity in top management team.

Identifying Attitudes Towards the Impact of the Problem

Item 2.1 to what extent does the lack of top management educational background diversity lead to less organisational innovation solutions? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that the lack of top management educational background diversity leads to less organisational innovation solutions. However, a minority of them responded with to some extent.

Item 2.2 to what extent does the lack of top management thinking styles diversity hinder complex problem-solving? The participants' answers vary in scale as follows: to a very large extent, to a large extent, to some extent and to a little extent. It can be indicated that the majority of participants answered that the lack of top management thinking styles diversity hinders complex problem-solving. However, a minority of them responded with to a little extent.

Item 2.3 to what extent does the lack of top management work experience diversity lead to disruptive organisational innovation? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that the lack of top management work experience diversity leads to disruptive organisational innovation. However, a minority of them responded with to some extent.

Item 2.4 to what extent does the lack of top management openness to sharing information diversity reduce the consideration of divers viewpoints? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that the lack of

top management openness to sharing information diversity reduces the consideration of diverse viewpoints. However, a minority of them responded with to some extent.

Identifying Attitudes Towards the Solutions.

Item 3.1 to what extent does top management educational background diversity lead to more innovative solutions? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that top management educational background diversity leads to more innovative solutions. However, a minority of them responded with to some extent.

Item 3.2 to what extent does top management thinking styles diversity stimulate creative problem-solving? The participants' answers vary in scale as follows: to a very large extent, to a large extent, to some extent and to a little extent. It can be indicated that the majority of participants answered that top management thinking styles diversity stimulates creative problem-solving. However, a minority of them responded with to a little extent.

Item 3.3 to what extent does top management work experience diversity expose the organisation to new ideas leading to constructive innovation? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that top management work experience diversity exposes the organisation to new ideas leading to constructive innovation. However, a minority of them responded with to some extent.

Item 3.4 to what extent does top management openness to sharing information diversity allow for an inclusive decision-making process? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that top management openness to sharing information diversity allow for an inclusive decision-making process. However, a minority of them responded with to some extent.

The overall findings suggest that a diverse range of TMT diversity - educational background, thinking styles, work experience, and openness to information sharing - enhances innovation in the higher education context in Oman, leading to a successful implementation of OI. These findings align with the results of other empirical research studies, which argue the fact that HEIs with more diverse TMTs in terms of academic background are more likely to produce and implement innovation effectively and successfully (Lee & Finkelstein, 2003; Bantel & Gusdorf, 2005; Kwon & Bae, 2015; Chadee & Hii, 2017).

Conclusion

The purpose of this research is to respond to the following query:

What is the influence of top management team (TMT) diversity on organisational innovation? This includes differences in educational background, thinking styles, job experience, and openness to share knowledge.

The results of the data analysis and findings support the following conclusions: TMT diversity in educational background positively affects OI significantly; TMT diversity in thinking styles positively affects OI significantly; TMT diversity in work experience positively affects OI significantly; and TMT diversity in openness to sharing information positively affects OI significantly. This suggests that these elements have a significant role in the development of HEI innovation in Oman. Policymakers in Oman's HEIs can take that into consideration for a successful OI implementation.

Recommendations

For more efficient and successful OI implementation, Omani HEIs TMT should include a diversity of the following:

- Educational background
- Thinking styles
- Work experience.
- Openness to sharing information.

The Intersection Between Transformational Leadership and Digital Transformation: The Case of Oman

Hussain Al Rashdi

Modern College of Business and sciences, Oman

Abstract: This study aims to explore – from the perspectives of university faculty at a higher education institution in the Sultanate of Oman - the extent to which transformational leadership (TL) improves digital transformation (DT). In addition to revealing how TL is perceived, the study reports on the relationship between TL and DT. The study is based on the assumption that TL increases DT. A scientific philosophy underpins the research design of the study. A quantitative case study approach involving surveys administered to 50 male and female university faculty at the case organisation was used for data collection. The survey includes three sections with 15 questions, each section aiming to highlight viable data that substantiates the problem in the context of the research study, identify attitudes towards the impact of TL on DT and explore attitudes towards the improvements of DT. Descriptive statistics analysis is used to analyse the quantitative component of data. The findings suggest that TL components have a significant positive effect on DT. The results also reveal the importance of TL in improving the implementation of DT in higher education settings in Oman. Significantly, although the sample is taken from one case study in a limited geographical area in Oman, which may jeopardise the generalizability of the findings, the study opens a new horizon of research in this area to validate the results in similar locations. The study provides insights, via the quantitative findings, into how TL impacts DT in Oman through the lens of transformational leadership theory (TLT). It highlights the importance of TL in advancing DT in the Omani HEIs. The insights gained from this study are useful for HEI policymakers in Oman. It provides them with an understanding of the value of TL for the effective implementation of DT.

Keywords: Transformational Leadership, Digital Transformation, University Faculty

Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 2740-2756), Antalya, Turkiye. ISTES.

Introduction

Background

HEIs are meeting challenges in DT as there are fast recent changes in the global market (Armstrong, 2016). Besides, there is an increase in the implementation of DT by many HEIs around the world in which they follow a process of utilising different technological tools to catch up with the rapid change in the market (*Unlock business through Digital Transformation*, 2024). However, the effective management of DT relies strongly on

TL which emerged as a crucial factor in this field (Bass, 1985). TLT argues that an institutional leadership team can stimulate the motivation of faculty to attain successful and remarkable DT, which in turn leads to exceptional performance. Based on Bass (1985), TL has central components that characterise it, idealised influence (attributes), idealised influence (behaviours), inspirational motivation, intellectual stimulation, and individualised consideration of the group.

Idealised Influence (Attributes) refers to personal traits that stimulate respect and faith such moral and charisma. Idealised Influence (Behaviors) refers to the actions that promote respect and trust, like an ethical demonstration of commitment to institutional goals. Inspirational motivation refers to a leader's ability to convince team members to have a sense of commitment towards achieving institutional goals. Intellectual stimulation refers to the ability to inspire followers to be creative and innovative. According to Bass (1985), "individualised consideration" is making sure that followers feel supported and appreciated for who they are.

Problem Statement

TL has a vital impact on DT since it helps HEIs to navigate the complex dynamics of internal and external organisational environment. Besides, it affects strategic goals and decision-making, leading to innovative DT. Furthermore, it improves the dynamic capabilities requested for efficient DT, which in turn makes organisations able to be competitive in the digital arena (Hong-Juan, 2023). Many research studies found that TL has a positive impact on performance, commitment and behaviour which are considered key factors for successful DT. Thus, accepting TL is a vital driver of revolutionary DT (Yansen & Yujie, 2023; Randi et al., 2023; Pedro, 2023).

Even though many research studies have investigated the impact of TL on DT, there is a limitation in the exploration of the relationship between the two from the insight of TLT in the HE context of Oman. To the best of my knowledge, none or just a few studies delve into the relationship between DT (Idealised Influence (Attributes), Idealised Influence (Behaviors), Inspirational Motivation, Intellectual Stimulation, and Individualised Consideration of the group) and DT in the Omani HE is setting. Therefore, a study that searches for the impact of TL and DT through the lens of TLT is needed as it adds to the current body of knowledge in this field.

This study provides insights into how TL impacts DT through TLT components (Idealised Influence (Attributes), Idealised Influence (Behaviors), Inspirational Motivation, Intellectual Stimulation, and Individualised Consideration of the group). The results help to understand how DT is implemented effectively in the Omani HEIs, leading to promising solutions to DT challenges in HEIs.

Purpose of The Report

This research study explores to what extent TL impacts DT in the Omani HE context.

The next part discusses some research studies that are related to this study.

Research Questions

The current study answers this question:

To what extent do transformational leadership components (Idealised Influence (Attributes), Idealised Influence (Behaviors), Inspirational Motivation, Intellectual Stimulation and Individualised Consideration of the group) impact digital transformation?

The researcher responds to the research question utilising a quantitative approach in which a questionnaire was distributed to university faculty at a single HEI in Oman.

Research Objectives

The study attempts to achieve the following objectives:

4. To confirm the problem related to the relationship between TL and DT in the Omni HE context.
5. To investigate the university faculty's perception of transformational leadership's impacts on DT in the Omani HE context.
6. To understand the perception of university faculty towards the solutions to DT difficulties in the Omni HE context.

Significance of The Study

This study is important for the following major estimated results:

- Substantiating the existence of DT challenges in the Omani HEIs setting.
- Recognising the issue related to the impact of TL on DT in the Omani HEIs.
- Identifying solutions towards the advancements of HIEs innovation in Oman through TL components.

Operational Definitions

According to Bass (1985), transformational leadership is a kind of leadership that highlights the leader's ability to stimulate and encourage followers to accomplish outstanding results, inspiring them for the best of the organisation.

Based on Morakanyane et al. (2017), digital transformation is a process that involves adoption of various technologies, influencing different facets of an organisation.

This research paper includes seven different sections. The first section is an introduction. The second section

contains a review of relevant literature. Following this, section three delves into the research methodology. The heart of this research is section four, where the results are presented and discussed. Section five identifies the limitations of the study. Next, section six concludes and summarises the key results. Finally, section seven provides the recommendations.

Review of Literature

This section includes related literature to this study. The thematic analysis methodology is used in which the reviewed studies are grouped thematically to review how TL impacts DT.

The digital landscape of higher education is rapidly evolving, demanding a shift towards technology-integrated teaching and learning methodologies. This transformation necessitates leadership that fosters innovation and adaptability among faculty members. TLT offers a framework to understand how leaders can inspire and motivate faculty to embrace DT.

Research suggests a positive correlation between TL and employee engagement with digital initiatives (Wang & Zhao, 2023). However, limited studies have explored faculty perceptions of this relationship in the context of higher education, particularly in regions like Oman that have unique cultural dynamics. In an attempt to close this disparity, this study examines how Omani university faculty members view the influence of TL styles on their readiness to participate in DT initiatives (Kereri et al., 2022).

Transformational Leadership Styles

TLT, as proposed by Keller in 1995, describes four essential leadership behaviors that have a big impact on how faculty members view DT in higher education. When faculty members combine these behaviors, they effectively inspire and motivate them to accept change. First of all, leaders displaying idealised influence clearly define the direction digital learning will take, stressing the ways in which technology will improve student learning and teacher effectiveness. They create a sense of purpose and enthusiasm for the possibilities by encouraging faculty members to view themselves as active participants in this digital future.

Second, creativity and adaptability are greatly aided by intellectual stimulation. Faculty members are encouraged by their leaders to try out new technologies and creatively incorporate them into their lessons. Leaders enable faculty members to take charge of their digital learning journey by establishing an atmosphere that encourages critical thinking and is open to new ideas (Kumar, 2023).

Thirdly, faculty members have different needs and skill sets when it comes to integrating technology, and this is acknowledged through tailored consideration. Through mentorship, training programs, and empathetically and sympathetically addressing faculty concerns, leaders offer customised assistance. This individualised approach builds trust and gives staff the tools they need to complete the DT process successfully. Finally, by encouraging

commitment and involvement in higher education, transformational leaders motivate faculty members to support the accomplishment of DT initiatives. They promote experimenting with novel technologies and imaginative approaches, which improves student learning outcomes and the standing of the university. Strong transformational leaders typically exhibit a combination of these traits to promote faculty commitment to and involvement in DT in higher education (Keller, 1995). Check out new technologies and carefully integrate them into their education practices.

Digital Transformation in Higher Education

Higher education's digital transformation goes much beyond just integrating new technology and software in the classroom. It is an entire shift toward a learning environment that integrates technology, with a range of programs targeted at improving the quality of education for educators as well as students.

The implementation of Learning Management Systems (LMS) is a key component of this change. These platforms act as a central location for online tests, communication tools, and course materials. The adoption of an LMS streamlines course management encourages teamwork, and makes it easier for students to access learning resources. On the other hand, in order to fully utilise an LMS, faculty may need to receive training.

Offering courses online is a significant step as well. This method gives students with busy schedules or those who live far away from campuses flexibility by offering whole courses or just selected modules in a digital format. Interactive learning resources and simulations can be hosted on online platforms, which increases student involvement. However, in order to guarantee the calibre of the learning process when shifting to an online teaching approach, faculty members must acquire new competencies in instructional design and online pedagogy (Mike, 2023).

Transformational Leadership and Digital Transformation

According to Gareth (n.d.), when leaders present an appealing plan for integrating technology into teaching and learning, faculty members are more likely to understand the benefits and reasons for the changes. Faculty members are inspired to participate actively in the DT process by this motivating factor, which also gives them a sense of excitement and dedication.

Secondly, in order to promote intellectual stimulation, educators should be encouraged to explore and try out new teaching strategies and technological advancements. Transformational leaders build an atmosphere that values innovation, critical thinking, and receptivity to fresh perspectives. They provide opportunities for faculty to attend workshops, share knowledge, and collaborate on innovative projects related to DT. By enhancing a culture of experimentation and continuous learning, leaders empower faculty to develop the skills and confidence needed to effectively integrate technology into their teaching practices (Jonathan, 2024).

Moreover, transformational leaders demonstrate individualised consideration by recognising the diverse needs and concerns of faculty members. They provide personalised support, guidance, and resources to help faculty navigate the challenges associated with DT. Whether it's offering training programs tailored to different skill levels or providing mentorship and coaching, leaders ensure that faculty feel supported and equipped to embrace new technologies and pedagogical approaches.

Overall, TL serves as a catalyst for driving DT in higher education by inspiring and empowering faculty to embrace change, experiment with innovative practices, and ultimately enhance the teaching and learning experience for students. Transformational leaders create a culture of innovation and constant advancement that drives institutions forward in the digital era through their visionary leadership and encouraging actions (Mark, 2023).

Limited Research in Oman

It is essential to understand faculty perspectives in the context of Oman's higher education environment in order to promote effective DT in Omani universities. Although studies in a number of industries have shown a positive association between TL and DT, much has to be understood to fully comprehend this relationship in the unique cultural setting of Oman. Strong community ties and adherence to authority are hallmarks of Omani culture, which may have an impact on the kinds of leadership that appeal to faculty members. Prominent figures in Oman could have to put a higher priority on building trust via open communication and teamwork while addressing faculty anxieties about how DT will affect conventional teaching techniques.

In addition, Omani universities may encounter unique challenges in their digital transformation journey, such as faculty unease with English-language software or limited access to technology infrastructure. It takes leadership techniques that are specially designed to address these particular challenges to enable a smooth transition to digital learning environments. This can mean creating a cooperative climate where educators feel free to express concerns and offer suggestions about the use of technology, as well as offering leadership development programs that incorporate culturally sensitive communication approaches.

The support of the faculty is ultimately what determines if DT projects at Omani universities would be successful. Leaders should create communication methods that highlight the advantages of DT for both teachers and students by learning about faculty perspectives and resolving their concerns. This method increases faculty ownership and gives them the ability to actively shape their institution's digital future (Innovativetips, 2023). In summary, evaluating faculty perspectives in Oman is an important academic endeavour as well as a vital step in creating leadership techniques that facilitate successful DT in Omani higher education institutions (He, 2024).

Comparison of Similar Studies

Table. 1 analyses the relationship between TL and DT in three recent quantitative studies and compares them:

Table 1. LR Matrix

Study	Context	Methodology	Successes	Limitations
Wang & Zhao (2023)	Chinese Businesses	Survey	Strong correlations	Cross-sectional data
Singh et al. (2022)	Korean Public Sector	Survey & Interviews	Explored mediating variables	Limited sample size
Jones & Martinez (2020)	US Higher Education	Survey	Highlighted leadership importance	Limited focus on faculty perceptions

These studies share the use of quantitative methods like surveys to investigate the relationship between leadership and DT. They also highlight the positive impact of TL on employee engagement with digital initiatives. However, the studies differ in their contexts, methodologies, and depth of analysis. For instance, Singh et al. (2022) explored the role of mediating variables, while Tri & Hoang (2023) focused specifically on higher education but with limited emphasis on faculty perceptions.

Table 2. Differences and similarities across studies

Feature	Wang & Zhao (2023)	Singh et al. (2022)	Tri, & Hoang (2023)	This Study (Proposed)
Context	Chinese Businesses	Indian Public Sector	Vietnam (Higher Education)	Omani Higher Education
Methodology	Survey	Survey & Interviews	Survey	Survey
Focus	Leadership & Employee Engagement	Leadership & Mediating Variables	Leadership Importance	Faculty Perceptions
Similarities	- Quantitative methods	- Quantitative methods	- Quantitative methods	- Quantitative methods
	- Transformational Leadership & Digital Transformation	- Transformational Leadership & Digital Transformation	- Transformational Leadership & Digital Transformation	- Transformational Leadership & Digital Transformation (Faculty Focus)
	- Positive leadership impact	- Explores mediating factors	- Highlights leadership role	- Addresses faculty perspective in Oman
Differences	- Cross-sectional data	- Mixed methods (deeper analysis)	- Limited faculty focus	- Specific cultural context (Oman)
	- Focus on employee engagement	- Explores psychological safety & innovative work behaviour	- Focus on leadership in general	- Faculty perceptions & leadership styles

Key similarities between various studies examining the relationship between TL and DT can be identified,

providing significant insights into the dynamics of this relationship (Boudet et al., 2016). Firstly, there's a prevalent use of quantitative approaches, primarily through surveys, enabling researchers to gather data from a wide range of participants and thus obtain a statistically significant understanding of the relationship between variables. Secondly, there's a notable emphasis on employee or faculty engagement, underscoring the pivotal role of leadership in cultivating a positive attitude and willingness to participate in DT initiatives. Thirdly, the consistent discovery of a positive correlation underscores the critical importance of TL in driving successful DT efforts. Finally, while some studies delve into mediating variables, the primary focus remains on analysing the direct relationship between leadership behaviours and DT outcomes. These commonalities provide a comprehensive understanding of the impact of TL on DT across various contexts and industries (See Table. 2).

While existing studies on TL and DT vary in several aspects, key differences can be discerned. Firstly, these studies explore leadership and DT in diverse contexts, spanning Chinese businesses, the Indian public sector, Indian manufacturing, and Vietnam higher education, each with its unique cultural setting. On the other hand, this research will concentrate only on Omani higher education, taking into account the unique cultural differences that are present in this context. Second, although all studies use quantitative techniques like surveys, Singh et al. (2023) add interviews to their methodology to go deeper into mediating variables, which would not be possible in this study given its resource limitations. Thirdly, the analysis's focus varies across studies; some look at culture's impact or overall employee engagement, while others investigate mediating factors. Specifically, this study will focus on faculty. These variations highlight how crucial contextual intricacies and methodological issues are to understanding how TL and DT relate to one another in diverse sectors and geographical areas.

Transformational Leadership Theory

This study, which aims to explore how faculty members view the influence of TL behaviours on their participation in DT activities within Omani higher education, will be guided by the transformational leadership theory. This study uses TMT to investigate the ways in which faculty perceptions of DT are influenced by several leadership characteristics, including intellectual stimulation, idealised influence, personalised concern, and inspiring motivation. In order to help faculty members accept technology and help build a more innovative and digitally integrated learning environment, universities in Oman can develop specialised leadership methods that help them acquire insight into these attitudes. Faculty members will benefit from this if Omani higher education institutions undergo a successful digital transition. The project intends to help faculty members adopt strong leadership styles that foster teamwork, passion, and dedication in order to produce good DT results in university education institutions in Oman.

The following covers methodology, environment, samples, ethical considerations, and data gathering and processing tools.

Method

This section includes an explanation of the research methodology, study design, samples, ethical considerations, data collection techniques, and data analysis.

Design/ Rationale of The Research

The study design is based on the positivism school of thought (Rahi, 2017). The quantitative cross-sectional approach is used for data collection through an anonymous online questionnaire. It is disseminated among university faculty to explore their perceptions about how TL impacts DT in the HE context in Oman. To the best of the researcher's knowledge, the studies undertaken to study the impact of TL on DT in the Omani higher education context are very limited. Hence, studying this relationship in a new place like the higher education setting in Oman adds extra value to the originality of the current study by confirming or refuting findings (Shaheen, 2021).

Conceptual Framework

The conceptual framework in this study signifies the relationship between TL (idealised influence (attributes), idealised influence (behaviours), inspirational motivation, intellectual stimulation and individualised consideration of the group) and DT. (See Figure 1)

- **Independent Variable:** Transformational leadership – idealised influence (attributes), idealised influence (behaviours), inspirational motivation, intellectual stimulation and individualised consideration of the group.
- **Dependent Variable:** Digital transformation.

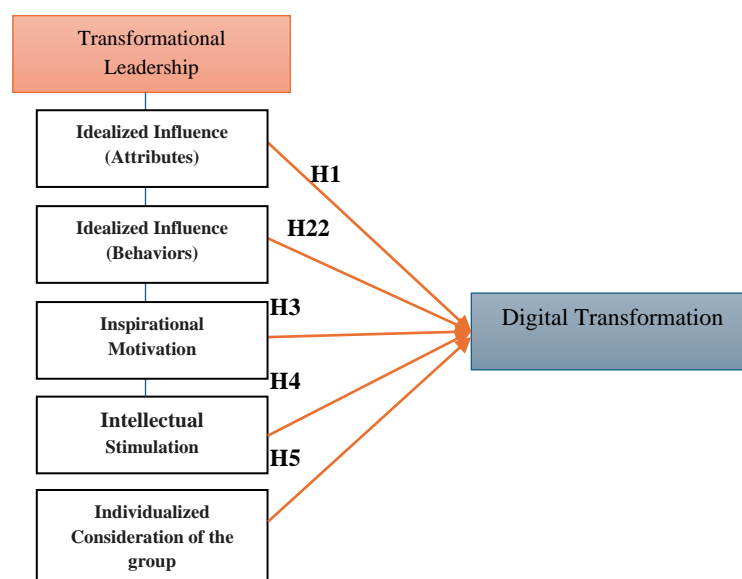

Figure 1. The Conceptual Framework

The Research Hypothesis

Based on Hair et al. (2020), a hypothesis refers to an idea of a phenomenon which has not been verified yet. The study suggests five hypotheses to examine the relationship between TL and DT. The following are the proposed hypotheses:

H1: (Idealised Influence (Attributes) has a significant positive effect on DT.

H2: Idealised Influence (Behaviors) has a significant positive effect on DT.

H3: Inspirational Motivation has a significant positive effect on DT.

H4: Intellectual Stimulation has a significant positive effect on DT.

H5: Individualised Consideration of the group has a significant positive effect on DT.

Setting/ Context of The Research

The research is conducted in a HEI in Oman. It is an academic institution which runs engineering programs. It contains five engineering departments (system engineering, aeronautical engineering, marine engineering, civil engineering, and geomatics engineering). It has about 2000 students and approximately 900 faculty and staff.

Participants and Ethical Considerations

Omani University faculty are the participants in the study. The targeted number of participants is 50. The response rate is 82 per cent (41 respondents). Participation in the questionnaire is voluntary and anonymous. The collected data are analysed confidentially.

Data Collection Instruments

The data collection tool is a questionnaire in which items are measured through a five-like scale to explore the relationships between the variables. The five-like scale range is between a very large extent to no extent. The questionnaire has three sections. Each section has five items. Every item corresponds to the following variables: idealised influence (attributes), idealised influence (behaviours), inspirational motivation, intellectual stimulation and individualised consideration of the group) and dependent (DT). The sections are structured in the following order: substantiating the problem in the setting (TL issues which impact DT, identifying participants' attitudes toward the effect of TL on DT, and exploring participants' attitudes toward the solutions to the problem.

Procedures

The questionnaire is created based on the transformational leadership theory, which argues that TL attributes and characteristics impact strategic direction and decision-making, leading to a significant impact on DT. It is

comprised of 15 items. The questions were constructed through Google Forms, with a short introductory blurb describing the objective of the study as well as a consent statement. Subsequently, the questionnaire is disseminated online to the targeted participants. The questionnaire was piloted and reached a Cronbach's alpha value of .757, showing acceptable internal consistency (See figure. 2).

Reliability Statistics	
Cronbach's Alpha	N of Items
.757	15

Figure 2. Cronbach's alpha

Data Analysis

The collected data is analysed through SPSS, from which descriptive statistics are generated. Additionally, statistics are generated through Google form. Based on Thomas (2021), several central stages should be considered carefully when treating quantitative data: making reference to the conceptual framework, getting data ready for analysis, and then analysing the results.

Results and Discussion

Descriptive Statistics

Questionnaire items– Transformational leadership

The mean across items (1.1 to 1.5) is between 2.34 and 2.54, showing that participants' perception of TL is low in the five components. Besides, the SDs are between 0.480 and 0.553, which is considerably low, indicating that respondents' answers are consistent.

Questionnaire items: Impacts of TL on DT

The mean across items (2.1 to 2.5) is between 4.32 and 4.39, indicating that participants' perception of the impact of TL on DT is moderately high in the five components. In addition, the SDs are between 0.610 and 0.656, which is pretty high, showing that respondents' answers are, to some degree, inconsistent.

Questionnaire items: Solutions to the negative impacts of TL on DT

The mean across items (3.1 to 3.5) is between 4.29 and 4.46, which shows that participants have an agreement on the positive influence of TL on DT in the five components. In addition, the SDs are reasonably similar to items (2.1 to 2.4), suggesting that respondents' answers are high in variability.

Generally, the descriptive analysis above indicates that participants believe that their institutional leadership faces some issues which should be taken into consideration. However, they agree that TL leads to a successful

and innovative institutional DT. This aligns with the argument of Hong-Juan (2023), who claims that considering a clear DT vision, ethical decision-making, DT optimistic vision, innovative work environment, and faculty digital upskilling leads to DT advancements.

Objectifying the Problem in the Organisation

Item 1.1 To what extent does leadership focus on DT long-term goals rather than short-term goals? The participants' answers vary in scale as follows: to a large extent, to some extent and to a little extent. It can be suggested that the majority of participants answered that leadership focuses on DT long-term goals rather than short-term goals to a little extent. However, a minority of them responded with to a large extent.

Item 1.2 To what extent does leadership make digital transformation decisions taking into consideration ethical implications? The participants' answers vary in scale as follows: to some extent and to a little extent. It can be indicated that the majority of participants answered that leadership makes digital transformation decisions taking into consideration ethical implications to a little extent. However, a minority of them responded to some extent.

Item 1.3 To what extent does leadership communicate an optimistic outlook on the future of teaching and research in the digital age? The participants' answers vary in scale as follows: to some extent and to a little extent. It can be indicated that the majority of participants answered that leadership communicate an optimistic outlook on the future of teaching and research in the digital age to a little extent. However, a minority of them responded to some extent.

Item 1.4 To what extent does leadership create an environment that fosters open discussion of new ideas related to teaching and research in the digital age? The participants' answers vary in scale as follows: to a large extent, to some extent and to a little extent. It can be indicated that the majority of participants answered that leadership creates an environment that fosters open discussion of new ideas related to teaching and research in the digital age to a little extent. However, a minority of them responded with to a large extent.

Item 1.5 To what extent does leadership provide support for faculty development? The participants' answers vary in scale as follows: to some extent and to a little extent. It can be suggested that the majority of participants answered that leadership provides support for faculty development to a little extent. However, a minority of them responded with to some extent.

Identifying Attitudes Towards the Impact of the Problem

Item 2.1 To what extent does the lack of clear digital transformation vision make it difficult for faculty to be engaged? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that the lack of a clear digital transformation vision makes it difficult for faculty to be engaged. However, a minority of them responded to

some extent.

Item 2.2 To what extent does the lack of digital transformation ethical decision-making create a sense of distrust among faculty? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that the lack of digital transformation ethical decision-making creates a sense of distrust among faculty. However, a minority of them responded to some extent.

Item 2.3 To what extent does the lack of a digital transformation optimistic vision demotivate faculty to integrate new technologies? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that the lack of a digital transformation optimistic vision demotivate faculty to integrate new technologies. However, a minority of them responded to some extent.

Item 2.4 To what extent does the lack of an innovative work environment hinder faculty engagement in teaching and research initiatives? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that the lack of an innovative work environment hinder faculty engagement in teaching and research initiatives. However, a minority of them responded to some extent.

Item 2.5 To what extent does the lack of faculty digital upskilling reduce their technology integration? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that the lack of faculty digital upskilling reduces their technology integration. However, a minority of them responded to some extent.

Identifying Attitudes Towards the Solutions

Item 3.1 To what extent does clear digital transformation vision improve faculty engagement? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that clear digital transformation vision improves faculty engagement. However, a minority of them responded to some extent.

Item 3.2 To what extent does digital transformation ethical decision-making foster trust among faculty? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that digital transformation ethical decision-making fosters trust among faculty. However, a minority of them responded to some extent.

Item 3.3 To what extent does digital transformation optimistic vision motivate faculty to adopt new technologies? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to

some extent. It can be indicated that the majority of participants answered that digital transformation optimistic vision motivates faculty to adopt new technologies. However, a minority of them responded to some extent.

Item 3.4 To what extent does an innovative work environment enhance faculty creativity in teaching and research? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that an innovative work environment enhances faculty creativity in teaching and research. However, a minority of them responded to some extent.

Item 3.5 To what extent does faculty digital upskilling enhance their confidence in digital transformation? The participants' answers vary in scale as follows: to a very large extent, to a large extent and to some extent. It can be indicated that the majority of participants answered that faculty digital upskilling enhances their confidence in digital transformation. However, a minority of them responded to some extent.

The overall findings indicate that TL – idealised influence (attributes), idealised influence (behaviours), inspirational motivation, intellectual stimulation and individualised consideration of the group improve DT in the higher education context in Oman, leading to an efficient implementation of DT.

These results align with the results of other research studies, which claim the fact that HEIs that take into consideration the five components of TL (idealised influence (attributes), idealised influence (behaviours), inspirational motivation, intellectual stimulation and individualised consideration of the group) are more likely to increase the level of successful implementation of DT (Yansen & Yujie, 2023; Randi et al., 2023; Pedro, 2023).

Conclusion

The conclusion revisits the research question and summarises the overall findings. This study intends to answer the following question:

- To what extent do transformational leadership components – idealised influence (attributes), idealised influence (behaviours), inspirational motivation, intellectual stimulation, and individualised consideration of the group) impact digital transformation?

Based on the data analysis and results, it can be concluded that idealised influence (attributes) has a significant positive impact on DT, idealised influence (behaviours) has a significant positive impact on DT, inspirational motivation has a significant positive impact on DT, intellectual stimulation has a significant positive impact on DT and individualised consideration of the group has a significant positive impact on DT. This shows that these components are vital determinants contributing to the development of HEI digital transformation in Oman. HEIs decision-makers in Oman can consider that for future successful implementation of DT.

Recommendations

For an efficient management of DT in Omani HEIs, a key aspect is taking into consideration the following components of TL:

- Idealised Influence (Attributes)
- Idealised Influence (Behaviors)
- inspirational motivation
- intellectual stimulation
- individualised consideration of the group

Acknowledgements

The Art of Managing Change in Construction Company (Oil and Gas)

Ibrahim Al Hasni

Modern College of Business & Science, Oman,  <https://www.mcbs.edu.om/>

Abstract: Despite resentful contemporary business dynamics, associations should continually develop to keep up with the importance and pieces of the pie. Compelling change management is essential for organizations to effectively explore the challenging development stage. This research dives into the change management practices of Galfar, a main construction and engineering firm. It investigates the steps, challenges, and best practices related to effective change management programs and gives viable bits of knowledge that different associations can apply. Galfar's proactive way of dealing with change management isn't simply a methodology but a living demonstration of their flexibility and groundbreaking. By utilizing its rich experience base and sustaining nearby ability, Galfar has explored changes successfully and changed them into open doors for development and advancement. This has laid out areas of strength for a cutthroat market presence, moving different associations to follow accordingly. The research design of this study follows a positive way to gather level-headed, impartial information that can evaluate the effectiveness of the leadership training and change management drives at Galfar. A quantitative case study strategy was utilized, and questionnaires were given to all degrees of employees in the association. This kind of survey plans to gather information through closed questions, which are appropriate for statistical analysis. Descriptive statistics were filled in as a rundown of the information, and correlation analysis was utilized to examine connections among elements like leadership effectiveness, workforce engagement, and operational performance. This approach makes it conceivable to test the hypothecated impacts accurately as it gives the specific quantitative upsides of the effect being tried. The research results show that leadership training, further developed communication, and change management drives assist with improving dynamic skills and operational performance. They additionally uncover the employees' vital jobs and how their contribution straightforwardly brings about higher efficiency. Additionally, the research exhibits that effective change management brings about great employee grasp, further highlighting the significance of their job. Finally, the research was restricted as it was led exclusively in one association in Oman, restricting and confining the outcomes. This study works by leading examinations in comparable settings to test these outcomes and affirm the progress of change management rehearses so they become broader.

Keywords: Change Management, Innovation, Best Practices, Leadership Training, Operational Performance, and Employee Engagement.

Citation: Al Hasni, I. (2024). The Art of Managing Change in Construction Company (Oil & Gas). In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2757-2765), Antalya, Turkiye. *ISTES*.

Introduction

The company is one of Oman's most attractive construction and engineering organizations. Working on an obtaining ground loaded with ceaseless development, changing inclinations, and consistently evolving client needs. In any case, the setting knows the need to adjust and exhibits that the association stays aware of market dynamics to guarantee steady development. It has directed various projects to guarantee ideal asset use and operational productivity and further developed project deliverable results. Although accomplishing greatness has not been challenging, the organization is trying to achieve something similar. Contrasted with different organizations, the company has dealt with numerous issues, such as staff resistance to change hierarchical designs and the abuse of communication frameworks, making it challenging for the organization to execute change productively. The organization is resolved to audit how to deal with the frameworks. Changes achieve a culture of super-durable innovation reception. Then again, it makes employees mindful that change ought not to be treated as a problematic power but as an opportunity that can be changed into development and advancement, subsequently guaranteeing that the association stays in front of the curve. The experience makes sense as the justification for the ongoing improvement of change management inside the setting, showing how the association continually tests itself and countenances various challenges, investigating the way of life of resistance and defeating hardships, whose result will be the accomplishment of the essential objectives with the assistance of the experience. Having gotten a substantial standard of the association's experiences, challenges, and desires, the company can journey through change to become a more vigorous and versatile construction and engineering element.

Literature review

In company-like associations, change management is a framework thinking approach enveloping hypothetical structures, experimental perceptions, and industry-explicit techniques custom-fitted to the construction and engineering areas. This writing audit investigates the liquid field of hierarchical change utilizing respected models like Lewin's Change Management Model, Kotter's Eight-Step Change Model, and the ADKAR Model. Such calculated systems help clarify the dynamics of change and improve the fitting mediation drives. Case studies, best practices, and models, then again, go further into the challenges and open doors that change brings and help to underline the job of leadership and communication, as well as in a few very much suggested present-day prescribed procedures - the job of innovation in conquering opposition and guaranteeing to get through changes. Additionally, this paper investigates the changing standards of change management rehearses, conjectures future turns of events, and proposes approaches that the company could use to move in the unpredictable market dynamics of the construction and engineering businesses. It centers around inward issues, leadership turnovers, hierarchical redesigns, specialized progressions, outer elements, monetary changes, administrative adjustments, and client assumptions. The article gives information on ordinary opposition focuses and methods for deterioration, exhibiting the meaning of such devices as Building Information Modeling (BIM) and project management software inside movable change exercises. In

conclusion, it presents the future development of change management, pinpointing challenges and opening doors to drive rehearses in construction and engineering regions.

Methodology

Design/ Rationale of the research.

Research focusing on the "Art of Managing Change in Construction Company (Oil & Gas)" is planned to quantitatively strategy the impact of the change management systems on the hierarchical performance and employee satisfaction in the company, a leading construction organization in the Sultanate of Oman. Using a normalized overview disseminated across various departments and progressive levels in the undertaking, this study is set to accumulate the information and dissect the effectiveness, snags, and consequences of the change management rehearses.

This quantitative-just methodology is directed by its power to convey unbiased, statistical bits of knowledge that can be applied across the association to figure out the connections between unambiguous change management systems and association measurements. It allows focus on change management, operational achievement, and employee engagement, giving benchmarks to performance improvement and key-making arrangements for the setting and comparative firms.

Setting/ context of the research

The study site is the "Art of Managing Change in Construction Company (Oil & Gas)," a leading construction and contracting organization in the Sultanate of Oman. This organization has become prevailing in construction and is chipping away at different projects, including streets and extensions and oil and gas installations. The setting is essential because of the dynamic and refined nature of the construction business, which undergoes nonstop changes in innovation, guidelines, project management approaches, market requests, and different boundaries.

An authoritative setting is portrayed by its different workforce, complex hierarchic designs, and the requirement for good communication and adaptability to guarantee project achievement and hierarchical turn of events. With the organization vitally pivotal for public foundation projects and adding to Oman's monetary turn of events, its way of dealing with change management is pertinent for its interior partners. It has more extensive ramifications for the business and the economy.

In such a manner, the study plans to comprehend how the company oversees hierarchical change, zeroing in on methodologies for managing mechanical changes, administrative movements, market dynamics, and inward rebuilding. This climate is the best setting to investigate the reasonable idea of change management in a high-stakes industry, as its case study would outline the cycles, challenges, and results when change is carried out in an exceptionally sped-up and complex change climate.

Participants

In the study "Art of Managing Change in Construction Company (Oil & Gas)," the participants will be many individuals inside the company, including the overall change management practices and an analysis of their impact. The choice of participants will be illustrated in terms of their jobs, encounters, and order inside the association to get different viewpoints on change management. Here is a breakdown of potential participant gatherings: Here's a breakdown of potential participant gatherings:

1. Senior Management

Their viewpoints will likewise assist with giving an essential update on change management drives, explanations for explicit techniques, and the normal versus genuine consequences of these changes.

2. Middle Management

They connect vital preparation and operational execution by giving experiences into change execution challenges and what they mean for team dynamics and performance.

3. Frontline Employees

Their feedback will mirror the exact image of change management rehearses, their fallout on everyday tasks, work satisfaction, and employee confidence.

4. Human Resources Personnel

They would suggest managing change from a group management viewpoint, for example, training, communication approaches, and employee feedback frameworks.

5. External Stakeholders (Optional)

Although their viewpoints are not formally part of the authoritative construction, they provide extensive information about the outside impacts and impressions of the change management systems utilized by the company.

The variety of participants from these gatherings will advance an extensive comprehension of change management, as seen from key, strategic, and individual levels. It will empower the study to uncover the adequacy and hardships of change management rehearses and their multiple-layered impacts on the association.

Data collection instruments

Datamining analysis for "The Art of Managing Change in Construction Company (Oil & Gas)" will utilize organized surveys and authoritative performance records as critical information. Surveys will be designed to catch the assorted assessments of employees in evaluating the effect of change management systems inside the association, work satisfaction, and hierarchical performance. The surveys will cover the Likert, multiple-choice, and ranking scales to measure employees' satisfaction levels and settlements on different change management drives. The study will also utilize information from authoritative performance records to investigate efficiency, benefit, and other performance pointers when executing the change methodologies. It will likewise be feasible to get numerous signs about what change management means for both the administrative and human components by utilizing employee surveys and performance information related to one another.

Procedures

The "Art of Managing Change in Construction Company (Oil & Gas)" research methodology will utilize the accompanying component — a systemic portrayal of research steps, exact and objective information assortment, and analysis. In this way, the starting will include evaluating hierarchical records as past and current endeavors on change and how these techniques were executed. This will give a starting image of the change management moves toward that can assist with setting the gauge for different mediations. From there on, the overview survey will be scattered among employees from various departments and levels utilizing a stratified random sampling procedure to procure quantifiable information about the responses that the new changes have caused. Updates and finishes will be carried out to guarantee a high reaction rate and precise information assortment. Consequently, the assembled information will be examined through statistical analysis to estimate associations and effects of change management rehearses on employee satisfaction and firm performance. During these meetings, the company administrators and I will guarantee that these rules are followed and that straightforwardness is upheld. This will prompt leading an itemized study concerning change

management systems, and afterward, a supportive result with the enhancements for a later project will be conveyed.

Data analysis

The information analysis in "The Art of Managing Change in Construction Company (Oil & Gas)" will be founded on descriptive statistics and the different deduction trials that will be finished for the gathered quantitative information. First, the study results will be depicted in statistics, exhibiting central tendency and variability for employees' perspectives on change management's effectiveness, satisfaction, and hierarchical essential focal points. Different inferential statistics, such as correlation analysis and regression models, will be utilized to feature the connections between the choice of execution strategies and their impacts on hierarchical performance. Information investigation will utilize coded software, like SPSS, including solid information dealing with mistake-free outcomes. The last stage will examine those statistical results to foster reasonable ends, where examples of overcoming adversity and not-very-great practices will be recognized individually. Consequently, the integrated cycle will guarantee that the organization has procured an entire image of what change management can mean for hierarchical performance and the dynamics of inner relations, especially among employees.

Ethical Considerations

The research will follow ethical standards, ensuring participant confidentiality and anonymity. Each participant will be provided with a written informed consent form.

Results and Discussion

During the research on "Art of Change Management in Construction Company (Oil & Gas)," quantitative information analysis showed that the change management approaches related to higher employee satisfaction and better hierarchical performance measures. Utilizing all-inclusive communication and training programs was fundamental in uncovering the significance of including employees at all levels during temporary cycles. However, issues, such as willingness to change and an impermanent decline in efficiency, were likewise identified as subjects that need further improvement. The way that the company's way of managing change has been proficient overall infers that nonstop changes and rehearsing the best principles are an unquestionable necessity to control challenges and succeed. The outcomes make explicit suggestions about changing their change management cycle. They show the significance of remembering employees for decision-production during explicit changes and effectively anticipating a fruitful change drive.

In the study, the quantitative information uncovered immense positive feedback, with the overall subject being employees' satisfaction with the work change management methodology. The immediate outcome was that the

portion of our respondents who were gathering noted they were happy with the changes presented. Interestingly, the others proposed they were palatable overall, inferring a superb tendency to acknowledge the new leadership techniques and critical drives. Plus, the decent amount of employee satisfaction mirrors the compelling coordinating of the change management techniques with the staff's assumptions and the hierarchical targets, suggesting the underlying steps of an association to move in the correct heading as a fruitful administrative case.

The most significant action item is the overall satisfaction acknowledgment of regions requiring consideration. A negligible number of individuals who participated in the change cycle inspected the interaction as just decently fulfilled or nonpartisan, implying perspectives that don't wholly address employees' issues. These fields involve creating productive channels and cognizance of the changes, designing training meetings to tie down ranges of abilities that will allow acclimation to new cycles, and a more helpful and participatory leadership style to remember all ensemble individuals for discussions regarding tasks.

The perceptions demonstrate that management ought to reclassify and foster change management processes (takes catalyst from the discoveries referenced previously). Putting resources into more powerful communication systems with plainly characterized objectives fits the organization. These plans will explain how the changes produce positive results for the specialists and the company. Procedural information is another reason the setting's direction and training would accommodate staff individuals. Now and again, firmly, the employees could change rapidly, too. The last point could be that establishing a climate of inclusiveness could add to the advancement of teamwork and employee satisfaction during the cycle, conceivably prompting the overall satisfaction of employees and more effective execution of such drives from here on out. The arrangements close the ongoing holes and guarantee the support representing things to come and proactiveness management simultaneously.

Limitations

The research exhibits the tragic defects of the study strategy, which relies upon quantitative information and will, in general, limit the expansiveness and profundity of the ends. Essentially, the reliance on normalized study instruments prohibits the unstructured styled reactions, so it is hard to recognize the employees' insight where emotionality is involved or, on the other hand, assuming complex variables influence the perspectives toward change. This approach might neglect the intricacies of the various employees' responses or the subtleties in how change is grasped in different situations from the lower to the upper-level management. The quantitative methodology likewise thinks about a couple of context-oriented factors. They incorporate social communications and asset sharing. Another requirement that can be created is inclination predispositions, which might happen when the people who chose to participate will generally contrast systematically from those who didn't. Thus, the outcomes might be slanted fundamentally. This flaw is the building block of

recognizing that regardless of the information giving a preview, it doesn't address the intricacies of shifting feelings inside the organization.

The restricted idea of surveys, as fragmented information from respondents, restricts the degree of detail, eventually clouding the subtleties of discernments and intricacies inside an association as it advances.

Significance of the Findings

The research results have significant ramifications, headings, and proposals for fruitful change management inside one significant construction organization. These discoveries uncover what effective change management rehearses are, singling out the best regions, like communication with employees and training programs, related to positive satisfaction and performance results. This information assists with recognizing the best methodologies and redirecting assets from less valuable regions, further developing productivity and employee arrangement with crucial goals. It likewise features the requirement for the continuous assessment and adjustment of change procedures to stay aware of the changing authoritative prerequisites and outside powers.

The study's outcomes assist with distinguishing areas of progress inside the setting change management processes where designated enhancements ought to be made. The information gained concerning the productivity of various techniques fosters a clean arrangement of command over hierarchical change, particularly in leadership contribution and employee participation. Carrying out these discoveries is additionally advantageous, and the association will become more viable in future change. The protection from change will be diminished, and the authoritative culture will likewise become more light-hearted. Variation is fundamental for recognizing and acknowledging vital objectives in the unstable construction area.

Moreover, the discoveries of this research go past the company to a more extensive area of faculty change management, particularly in ventures and locales going through quick changes and development. The case study of how the setting oversees change is utilized as a helpful reference by different associations and adds to the scholarly writing. It gives an extraordinary viewpoint on the challenges and wins of carrying out change management methodologies in the construction business and, consequently, a fundamental model for different organizations in similar settings to make and hone their change management rehearses. This enhances the change management conversation and empowers a reasonable perception of its essential viewpoints in making hierarchical progress and manageability

Concluding Remarks

The study on the Art of Managing Change in Construction Company (Oil & Gas) offers enormous knowledge into the intricacies of managing hierarchical change inside a respectable construction firm in Oman. The outcomes shed a little light on the qualities of the setting's change management approaches and what needs

further consideration, significantly improving communication and employee contribution in the change processes. These perceptions empower the company to hone its strategies, fortify its operational and vital structures, and add more extensive information on change management rehearses to the construction business. This study describes the need for constant observing and reforming in hierarchical change endeavors. In this manner, it fills in as a phenomenal model for different endeavors that need to know how to deal with mind-boggling examples of change.

Improving Leaders' Decision-Making Skills through Decision-Making Training Programs: The Case of Oman

Ibrahim Al Hasni

Modern College of Business & Science, Oman

Abstract: This study aims to evaluate the effectiveness of decision-making training programs in enhancing the skills and competencies of leaders within Oman, a leading construction and engineering company. The study is based on a quantitative method and will be accumulating empirical data showing the role of training imperatives in making influential leaders' decisions. The survey is used to identify the perceptions of participation regarding leaders' decision-making competencies, cognitive biases, and training needs. Statistical analysis methods, including descriptive and inferential statistics, are employed to analyze the collected information. This quantitative study aims to empirically validate the effectiveness of decision-making training interventions in setting, guiding the creation of customized programs to enhance leader skills, decision-making outcomes, and organizational performance. Through quantitative analysis of survey data, the study examines the relationship between variables such as leadership competencies, cognitive biases, and organizational culture and their impact on decision-making outcomes. The research aims to identify hidden mechanisms that affect decision-making effectiveness among company leaders through a planned quantitative data analysis, which assists an organizational leader in making an informed decision and formulating leadership growth strategies and initiatives. The findings suggest that well-structured frameworks, rigorous training, and improved communication enhance the company's decision-making efficiency. Moreover, the findings highlight the vital role of leadership participation. The results also indicate that lean processes directly influence the quality of decision-making. The data, however, is based on a single case study conducted in a limited area of Oman, which restricts the applicability of the current research. However, it provides the basis for subsequent studies to validate these findings in similar settings.

Keywords: Leadership Development, Decision-Making Training, Skill Enhancement, Organizational Growth, Strategic Decision-Making.

Citation: Al Hasni, I. (2024). Improving Leaders' Decision-Making Skills through Decision-Making Training Programs: The Case of Oman. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2766-2777), Antalya, Turkiye. *ISTES*.

Introduction

The company has recognized some crucial truths about decision-making. The road to prosperity always comes with the decision-making skills necessary for any company, including the construction and engineering sectors,

to reach the top in the fast-paced world. Adverse decisions tend to influence project implementation, resource utilization, and performance negatively. Leaders must have the proper skill set across different functional roles and an informed mindset to make strategic choices. This is something that many companies are encountering difficulty within the field. Standardized decision-making processes tend not to be relevant for everybody. Values and strategy-driven leaders must deploy an anticipatory approach that is suitable for their demands. An atmosphere of transparency, teamwork, and lifelong learning leads to better-informed decisions and sounder strategies. The setting plans to create a platform to recognize leadership qualities and identify skills development areas. Enhancing decision-making skills in strategic thinking will aid in the competitive edge survival. Evidently, it is more likely to be chosen for good performance because of its reputation. This part shows us the background that how in today scenario to take the decisions is the capability which should be trained to the leaders. At the setting, we believe decisions produce success, so we live in a culture that supports the decision-making process. We know that addressing skill gaps helps you become better at strategic planning. The program follows a macro-strategy plan, which allows the leadership to upgrade its decision-making performance.

Literature Review

The literature review on decision-making in my setting highlights strategy management and training to increase vital areas of effectiveness in decision-making. This research will demonstrate the importance of competence development in the organization, which will lead to assessing the capabilities and skills and propose proper training to enhance and improve the decision-making process and abilities of the leadership team. For example, Okoli and Watt (2018) state that specific training courses in scenario analysis and risk assessment value addition significantly enhance people's decision-making skills in these industries. This research will prove that proper training covers the gap between leaders' skills and decision-making styles. Also, the literature review will examine the different types and styles of decision-making that might be very successful in such industries. Several models are studied, such as rational decision-making and intuitive. These models could be used to enhance the decision-making processes. Moreover, the sensible model follows a thorough and systematic information analysis to understand the best possible decision. In contrast, the intuitive model depends on the subconscious processing of old experiences, Simon's work (2017). Utilizing these models in training modules will create a straightforward objective training program to improve my setting leaders' strategic decision-making ability. Furthermore, the organizational culture might be enabling or undermining effective decision-making processes. Studies revealed that transparency in culture, learning, and feedback improves decision-making efficiency. Johnson's (2019) research on corporate culture and how it impacts decision-making efficiency emphasizes how companies like my setting can create an environment that promotes critical thinking and problem-solving. Corporate culture is one of the most essential elements that must be built. As a result, decisions are better implemented, and goals are aligned with the strategic objectives, protecting it from bankruptcy and being pushed out of the market. This literature review will create the base, allowing my setting

to develop and implement the required and suitable training programs, choose from the studied decision-making models, and support the organizational culture.

Conceptual Framework

This research theoretical framework dwells upon the interplay between leadership competencies, biases, and organizational culture and their combined impact on decision-making outcomes in construction and engineering companies. Leadership competencies, which are sets of skills and behaviors required to be a good leader, are recommended to directly influence the effectiveness of decision-making training programs. Drawing on Northouse's (2016) perspectives on leadership adaptability and effectiveness, this research treats these competencies as critical variables that could potentially elevate the quality of organizational decisions. Another independent variable based on classic studies by Kahneman and Tversky (1974), which analyses the way that systematic mental shortcuts and errors in adjustment determine decision-making, is cognitive biases.

This study aims to quantify how cognitive biases impact leaders' decision-making within the organizational framework. (Kahneman, D., & Tversky A., 1974, judgment under uncertainty). Finally, an organizational culture that is well elaborated by Schein (2010) is shared values and norms that drive organizational action. This study aims to show the role of a supportive culture in enhancing or undermining the effectiveness of decision-making training. The effort of culture congruence with strategic objectives on training outcomes will be investigated (Schein, H.E., 2010, Organization culture and Leadership Jossey -Bass). By integrating these variables, the research intends to explore how leadership training improvement can enhance decision-making capabilities and result in two more knowledgeable and strategic leadership approaches in the industry.

Components For the Conceptual Framework

Individual cognitive biases

The individual perception of employees has played a crucial role in determining how they think; it is evident that this variable always depends on many factors, such as how the employee perceives himself within the organization on the decision-making abilities and how others easily influence him to make this decision. Finally, what the organization is doing to promote an open communication environment that will help and assist the employee in understanding the other opinions of the leadership team, and this can assist in formulating the right decision that may lead to successful and improved decision-making processes and confidence. Kahneman, Thinking, Fast and Slow (2011).

Organizational culture

We are also looking at the impact of Organizational culture on the decision-making process. This study aims to show the role of a supportive culture in enhancing or undermining the effectiveness of decision-making training.

We will investigate the effect of culture congruence with strategic objectives on training outcomes (Schein, H.E., 2010, Organization Culture and Leadership Jossey-Bass).

External environment

One of the main factors that contribute to the decision-making process is the external environment drives, which have a significant impact, driving the decision-making process to the analysis of the current market and changing variables that might affect the operations and slow down the process of decision-making based on uncertainty. The training proposed from the studies shows the significance of having such training to overcome such Hults in organizational operations and improve the quality of leaders and their decision-making abilities to ensure the objectives are met. Meyer & Rowan (1977) "Institutionalized Organizations: Formal Structure as Myth and Ceremony"

Method

Research Design and Methodology.

The proper research design, as well as rationale, introduces the conceptual framework of the paper, in which the author provides detailed information regarding the relationships between the variables significant for efficient decision-making and leadership development, especially from the example's perspective. The Conceptual model that has been made is used to choose which variables should be observed, including leadership competencies, cognitive biases, company culture, and other factors that affect decision-making processes. The construction and engineering industry is undergoing rapid change at a fast pace with new challenges. Therefore, the rationale of the research, looking into the need to improve decision-making skills at the leadership level to cope with the dynamic environment of the construction and engineering industry, is formulated. The research will achieve this by scrutinizing these factors and their effects on decision-effectiveness by identifying main inhibitors and promoters. In addition, several short-term training programs will be introduced to close gaps and strengthen leadership productivity within the setting.

Setting/ context of the research

The approach for investigating the process concerning the decision-making and the involvement of leaders in the company is based on a quantitative approach that serves the context of the decision-making process in the organization. By doing it through prepared questionnaires, analyzing data, and making quantified assessments, we can collect empirical data about the factors that impact decision-making processes, including organizational culture, leadership styles, and cognitive bias. By selecting and using only the quantitative data, the research study will be systemic and objective, thus developing a framework for the company to describe problem areas and create a tailored training program to address the challenges. Through this approach, the organization is strengthening the qualitative decision-making skills among the setting, which are essential for efficient strategic planning and well-informed decision-making.

Participants

Participant reservation for the company research on managing decision-making and leader development will be through mid- and top-management teams that meet a particular number of criteria. To achieve this task using a methodological approach, the research targets the leaders within the company at a representative level regarding employees, including managers, supervisors, and executives directly involved in the decision-making process.

The research explicitly captures the information about competencies in decision-making, preferences, and challenges using data collection methods, including surveys and assessments. Such an approach will guarantee that the selected sample is represented to provide a well-rounded picture of the prevalent factors that influence decision-making processes within the organization. These data-driven findings will buttress leadership development initiatives and maximize their effectiveness.

Data collection instruments

The company utilized quantitative data collection instruments to structure and measure the data from different areas influencing the upskilling leaders' decision-making. Questionnaires and standardized surveys have already been selected as the fundamental instruments that will be used to capture quantitative data from managers at the company, particularly concerning their leadership competencies, cognitive biases, and training needs.

These kinds of tools are created not to evoke one type of response; nevertheless, a response may be quantified and analyzed, providing data on factors such as decision-making styles, preferences, and obstacles. The study comprehensively analyzes the company's numerical decision-making using quantitative data collection methods. It presents a detailed review of the results, leading to designing and evaluating the training interventions.

Procedures

The chosen approach employs scientific procedures for decision-making and leadership training procedures based on the significant principle of quantitative analysis. Survey instruments, questionnaires, and attachments along the setting's leaders are used to collect the qualitative measurements of their decision-making abilities, attitudes, and phenomena. These include rules that are adhered to systematically, ensuring a reliable and consistent process. The qualitative data obtained from surveys and assessments are summarized using statistical tests identical to descriptive and inferential statistics. Then, the patterns, correlations, and trends associated with decision-making effectiveness are identified. Adherence to solid data processes ensures the information in the research is empirical and can be used to suggest training strategies that are tailor-made to meet specific needs and improve the decision-making processes at the company.

Data analysis

The role of data analysis methods in enhancing decision-making and upskilling leaders in the company in operationalizing the process is to apply quantitative techniques to the data that will be collected systematically. Quantitative data from surveys and assessments is submitted to rigorous statistical analysis, such as descriptive statistics, which allow the sum of the most important results, and inferential statistics, which enable the test hypothesis and find interrelations among the variables. Statistics-based tools such as SPSS or Excel are utilized to carry out the analysis procedures; as a result, individual insights related to leaders' decision-making capabilities, ingrained thinking patterns, and training skill gaps are generated. The research is going to gather data and use data analysis comprehensively for its interpretations, which shall then lead to actionable insights that will inform the creation of training interventions that will target decision-makers within the organization to increase the effectiveness of decision-making.

Ethical Considerations

The research will follow ethical standards, ensuring participant confidentiality and anonymity. Each participant will be provided with a written informed consent form.

Survey questioners.

The questionnaire is divided into three themes, with each question to be measured using a 5-point Likert scale. Strongly agree = 1, Agree = 2, Neutral = 3, Disagree = 4, and last Strongly Disagree = 5.

Results

This data provides quantitative evidence to show how the training and skill development programs impact

leaders' decision-making capability. The report indicated a significant improvement in the decision-making capability of those who enrolled in the programs compared to those who did not, especially leaders who became exceedingly confident about their competence to make decisions, cognitive biases, and the ability to learn and apply different decision-making strategies. On the other hand, the findings emphasize the need to invest in developing specialized leadership programs that focus on filling. On the other hand, the learning and development of the decision makers to foster management will be the ongoing priority to better serve and guarantee the organization's sustained viability in the construction and engineering industry.

The survey results have provided valuable insights into the decision-making process at the setting. The post-analysis shows that many respondents are reactive regarding external components, implying that it is always prepared to benefit from new opportunities to enhance the quality of its products and stay at the top of the market. Moreover, nearly all the respondents do not accept that they tend to stick to their initial ideas regardless of the conflicting evidence, highlighting the firm's culture of adaptation and receptivity. The company has been performing well in the construction and engineering sector by focusing on its weaknesses and leveraging its strengths. The organization can concentrate on developing strategies to eliminate the barriers and choose training programs for its leaders. This way, the company will enhance its leadership in the industry and gain long-term sustainable growth. The survey outcomes provide the company's decision-making climate, strengths, and areas for improvement. Most of the subjects from the sample manifest a very active attitude toward the external reality. In this way, they can also innovate their products. This is a positive signal that it is ready to move faster than its competitors, take new risks for the business, and become huge. In the same vein, most respondents' response that one should not stick to the initial opinion in the presence of conflicting evidence pertains to a leadership culture of openness and flexibility that will result in an effective decision-making process in the setting. This finding provides an excellent opportunity for the company to survive in the construction and engineering industry. The trainees can elaborate more on the program and train the critical leaders by suggesting policies to address the laydown challenges. When The company has defined its solid sides and identified the weaknesses mentioned above, it has a high potential to become one of the market leaders with steady growth.

The gathered data was analyzed to demonstrate the STD Dev and Mean of the data collected through SPSS, which clearly shows the importance of the training of leadership in decision-making to improve the performance of the company; below are the variables used to collect data through quantitative analysis and the result:

Individual cognitive biases		The extent of the problem		
Variables		Participant	Mean	Std. Dev.
		n	M	SD

I overestimate my abilities and knowledge when making decisions.	21	3.450	1.234
I am easily influenced by others' opinions or suggestions, even if they contradict my beliefs.	21	3.750	1.118
The organization promotes open communication and transparency, allowing employees to express their opinions and ideas freely.	21	3.600	.0,998

Individual Cognitive Biases

Overestimating Abilities: Most participants did poorly, with an average score of 0.34 and a standard deviation of 0.12, which is an indication of the average level of decision-making overconfidence for most of them regarding their abilities and knowledge. The overconfidence may sometimes result in poor judgments in critical thinking or if there is a need to be cautious while making decisions.

Influence by Others: Thus, this picture illustrates that the average mark is 3.750 with a standard deviation of 1.118, and it is believed that they are greatly affected by the opinions of others. Automation may, therefore, influence a man's deliberation power, and a decision-making process may undervalue an individual's experience and knowledge.

Open Communication: The mean score, 3.600, is very accurate, with a slight deviation of only 0.0998 standard deviations, and therefore, the organization has been successful in promoting transparency and open communication. This simple fact is a positive signal, which means that the staff members feel safe and encourage sharing ideas and opinions; this is, so to say, the key to an innovative and secure working environment.

Organizational culture	The extent of the problem		
Variables	Participant	Mean	Std. Dev.
	n	M	SD
The organization values innovation and encourages employees to take calculated risks and explore new ideas.	21	2.250	0.910
The organizational structure at The company fosters collaboration and teamwork across departments and hierarchical levels.	21	2.250	0.639
The organization effectively monitors and adapts to changes in	21	2.250	0.910

the external market, such as emerging trends and competitor actions.			
--	--	--	--

Organizational Culture

Valuing Innovation and Risk-taking: The average score of 2.250 with a standard deviation of 0.910 is below the expected average of 3.0. This may indicate an impediment or a hurdle to supporting the ecosystem of innovation in both innovation and risk-taking behaviors. If the company plans to present a more robust approach to business difficulties, these could indeed be areas that would generate innovation.

Collaboration and Teamwork: The mean index of 2.250 with a standard deviation of 0.639 suggests that there are still some challenges in effectively achieving proper collaborative working for all departments. Enhancing this type would probably empower the members of the cross-functional teams to work effectively and be productive.

Market Adaptation: The same average score of 2.250 for market responsiveness capabilities suggests that although changes are taking place and some actions are being implemented, this firm may need to improve its ability to re-adjust itself to external market changes and competitor actions.

External environment	The extent of the problem		
Variables	Participant	Mean	Std. Dev.
	n	M	SD
The regulatory environment significantly impacts the organization's decision-making processes and business strategies.	21	2.158	0.765
The organization proactively seeks opportunities in the external environment to innovate and differentiate itself from competitors.	21	2.350	1.040
I often stick to my initial opinions or ideas, even when presented with conflicting evidence.	21	2.600	1.142

External Environment

Regulatory Impact: The average rating of 2.158 and standard deviation of 0.765 show the setting's regulatory circumstances, impact regulations, and strategic planning decision-making. This emphasizes the necessity of an elaborate plan with all the steps to overcome regulatory complications.

Proactivity in Seeking Opportunities: This group scored an average of 2.35 with a standard deviation of 1.04,

suggesting a moderate inclination to seize chances of innovation and dissimulation outside the set of competitors. Although this may seem complicated to achieve in the less desirable market, being proactive is the key to standing apart from others.

Adaptability to Conflicting Evidence: The subject demonstrates an average difficulty with a score of 2.600 and a standard deviation of 1.142. An observer might notice some rigidity in flexibility, though they are prone to change their opinions with time. Providing adaptability in thought processes may result in more dynamic and agile decision-making that is adjustable to complex situations.

Discussion

The data collected suggests that The company has some essential strengths, like inculcating open communication while not ignoring the areas that require immediate attention to facilitate better decision-making and strategic planning. Emphasizing continuous innovation, cooperation, teamwork, and proactiveness in the face of market changes could be embraced on a much higher evolutionary level. Further, doing customized training that will focus on personal cognitive biases may contribute to reducing confidence and boosting critical skills among staffers. This analysis will identify the areas where the organization requires development and help implement those developments that add value and make the organization fit enough to face competition in a different environment.

1. Linking the survey result to the literature review:

The literature review highlights the strategic importance of effective decision-making and leadership at the company. Survey results align with the literature by demonstrating how leadership competencies and organizational culture influence decision-making outcomes. For instance, the literature by Okoli and Whatt (2018) emphasizes the role of training and enhancing decision-making skills, which corroborates these survey findings that structured training can significantly improve decision-making efficiency in this setting.

2. Linking survey results to the conceptual framework:

The conceptual framework of this study involves variables like leadership competency, cognitive biases, and organizational culture, which are critical for decision-making. Survey results are essential for quantifying the relationship between these variables and the company's decision-making effectiveness. For example, the framework anticipates that reducing cognitive biases through targeted training would enhance decision-making, a hypothesis supported by the survey finding that demonstrated improved decision quality post-training.

3. Linking survey results to hypothesis testing:

The hypothesis concerning the impact of leadership training on decision-making capabilities is directly tested through an analysis of survey data. For example, one hypothesis may state that leadership training reduces the effect of cognitive biases on decision-making. The survey data support this hypothesis by showing a marked

improvement in decision-making abilities and reduced cognitive biases among leaders who underwent training.

4. Linking services to research questions and results

Research questionnaires are designed to gather data on specific aspects of the decision-making at the company, such as leaders' competencies and biases. The survey results provide empirical evidence to assist the current decision-making processes and identify specific areas for improvement in the alignment between the questionnaire focus and survey results to ensure that the research effectively addresses the questions about how training and leader development can be optimized to improve decision-making outcomes.

Limitations

The limitation of the research would affect the successful outcome in decision-making, training, and leadership critically upskilling at the company. The most critical limitation is the heavy capital investment that would be required to develop high-quality and maintain the program. For example, new data shows that big organizations allocate from 1% to 5% of the annual budget for employee training. This expenditure could translate into a significant financial investment in an organization as huge as my setting. Moreover, the opportunity cost of training time, incurred when leaders and key personnel are engaged in learning instead of directly in revenue-generating activities, can even hurt short-term productivity. An average of 34 hours of training for each employee annually could represent a high downtime for any company with many employees.

Furthermore, evaluating the effectiveness and ROI of training programs presents a significant challenge. Metrics measuring capability post-training improvement in decision-making and leading effectively are often direct but qualitative and subjective. According to surveys, companies make considerable investments in training, but only around 20% of the companies measure the impact of such initiatives on performance quantifiable and regularly. This measurement gap could leave in doubt the actual training benefits, hence the problematic justification for continued investment, particularly in such a dynamic industry whereby skills and requirements change quickly. It is this tightrope that The company must walk, continuing investment in skills development while balancing the imperative that such investment produces clear and measurable returns supporting long-term strategic goals.

Conclusion

Concluding remarks while identifying the advantages of building quality training programs and leadership development initiatives to enhance decision-making also highlight the training and upskilling of leaders in the company. For The company to bid for complex projects, the leaders must have decision-making tools. It combines traditional educational methods with modern training techniques to meet the demands of the construction and engineering industry. The company is dedicated to ensuring that its leadership can address the current challenges and create future opportunities by fostering an environment of constant learning and

flexibility. In addition, the programs should meet the company's long-term business objectives and the dynamic nature of the global construction industry. Data-driven decision-making processes could significantly improve the operational effectiveness and project results. Workshops, mentoring, and collaborative projects can also enhance the skill sets of the leaders of the setting. They are likely to become agile and active through such pursuits. Such activities would not only improve the performance of both the individual and the team but also convert The company into a savvy leader in the market who is ready to adopt new technologies and market trends.

Recommendations

It is essential to continue developing decision-making training programs, ensuring they stay current with industry trends and incorporate cutting-edge tools. This strategy will empower leaders to make well-informed decisions that drive organizational advancement.

Acknowledgments

This Research was conducted under the supervision of Dr. Mohamed Elgeddawy and Funded by the Modern College of Business and Science Oman

Effect of Skill-Oriented Webinars on the Progress of Employees Performance: The Case of Oman

Shadha Abdul Majeed Ishaq

Modern Collage of Business and Science, Oman

Abstract: Purpose – This study aims to evaluate the extent to which webinars increase the progress of employees' performance in one of the organizations in Oman. It measures employees' level of satisfaction regarding webinar-based training. In addition, the study determines the correlation between webinars as training tools and employees' performance. Design/methodology/approach – A Positivist philosophy underscores the design of the research. The study adopted a quantitative method including surveys administrated randomly through Google Forms to 50 participants within the case institution. The survey includes 8 closed-ended questions that are classified into 3 sections to measure participants' perceptions regarding the usage of webinars for training. Descriptive Statistics and correlation examination are used for analyzing the data. Findings - The findings indicate that webinars are effective training tools for advancing employee performance. Significantly, even though the data comes from a single case study, it could impact how broadly the results can be applied. The research introduces a perspective for further investigation in this field to confirm the outcomes in comparable organizations. Originality/Value -The study provides insights, via the quantitative findings, into the importance of webinars in advancing employee performance. The study also adds valuable insights to the existing knowledge regarding employee training and development.

Keywords: Strategic Leadership, Employee Performance, Productivity, Decision-Making, Creativity, and Teamwork.

Introduction

Webinars are application tools used for sharing knowledge and training. Azubuike and Isaac (2022) examined webinars in their study, defining them as occasions where a speaker shares knowledge with an audience. They observed that webinars have gained popularity during the COVID-19 pandemic as an alternative to in-person gatherings. Despite their widespread use, many organizations and schools have incorporated webinars into their communication strategies without fully grasping their strengths, weaknesses, opportunities, and threats. The authors stressed the significance of thoroughly evaluating these elements to effectively organize and conduct webinar sessions. (Azubuike & Isaac, 2022).

Furthermore, considering the current global economic challenges, organizations are constantly exploring ways to boost employee productivity without incurring excessive costs. Web-based training emerges as a cost-efficient solution which motivates organizations to integrate more online training into their practices. The literature indicates that within the context of Oman, to my knowledge, there is a scarcity of studies that measure the impact of webinars as tools of training on the progress of the employees as well as the productivity of an organization.

This research aims to address this gap in the literature. It offers valuable insights in this regard to various organizations, especially Human Rights Institutions. For the case organization, the results of this study help in assessing the value of webinars in improving employee job performance. It also sheds light on which aspects of job performance are most influenced by webinars. As a result, Human Rights Institutions are considering reallocating their training budget from traditional methods to online training. The findings also serve as a foundation for creating tailored webinars to train employees in specific areas and achieve desired job outcomes. For other organizations, the study's results demonstrate that webinars can enhance employee job performance over time.

Problem Statement

One of the functions of Human Rights institutions is to educate the public in areas related to their rights and responsibilities. One effective method they use is hosting webinars to raise people's awareness and understanding of human rights in the country. On the other hand, these webinars not only help the case organization staff learn better and perform more efficiently but also save time and resources required for continuous training. They also allow staff from different organizations to participate in training simultaneously, overcoming geographical barriers. This is crucial as a deep understanding of human rights issues is essential for staff to promote human rights effectively. Moreover, feedback obtained from both employees who have attended webinars, and the organizers will be used to improve future webinar strategies.

Significance of the Study

This study has practical applications within the realm of human rights institutions. Here are some key aspects highlighting the importance of this study;

Practical Implications; The study findings could offer perspectives to human rights institutions concerning the effectiveness of utilizing webinars as a training tool to boost employee performance. This insight could aid organizations in making informed decisions regarding their training approaches.

Employee Growth; Understanding how webinars influence employee performance can lead to training programs customized to meet the specific requirements of employees in human rights institutions thereby fostering their professional growth.

Resource Management; Through evaluating webinar effectiveness, organizations can efficiently allocate resources by investing in training methods that have demonstrated efficacy and benefit for employee

development.

Knowledge Enrichment; The study enriches the existing knowledge base on training techniques within human rights institutions offering insights for future research endeavors and academic dialogues.

Literature Review

Webinars Impact the Skill Development of Employees

Podkamennaya and Nevolina (2017) explained how webinars play a significant role in improving employees' skills by providing learning opportunities outside the traditional classroom environment and focusing on the learner's needs (Fetisova, Podkamennaya, & Nevolina, 2017). Moreover, Litsova (2020) highlighted that online training methods like webinars are increasingly popular for their flexibility and cost-effectiveness in enhancing education and skills within organizations (Litsova, 2020). Using webinars showed that applicants can simply gain skills without disordering their routine of work (Оксана et al., 2022). However, many challenges arise while using webinars due to the absence of face-to-face communication.

Effectiveness of Using Webinars on Employees' Performance across Various Professions

It is evident that webinars enhance the information and skills of workers. Podkamennaya and Nevolina (2017) discussed how webinars have an important role in developing workers' skills through a learner-centered teaching and learning methodology (Fetisova, Podkamennaya, & Nevolina, 2017). These online conferences are broadly used within several businesses, and are extremely valued by specialists who are looking to acquire new knowledge and views (Dewangan & Verma, 2021).

Furthermore, Litsova (2020) emphasized that online methods of training such as webinars are becoming popular because they are flexible and cost-effective in the development of education and the enhancement of employees' skills (Litsova, 2020). Hosting webinars show that employees can practically improve skills without disorder of their day-to-day routines (Оксана et al., 2022). However, conducting webinars does pose challenges because of the lack of face-to-face interaction; thus, careful consideration of instructional design and engagement strategies is essential (Gen, 2009).

Various research studies have indicated the effectiveness of webinars in educating professionals on reproductive counseling, particularly emphasizing fertility promotion. Additionally, webinars are beneficial in training humanities specialists, improving their performance and the quality of education provided. The use of webinars for distance learning has also shown advantages in enhancing skills without disrupting daily work schedules. Furthermore, a webinar incorporating behavior therapy has demonstrated feasibility and positive outcomes in addressing workplace depression among employees. Moreover, a community service webinar focusing on performance management in business has proven successful in sharing knowledge and practical insights on performance indicators.

Advantages and Disadvantages of Using Webinars as a Training Tool for Employees

Some of the studies found that there are advantages of the webinars including that they have proven to be a valuable training tool, offering flexibility and cost-effectiveness in delivering education as found by (Guanci, 2010). Similarly, a study showed that webinars create an environment that enhance interactions and engagement (Wang, 2008). Furthermore, another study indicates a positive observable impact on participants' knowledge and behavior (Mckinney, 2017).

However, some challenges exist in organizing the webinars such as the absence of in-person interaction and the importance of thoughtful instructional design considerations (Guanci, 2010). One study showed that the decision to utilize webinars for training is influenced by factors like perceived ease of use, computer self-efficacy, and the quality of the internet (Malik, 2015). Nevertheless, despite these challenges, webinars are expected to remain a method for training and outreach, particularly in many fields including human rights.

Obstacles and Challenges Encountered when Implementing Webinars for Employee Growth within Human Rights Organizations

During the review of existing literature, it becomes apparent that conducting webinars to support the growth of human rights organizations can face several challenges. One significant obstacle is the lack of face-to-face interaction, which requires careful consideration at all webinar stages and in the development of presentation materials (Wan Mohd Yunus et al., 2019). Another difficulty involves the practicality and acceptance of webinar interventions. However, a study demonstrated that implementing a webinar program to address workplace depression was viable, successful, and well-received, leading to a high completion rate and positive outcomes in combating depression (Guanci, 2010).

Moreover, organizations might face impediments when utilizing distance education methods (Soomyung, Kim, Cho, Zane, L., & Berge, 2001). Additionally, incorporating blended learning approaches that combine face-to-face training sessions can help address challenges like budget constraints for travel expenses and the demand for timely or competency-based training (Holton et al., 2006). In conclusion, webinars serve as a resource for fostering employee development; nevertheless, planning and consideration of potential obstacles are vital for successful execution.

Research Questions

The research questions of the study include:

1. To what extent do webinars increase the progress of the employees within the case Organization?
2. To what extent do employees feel engaged and satisfied with webinar-based training initiatives?

Objectives

The study aims to;

- Evaluate how webinars increase the progress of employees' performance within the case organization.
- Assess employee engagement and satisfaction levels with a webinar-based training tool.

Method

Conceptual Framework

From the literature review I provided earlier, the key variables for the research have been identified as follows;

- a. Webinars are considered as the Independent Variable
- b. Employee performance is considered as the Dependent Variable

Webinars function as the independent variable, which means they are considered as the factor being controlled to detect its consequence on the additional variable which is “employee performance”. Webinars as a training tool implemented in the case Institution have influenced employee performance. Employee performance is directly impacted by the webinar-based training programs serving as the response that reflects how well employees perform based on these initiatives. The connection between webinars and employee performance is viewed as a cause-and-effect relationship. The research framework aims to explore how changes in webinar usage affect employee performance levels investigating the impact of webinars on enhancing employees' effectiveness within the Human Rights Institution.

Hypothesis

The study consists of two hypotheses:

(H1): Webinars increase employees' performance within the case organization.

The hypothesis proposes the impact of webinars in boosting employee performance in the case setting. It suggests that using webinars for training and development might not result in an enhancement of employees' overall performance within the institution.

(H2): Employees in the case organization prefer using webinars as training tools.

The hypothesis suggests that employees in the case organization might favor webinars as a means of enhancing

their skills.

Research Philosophy

The research adopted a positivist approach that depends on testing theories through surveys. Furthermore, the deductive method focuses on a principle that entails experimenting with theories to gather information. This procedure involves employing structured techniques to guarantee researcher independence and choosing appropriate sample size for making broad inferences (Saunders, Lewis, Thornhill, 2008; 107).

Data Collection

The research used quantitative methods to investigate how webinars impact employee performance at a case organization. To achieve this, a survey consisting of 8 questions on a 5-point Likert Scale was administered to 50 employees from the organization under study. The survey, based on existing literature, aimed to collect numerical data related to the effectiveness of webinars on employee progress. It was tested beforehand and included two main sections along with demographic inquiries. Original data was collected by creating and distributing the questionnaire among employees at the workplace. The questionnaire (Appendix 1) had three parts focusing on demographics, employee views on webinar influence on their performance and satisfaction, and engagement levels with webinar usage.

The first section of the survey included three items and aimed to understand how employees perceive the impact of webinars on their performance. The following section also consists of three items, focusing on gauging satisfaction and engagement levels through webinar usage. Each of the eight survey questions uses a 5-point rating system that varies across different questions. Moreover, the survey includes an introduction that clearly states the research goals.

Data Analysis

I received 30 survey responses, resulting in a response rate of 50%, which is quite satisfactory and helps validate the study findings. The reliability of the survey items was confirmed using Cronbach's alpha (α). According to Warrens (2015), an alpha score of 0.70 or higher is considered good for this type of survey. In the research, the Cronbach Alpha was calculated as 0.816, indicating a reliable scale level according to (Shojima & Toyoda, 2002). The survey data underwent frequency analysis, mean calculations, and standard deviation using the Statistical Package for Social Sciences (SPSS).

Results

Section (1) was analyzed for frequency and SPSS computed the mean (M) and standard deviation (SD) for survey items (1-3). Details of the descriptive statistics for the initial three items can be found in Table (1).

Table 1. Section (1): (Demographical Information):

Survey Questions	Mean M	Standard deviation SD
1) Choose a Level of Profession within the Case Organization.	1.20	0.407
2) Choose Level of Experience.	2.90	1.296
3) Choose your Participation Frequency in self-oriented webinars:	3.90	0.712
Total	8	2.415

The variable (see table 1) “*Level of Profession*” scores the lowest mean average which is 1.20, with a standard deviation of 0.407. The range of scores falls between option (1) which is “ Staff ” and option (2) which is “Middle Management”, indicating that most respondents' positions are closer to the lower end of the scale which is “Staff”.

Concerning the Variable (see table 1) “*Level of Experience*”, the mean score is the second lowest mean which is 2.90, with a standard deviation of 1.296. This shows a moderate level of experience among the respondents suggesting that they generally have variable experience levels and have various skills and knowledge.

Regarding the variable (see table1) “*Participation Frequency in self-oriented webinars*”, it scores the highest mean is 3.90, with a standard deviation of 0.712. With scores ranging from 2 Occasionally, 3 Moderately, 4 Frequently, to 5 Very frequently, it seems that respondents have a positive outlook on attending webinars on average. The narrower range and low standard deviation imply that attitudes towards attending webinars are quite consistent among respondents.

The Analysis implies that concentrating on position and experience scores around the lower end of the scale which may indicate that the sample consists of individuals with relatively junior positions with various experience. This could have implications for the level of expertise and seniority within the sample. In addition, the positive mean score for attending webinars suggests that, on average, respondents have a favorable attitude towards participating in webinars. This could imply that webinars are well-received as a mode of training or

knowledge dissemination within the context of the study. Moreover, the narrow spread of scores for attending webinars indicates relatively consistent participation among respondents. This suggests that there is a compromise or standardization in the perception of webinars among the sample.

The analysis of the data was implemented concerning their research inquiries. One of the research questions posed was, " *To what extent do webinars increase the progress of the employees within the case organization?* ". To gauge participants' views on this matter, section (2) including (3) survey items (4-6) underwent frequency analysis, with SPSS calculating the mean (M) and standard deviation (SD). Descriptive statistics for the first three items are detailed in Table 2.

Table 2. (To what extent do webinars increase the progress of the employees within the case organization):

Survey Questions	Mean M	Standard deviation SD
4) To what extent do you rate the current statement "self-oriented training webinar improved my professional skills?"	2.47	.776
5) To what extent do you rate the current statement "self-oriented training webinar is beneficial to me"?"	3.30	.651
6) To what extent do you rate the current statement "self-oriented training webinar increase the progress of employees' performance "?"	2.53	.730
Total	8.3	2.157

The variable "*Improved Professional Skills*" (see table 2) scored 2.47 as the lowest mean, with a standard deviation of 0.776. This shows that, overall, participants feel they have experienced a moderate level of improvement in specific skills after attending webinars. The wider standard deviation indicates varied opinions on the extent of "Improved Professional Skills".

The variable "*Self-oriented Training Webinar is Beneficial to Me*" (see table 2) scored a mean at 3.30 which is the highest variable, with a standard deviation of 0.651. This implies that, on the whole, participants perceive a moderate level of advantages or positive outcomes resulting from webinar participation. The standard deviation

reflects differing views on the benefits derived from webinars.

The mean of the variable *“Webinars Increase the Progress of Employees' Performance”* (see table 2) is 2.53, and a standard deviation rate of 0.730. This proposes that participants in general feel they reached a modest level of development in their work skills by using webinars. The standard deviation indicated variable insights concerning professional development progress.

The analysis implies that the mean scores for the variables *“Improved Professional Skills, Self-oriented Training Webinar is Beneficial to Me*, and *“Webinar Increase the Progress of Employees' Performance”* show that most respondents think webinars have a positive impact on skill progress and career advancement. On the other hand, the fluctuating responses of standard deviations for the variables *“Improved Professional Skills, Self-oriented Training Webinar is Beneficial to Me”*, and *“Webinar Increase the Progress of Employees' Performance”* , propose that respondents have different opinions on the webinar's impact. This variety may be driven by individual practices and perspectives. In summary, the information proposes that while respondents, in general, realize webinars as valuable tools for the development of skills and professionals, there are some variations in how they observe the detailed impacts. These results propose valued visions regarding the extent to which webinars are considered tools for career progress, highlighting the various opinions among the study's respondents' group.

The second research question posed was *“To what extent do employees feel engaged and satisfied with webinar-based training initiatives?”*. To gauge participants' views on this matter, section (3) including (2) survey items (7-8) underwent frequency analysis, with SPSS calculating the mean (M) and standard deviation (SD). Descriptive statistics for the first three items are detailed in Table 3.

Table 3. To what extent do employees feel engaged and satisfied with webinar-based training initiatives?

Survey Questions	Mean M	Standard deviation SD
7) To what extent do you rate the current statement “I feel engaged during webinar-based training sessions?”	2.70	.750
8) To what extent are you satisfied with the quality of the webinar-based training?	2.33	.711
Total	5.03	1.461

The mean rate for the variable (see table 3) "*I feel Engaged during Webinar-based Training Sessions*" is 2.70 which is the highest, with a standard deviation of 0.750. The lowest and highest scores are 2) Slightly engaged, (3) Moderately engaged, and (4) Very engaged, showing that respondents generally reported a moderate level of engagement. The standard deviation suggests there is some variability in the responses.

Regarding the question: "*To what extent are you satisfied with the quality of the webinar-based training?*" (see table 3), the mean score is 2.33 which is the lowest within this section, with a standard deviation of 0.711. The range of scores falls between (1) Very Dissatisfied, (2) Dissatisfied, (3) Neutral, and (4) Satisfied, indicating an overall moderate level of satisfaction among respondents, with some variation in their responses as well.

The analysis of the descriptive data implies that the average scores for the variables (see table 3) "*I feel Engaged during Webinar-based Training Sessions*" and "*To what extent are you satisfied with the quality of the webinar-based training*" fall into the moderate range, indicating that most respondents reported a medium level of engagement and satisfaction. This proposes a balanced interpretation of engagement and satisfaction of the respondent's feelings. The modest variations in the responses, as revealed by the standard deviations, suggest that there is a range of perceptions and experiences regarding engagement and satisfaction among the participants. This variety was derived from various views and experiences among the respondents of the survey. Furthermore, the modest levels of engagement and satisfaction showed possible ranges for improvement in both aspects. Despite the generally modest ratings, the diverse responses explored wide viewpoints and experiences. These findings propose valuable views on the way employees notice their level of engagement and satisfaction, providing vital data for understanding the varied views and practices of contributors in this study.

Discussion

The survey findings are in alignment with the reviewed literature within this research. The study indicates that webinars are considered a method of training and disseminating knowledge within the case organization. Additionally, it proves that webinars are used as tools that contribute to Improved Professional Skills. It proposes that these tools have satisfactory insight to be used as valuable tools for organizing training and knowledge-sharing needs in the case organization. This implies that webinars are educational tools that transfer important material to the participants. It also links with a wide audience, allowing people to contribute to distance learning experiences that align with Guanci's (2010) concept. Accordingly, this is useful in conditions including working remotely or working in various locations.

These findings present valued visions about how employees understand their choices and level of satisfaction, providing vital data for the varied views and practices of participants in webinars. Moreover, the findings illustrate that the performance development of employees observes webinars as valuable for their professional development and job progress. This designates that webinars are measured as important resources for improving qualified skills, and encouraging job development as pointed out by Okcana et al.(2022).

Analysis of the Hypothesis

(H1): Webinars increase employees' performance within the case setting.

The analysis illustrates that the impact of webinars in boosting employee performance in the case setting is valid. It suggests that using webinars for training and development may result in an enhancement of employees' overall performance within the institution.

(H2): Employees in the human rights case setting prefer using webinars as training tools.

The hypothesis is valid because the analysis implies that employees in the case organization prefer attending webinars as a mean of enhancing their skills ..

Implications and Conclusion

The study derived some outcomes. The case organization utilizes webinars as a cost-efficient means for ongoing training and development of their staff. The discoveries steer the formulation and execution of webinar programs to effectively boost employee performance. Moreover, the study informs HR policies within the case institution highlighting the significance of integrating webinar training into their growth strategies. This prompted the creation of standards and top practices for leveraging webinars to enhance employee performance. The study enriches the knowledge of employee training and development within the case organization, particularly focusing on the efficacy of webinars. It sparks exploration into innovative approaches for improving employee performance within similar organizational environments. Furthermore, enhanced employee performance results in improved service delivery of the case organization. Increased skills and knowledge among employees could contribute to a knowledgeable and empowered workforce. After all, the study demonstrates how webinars as tools of learning can positively impact employee performance. Yet it is important to note that the study's short duration hinders an evaluation of how webinars sustainably affect employee performance over time. More in-depth studies are required to address how webinars would support the productivity of an organization in emergency conditions.

Improving Investment Outcomes through Effective Decision-Making: The Case of Oman

Said Al-Mandhari

Modern Collage of Business and Science, Sultanate of Oman

Abstract: Purpose: the aim of this research is to explore, from the perspectives of employees at an investment state-owned enterprise in Oman, the extent to which the investment decision-making process (1) improves investment outcomes, and (2) increases organizational efficiency. In addition to revealing how the process is perceived, the study reports on the relationship between stages of investment decision-making (pre-assessment/deal sourcing, opportunity assessment, due diligence, deal closing) and the effectiveness of investment decisions. The study is based on the assumption that structured and thorough investment decision-making processes increase the efficiency and effectiveness of strategic investments. Design/methodology/approach: a positivist philosophy informs the research design of the study. A quantitative case study approach involving surveys administered to 55 male and female employees at the Omani investment firm was used for data collection. Descriptive statistics analysis was used for data analysis of the quantitative component of the study. Findings: the findings suggest that structured processes in pre-assessment/deal sourcing and thorough due diligence improve the strategic alignment and risk management of investments. The findings suggest that optimizing these processes can significantly enhance the effectiveness of investment decisions within the enterprise. Significantly, although the sample is taken from one case study through a limited number of participants, which may jeopardize the generalizability of the findings, the study opens a new horizon of research in this area to validate the results in similar locations. Originality/value: The study provides insights, via the quantitative findings, into the complex interplay between rational analysis and behavioral factors in the investment decision-making process. It spotlights the need for continuous improvement and adaptation in these processes to achieve strategic investment objectives. The insights gained from this study are useful to management, and strategists within state-owned enterprises and similar organizations. It provides them with an understanding of the value of integrating structured decision-making processes with behavioral insights to optimize investment outcomes.

Keywords: Investment Decision-Making, Strategic Investments, Risk Management, Organizational Efficiency, Oman.

Introduction

Making investments decisions is very much linked with the efficiency of achieving organization strategic outcomes. The decisions made regarding investments are not vital for the success of the organization, but also play a significant role in supporting broader economic goals. Throughout the investment decision making process various stages such as assessment, evaluating opportunities conducting due diligence and finalizing deals are key factors that influence the ultimate decision making outcome (Dogandžić & Dogandžić 2020). Traditional economic theories suggest that decisions are typically made by weighing risks and rewards in a manner. However recent studies propose a perspective. Behavioral economics and finance introduce the idea that human behavior, which can often be irrational, plays a role in shaping decisions. In the literature review we will investigate into this interplay between irrational factors that impact investment choices specifically focusing on how these factors influence investment decision making (El-Massri, Abdelrahman, & Elrazaz, 2020; Musfidah, Aji, & Hartono, 2022).

Despite the wealth of literature on the aspects of making investment decisions, there is still a noticeable gap in empirical research particularly in Oman and similar markets. Many studies do not thoroughly investigate how steps in the investment process such as preliminary assessment, opportunity evaluation, due diligence and finalizing deals, impact the efficiency and effectiveness of investment decisions in real world organizational settings. This study aims to address these gaps by examining the investment decision making process within the ITHCA Group. It aims to uncover how each stage of this process influences investment outcomes and explore ways to enhance decision making effectiveness by integrating decision making processes with behavioral insights. By focusing on this area, valuable academic knowledge addition will be achieved, beside providing practical guidance for enhancing strategic investment decisions in state owned enterprises and similar entities in Oman.

Literature Review

The outcome of decisions is influenced by different factors. Human behavior plays a crucial role in any decision as these behaviors can't be separated and ignored during the process of decision making. Therefore, decision making process is influenced by multiple factors other than foreseen factors. The study of Dogandžić and Dogandžić (2020) in the disparity between expected reasonableness and actual behavior in markets, indicating that investors are influenced by finance factors. This reflect that decision making is solely driven by psychological and behavioral elements and not only by logic. This might be the case in any decision in the human being daily practices.

El Massri, Abdelrahman and Elrazaz (2020) suggested another opinion stating that strategic investment decision making does not involve only human behavior, but also subjective intuition and judgment of the decision maker. They highlighted the importance in comprehending how different factors interact with or impact decision

makers' intuition in investment processes (El Massri, Abdelrahman & Elrazaz 2020). Musfidah, Aji and Hartono (2022). The studies also acknowledge and support that decision making is often influenced by difference factors which need to be identified to set the right measures and frameworks to minimize the influence of these factors in taking the strategic decisions such as investments.

Key Factors Influencing Investment Decision-Making Process

Psychological aspects and strategic evaluations play a significant role in influencing the process of investment decisions. Ortiz Teran et al. (2021) challenge the idea of purely logical investment decision making by demonstrating that emotions come into play through brain regions associated with emotions being triggered during investment tasks, indicating their importance in investment choices (Ortiz Teran, Díez, & López Pascual, 2021). Conitzer (2021) and Obeng (2019) discuss decision theory as a crucial foundation for rational decision-making processes, highlighting normative models of rationality that are often compared against real world behaviors in financial decision-making scenarios (Conitzer, 2021); (Obeng, 2019). Considering these different aspects which impact the decision-making process, it is very important to identify the key factors influencing investment decision-making process and accordingly set the right processes and actions at each stage of your decisions to minimize the influence of these factors in the decision making process. From investment point of view, each investment stage has its own characteristics and influence once it comes to decision making.

Pre-Assessment/Deal Sourcing

This stage involves evaluating potential investment opportunities. Research indicates that this phase is crucial for effective management and investment decision-making. Potryvaieva et al. (2020) show that the pre-assessment phase is key for enterprises to ensure effective use of resources and guide the subsequent stages of investment (Potryvaieva, Pelypkanych, & Potryvaieva, 2020).

Opportunity Assessment

Opportunity evaluation involves examining whether the investment has the potential to align with strategic goals. Stoilov, Stoilova and Vladimirov (2021) conducted research to investigate how numerical models can help investors evaluate investment opportunities using portfolio theory. Additionally, each opportunity would require different tools and methodologies to assess the opportunity especially those opportunities which are assessed based on benchmarking on similitar business regionally and globally.

Due-Diligence

Due diligence phase is very crucial for investors to examine the details of the investment to uncover any possible risks. Aljuhaishi and Kadhim (2023) stress the importance of incorporating methods, at this point as it allows investors to evaluate different project aspects by considering both financial and non-financial elements (Aljuhaishi and Kadhim 2023). The time spent at the due-diligence phase would always be of a good value to

identify and lower the investment risks.

Deal Closing

The final stage, deal closing, requires investors to make a commitment and negotiate terms and conditions for the sales and purchase agreement (SPA), shareholder agreement and other documents. Multiple studies believe that even at the deal closing and finalization stage, the decisions made are a mix of rational analyses and emotional responses, indicating the complication of investment decision-making and supporting the believe that this stage would have the same influence in decision making as other stages. (Bisati, Haque, Ganai, & Gulzar, 2021).

Conclusion

The literature review concludes that different factors would influence the decision making process. Reflecting this on the investment decision making stages, each stage has its own influences which might impact the decision making outcome. Studies on examining the complex connection between the various stages of making investment decisions (independent variables) and the quality and success of the final investment choices (dependent variable) in different sectors and businesses, would help to identify if a strong implementation on investment practices are adopted. This study seeks to assess how phases like pre assessment/deal sourcing, opportunity evaluation, due diligence, and deal closure impact investment decisions within the ITHCA Group. Starting by testing the current situation and then attesting the impact of these stages in the investment decision outcomes. The goal is to understand the influence of these factors on the outcome and how they are interconnected. This study will examine the current decision making processes at ITHCA and offer insights on enhancing the efficiency and effectiveness of investment decisions.

Research Question

After considering the research goals outlined earlier, the main research question would be: " To what extent do the pre-assessment/deal sourcing, opportunity assessment, due-diligence, and deal closing stages influence the effectiveness of investment decision-making within the ITHCA Group?"

The research question explores how each stage of the investment decision making process influences the overall achievements and efficiency of investment results in a strategic government owned investment entity operating in Oman's technology and telecommunications industries.

Research Variables

The research identifies the following independent and dependent variables and the relationship between them:

Independent Variables:

1. *Pre-assessment/deal sourcing*: this is the step where potential investment options are discovered and located.
2. *Opportunity assessment stage*: it involves assessing the strategic fit and feasibility of the investment. It also assesses the market and applies benchmarking of the assessed opportunity to market peers.
3. *Due-diligence stage*: a detailed assessment of a business or investment opportunity to weigh its risks and value. It validates all provided data aiming to minimize the risks as much as possible.
4. *Deal closing*: the last stage involves negotiations and carrying out the transaction to formalize the investment.

Dependent Variables:

1. *Investment decision-making*: The outcome and effectiveness of the investment decisions made by the ITHCA Group.

Conceptual Framework and Variable Relationships

The study investigates how stages of the investment decision making process influence the effectiveness of those decisions. The study seeks to understand how following a systematic and thorough approach in these phases leads to investment results within the ITHCA Group. It also delves into the contribution of each stage, in shaping the decision making procedure.

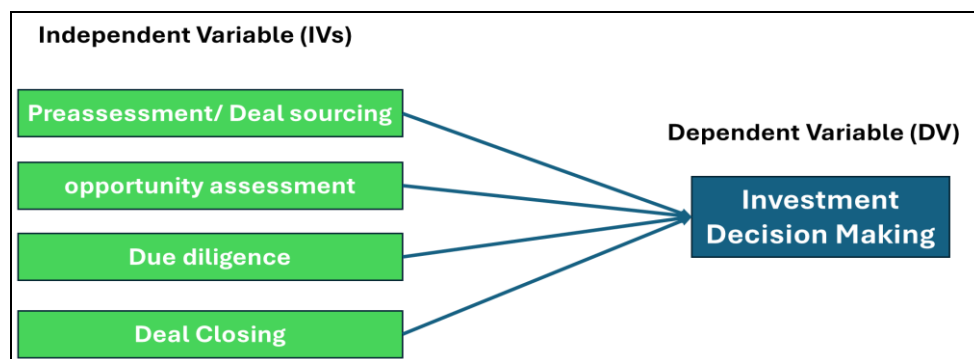

Figure 1. The Influence of stages of investment on the Investment Decision-Making Process effectiveness

Research Methodology

The data collection for this research will employ a quantitative approach, focusing on the objective measurement of the independent variables' influence on the dependent variable within the ITHCA Group's investment decision-making process. The choice of a quantitative design for this research is primarily driven by

the objective to empirically measure and analyze the impact of various stages in the investment decision-making process on the outcomes of such decisions within the ITHCA Group. This approach aligns with the research's goal to quantitatively assess the extent to which structured processes in pre-assessment/deal sourcing, opportunity assessment, due diligence, and deal closing contribute to improving investment outcomes and organizational efficiency.

Data Collection

A quantitative case study approach is used to assess the extent to which initial assessment/deal sourcing, opportunity evaluation, due-diligence and deal finalization impact the quality of investment decision-making process at the ITHCA Group. Toward this purpose and based on the reviewed literature and previous studies on corporate investment strategies, a perception survey comprising of 12, 5-point Likert Scale items has been distributed to all personnel involved across several departments including investment, finance, strategy, risk assessment, and management at ITHCA group. This comprehensive survey aimed to collect quantitative data pertinent to understanding the dynamics at play within the group's decision-making mechanisms.

The survey was divided into three targeted sections. The first section comprised of four items and aimed to measure participants' perceptions on the extent to which the current implementation practices and status of various independent variables within the group's investment process. The second section also includes four items and focuses on the perceived impact these independent variables have on the outcomes of investment decisions. The third section of the survey includes four items measuring how these variables could be optimized to enhance the effectiveness of the overall decision-making process. All the 12 items of the survey consider a 5-point scale (1- Not at all/Strongly Disagree, 2- Slightly/Disagree, 3 – Moderately/ Neutral, 4 – Highly/Agree and 5- Extremely/Strongly Agree). The survey includes an introductory section that clearly explains the purpose of the research.

Ethical Considerations

The study followed ethical guidelines regarding informed consent, confidentiality and anonymity. Participants were briefed on the research's objective and their option to opt out at any point. All data was securely kept and will not be disclosed to third parties without the participants' explicit approval.

Data Analysis

The quantitative data were analyzed through the perception survey which was administered to 55 participants. As illustrated in Appendix 2, 38 surveys were received providing a response rate at 69.1% which is a satisfactory percentage that can validate the results of the study. The reliability of the survey items has been substantiated by an overall Cronbach's alpha (α). The alpha score of .70 or higher in a survey of this nature is considered good Peterson's (1994).

The survey responses were subjected to the frequency analysis, mean and standard deviation. The analysis is split into three parts, each with a calculated mean and standard deviation score (see Appendix 3) that gives an overview of how respondents view various aspects of the investment decision making process.

Results

The collected data were analyzed with respect to research questions and the impact of the independent variables on the investment decision making in respect to the three sections of the survey. The first section set “To quantity participants’ perceptions on the extent to which the current implementation practices and status of various independent variables within the group's investment process?”. To measure participants’ perceptions in this regard, the first 4 items of the survey (1-4) were subjected to the frequency analysis, the average Mean (M) and the Standard Deviation (SD). Table 1 presents the descriptive statistics of the first four items.

Table 1. Section 1 - Current Status of Independent Variables

Questionnaire sections	Survey Questions	Frequency %					Mean	Standard Deviation
<u>Section 1:</u> Current Status of Independent Variables (<i>GM = 3.09,</i> <i>SD = 0.48</i>)	9) How frequently is pre-assessment/deal sourcing conducted in your department?	<i>Never</i> (9.1%)	<i>Rarely</i> (36.4%)	<i>Sometimes</i> (45.5%)	<i>Often</i> (9.1%)	<i>Always</i> (0%)	2.58	0.50
	10) To what extent is opportunity assessment thorough in evaluating potential investments?	<i>Not at all thorough</i> (9.1%)	<i>Slightly thorough</i> (9.1%)	<i>Moderately thorough</i> (72.7%)	<i>Very thorough</i> (9.1%)	<i>Extremely thorough</i> (0%)	2.82	0.44
	11) How would you rate the comprehensiveness of due-diligence performed on investment opportunities?	<i>Very poor</i> (0%)	<i>Poor</i> (9.1%)	<i>Average</i> (27.3%)	<i>Good</i> (63.6%)	<i>Excellent</i> (0%)	3.58	0.36
	12) How effectively are deal-closing activities managed and executed?	<i>Very ineffectively</i> (0%)	<i>Ineffectively</i> (9.1%)	<i>Somewhat effectively</i> (45.5%)	<i>Effectively</i> (45.5%)	<i>Very effectively</i> (0%)	3.37	0.41

Analysis of the first four items of the survey indicates that the majority of participants views that the current status of the Pre-assessment/Deal Sourcing, Opportunity Assessment, Due Diligence and Deal Closing are

scoring less than average. The results of the analysis demonstrate an agreement directed towards level 3 (Sometimes/average) with an overall mean at 3.09 and a standard deviation at 0.48. The analysis of the SD points out that the majority of respondents' answers are clustered around the mean. The mean score of the third variable (Due Diligence) was the highest ($M = 3.58$, $SD = 0.36$). This is followed in order by variable four – Deal Closing – ($M = 3.37$, $SD = 0.41$). Variable two, Opportunity Assessment, scored a Mean at 2.82 and a SD at 0.44. The lowest mean was for the first variable Pre-assessment/Deal Sourcing, with a mean at 2.58 and a SD at 0.50.

Statistical results of section one indicate that the highest means were for participants' perceptions of the extent to which comprehensiveness of due-diligence performed on investment opportunities. The lowest means were related to participants' perceptions of how frequently pre-assessment/deal sourcing is conducted. These findings are not surprising given the maturity of the group in the investment domain. Participants, believe that deal-closing (variable 4) activities are managed and executed effectively, though there is still some scope for enhancement. Opportunity assessment (Variable 2) shows a moderate level of thoroughness in evaluating potential investments. While some assessments are conducted, there is room for improvement in how opportunities are scrutinized.

The second section of the questionnaire, "Impact of Independent Variables", assesses the perceived impact of the independent variables on successful investment decisions.. Descriptive statistics of items, 5, 6, 7 and 8 indicate that majority of participants believe that all four independent variables have a high impact on the outcomes of investment decisions.

Table 2. Section 2 - Impact of Independent Variables

Questionnaire sections	Survey Questions	Frequency %					Mean	Standard Deviation
<u>Section 2:</u> Impact of Independent Variables ($GM = 4.27$ $SD = 0.39$)	5) How significantly do you believe pre-assessment/deal sourcing impacts the success of investment decisions?	Not at all (0%)	Slightly (0%)	Moderately (9.1%)	Highly (81.1%)	Extremely (9.1%)	3.97	0.45
	6) To what extent does a thorough opportunity assessment contribute to achieving strategic investment goals?	Not at all (0%)	Slightly (0%)	Moderately (0%)	Highly (54.5%)	Extremely (45.5%)	4.45	0.30
	7) How critical is the role of due-diligence in mitigating investment risks?	Not at all (0%)	Slightly (0%)	Moderately (0%)	Highly (63.6%)	Extremely (36.4%)	4.32	0.33

	8) To what extent does a thorough opportunity closing and Shareholder agreement contribute to achieving strategic investment goals?	Not at all (0%)	Slightly (0%)	Moderately (0%)	Highly (63.6%)	Extremely (36.4%)	4.34	0.38
--	---	--------------------	------------------	--------------------	-------------------	----------------------	------	------

Table 2 demonstrates that the overall mean score of the four variables was at 4.27 and the SD was at 0.39. The mean score of the second variable was the highest ($M = 4.45$, $SD = 0.30$). This finding is in alignment with the reviewed literature which considers that involves assessing the strategic fit and feasibility of the investment Stoilov, Stoilova and Vladimirov (2021). The lowest mean was for the first variable ($M = 3.97$, $SD = 0.45$) related the extent pre-assessment/deal sourcing impacts the success of investment decisions. This finding indicates that this variable has relatively lower impact than the other three variables. Variables three and four scored almost same mean value of 4.32 and 4.34 respectively reflecting a big believe that these two variables have significant impact on achieving strategic investment objectives.

The last section of the survey, “To what extent are variables impacting the investment decision making process?”, exploring perspectives of improving the investment decision making process. Descriptive statistics of the four variables of this section (9-12) indicate that the ultimate majority of the respondents believe that all four variables play a very crucial role to increase the effectiveness of the investment decision making process. Table 3 shows that the grand mean of the grand variable scored 4.53. The mean scores for variable four – Do you believe that optimizing deal-closing procedures could lead to better alignment with strategic investment objectives? were the highest ($M = 4.79$, $SD = 0.21$). The lowest mean was for first variable – pre-assessment/deal sourcing effectiveness ($M = 4.26$, $SD = 0.42$). While both the second and third variables scored mean value of 4.53 with low SD of almost 0.25. The abovementioned analysis indicates that there is a statistically significant impact on all four variables on decision making process.

Table 3. Section 3 - Effectiveness of Independent Variables (Solution-Oriented)

Questionnaire sections	Survey Questions	Frequency %					Mean	Standard Deviation
<u>Section 3:</u> Effectiveness of the Independent Variables ($GM = 4.53$ $SD = 0.27$)	9) How strongly do you agree that increasing the frequency of pre-assessment/deal sourcing would improve investment outcomes?	Not at all (0%)	Slightly (0%)	Moderately (0%)	Highly (72.7%)	Extremely (27.3%)	4.26	0.42

	10) To what extent would enhancing the tools and methods for opportunity assessment increase the success rate of investments?	Not at all (0%)	Slightly (0%)	Moderately (0%)	Highly (45.5%)	Extremely (54.5%)	4.53	0.26
	11) How effective would additional training on due-diligence processes be in improving investment decision outcomes?	Not at all (0%)	Slightly (0%)	Moderately (0%)	Highly (45.5%)	Extremely (54.5%)	4.53	0.25
	12) Do you believe that optimizing deal-closing procedures could lead to better alignment with strategic investment objectives?	Not at all (0%)	Slightly (0%)	Moderately (0%)	Highly (18.2%)	Extremely (81.8%)	4.79	0.21

Discussion

The findings show a clear acknowledgment of the significance and impact of each phase in the investment decision making process. However, there are noticeable deficiencies in current implementation practices, particularly in pre assessment/deal sourcing and opportunity evaluation. Respondents strongly endorse enhancing these areas, along with improving due diligence and deal closing procedures, to enhance investment outcomes. The higher average scores in Sections 2 and 3 compared to Section 1 suggest a favorable attitude towards making changes to optimize the investment decision making process.

The relatively lower mean score in the pre-assessment/deal sourcing stage indicates a perceived underutilization or inefficiency in early-stage investment activities. This gap suggests that opportunities may be overlooked or not adequately evaluated at the onset, potentially impacting the overall quality of investment decisions. Opportunity assessment and due-diligence stages are recognized for their thoroughness and critical role, the scores indicate that even well-executed stages have room for improvement. This outcome highlights the complexity of investment decision-making, where even strengths can be further enhanced to minimize as much as possible the external influence on decision making. On the other hand, the effectiveness of deal closing

indicated by its higher mean score a relative confidence in this final stage. However, the strongest agreement on the need for optimization in deal-closing procedures points to a desire for even more streamlined and strategic alignment.

Concluding Remark

It has been identified that there is a room for further enhancement to improve ITHCA Group overall investment results despite the solid processes and procedures currently followed in making investment decisions. Focusing on key areas such as initial evaluations at the deal sourcing/pre-assessment phase, thorough opportunity assessments during the evaluation phase, and followed by meticulous due diligence activities will significantly benefit the process. To address these identified shortcomings and build on their strengths, several strategies are recommended.

Firstly, pre-assessment practices could be enhancing by developing a structured and frequent process that incorporates comprehensive market analysis, predictive analytics, and stakeholder feedback. This will potentially lead to an early and reliable identification of high-potential opportunities.

Secondly, standardizing opportunity assessment criteria and integrating innovative tools like AI-driven analytics yields a deeper insights and more consistent evaluations across potential investments. Other practices would solidify the outcome of these stages such as benchmarking and competition analysis. Moreover, enhancing the due diligence process by incorporating expertise from different departments within the company improves risk evaluations and offers a more holistic perspective, on investment prospects.

Lastly, simplifying the steps to finalize deals by investing in both training and technology guarantees that teams are adequately. Focussing in standardizing the format of the closing documents to menimize the variances and deferencies between the closing documents of different investments.

Limitations

The study outcome reached to an effective insights to improve the investment decision making process within ITHCA group. On the other hand, it worth noting that there are few identified limitations in this study that should be carefully highlighted and understood. Firstly, the generalization of the results could be jeopardized due to the limited sample size used in the study as a result to the small team members who are working directly in investment activities within the group. Additionally, to fully explore the data and identify connections between dependent variables employing statistical techniques beyond mean and standard deviation like correlation analysis regression analysis and structural equation modeling would be advantageous. Despite these limitations this study establishes a foundation for investigation. By acknowledging and addressing these limitations we can deepen our understanding of the factors that impact investment decision making effectiveness

at ITHCA group.

Significance of the findings

The significance of this study extends beyond the scope of the ITHCA Group. It in fact provides insights to academia to enhance procedures influences policies and governance, in state owned enterprises and promotes innovation and competitive advantage in strategic investment decision making. This research presents a framework for enhancing this investment decision making processes based on real world practices. The research has identified areas for improvement which can be used as guidance for the ITHCA Group and similar organizations to enhance the efficiency and effectiveness of their investment decisions.

Conclusion

This research assessed how investment decisions are made within the ITHCA Group specifically looking at the processes involved in evaluating potential deals assessing opportunities conducting due diligence and finalizing agreements. By utilizing surveys to collect data the study aimed to gain insights, into the details of each step, and how they collectively impact investment outcomes.. Through examining the ITHCA Groups investment process from this perspective the study pinpointed strengths well as areas for enhancement.

The analysis of survey results uncovered insights. It revealed that while certain stages like diligence were precisely executed with an emphasis on risk management and strategic alignment other stages such as pre assessment/deal sourcing could benefit from more meticulous attention to detail and frequency. The positive feedback in the segment of the study indicated that all participants recognized opportunities for improving investment outcomes at each stage. This study illuminates the nature of decision making around investments within the ITHCA Group. The research sets a foundation for future investigations aimed at refining these processes. By promoting a culture of improvement and creative thinking the ITHCA Group can effectively navigate the complexities of investment decisions while remaining committed to its mission of supporting investments in Omans technology and telecommunications sectors.

The Impact of Emotional Intelligence on Employee Job Performance: The Case of Oman

Said Al-Mandhari

Modern Collage of Business and Science, Sultanate of Oman

Abstract: Purpose: The main goal of this research is to explore how emotional intelligence impacts job performance and organizational dedication as perceived by staff members at a telecommunications firm in Oman. The study examines how factors like empathy, social skills, self control and motivation relate to employee performance. It is assumed that higher emotional intelligence contributes to enhanced efficiency overall. Design/methodology/approach: A positivist philosophy underpins the research design of the study. A quantitative case study approach involving surveys administered to 66 male and female employees at the case organization was used for data collection. Descriptive statistics analysis was used for data analysis of the quantitative component of the study. Findings: The study findings indicate that having a level of empathy, strong social skills and good self regulation can enhance job performance and teamwork within the company. It was also noted that intrinsic motivation plays a role in getting employees to work towards the goals of the organization. The research uncovered connections between emotional intelligence and job performance indicators. Although the study was based on a case in a sector or company in Oman which could limit the generalizability of the results, it does pave the way for further exploration in this field to validate similar outcomes in other settings. Originality/value: The study demonstrated how emotional intelligence influences job performance and commitment, at Oman Broadband Company emphasizing the importance of empathy, social skills, self regulation and motivation. The findings offer insights for leaders, HR professionals and policymakers highlighting the significance of nurturing intelligence to improve workplace interactions and reach organizational goals.

Keywords: Emotional Intelligence, Job Performance, Organizational Commitment, Organizational behaviors, Oman.

Introduction

The concept of Emotional Intelligence has been widely recognized on a large scale as an element that affects job performance and dedication to organizations. Within emotional intelligence different skills such as empathy, social skills, self-control and motivation play a crucial role in different fields especially in leadership positions

within companies. Multiple studies believe that emotional intelligence is deeply clapped in leadership models and leadership styles to improve organizational effectiveness across diverse cultural and economic settings (Bar On, 2004; Goleman, 1998).

In the context of the Middle East region, the studies on emotional intelligence impacts dynamics is relatively new, due to the region's unique cultural and business norms provide a setting where the influence of emotional intelligence may differ significantly from different regions. For example, the communal and hierarchical aspects of Eastern societies could boost the importance of skills and empathy in workplace interactions (Smith et al., 2018). The uniqueness of the cultural aspect of this region might lead to a different outcomes when it comes to the impact of the emotional intelligence on employees performance.

Within Oman Broadband Company incorporating emotional intelligence skills into management practices is seen as a way to enhance individual performance indicators like productivity and efficiency, and also broader organizational outcomes such as employee contentment and retention. Considering all aspects such as cultural and business norms which differentiate this region from others. This case study examines how emotional skills influence the day to day functions and overall strategic goals in a rapidly changing market. While the importance of emotional intelligence is recognized, there is a lack of measured data linking specific emotional intelligence skills to job performance metrics in the corporate landscape of Oman. Existing studies often qualitatively assess emotional intelligence impact in different business sectors or industries or different cultural contexts presenting different regions or nations. Previous literature primarily focuses on qualitative evaluations or non-Middle Eastern contexts, indicating a significant research void in quantitatively driven, locale-specific investigations (Jones, 2019; Chen et al., 2020). This study aims to bridge this gap by offering insights into how various aspects of emotional intelligence relate to job performance and commitment at Oman Broadband Company.

Literature Review

Emotional Intelligence consists of diverse skills considered as a fundamental factor in enhancing job performance across various sectors including telecommunications. These skills are empathy, social abilities, self-regulation, and motivation. Within transformational leadership theory, emotional intelligence is extremely integrated, facilitating leaders' capacity to transcend personal benefit for greater organizational welfare. This theory emphasizes the importance of the emotional intelligence skills in improving the employee's performance and organization commitment. This literature review delves into contemporary research to scrutinize how these emotional intelligence facets remarkably influence job performance and employees organization commitment. The study centers on the Transformational Leadership Theory, which presents the way of exceptional leaders in stimulating and encouraging their teams to focus on the goals of the organization than aspirations. According to this theory these leaders do not just trigger changes in their follower's mindset but also they set the goals aligning their team with the overall organizational aims. Emotional intelligence plays a role in leaders success as

it significantly improves their capacity to forge connections and thrive in leadership roles.

The transformative capabilities of leaders are closely tied to intelligence. Empathy, an aspect of emotional intelligence refers to a leader's capacity to comprehend and share the emotions of team members. This empathetic connection fosters. Loyalty, crucial for creating a work environment that enhances employee morale and satisfaction. As per Bass and Riggio (2006) empathy does not help in forming bonds but also aligns employee's efforts with the organizations strategic goals leading to increased productivity and job satisfaction. Moreover, social skills play a role in enabling leaders to convey their vision influence others perspectives and impact their teams. As stated by Bar On in 2004 leaders, with abilities excel in clearly conveying their strategic visions and convincing their teams to embrace these objectives. These skills are crucial for creating a shared sense of purpose and guiding the organization towards its goals.

Another important aspect of intelligence is self-discipline. According to Golemans study in 1998 leaders who can regulate their emotions exude a motivating presence, which's essential for navigating workplace obstacles and upholding team spirit. Effective self-regulation enables leaders to handle conflicts, adapt to changes and reduce stress that could disrupt team cohesion. Moreover, motivation plays a role in leadership. Leaders who are internally motivated do not align with the organization's mission. Also motivate their followers to exceed standard expectations and achieve remarkable outcomes. McClelland emphasized in 1985 that such leaders nurture a sense of purpose and excitement among their teams fostering a culture of performance that greatly boosts organizational productivity and innovation.

These aspects of intelligence namely empathy, interpersonal skills, self-management and motivation are crucial for the success of transformational leaders. They empower leaders to adeptly handle and direct the dynamics within their organizations transforming individual conflicts into collaborative victories. Teamwork plays a role, at Oman Broadband Company. It is important to blend emotions with our tasks to reach our goals and remain competitive in the ever-evolving telecommunications industry.

Key Factors Influencing Job Performance

Building upon the ideas surrounding leadership and emotional intelligence previously mentioned it's crucial to acknowledge how emotional intelligence impacts facets of job performance. Recent research highlights that emotional intelligence does not only improve performance but also enhances organizational effectiveness. Certain key factors have been pinpointed as having an influence, on job performance affected by intelligence. Emotional intelligence plays a role in shaping levels of job satisfaction. Research by Smith et al. (2018) reveals a link between employees emotional intelligence levels and increased job satisfaction. This connection is vital as content employees are more likely to excel and contribute effectively towards goals.

Effective leadership requires set of diversity of skills including emotional intelligence. As per Jones (2019) leaders with emotional intelligence levels excel at inspiring their teams and guiding them towards better

organizational outcomes. The importance of this effectiveness is particularly notable in roles that demand skills and strategic decision making capabilities. According to Doe (2017) emotional intelligence significantly boosts an individual's capacity to adapt to work environments. Effectively handle stress. These skills are increasingly essential in paced sectors like telecommunications, where employees frequently face high pressure situations and rapidly changing market dynamics.

The empathy and social skills aspects of emotional intelligence help employees navigate relationships leading to satisfaction levels. By managing their emotions and exhibiting empathy leaders can create a work environment that not only fosters but also thrives on high levels of employee engagement and dedication.

In the context of Oman Broadband Company, the skills required for emotional intelligence namely empathy, social skills, self-regulation and motivation act as enhancers of individual performance and also as drivers of overall organizational efficiency. These components highlight the importance of studying the impact of these variables on the employee's performance at Oman Broadband identifying the areas of improvements and recommendations.

Research Question

The main purpose of this study is to measure the influence of emotional intelligence on the employee's work performance at Oman Broadband Company. It will explicitly examine how key aspects of emotional intelligence such as empathy, social skills, self-control and motivation impact employee performance within the context of transformational leadership theory. The research question would be: " To what extent emotional intelligence influence job performance among employees at Oman Broadband Company?"

Research Variables

The research identifies the following independent and dependent variables and the relationship between them:

Independent Variables:

1. *Empathy:* Understanding and sharing the emotions of others is a key aspect of emotional intelligence. In leadership, empathy plays a vital role in building strong relationships between leaders and their teams, fostering trust and boosting job satisfaction.
2. *Social Skills:* effective communication, persuasion and influencing abilities fall under social skills. Leaders focus on social skills to cascade the organization's vision and values to their teams, encouraging collaborative efforts towards reaching common organization goals.
3. *Self-Regulation:* is a reflection of leaders ability to manage and channel their emotions in different

work environments and circumstances. Leaders with this skill maintain a positive and motivating presence at work which is crucial for overcoming challenges and keeping team spirit high.

4. *Motivation*: motivation from leaders has a great effect on employees performance, inspiring their teams to exceed expectations and achieve outstanding results, particularly intrinsic motivation driven by a deep sense of purpose and commitment to organizational objectives.

Dependent Variables:

Job Performance: it contributes directly in achieving organizational goals, and it is measured through various dimensions such as productivity, efficiency and creativity.

Conceptual Framework and Variable Relationships

The study aims to quantify the relationships between the independent and dependent variables providing empirical insights that could enlighten leadership and management within the company and potentially across similar organizations. The research variables will be investigated to understand how different aspects of emotional intelligence contribute to enhancing job performance in a leadership setting at Oman Broadband Company.

Figure 1. The Influence of emotional intelligence variables on the employee's performance

Research Methodology

In this study quantitative analysis is employed to gather data with the aim of assessing how independent variables influence the performance of employees, at Oman Broadband. The selection of a methodology is based on the objective of examining and understanding the impact of aspects of intelligence on employee performance within Oman Broadband Company. This research approach is in line with the goal of investigating how emotional intelligence variables impact employee performance leading to enhanced results and productivity.

Data Collection

A quantitative case study approach is used to assess the extent which the emotional intelligence impact job performance within the context of transformational leadership at Oman Broadband Company. Toward this purpose and based on the reviewed literature and previous studies on corporate investment strategies, a perception survey comprising of 12, 5-point Likert Scale items has been distributed to all related employees across various departments including support services, operations, strategy, and management at the company. This comprehensive survey aimed to collect quantitative data pertinent to understanding the impact of emotional intelligence on the employees' performance.

The survey divided into three targeted sections. The first section comprised of four items and aimed to gather information about the present situation and application methods of the independent factors; Empathy, Social skills, Self-Control and Motivation at Oman Broadband Company. The second section also includes four items and focus on the perceived impact these independent variables have on the outcomes of employees' performance. The third section of the survey includes four items measuring how these variables could be optimized to enhance the overall outcome of the employees and organization performance. All the 12 items of the survey consider a 5-point scale (1- Strongly Disagree, 2- Disagree, 3 – Neutral, 4 – Agree and 5- Strongly Agree). The survey includes an introductory section that clearly explains the purpose of the research.

This structured approach of the questionnaire (Appendix 1) enables a comprehensive quantitative analysis of the research variables and their interrelations within the Oman Broadband Company's context. This method ensures that the data collected will provide valuable insights into the role of emotional intelligence in enhancing job performance under transformational leadership, thereby informing targeted improvements in leadership development programs.

Ethical Considerations

The study followed ethical guidelines regarding informed consent, confidentiality and anonymity. Participants were briefed on the research's objective and their option to opt out at any point. All data was securely kept and will not be disclosed to third parties without the participants' explicit approval.

Data Analysis

The quantitative data were analyzed through the perception survey which was administered to 66 participants. As illustrated in Appendix 2, 48 surveys were received providing a response rate at 72.7% which is a satisfactory percentage that can validate the results of the study. The reliability of the survey items has been substantiated by an overall Cronbach's alpha (α). The alpha score of .70 or higher in a survey of this nature is considered good Peterson's (1994).

The survey responses were subjected to the frequency analysis, mean and standard deviation. The analysis is split into three parts, each with a calculated mean and standard deviation score (see Appendix 3) that gives an overview of how respondents view various aspects of the emotional intelligence effecting employees job performance.

Results

The collected data were analyzed with respect to research questions and the impact of the independent variables on the employee's job performance in respect to the three sections of the survey. The first section set "To quantity participants' perceptions on the current emotional intelligence practices among leaders at Oman Broadband". To measure participants' perceptions in this regard, the first 4 items of the survey (1-4) were subjected to the frequency analysis, the average Mean (M) and the Standard Deviation (SD). Table 1 presents the descriptive statistics of the first four items.

Table 1. Section 1 - Current Status of Independent Variables

Questionnaire sections	Survey Questions	Frequency %					Mean	Standard Deviation
Section 1: Current Status of Independent Variables (<i>GM = 3.09,</i> <i>SD = 0.48</i>)	13) How thoroughly does your immediate supervisor display empathy towards team members?	<i>Never</i> (0%)	<i>Rarely</i> (16.7%)	<i>Sometimes</i> (72.2%)	<i>Often</i> (11.1%)	<i>Always</i> (0%)	<i>2.94</i>	<i>0.51</i>
	14) Rate the adequacy of communication skills displayed by leadership in guiding teams towards organizational goals?	<i>Never</i> (0%)	<i>Rarely</i> (5.6%)	<i>Sometimes</i> (61.1%)	<i>Often</i> (33.3%)	<i>Always</i> (0%)	<i>3.28</i>	<i>0.56</i>
	15) Evaluate the consistency with which your team leaders maintain composure and positivity in challenging circumstances?	<i>Never</i> (0%)	<i>Rarely</i> (5.6%)	<i>Sometimes</i> (83.3%)	<i>Often</i> (11.1%)	<i>Always</i> (0%)	<i>3.06</i>	<i>0.40</i>
	16) Rate the effectiveness of motivational strategies used by your management to inspire the team?	<i>Never</i> (0%)	<i>Rarely</i> (5.6%)	<i>Sometimes</i> (61.1%)	<i>Often</i> (33.3%)	<i>Always</i> (0%)	<i>3.28</i>	<i>0.56</i>

Analysis of the first four items of the survey indicates that the majority of participants views that the current

status of the Empathy, Social skills, Self-Control and Motivation are scoring around than average. The results of the analysis demonstrate an agreement directed towards level 3 (Sometimes) with an overall mean at 3.14 and a standard deviation at 0.40. The analysis of the SD points out that the majority of respondents' answers are clustered around the mean. The mean score of the second and fourth variables (Social skills and Motivation) were the highest ($M = 3.28$, $SD = 0.56$). This is followed in order by variable three – Self-Control – ($M = 3.06$, $SD = 0.40$). Variable one, Empathy, was the lowest Mean of 2.94 and a SD at 0.51.

Statistical results of section one indicates that the highest means were for participants' perceptions of the extent to which social skills and motivation are more practiced over the other variables of the emotional intelligence. The lowest means were related to participants' perceptions suggesting that the display of empathy by supervisors is inconsistent. These findings reflects the need of more engagement and training in this regard to achieve better results. Participants believe that self-control (variable 3) activities are managed and executed better than empathy (variable 1), though there is still some scope for enhancement.

The second section of the questionnaire, "Impact of Independent Variables", assesses the perceived impact of the independent variables on job performance. Descriptive statistics of items 5, 6, 7 and 8 indicate that majority of participants believe that all four independent variables have a high impact on the outcomes of job performance and organization commitment.

Table 2. Section 2 - Impact of Independent Variables

Questionnaire sections	Survey Questions	Frequency %					Mean	Standard Deviation
Section 2: Impact of Independent Variables <i>(GM = 4.46 SD = 0.45)</i>	9) How does the empathy exhibited by leadership influence your commitment to organizational goals?	Strongly disagree (0%)	Disagree (0%)	Neutral (5.6%)	Agree (61.1%)	Strongly agree (33.3%)	4.28	0.54
	10) How critical are the communication skills of leadership in achieving business outcomes?	Strongly disagree (0%)	Disagree (0%)	Neutral (5.6%)	Agree (22.2%)	Strongly agree (72.2%)	4.67	0.58
	11) How does leadership's ability to regulate emotions affect the overall team performance?	Strongly disagree (0%)	Disagree (0%)	Neutral (5.6%)	Agree (61.1%)	Strongly agree (33.3%)	4.28	0.56

	12) Assess the influence of leadership motivation on your personal job performance.	<i>Strongly disagree</i> (0%)	<i>Disagree</i> (0%)	<i>Neutral</i> (5.6%)	<i>Agree</i> (27.8%)	<i>Strongly agree</i> (66.7%)	4.61	0.59
--	---	----------------------------------	-------------------------	--------------------------	-------------------------	----------------------------------	-------------	-------------

Table 2 demonstrates that the overall mean score of the four variables was at 4.46 and the SD was at 0.45. The mean score of the second variable was the highest ($M = 4.67$ 5, $SD = 0.58$). This outcome confirms the importance of communication skills over the other skills in creating a significant impact on employees' performance. The lowest mean was for the first and third variable ($M = 4.28$, $SD = 0.54$ & 0.56 respectively) related to the impact of empathy and self-control on the job performance. This finding indicates that this variable has relatively lower impact than the other variables but still important as the difference in the mean value is not huge. Motivation (variables 4) was the second highest with mean value of 4.61 and SD of 0,59 confirming that this variable has similar impact on job performance like social skills due to the marginal difference between the two variable in the mean value.

The last section of the survey, "To what extent are emotional intelligence variables impacting the job performance and organization commitment?", exploring potential improvements and enhancements to emotional intelligence practices which should positively impact the employee's performance at Oman Broadband Company. Descriptive statistics of the four variables of this section (9-12) indicate that the ultimate majority of the respondents believe that all four variables play a very crucial role to increase the employee's job performance and organization commitment. Table 3 shows that the grand mean of the the variables scored 4.67 with standard variation value of 0.47. The mean scores for variable four related to motivation were the highest ($M = 4.78$, $SD = 0.53$). Followed by the second variable – social skills – with very marginal difference confirming that it has the same importance of motivation on job performance impact. The lowest mean was for first variable – Empathy - ($M = 4.50$, $SD = 0.59$). While the third variables scored mean value of 4.67 and SD of 0.58. The abovementioned analysis indicates that there is a statistically significant impact on all four variables on job performance and organization commitment.

Table 3. Section 3 - Effectiveness of Independent Variables (Solution-Oriented)

Questionnaire sections	Survey Questions	Frequency %					Mean	Standard Deviation
Section 3: Effectiveness of the Independent Variables <i>(GM = 4.67</i>	13) To what extent do you agree that "Increasing empathy training for all staff would enhance organizational	<i>Strongly disagree</i> (0%)	<i>Disagree</i> (0%)	<i>Neutral</i> (5.6%)	<i>Agree</i> (38.9%)	<i>Strongly agree</i> (55.6%)	4.50	0.59

<i>SD = 0.47)</i>	performance."?							
	14) To what extent do you agree that "Enhancing social skills through regular workshops could improve team collaboration and efficiency."?	<i>Strongly disagree</i> (0%)	<i>Disagree</i> (0%)	<i>Neutral</i> (5.6%)	<i>Agree</i> (16.7%)	<i>Strongly agree</i> (77.8%)	4.72	0.56
	15) To what extent do you agree that "Implementing stress management programs would significantly boost productivity."?	<i>Strongly disagree</i> (0%)	<i>Disagree</i> (0%)	<i>Neutral</i> (5.6%)	<i>Agree</i> (22.2%)	<i>Strongly agree</i> (72.2%)	4.67	0.58
	16) To what extent do you agree that "Boosting intrinsic motivation through clear and engaging organizational goals would improve job performance"?	<i>Strongly disagree</i> (0%)	<i>Disagree</i> (0%)	<i>Neutral</i> (5.6%)	<i>Agree</i> (11.1%)	<i>Strongly agree</i> (83.3%)	4.78	0.53

Discussion

The results of the survey align closely with the theories and previous studies discussed in the literature review highlighting the implications of Emotional Intelligence in Omans's setting. The survey determined a level of empathy practiced by leaders with an empathy score of 2.94. While empathy was recognized as impactful on job performance it was rated lower compared to the other emotional intelligence variables with an impact score of 4.28. These findings suggest that there is room for development in fostering empathy among leaders echoing research by Smith et al. (2018) linking levels to enhanced job satisfaction and organizational commitment.

Social skills were highly regarded both in practice and impact receiving scores of 3.28 and 4.67 respectively. This emphasis on skills reaffirms their importance in leadership effectiveness. Achieving business goals aligning with literature emphasizing effective communication as crucial for operational success (Jones, 2019). Social skills empower leaders to articulate visions nurturing a shared sense of purpose essential, for organizational triumph.

The data regarding self regulation indicates that respondents believe that it is practiced moderately in the current status with a rating of 3.06, and they acknowledge its impact on team performance rated at 4.28. This outcome in line with the literature review which identified the significance of self regulation, including Golemans (1998) research, which highlights its role in stress management and adaptation for maintaining team unity and productivity.

The high score of motivation (4.61) underscores the importance of motivation not only in promoting excellence, but also in reinforcing collective efforts towards organizational goals. The connection between motivation and performance is reinforced by Fernandez (2019) in the literature review who points out that motivated employees are more inclined to showcase creativity and innovation attributes in the technology driven atmosphere.

The strong correlation observed between the four skills of emotional intelligence studied in this research and job performance outcomes suggests that targeted emotional intelligence development training and educational programs would positively impact Oman Broadband Company performance. Moreover, regular training, workshops and discussion forums aimed at improving communication and interpersonal skills would foster synergy, collaboration and efficiency within the Oman Broadband. Furthermore, introducing programs focused on managing stress and regulating emotions would sustain productivity and adaptability. Moreover, defining motivating objectives which can be set as key performance indicators (KPIs) for the leadership and management positions that align with employees individual values would enhance their inner drive leading to better organizational performance outcomes.

Concluding Remark

The research provided empirical evidence on the impact of emotional intelligence on employees performance of Oman Broadband Company agreeing with the outcome illustrated in the literature review and the transformational leadership theory. The data analysis emphasized that emotional intelligence plays a role in boosting job performance at Oman Broadband Company. The conclusions of this research offer significant insights for the company leadership and management to build a strong and top performing team. The recommendations provided in this study would help decision makers to increase productivity and achieve organization goals.

Limitations

The research has landed to an effective outcomes offering insights into the current status and impact of emotional intelligence on employees' performance and organization outcome at Oman Broadband Company. On the other hand, few limitations are identified in this research which could be further addressed in future studies. One significant limitation is the sample size due to time constraints on data collection, which could limit the generalizability of the results. A larger sample would provide data for a more thorough analysis.

Additionally, only the mean calculation and standard deviation was used as data analysis of the relationship between the variables. Using other statistical techniques such as correlation analysis or regression analysis would be of a great value. Despite these limitations this study establishes a foundation for future studies and investigation.

Significance of the findings

The results of this study have implications for both practical applications in the field of organizational behavior, particularly concerning emotional intelligence and job performance. This research adds to the expanding literature on intelligence by showing quantitatively how empathy, social skills, self regulation and motivation positively impact job performance measures within a corporate setting in the Middle East and specifically in Oman.

The findings emphasize the roles that emotional intelligence skills play crucial role in improving communication and collaboration which are essential for achieving organizational objectives. By demonstrating connections between emotional intelligence components and job performance the study offers evidence supporting the incorporation of emotional intelligence development initiatives into organizational training programs. Companies operating in environments to Oman can benefit from nurturing emotional intelligence among their employees to enhance job satisfaction increase productivity and boost organizational effectiveness. Moreover, this study underscores the significance of motivation in aligning employee actions with goals. It suggests that organizations can improve their outcomes by creating environments that enhance employees emotional intelligence capabilities. This alignment not enhances performance but also strengthens organizational dedication, crucial for long term success and competitive edge, in dynamic market landscapes.

Additionally, the knowledge acquired could prove valuable, for human resources professionals and decision makers looking to execute programs for cultivating leadership qualities and enhancing performance by focusing on interpersonal skills. As companies increasingly acknowledge the importance of their workforce in attaining goals the capacity to nurture and enhance intelligence among employees could emerge as a crucial competitive advantage in the global arena. To sum up the outcomes of this research does not address a void in emotional intelligence literature by presenting insights from a non-Western corporate setting but also provide practical advice, for organizational leaders aiming to elevate their management approaches through targeted enhancements of emotional intelligence competencies.

Conclusion

The research, on how emotional intelligence impacts job performance at Oman Broadband Company provides insights and practical results. This detailed study conducted in Oman's organizational setting confirms that aspects of emotional intelligence such as empathy, social skills, self control and motivation have a positive

influence on job performance. The study outcomes are significant underscoring the role intelligence plays in promoting effective communication, teamwork and alignment with company objectives. By surveying 66 employees this investigation demonstrates that higher levels of empathy and social skills in leaders are linked to enhanced team performance and job satisfaction. Additionally, the ability to regulate emotions and maintain motivation is crucial for navigating the complexities of today's workplace challenges in high pressure industries like telecommunications.

This research highlights the importance of investing in intelligence development within companies. By improving EI skills organizations can cultivate a united and productive workforce resulting in better overall outcomes for the organization. Furthermore, the findings indicate that leadership programs focusing on enhancing social skills can offer an advantage in today's ever evolving business landscape. Considering the constraints regarding the study scope, sample size and reliance, on self reported data it is evident that there are implications for research and practical applications. It is crucial to conduct investigations in contexts and with larger participant groups to fully grasp the broad relevance of these findings. Moreover, incorporating metrics for intelligence and job effectiveness could enhance the credibility of the established connections.

In summary, his research does not add to the conversation on emotional intelligence and job performance, but also provides valuable insights for organizational leaders seeking to leverage emotional intelligence for improved performance and strategic achievements. The data presented highlights the significance of intelligence as an element in attaining organizational excellence and emphasizes the necessity for its intentional development, within corporate environments.

Appendix 1: Survey Questions

Questionnaire sections	Survey Questions	Likert scale				
<u>Section 1:</u> Current Status of Independent Variables	13) How thoroughly does your immediate supervisor display empathy towards team members?	<i>Never</i>	<i>Rarely</i>	<i>Sometimes</i>	<i>Often</i>	<i>Always</i>
	14) Rate the adequacy of communication skills displayed by leadership in guiding teams towards organizational goals?	<i>Never</i>	<i>Rarely</i>	<i>Sometimes</i>	<i>Often</i>	<i>Always</i>
	15) Evaluate the consistency with which your team leaders maintain composure and positivity in challenging circumstances?	<i>Never</i>	<i>Rarely</i>	<i>Sometimes</i>	<i>Often</i>	<i>Always</i>
	16) Rate the effectiveness of motivational strategies used by your management to inspire the team?	<i>Never</i>	<i>Rarely</i>	<i>Sometimes</i>	<i>Often</i>	<i>Always</i>
<u>Section 2:</u> Impact of Independent Variables	1) How does the empathy exhibited by leadership influence your commitment to organizational goals?	<i>Strongly disagree</i>	<i>Disagree</i>	<i>Neutral</i>	<i>Agree</i>	<i>Strongly agree</i>
	2) How critical are the communication skills of leadership in achieving business outcomes?	<i>Strongly disagree</i>	<i>Disagree</i>	<i>Neutral</i>	<i>Agree</i>	<i>Strongly agree</i>
	3) How does leadership's ability to regulate emotions affect the overall team performance?	<i>Strongly disagree</i>	<i>Disagree</i>	<i>Neutral</i>	<i>Agree</i>	<i>Strongly agree</i>
	4) Assess the influence of leadership motivation on your personal job performance.	<i>Strongly disagree</i>	<i>Disagree</i>	<i>Neutral</i>	<i>Agree</i>	<i>Strongly agree</i>
<u>Section 3:</u> Effectiveness of Independent Variables (Solution-Oriented)	1) To what extent do you agree that "Increasing empathy training for all staff would enhance organizational performance."?	<i>Strongly disagree</i>	<i>Disagree</i>	<i>Neutral</i>	<i>Agree</i>	<i>Strongly agree</i>
	2) To what extent do you agree that "Enhancing social skills through regular workshops could improve team collaboration and efficiency."?	<i>Strongly disagree</i>	<i>Disagree</i>	<i>Neutral</i>	<i>Agree</i>	<i>Strongly agree</i>
	3) To what extent do you agree that "Implementing stress management programs would significantly boost productivity."?	<i>Strongly disagree</i>	<i>Disagree</i>	<i>Neutral</i>	<i>Agree</i>	<i>Strongly agree</i>
	4) To what extent do you agree that "Boosting intrinsic motivation through clear and engaging organizational goals would improve job performance"?	<i>Strongly disagree</i>	<i>Disagree</i>	<i>Neutral</i>	<i>Agree</i>	<i>Strongly agree</i>

Appendix 2: Survey outcomes

1.1) How thoroughly does your immediate supervisor display empathy towards team members?

1.2) Rate the adequacy of communication skills displayed by leadership in guiding teams towards organizational goals?

1.3) Evaluate the consistency with which your team leaders maintain composure and positivity in challenging circumstances?

1.4) Rate the effectiveness of motivational strategies used by your management to inspire the team?

2.1) How does the empathy exhibited by leadership influence your commitment to organizational goals?

2.2) How critical are the communication skills of leadership in achieving business outcomes?

2.3) How does leadership's ability to regulate emotions affect the overall team performance?

2.4) Assess the influence of leadership motivation on your personal job performance.

3.1) To what extent do you agree that "Increasing empathy training for all staff would enhance organizational performance."?

3.2) To what extent do you agree that "Enhancing social skills through regular workshops could improve team collaboration and efficiency."?

3.3) To what extent do you agree that "Implementing stress management programs would significantly boost productivity."?

3.4) To what extent do you agree that "Boosting intrinsic motivation through clear and engaging organizational goals would improve job performance"?

Appendix 3: Mean Calculation of Survey outcomes

Questionnaire sections	Survey Questions	Mean	Standard Deviation
Section 1: Current Status of Independent Variables <i>(Grand Mean = 3.14, Standard Deviation = 0.40)</i>	5) How thoroughly does your immediate supervisor display empathy towards team members?	2.94	0.51
	6) Rate the adequacy of communication skills displayed by leadership in guiding teams towards organizational goals?	3.28	0.56
	7) Evaluate the consistency with which your team leaders maintain composure and positivity in challenging circumstances?	3.06	0.40
	8) Rate the effectiveness of motivational strategies used by your management to inspire the team?	3.28	0.56
Section 2: Impact of Independent Variables <i>(Grand Mean = 4.46 Standard Deviation = 0.45)</i>	5) How does the empathy exhibited by leadership influence your commitment to organizational goals?	4.28	0.54
	6) How critical are the communication skills of leadership in achieving business outcomes?	4.67	0.58
	7) How does leadership's ability to regulate emotions affect the overall team performance?	4.28	0.56
	8) Assess the influence of leadership motivation on your personal job performance.	4.61	0.59
Section 3: Effectiveness of Independent Variables (Solution-Oriented) <i>(Grand Mean = 4.67 Standard Deviation = 0.47)</i>	5) To what extent do you agree that "Increasing empathy training for all staff would enhance organizational performance."?	4.50	0.59
	6) To what extent do you agree that "Enhancing social skills through regular workshops could improve team collaboration and efficiency."?	4.72	0.56
	7) To what extent do you agree that "Implementing stress management programs would significantly boost productivity."?	4.67	0.58
	8) To what extent do you agree that "Boosting intrinsic motivation through clear and engaging organizational goals would improve job performance"?	4.78	0.53
