In Case 1, the ASMC controller exhibits remarkable performance adaptability to different load conditions, showcasing rapid rise times, minimal overshoot, and consistently short settling times. As the load increases from 0.125 N to 0.5 N, the controller maintains its efficiency, with negligible deviations in its performance metrics, illustrating its robustness across a range of loads. Similarly, in Case 2, conducted at 350 rpm, the ASMC controller continues to demonstrate excellent performance attributes under varied load conditions. It exhibits swift rise times, minimal overshoot, and short settling times, indicating its stability and reliability in the presence of different loads. As the load escalates from 0.125N to 0.5N, the controller maintains its impressive performance consistency, further reaffirming its suitability for applications demanding precise and dependable speed control across different load and speed settings.

Conclusion

The comprehensive analysis of speed controllers operating at different speeds and load conditions highlights the Adaptive Sliding Mode Controller (ASMC) as superior performance. Whether at a rated-speed of 1400 rpm or a lower speed of 350 rpm, the ASMC consistently demonstrates rapid rise times, minimal overshoot, and relatively short settling times. Even when subjected to a 0.5N load, it maintains its commendable performance, underlining its adaptability and stability across diverse operational scenarios. These findings position the ASMC as the preferred choice for applications demanding precise and swift control, making it the standout controller in this comparative study.

Enhancing Road Design Education: A Comprehensive Analysis of Micro-Field Trips from the Perspective of Students

Yasmany García-Ramírez

Universidad Técnica Particular de Loja, Ecuador,  <https://orcid.org/0000-0002-0250-5155>

Abstract: Road design education faces challenges in effectively bridging theoretical knowledge with real-world applications. Traditional classroom-based teaching methods often fall short in preparing engineering students for the complexities encountered in practical scenarios. To address this gap, innovative pedagogical strategies, such as micro-field trips, have been introduced to enhance the learning experience. This study explores the influence of micro-field trips on the learning experiences of students in the 'Road Construction II' course at Universidad Técnica Particular de Loja. The course adopts a varied instructional approach, incorporating micro-field trips to bridge theoretical understanding with practical, hands-on applications. Two student groups, Group A (22 students) and Group B (45 students), participated during the academic period from April to August 2023. A confidential survey was conducted a week before the semester's end to gather student perceptions of micro-field trips, revealing that students agreed with the one-hour weekly duration and its alignment with weekly topics. The study aims to provide insights for optimizing future implementations. Results indicate the positive impact of micro-field trips in reinforcing theoretical concepts, fostering professional skills, and addressing real-world problems. Despite these advantages, challenges such as time constraints, weather dependency, and content coverage limitations are identified, necessitating strategic planning for enhanced effectiveness.

Keywords: Micro-field trips, Road construction education, Student perceptions, Educational challenges.

Ozturk (Eds.), *Proceedings of ICRES 2024- International Conference on Research in Education and Science* (pp. 723-735), Antalya, Türkiye. ISTES.

Introduction

As societies advance, the demand for resilient and well-organized road networks becomes increasingly evident. This emphasizes the necessity for engineering students to acquire a thorough understanding of road design principles. The complexity of this field doesn't just stem from the employed formulas but also from the fact that road design typically involves three dimensions: horizontal alignment, vertical alignment or profile, and in cross-section elements. Numerous studies have highlighted the importance of engineers and students mastering the use of these three dimensions in road design (Hassan et al., 2011; Kuhn et al., 2012).

While traditional classroom-based teaching has long been fundamental to education, its application in the realm of road design encounters inherent challenges. Theoretical instruction often falls short in adequately preparing students for the complexities they will face in real-world scenarios. The gap between classroom learning and practical application imposes limitations, impeding the development of skills crucial for effective road design. Consequently, several studies have sought to cultivate these skills, particularly through project-based learning methods (Castro, 2012; García-Ramírez, 2021, 2023). When complemented with visual elements or practical cases to aid students in comprehending the three dimensions, the results are markedly improved. These elements may involve the use of software (Castro, 2012; Liao & Levinson, 2012), virtual reality (Han et al., 2006), or simulators (Van Der Horst & Hogema, 2011) to enhance understanding of this critical concept.

The integration of field visits as a pedagogical tool enhances the educational experience by providing students with tangible exposure to the intricacies of road design. Unlike virtual trips, which have shown success in certain areas like construction science (Man et al., 2023), students in the realm of roads must be aware of measures, sizes, shapes, etc., that cannot be fully experienced in a virtual setting. Real field visits offer distinctive pedagogical advantages, including the improvement of critical thinking, long-term retention, and transfer potential. They also foster positive attitudes towards science and nature (Manner, 1995) and provide immediate contact with knowledge objects, interdisciplinary study, and diverse teaching methods. This, in turn, enhances motivation, social relations, and fieldwork skills (Anđelković et al., 2018). Particularly valuable in the early weeks of higher education, field trips contribute to personal and social development, stimulate interest and motivation, and imbue learning with meaning (Larsen et al., 2017). These benefits can be further amplified through the integration of active learning, collaborative problem-based activities, place-based learning, and rapid feedback, applicable to both virtual field trips and classroom activities (Jones & Washko, 2022). Field visits often involve logistical challenges and potential risks for students. For example, measuring the cross-section of a road with heavy traffic can be particularly demanding and hazardous.

Therefore, an alternative approach is to conduct micro-field trips instead of full field visits. Unlike traditional field trips that often entail extended periods away from the classroom, micro-visits are short, focused excursions scheduled for one hour per week. During these micro-visits, students venture inside the campus to observe and analyze road infrastructure directly related to the weekly topic under discussion. For instance, if the focus is on road transversal sections, students step out of the classroom to witness and measure the cross-section of a road within the campus. This targeted, hands-on experience is designed to provide students with immediate, practical exposure to the specific aspects of road design they are studying, creating a dynamic link between theoretical concepts and real-world applications. The essence of micro-field trips lies in their ability to bring the learning environment to life, making it an integral component of the overall road design curriculum.

The integration of micro-field trips into road design education is motivated by several compelling reasons. These expeditions offer a unique opportunity to address the challenges inherent in traditional classroom-based teaching methodologies. By exposing students to real-world scenarios and practical applications through brief, targeted visits, micro-visits bridge the gap between theoretical knowledge and hands-on experience that is

needed for the demands of the field.

The main goal of this article is to investigate the impact of micro-field trips on students' learning experiences in the 'Road Construction II' course used as a pedagogical strategy in supporting the teaching of road design. To achieve this, the study examined the perceptions of two groups of students enrolled in the 'Road Construction II' course at the Universidad Técnica Particular de Loja during the academic period from April to August 2023. Through a thorough examination of the impact of micro-visits on student learning outcomes, engagement, and the practical application of theoretical knowledge, the article aims to offer insights into the potential benefits and challenges associated with this innovative approach. The ultimate objective is to contribute valuable knowledge to the field of road design education, providing guidance for educators, curriculum developers, and researchers on the role and effectiveness of micro-visits in enhancing the overall learning experience.

Method

Study Groups

During the academic period from April to August 2023, students registered for the 'Road Construction II' course at the Technical University of Loja. The students were divided into two groups: Group A, consisting of 22 students, and Group B, consisting of 45 students. Classes for Group A were scheduled on Wednesdays, while Group B had classes on Thursdays.

Course content

The 'Road Construction II' course builds upon the content covered in the 'Road Construction I' course, which primarily focuses on traffic and alignment horizontal design. In 'Road Construction II,' students delve into the study of vertical alignments of profiles and cross-sections, supplemented by additional aspects of road operation, as detailed in Table 1.

Table 1. Detail of the Content of the 'Road Construction II' Course in this Study

Nro.	Topic	Detailed content
1	Vertical alignment	1.1 Introduction
		1.2 Geometric elements comprising the vertical alignment
		1.3 Parabolic curve geometry
		1.4 Visibility on roads
		1.5 Criteria for determining the lengths of vertical curves

Table 1. Detail of the Content of the 'Road Construction II' Course in this Study

2	Combinations of horizontal and vertical alignment	2.1 Introduction
		2.2 General design controls
		2.3 Alignment coordination in design
3	Cross section elements	3.1 Introduction
		3.2 Geometric elements comprising a cross-section
		3.3 Curve widening
		3.4 Typical cross-sections
		3.5 Shoulder widths
		3.6 Cross-sectional area
		3.7 Earthwork volumes and measurement
		3.8 Earthwork volume movement
4	Capacity and level of service	4.1 Introduction
		4.2 Calculation of capacity and level of service
5	Climbing lane	5.1 Introduction
		5.2 Additional passing opportunities on two-lane roads
6	Escape ramps	6.1 Introduction
		6.2 Need and location of escape ramps
		6.3 Types of escape ramps
		6.4 Design considerations
7	Roadway marking	7.1 Introduction
		7.2 Horizontal signage
		7.3 Vertical signage
8	Safety analysis	8.1 Introduction
		8.2 General formula
		8.3 Use of IHSDM (Interactive Road Safety Design Model)

Course details

The course extended over 16 weeks, with two weeks reserved for the midterm and final exams, during which no micro-field trips took place. Consequently, there were a total of 14 micro-field trips conducted throughout the course. The instructional approach integrated five pre-analyzed learning moments (García-Ramírez, 2023), involving activities such as watching prerecorded lectures, creating a comic image, participating in synchronous classes, and preparing an infographic or presentation to showcase the road project's progress. Furthermore, micro-field trips were introduced, as depicted in Figure 1.

As depicted in Figure 1, the instructional approach employs a diverse range of active learning methods to enrich student engagement and comprehension. Students actively participate in their learning journey by watching

prerecorded lectures, fostering creativity through the creation of comic images, engaging in real-time interaction, and collaboratively developing a road project in teams during synchronous classes. They also demonstrate their understanding through the preparation of infographics or presentations that showcase the progress of the road project. Additionally, micro-field trips, illustrated in Figure 1, have been incorporated, providing students with practical, hands-on experiences that complement theoretical knowledge. This multifaceted approach is designed to accommodate various learning styles, fostering a dynamic and immersive educational experience for the students.

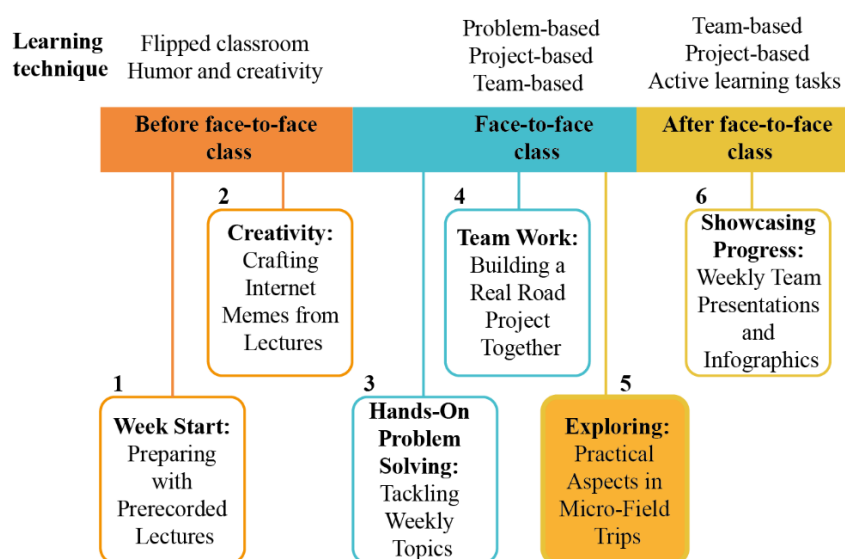

Figure 1. Academic Activities Performed during the Course

The micro-field trips occurred during the last hour of the class, following 2 hours dedicated to problem-solving and 2 hours of teamwork on the road project. The chosen site typically had minimal vehicular traffic and included all the elements analyzed in class. However, only one location fulfilled these criteria, situated between Prendho UTPL and the UTPL residence, covering an approximate distance of 400 meters. These trips did not involve topographic equipment; instead, basic measurement instruments like rulers, tape measures, and tape were utilized, as depicted in the examples presented in Figure 2.

Data collection and processing

A confidential survey was administered one week before the semester concluded, seeking insights into students' perceptions of the micro-field trips. One question inquired: "On a scale from 1 to 10, where 1 is the lowest and 10 is the highest, how would you rate the micro-visits conducted during the semester?" This question was accompanied by inquiries such as "On a scale from 1 to 10, where 1 is the lowest and 10 is the highest, how much of the subject's learning was done by you?" and "On a scale from 1 to 10, where 1 is the lowest and 10 is the highest, how would you overall rate this course?" Additionally, students were asked to elaborate on the micro-field trips, specifically providing a minimum of two advantages and two disadvantages of this type of

academic activity.

Figure 2. Photographs illustrating some of the Micro-field Trips conducted during the Course

The survey was shared online, and participation was voluntary. The numerical responses underwent analysis, including the calculation of averages and confidence intervals. For the text responses, an analysis was conducted, involving categorization and presenting a general summary of the answers.

Results

Initially, the survey garnered responses from all students in both groups, indicating substantial participation and yielding noteworthy results for the sample. To provide context, Table 2 displays the academic outcomes of the respective groups.

Table 2. Summary of Group Grades and Reprobation Percentage

Group	n	Average Grade \pm 95% Confidence Interval	Min	Max	% of Reprobation
A	22	7.25 ± 0.63	1.34	8.40	27
B	45	7.51 ± 0.07	7.06	8.24	0

Group A

In response to the query about the extent to which students contributed to their learning in the subject, the average response was 7.76 ± 0.89 (min = 3, max = 10). The overall course rating averaged 9.19 ± 0.34 (min = 8, max = 10), while the micro-field trips received a rating of 9.86 ± 0.16 (min = 9, max = 10). Overall, it is evident that students engaged in significant self-directed learning, providing high ratings for both the course and the micro-field trips.

After analyzing the advantages and disadvantages of the micro-field trips, a summary of the responses received has been compiled. Let's begin with the perceived advantages reported by this group:

1. Practical Application of Theory: Relating theoretical concepts to practical scenarios enables a deeper understanding.
2. Development of Professional Skills: Provides an experience akin to analyzing projects in a professional environment.
3. Identification of Real Problems: Allows the detection of specific issues that might go unnoticed with theoretical knowledge alone.
4. Reinforcement of Learning: Facilitates the assimilation of knowledge by observing and applying it in the field. Enables a better comprehension of theoretical calculations by physically observing what is studied in class. Offers the opportunity to reinforce concepts that may not have been fully understood in class.
5. Generation of Ideas and Dialogue: Encourages the discussion of ideas and teamwork.
6. Improvement of Critical Thinking: Contributes to the development of integrative critical thinking.
7. Knowledge of Real Measurements: Facilitates understanding the actual dimensions of what is studied at scale in the classroom.
8. Field Experience: Presents new challenges that contribute to gaining experience in real-world situations.

Despite the students recognizing the benefits of the micro-field trips, they have some perceived disadvantages, as reported by Group A:

1. Difficulty Due to Lack of Theoretical Understanding: A lack of theoretical comprehension can hinder practical learning. There is a possibility that topics reviewed in class may be confused during practices.
2. Time Limitation: Temporal constraints may impact the coverage of topics and the depth of practices. Limited time may restrict the number of topics addressed during micro-field trips. Short timeframes may not be sufficient to comprehend or solve problems during practices.
3. Limited Availability of Participants: Reduced availability of certain group members can be an inconvenience.
4. Dependency on Weather Conditions: Weather conditions, such as rain or excessive sunlight, can affect

the execution of practices. Climate conditions may complicate the execution of outdoor visits. Outdoor practices may be canceled due to adverse weather conditions.

5. Lack of Necessary Materials: The absence of materials can be a limitation for conducting practices effectively.

Group B

In response to the query about the extent to which students contributed to their learning in the subject, the average response was 7.20 ± 0.54 (min = 3, max = 10). The overall course rating averaged 9.30 ± 0.28 (min = 7, max = 10), while the micro-field trips received a rating of 9.25 ± 0.39 (min = 5, max = 10). Overall, it is evident that students engaged in significant self-directed learning, providing high ratings for both the course and the micro-field trips.

After analyzing the advantages and disadvantages of the micro-field trips, a summary of the responses received has been compiled. Let's begin with the perceived advantages reported by this group:

1. Practical Experience: Micro-field trips related to daily classes provide an opportunity to gain practical experience, surpassing theory. Also, familiarizes students with the practical application of concepts taught in class. Aids in the formation of criteria for students to navigate the professional environment.
2. Clarification of Doubts: Contributes to resolving doubts while gaining experience, enhancing the understanding of concepts. Allows a real-time doubt clarification for the clarification of doubts that arise during the practical experience.
3. Rewarding Learning: The visit offers a rewarding way of learning, identifying and understanding with the teacher's explanation.
4. Theory-Practice Relationship: Allows for relating theoretical concepts to their practical application. Facilitates the direct application of theoretical concepts in real-world settings. Provides practical knowledge of activities conducted in class.
5. Development of Social Skills: Facilitates the development of social and emotional skills through interaction with peers and the guide.

And the summary of the disadvantages of Group B is detailed below.

1. Recurrence of the Same Location: In most visits, the same location is repeated, suggesting exploration of nearby places for a better application of concepts. There are not many nearby places where practices can be conducted effectively. Zone limitation affects the variety of practices that can be carried out. Visiting only one road restricts exposure to different scenarios that could enrich the experience.
2. Limited Time: The allocated time is insufficient for conducting some micro-field trip activities, suggesting the allocation of more time to fully leverage these experiences.
3. Lack of Resources and University Support: The lack of time, resources, and university support hinders

visits to other sites with diverse information. The lack of equipment and space for practical activities is a limitation.

4. Weather Conditions: Weather conditions can affect the planning and execution of field trips.
5. Limited Content: While they offer practical experience, there may be limitations regarding specific concepts or topics that can be addressed.

Overall Analysis

Both Group A and Group B recognize the benefits of micro-field trips in enhancing their learning experience. The advantages perceived by both groups include the practical application of theoretical knowledge, the development of professional skills, the identification of real problems, reinforcement of learning, generation of ideas through dialogue, improvement of critical thinking, understanding of real measurements, and gaining valuable field experience. However, there are also shared concerns and disadvantages expressed by both groups. These include challenges related to time limitations, with insufficient time for certain activities during micro-field trips. Both groups highlight the dependency on weather conditions, which can affect the planning and execution of outdoor visits. Additionally, there are concerns about the recurrence of the same location, limited availability of participants, lack of necessary materials, and the overall limited content coverage in some cases.

In summary, while micro-field trips offer substantial advantages in practical learning, challenges such as time constraints, weather dependency, and limitations in variety and content coverage are recognized by both groups as areas for improvement in the implementation of these experiences.

Discussion

The study explores the impact of micro-field trips on students' learning experiences in the 'Road Construction II' course at the Universidad Técnica Particular de Loja, focusing on two student groups (Group A and Group B). The instructional approach employed a multifaceted strategy, integrating various learning moments and activities such as prerecorded lectures, synchronous classes, and micro-field trips. Micro-field trips were introduced to provide practical, hands-on experiences, offering a dynamic complement to theoretical knowledge. However, these trips raised certain challenges, as discussed by both Group A and Group B.

In analyzing the advantages and disadvantages reported by both groups, common themes emerge. Both groups acknowledge the practical benefits of micro-field trips, citing advantages such as the practical application of theoretical concepts, the development of professional skills, and the identification of real-world problems. These experiences contribute to the reinforcement of learning, fostering critical thinking, and providing valuable field exposure. In previous research, field trips have been shown to enhance learning by providing real-world context and fostering critical thinking (Krakowka, 2012; Manner, 1995). When designed with a purpose, they can promote higher-order thinking skills (Foo & Foo, 2022). These trips also create opportunities for first-hand

experiences, cognitive development, and motivation (Manner, 1995). In higher education, field trips can integrate active learning, co-creation of knowledge, and place-based learning, contributing to the value of field trips as a pedagogical tool (Jones & Washko, 2022).

Despite the shared benefits, challenges are identified by both groups. Time constraints emerge as a common concern, with insufficient time allocated for certain activities during micro-field trips. The influence of uncertain travel times on activity schedules, with some activities, being canceled due to increased travel time (Rasouli & Timmermans, 2014). The dependency on weather conditions poses a significant challenge, impacting the planning and execution of outdoor visits. This is particularly evident in the case of adverse weather, where drivers tend to acquire more information and make changes to their travel plans (Kilpeläinen & Summala, 2007). However, the impact of weather on field trips can be mitigated through consistent learning outcomes, an immersive field area, and flexible assessments (Jolley et al., 2019). The influence of weather on active transportation is also notable, with significant changes in travel behavior observed in different weather conditions (Saneinejad et al., 2012). The recurrence of the same location, limited availability of participants, lack of necessary materials, and concerns about content coverage are additional shared disadvantages.

The findings suggest a need for careful consideration in the planning and execution of micro-field trips. Strategies to address time limitations, such as better scheduling or extending trip durations, should be explored. Previous discusses the tradeoff between maintaining temporal flexibility and maximizing quality in schedule optimization, which is a key consideration for field trip planning (Policella et al., 2005). Additionally, measures to mitigate the impact of weather conditions, such as having alternative indoor activities or rescheduling trips, could enhance the overall effectiveness of these experiences. Furthermore, efforts should be made to diversify locations and ensure comprehensive coverage of course content during micro-field trips.

In conclusion, while micro-field trips offer substantial advantages in enhancing practical learning experiences, the identified challenges underscore the importance of thoughtful planning and continuous improvement. The study provides valuable insights for educators and curriculum designers seeking to optimize the integration of micro-field trips into coursework, ensuring a balanced and effective approach to experiential learning.

Conclusion

The diverse instructional approach effectively engaged students, with micro-field trips proving instrumental in providing practical, hands-on experiences alongside theoretical learning. Reported advantages, including the practical application of theory and skill development, underscore the positive impact of micro-field trips. However, challenges like time constraints and weather dependency demand careful planning adjustments, potentially involving revised schedules, extended durations, and contingency measures. Concerns about location repetition, participant availability, and content coverage suggest opportunities for improvement in trip variety and scope. Enhancing location diversity, ensuring comprehensive content coverage, and optimizing participant

involvement are essential considerations. While micro-field trips significantly enhance practical learning, addressing identified challenges is crucial for maximizing their overall impact. Strategic planning and ongoing refinement are key for educators and curriculum designers, offering guidance to optimize experiential learning benefits in engineering and construction-related courses.

Recommendations

- Consider revisiting scheduling strategies for micro-field trips to address time constraints. This could involve optimizing the duration or frequency of trips to allow for more in-depth exploration.
- Develop contingency plans for adverse weather conditions that may impact the execution of outdoor micro-field trips. This could involve having alternative indoor activities or rescheduling trips as needed.
- Explore opportunities to diversify the locations of micro-field trips to avoid the recurrence of the same site. This can enrich students' experiences and provide exposure to a variety of real-world scenarios.
- Address concerns related to the limited availability of participants by implementing strategies to optimize involvement. This might include flexible scheduling options or alternative ways for students to catch up on missed experiences.
- Implement a feedback loop for continuous improvement by regularly evaluating the effectiveness of micro-field trips. Gather feedback from students and use it to refine the planning and execution of future trips, making adjustments based on their experiences and suggestions.
- Collaborate with the university to enhance support for micro-field trips. This could involve securing additional resources, allocating dedicated spaces for practical activities, and fostering a supportive environment for experiential learning.
- Encourage documentation of successful practices and challenges encountered during micro-field trips. Share these experiences with other educators to contribute to a collective pool of best practices in implementing similar experiential learning approaches.

These recommendations aim to address identified challenges and enhance the overall effectiveness of micro-field trips in the 'Road Construction II' course. They emphasize a strategic and continuous improvement approach to ensure that these experiences align with educational objectives and provide meaningful learning opportunities for students.

Abstract: One of the latest learning models developed by Bina Nusantara (BINUS) University is Project Based Learning (PBL). The main theoretical basis used in this research is Dewey's theory. This research aims to describe the teamwork of BINUS students who apply the PBL model in learning activities. Does engagement occur in the work team? Does engagement influence the spirit of team collaboration effectively so that the PBL goal is achieved, namely cooperation as one of the competency targets (quality or skill) for graduates from the 9 BINUS Graduate Attributes (BGA) that BINUS requires of all students and alumni? Respondents (n) in this study were 108 people consisting of class LB24 (n=52) and class LI24 (n=52) in the odd semester of 2023. Each class was divided into 9 groups randomly with the number of members 5-6 per group. The research method used is the Class Action Research (CAR) model, consisting of 3 stages of PBL, namely Planning, Implementation, and Reporting (PIR) with eight learning activities. Based on the results of a questionnaire with a Likert scale, the following description was obtained: Groups that felt stronger engagement were also able to work together better than groups that felt less engaged. This research also shows the result, groups that feel stronger engagement make more creative efforts in Community Service activities which are a form of implementation of PBL.

Keywords: project-based learning, engagement, teamwork

Introduction

There are at least three interesting facts about learning at Bina Nusantara University (BINUS) in the last five years. Firstly, facts related to the Independent Curriculum (Kurikulum Merdeka). This curriculum is the most actual reference (the latest curriculum) in the development of education in Indonesia. This curriculum encourages changes in various aspects, from a teacher-oriented paradigm-shifting to a student-oriented paradigm; encouraging scientific learning models that build students' thinking constructions starting from observing, asking, experimenting, associating and communicating; and efforts to encourage high-level understanding by providing 21st century skills, namely critical thinking, communication, collaboration and

creativity in learning activities (Hendrastomo & Januarti, 2023). Hendrastomo and Juniarti further said that through the Independent Curriculum, students are invited to explore the world, carry out analysis, and find solutions to the problems that befall them. Secondly, this fact is related to learning methods. Currently, the learning method applied at BINUS is an andragogical learning method, adult learning, which is critical-analytical, multi-directional, and emphasizes group collaboration without excluding individual or personal aspects. This model at BINUS also requires students to learn by doing and applying ideas. Students are engaged in real-world activities that are similar to the activities that adult professionals are engaged in. At BINUS, the models or approaches that are considered appropriate are Problem-Based Learning and Project-Based Learning. Specifically for the Character Building course at BINUS, the approach used is Project-Based Learning. Thirdly, a fact that is no less interesting is related to the characteristics of the learners themselves. Students at BINUS, especially for the Character Building Pancasila course which is mandatory and given in the first semester, are followed by the post-millennial generation (Gen-Z). The definition of Gen-Z according to experts has several different criteria. Schmidt et al. (2023), said Gen-Z was born in 1997-2012. Meanwhile, Dwidienawati & Gandasari (2018), said that Gen-Z in Indonesia was born in 1995-2015. The general characteristics of Gen-Z are as follows: This generation is known as iGen or the Internet Generation. They grew up with smartphones, social media, and the internet dominating their daily lives. According to Dwidienawati & Gandasari it is impossible to imagine their life without the internet. This generation is known as digitally naïve and hyper-connected junkies. They are the first generation to have access to wide-scale digital communications technology in the form of cell phones, Wi-Fi, and interactive computer games. They like to collaborate in doing work, are a flexible generation, like challenges and are motivated by achievement, like to explore looking for new ways to solve problems, are tech savvy, like to indulge in privacy, are independent, tolerant, like to communicate virtually, and have ambition. Their attention span is short, meaning they find it difficult to focus on something for long periods of time. However, Gen-Z spends an average of 6.5 hours every day in front of screen electronic devices. They write and receive 109.5 texts per day. They consider smartphones to be an important part of their lives. Even though Gen-Z spends most of their time in front of electronic screens, they are not necessarily anti-social.

This research aims to describe the teamwork of BINUS students who apply the PBL model in learning activities. This goal is an important thing related to the BINUS Graduate Attribute (BGA). BINUS Graduate Attribute (BGA) is a collection of attributes related to qualities or skills that BINUS University graduates need to possess and develop while studying at BINUS University through the Educate, Enrich, and Empower processes in order to prepare themselves for the future. BINUS Graduate Attributes (BGA) consists of nine (9) qualities or non-technical skills (soft skills) which are developed based on the profile needed by a student in carrying out his career. The nine attributes or skills developed in BINUS Graduate Attributes are Global Standard Technical Competencies, Adaptability, Applied Management Skills, Collaboration, Critical & Creative Thinking, Digital & Technology Fluency, Growth Mindset, Initiative, and Social Awareness. BGA development is based on BINUSian Values (S-P-I-R-I-T): Striving for Excellence, Perseverance, Integrity, Respect, Innovation, Teamwork. The aim is to strengthen character as a BINUS University student. These qualities or skills prepare graduates to be able to undertake 3 alternative career choices, namely as an Employee, Entrepreneur, or Further Study. In other words, the implementation of BGA based on BINUS values is carried out so that BINUS

University graduates could have competitiveness and strength that can support their career achievements in the future.

This research focuses on the issue of cooperation or teamwork which is one of the attributes and values of BINUS. Collaboration is also a characteristic of Gen-Z, the model promoted by the Independent Curriculum, and is the core pattern of Project-Based Learning. In connection with these matters, the questions in this research are:

1. Does engagement occur in the work team?
2. Does engagement influence the spirit of team collaboration effectively so that the PBL goal is achieved, namely cooperation as one of the competency targets (quality or skill) for graduates from the 9 BINUS Graduate Attributes (BGA) that BINUS requires of all students and alumni?

Methods

This research uses the literature study method, especially Dewey's theory as the basis for the thinking framework. Apart from that, this research uses the Class Action research method consisting of 3 stages of PBL, namely Planning, Implementation and observation, and Reporting (PIR). This approach is based on the model created by Kemmis and McTaggart (1982, 2000). Firstly, Planning or Preparing: During forum group discussions (FGD), instructors and researchers work together to create cooperative learning designs that will be used in instructional activities. Researchers offer suggestions and original ideas for developing practical contextual learning designs in this exercise. Secondly, Doing or Acting and Seeing or Observing: Teachers and researchers jointly consider the student activities that have been going on. The instructor instructs the class using the lesson plan as a guide. Researchers observe the teaching and learning process in this section while documenting and observing how the learning methods are used when carrying out teaching and learning activities. Thirdly, Reporting: After Seeing and observing, through FGD, the researcher and teacher try to improve the plans for the upcoming meeting, they refer to or consider the reflection points in this part. All these activities are called planning-to-do-see-observe-report-and-reflecting-cycles. This research was carried out by conducting direct observations of the learning process over eight (8) sessions or cycles of repeated learning activities and distributing questionnaires with a Likert scale to all respondents in the study to get a picture or description of the final results of their involvement during teaching and learning activities using the group discussion method.

The focus object of engagement of this research is classrooms. There are 4 categories/levels of engagement that we focus on in our research: Highly Engagement, Moderate Engagement, Barely Engagement, and Disengagement. In the Likert scale, there are 3 domains (cognitive, affective, psychomotor) that will be measured, each consisting of 5 questions with a total of 15: Affective/emotional (low-interest enjoyment, boredom) with 5 questions, behavioral (skipping class) with 5 questions, cognitive (lack of attention to task) with 5 questions. The questions are positive with answers ranging from Strongly Disagree (SD), Disagree (D),

Neutral (N), Agree (A), and Strongly Agree (A). SD=1 point, D=2, N=3, A=4, SA=5. If the total score of the average answer for members in one team is 60-75 points, it means a highly engaged team; 45-60 points moderately engaged; 30-45 points barely engaged; and 15-30 points disengaged team.

Picture 1. Class Action Cycle according to Kemmis & Mc Taggart.

Respondents (n) in this study were 108 people consisting of class LB24 (n=52) and class LI24 (n=52) in the odd semester of 2023. There were 18 groups in this research, each class was divided into 9 groups randomly with the number of members 5-6 per group. Class LB24 is the research target (treatment class), and class LI24 is the control class (non-treatment class).

Results and Discussion

Krajcik and Blumenfeld (2012) said that the average parent considers that many students feel bored in class as something that does not need to be taken too seriously. Those who think so believe that this problem is only experienced by students who get bad grades and not the same for students who get good grades. They also believe that if students who get bad grades study more seriously then they will not feel bored because they get good grades. But in fact this is not the case. Almost all students who get good grades also experience boredom (Csikszentmihalyi, Rathunde, & Whalen, 1993). Therefore, Krajcik and Blumenfeld concluded that the problem of students feeling bored in learning does not lie with the students themselves. There was something wrong with the structure of schooling. If we could find a way to engage students in their learning, to restructure the classroom so that students would be motivated to learn, that would be a dramatic change.

Krajcik at.al. (1994) and Blumenfeld at.al. (2000) noted that there are many researchers in the field of education who develop curriculum models and learning methods with the aim of increasing student engagement and helping students to deepen and understand important points in learning. One model developed since the 1990s is Project-Based Learning. Project-Based Learning allows student to learn by doing and applying ideas. Student engage in real world activities that are similar to the activities that adult professionals engage in. PBL is a form of situated learning and is based on the constructivist finding that students gain a deeper understanding of material when they actively construct their understanding by working with and using ideas. In PBL, students

engage in real, meaningful problems that are important to them and that is what scientists, writers, historians, mathematicians do. In PBL classes students have many opportunities to ask questions, propose hypotheses and explanations, discuss their opinions, challenge other people's ideas, and dare to try new ideas. Various research has also proven that students who study in PBL classes have better scores compared to students in traditional classes (William & Linn, 2003; Marx et. al. 2004; Rivet & Krajcik, 2004).

There are five main keys in PBL, namely:

1. Starting with a guiding question regarding the problem to be solved. In learning at BINUS, especially LB24 and LI24 which are the Character Building Pancasila classes, the questions asked are related to Sustainable Development Goals (SDGs) 16: Peace, justice and strong institutions and 17: Partnerships for the goals. Students are invited to choose projects, answer questions, according to their interests.
2. Students explore the driving question by participating in authentic, situated inquiry—processes of problem solving which are central to expert performance in the discipline. As students explore the driving question, they learn and apply important ideas in the discipline.
3. Students, lecturers, and community members engage in collaborative activities to find solutions to the driving question. This mirrors the complex social situation of expert problem solving.
4. While engaged in the inquiry process, students are scaffolded with learning technologies that help them participate in activities normally beyond their abilities.
5. Students create a set of tangible products that address the driving question. These are shared artifacts, publicly accessible external representations of the class's learning. In BINUS students product poster. (Blumenfeld, et.al, 1991; Krajcik, et.al., 1994; Krajcik, Czerniak, & Berger, 2002).

According to Krajcik and Blumenfeld, based on their research and experience of more than ten years of teaching using the PBL method, the roots of PBL are found in the theory developed by the philosopher John Dewey, who was also an educator (1959). Dewey, through his research in his school laboratory at the University of Chicago, developed the inquiry process in learning activities. Dewey argued that students will develop personal investment in the material if they engage in real, meaningful tasks and problems that emulate what experts do in real-world situations. Further Dewey and Dewey (1919) says, learning by doing does not, of course, mean the substitution of manual occupations or handwork for text-book studying. At the same time, allowing the students to do handwork whenever there is opportunity for it, is a great aid in holding the child's attention and interest.

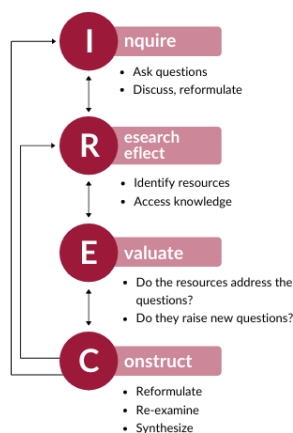

Research conducted by Dewey regarding the importance of active inquiry in developing deeper understanding, according to Bransford, Brown, & Cocking (1999) has produced at least four ideas in learning, namely active construction, situated learning, social interactions, and cognitive tools (technologies in learning, such as video-based learning and other interactive activities). These four ideas are also known in a learning theory called Inquiry-Based Learning (IBL), one of the strategies that can be used in the learning process to improve students' thinking abilities and help them understand the material better, which has four pillars, namely constructivist theory, student-centeredness, collaboration, and critical thinking.

Picture 2. Inquiry-Based Learning Model

Constructivist learning: This theory encourages learners to build knowledge through exploration and discovery. IBL assumes that this is correct. Student-centred: IBL puts the learner in control, giving them autonomy and allowing them to take charge of their learning journey (within limits). Collaborative: IBL promotes teamwork and interaction when solving problems. Critical thinking: IBL encourages higher-order thinking skills essential for success in the 21st century (Weller, 2023).

Ai et.al. (2008) highlight the following four elements central to inquiry-based learning:

Based on the explanation above, it can be said that the inquiry model has similarities with the project model, except that in the project model the result is in the form of an output called a work product.

In this research, researchers have carried out eight learning cycles or eight learning session activities. In the LI24 Character Building Pancasila class the class is divided into small groups containing 5-6 members in each group. However, this class was not given any treatment at all; that is, after small groups are formed in the class, the learning process is allowed to run naturally. This is different from the LB24 Character Building Pancasila class which is a treatment class. In this class, in each cycle of learning activities, treatment is carried out based on the evaluation carried out in the FGD, every time the learning process in one cycle ends.

First Cycle

Students were divided into several groups randomly throughout learning cycle 1, each group numbering 5-6 students so that there were 9 groups with (n) 52 students. In the first cycle of the learning process, the lecturer highlighted that students were actively involved both academically and emotionally in pursuing knowledge and information about the subjects discussed. Meanwhile, the instructor functions as a motivator and facilitator, guiding and inspiring the class. Learning activities are student-centered during the learning process. The instructor asks several questions to groups of students, and students are expected to work together in their groups and participate actively in the conversation. The YouTube video (VBL) with the theme Introduction to Pancasila Character Building contained in the BINUS Learning Management System (LMS) is an action given in cycle 1. Then group members are asked to discuss (researchers and instructors are tasked with watching the activity). Before the meeting ended, three groups were randomly selected to give short oral presentations (15 minutes each) regarding the results of the group discussions. After that, using a random interview method, researchers carried out direct observations, specifically noting the presence or absence of engagement and the extent to which students made progress in learning. Learning progress is recorded based on the progress of project assignments for each student group.

Second to Eight Cycle

In the second cycle to the eighth cycle the learning process by providing treatment is still given in the same way as in the first cycle. Lecturers as researchers collaborate with teaching assistants who act as instructors to provide several key questions according to the topic being discussed. Then students in groups discuss the given topic critically. As stated by Johnson & Johnson (1985), group conversations and interactions will teach students how to solve potential social problems and help them recognize each other's differences. This opinion from Johnson & Johnson confirms the conclusions of similar research conducted by Davis (1993), Pane et al. (2017), and Siregar et al. (2018, 2019), which states that the group collaboration method is much more effective in enabling students to remember. Students can remember more learning material by using the collaboration method compared to the traditional lecture method. Various studies also show that students who collaborate in groups experience higher levels of satisfaction than students in other classes who use non-cooperative teaching strategies. Through group discussions and analysis of contextual and actual problems, cooperative learning allows everyone in the group to help each other in solving problems. Gokhale (1995) said that to accept each other's criticism and ideas and work together towards a common goal in completing a task, all group members must understand the content discussed and communicate and respect each other. Developing students' emotional competence is another benefit of cooperative learning, in addition to increasing students' interest and motivation, which helps them achieve academic goals. Cycles 2-8 which use internet-based technology application treatments such as Kahoot (online game, session 2), Mentimeter (online application, session 3), Quizizz (online game, session 4), Roleplay (session 5), Forum discussion (session 6), Podcast onsite (session 7), Debate (session 8) showed quite significant progress in increasing results.

Overall, engagement in the treatment groups in the LB24 class showed more positive results compared to

engagement in the LI24 control class. The following tables explain this:

Table 1. Achievement Target of Engagement during Learning Process in Cycle 1-8 of Action Learning

DOMAIN (CLASSROOM)	GROUPS OF LB24								
	1 (5 members)	2 (6 members)	3 (5 members)	4 (6 members)	5 (6 members)	6 (6 members)	7 (6 members)	8 (6 members)	9 (6 members)
	Score 60-75 (Highly Engaged); 45-60 (Moderately Engaged); 30-45 (Barely Engaged); 15-30 (Disengaged)								
Affective/emotional (low-interest enjoyment, boredom)	63	66	53	66	67	69	63	71	68
Behavioral (skipping class)	68	64	49	67	64	64	66	70	70
Cognitive (lack of attention to task)	64	65	59	67	70	66	65	71	71
TOTAL	65	65	54	66	67	66	65	71	69

Table 1 is the results of a questionnaire with a Likert scale which shows that engagement in the LB24 treatment class is on average in the Engaged to Highly Engaged category. There is 1 group (Group 3) which is in the engaged category and 8 groups of students (Group 1,2,4,5,6,7,8,9) which are in the highly engaged category.

Table 2. Achievement Target of Engagement during Learning Process in Cycle 1-8 of Action Learning

DOMAIN (CLASSROOM)	GROUPS OF LI24								
	1 (6 members)	2 (6 members)	3 (5 members)	4 (6 members)	5 (6 members)	6 (6 members)	7 (6 members)	8 (6 members)	9 (5 members)
	Score 60-75 (Highly Engaged); 45-60 (Moderately Engaged); 30-45 (Barely Engaged); 15-30 (Disengaged)								
Affective/emotional (low-interest enjoyment, boredom)	43	48	53	49	60	32	58	53	59
Behavioral (skipping class)	44	47	49	46	54	34	55	51	58
Cognitive (lack of attention to task)	46	58	59	45	56	44	59	55	61
TOTAL	44	51	54	47	57	37	57	53	59

Table 2 is the results of a questionnaire with a Likert scale which shows that engagement in the LI24 non-treatment class is on average in the Barely to Moderate Engaged category. 2 groups (Group 1 & 6) fall into the barely engaged category and 7 groups of students (Group 2,3,4,5,7,8,9) fall into the moderately engaged category.

Thus, it can be said that treatment in the LB24 class showed much more positive engagement results than non-treatment in the LI24 class. The strong influence of engagement in the LB24 treatment class also shows other results, namely the final exam scores (final PBL assignments in the form of posters and explanations) from the average student are higher than in the LI24 class. This shows that students in the treatment class are more creative than students from the non-treatment class. Pay attention to table 3 below:

Table 3 Comparison of Scores from One of the Final Student Assignments in PBL

POSTER	Competency Standard Score	LI24 (n=52)	LB24 (n=52)
		Average Score	Average Score
Appearance (accurate and informative)	75	78	87
Suitability to the theme	75	80	86
sDesign creativity	75	81	88
Total	75	80	87

Table 3 shows that the groups in the LB24 treatment class got higher scores than the LI24 non-treatment class in

making posters as the product they produced. This can be expected to be directly related to the influence of engagement in the treatment class which is superior to engagement in the non-treatment class.

Conclusion

Does engagement occur in the work team? The answer is yes it does. Especially in the LB24 Character Building Pancasila treatment class. Engagement occurs because the treatment is carried out over eight session cycles. The treatment developed refers to PBL theory which has four pillars: Constructivist theory, student centeredness, collaboration, and critical thinking.

Does engagement influence the spirit of team collaboration effectively so that the PBL goal is achieved, namely cooperation as one of the competency targets (quality or skill) for graduates from the 9 BINUS Graduate Attributes (BGA) that BINUS requires of all students and alumni? The answer is also yes it does. Engagement has increased the spirit of team collaboration effectively. This is proven by the average final score in the treatment class, especially in terms of creativity in making posters, where the group of students from class LB24, which is the treatment class, showed higher final results than class LI24.

Based on the conclusion above, it can be said that the aim of this research is to describe the teamwork of BINUS students who apply the PBL model in learning activities to get success. PBL is effective in creating engagement through teamwork learning.

Recommendation

Several recommendations are offered considering the research findings: 1) Lecturer can select and implement the most appropriate learning model; and 2) a contextual model, like the group discussion in teamwork supported by the interactive activities and tools, can be selected to boost student motivation and academic accomplishment. In connection with this, previous studies might be consulted to guide future investigations. Then, to enhance learning so that the learning process occurs more effectively and maximally and may accomplish the anticipated learning objectives, BINUS University and the others should urge their lecturer to perform classroom action research.

Abstract: This research aims to have an overview of the effectiveness of the "Sabilulungan" culture-based group discussion model assisted by Video-based learning (VBL) to increase the motivation and learning achievement of Tri Mulya Middle School students after the COVID-19 pandemic. The research subjects were Civics students (n=36), 8th grade (even semester 2022). The research method was Class Action Research (CAR) with 3 to 4 stages: Planning, doing, observing (and reflecting). The activities were carried out in three cycles. The data demonstrates a rise in student learning outcomes, particularly in the areas of affection and cognition, as well as motivation. Students learning completeness as a percentage of 76.01 based on cycle 1's cognitive test and a percentage of completeness of 77.10 based on the affective test, with a class average of 76.55. The percentage rose to 79.18 on the cognitive exam and 81.13 on the affective test in cycle 2, with a class average score of 80.15. The average score in cycle 3 was 84.18, while cognitive and affective aspects scored 83.07 and 85.29, respectively. These findings show how well the group discussion model based on the "Sabilulungan" traditional culture at Tri Mulya Middle School works with VBL support.

Introduction

One, possibly the most crucial aspect of raising the caliber of human resources is education. A person gains knowledge, modifies their attitudes, and develops new abilities through education. Both formal and informal education are deliberate, planned endeavors that strive to fulfill people's need for advancement. Learning is the

core activity of education. Students must engage in the process of learning to gain new information, modify their attitudes, and develop their skills. One of the objectives of the Indonesian state, according to the preamble of the fourth paragraph of the 1945 Constitution, is to educate the people of the country. Every learning activity that is planned by the school and carried out by the instructor starts with and progresses toward the curriculum's learning objectives.

The Indonesian government is constantly working to raise the standard of education, and one of its initiatives is to modify, enhance, and polish the high school curriculum. The previous curriculum was refined to create the "Merdeka Belajar" (Freedom to Learn) curriculum, which was introduced by the Indonesian Minister of Education and Culture Nadiem Makarim in January 2020. Additionally, this curriculum emphasizes character development in addition to information and skill acquisition, and it gives students additional possibilities for flexible learning. The Directorate General of Primary and Secondary Education, one of the main divisions of the Indonesian Ministry of Education and Culture, has mandated those students study civics as one of the required subjects. Tri Mulya is gradually beginning to implement the Freedom to Learn curriculum.

A curriculum designed with consideration for each location, the educational unit, and the unique qualities of the students is known as an independent-to-learn curriculum. Along with having more creative control over the selection and creation of instructional materials, this curriculum permits teachers to create their own indicators. Within the framework of the Freedom to Learn curriculum, students are expected to take an active part in their education (also known as student-centered learning), with the teacher primarily serving as a facilitator, motivator, and evaluator of the student's learning. The paradigm for education has shifted from being teacher-centered to being student-centered, requiring students to be engaged, imaginative, and acclimated to critical thinking. It is anticipated that this will enhance the quality of education in terms of processes, products, and results. As a result, learning must be contextual, and educators must give students more chances to experiment, do, and learn on their own (learning by doing and learning by experience). Contextual learning is another name for constructive learning, which is a concept of learning that stresses not only the development of knowledge, attitudes, and skills but also the meaningful (to construct meaning) connection between the teacher and the students' real-world experiences. This encourages students to draw connections between their education and how it applies to their families, communities, and workplaces (reflective learning). To learn, students must actively do, try, and experience the content. As part of the Freedom to Learn curriculum, students must also be able to collaborate in groups (cooperative learning). According to Panitz (1987) and Bruffee (1995), students are thought to be able to absorb and retain learning content more easily when they cooperate in groups.

Based on their research, Davis (1993), Pane et al. (2017), and Siregar et al. (2018, 2019) concluded that students who work in small groups, regardless of the type of material being taught, generally learn more about it and retain it longer than students who receive the material in other formats, such as a teacher lecture. Furthermore, the study's conclusions show that students who collaborate in groups experience higher levels of satisfaction than those in other classes where non-cooperative teaching strategies are used. Through group discussions and problem analysis, cooperative learning involves students applying the Sundanese cultural concept of

"Sabilulungan" (means cooperation), which calls for everyone in the group to assist one another. To accept each other's critiques and ideas and to work toward the common goal of finishing assignments, all group members must comprehend the content covered and communicate with and respect one another. The development of students' emotional competence is another benefit of cooperative learning, in addition to raising student interest and motivation, which helps them meet academic objectives (Gokhale, 1995). Students actively participate in the learning process through cooperative learning, which stimulates their minds and emotions. Cooperative learning has several advantages, including social, psychological, and intellectual ones, as noted by Laal and Ghodsi (2012). According to Sotto (2021), students' academic performance or cognitive dimension was significantly impacted by cooperative learning. Related to psychological variables, students who participate in collaborative learning can improve their self-esteem, reduce their anxiety, and form good attitudes toward their teachers. Furthermore, Johnson & Johnson (1985) contend that group talks and interactions will teach students how to resolve potential social issues and help them recognize their differences from one another.

Within the framework of Indonesian education, "Sabilulungan," a Sundanese local culture in the area surrounding Tri Mulya Junior High School, situated in the center of the Sundanese-Javanese traditional community that upholds the "Sunda Wiwitan" belief, and one of the central tenets of Pancasila, an Indonesian ideology deeply ingrained in the lives of all local communities in Indonesia, ought to be taken into account for their efficacy in the educational process. As stated on June 1, 1945, at the BPUPKI summit by Soekarno, the country's first president. An extract from Soekarno's speech to the gathering is as follows:

"Gotong-royong" is the only authentic Indonesian word I have if I squeeze the five (the five principles of Pancasila, which are derived from the Sanskrit language, an ancient Javanese language; "panca" means five and "sila or syila" means joint stone or principle) into three and the three into one. Our nation, the State of Indonesia, was established as a cooperative nation! How wonderful! Nation of collaboration! Brothers, "Gotong Royong" is a livelier understanding than "kinship"! While kinship is a static understanding, cooperation is a company, a charitable organization, or a job, and it is referred to as one task, one performance, Dear Soekardjo. Together, let's complete these charitable tasks! "Gotong Royong" is the collective effort of laboring, perspiring, and battling. All good deeds for the good of all—sweat all for the joy of all. For the sake of all, hol-lopis kuntul-baris! Now that's collaboration!

The values of the fifth sila of Pancasila ideology are practiced following the spirit of "Gotong Royong" (in Indonesian) or "Sabilulungan" (in Sundanese). All Indonesian People: Social Justice is the fifth chapter. Cotton and rice represent the fifth sila. Prosperity and well-being are the key concepts. Soekarno says that "Gotong Royong" describes one "karyo" (creation), one work, one enterprise, and one charity. From ancient times to the present, the Indonesian people, whether traditional or modern, have valued and experienced this spirit, which is deeply ingrained in the community and is particularly evident when deciding how to resolve customary conflicts and issues that arise in day-to-day life. The "Gotong Royong" or "Sabilulungan" culture embodies the elements of convergent communication, specifically mutual understanding, mutual agreement, and collective action. These customs and spirit serve as the cornerstone for all Indonesian communities' ability to assist one another

and meet their basic needs in a participatory manner. According to Zainal in Matoneng et al. (2020), efforts to foster cooperation that is rooted in a community's local wisdom are meant to address issues of poverty and are elements of social capital and social energy that need to be nurtured to attain empowerment and independence, including via education.

As previously said, the researcher is interested in this study to gain insight into how the cooperative learning model grounded in the spirit and ideals of the "Sabilulungan" might enhance student motivation and achievement.

Research Strategy

Particularly, this study used the three-cycle Class Action Research (CAR) paradigm. Implementing this CAR involves a spiral process with four stages: planning, acting, observing, and reflecting. This approach is based on the model created by Kemmis and McTaggart (1982, 2000). 36 eighth-grade students from "Tri Mulya" Junior High School participated in this study as respondents during the even semester of the academic year 2022. A combination of qualitative and quantitative data regarding the state of the students is being gathered for this study. Qualitative elements are extracted from student observations by teachers, document evaluations, and interviews that explain how students learn in the classroom. The learning assessment results from cycles 1, 2, and 3 are used to determine the quantitative component. These findings come from students' cognitive and emotional exams on learning as well as their ability assessment results. Both learning and assessment instruments are used in this assessment. The Learning Implementation Plan (RPP, or syllabus in Indonesian) serves as the learning tool. The cognitive and affective components of the exam are measured using this tool.

The application of learning (lesson study) in this research is divided into three phases, which are the following: planning-to-do-see cycles.

Firstly, Planning or Preparing: During forum group discussions (FGD), instructors and researchers work together to create cooperative learning designs that will be used in instructional activities. Researchers offer suggestions and original ideas for developing practical contextual learning designs in this exercise.

Secondly, Doing or Acting: Using the lesson plan as a guide, the teacher instructs the class. To document and observe how the learning method is used when carrying out teaching and learning activities, the researcher watches the teaching and learning process in this section.

Thirdly, Seeing or Observing: through FGD, teachers, and researchers jointly consider the student activities that have been going on. To improve the plans for the upcoming meeting, the researcher refers to or considers the reflection points in this part.

There are three cycles in which the planning-do-see cycle is repeated. The researchers gathered qualitative data during the task. After the data collection process was finished, the data were analyzed using descriptive qualitative and quantitative data analysis techniques to obtain an understanding of the benefits of utilizing the group discussion method with VBL support in learning activities, as well as the positive effects it had on students' motivation and academic achievement based on the local cultural values of "Sabilulungan."

Research Outcome

Learning is a pattern of interaction between teachers and students that uses different learning resources to support and develop knowledge, and changes in students' attitudes and skills throughout the entire learning process so they can achieve predetermined learning goals, both in the curriculum and in the lesson units. Learning is an interactive and communicative process that can take place both inside and outside of the classroom. Planning learning activities are required to meet the established learning objectives. Student's learning performance can be effectively supported by well-designed, creative, and contextually based learning activities that align with their actual needs. The effective method of learning within the teaching-learning environment Civics instruction at Tri Mulya Junior High School is supported by an appropriate learning model, which is cooperation learning aided by VBL based on the cultural values and spirit of "Sabilulungan." This model is thought to be effective in encouraging students to learn more and assisting them in successfully mastering the material. Teachers can learn about each student's fundamental skills, background, motivation, curiosity, attitudes, and interests through the learning process. Teachers possess the ability to recognize the traits or characteristics of their students who are the primary sources of information and success markers in the educational process. Teachers must carefully arrange learning activities, carry out regular evaluations, and make use of all available resources to support the learning process to meet these learning objectives. This study is conducted as classroom action research using the Teacher's Note "Negara Kesatuan Republik Indonesia (The Unitary State of The Republic of Indonesia)" and the small group discussion assisted by the VBL model. Session 10: Analysis of the concept of national defense; Session 11: Implementation of national defense; Session 12: Perform national defense work. All the sessions (10, 11, 12) for this research were established as extracurricular activities where all teaching and learning activities are carried out alternatively online and face-to-face by offering group discussion tasks, including case studies. Research has demonstrated that utilizing the group discussion model in learning interviews, affective questionnaires, cognitive tests, and observations can enhance students' motivation and learning accomplishment, encompassing both cognitive and affective components. These results support those of other studies of a similar nature, such as those by Deanova et al. (2023) and Islami et al. (2020), which found that the group discussion model can enhance learning outcomes when compared to traditional learning models, which involve students less actively because they place more emphasis on the teacher's role. In a group discussion, Galanes and Adams (2009) stress the significance of observing communication and group culture: tension, fantasy, socialization, norms, and climate. Meanwhile, Albedaiwi (2022) enumerated the following eight factors that had a positive effect on cooperation success: autonomy; task density and complexity; rewards; group size; team and task regulation; positive

interdependence; constructive interaction; and mutual support and motivation. To make cooperative learning successful, teachers' roles are just as important as students'.

First Cycle

Students were split up into groups at random throughout cycle 1 learning, with 4-5 students in each group for a total of 8 groups with (n) 36 students. In the first cycle of the learning process, the teacher highlights that students are actively engaged both academically and emotionally in their pursuit of knowledge and information on the subjects covered. In the meantime, the instructor serves as both a motivator and a facilitator, guiding and inspiring the class. Learning activities were student-centered (learner-centered) during the learning process. The teacher asks groups of students some questions, and the students are expected to cooperate in their groups and actively participate in the conversations. YouTube videos (VBL) with the following URL <https://www.youtube.com/watch?v=U0Zd3OwskIY> is the treatment provided in cycle 1. Then the group members have a discussion (the researcher and teacher are invited to witness the activity). Before the meeting concluded, two or three randomly selected group members gave a verbal presentation on the discussion's outcomes. Affective and cognitive questionnaires were completed after learning cycle 1. After that, using the interview method, the researcher did a direct observation, specifically noting the emotive elements of students. Cycle 1's observations, assessments, and questionnaire findings showed that the class average score was 76.55, with a score of 77.10 for the affective component and 76.01 for the cognitive segment. Increases in student motivation and achievement in cycle 1 impact the cognitive and emotive components of their performance. Table 1 displays the completion of each cycle 1 aspect.

Table 1. Achievement Target in Learning Process During Action Learning Cycle 1

Session 10: Analysis of the concept of national defense

No	Rated aspects	Cycle target 1	(in %)	The average class	Criteria
		Std of success (SKBM)	Accessibility		
1	Cognitive aspect	75 (Grade B)	76.01	76.55	Success
2	Affective aspect	75 (Grade B)	77,10		Success
	a. Observation		76,01		
	b. Questionnaire		78.19		

Although they fall short of expectations, cycle 1's affective and cognitive outcomes are nonetheless below par. Consequently, cycle 2 activities must be completed to enhance learning and more effectively meet the desired goals.

The Second Cycle

Cycle 2 activities are mostly concentrated on refining and enhancing the limitations identified in Cycle 1. With

4-5 students in each group, the split of groups in this cycle is done but not at random (group members are the same as the group in cycle 1). The teacher gives VBL, the following URL <https://www.youtube.com/watch?v=xYkCCCS2Aec>, in the second cycle. Following their viewing of the VBL, students were given a few questions to answer before having to debate and work through challenges in groups. Cycle 1's class activity follows the same pattern in session 2. An affective questionnaire and a cognitive test are administered following the conclusion of the second learning cycle. After that, students' affective characteristics are directly observed. According to cycle 2's observations, assessments, and questionnaires, the class average for achievement was 80.15, with the cognitive parts of achievement coming in at 79.18 and the emotional exam at 81.13. Lesson 12: Perform national defense work with the same pattern in cycle 3 produced results that were not too dissimilar from those of cycle 2—that is, the achievement of cognitive aspects of 83.07, affective aspects of 85.29, and the class average score of 84.18—so these results have reached the optimal target. Table 2 displays each aspect's accomplishment for cycle 2.

Table 2. Achievement Target in Learning Process During Action Learning Cycle 2

Session 11: The implementation of national defense

No	Rated aspects	Cycle target 2	(in %)	The average class	Criteria
		Std of success (SKBM)	Accessibility		
1	Cognitive aspect	75 (Grade B)	79.18	80.15	Success
2	Affective aspect	75 (Grade B)	81.13		Success
	a. Observation		80.15		
	b. Questionnaire		82.11		

Discussion

The terms "Dalihan Na Tolu" in North Sumatera, "Tok Tabua" in North-Central Timor and East Nusa Tenggara, "Sabilulungan" in Sundanese, "Krigan" in Central Java which means "mobilization" (from Sanskrit) all refer to sitting together, cooperating, or working as a group to solve problems. The culture of cooperation in many Indonesian regions is ingrained in daily life and encourages cooperative behaviors, even in educational settings. The traditional community of Sunda Wiwitan typically practices "Sabilulungan," or "cooperation," in both special occasions and day-to-day activities. However, it is uncommon for classroom activities that typically employ the one-way (lecture) method to incorporate the group discussion model that incorporates the "Sabilulungan" ideals. Because they must support one another and collaborate to create a learning environment that can help increase motivation and learning ability despite all their limitations, teachers in this research are conditioned to instill in their students the habit of always participating in "sit-down activities" and problem-solving together, especially when case studies are used to support VBL.

Based on Maslow's theory of needs, McClelland (1961, 1987) proposes that people have potential energy reserves that can be produced or released based on their unique motivations and the opportunities and

circumstances to which they have access. McClelland states that three types of needs—the need for achievement, abbreviated as nAch; the need for power, abbreviated as nPow; and the need for affiliation, or the need of affiliation, abbreviated as nAff—are the driving forces behind the mobilization of these potential energy reserves. As per McClelland's research, individuals with high nAch tend to be self-reliant in problem-solving, set moderately challenging objectives for themselves, take calculated risks to accomplish these objectives, and appreciate constructive criticism on their performance. For them, employment pleasure comes from doing the work properly, not from financial incentives. Conversely, Wolf and Smith (1995) contend that two factors—first, whether test questions relate to the student's interests, and second, the student's level of effort during the test—have a significant impact on the student's motivation to learn and finish the assigned material.

In this three-cycle learning process, class action research (CAR) has demonstrated that group cooperation and motivation are critical factors in students' attempts to finish teacher-given homework. All students' unique features are respected, acknowledged in group assignment activities, and taken into consideration when meeting their various requirements and types of motivation. Students who appear to require accomplishment are motivated to get the greatest possible score. It is acceptable for students who require authority to lead groups. It is recommended that students who require affiliation get along with other members of their team. When collaboration in learning (group discussion) based on the cultural principles of "Sabilulungan" is applied, the outcomes grow from cycle 1 to cycle 2 and subsequently to cycle 3. Table 3 displays the comparison of the aspect outcomes between cycles that were obtained based on the findings of tests, questionnaires, and observations.

Table 3 (Table of Results Comparison). Comparison of Intercycle Results Material Session 10, 11, 12

Rated aspects	Accessibility cycle 1 (%)	Average	Accessibility cycle 2 (%)	Average	Accessibility cycle 3 (%)	Average	Information
Cognitive	76.01	76.55	79.18	80.15	83.07	84.18	Increase
Affective	77.10		81.13		85.29		Increase

This study was successful since the evaluated affective and cognitive components had attained the set targets, according to a comparison of the data between cycles 1, 2, and 3.

Conclusion

The question that the principal of Tri Mulya Middle School asked the research team before this research took place was whether there were alternative solutions that could help students learn better. When this question was confirmed with the team teachers, it was discovered that the problem at Tri Mulya Middle School was related to student demotivation after the COVID-19 pandemic. Demotivation also causes a decline in student learning achievement.

The research team then conducted a direct survey of learning activities in the classroom. The class that the

research team chose was the 8th grade which was studying Civics material. The teaching method used by teachers at that time was a traditional method with a two-way pattern. It was indeed seen during the survey that some students were sleepy, chattered, and on average paid little attention to asking or responding to the teacher's questions. The classes that the research team surveyed did not appear interactive, indicating low interest and motivation to learn.

Based on the survey results, the research team proposed a trial of an interactive approach with learning methods which is expected to make the classroom atmosphere more interactive. The expected result is increased motivation and learning achievement of students. Therefore, a group discussion approach based on the typical Sundanese culture, namely Sabilulungan, using VBL tools was tried out. The use of VBL considers the limited internet and Wi-Fi facilities at schools located in rural areas. VBL, which is downloaded or recorded before the class session takes place, will help teachers overcome the limitations of internet-based online social media.

The research results show that the application of group discussion supported by VBL based on the cultural values of "Sabilulungan" can raise students' motivation and learning achievement on the subject matter of Session 10, 11, and 12 of Civics at the 8th grade of Tri Mulya Middle School, even semester academic year 2022, according to the research findings. These findings answer one of the main problems faced by Tri Mulya Middle School, namely demotivation and a decline in learning achievement after the COVID-19 pandemic.

Recommendations

Several recommendations are offered considering the research findings: 1) teachers can select and implement the most appropriate learning model; and 2) a contextual model, like the group discussion supported by the VBL model, can be selected to boost student motivation and academic accomplishment. In connection with this, previous studies might be consulted to guide future investigations. Then, to enhance learning so that the learning process occurs more effectively and maximally and may accomplish the anticipated learning objectives, Tri Mulya Junior High School and the others should urge teachers to perform classroom action research.

EFL Students' Acceptance of Using Learning Management System for Online Testing

Toan Bao Nguyen

FPT University, Vietnam,  <https://orcid.org/0009-0007-6709-2949>

Abstract: The use of Learning Management System (LMS) is widespread in academic institutions across worldwide as technology integration in education keeps evolving. This study aims at investigating students' acceptance of using LMS for online testing. Additionally, the study seeks to thoroughly examine the reasons that lead to their acceptance of this educational technology for online testing. Using a mixed-methods approach, the study collects data from 245 university students in the Mekong Delta, Vietnam, using both quantitative questionnaires and semi-structured interviews. The theoretical framework, the Technology Acceptance Model (TAM), directs the examination of the major reasons influencing students' acceptance of LMS for online assessments. Findings from this research indicate that participating students approve of using LMS for online testing due to several reasons. The implications of the study extend to educators, administrators, providing valuable insights for optimizing the integration of LMS into educational practices and fostering a positive online learning environment.

Keywords: acceptance, online testing, Learning Management System

Citation: Nguyen, T. B. (2024). EFL students' acceptance of using learning management system for online testing. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 758-771), Antalya, Turkiye. ISTES.

Introduction

Modern technology, particularly in the realm of education, has become the predominant means of disseminating information through various platforms and processes (Al-Mamary, 2022). According to Alharbi et al. (2021), the widespread reliance on computers in daily life, accompanied by significant technological advancements, has instigated various changes across different domains, including education. Concurrently, the progress in information and communication technology (ICT) has given rise to the implementation of learning management systems (LMS), which seamlessly integrate course content and student databases within the learning process (Alharbi et al., 2021).

The adoption of LMS is similar to ICT-based learning technologies being included into global educational institutions' infrastructure (Al-Mamary, 2020). The researcher mentioned while the integration of technology in classrooms is not a novel concept and has been practiced for many years, the prevalence of computers in higher

education institutions in developed nations is now commonplace (Al-Mamary, 2020). The integration of technology into the interaction between teaching and learning presents a challenge to traditional teaching approaches. Keeping up with technological advancements in education requires utilizing contemporary tools like learning management systems (Al-Mamary, 2020). The term Learning Management System has been identified by various other terms like Virtual Learning Environment or Course Management System (Kasim & Khalid, 2016; Piña, 2013). According to Kasim and Khalid (2016), Rhode et al. (2017) an LMS is characterized as software designed to oversee and monitor teaching and learning activities. It enables teachers and students to exchange learning materials, facilitates testing and assessment, and promotes interactive communication between educators and learners through an online platform.

Although LMS is a universal and familiar concept in education, students' acceptance of LMS for online testing has still been novel. The research regarding the utilization of online tests in higher education is continuously expanding, with a focus on investigating teacher and student perceptions (Al-Busaidi, 2010; Almarashdeh et al., 2011), its benefits and challenges (Cao, 2023), and the factors influencing students' acceptance of Learning Management Systems in Brunei (Hamid et al., 2020). However, limited studies have explored students' acceptance of using LMS for online testing and the reasons influencing their acceptance, particularly in the Vietnamese educational setting. Therefore, it is necessary to conduct a study to bridge the gap. This paper aims to explore students' acceptance of using LMS for online testing and seek the reasons why they accept it. From the reasons above, the two following research questions are highlighted in this study:

1. To what extent do students accept using LMS for online testing?
2. Why do students accept using LMS for online testing?

Learning management system (LMS), its benefits and challenges

According to Al-Mamary (2017), Learning Management Systems (LMS) function as digital instruments assisting educational institutions in constructing, executing, and evaluating learning frameworks. Alharbi et al. (2021) highlight that LMS, typified by platforms such as Blackboard, represent a type of communication and information technology widely utilized in higher education. These systems encompass a range of functionalities enabling both educators and learners to access educational materials, providing diverse services tailored to individual platforms. Moreover, LMS has evolved into a crucial platform for virtual interaction between teachers and students in higher education institutions, utilizing the internet and related software to enhance the dissemination of diverse solutions that foster interactive learning and knowledge sharing (Paulsen, 2002). The functionalities of LMS extend to tracking learners' activities, monitoring progress, managing course assignments, and conducting online quizzes. Additionally, it furnishes essential features for generating online reports on each course and learner. These attributes are particularly conducive to distance instruction, as emphasized by Almarashdeh et al. (2011). Consequently, universities and higher education institutions widely adopt LMS to establish a comprehensive digital framework within the educational system.

Noor-Ul-Amin (2013) asserted that incorporating and utilizing technology in teaching and learning will positively impact teaching, learning, and research. This integration not only grants students increased flexibility, allowing them to access instruction at their convenience and from any location, but it also establishes a dynamic and immersive environment for the educational process. Consequently, it is expected to significantly enhance the educational experience by presenting students with new and diverse learning opportunities. It is said that LMS offers users several benefits. First of all, Liu et al. (2019) believe that multifunctionality is one undeniable merit of using LMS as it provides teachers and students with all the tools they need for their teaching and learning activities just on one single platform. Secondly, Kasim and Khalid (2016) said that most LMSs are designed to be user-friendly so that even people who have basic technical skills can learn to use LMS successfully with some initial guides. In addition, users can also manipulate LMS easily because of its simply-designed interface. Thirdly, Cavus and Alhih (2014) and Choi (2019) mentioned interactivity as one of the advantages that LMS has over other teaching and learning tools because it enables teachers and students interact better through communicative functions. Moreover, according to Holmes and Prieto-Rodriguez (2018) and Santiana et al. (2021), flexibility is also an important benefit that LMS offers both teachers and students. LMS is especially useful for blended learning because teachers and students can have easy access to learning resources everywhere and at any time

Despite several advantages of LMS, there are some notable disadvantages. Sayfour (2016) and Bhalalusesa et al. (2013) highlights one of the most common drawbacks is related to internet connectivity. The reliance on a slow or unstable internet connection can disrupt the use of LMS and significantly impact the teaching and learning process. Besides, studies by Al-Handhali et al. (2020) and Darvin et al. (2021) shed light on another challenge associated with LMS usage, namely the simply-designed interface of most LMS platforms. This simplistic design often leads to a monotonous and unattractive user experience, which can result in boredom among users. Consequently, maintaining user engagement becomes more challenging when utilizing LMS. According to Bhalalusesa et al. (2013), teachers and students often feel that they lack adequate guidance and instructions on how to effectively navigate and utilize LMS. This absence of comprehensive guidance creates difficulties for users during their LMS application, hindering their ability to leverage the full potential of the system. Moreover, it is worth noting that using technological advancements, particularly LMS, requires users to possess a certain level of knowledge and skills (Al-Handhali et al., 2020).

Online testing and its benefits

E-learning incorporates online testing as a segment aimed at evaluating learners' knowledge through electronic means (Abazi-Bexheti, et al. 2013). Recently, the methods for assessing knowledge have evolved to meet the demand for evaluating a large number of learners simultaneously. Consequently, online tests, which are easily and promptly accessible, have gained significant importance in determining learners' outcomes, particularly in online studies (Abazi-Bexheti et al., 2013).

Online testing refers to a type of assessment conducted via technology, known as e-assessment or ICT-based

assessment, which serves various educational purposes such as diagnostic, formative, and summative evaluation (Boitshwarelo et al., 2017). Unlike broader e-assessment methods, online tests specifically involve automated deployment and grading through computer-assisted assessment tools (Davies, 2010; Gipps, 2005). Often referred to as online quizzes, these assessments are commonly utilized within learning management systems (LMS) for delivering online and blended learning courses (Boitshwarelo et al., 2017).

The adoption of e-assessment, especially online tests, has surged in higher education over the past two decades due to several advantages. Firstly, it is a response to reduced resources for teaching and an increase in student numbers, requiring educators to do more with less while adapting to the growing use of technology in teaching (Donnelly, 2014; Nicol, 2007). Secondly, the distribution of tests is more convenient for online tests, as they can be delivered to students within a specified time interval without the need for physical presence in the classroom. This flexibility allows students to take the test from various locations, such as while traveling, in the library, or at an internet café (Bexheti et al., 2013). Additionally, the prevention of plagiarism by disabling copy/paste functions is feasible, although it remains an active issue in ongoing developments (Abazi-Bexheti et al., 2013). Furthermore, online tests are considered more objective since they enable the establishment of grades and the determination of correct and incorrect answers during the test construction phase, before testing begins. This independence from the corrector/grader contributes to the impartiality of grading (Abazi-Bexheti et al., 2013). Gipps (2005) highlights the effectiveness and educational advantages of employing online tests, emphasizing their automated grading and feedback mechanisms, which render them highly efficient, rapid, and dependable, particularly in situations with a large student population.

Method

Research design

The methodology used in this study is a descriptive design with a mixed-method approach, utilizing both quantitative and qualitative data collection methods to achieve a holistic comprehension of the research phenomenon (Fraenkel et al, 2012). The study employed a couple of instruments to collect data, which were a questionnaire and semi-structured interviews. The questionnaire, designed to capture quantitative data, comprises closed-ended questions to gather numerical responses from participants. On the other hand, semi-structured interviews provide a qualitative dimension, allowing for in-depth exploration and interpretation of participants' experiences, perspectives, and insights. This combination of methods strengthens the study's reliability by cross-referencing results from both data sets, providing a comprehensive viewpoint on the topic being examined (Mertens, 2010; Creswell, 2023).

Participants

A population of 120 students enrolled at a private institution in Vietnam was the subject of the study. To effectively identify participants for the study's initial phase, convenience sampling was used (Fraenkel et al.,

2012). This method was selected due to its usefulness and ability to save time (Creswell, 2023). A subset of 10 individuals was then randomly selected from the original population for the study's second phase. Following that, these participants were given the chance to express their opinions in semi-structured interviews regarding the acceptability of LMS for online testing. It is noteworthy that the chosen participants had at least one semester's worth of experience with the LMS, or roughly ten weeks of English language training. This length of time for a more thorough examination of their familiarity and acceptance of the LMS as a platform for conducting online tests in the context of their English classes.

Instruments

The research adopted a dual-method strategy, employing both quantitative and qualitative tools for gathering data (Fraenkel, et al., 2012). A survey questionnaire was used to collect information on students' acceptance of the use of learning management systems for online exams in order to address the quantitative component. Five variables were included in the questionnaire, which was constructed based on TAM (Davis, 1989). The 17-item survey used a 5-point Likert-type scale, with one meaning "strongly disagree" and five meaning "strongly agree," to provide a more thorough evaluation of participants' answers.

In the qualitative phase, semi-structured interviews were conducted to delve deeper into students' perspectives on the acceptance of LMS for online testing. The four open-ended questions in the interviews were designed to align with the four themes derived from the quantitative questionnaire. This approach allowed the researchers to guide participants in providing more detailed and insightful responses, enriching the qualitative data gathered. Combining statistical data with qualitative insights for a more thorough analysis, the two instruments provide a thorough grasp of the elements impacting students' adoption of LMS for online assessment.

To assess the degree of adoption of LMS for online testing, the mean scores for each construct derived from the survey questionnaire were calculated. The interpretation of these mean scores was based on adapted interpretation ranges from Oxford (1990). The mean scores were categorized into four ranges to gauge the extent of adoption. A Low level of adoption was indicated when the mean score fell within the range of 1 to 2.4. The Medium level of adoption encompassed mean scores ranging from 2.5 to 3.5. A High level of adoption was determined when the mean score fell within the range of 3.6 to 4.4. Finally, a Very High level of adoption was ascribed to mean scores ranging from 4.5 to 5. This categorization provided a clear framework for interpreting the degree of acceptance based on participants' responses, allowing for a nuanced understanding of the acceptance of LMS for online testing among the university students in the study.

Results

Results from the questionnaire

Reliability tests for each construct to assess the goodness and consistency of the measures are conducted. The

student's questionnaire shows a high-reliability index (.91), which is reliable enough for the study. The following results show high reliability of each factor including *Perceived Ease of Use* (0.91), *Perceived Usefulness* (0.94) and *Attitude toward the use of LMS for online testing* (0.93) *Behavioral Intention to Use* (0.95).

Table 1 presents data which indicates students' acceptance of utilizing the LMS for online testing, gathered from 245 participants. A Descriptive Statistics Test was conducted to ascertain the overall outcome of the assessment.

Table 1. Mean score of students' acceptance

	N	Min	Max	Mean	Std. Deviation
Mean score of students' acceptance	245	1.12	5.00	3.95	.79

Table 1 illustrates that the mean score of students' acceptance of using the LMS for online testing (M= 3.95, SD= .79) was at a high level.

A Descriptive Statistics Test was employed to analyze the mean score across five clusters. The outcomes of this examination are presented in Table 2.

Table 2. The average mean score of five clusters

	N	Min	Max	Mean	Std. Deviation
Mean PU	245	1.40	5.00	3.98	.82
Mean PEU	245	1.00	5.00	4.01	.83
Mean AT	245	1.00	5.00	3.91	.86
Mean BE	245	1.00	5.00	3.85	.92

Participants' agreement levels across various indicators range from 3.85 to 4.01, suggesting a substantial level of consensus. Particularly, indicators such as perceived usefulness (M= 3.98, SD= 0.82), perceived ease of use (M= 4.01, SD = 0.83), attitude toward use (M= 3.91, SD= 0.86), and behavioral intention (M= 3.85, SD= 0.92) received notably high levels of agreement. Notably, perceived ease of use (M= 4.01, SD= 0.83) garnered the highest mean score among these indicators. The overall high mean scores across these indicators suggest that students have a positive acceptance of using LMS for online testing.

Perceived usefulness

From the findings displayed in Table 2, the mean score of perceived usefulness (M= 3.98, SD= 0.82) was notably elevated. This section presents the five questions concerning perceived usefulness, with Table 3 detailing the students' responses to these questions.

Table 3. The mean score of perceived usefulness

	N	Min	Max	Mean	Std. Deviation
Using LMS for online testing would enable me to accomplish tests more quickly.	245	1.00	5.00	4.10	.92
Using LMS for online testing would help me to do tests better.	245	1.00	5.00	3.99	.96
Using LMS for online testing would increase my scores.	245	1.00	5.00	3.73	1.01
Using LMS for online testing would make it easier to do tests	245	1.00	5.00	4.00	.98
I would find LMS useful for online testing.	245	1.00	5.00	4.07	.90

As indicated in Table 3, students expressed a strong consensus regarding the perception that employing a Learning Management System (LMS) for online testing would enhance their ability to complete tests more efficiently, attaining the highest level ($M=4.10$, $SD=.92$). Additionally, respondents held a positive view on the utility of LMS for online testing, with a notable level of agreement ($M= 4.07$, $SD= .90$). Another prevalent belief among students was that utilizing LMS for online testing would simplify the test-taking process, reflecting a high level ($M=4.00$, $SD= .98$). Subsequently, students embraced the idea that incorporating LMS into online testing would contribute to improved test performance ($M=3.99$, $SD= .96$). Lastly, even though there was the least amount of agreement among the five things, respondents nevertheless recognized that using LMS for online testing may improve their scores and bring them up to an acceptable level ($M=3.73$, $SD = 1.01$).

Perceived ease of use

As displayed in Table 2, the mean score for perceived ease of use ($M= 4.01$, $SD= 0.83$) indicated a high level. This section outlines the five questions related to perceived ease of use, with Table 4 showcasing the responses from the students.

Table 4. The mean score of perceived ease of use

	N	Min	Max	Mean	Std. Deviation
Learning to operate LMS for online testing would be easy for me.	245	1.00	5.00	4.04	.93
My interaction with LMS would be clear and understandable.	245	1.00	5.00	4.03	.94
I would find the process on LMS clear and understandable.	245	1.00	5.00	4.02	.92
I am skillful at using LMS for online testing.	245	1.00	5.00	3.96	.94
I find LMS easy to use for online testing	245	1.00	5.00	4.02	.90

According to Table 4, students expressed confidence in their ability to learn how to use the LMS for online testing ($M= 4.04$, $SD = 0.93$). Additionally, they believed that their interactions with the LMS would be

straightforward and comprehensible ($M = 4.03$, $SD = 0.94$). Following this, they anticipated finding the processes on the LMS to be clear and manageable ($M = 4.02$, $SD = 0.92$), and perceived the LMS as easy to use for online testing ($M = 4.02$, $SD = 0.90$). Lastly, students indicated their proficiency in using the LMS for online testing, which received the lowest mean score ($M = 3.96$, $SD = 0.94$).

Attitude toward use

Table 2 demonstrates that the mean score of students' attitude toward use ($M = 3.91$, $SD = 0.86$) was at a high level. This section outlines the four questions regarding attitude toward use, with Table 5 displaying the responses from the students.

Table 5. The mean score of attitude toward use

	N	Min	Max	Mean	Std. Deviation
Using LMS for online testing is a good idea.	245	1.00	5.00	3.98	.91
LMS makes online testing more interesting.	245	1.00	5.00	3.89	.99
Using LMS for online testing is a pleasant experience.	245	1.00	5.00	3.91	.92
I like using LMS for online testing.	245	1.00	5.00	3.89	.99

As shown in Table 5, the majority of students expressed a positive sentiment towards the idea of utilizing Learning Management Systems (LMS) for online testing, with this belief garnering the highest level of agreement ($M = 3.98$, $SD = .91$). Additionally, students held the view that the experience of using LMS for online testing is pleasant ($M = 3.91$, $SD = .92$). Subsequently, respondents also conveyed positive opinions regarding the impact of LMS on online testing, stating that it made the process more interesting and expressing an overall liking for using LMS in the context of online testing, both of which received a mean score of 3.89.

Behavioral intention

As presented in Table 2, the mean score for students' attitude toward use ($M = 3.91$, $SD = 0.86$) indicated a high level. This section outlines the three questions concerning attitude toward use, with Table 6 showcasing the responses from the students.

Table 6. The mean score of behavioral intention

	N	Min	Max	Mean	Std. Deviation.
I intend to use LMS for online testing in the next 3 months	245	1.00	5.00	3.84	.94
I plan to use LMS for online testing in the next 3 months	245	1.00	5.00	3.86	.98
I expect to use LMS for online testing in the future	245	1.00	5.00	3.85	.98

According to the data presented in Table 5, students expressed their intention to utilize Learning Management Systems (LMS) for online testing within the upcoming three months ($M= 3.86$, $SD= .98$), marking the highest mean score. Subsequently, a significant number of students demonstrated their anticipation of employing LMS for online testing in the future ($M=3.85$, $SD= .98$). Additionally, there was a high level of agreement among students who planned to use LMS for online testing within the next three months ($M=3.84$, $SD= .94$).

Results from interviews

To gather understanding regarding students' willingness to utilize LMS for online testing, ten students were interviewed based on the four clusters outlined in the questionnaire.

The findings from interviews showed that the majority of the participants found LMS was useful online testing since it helps them to do the test faster. They shared a similar idea that:

"Taking online tests on the LMS is so fast and convenient since after I log in with my account I can take the tests immediately, so I can save a lot of time" (Participant 2)

"Since it has the time set on the system, that's why I can manage time effectively while taking the test." (Participant 6)

"Also, I can click on the answers quickly compared to circling when taking the test with paper and a pencil." (Participant 3)

Overall, based on the analysis of the interviews, a consensus among the majority of participants emerged, supporting the notion that Learning Management Systems (LMS) were beneficial for online testing, primarily due to the efficiency it offered in completing tests promptly. Participants expressed a shared perspective, emphasizing the speed and convenience associated with taking online tests through the LMS.

Furthermore, in response to inquiries regarding the ease of utilizing the LMS, a majority of students concurred that the system is user-friendly. They also expressed the view that learning to navigate the LMS was straightforward and that their interactions with it were clear and comprehensible. They said:

"I think that LMS is easy to use since I do not log in with many steps. Also, the instruction on LMS is quite clear to me. I can read and understand it" (Participant 4))

"It's not necessary for me to learn how to operate the LMS because it has the instruction on it which is clear and understandable. Hence, I am confident about operating the LMS for online testing" (Participant 1)

However, one of the six participating students share a notable point that should be considered:

"I find the instruction on the LMS sometimes hard to understand since it is written in English so I can't understand all of the notification on it" (Participant 2)

In short, the majority of students expressed agreement that the LMS is user-friendly. They also conveyed a belief that learning to operate the LMS was easy, and their interactions with the system were clear and comprehensible. However, it also highlights a language barrier which concerns for a particular student and underscores the importance of providing clear instructions in a language accessible to all users.

Moreover, when they were asked about their attitude towards using this platform for online testing, most of students held a positive attitude toward using this platform for online testing since it is a good idea and it is a pleasant experience.

“I think testing on the LMS is a good idea because it is easy for me to edit my writing or change the answers if I wish, I needn’t erase the mistakes” (Participant 4)

“To me, it is a good experience since I can manage the time easily, and also students don’t cheat in the quiz/tests when using this platform for testing. It is equal, I think” (Participant 6)

Overall, these sentiments highlight the perceived advantages of the Learning Management System (LMS) for online testing, including ease of editing, efficient time management, and a level playing field for all students, fostering a positive attitude among participants.

Finally, when the participants were asked to share their behavioral Intention to use LMS for online testing, 90% students planned to use it soon. However, 10% of participants pointed out some drawbacks of LMS.

“I plan to use LMS for online testing next month since we are going to have a Progress Test on the LMS” (Participant 1)

“I find one of the drawbacks of testing on the LMS is poor internet connection or technical problems. Sometimes, when many students log in at the same time, the system is very slow, I can’t go on with the next parts of the test” (Participant 2)

From students’ sharing, it suggests that while participants recognize certain challenges with the LMS, most of them still intend to use it, possibly because of the perceived benefits outweighing the drawbacks or the necessity of using the platform for specific assessments.

Discussion

This study aims at investigating students' acceptance of using Learning Management Systems for online testing. The results indicate a high level of acceptance among students for utilizing this platform in general. Consequently, the analysis suggests a positive inclination of students toward using LMS for online testing. This affirmation aligns with prior research conducted by Alharbi et al. (2021) and Al-Mamary (2022), who similarly found that students embraced the use of LMS. The detailed exploration of specific findings from both the

questionnaire and interviews follows.

To begin with, both the questionnaire and interview responses demonstrate that students perceive LMS as beneficial for online testing, attributing its usefulness to the ability to complete tests more efficiently. This finding is substantiated by Al-Busaidi et al.'s (2010) study, which highlighted that LMS provides students with flexibility in terms of location, timing, and pace, leading to significant time savings. Furthermore, participants collectively emphasized the convenience associated with taking online tests through LMS. This viewpoint is consistent with research by Holmes and Prieto-Rodriguez (2018), Santiana et al. (2021), and Abazi-Bexheti et al. (2013), who noted that the distribution of tests is more convenient in an online format, allowing for delivery within a specified time frame without the necessity of physical presence in a classroom.

Furthermore, the outcomes also suggest that students embraced the user-friendliness of the online platform, emphasizing its ease of use. They attested to the clarity and comprehensibility of the instructions provided by the Learning Management System (LMS). A majority of students agreed that the LMS interface is user-friendly, and they perceived the learning process of operating the system as straightforward. This aligns with findings from Kasim and Khalid (2016), who asserted that most LMSs are intentionally designed to be user-friendly, allowing individuals with basic technical skills to navigate them successfully with initial guidance. Additionally, the simplicity of the interface enables users to manipulate the LMS easily.

Moreover, participating students highlighted various perceived benefits of utilizing the Learning Management System (LMS) for online testing, such as easy editing, efficient time management, and creating a fair playing field for all students. These positive aspects contributed to a favorable attitude among participants. This is supported by Almarashdeh et al. (2011) who emphasized the LMS's capacity to facilitate learning tasks, enhance learning effectiveness, and increase productivity. The finding is also consistent with a study by Abazi-Bexheti et al. (2013), who said the prevention of plagiarism through disabling copy/paste functions was acknowledged. Consequently, students expressed their intention to continue using LMS for online testing in the next three months. This intention aligns with the findings of Davies (1989), who noted that both perceived usefulness and perceived ease of use positively influence the behavioral intention to use.

However, the interviews conducted in this study unveiled some drawbacks of using LMS for online testing. Language barriers emerged as a concern for certain participants, emphasizing the importance of providing clear instructions accessible to all users. This finding concurs with Al-Handhali et al. (2020), who pointed out that utilizing technological advancements, especially LMS, requires users to possess specific knowledge and skills. This contrasts with the findings of Kasim and Khalid (2016), who claimed that instructions on LMS were clear and understandable. Another identified disadvantage is the issue of poor internet connection during online tests. This drawback resonates with studies by Sayfour (2016) and Bhalalusesa et al. (2013), both highlighting that a common challenge is related to internet connectivity. The reliance on a slow or unstable internet connection can disrupt the use of LMS and significantly impact the teaching and learning process.

Conclusion

In conclusion, this study set out to investigate students' acceptance of utilizing Learning Management Systems for online testing, with a focus on exploring the reasons influencing their acceptance of this educational technology. The findings of this research reveal a high level of approval among participating students for using LMS in online testing, primarily attributed to its perceived usefulness and ease of use. These positive attitudes underscore the potential efficacy of integrating LMS into educational practices. Notably, participants emphasized the convenience and efficiency of the LMS for test-taking, as well as the platform's role in fostering equal and fair assessment conditions. The implications of this study are significant for educators and administrators, providing valuable insights into optimizing the integration of LMS into educational practices. By understanding the factors that contribute to students' acceptance, educational stakeholders can enhance the implementation of LMS, ultimately fostering a positive and effective online learning environment. As technology continues to play a pivotal role in education, these findings contribute to the ongoing efforts to leverage digital tools for improved learning outcomes and student satisfaction.

Limitations and Recommendations

While this research offers valuable insights into the acceptance of Learning Management Systems for online testing among students and delves into the factors shaping this acceptance, it's important to recognize certain constraints that could affect the applicability and thoroughness of the conclusions. Firstly, the study centered on a specific demographic – 245 university students in the Mekong Delta region, Vietnam. The constrained sample size and geographical focus might limit the extent to which the findings can be applied to a broader student populace or different educational environments. Secondly, cultural considerations play a significant role. The research was conducted within the cultural framework of Vietnam, and cultural elements can greatly influence technology adoption. Hence, the results may not directly translate to students in disparate cultural milieus, constraining the study's external validity. Recognizing these constraints holds significant importance in accurately interpreting the findings of the study and directing forthcoming research endeavors geared towards unraveling the complex interplay of factors influencing students' embrace of LMS for online assessment.

Enhancing EFL Learners' Listening Skills Through the Flipped Classroom Approach

Kien Nguyen Trung

FPT University, Vietnam,  <https://orcid.org/0009-0007-4627-0507>

Abstract: The use of the Flipped Classroom model in teaching English has gained considerable traction, particularly in the context of Industry 4.0, with a growing body of research examining its effectiveness. This study was designed to explore the effectiveness of the Flipped Classroom approach on students' listening skills. A total of 37 participants were recruited through convenience sampling and divided into two groups: an experimental group (N=18) and a control group (N=19). The experimental group was taught using the Flipped Classroom method, while the control group received traditional instruction for the same listening course. Data were collected through pre-tests and post-tests, and analyzed using T-tests to determine any significant differences in listening performance between the two groups. The results indicated that the experimental group demonstrated significantly higher performance on the listening test compared to the control group. These findings have important pedagogical implications for the use of the Flipped Classroom model in language education.

Keywords: Flipped Classroom model, listening skills, EFL learners

Introduction

Rationale

Theoretical Background

The emergence of English as a global language is closely linked to the ongoing process of globalization, which is evident in the increasing frequency of international trade, travel, education, Internet use, and mass entertainment. This globalization has heightened the significance of English communication skills. As noted by Nunan (2003), among the four fundamental language skills—speaking, listening, reading, and writing—listening has historically been regarded as the "Cinderella skill" in second language learning, often overshadowed by a greater emphasis on speaking skills. Language educators and learners frequently prioritize speaking, neglecting the importance of developing listening comprehension skills as a foundational step toward proficiency in speaking (Chastain, 1988). Flowerdew & Miller (2005) highlight that, while speaking and writing have traditionally been the primary indicators of language proficiency, listening (along with reading) plays a

critical role in achieving communicative competence, warranting greater attention in language education.

In the field of Teaching English as a Foreign Language (TEFL), listening skills often receive limited focus, with few sustained efforts to support learners in enhancing their listening capabilities. Although contemporary classrooms have introduced more listening activities, learners often face the challenge of developing these skills with minimal guidance from instructors. This necessitates a broader academic and methodological inquiry to propose innovative approaches for teaching listening skills effectively.

Technological advancements have significantly impacted educational methodologies, leading to a redefined role for both teachers and students. Teachers are no longer the central source of knowledge ("the sage on the stage"), while students are taking on greater responsibility for their own learning. One such pedagogical innovation is the Flipped Classroom model, which aims to improve teaching and learning efficiency by shifting the initial learning process outside the classroom (Chen, Wang, and Chen, 2014). Under this model, students engage with lesson content through videos, readings, or recordings before attending class, allowing classroom time to be utilized for interactive discussions and collaborative activities. This approach has the potential to enhance listening skills, as students can review relevant materials at home and then participate in focused discussions during in-class sessions. This research aims to explore the application of the Flipped Classroom model in the context of teaching listening skills, specifically for TOEIC listening tests.

Contextual Background

In the Vietnamese educational context, particularly in Can Tho City, listening instruction has received comparatively less emphasis. Despite high school textbooks containing all four macro skills, the official English curriculum in Vietnam has prioritized exam-driven instruction, with a focus on grammar, reading, and vocabulary, rather than comprehensive communicative competence (Duong & Chau, 2019; Nguyen & Thai, 2018). This has led to a marginalization of listening skills in many Vietnamese schools.

In my teaching context, where I instruct at a private English center specializing in TOEIC preparation, listening remains a significant challenge, particularly for students with non-English-related academic backgrounds. This may be due to limited classroom time allocated to exploring detailed listening strategies, the complexities of large classes with diverse learning styles, and the requirements of the TOEIC listening test, which demand extensive listening skills, vocabulary, and contextual knowledge. My colleagues share similar concerns about the difficulties in effectively teaching listening skills. Additionally, the COVID-19 pandemic has accelerated the shift to online learning, further emphasizing the importance of leveraging technology in the educational process.

Given these challenges, this research is driven by the need to examine the effectiveness of the Flipped Classroom model in teaching listening skills and how different subskills of listening (listening for main ideas, listening for details, listening to infer information) can be affected using this approach.

For such purposes, it is worth an investigation that is guided by the following questions.

1. How does the Flipped Classroom model impact the listening comprehension skills of EFL learners compared to traditional classroom instruction?
2. How effective is the Flipped Classroom model in teaching specific listening sub-skills to EFL learners, such as listening for main ideas, listening for details, and listening to infer information?

Flipped Classroom model

The Flipped Classroom model has gained substantial attention, yet a standardized definition or model has yet to emerge. Baker (2000) first used the term "classroom flip," coinciding with Lage et al. (2000), who introduced "inverted classroom" in the context of higher education. As per Lage et al. (2000), the inverted classroom approach signifies that "events that have traditionally taken place inside the classroom now take place outside the classroom and vice versa" (p. 32). This model reflects a reorientation of learning activities, both spatially and temporally. However, it has not been immune to misunderstandings. For example, one misconception suggests that the Flipped Classroom replaces teachers with instructional videos, a claim refuted by Nochese (2011). This misconception raises concerns about the potential for online video content to undermine traditional teaching roles. Another common misunderstanding equates flipped learning with online courses, as noted by Fink (2011). Although the Flipped Classroom involves online elements, it does not necessarily reduce the frequency of in-person classroom sessions compared to traditional models.

Further variations on this theme include Fulton's (2014) interpretation, suggesting that "flipping the classroom" means reversing the traditional order of classroom activities, with direct instruction taking place through out-of-class assignments, and in-class time dedicated to active learning. This approach may involve asynchronous video lectures, presentations, or vodcasts for homework, allowing classroom time to focus on interactive, hands-on, or collaborative learning experiences (Bishop & Verleger, 2013; Chen, Wang & Chen, 2014). In light of the varied interpretations and existing literature, this study defines the Flipped Classroom model as an instructional framework incorporating educational video content for out-of-class learning while maintaining regular face-to-face classroom sessions for interactive activities. The terms "flipped classroom" and "inverted classroom" are often used interchangeably; however, in this research, "flipped classroom" is preferred for consistency and due to its prevalent use in related studies.

Method

Research design

The intervention of the study lasted for 8 weeks. During the intervention, both groups received the same instructions from "Skills for the TOEIC test: Listening and Reading" written by Collins. The control group was taught listening skills of the lessons in traditional ways. Meanwhile, for the experimental group, the Flipped Classroom approach (independent variable) was implemented and students' listening performance (dependent

variable) was measured. The implementation of the Flipped Classroom model was monitored during the study.

As the pioneer instrument of the research, the listening test which is a TOEIC listening module is essentially quantitative. The quantitative techniques are applied to provide full analysis of the descriptive data related to the effects of the Flipped Classroom model in teaching listening skills.

Participants

Teachers

The researcher was in charge of instructing lessons to the experimental group while another qualified TOEIC teacher from an English Center taught the same lessons using traditional teaching methods for the control group. To minimize the effect of the difference in experience if there is any, both teachers worked and planed the activities together based on the same text book. Which meant that they took the same step regarding the content, assessment and the learning outcomes of the course.

Students

The participants of the study were 37 EFL learners (most of them are students from different schools and office workers in Can Tho city). All the learners were taking part in the TOEIC 2 course (level 2 of a 3-level TOEIC test preparation program at FRIENDS) which lasted for 2.5 months. The participants were the students of two TOEIC 1 classes (intermediate level with the expected outcome score ranging from 405-600/990) with 19 students for the control group and 18 students for the experimental group. To better make use of the data collected from the participants, a “Student information” form regarding personal information of age, job, gender, proficiency level, etc. was delivered to the students before the experiment. According to the results from the online form, 23 of them were female while 14 of them were male with an age range from 18 to 28. Their English proficiency was considered to be at the elementary level proven by the result of the TOEIC placement test which is from 255-400/990 according to the TOEIC score conversion chart provided by (Damayanti & Gafur, 2020). The majority of the participants are undergraduate students majoring in International Business, Environmental Sciences, Commercial Business, Auditing, Information Technology and Logistics and Supply Chain Management. Other participants are working as doctors, office workers, architectures and freelancers. None of them have English-related majors and have never studied abroad in any English-speaking country.

Table 1. Participants of the Control and Experimental groups

Group	Number of students	Gender	
		Male	Female
Control	19	6	13
Experimental	18	8	10

Materials

The main teaching material employed for the current research for both the control and experimental groups was compiled from the “Skills for the TOEIC test: Listening and Reading” textbook written by Collins in 2012. This book is one of a two book series (1 Listening/Reading; 2 Speaking/Writing) and focuses on providing essential language structures, vocabulary, and strategies to help learners handle the integrated skill aspect of the listening and reading sections in the TOEIC test. Each unit lesson is presented in 4 structured parts: from an overview, analysis of examples, providing test strategies to practical exercises.

The exercise section in each unit is logically designed, with the level of difficulty and test format close to the actual TOEIC test, helping learners to accurately self-assess their ability for each different type of question. The book also carefully analyzes the types of topics, sentence patterns, and traps that will appear in the test, which other TOEIC textbooks often do not specifically present or mention.

However, the table of contents of the book is quite sketchy, does not summarize the content to be discussed in each part, making it difficult for readers to follow the progress of each part or choose the appropriate learning sequence. Apparently, it would be difficult for self-learning and therefore, the participation of teachers is needed to instruct, deliver the main contents, and assign the most feasible learning sequence for the students.

Besides, other materials such as online reading texts, listening exercises from TOEIC actual test textbooks and online quizzes through Google Form, etc. were also employed for the lessons.

Research instrument

The TOEIC listening test

In order to determine the impact of the Flipped Classroom model on EFL learners’ listening skills, the listening module of an actual TOEIC Test of a 5-test ETS TOEIC Test book published in 2017 by YBM was employed as the first data collection tool (for both the pre-test and post-test). The aim of the TOEIC listening test is to provide accurate scores before and after the intervention. Moreover, the test followed what students learn from “Skills for the TOEIC test” written by Collins. This test was chosen as for its reliability and validity was proven by its publisher, YBM, the publishing organization authorized by the American Testing Agency - ETS to organize the TOEIC exam and issue certificates in Korea.

Listening test design

The test is composed of two parts with 69 questions and takes approximately 35 minutes to complete. The test can be classified into 3 sub-skills as follows:

Table 2. Classification of the sub-skills used in the **TOEIC** listening test

Part	Sub-skills	Questions
Part 3	Listening for Main idea	35, 44, 50, 53, 56
	Listening for Details	32, 33, 34, 36, 37, 39, 40, 42, 43, 45, 46, 47, 49, 51, 52, 55, 57, 60, 61, 62, 64, 65, 66, 68, 70
	Listening to infer information	38, 41, 48, 54, 58, 59, 63, 67, 68
Part 4	Listening for Main idea	77, 81
	Listening for Details	72, 73, 74, 75, 76, 78, 79, 82, 84, 86, 87, 89, 91, 92, 94, 95, 97, 98, 99
	Listening to infer information	71, 80, 83, 85, 88, 90, 93, 96, 100

Results

Participants' listening scores within the two groups before and after the study

A Pearson's correlations analysis showed that there was a positive relationship between pre-test scores and post-test scores within the two groups. Specifically, with the Control group, $r(19)=.934$; $p=.00$ (two-tailed), showing that the higher participants scored in the pre-test, the higher they would score in the post-test. Similar result was also observed with the Experimental group $r(18)=.799$; $p=.00$ (two-tailed).

To identify students' changes in listening performance within the Control group and Experimental group, the Descriptive Statistic Test was first performed to identify mean scores of each test for both groups. These scores are illustrated in Table 3.

Table 3. Mean difference of students' listening scores within the two groups

Group	Test	N	Min	Max	Mean	SD
Control	Pre-test	19	22.00	41.00	29.74	5.80
	Post-test	19	28.00	53.00	37.00	6.38
Experimental	Pre-test	18	22.00	42.00	31.39	5.37
	Post-test	18	26.00	61.00	42.00	8.02

The results indicates that there were variations in the mean scores achieved from both groups before and after the intervention: the control group ($M_{pre}=29.74$; $SD=5.80$, $M_{post}=37.00$; $SD=6.38$) and the experimental group ($M_{pre}=31.39$; $SD=5.37$, $M_{post}=42.00$; $SD=8.02$). From observation, it can be initially depicted that the mean scores of the post-test was higher than those of the pre-test. Thus, a Paired-Sample T-Test was run to figure out whether there was any statistically significant difference between these mean scores. The result presented in the table below showed that a remarkable difference between the mean scores of both group was found: the Control group ($t=-13.88$, $p=.00$), the Experimental group ($t=-9.12$, $p=.00$). It can be concluded that after eight weeks of intervention, students' listening skills of both groups were improved. Table 4 shows the

results of the Paired-Samples T-Test comparing Pre-test and Post-test Scores of the Control group and Experimental group.

Table 4. Results of the Paired-Samples T-Test comparing Pre-test and Post-test Scores of the Control group and Experimental group

		Pair differences							
Group	Pair	Mean	Std. Deviation	Std. Error Mean	95% Confidence		t	df	Sig. (2-tailed)
					Interval of the				
					Lower	Upper			
Control	Pre-test – Post-test	-7.26	2.28	.52	-8.36	-6.16	-13.88	18	0.00
Experi- mental	Pre-test – Post-test	-10.61	4.94	1.16	-13.06	-8.16	-9.12	17	0.00

To give additional information to whether the mean scores within experimental group were significant different between 7 males and 11 females, an Independent Samples T-Test on the post-test were carried out. As can be seen from Table 5, there is no gender difference in the post-test results, according to a significant value ($p = 0.49$). This indicates that there is no discernible gender bias in the efficacy of flipped classrooms for the listening learning process when it comes to men and women. The current findings appear to be in line with Khoiriyah's (2021) research, which discovered that there was no discernible difference in the listening abilities of male and female students using the Flipped Classroom paradigm.

Table 5. Results of the Independent Samples T-Test comparing Post-test Scores between males and females within the Experimental group

Variable	M	SD	T	df	p
Listening Post-test					
Male	40.28	7.52	-.713	16	.486
Female	43.09	8.49			
Independent samples T-Test					

Participants' listening scores between the two groups before and after the intervention

The Independent Samples T-Test and the Descriptive Statistic Test were used to compare the listening scores of the two groups of students before and after the intervention. First, Table 6 below shows the outcomes of the Descriptive Statistic Test.

Table 6. Students' listening scores between the two groups

	Group	N	Min	Max	Mean	SD
Pre-test	Control	19	22.00	41.00	29.74	5.80
	Experimental	18	22.00	42.00	31.39	5.37
Post-test	Control	19	28.00	53.00	37.00	6.38
	Experimental	18	26.00	61.00	42.00	8.02

Students' listening performance between the two groups before the intervention

The TOEIC placement test scores of both the control and experimental groups placed all of the students in the same TOEIC 2 program; however, the control group's pre-test mean score ($M=29.74$, $SD=5.80$) was slightly lower than the experimental group's mean score ($M=31.39$, $SD=5.37$). In order to determine whether the participants' proficiency levels at the start of the study were the same, a T-Test was used to analyze their pre-test results. Based on the pre-test scores, an Independent Sample T-Test was conducted. The findings, which are shown in Table 7 below, indicated that there were no significant differences between the groups ($t=-.898$, $df=35$, $p=.38$). This finding suggests that the pre-test scores for the two classes were identical, which means that students' listening performance in the pre-test of two groups was the same.

Table 7. Comparing pre-test results of the two groups

Variable	M	SD	T	df	p
Listening Pre-test					
Control group	29.74	5.8	-.898	35	.376
Experimental group	31.39	5.37			
Independent samples T-Test					

Students' listening performance between the two groups after the intervention

Additionally, Table 8 demonstrated that following the intervention, there were differences in the students' listening abilities between the two groups. The means of the post-test for both groups showed significant improvement after eight weeks of the intervention ($M=37.00$, $SD=6.38$ for the Control group and $M=42.00$, $SD=8.02$ for the Experimental group). To compare the outcomes, the Independent Samples T-Test was used. We may determine that the sig. $=.043 < \alpha$ (5%) based on the table below. Thus, the test's outcome indicates that there was a statistically significant difference between the two groups' listening abilities.

Figure 1 below showed the mean score performance of both groups. The line chart highlighted that two groups' listening scores performed a noticeably small gap (control group $M=29.74$, $SD=5.8$; experimental group $M=31.39$, $SD=5.37$) on the pre-test. This result was quite reasonable since participants from both groups experienced nearly similar language competence. While the post- test showed a surged trend in both groups'

speaking mean score, it could not be denied that post-test result of control group ($M=37.00$, $SD=6.38$) was significantly lower than experimental one's ($M=42.00$, $SD=8.02$).

Table 8. Comparing post-test results of the two groups

Variable	M	SD	T	df	p
Listening Post-test					
Control group	37.00	6.38	-2.103	35	0.043
Experimental group	42.00	8.02			
Independent samples T-Test					

Figure 1. Participants' listening performance before and after the treatment of both groups

Students' listening sub-skills scores of the experimental group after the intervention

To evaluate students' listening sub-skills scores of the experimental group, a Paired Samples T-Test was carried out. The results of the Test are presented in Table 9 below.

Table 9. Comparing students' listening sub-skills scores of the experimental group

Variable	Pre-test M	Post-test M	Mean Diff	Sig. (2-tailed)
Listening for Main idea	3.33	5.44	-2.11	.000
Listening for Detail	21.00	26.78	-5.78	.000
Listening and Making Inference	8.56	9.61	-1.06	.109
Paired Samples T-Test				

The findings displayed in the preceding table indicated a significant difference between the students' mean Listening for Detail sub-skill scores ($M=21.00$) and mean scores ($M=26.78$) following the Flipped Classroom model implementation ($df=17$, $sig=0.00<0.05$). The findings highlighted how exercising listening skills with Flipped Classroom improves EFL learners' ability to answer Detail questions. The results also showed that, with

Mpre=3.33, Mpost=5.44, df=17, and $P=0.00<0.05$, there was a significant difference between the students' mean scores for the Listening for Main concept sub-skill before and after the therapy. Therefore, the outcome demonstrated that using flipped classrooms enabled students to respond to main idea questions in an efficient manner.

However, the results from the Listening and Making Inference category indicated that there was no difference in how students performed in the pre-test and post-test with Mpre=8.56, Mpost=9.61, df=17 and $P=.109>0.05$. It can be concluded that even though there was an increase in listening scores of Inference questions after the Flipped Classroom model was employed, it did not significantly help students answer this type of question effectively.

Discussion

As seen in the quantitative analysis, the findings of this study indicated that both the control and the experimental groups had a significant improvement on their listening skills. This result could be explained by the fact that after the 8 weeks of learning, the students from both groups received the sufficient new knowledge of how to deal with the listening tests strategically from the qualified teachers. Whether the Flipped Classroom model was applied or not would have a positive impact on how students performed in the post-tests. However, when comparing the results of the post-tests by using the Independent Samples T-Test between the two groups, there was a significant difference in the mean scores proving that even though both groups showed signs of improvement, the experimental group outperformed the control group in terms of listening scores and skill improvement with $\text{sig.} = .043 < \alpha (5\%)$. This echoed the results found in the previous research conducted by El Sakka (2016), Ahmad (2016), Roth and Suppasetseree (2016), Namaziandost, Neisi & Momtaz (2019), Khoiriyah (2021), which were mentioned previously in Chapter 2. All these studies used the same data collection tool which was achievement tests to measure the effectiveness of the Flipped Classroom model on listening comprehension skills. These quantitative results confirmed by the Paired Samples T-Tests revealed the fact that there was a statistically significant improvement in participants' listening comprehension. In specific, all of the students participating in these studies were university students whose majors were not English-related, and they were all at intermediate level of proficiency when they participated in those studies. However, contrary to the current study's encouraging results, Phung & Yen (2020) and Smallhorn (2017), in their studies, found that there were no significant differences in learning outcomes or learners' academic performances between the traditional and flipped classes. The reason for this contrary may be because of the difference in nature of the courses. The current research employed the Flipped model in teaching for a TOEIC course whereas the other two mentioned studies used the Flipped model to teach general English courses. To be specific, in a test preparation course, the success of delivering the course lies in the learners' real practice of the actual tests as well as sufficient class time to discuss the problems or explore the tips and strategies to perform well on the tests. This goal could be best achieved using the Flipped Classroom model.

Sharing the similar results with the current study, Khoiriyah (2021) confirmed the facts that adopting the

Flipped Classroom model to teach listening does not significantly differ for men and women, or, to put it another way, is not prejudiced against either gender. In addition, these students' backgrounds revealed that the studies were conducted under similar conditions in terms of research settings and participants. However, there was a fact that the current research listening course under the experiment tended to equipped learners with strategies and techniques to deal with listening tasks, especially for the TOEIC test whereas the other mentioned studies focused on teaching for general listening comprehension skills. Supporting this aspect of the current research, Khoiriyah (2021) also carried out his study focusing on another specific listening proficiency, the TOEFL test. The results were also positive and together with the current research proved that the effects of the Flipped Classroom model were significant regardless the mode of teaching (both general listening courses and test preparation courses).

In the current study, the researcher also tried to explore the effects of the Flipped Classroom model on 3 specific listening sub-skills, namely Listening for Main Idea, Listening for Detail and Listening and Making Inference. The results showed that among the 3 sub-skills, Listening for Main Idea, Listening for Detail appeared to be the most effectively affected by the model whereas Listening and Making Inference seemed to have the least beneficial effect. This result could be explained by the nature of the sub-skill itself. Marisa (2012) explained the fact that the problems with making inferences skills maybe related to a lack of background knowledge and general knowledge. Besides, a strong working memory also plays an important role in facilitating student's inferential ability. Another possible reason for this result could be because the materials provided through videos and handouts were not sufficient and effective enough to better help enhance this sub-skill. Therefore, the researcher himself needed to review the materials again and tried to look for other reliable sources to teach this sub-skill effectively in future courses.

What elements most significantly contributed to these beneficial benefits is the key question. One component—rather, a conglomeration of interrelated elements—cannot be identified. The first plausible reason explaining the positive results of the current study could be because the participants in the Flipped classroom were exposed to the materials and had a preparation for each lecture's content prior to class. Before class even started, students were exposed to the materials on Google Classroom and they needed to pay close attention to these videos in order to understand the questions on the online quizzes and to build a foundational understanding of the material so they could participate in the sharing and discussion in class. Since the students have had exposure to the content, it is not surprising if they arrive prepared for the lesson with a solid comprehension of the materials. It is backed up by Peregoy and Boyle (2005), who claim that language exposure significantly influences a learner's ability to produce a language. Compared to the typical lecture-based classroom, the Flipped class offered students greater opportunities for practice both individually and in small groups.

Another possible reason for this result could be explained by the effectiveness of class time, which was confirmed by Zappe et al (2009) and Thinh (2021). From the instructor's experience with the Flipped Classroom model, there was no need to spend hours talking and explaining theory which frequently failed to finish the class on time. Better satisfaction with class time was the outcome of this. The current finding was also supported by

Van et al. (2019) who reported that sustaining face-to-face time is a crucial feature for a successful implementation of the Flipped Classroom model. It is the fact that teaching listening skills would be more effective if the time spent in the class was used to do further practices and listening activities rather than explaining the lengthy theory (Astri et al, 2019). The learning opportunities provided by Flipped activities before class have thereby made it easier for students to acquire these key concepts. This idea was also supported by Khoiriyah (2021) who claimed that students are encouraged to ask any questions, in person or online and are expected to collaborate during in-class activities. As a result, students develop their listening comprehension skills through group learning and knowledge sharing as they look for solutions to difficulties they experience.

A further explanation for the positive results is the individualized aspect of flipped learning, which enables each student to learn on his or her own schedule and at his or her own pace. This finding was also supported by El Sakka (2016), comparing to the use of the conventional lecture model, students in flipped classes can review any part of a lecture that has been recorded or take breaks at their own learning pace. Moreover, they can bring specific questions to class if they find the materials confusing or difficult and have plenty of time in class to explore them. Choe and Seong (2016) also claimed that many of the participants in their study preferred the option of doing their assignments or learning the materials when it was most convenient for them. Thinh (2021) also mentioned in her research that students preferred the format of Flipped Classroom in which they could study the materials at their own pace, in their favorite place, and at any time that was most convenient for them. In addition, the teacher would have more time during class to direct students' practice rather than provide lengthy theory. As a result, she was also more aware of the issues the students were having and how to make accommodations so they could complete the project.

Conclusion

The findings from the current study indicated that implementing the Flipped Classroom model in a TOEIC listening course had a significant positive impact on students' listening skills. Here are the key conclusions drawn from the results and findings:

Both the control and experimental groups showed significant improvement in their listening skills after 8 weeks of learning, suggesting that strategic training from qualified teachers played a crucial role. Despite both groups showing improvement, the experimental group, which used the Flipped Classroom model, outperformed the control group. This suggests that this instructional approach has additional benefits for enhancing listening comprehension skills. The positive outcomes of the Flipped Classroom model in this study aligned with several previous studies focusing on listening skills. These studies utilized similar methods and tools, reinforcing the idea that flipped learning can be an effective strategy in enhancing listening comprehension.

The mixed results from other studies indicate that the effectiveness of the Flipped Classroom model may vary depending on factors like course content and structure. The lack of improvement in some studies may be tied to

the nature of the courses, suggesting that the Flipped Classroom model might be more effective in test-preparation contexts than in general English courses. Among the three listening sub-skills examined (Listening for Main Idea, Listening for Detail, Listening and Making Inference), the Flipped Classroom model had the most significant impact on Listening for Main Idea and Listening for Detail. The relatively smaller impact on Listening and Making Inference might be due to the nature of this skill, which requires a broader context and stronger working memory.

Recommendations

It is suggested for any further study to employ a design with a larger than 20 sample of participants. The results should, in the researcher's opinion, be generalized to the full population in order to be more valid. Moreover, even though the flipped instruction was successful in this study, we are unable to generalize from this sample because the participating students in the study had intermediate English proficiency, and the Flipped Classroom model might produce different results in classes with students who have lower proficiency levels. In addition, other future studies should be conducted on different types of English classes with various learner groups, situations, and English learning skills so that the results can be representative for the general English learners with different learning purposes, not just for any specific certificate. Moreover, future research should also consider the factors of students' prior flipped classroom experiences as well as their learning preferences to bring the utmost effectiveness.

Abstract: The goal of this classroom action study is to increase the vocabulary of Vietnamese EFL university students by utilizing Kahoot! in the teaching and learning process. Eleven undergraduate Vietnamese students majoring in Information Technology in a university in the south of Vietnam took part in the study. The two-cycle Kemmis and McTaggart (1988) model was used. The investigator employed assessments for learners and surveys for educators to gather information, investigate if including Kahoot! may enhance students' vocabulary acquisition, and ascertain the viewpoints of educators on the benefits and drawbacks of their involvement. The results show that learners' vocabulary performance has improved. Teachers' feedback also shows that the Kahoot! application has increased student engagement in several ways, most notably by creating an enjoyable learning environment where students may practice both individually and in groups. It is reported that Kahoot! is easy to use and convenient. Technical issues and time management are a few of the drawbacks mentioned. The study's findings could be useful in helping teachers implement changes in their classrooms as well as serving as a resource and source of inspiration for academics and researchers with related fields of study.

Keywords: Vocabulary acquisition, Gamification, EFL context

Introduction

Context of the study

Language serves as a cornerstone of communication, enabling individuals to exchange information and ideas (Nunan, 2003). Among languages, English has emerged as a global lingua franca due to its widespread use across nations (Fiedler, 2011). This prominence has led to English permeating various sectors, including economics, technology, and education (Broughton et al., 2003). In the era of globalization, possessing a strong

command of English becomes crucial for accessing diverse fields of human knowledge and becoming a well-rounded global citizen (Nunan, 2003). Recognizing this importance, the Vietnamese government has prioritized English as a foreign language and implemented educational reforms to enhance English teaching and learning (Ngo et al., 2015). Consequently, English is a compulsory subject for most Vietnamese students, starting from primary education (Grade 3) and continuing through university (Vu & Peters, 2021). This emphasis aims to equip students with the necessary English skills to navigate the competitive job market, where professional competence is often coupled with the ability to effectively use the language in work-related tasks (Othman et al., 2011). Therefore, ensuring university students are well-prepared in English is paramount for their confidence, success, and self-development in the workforce, ultimately benefiting both the individual and society as a whole.

Research underscores the crucial link between English proficiency and employability. Studies reveal that graduates with limited English skills encounter difficulties in the workplace, creating challenges for companies (Othman et al., 2011). A concerning trend is also highlighted by Ngo et al. (2015) who found that many Vietnamese university students, even those majoring in English, demonstrate inadequate English proficiency as measured by the Test of English for International Communication (TOEIC). A recurring challenge faced by Vietnamese EFL learners is limited vocabulary acquisition. This encompasses deficiencies in both receptive and productive knowledge, including understanding the meaning and form of individual words, as well as the ability to utilize formulaic language sequences such as collocations and idioms (Nguyen & Webb, 2017; Dang, 2020).

Literature review

The Centrality of Vocabulary in Language Learning and Teaching

The centrality of vocabulary in successful second language (L2) learning has been well-established in English learning and teaching. McCarthy (1989) emphasizes that effective communication in L2 necessitates a strong vocabulary foundation. Similarly, Holderness and Lynn (2017) highlight vocabulary as a vital component of language acquisition, without which comprehension of written texts becomes a significant challenge for students. Several scholars (Syafriзал & Haerudin, 2018; Neuman & Dwyer, 2009) define vocabulary as the set of words learners must master to achieve fluency and effective communication. Cook (2013) suggests that vocabulary development flourishes when learners are initially exposed to new words and their meanings, followed by opportunities to practice retrieving, recalling, and utilizing these target vocabulary items across diverse settings and contexts. In essence, vocabulary knowledge encompasses understanding word meaning, form, and usage, coupled with the ability to apply this knowledge appropriately in various contexts. Therefore, a strong vocabulary base is demonstrably crucial for successful language learning and teaching.

Limited Vocabulary Knowledge in Vietnamese EFL Learners

Recent research (Nguyen & Webb, 2017; Dang, 2020) indicates that Vietnamese EFL learners typically possess

limited vocabulary knowledge. This limitation encompasses both understanding the meaning and form of individual English words, as well as formulaic sequences such as collocations and idioms. Peters (2019) identifies several factors contributing to this phenomenon, categorized as word-related, contextual, and learner-related factors. While word-related factors affect all English learners, Peters (2019) highlights contextual factors as a primary obstacle for Vietnamese EFL learners specifically. These contextual factors include the frequency of word occurrence, the frequency of the word in the learner's first language (L1), and the frequency of the word in the target language (L2). The limited exposure to high-frequency vocabulary ultimately leads to difficulties in retention (Peters, 2019).

To address these challenges, Vu and Peters (2021) emphasize the importance of both learners and teachers understanding the conditions necessary for effective vocabulary learning. These conditions include repetition and focused attention (Webb & Nation, 2017). Consequently, the potential of Information and Communication Technologies (ICT), particularly game-based learning, is being explored to determine its effectiveness in promoting vocabulary acquisition through increased repetition and enhanced learner engagement.

Kahoot!

Launched in 2013, Kahoot! is a game-based learning platform specifically designed to enhance educational experiences, motivation, and student engagement (Wang, 2015). Widely adopted by educational institutions due to its online and face-to-face functionality, Kahoot! allows educators to create engaging practice activities and readily assess student learning across various topics and subjects (Ahmed et al., 2022). The platform's versatility enables educators to use it for concept introduction, content delivery, and facilitating idea sharing and focus (Rofiyarti & Sari, 2017). In the context of EFL learning and teaching, Kahoot! holds particular promise as a valuable tool. Research suggests that a combination of collaboration, interaction, and enjoyment fosters more successful learning outcomes (Tivaraju et al., 2017). The literature highlights several key advantages associated with implementing Kahoot! in the classroom. First, it effectively boosts student enthusiasm and engagement in the learning process (Dellos, 2015). Second, Kahoot! fosters an interactive learning environment that promotes both independent and collaborative learning with teachers and peers (Rofiyarti & Sari, 2017). Finally, the user-friendly interface, accessible without downloads, and visually appealing design elements (Qian & Clark, 2016) make Kahoot! convenient for both educators and learners, particularly in higher education where students often favor mobile learning (Qian & Clark, 2016). In conclusion, Kahoot! emerges as a potentially transformative tool, addressing the need for increased teaching and learning effectiveness. It facilitates flexible learning modes, fosters positive classroom dynamics by "breaking the ice" (Ginnis, 2008), and enhances student focus and energy levels. These qualities position Kahoot! as an ideal platform worthy of consideration for implementation in EFL classrooms.

Previous studies on the effectiveness of Kahoot! in enhancing EFL vocabulary acquisition

The application of Kahoot! as a tool to enhance EFL learners' vocabulary achievement has garnered considerable research interest. Boulaid and Moubtassime (2019) employed a quasi-experimental design to

investigate the impact of Kahoot! on Moroccan undergraduate students' vocabulary learning. Their findings revealed positive student feedback regarding increased confidence in vocabulary usage and a more engaging learning process facilitated by Kahoot!'s user-friendly and interactive features. Similarly, Ahmed et al. (2022) explored the effects of Kahoot! on Iranian EFL learners' vocabulary recall and retention. Their results indicated a significant difference in performance between groups, suggesting Kahoot!'s efficacy in aiding vocabulary recall.

Studies conducted within Indonesia further support the potential of Kahoot! Mansur and Fadhilawati's (2019) action research applied Kahoot! to improve vocabulary achievement for senior high school students, yielding positive outcomes. Kusumayanthi and Rusmiyati (2021) conducted a qualitative study examining Kahoot!'s impact on seventh-grade students' engagement in EFL vocabulary learning, again demonstrating positive results. Ayumi and Chan's (2021) classroom action research at the tertiary level examined the effects of Kahoot! on improving students' vocabulary in a Reading and Writing class at an intermediate level. Their findings revealed that Kahoot! significantly enhanced students' ability to recognize word meanings in context. In a 2021 study by Manurung, a comparative investigation was conducted to assess the effectiveness of Kahoot! and Google Forms vocabulary quizzes in enhancing the vocabulary acquisition of fourth-grade students. The research aimed to determine if there were significant discrepancies between these two strategies in improving vocabulary comprehension. The findings revealed that both applications yielded positive outcomes in student vocabulary development. However, the study also identified potential challenges associated with internet-based learning, including unreliable internet connectivity, limited visibility of the screen for some students, and the potential for time pressure caused by countdown timers, which could be detrimental for young learners.

Beyond vocabulary acquisition, Noori and Azimi's (2023) research explored the impact of Kahoot! on students' motivation to learn English, demonstrating a significant increase in motivation within the Kahoot! learning group. Furthermore, Aibar-Almazán et al. (2024) investigated how gamified learning tools like Kahoot! benefit university students' attention, focus, creativity, and overall learning skills. Their findings indicated that Kahoot! can improve these key areas, particularly in longer learning sessions.

While the literature highlights the potential benefits of Kahoot! in language learning, there is a paucity of research investigating its implementation for vocabulary acquisition specifically within Vietnamese EFL higher education. Furthermore, existing studies rarely explore the perspectives of teachers on incorporating Kahoot! into their vocabulary teaching practices. This gap in research knowledge serves as the impetus for the current study, which aims to address the challenges faced by Vietnamese EFL undergraduate students majoring in Information Technology, as described previously. The project seeks to answer the following research questions:

1-Does the use of Kahoot! as a game-based learning tool lead to statistically significant gains in vocabulary achievements for Vietnamese EFL learners?

2-How do teachers perceive the integration of Kahoot! in their vocabulary instruction and learning activities in Vietnamese EFL classrooms?

Method

Research design

This research adopted an action research approach to address a classroom issue impacting several students and aligning with the teacher's goals. Action research, as defined by Kemmis and McTaggart (1988), involves educators gathering data within the classroom to enhance teaching and learning effectiveness. Following a cyclical process, educators analyze existing practices, implement changes, observe the results, and reflect on the experience before repeating the cycle (Kemmis & McTaggart, 1988; Burns, 2009). This iterative nature allows educators to continuously adapt and improve their teaching practices (Burns, 2009). The current study employed this approach due to its clear structure, including a reflection stage that enables researchers to refine their plan and make adjustments before initiating a new cycle.

Participants

This study involved 11 sophomore Information Technology students (6 male, 5 female) at a southern Vietnamese university. They participated in a twice-weekly Basic English class for eight weeks (16 total sessions). Initially, vocabulary instruction followed the PPP (Present-Produce-Practice) method with recommended coursebook activities. However, the teacher observed vocabulary learning difficulties using conventional methods, confirmed by mid-course vocabulary test results. The majority of students didn't meet the university's minimum vocabulary requirement of 75, prompting the teacher to explore alternative approaches. Additionally, five university English department instructors participated by completing an open-ended researcher-designed questionnaire on their experiences with the advantages and disadvantages of using Kahoot!.

Data collection

To assess student learning, the study employed pre- and post-tests. The pre-test, administered during the eighth session, evaluated students' vocabulary knowledge on covered topics after traditional instruction. Two post-tests were conducted: the first at the end of cycle 1 (session 12) and the second at the end of cycle 2 (session 16). These post-tests aimed to measure any improvement in student performance following the implementation of Kahoot!. Both tests comprised 25 questions in various formats (multiple choice, gap-filling, matching) and were reordered to prevent students from memorizing answers. To address the second research question, the researcher distributed questionnaires to five colleagues during the study period to gather data on their experiences with Kahoot!.

Data analysis

This study employed a mixed methods approach to address the research questions. Quantitative data from pre- and post-tests was analyzed using Microsoft Excel to assess student learning. Qualitative data from teacher questionnaires was coded to identify various perspectives on the advantages and disadvantages of using

Kahoot!.

Research procedure

Cycle 1 of the study employed a cyclical action research design with planning, implementation, and reflection phases. The planning stage involved identifying students' vocabulary learning difficulties and developing lesson plans targeting specific vocabulary with essential resources like Kahoot! activities, pre-tests, post-tests, and questionnaires. A pre-test was administered in session eight to assess baseline vocabulary knowledge. The implementation phase, encompassing sessions nine to twelve, integrated Kahoot! as an interactive learning activity. The established classroom routine involved the instructor delivering vocabulary instruction followed by a directive for students to access the Kahoot! app on their devices. The prepared Kahoot! was then projected, and the instructor provided instructions. Students joined using a game pin and selected nicknames. Each Kahoot! session lasted approximately 15 minutes, and students were encouraged to ask questions and review the material independently at the conclusion of each session. The post-test administered at the culmination of session twelve, informed by the collected data, revealed a positive trend in student vocabulary acquisition relative to the pre-test. However, student performance still fell short of the minimum proficiency criteria established by the university. Consequently, a second iteration of the program is necessitated, maintaining a similar structure but incorporating modifications informed by the instructor's pedagogical reflections on the initial implementation of Kahoot!

Cycle 2 of the action research design aimed to address limitations identified in Cycle 1 and maximize Kahoot!'s effectiveness in facilitating vocabulary acquisition. Encompassing the final four course sessions, Cycle 2 began with the reflection stage. Here, the instructor analyzed observations and student performance data from Cycle 1, particularly focusing on the rapid response time potentially hindering comprehension. Based on these reflections, the acting phase incorporated modifications. While maintaining the focus on new vocabulary topics, the response time for Kahoot! questions was extended from 15 seconds to 45 seconds. Furthermore, to enhance comprehension and promote active learning, the instructor strategically incorporated brief pauses after each question. These pauses served a dual purpose: firstly, to elucidate the correct answer, and secondly, to assess student understanding through the random selection of students who were tasked with constructing sentences that utilized the target vocabulary. The observing stage remained consistent, with a post-test administered at the conclusion of session sixteen. Finally, the reflection stage involved the instructor analyzing both student scores and observed classroom behavior to assess the impact of the modifications on vocabulary learning and student engagement.

To gather data on teachers' experiences with Kahoot!, an open-ended online questionnaire was distributed to five English department instructors at the university (2 male, 3 female) via Google Docs. Participants were granted a maximum of two weeks to complete the questionnaire. Their responses were then coded and analyzed thematically to identify perceived advantages and disadvantages associated with Kahoot! application in the English language classroom.

Results

Learners' vocabulary achievement before and after the implementation of Kahoot!

To address observed student difficulties with vocabulary learning, the instructor implemented Kahoot! as an interactive learning activity within the established classroom routine. This intervention aimed to explore the potential of Kahoot! to enhance student vocabulary acquisition. The effectiveness of the intervention was evaluated through pre- and post-testing. The mean scores for these assessments are presented in the following chart.

Figure 1. The mean score of students' pre-test and post-tests

To assess the effectiveness of Kahoot! in enhancing vocabulary acquisition, a pre-test was administered before the intervention began. The mean pre-test score of 39.27 indicated a low level of initial vocabulary knowledge among the students (median = 40). Following Cycle 1, the post-test results revealed a positive increase in the average score (61.45, median = 60) compared to the pre-test. However, this increase still fell short of the university's minimum required score of 75 for vocabulary mastery, necessitating a second cycle. The post-test scores at the end of Cycle 2 demonstrated a significant improvement, with the mean score reaching 85.81 (median = 88) and exceeding the minimum criteria. Notably, all students achieved scores above 75, with the highest score reaching 96. These findings strongly suggest a substantial increase in student vocabulary acquisition following the implementation of Kahoot! as a learning activity.

How Teachers See Kahoot! in the Classroom: Benefits and Challenges

To gain a well-rounded perspective on the pedagogical utility of Kahoot! within the teaching and learning process, a semi-structured questionnaire was administered to a sample of five university English language instructors. The questionnaire itself employed open-ended questions to encourage in-depth responses. These inquiries focused on the frequency of Kahoot! implementation within the instructors' curricula, the specific

learner groups for which it was deemed most appropriate, the intended pedagogical purposes behind its use, student reactions to its incorporation into the classroom environment, and, most importantly, the perceived advantages and disadvantages encountered by the instructors during its implementation.

An analysis of Kahoot! utilization frequency revealed teacher variability. Three instructors reported infrequent use, averaging one to two sessions per month. One teacher elaborated on a tiered approach based on student age and level:

"Teens with devices benefit from revision, practice, or introducing grammar/vocabulary (max twice per month). Younger or lower-level students (6-7 years) may use it once per course (3 months). Overall, Kahoot! is used monthly or less."

Conversely, two instructors reported weekly usage (once or twice). All teachers employed Kahoot! for vocabulary and grammar review across various student levels. For vocabulary, one teacher focused on meaning, form, and spelling. Another used Kahoot! for grammar review or pre-assessment before introducing new rules. Kahoot! also served as a tool for practicing speed reading and covering non-coursebook topics like Halloween.

The advantages of Kahoot! Application

All teachers reported positive student reactions to Kahoot!. Younger learners, in particular, displayed excitement when the Kahoot! theme appeared on screen. One teacher highlighted Kahoot!'s potential for both individual learning and collaborative learning. Another teacher valued its convenience and ease of use, allowing educators to create or use existing quizzes, thus saving preparation time. The variety of game modes facilitated assigning practice at home. Notably, students could choose nicknames, potentially contributing to a sense of anonymity that fostered comfort in answering incorrectly. Teachers also found the multiple-choice format suitable for lower-level learners, promoting engagement through participation. Implementing Kahoot! fostered a friendly competitive environment, with students striving for high scores and recognition on the leaderboard. The classroom atmosphere became lively and engaging with cheers and excitement. In conclusion, teachers reported that Kahoot! enhances student engagement, creates a joyful learning environment, and promotes both individual and collaborative practice. Additionally, its user-friendliness was viewed as beneficial for teacher workload management.

The disadvantages of Kahoot! application

Internet dependence emerged as a key drawback. Teachers reported difficulties with slow connections impacting student performance and final scores. Device availability also presented a challenge, as not all students possessed them. Additionally, despite Kahoot!'s filtering system, one teacher noted students circumventing it by writing inappropriate usernames backward. Finally, time constraints posed a potential issue. Teachers who stopped to explain correct answers risked exceeding allotted lesson time.

Discussion

Conducted within a Vietnamese university English language class, this research investigated the effectiveness of Kahoot! in enhancing vocabulary acquisition among EFL undergraduates. The study employed a two-cycle design, demonstrating significant improvement in learner performance as evidenced by a rise in average test scores from 39.27 to 61.45 and subsequently to 85.81. These findings suggest that incorporating Kahoot! into vocabulary instruction can demonstrably improve EFL undergraduate students' vocabulary achievement.

Beyond the observed improvement in vocabulary acquisition, Kahoot! garnered positive feedback from educators. Its ability to enhance student engagement and participation aligns with research highlighting the importance of interaction, cooperation, and enjoyment for successful learning (Dellos, 2015; Tivaraju et al., 2017). Kahoot! fosters a positive attitude towards English learning by making vocabulary practice engaging. Furthermore, the study's findings regarding Kahoot!'s ability to promote individual and collaborative learning through its diverse modes resonate with previous work by Rofiyarti & Sari (2017) and Mansur & Fadhilawati (2019). Educators can use Kahoot! for both in-class instruction and assigning practice activities for students to complete at home. Notably, the option for students to choose nicknames and potentially remain anonymous can boost confidence, particularly for those hesitant about making mistakes. Despite these benefits, teachers also acknowledged some drawbacks. These included unreliable internet connections, device accessibility limitations, inappropriate usernames, and potential time constraints when implementing Kahoot! activities. As Manurung (2021) points out, technical issues are common challenges associated with internet-based platforms.

The current study's findings resonate with prior research conducted within EFL university contexts. Similar positive impacts on vocabulary learning and performance were observed in the study by Boulaid and Moubtassime (2019). These findings align with Aljaloud et al. (2015) who highlight Kahoot!'s ability to promote interactivity, enhance academic performance, and boost student engagement, alongside potential practical classroom challenges. Nikou & Economides (2018) further contribute by confirming Kahoot!'s effectiveness in fostering motivation, positive attitude, and learning outcomes in EFL classrooms. In conclusion, this research adds to the growing body of evidence supporting Kahoot! as a valuable tool for significant vocabulary improvement in EFL undergraduate learners. While some drawbacks exist, such as those outlined in the present study and by Manurung (2021), Kahoot! demonstrably offers numerous benefits for both educators and learners.

Conclusion

This research investigates the effectiveness of Kahoot! in enhancing vocabulary acquisition among EFL university students in Vietnam. The study employed a two-cycle design, with post-test scores demonstrating a significant increase in student vocabulary learning. All participants achieved success criteria by the end of cycle 2. To gain a holistic understanding and inform future applications, teacher perspectives on Kahoot!'s advantages

and disadvantages were also collected. The findings suggest that Kahoot! possesses pedagogical value, facilitating both teaching and learning. It plays a crucial role in boosting vocabulary performance, participation, and student engagement. However, alongside these positive aspects, consideration must be given to potential drawbacks, such as technical difficulties, time management constraints, and inappropriate student nicknames.

This study offers valuable insights for educators seeking to improve their teaching practice. Implementing Kahoot! to facilitate vocabulary learning resulted in increased student enthusiasm and a stronger desire for frequent Kahoot! activities. The classroom atmosphere became more vibrant, marked by joyful participation and a commitment to independent vocabulary review fueled by the desire to achieve high scores. These observations suggest that Kahoot! can not only enhance learning outcomes but also motivate students and foster a more engaging learning environment.

Recommendations

It is important to acknowledge that the research focused specifically on Information Technology students, and the outcomes may differ for students with other majors. Additionally, the sample size was relatively small, potentially limiting the generalizability of the results. Future research could address these limitations by expanding the participant pool to include students from diverse majors. Furthermore, the investigation could delve deeper into the broader applications of Kahoot! This might include exploring its potential as an assessment tool or its effectiveness in enhancing other language skills beyond vocabulary acquisition. In light of the encouraging outcomes yielded by this investigation, Kahoot! merits continued exploration to comprehensively unveil its capacity to enhance the pedagogical process.

English Language Students' Perception of Using Grammarly in Academic Writing Subject

Nuong To Huynh

FPT University, Vietnam,  <https://orcid.org/0009-0005-3200-0085>

Abstract: The rationale of the current research was to investigate English Language (EL) students' perception on their using Grammarly in Academic Writing Subject at a private university in The Mekong Delta of Vietnam. This study also desires to find out and explore the strong as well as weak aspects of Grammarly application. The mixed-method design was applied in this research. The participants of the paper were 50 EL students attended in Academic Writing Subject which was one of the compulsory courses in their university curriculum. The study employed the 15-item questionnaire with a five-point Likert scale and a semi-structured interview for data collection. The findings showed that students' perceptions on using Grammarly in their course were positive. The results also showed some strengths and weaknesses of this Grammarly application. Several challenges were discussed to recommend possible solutions to better EL students' academic writing. Implications for practical applications of Grammarly in Academic Writing Subject were addressed in this study to enhance EL students' academic writing performance.

Keywords: EL Students' Perception, Grammarly, Academic Writing Subject

Citation: Huynh, N.T. (2024). English Language Students' Perception of Using Grammarly in Academic Writing Subject. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024- International Conference on Research in Education and Science* (pp. 799-809), Antalya, Turkiye. ISTES.

Introduction

Among the four skills in English such as Speaking, Listening, Reading, and Writing, the last one is considered to be essential and significant in acquiring a language (Gloria & Mbato, 2023). Ravana et al. (2023) claim that writing can be used as a medium to offer creative as well as reflective insights, a deep understanding of a complicated issue or matter. In the environment of academic institutions, EL students have to master writing skills for a numerous professional and educational reasons (Harahap, 2023). With the development of technology, EL students can employ an online tool to improve the performance of their compositions like Grammarly. Fahmi and Cahyono (2021) highly recommend this application thanks to its ease, popularity and effectiveness for EL students.

For such purposes, it is worth an investigation that is guided by the two questions below.

1. What are EL students' perceptions on the use of Grammarly in Academic Writing Subject?

2. How do students perceive the benefits and shortcomings of utilizing Grammarly in Academic Writing Subject?

Literature Review

Perception

Based on the definition suggested in the Cambridge Online Dictionary, Bedir (2019) describes perception as people's belief as well as perspective about the world. More specifically, Agung et al. (2020) adds some more ideas to the definition. According to them, perception is seen as a result of the fact that people's viewpoints can be adjusted after they experience certain things in life. Therefore, people frequently obtain different perceptions on something new (Nasution et al., 2020). They believe that such a process starts with the use of people's five senses to receive the input. The input is organized and analyzed as so to form an interpretation of what it sensed. In this study, perception is understood as EL students' belief and opinions toward their using Grammarly in the course Academic Writing, which is a compulsory subject in their university curriculum.

Writing and Academic Writing

Writing is defined as people's ability to express ideas in their mind under the form of written works which others can read and understand (Handayani & Mantra, 2022). According to Zulaiha and Triana (2023), writing is significant in communication; moreover, it is described as an English productive skill.

Academic writing is considered to be challenging for students (Handayani & Mantra, 2022), and required in formal educational settings (Budiana, 2023). Bower et al. (2023) highly evaluates academic writing which is beneficial to conduct students' assessments. That is because this type of writing empowers students to prove their skill and knowledge acquisition.

The effectiveness of Grammarly application in academic writing

Prasetya and Raharjo (2023) admit that Grammarly grows in popularity among EL students in learning writing. Fitria (2021) identifies this application as a tool to analyze any composition along with offer feedback in terms of grammar, writing style, spelling, and punctuation as well, which are important elements in writing. In order to enhance writing skills in an effective way, Grammarly can be used as a valuable tool to detect grammatical mistakes (Thi & Nikolov, 2022). Besides providing immediate feedback, Grammarly can adopt the EL students' writing style, thus its response will be more specific (Perdana et al., 2021).

EL students find this application meaningful for their study when it assists them in avoiding errors (Ardhy et al., 2023). Similarly, Huang et al. (2020) discover that EL students' academic writing performance is developed by using Grammarly. Raheem et al. (2023) this tool also focuses on bettering students' grammar as well as writing style. According to these authors, grammatical mistakes and inconsistent writing style may prevent them from

producing their brilliant ideas. Therefore, Grammarly is considered to bridge this gap and aid them in expressing what they really want.

Conceptual Framework

The framework was adapted from the research by Rejeki (2023). Based the conceptual framework below, the author conducted this research related to students' perceived knowledge of using Grammarly in terms of Grammarly application and its features. Such knowledge is examined by investigating how EL students accept, understand and evaluate this writing tool.

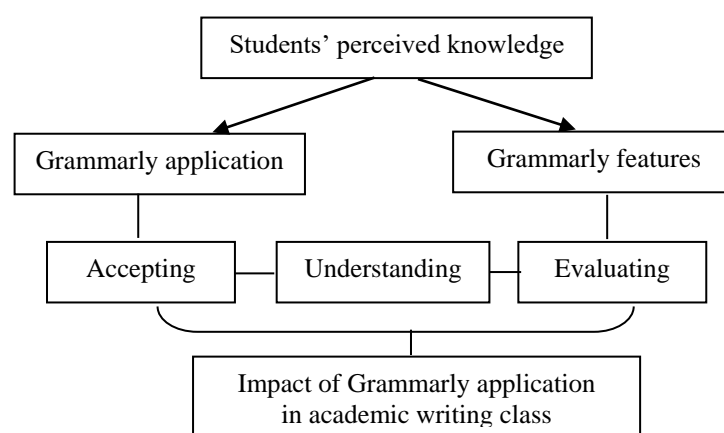

Figure 1. Conceptual Framework

Methodology

Participants

The participants are English majored students in a private university in the Mekong Delta of Vietnam. These 50 English Language students who attended in Academic Writing Subject which is one of the compulsory courses in their university curriculum. All of them completed Academic Writing Course and already took the final exam. The 50 students first completed the questionnaires, and then 10 out of them were randomly selected for semi-structured interviews.

Research instruments

This study employed 2 instruments: a 15-item questionnaire and semi-structured interviews. These 15 questions are classified into three aspects such as accepting of Grammarly application, understanding of Grammarly application, and evaluating of Grammarly application. For each aspect, there are five questions. The questionnaire adapted by O'Neill & Russell (2019) consists of three aspects of students' perceived knowledge on the use of Grammarly application in Academic writing subject. These questions are based on the 5-point

Likert scale, ranging between strongly disagree (one) and strongly agree (five).

Table 1. The three aspects related to EL students' perception of using Grammarly in academic writing

Aspects	Indicators	Number of Questions
Accepting	The reasons for using Grammarly	5
Understanding	The use of Grammarly	5
Evaluating	The strengths and weaknesses of Grammarly	5
Total		15

Besides, interviews consists of three questions including (1) *What are two reasons that you want to use Grammarly for your academic writing?*, (2) *What can you learn from using Grammarly for your academic writing?*, and (3) *What do you think about feedback and suggestion from Grammarly for your academic writing?* These open-ended questions are used in the form of semi-structured interviews.

Reliability Statistics	
Cronbach's Alpha	N of Items
.897	15

Figure 2. Value of reliability

To ensure the reliability of the research instrument, the questionnaire, during the procedure of collecting quantitative data. The alpha value for Cronbach is determined to be .897. This value is sufficient for the reasearch to be conducted.

Results

Results from the questionnaires

Table 2: Mean score of EL students' perception of using Grammarly in academic writing

	N	Minimum	Maximum	Mean (M)	SD
Students' perception on the use of Grammarly in Academic writing subject	50	1.80	5.00	3.83	0.61

Table 2 presents the findings of the questionnaire with 15 items. It shows that EL students' perception on the use of Grammarly in academic writing is quite high ($M=3.83$, $SD=0.61$).

Table 3: Mean scores of the three aspects related to EL students' perception on the use of Grammarly in academic writing subject

Aspects	N	Minimum	Maximum	Mean (M)	SD
EL students' accepting the use of Grammarly	50	1.40	5.00	3.80	.73

www.icres.net	April 27-30, 2024	Antalya, Turkey		www.istes.org		
EL students' understanding the use of Grammarly	50	2.00	5.00	3.76	.63	
EL students' evaluating the use of Grammarly	50	1.80	5.00	3.95	.64	

The mean agreement degrees of EL students towards this application are quite high ranging between 3.76 and 3.95 as indicated in Table 3.

EL students' accepting their using Grammarly in academic writing

Table 4: Mean scores of EL students' accepting their using Grammarly in academic writing

Aspects	N	Minimum	Maximum	Mean (M)	SD
1. I use Grammarly to complement the lecturer's feedback.	50	1	5	3.86	.97
2. I use Grammarly because of the recommendation from the writing lecturer.	50	1	5	2.70	1.06
3. Grammarly feedback helps me become confident in handing in my assignment.	50	1	5	4.20	.95
4. I am motivated when the lecture appreciates my academic writing performance using Grammarly.	50	1	5	3.98	1.00
5. Grammarly can minimize the writing errors in my academic writing.	50	1	5	4.24	.89

According to the results, the participants accept that Grammarly can help them minimize errors in their composition, which gets the highest value ($M=4.24$, $SD=.89$). The lowest value among the five ones is their acceptance on the writing teachers' recommendation for this application ($M=2.70$, $SD=1.06$). The participants are likely to have no idea about this. The other three values are positive (from $M=3.86$ to $M=4.20$). In short, they accept to use this application as a writing tool to assist them in improving the quality of their composition in academic writing.

EL students' understanding the use of Grammarly in academic writing

Table 5: Mean scores of EL students' understanding the use of Grammarly in academic writing

Aspects	N	Minimum	Maximum	Mean (M)	SD
6. I think it was essential to receive grammatical feedback for my assignment.	50	1	5	3.78	1.06
7. The grammatical feedback focused on	50	2	5	4.12	.75

main errors of my writing.						
8. Sometimes, I ignore some suggestions from Grammarly.	50	1	5	3.56	1.15	
9. Such clear explanations were very easy to understand the errors.	50	2	5	3.80	.78	
10. My language skill was developed thanks to its feedback since I was able to understand the grammatical rules more.	50	1	5	3.52	.97	

The result in Table 5 shows that the participants understand how Grammarly offers feedback on their writing with the highest value ($M=4.12$, $SD=0.75$). Although item number 10 is the lowest, it still remains high ($M=3.52$, $SD=.97$). It can be interpreted that the participants comprehend grammatical rules based on its feedback. The rest of the items are fairly positive (between $M=3.78$ and $M=3.80$). To sum up, the use of Grammarly can be understood by these EL students in learning Academic subject.

EL students' evaluating their using Grammarly in academic writing

Table 6: Mean scores of EL students' evaluating their using Grammarly in academic writing

Aspects	N	Minimum	Maximum	Mean (M)	SD
11. I recieved lots of valuable suggestions about how to better my knowledge of grammar by using Grammarly.	50	1	5	3.92	.97
12. I prefer feedback from lecturers rather than Grammarly.	50	1	5	3.82	1.00
13. Grammarly encourages me to do independent proofreading.	50	1	5	4.14	.99
14. I found some feedback from Grammarly that needed to be more accurate.	50	2	5	4.00	.86
15. Grammarly gives me a performance score that calculates the accuracy level of my writing on the base of word count as well as number and types of writing problems checked.	50	2	5	3.88	.92

As Table 6 describes, EL students' evaluation toward the encouragement of Grammarly in independent proofreading obtains the highest degree ($M=4.14$, $SD=.99$). In other words, thanks to its function, the students are able to improve their writing skill themselves. In addition to feedback from this tool, the participants admit

that they need correction from their teachers as well, which receives the lowest value ($M=3.82$, $SD=1.00$). In spite of the lowest among the five items, it still remains positive. The other items are relatively high (from $M=3.88$ to $M=4.00$). In short, the participants evaluate the importance of Grammarly for their writing improvement.

Results from the interviews

EL students' accepting their using Grammarly in academic writing

For this aspect, 50 participants are asked to speak out two reasons for their using this writing in academic writing subject. 6 out of 10 EL students think that this application is quite easy to use.

"I think the first reason for using Grammarly should be its ease. With some simple steps, I can have a correct essay with suggestions on spelling, and grammar."

(Student 1, interview extract)

Interestingly, there are 3 responses related to students' confidence after Grammarly check their composition. They can even learn from their mistakes.

"When I use Grammarly to check my writing before submission, I feel fairly confident with my teacher."

(Student 3, interview extract)

Specifically, student 5 accepts its effectiveness in learning academic writing.

"I can learn from its suggestions and feedback. I know and understand my mistakes."

(Student 5, interview extract)

Most of the participants show their acceptance toward this tool thanks to its usefulness in such a complicated kind of writing in university.

EL students' understanding their using Grammarly in academic writing

To find out the participants' understanding the use of Grammarly, they need to express their opinions on what they can learn from using Grammarly for your academic writing. 8 out of ten EL students claim that they can avoid making grammatical mistakes after a period of time using it.

"It's useful for me because after reading its suggestions I can understand and remember my mistakes."

(Student 7, interview extract)

Besides grammar, some of them use this application as a tool to correct their spelling and punctuation errors.

"Thanks to this website, I can check my spelling, grammar and punctuation. I think my writing improves a lot."

(Student 6, interview extract)

When the students pay attention to their mistakes after using Grammarly, they can avoid making the same one next time.

“Once my writing is corrected by this tool, I will not make these errors again. That’s why my writing is better now.”

(Student 10, interview extract)

According to the responses to this question, the participants are able to understand how Grammarly can be used to enhance their writing skill with three elements of a language such as spelling, grammar and punctuation.

EL students’ evaluating their using Grammarly in academic writing

The last question requires the participants to evaluate whether Grammarly is really effective and necessary to use in bettering the quality of their composition. 8 out of 10 agree that, at the present, Grammarly is suitable for their learning academic writing.

“I think that Grammarly can help me improve my skill because it is effective to me.”

(Student 10, interview extract)

There are 2 students think that sometimes this tool provides incorrect feedback and inappropriate suggestions.

“Although Grammarly is helpful, I am not sometimes convinced when I recognize some errors of this tool. Therefore, I need my teachers’ correction besides Grammarly.”

(Student 4, interview extract)

After a period of time using this writing tool, the participants have the ability to evaluate its effectiveness. Besides the benefits, Grammarly still has some shortcomings. They can distinguish correct grammatical rules from inappropriate suggestions.

Discussion

This research is conducted related to English language students’ perceived knowledge of using Grammarly in terms of its application as well as its features. Such knowledge is examined by investing students’ accepting, understanding and evaluating toward Grammarly.

In terms of their acceptance toward this writing tool, the result of the current study shares some similarities with the research by Raheem et al. (2023). Both find out that students’ performance can be improved with better grammar and writing style. Some students believe that, in the present time, this application can be considered as one of the most useful tool for their writing skill. It is accepted as essential assistance in the process of enhancing their academic performance.

Regarding to students’ understanding the use of Grammarly, the current research also aligns with the study by

Thi & Nikolov (2022) in discovering that students can use it to detect grammatical mistakes. The most convenient of this application is that feedback and suggestions can be delivered immediately as soon as students' writing is uploaded. Thanks to such useful suggestions, EL students are able to edit their composition. In addition, using Grammarly to check their papers before the submission can help gain their confidence. They understand that this writing tool can aid them in creating academic work with fewer mistakes.

Once EK students accept as well as understand the use of Grammarly in academic writing, they obtain the ability to evaluate it. Both Fitria (2021) and this study praise its usefulness in offering immediate feedback including spelling, grammar, and punctuation. The sole difference between this research and related studies is that EL students admit Grammarly has some limitation with inappropriate suggestions. In other words, students can distinguish useful feedback for their composition from the one that is not suitable in their writing.

Conclusion

Grammarly has shown its excellent functions toward English language students' needs to enhance and better their academic writing performance. Thanks to its immediate feedback as well as suggestions in terms of spelling, grammatical rules, punctuation, and writing style, students themselves are able to learn and correct mistakes in their papers. As a result, they can produce better language in their composition. An interesting point of the interviews is that these students show their ability in discovering inappropriate suggestions from this application. They even can distinguish between good grammatical rules and some feedback that need to be more correct. Hence, these students desire their writing teachers to not only offer feedback on their papers but also provide explanations on inappropriate suggestions from Grammarly so that they can obtain comprehensive knowledge in their course of academic writing.

Limitations & Recommendations

Although the current research shows the usefulness of Grammarly, it still has some limitations. The participants are encouraged to use this tool after class without the teachers' control. Thus, they do not know how much time and how often the students use Grammarly to detect their writing issues. In addition, the number of participants is quite small, which may prevent the result of the current study from discovering more findings related to the detailed benefits as well as shortcomings of Grammarly. The writing teachers should control the participants' using this application in and after class. In addition, there should be a pre-test and a post-test in order to measure their progress in the process of learning academic writing subject. Thus, analysis and explanation can be given clearly with more details.

Abstract: The aim of the study was to investigate English as a Foreign Language (EFL) students' perception of using Wordwall application in vocabulary memorization at a private university in the Mekong Delta of Vietnam. This study also explores the strengths and weaknesses of Wordwall application. The mixed-method design was used in this study. The participants of the study were 75 students from different levels of English proficiency. The SPSS 25 program was used to examine the data. The study employed a five-point Likert scale questionnaire and a semi-structured interview for data collection. The findings showed that students' perceptions of using Wordwall for their memorizing vocabulary were positive. The results also showed some strengths and weaknesses of this Wordwall application. Some challenges were discussed to recommend possible solutions for EFL students' vocabulary memorization. Implications for practical applications of Wordwall to memorize vocabulary were addressed in this study to enhance EFL students' ability to memorize vocabulary.

Introduction

Vocabulary is a crucial aspect of language teaching and learning as it helps humans understand and articulate their thoughts (Bandjarjani & Efrata, 2023). Vocabulary must be acquired to be used correctly and effectively (Amaliyah & Rahayu, 2023). Teachers play a key role in students' vocabulary learning as they can analyze difficulties that students have in learning (Rahayu & Bhaskoro, 2022 as cited in Amaliyah & Rahayu, 2023).

Gradually, teachers have started to apply gamification which is the integration of games into teaching and learning. Educational game websites such as Quizlet, Kahoot!, Quizzes, or WordWall are gamification in education, these applications are well-known for their games and fun activities. However, Wordwall is among the most efficient websites that can simplify the process of creating educational activities. It provides over 15

activities on its website, and the designs and functions are intriguing to students which enables their learning to be more efficient and interesting (Swari, 2023). These game activities are clear and straightforward enabling students to test their knowledge and reinforce their understanding of vocabulary. Furthermore, students can have access to the quizzes anytime and anywhere, they can create their games with the vocabulary of their own or their friends'. Teachers can track their students' progress to see how well their students are with real-time leaderboards and points (Swari, 2023).

To examine the effectiveness of Wordwall in enhancing students' vocabulary memorization, two research questions below are used in this study:

1. What are university students' perceptions of using Wordwall application to enhance vocabulary memorization?
2. How do students perceive the benefits and drawbacks of utilizing Wordwall application to enhance vocabulary memorization?

Literature Review

Importance of vocabulary memorization

Vocabulary can be recognized as words that include lexical items or phrases (Jaikrishnan & Ismail, 2021). However, new words and phrases can be difficult to memorize (Jaikrishnan & Ismail, 2021; Gaybulloyevna, 2022). Thus, it is essential to acknowledge the importance of memorizing vocabulary as it is an essential skill in vocabulary acquisition (Gaybulloyevna, 2022). Such a significant skill is the very first stage according to Bloom's taxonomy. This skill can help students build a strong foundation in vocabulary, providing better comprehension and critical thinking (Siddiq, 2022). Moreover, Siddiq (2022) states that students' vocabulary knowledge can greatly aid other language skills, especially in their language creation (Quy & Huyen, 2021).

Vocabulary is regarded to be the most important skill during language acquisition that every student must acquire alongside grammar (Khasanovna, 2022; Agazzi, 2022; Gaybulloyevna, 2022; Zarfsaz & Yeganehpour, 2021). Even if an individual has a strong grasp of grammar, they need vocabulary to comprehend and communicate effectively (Aji, et al., 2023). Vocabulary is the fundamental factor of language proficiency for students to obtain others' ideas and express their own (Rashid, et al., 2022), helping them to be more convincing.

Gamification and the effectiveness of gamification in language learning

Gamification is the integration of game elements into real-world contexts (Shakhnoza, 2023; Armand & Indriani, 2022) such as language acquisition. Students usually see boring and un-motivating language learning lessons (Sari & Ningsih, 2022) but gamification can turn it into an immersive and enjoyable experience (Shakhnoza, 2023). Gamification can take different forms based on the context and the objective of the lesson

(Azar & Tan, 2020; Turunen, 2023) as it can be carried out by mobile devices or even real-world activities. Gamification games are created with objectives, obstacles, and perks, which enhance students' motivation to learn and obtain achievements (Shakhnoza, 2023).

A normal way of learning a language is by doing tests that take teachers a long time to grade, so the process can be an endurance test for both teachers and students. However, gamification can take out this long process with educational games that can instantly evaluate, give points to students, and provide feedback that can improve students' acquisition process (Shakhnoza, 2023). Armand and Indriani (2022) argue that not only is gamification efficient, but it is also the best innovative method for learning languages.

The use of Wordwall platform in vocabulary memorization

There are no obstacles when someone wants to access Wordwall (Swari, 2023). Wordwall application is designed to aid students in learning a language with a variety of templates such as quizzes, puzzles, matching tasks, and so on (Rodríguez-Escobar et al., 2023). Such a great tool is considered to be a new and educationally entertaining application that provides a lot of vocabulary-building activities (Swari, 2023). Çil (2021) describes Wordwall as a source of distinctive as well as interactive tasks for students' vocabulary development. Thus, students can utilize Wordwall application as a medium for their language learning (Anjani et al., 2023). Similarly, Umar et al. (2023) admit that Wordwall can assist students in understanding vocabulary as well as its definition.

Theoretical framework

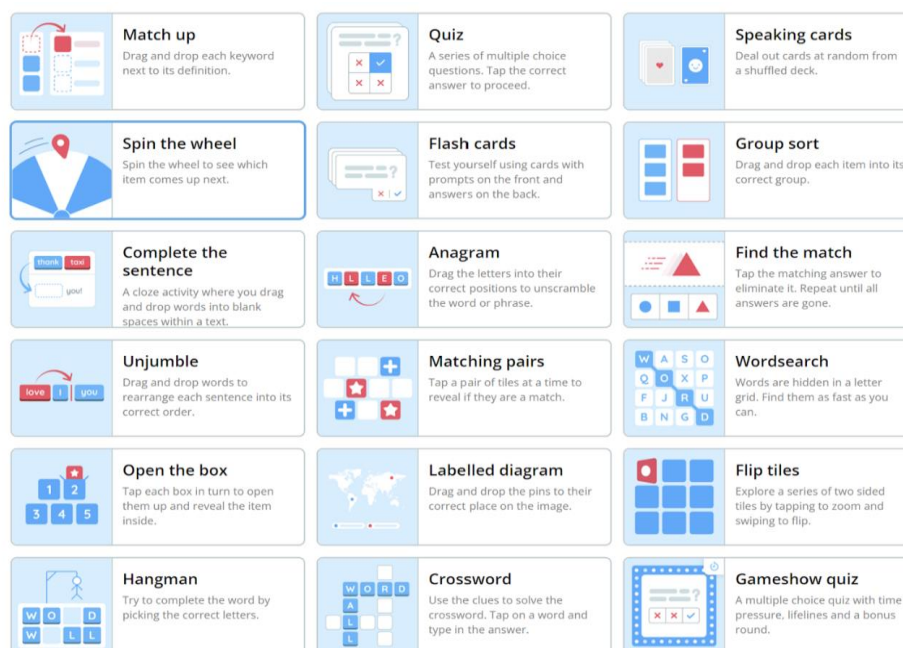

Figure 12. Templates of Wordwall application

According to TAM by Davis (1989) (Technology Acceptance Model), the three elements including PEOU (perceived ease of use), PU (perceived usefulness), and BI (behavioral intention to use) are applied to investigate students' perception of using Wordwall website in vocabulary memorization. In this research, PEOU refers to the degree to which students can use this tool with effortlessness, and PU involves the degree to which students believe Wordwall could aid them in better vocabulary memorization. As shown in the figure, PU and BI are both influenced directly by PEOU.

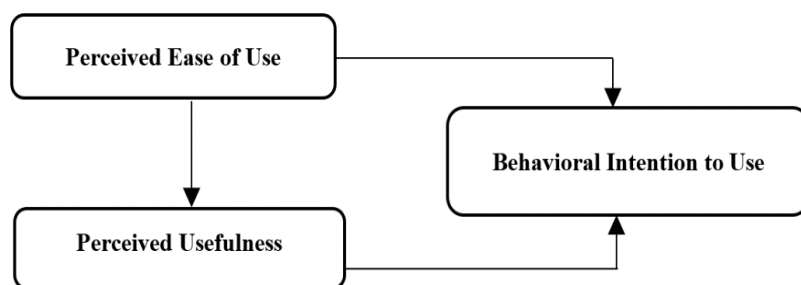

Figure 2. Aspects of acceptance questionnaire adapted from TAM model by Davis (1989)

Method

Participants

The participants of this research are students at a private university in Vietnam. The total number of participants is 75 students. All of them are asked to fill out the questionnaire. 10 out of 75 students are chosen randomly to take part in the interviews. The participants have experienced using Wordwall to enhance their vocabulary in the process of learning English.

Research instrument

Two instruments, a 14-item questionnaire, and interviews, are employed in this study. Items in this questionnaire are adapted from the research by Almarashdeh et al. (2011), there are five questions for each aspect PEOU and PU, and there are four questions for the aspect BI. These questions are based on the 5-point Likert scale, ranging between strongly disagree (1) and strongly agree (5).

The interviews include three questions related to the three aspects of the TAM such as (1) *In your opinion, is Wordwall easy for you to use? Why or why not?*, (2) *In your opinion, is Wordwall useful for you to learn vocabulary? Why or why not?*, (3) *In your opinion, will you use Wordwall to learn vocabulary in the future? Why or why not?* These questions are open-ended and the interviews are designed as semi-structured ones. To guarantee the reliability of the questionnaire during the procedure of collecting quantitative data, the value for Cronbach's alpha is measured with sufficiency for the data collection with the value of .970.

Reliability Statistics

Cronbach's Alpha	N of Items
.970	14

Figure 3 Results of Cronbach's Alpha for the questionnaire

Results

Results from the questionnaires

Table 1. Mean score of students' acceptance of using Wordwall platform in vocabulary memorization

	N	Minimum	Maximum	Mean (M)	SD
Students' acceptance of using Wordwall platform in learning vocabulary	75	1.71	5.00	4.15	.86

Table 2. Mean score of the three aspects of students' acceptance of using Wordwall platform in vocabulary memorization

Aspects	N	Minimum	Maximum	Mean (M)	SD
Students' perceived ease of use of using Wordwall	75	1.00	5.00	4.23	.89
Students' perceived usefulness Wordwall	75	1.80	5.00	4.15	.89
Students' behavioral intention to use Wordwall in the future	75	1.75	5.00	4.05	.94

The results from the 14 questions are shown in Table 1. It can be seen that students' acceptance of Wordwall platform is considerably positive ($M = 4.15$, $SD = .86$). Mean score of the three aspects in Table 2 shows that students' perception of Wordwall platform is at a quite high value (from 4.05 to 4.22).

Table 3. Students' perceived usefulness of using Wordwall platform in vocabulary memorization

	N	Minimum	Maximum	Mean (M)	SD
1. Wordwall allows me to understand vocabulary lessons more quickly.	75	1	5	4.29	.99
2. Wordwall enhances my effectiveness in learning vocabulary.	75	1	5	4.27	1.01
3. Wordwall increases my interest in learning vocabulary.	75	1	5	4.09	1.05

4. Wordwall helps me reinforce my vocabulary lessons.	75	1	5	4.25	.93
5. Wordwall has a variety of templates which motivate my vocabulary memorization.	75	1	5	4.24	.97

Table 3 shows that students' vocabulary retention and understanding improved when using Wordwall platform which has the highest value ($M = 4.29$, $SD = .99$). Students agree that using Wordwall can boost their interest in studying vocabulary although it has the lowest value in the table ($M = 4.09$, $SD = 1.05$). This indicates that students are more excited when using Wordwall platform in their study. The other values are fairly high (From $M = 4.25$ to $M = 4.27$). In conclusion, nearly all of the students agree that Wordwall platform is useful for their vocabulary learning.

Table 4. Students' perceived ease of using Wordwall platform in vocabulary memorization

	N	Minimum	Maximum	Mean (M)	SD
6. My interaction with Wordwall is clear and understandable.	75	1	5	4.11	1.10
7. Searching vocabulary exercises from Wordwall is easy.	75	1	5	4.08	.98
8. I find Wordwall easy to use.	75	1	5	4.25	.97
9. Wordwall is easily accessible.	75	1	5	4.15	1.04
10. Templates of Wordwall are understandable.	75	1	5	4.19	.96

According to Table 4, students find that Wordwall platform is easy to use and has the highest value ($M = 4.25$, $SD = .97$). Students find that there are no difficulties in searching for vocabulary exercises from Wordwall even though this value is the lowest among the five values ($M = 4.08$, $SD = .98$). Other positive values (from $M = 4.11$ to $M = 4.19$) indicate that students can easily get access to Wordwall and find its design understandable. In short, students' perception of the ease of use of Wordwall is highly positive.

Table 5. Students' perceived behavioral intention to use Wordwall platform in vocabulary memorization

	N	Minimum	Maximum	Mean (M)	SD
11. I would recommend Wordwall to my friends.	75	1	5	4.15	1.06
12. I intend to increase my use of Wordwall in the future.	75	2	5	4.07	.99
13. I would use Wordwall to practice more	75	2	5	4.08	.97

vocabulary exercises outside the classroom.

14. I plan to use Wordwall in the next three months.	75	1	5	3.91	1.09
--	----	---	---	------	------

According to the statistics from Table 5, students are likely to recommend Wordwall to their friends which has the highest value among the four values ($M = 4.15$, $SD = 1.06$). Furthermore, a majority of the students intend to use Wordwall in the next three months which has the lowest value in the table ($M = 3.91$, $SD = .99$). The other two values are considerably high ($M = 4.07$ and $M = 4.08$) showing that students will use Wordwall in their studying, especially for vocabulary memorization. To conclude, students' behavioral intention to use Wordwall for vocabulary memorization is positive.

Results from the interviews

Students' Perceived Usefulness of Using Wordwall Platform in Vocabulary Memorization

Ten out of ten students find Wordwall useful for vocabulary memorization, which provides students with lots of diversified templates in its platform.

"Very useful as it helps me learn vocabulary easier"

(Student 5, interview extract)

Four out of ten students admit finding Wordwall useful because it provides various templates and exercises for them to choose from.

"It has many exercises, doing them help me memorize better"

(Student 1, interview extract)

"We can choose exercises from many different exercises, which improve our memorization"

(Student 3, interview extract)

"Extremely useful, it has various exercises"

(Student 7, interview extract)

"Totally useful, a range of vocabulary can be played in different forms of exercises"

(student 8, interview extract)

Students' Perceived Ease of Use of Wordwall Platform in Vocabulary Memorization

Ten out of ten students agree that Wordwall is easy to access as it only needs a link to enter. Saving students' time when they want to memorize their vocabulary knowledge.

"I find it easy to use as we can play right away just by clicking the link"

(Student 1, interview extract)

"Wordwall is fairly easy as you can access the games from the link"

(Student 9, interview extract)

Interestingly, one of the students also states that Wordwall is easier than other apps.

"It is easier than Quizizz because you don't have to name or enter a code"

(Student 7, interview extract)

Students' Behavioral Intention to Use Wordwall Platform in Vocabulary Memorization

Ten out of ten students intend to use Wordwall for their study in the future. A big part of this intention is because of the new experiences that Wordwall gives students.

"I will definitely use it because it easy, good, and it is quite new"

(Student 3, interview extract)

Some of the students plan to use Wordwall as it helps them to enhance their study quality.

"I will learn Wordwall with other platforms to increase my interest when learning vocabulary"

(Student 1, interview extract)

One of them wants to learn Wordwall for their own purposes.

"I will use Wordwall for learning single words, but not for learning phrases and idioms"

(Student 2, interview extract)

Discussion

The target of this study is to examine how students accept the use of Wordwall platform in their vocabulary learning in their perceived ease of use, perceived usefulness, and behavioral intention in the future. The interesting results from the questionnaire and interviews show that students are excited to use Wordwall platform for vocabulary learning. According to Swari (2023) study results, which are matched with the results of this study, Wordwall helps students' vocabulary learning become more intriguing and productive. Furthermore, the findings regarding ease of use in the study conducted by Swari (2023) are similar to the results obtained in our study, accessibility of Wordwall has no challenges in any case for students and teachers as Wordwall is just one click away from using it. This study agrees with the study by Anjani et al. (2023) that Wordwall can be used as a tool that helps students to find enthusiasm in their vocabulary learning. In terms of perceived usefulness, the study from Umar et al. (2023) and Rodríguez-Escobar et al. (2023) are consistent with the findings that Wordwall exercises aid students' vocabulary memorization. Accordingly, the TAM model shows that students' perceived ease of use aspect has a considerable influence on students' perceived usefulness which leads to the behavioral intention of students to use Wordwall platform soon. The results from the interviews show that 100% of the students will use Wordwall in the near future with 20% of them will use it with other educational games. In conclusion, Wordwall is an educational game that teachers can make use of it to enhance students' vocabulary learning experience and knowledge.

Conclusion, Limitations & Recommendation

Based on the results, students' perception of using Wordwall in vocabulary memorization is positively high. The results in this study share a major of similarities with other researchers' results which can conclude that Wordwall is a useful tool for vocabulary acquisition and teaching languages. This study also points out the importance of vocabulary, especially vocabulary memorization skills. However, the number of participants is the first limitation of this study as the results from 75 participants can accurately decide whether or not

Wordwall is the best platform for studying vocabulary. The second limitation is that the participants were not exposed to Wordwall long enough to confirm the credibility of this study. The participants' answers could be more accurate if they were given more time using Wordwall to study. It is recommended that teachers should be a part of this study with the students so that the results can be more credible.

Acknowledgments

Sincere gratitude to those who participate in the research. Without their contributions, the study cannot be finished as expected.

Prefixes of Present Tense Between Arabic & Amharic Languages: A Descriptive Analytical Comparative Study

Prof. Dr Labidi Bouabdallah

Mohamed Bin Zayed University for Humanities, Abu Dhabi – UAE,  <https://orcid.org/0000-0001-9056-486X>

Usra Hassen

Mohamed Bin Zayed University for Humanities, Abu Dhabi – UAE,  <https://orcid.org/0009-0004-9058-8190>

Abstract: This research seeks to identify the characteristics of verbs in Arabic and Amharic languages to find out the similarities between the two languages at the level of present tense verbs and its indicator prefixes. It also contributes to revealing the relationship and similarities between them. The research followed the comparative descriptive approach. The limit of the research is represented in the Amharic language and its relation to the Arabic language. This research includes three topics, the first topic: the relationship between Arabic and Amharic language, the second chapter: verbs in the Arabic and Amharic languages, and the third and final topic: the Prefixes of present tense in the Arabic and Amharic languages. The research concluded that the Arabic and Amharic languages are similar in many characteristics, as they belong to the family of Semitic languages, in addition to other factors that led to direct contact between them. As for the present tense verbs, the two languages are identical in three prefixes, which are /Alif/(A), /Taa/ (T) and /Yaa/ (Y), and they differ slightly in the prefix of the first person plural (We), in Arabic it is the letter /Noon/ (N), while Amharic uses two letters, /Alif/ (A) and /Noon/(N).

Keywords: Letters of present tense (hurūf 'al muḍāra'a), Prefixes of present tense, Arabic language, Amharic language, Semitic languages

Introduction

Language comparison is one of the most important linguistic areas that focuses on studying linguistic relations between two languages or dialects from the same family, as well as the phenomena of linguistic influence and impact between languages. Languages have been divided into families based on their similarities and differences, and the occurrence of isolation among individuals of the same language due to geographical, political, social, or other reasons resulted in variations in the dialects of the same language.

Comparing languages at their different levels is one of the most important studies in linguistic research. It aims to understand the common phenomena between languages that belong to the same language family, such as the Arabic and Amharic languages, or what was known in the past as the Abyssinian language. Both languages belong to the Semitic language family, which originated from the Afro-Asiatic language family. This family includes several languages that were widespread in Asia and Africa since ancient times, such as Arabic, Syriac, Hebrew, and Amharic.

Many linguists and researchers have been involved in studying Semitic languages of the most important and oldest civilizations in history. Studies have focused on uncovering the historical and linguistic relationships between the languages in this family, as they possess common and similar linguistic characteristics.

One of the linguistic archaeological issues they noticed is that the Amharic language has preserved elements of ancient Semitic linguistic features that are lost in other Semitic languages, especially in terms of style. (Wolfson, 1929, p.129). It can be said that the Arabic language is the closest Semitic language to the original Semitic language because it lived with the illiteracy of the Arabs, preserved from change and substitution. (Dhadha, 1990, p.25) This may have been the reason for their similarity in several elements, especially in terms of the morphological level, like in verb conjugation and the prefixes of the present tense.

This research aims to demonstrate the fact that the relationship between the Arabic and Amharic languages originated due to their common origin. The relationship between the two languages is linked to the common features that both have inherited from the mother Semitic language. This relationship has resulted in similarities in phonological, morphological, syntactic, and semantic structures.

The desire to compare between the Arabic and Amharic languages on the level of prefixes of present tense arose due to the fact that Amharic is the native language of one of the researchers, and on the other hand, since it was known that both languages belong to the same linguistic family, referring to what Abu Hayyan Al-Andalusi (d. 745 AH) mentioned in his book “Jalā’u ’al-ğabaš ‘an Lisāni ’al-habaš” regarding the nature of the relationship between the two languages and the points of agreement between them, including the prefixes of present tense. This motivated the researchers to explore the similarities between the two languages (Arabic and Amharic) in order to confirm and analyze them using modern linguistic and methodological approaches.

In addition, Amharic language is given less attention from linguists in the field of comparative studies, particularly compared to Semitic languages, and specifically to the Arabic language.

Problem of the research:

This research attempts to answer the following questions:

- What are the similarities between the Arabic and Amharic languages in terms of characteristics, verb tense classification, and verb conjugation?

- Where does the similarity between Arabic and Amharic lie in terms of prefixes of present tense specifically regarding the syntactic and morphological aspects?
- Does the phonological aspect of Arabic have an influence on the pronunciation of prefixes of present tense in Amharic language?

- The importance of the research:

The importance of this research lies in its novelty, as it addresses a new topic that has not been previously studied. It compares the prefixes of present tense in the Arabic and Amharic languages, which is a new addition to the study of Semitic languages in general and Amharic grammar in particular. These letters have not been classified as prefixes of present tense, despite their temporal and morphological functions.

Additionally, the research is not limited to linguistic aspects, but extends to historical, cultural, and civilizational aspects spotting the relationships between the Arab and Ethiopian society, and touches on deeper issues that determine the reasons for direct interaction between the two languages.

Furthermore, this type of comparative research is important in terms of contrast, as it shows the similarities and differences between the two languages in terms of their phonetics. This contributes to enriching the applied linguistic aspects, particularly in facilitating language teaching strategies for both languages.

Research Objectives:

Through the raised questions, we can summarize the research objectives as follows:

- To reveal the relationship and similarities between the Arabic and Amharic languages.
- To identify morphological features of the verb in both Arabic and Amharic.
- To understand the similarities in verb conjugation in general and the prefixes of present tense in particular.
- To examine the pronunciation of prefixes of present tense in some Arabic dialects and their influence on the pronunciation of these letters in Amharic.

Research methodology:

The nature of the current research demands the descriptive and analytical approach to track the prefixes of present tense between Arabic and Amharic language. This also requires the comparative method that emerges from the core of comparative linguistic orient.

Research Plan:

The research includes an introduction, three sections, and a conclusion. The first section discusses the

relationship between the Arabic language and Amharic language. The second section will focus on verbs in the Arabic and Amharic languages. The third section will discuss the prefixes of the present tense in the Arabic and Amharic languages. The fourth and final section will address the pronunciation of prefixes present tense letters in Arabic dialects and the Amharic language.

Literature Review:

As mentioned earlier there are no specific studies that have addressed the topic. However, there are relevant studies:

1. The study by researcher Omar El-Sayed Abdel-Fattah Amer, titled Verbs in the Amharic Language: A Morphological Study (2005):

This study is the first to address the topic of verbs in the Amharic language in Arabic. The researcher attempted to provide a deeper and more comprehensive understanding of verb study, contrary to previous studies. This was achieved by presenting verb forms in terms of abstraction and augmentation, as well as verb forms that respond to the abstract verb in the Amharic language. Additionally, the study examined the verb augmentations, prefixes, and their various morphological meanings using a descriptive analytical approach.

The study revealed that the majority of Amharic verbs follow a standardized manner, with a few exceptions. It also illustrated that verbs in Amharic behave to express various inflectional meanings, such as indicating tense, direction, condition, person, gender, and number.

2. A comparative study between Amharic and Arabic languages at the verb level by Maymoona Kebed (2018):

This research is a comparative study between the Arabic and Amharic languages at the verb level that aims to explore the similarities and differences between the two languages using the historical, descriptive, and comparative approaches. The researcher's results reveal that both languages agree that the verb revolves around an action, with the Amharic language differing in terms of verb indicators. Regarding word order, the verb is positioned at the end of the sentence in Amharic, except in certain cases in poetry. The study also demonstrates the resemblance between the two languages in terms of verb tense and the classification of verbs into transitive and non-transitive.

The current research is related to the previous two studies about the verb, but the difference lies in the fact that this research focuses on the present tense markers and the similarities between the two languages in this morphological study. On the other hand, the two previous studies have focused on highlighting the similarities and differences in verb structures in Arabic and Amharic, identifying the characteristics of the verb in terms of morphology and syntax. Meanwhile, the current research focuses on the similarity between the two languages in the usage of prefixes of present tense, as well as relating these markers with their pronunciation in various Arabic dialects that have brought the similarities closer.

Difficulty of the research:

The difficulty of this research lies in finding sources and references that discuss the verb conjugations in the Amharic language. Therefore, the researchers conducted an interview with a specialist professor in both the Arabic and Amharic languages at Addis Ababa University.

The second difficulty was in searching for previous studies that included a comparison between the Arabic and Amharic languages, specifically on the level of the verb.

I. The relationship between the Amharic and Arabic languages:**A. The origin and history of Arabic language:***1. The origin of the Arabic language:*

Arabic is attributed to the Arabs who existed in their lands before they were known by this name among their neighbors. They had an Arabic language that they spoke, which evolved over time. (Scientist, 2004, p.127) Abdul Ghaffar Hamed Hilal mentions that there are different opinions about who first spoke the language, with three main opinions:

1.1. It is said that it originated from the tongue of Ya‘rub bin Qahtan, who was the first to speak it, and then it spread to the rest of the Arabs.

1.2. The second opinion is that the Prophet Ismail was the first to speak the Arabic language after forgetting his father Ibrahim's Hebrew language.

1.3. The third opinion is that Arabic was the language of the Arabs who perished before Islam, such as the 'Ad and Thamud, and this is the most accurate opinion. (Hilal, 2004, p.138-139)

It is known that there were ancient and modern Arab tribes. In ancient times, there were Arab tribes and kingdoms that were attributed to them, such as the 'Ad and Thamud. 'Ad inhabited the region of Al-Ahqāf in the south of the Arabian Peninsula, while Thamud resided in Al-Hijr in the north of the peninsula, between Al-Hijāz and Al-Sham. (Hilal, 2004, p.127).

2. The development and spread of the Arabic language:

The Arabic language carries within its reasons for its spread. It is the language in which the Quran was revealed, and it is beyond the ability of the Arabs with their words, style, and structures to produce anything like it. The Quran also mentions the existence of other languages, stating: And of His signs is the creation of the heavens and the earth and the diversity of your languages and your colors. (Al-Rūm Chapter: 22)

The Arabic language is one of the oldest languages in the world, with a history of over fifteen centuries (some argue that it is seventeen centuries old), and it is still alive and spoken by hundreds of millions of people. (Al-

Awdat, 2015, p.2). Ahmed Dhadha says, The Arabic language is the closest Semitic language to the original Semitic language, as it remained unaffected by changes and substitutions in the Arabic illiterate society. (Dhadha, 1990, p.25) The term Semitic is derived from Sam, the son of Noah. The scientific usage of the term Semitic dates back to 1781, when the German linguist Schlözer suggested that the peoples who established civilizations in West Asia are linguistically and historically connected, as well as somewhat connected in terms of ancestry. (Dhadha, 1990, p.8).

The unified Arabic language spread throughout the Arabian Peninsula with the spread of Islam. Just as Islam united the Arabian Peninsula as one community, the languages of this peninsula were unified under the language of the Quraysh tribe. This language became the common language among the tribes of the peninsula and its inhabitants.

The reason for its widespread use, more than any other language, is its association with the Quran and its status as the language of worship for all Muslims. Therefore, the Arabic language surpassed all other languages spoken by Muslims and became the common literary language in most cases.

A'bdelghaffar Hamed Hilal states that, historical facts indicate the sovereignty of the Quraysh tribe and their dialect existed before Islam. Islam came and found the general language represented in most of the Quraishi linguistics, so it was revealed in this language. This was consistent with the common linguistic reality in the Arab environment at that time.

B. The Amharic Language: Its Origin, Development, and Spread:

1. Origin and History of the Amharic Language:

Ethiopia is a multilingual country, with the number of national languages ranging from 70 to 80, divided into three language families. The Amharic language is at the forefront of these languages, as it is the official language of Ethiopia. (Abdel-Fattah, p.1).

The Amharic language is derived from the ancient language of Ge'ez, which is the language of Ancient Ethiopia, attributed to the Ag'az tribe or Ge'ez, who came from the southwestern Arabian Peninsula. They formed the Kingdom of Axum, and this language has preserved its existence in the current Tigray region. (Hamed, p.120, Wolfson, p.254).

Amharic is the oldest Semitic language in the land of Abyssinia (Wolfson, p.254), and it belongs to the South Semitic branch of the Afro-Asiatic language family. Some Greek words had infiltrated into the Ge'ez language before the spread of Christianity in the land of Abyssinia, along with some words from Syriac, Hebrew, and Arabic. However, all these elements did not have an influence on the origin of the language (previous reference, p.261). The Ge'ez language continued to be used until a later period as the main literary means of expression in

Ethiopia, after it was introduced by Christianity in the year 340 AD (Gesese, p.33).

2. Development of Amharic language and its spread:

Amharic remained the language of conversation, while Geez was used for authorship. However, when missionaries started heading towards the land of the Abyssinians, they translated religious books into Amharic to establish a connection between all the factions in the country. As a result, Amharic flourished and replaced Geez in writing and authorship in both religious and worldly affairs.

The Amharic language is originally the dialect of the Amhara tribes (referring to the Amhara region). Its popularity expanded after the Amhara dynasty took power, replacing the Ge'ez language in communication. It flourished and is now the official language in Ethiopia. Historians believe that the Amhara tribe is one of the Arab tribes that migrated to this region from southern Arabia. Its original homeland was Hadramout and Sheh'r, and it is one of the clans of the Muhra tribe found there. It is the official language in Ethiopia, despite the presence of numerous languages, and many Ethiopian inhabitants speak it as it is the official language. It is the language of education in schools and serves as a means of communication among the people. Ge'ez is now unknown even among religious leaders and scholars of the Ethiopian culture (Wolfson, p.266). In modern times, Amharic is the most widely spoken language in Ethiopia and is spoken by the majority of Ethiopians.

C. Similarities between the Arabic and Amharic languages:

As indicated previously both languages belong to the Semitic branch; therefore, they share many words, grammatical and morphological rules, with the presence of other factors that have brought the two languages closer together, such as geographical proximity, Arab migrations, and the emergence of Islamic kingdoms in Abyssinia.

Some of the most important similarities between the two languages are:

1. Phonological aspect:

Most of the sounds of Arabic letters are similar to the sounds of Amharic letters. Like the guttural letters, Abd El-Ghaffar Hamed Hilal believes that the guttural letters - especially the /ha/ and the /'ayn/ - exist in their correct pronunciation in Arabic, Hebrew, and Amharic, and the disappearance of some sounds; such as: that in some Semitic languages that have originated. (Hilal, p.92).

2. Derivation:

The majority of the vocabulary in these two languages originates from a trilateral root (with some bilateral roots

as well). Vocabularies are composed of roots, from which words are derived and generated by adding suffixes and prefixes. (Dhadha, p.21).

3. Verbs:

Both languages agree that the verb revolves around an action, and they also agree in classification of the tenses of the verbs (will be explained later in the coming section), and the origin of verbs in both languages is the past form.

The Amharic language takes the conjugated form of the verb from the third person singular as a model for the verb conjugations, as is the case in most Semitic languages, due to its simplicity and abstraction. (Abdel-Fattah, p.90)

4. Classification of sentences:

There are two types of sentences in Semitic languages: nominal and verbal. In a nominal sentence, the predicate is represented at the beginning of the sentence and the rest of the sentence functions as the subject. In a verbal sentence, the verb is placed at the beginning followed by the subject. (Hilal, 2004, p.95).

5. Irregular Plural formation:

Arabic and Amharic are Semitic languages that use irregular plural in addition to regular plural, and this plural is formed through internal changes. (Previous reference, p.95)

6. Masculine and Feminine:

In Semitic languages, nouns and adjectives are divided into masculine and feminine genders (Hilal, 2004, p.96). They both lack a fixed rule for distinguishing between masculine and feminine genders like the original semitic languages (Wolfson, 1929, p.262).

7. Similarities in words:

Arabic and Amharic languages share many words that have influenced each other. Some Arabic words have entered the Amharic language and other Ethiopian languages due to factors such as migration. Some words have not changed at all, such as the word horse (فرس/ፈረስ), eye (عين/ ዓይን), and house (بيت/ ቤት). Other words deviate slightly from Arabic, such as the word devil (شیطان/ ስይጥን) which is /saytan/ in Amharic and /šaytan/ in Arabic. There are also common words between the two languages without any indications of one preceding the other in usage (Hameddeen, 2007, p.251-252).

8. Morphology:

Arabic and Amharic are morphological languages, meaning they are inflected languages that change their words and combine roots and affixes with links between the different parts of their structure.

II. Characteristics and Classifications of the Verb in Arabic and Amharic:

This topic discusses the most important characteristics of verbs in Arabic and Amharic languages, including the classification of verbs and their different conjugations. It also highlights the similarities between the two languages in terms of verbs.

A. Definition of the verb in Arabic and Amharic languages:

The verb is one of the components of speech found in all languages of the world, and the verb in the Arabic language is an important element in making the sentence. Ancient grammarians have paid attention to the issue of the verb in their grammatical discussions, and modern scholars have also focused on the same topic in their modern grammatical and linguistic studies.

In Amharic language, the verb is the foundation of the sentence and is necessary. Its presence in the sentence allows us to know what happened, when it happened, and clarifies the extent of the comprehensiveness of the meaning of speech or the sentence.

1. Definition of the verb in the Arabic language:

According to Sibawayh verbs are taken from the words that indicate actions and it is structured for the past, for the future, and for what is happening continuously. As for the structure for the past, present and future it includes verbs like went, heard, stayed, and praised. As for the structure for what has not yet occurred, it includes sentences like “Go”, “Kill”, “Strike”, and for the continuous happening, it includes sentences like “He kills”, “He goes”, “He strikes”, “He is killed”, “He is struck”. And likewise, for the structure of happening continuously, if it is something continuous. (Sibawayh, 1988, 1/12)

Al-Zamaxšari says in Al-Mufaṣṣal: The verb indicates the occurrence of an event in a certain time, and its characteristics include the acceptance of the particle /qad/, as in saying /qad fa‘ala/ (he did), /qad yaf‘alu/ (he might do) acceptance of will or shall, like /sayaf‘alu/, /sawfa yaf‘alu/ (he will do) the constraints , /lam yaf‘al/, its connection with pronouns as in /yaf‘alna/, /if‘ali/ (they do, you do), and the feminine tā’ like , /fa‘alat/ (she did), (Al-Zamaxšari, 1/ 319)

2. Definition of the verb in Amharic:

Tekle Mariam Fantaye defined the verb as an indicator of the occurrence of an action or the action of something by a human or irrational beings (Fantaye, P.45).

Blata Mersie defined the verb as: Something we want to talk about or write about, and it specifies the occurrence of an action or an event; therefore, we add the verb at the end of the sentence, and then the meaning of the sentence becomes complete, and the word we put at the end of the sentence is called /ankats/ verb, which indicates the type of the action (Wolde Qirqos, P.74).

B. Types of verbs in the Arabic language:

Sibawayh divides the verb tense into three categories: the past, future, and present continuous (Sibawayh, 1988, 1/12). According to this statement, the tenses are past, future, and present, which are the absolute tenses and any other tense is a branch of these tenses (Tawama, p.3).

This division is due to the inclusion of two different time frames in the present tense, which are the present and the future. The basis on which this division is built is not time itself, but rather the accomplishment of the event. Whatever has been accomplished is considered past, whatever has not been accomplished is considered present, and whatever is likely to be accomplished or not is considered imperative. (Sakhnini, p.22)

The original division of verbs based on tense is past, present, and future. However, linguists have modified this division to include past, present, and imperative, taking other factors into consideration. (See: Al-Fakhri, 106). Arabic expressions of time are characterized by high flexibility, providing speakers with various linguistic means to accurately express temporal meanings and variations in any discourse context.

The Arabic language relies on grammatical or contextual tense, without the need to provide all the corresponding forms for different expressions. (Boudjadi, p.1)

And from the division of the verb according to its meaning, it can be classified into active and passive forms. The verb in the active form has a subject (noun or pronoun), who is the doer of the action. The verb in the passive form has its subject removed and is replaced by another. (Qabawa, p.248-249)

And from the division of the verb according to meaning, there is also the /'al-fi'l 'al-mutasarrif/ transitive or declinable) and /'al-fi'l 'al-Jāmid/ (intransitive or indeclinable) verb. The transitive verb is one that accepts transformation to indicate meanings in different tenses, while the intransitive or modal verb is similar to a letter that has one form and does not accept transformation to indicate meanings in different tenses.

Verbs in Arabic language are also divided into infinitive and the intensified verb or abstract and complex verbs. The infinitive or abstract verb is one that all its letters are original without any prefix or suffix. The intensified or complex verb is one that has one or more additional letters (Qabawa, p.27).

C. Types of verbs in Amharic:

Most of the Amharic linguistics agree that verb tense in Amharic is divided into three main categories:

- Past tense, which indicates an event that occurred in the past, before the time of speaking. For example: መጣ [meta] - came.

- Present tense, which indicates an event happening during the time of speaking. For example: እየመጣ ነጩ [eyemeta new] - is coming.

- Future tense, which indicates an event that will happen in the future. For example: ይመጣል [yemetal] - will come. However, there is a debate about the extent to which the verbal system expresses these tense distinctions, in that the tense of the verb can be distinguished through inflectional means. This debate is not limited to the Amharic language only, but it arises in Semitic languages in general. Tsehay Tewolde states in this regard that tense is one of the most complex issues in the study of Semitic linguistics. (Tewolde, p.p.552-562).

Others believe that Amharic has grammatical distinctions for verb tenses, where the past is expressed through conjugational suffixes, and the present and future are expressed through conjugational prefixes as well as some suffixes.

Some (such as Hetzeron, Bender, and Isenberg) believe that the Amharic language has only two tenses, the past and the present, and that the present tense is also used to express the future. (Abdel-Fattah, 2005, p.94)

D. Verb conjugation in Arabic language:

Verbs are conjugated in Arabic language by assigning them to different pronouns (explicit or implicit) or to explicit nouns. The verb cannot be used without being assigned to a subject. Verb conjugation involves deriving some forms from others, such as /kataba/ in the past tense, and /yaktubu/ in the present tense (indicative or subjunctive). It also involves deriving the doer (kātib) and the object (maktūb) from the verb. In all these cases, there is a slight or significant change in the structure of the word, and every change that occurs in the structure of the word is considered verb conjugation. (Al-Fakhri, 1996, p.p.34-35)

E. Verb conjugation in Amharic language:

The verb in the Amharic language is conjugated to express several conjugational meanings, indicating tense and aspect (completed or ongoing), mood (indicative, imperative, or potential), person, gender, and number. In doing so, it utilizes more than one formal conjugation method to convey these conjugational meanings. (Abdel-Fattah, 2005, p.90)

When conjugating a verb, the root is usually fixed and does not change with different conjugation forms (Blata,

p. 118). For example, the verb ቆመ Qome (stood) remains the same in all conjugation forms: ቆመ Qome (he stood), ቆመች Qomech (she stood), ቆመን Qomn (We stood), ቆመኩ Qomku (I stood) .

F. Similarities in verbs between the Arabic and Amharic languages:

1 - Constancy of the root verb:

The root verb in both Arabic and Amharic languages often remains stable and does not change with different inflectional forms, while changes occur in prefixes and suffixes as in the previous example.

2 - Assigning verbs to pronouns:

The changes that occur to the verb when it is assigned to pronouns are similar in both languages. For example, in the past tense verb, no prefix enters before the verb. There are only suffixes added to the end of the verb and they change according to the pronoun.

For example, in the past tense verb (سَمِعْنَا) (we heard), the suffix “نا” is added to indicate the pronoun (we). Similarly, in Amharic language, the verb ሰማን [saman] which means (we heard) in Arabic, has the suffix "ን" added at the end to indicate the same pronoun (we).

In the present tense verb, there is a prefix before the verb, which is known as the letters or prefixes of present tense, and we will discuss them in the third section.

3 - The verb tense:

The verb tense is divided into three in both Arabic and Amharic languages, two of which are present and past tense, which they both agree on, while Amharic includes future tense and Arabic includes imperative tense. For example, the future tense verb in Amharic is ይመጣል [Yemetal] which means will come.

This does not mean that there are no forms for the future tense in the Arabic language, or forms for the imperative in the Amharic language.

Also, the present tense in both languages includes two different tenses, which are present and future.

4 - Transitivity of the verbs:

The Arabic language shares with the Amharic language the division of verbs into transitive and intransitive, such as አነበ [Anebebe] meaning he read which is an intransitive verb, and አስነበ [Asnebebe] meaning make

someone read which is an intransitive verb. However, Arabic differs from Amharic in dividing transitive verbs into three categories.

5 - Abstract verbs:

The Arabic language agrees with the Amharic language on the existence of the abstract verb, which consists of all its original letters, and the verb more, in which one or more letters are added to its original letters. Examples of this in the Amharic language are: /heda/ ካደ which is a simple verb, and /argafagafa/ አርገፈገፈ meaning I drop, which is a complex verb with the letter A added.

6 - The implication of the present tense verb:

The present tense verb indicates the occurrence of an event in the present or future in both Arabic and Amharic languages. This is dependent on the context and clues provided. For example, in Amharic, the sentence ሙሐመድ ውሃ ይጠጣል [Muhammed weha yetetal] translates to Muhammed drinks water. If we add a clue like tomorrow (ነገ) to the sentence, the verb indicates the future tense, like ሙሐመድ ነገ ውሃ ይጠጣል [Muhammed nageweha yetetal] meaning Muhammed will drink water.

III. Prefixes of present tense in Arabic and Amharic Language:

The indicator letter of the present tense are: “Hamza”, “Nūn”, “Tā”, and “Yā” (أ ن ت ي), which are placed at the beginning of the present verb. Their addition in the beginning is compulsory and is actually part of its characterization. (Al-Qurni, 2002, p.6).

A. Prefixes of present tense for the first-person pronouns (singular and plural):

In Arabic, the present tense letter for the first-person singular, for both male and female, irrespective of whether the verb is trilateral, quadrilateral, intransitive, or transitive, is (أ) such as: أدرس (I study), أتحدث (I speak), أستنشق (I inhale). In Amharic, the present tense letter for the singular speaker, for both masculine and feminine, is “ኧ” derived from the letter “አ” A and it phonetically corresponds to the sound “’al-hamza”.

For example:

- ኧበላለሁ [Ebelalehu], meaning I eat.

- ኧሰማለሁ [Esemalehu], meaning I hear.

B. Prefixes of present tense for Second Person pronouns (singular, dual, plural):

The present tense letter used in the Arabic language for the second person singular masculine, second person

singular feminine, second person dual masculine and feminine, and the second person plural masculine and feminine is ت (ta). It is followed by different suffixes to distinguish between singular and dual/plural forms, as well as masculine and feminine forms. Examples include تَدْرُسُ /tadrusu/ (you study), تَكْتُبِينَ /taktubīn/ (you write), تَرَسُمَانِ /tarsumān/ (you both draw), تَجْلِسُونَ /tajlisūn/ (you all sit), and تَشْرَبْنَ /tašrabna/ (you all drink).

In Amharic, there is also one present tense letter for addressing males, females, and plural, and there is no dual form - as we mentioned before. The present tense form for addressing someone is "ት" derived from the letter "ተ", which corresponds to the letter "ت" in Arabic. For example:

ትበያለሽ You are eating for singular feminine. /Tebeyalesh/

You come for singular masculine ትመጣለህ /Temetaleh/

ትሰራላችሁ You all work for plural. /Teseralachu/

C. Prefixes of present tense for the third person pronouns (singular, dual, and plural):

In Arabic, the present tense indicator letter for the third person pronoun is the letter (ياء) /yā'/, except for the feminine singular and dual forms where the letter تاء (ta) is used as the present tense indicator letter. For example: هي تجلسُ /hiya tajlisu/ (she sits), هما تجلسانِ /humā tajlisān/ (they both sit), هو يجلسُ /huwa yajlisu/ (he sits), هم يجلسونِ /hum yajlisūn/ (they sit), هنَّ يجلسنَ /hunna yajlisna/ (they [feminine] sit), هما يجلسانِ /humā yajlisān/ (they [dual] sit).

Similarly, in the Amharic language, the present tense letter for the singular and plural forms of the absent pronoun is ይ (yi), which corresponds to the Arabic letter ياء. For example: ይሰራል (Yeseral) meaning he works, ይሰራሉ (Yeseralu) meaning they work. However, for the feminine singular form, the present tense marker is ት (te), which corresponds to the Arabic letter تاء. For example, ትመጣለች (Temetalech) meaning she comes.

It should be noted here that researchers did not mention the present tense markers for the dual and feminine plural due to the absence of dual and feminine plural forms in Amharic language. However, studies indicate that in Ge'ez, the original language of Amharic that we referred to earlier, there is a feminine plural in pronouns and verbs. And every language has its regular rules that it follows throughout its history, although days have an effect on it and introduce some changes on it (Hilal, 2004, p.3).

D. Prefixes of present tense that are pronounced with the short vowel "kasra" (i):

Abdul-Ghaffar Hilal states that the general rule among most Arabs is to read the letter of present tense with the short vowel "fatha" in all verbs except for the quadrilateral ones, where they are pronounced with the short vowel "ḍamma". However, there is what is called "talteela bahra", where the letter of present tense is pronounced with the short vowel "kasra" for verbs that have more than three letters. As for the trilateral verbs, if the verb is hollow, deficient, or duplicated, and the past tense is broken, then the language of the non-Hijazis breaks the 'al-muḍāri' except for the letter /yā' (Hilal, 1993, p.290). The practice of talteela has spread to other

tribes in the Hijaz, such as: Qays, Tamīm, 'Asd, Rabī'ah, and Huḍayl (Hilal, 1993, p.293).

Sibawayh says in this regard: This is a rule that in which the prefixes of present tense verbs are pronounced with the short vowel “kasra”. This is the case in the language of all Arabs except the people of Hijaz, and they say: /'anta ti'lamu dāka/ (you know), /'anā 'i'lamu dāka/ (I know), /hiya ti'lamu dāka/ (she knows), /nahnu ni'lamu dāka/ (we know). (Sibawayh, 4/110).

From this text, it becomes clear that there are three prefixes of the present tense that can be pronounced with the short vowel “Kasra”: the /hamza/ ('), the /tā'/', and the /nūn/. These prefixes are not pronounced with the short vowel kasra in all verb forms, but only in the present tense of the verbs whose second letter is pronounced with kasra in the past tense. (Al-Qarni, 2002, p.460).

Some researchers believe that the pronunciation of prefixes of present tense with the short vowel “kasra” is an ancient Semitic phenomenon found in Arabic, Syriac, and Amharic, and that the short vowel “fatha” in the prefixes of present tense is a coincidence in Old Arabic, as it does not exist in other Semitic languages (Hilal, 1993, p.295). The researchers confirm the existence of this phenomenon in the Amharic language, where the prefixes of present tense are pronounced with a “sukūn”, which is closer to the short vowel “kasra” than the “fatha”. Like

أَنْتَ تَعْلَمُ — أَنْتَ تَعْلَمُ

Conclusion:

This research concludes the following results:

- From a classification perspective, both the Arabic and Amharic languages belong to the Semitic language family, which is part of the Afro-Asiatic language family.
- Amharic is the descendant of the Ge'ez language, which was the ancient language of Ethiopia.
- Historical, political, and economic circumstances led to direct interaction between the two languages. The basis of this interaction was trade exchange, coexistence, migrations, and the spread of Islam.
- The Semitic languages in Ethiopia can be traced back to a common origin, which is the Ge'ez language. It was named after the Ajaza tribe or /Ge'ez/, which was one of the Arab tribes that migrated to the land of Ethiopia.

The Ge'ez language is considered the closest to the Arabic language among the Ethiopian languages, and the Amharic language ranks fourth.

- There is a similarity in the prefixes of present tense between the two languages. In Arabic, it is أَنْتَ [Anayta] and in Amharic, it is አንት [Aniyat] with a slight difference in the plural first person present tense where Arabic uses the letter nūn (النون) while Amharic uses two letters, ነ (ene) combined with ነን (yn).

- There are similarities between the two languages in several aspects, like: derivation, sentence structure,

phonetics, verb tense, and conjugation.

- In some Arabic dialects, the present tense indicator letter is pronounced with the short vowel “kasra” if the verb base has a kasra in the second letter (a vowel). This phonetic phenomenon has also had an influence on the Amharic language.

EFL Students' Perceptions on the Use of Liveworksheets in Self-study

Danh Thanh Ly

FPT University, Vietnam,  <https://orcid.org/0009-0000-5015-4989>

Abstract: In an era of rapid technological growth in education, both teachers and students alike must adapt to up-to-date learning and teaching paradigms. Liveworksheets is advantageous in offering students a compilation of interactive sheets that provide instant online feedback. Nevertheless, whether utilizing Liveworksheets in self-study is efficient has not been adequately investigated. Thus, this study seeks to examine EFL students' perspectives on using Liveworksheets for self-study by using a combination of quantitative and qualitative methods. The data was collected via a 5-point Likert scale questionnaire and a semi-structured interview with 117 university students at a private Vietnamese institution. The questionnaire was created utilizing the TAM Model as the foundational framework for examining students' perspectives on utilizing Liveworksheets for self-study. The finding revealed that students' perceptions of using Liveworksheets in self-study were favorable in terms of perceived utility, perceived ease of use, attitude toward using technology, behavioral intent to utilize the system and satisfaction. Nonetheless, some identified obstacles can facilitate EFL students strengthening their self-study skills. This study also addresses several implications for practical uses of this platform in self-study, thereby sharpening students' self-study skills.

Keywords: education, Liveworksheets, perception, self-study

Introduction

Teaching occurs both within and beyond the confines of school premises (Heng et al., 2023). In reality, self-regulated learning has played a vital role in the undergraduate curriculum, empowering students to assume responsibility for their education and develop indispensable proficiencies for life-long learning (Brandt, 2020). Moreover, self-study pursuits pertain to planning, supervision, and facilitation to aid and govern their autonomous learning (Diacopoulos et al., 2022). According to Roll (2021), self-study competency refers to a learning approach in which students independently engage in studying outside of the classroom, without direct supervision. Nevertheless, the administration of self-study endeavors poses unique obstacles and possible drawbacks (Van, 2020).

There has been a rapid development in information and communication technology (ICT) during the last twenty years, which has had a significant impact on teaching competency (Bastari et al., 2021). Also, web-based

learning applications are a direct outcome of rapid technology advancements, aiming to present students with a diverse range of real-life examples by integrating text, audio, images, videos, and animations (Barella & Linarsih, 2020). Incorporating voice and screen contact and mouse movement can contribute to an engaging learning environment (Fokides & Kefallinou, 2020).

The integration of audio and vocalization via screen touch and mouse manipulation can generate a captivating educational encounter (Fokides & Kefallinou, 2020). This can lead to the appearance of Liveworksheets as this digital tool assists educators in generating electronic worksheets that provide immediate feedback (Ransom & Manning, 2013). However, Liveworksheets has not gained significant popularity in language schools. There is a scarcity of research examining the students' perception of the efficacy of Liveworksheets, specifically in the Vietnamese context of self-studying. Hence, this exploration intends to analyze the students' viewpoints on the utilization of Liveworksheets for self-study.

1. How do students perceive the utilization of Liveworksheets for self-study?
2. What are the benefits and drawbacks of using Liveworksheets for self-study?

Literature Review

Self-study in education

Self-study aims to develop a comprehensive grasp of both the practice itself and its surrounding context (Hauge, 2021). In reality, self-study activities encompass a range of autonomous learning tasks such as conducting research, engaging in project work, completing reading assignments, utilizing online modules, and undertaking other self-paced learning activities (Bosch, 2017). Self-study can help enhance the practice level and promote academic discourse within the teacher education community, thereby contributing to the existing knowledge base (Vanassche & Kelchtermans, 2015).

The use of Liveworksheets in education

Liveworksheets is a website that offers interactive online with self-correction (Valverde, 2022). This feature renders the site advantageous for educators and learners alike. Moreover, Sukono (2018) asserted that the use of technology requires instructors to be innovative and enhance their creativity. In addition, the integration of technology in education fosters an engaging and stimulating learning environment, eliminating the monotony typically associated with traditional methods.

Sukono (2018) emphasized the need to incorporate technology in various aspects of teaching, including lesson planning, content delivery, assignment distribution, and evaluation. Liveworksheets can be accessed online, allowing students to flexibly complete activities assigned by the teacher (Agustina & Cahyono, 2023; Valverde, 2022). Teachers can save time and paper by utilizing this application, which is also beneficial for students as it is motivating and interactive (Andriyani et al. 2020).

Theoretical framework

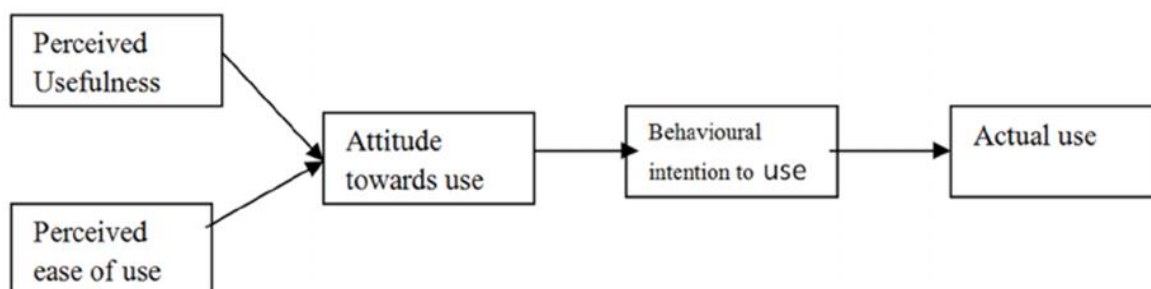

Figure 1. TAM model (Davis, 1989)

Figure 1 depicts the initial iteration of the TAM Model (Davis, 1989). This model is employed to demonstrate users' behavior in relation to technological applications (Chang et al., 2017). The present study utilized the TAM model to examine students' opinions of utilizing Liveworksheets for self-study, focusing on key criteria including usefulness, ease of use, and attitudes. Figure 1 also demonstrates that utility and ease of usage are essential in capturing students' interest and having a beneficial impact on users' inclination to utilize it. Consequently, positive attitudes might result in the intent to utilize and successful implementation.

Methodology

Research design

The paper intends to inspect EFL students' viewpoints of Liveworksheets utilization for self-learning. Hence, the use of a descriptive study methodology can facilitate the comprehensive depiction of real-time occurrences from the perspectives of multiple participants (Yin, 2003).

Participants

This paper attracted the participation of 290 EFL students, selected by convenience sampling, which aided in gathering data from those who were available for the research at that time. These are all freshmen with ages ranging from eighteen to twenty, in a Vietnamese private institution. In addition, the students possessed prior experience with the utilization of Liveworksheets for self-study for at least three months.

Instruments

This paper employed a mixed-methods strategy to address the study goals, incorporating both quantitative and qualitative data (Fraenkel & Hyun, 2012).

In the first segment, a questionnaire was utilized to gather data on the perspectives of EFL students regarding the use of Liveworksheets for self-study. Modifications were made to the Jamoom questionnaire for quantitative

research (Davis, 1989). The survey comprised a total of 23 items, which were categorized into five primary categories: perceived utility, perceived simplicity-of-usage, viewpoint regarding utilizing technology, behavioral intent to utilize the system, and contentment. Students were instructed to evaluate their views based on a scale, from 1 (strongly disagree) to 5 (strongly agree).

The next segment utilized qualitative data obtained via the interviews with unrestricted inquiries. This data can bring valuable insights into students' viewpoints regarding utilizing Liveworksheets for self-study purposes. The interview questions mostly focused on the aforementioned clusters, with the involvement of eight participants. There are six questions, including (1), Is Liveworksheets beneficial for self-study?, (2) Is Liveworksheets user-friendly for self-study?, and (3) Do you hold favorable opinions regarding the use of Liveworksheets for self-study?, (4) Will you enjoy the utilization of Liveworksheets for independent study in the future?, (5) What are the three primary benefits of utilizing Liveworksheets for self-study? (6) What are the three main drawbacks or problems of using Liveworksheets for self-study?

Several colleagues verified the survey's credibility prior to gathering data for research. The research revealed that Cronbach's alpha coefficient was 0.95, which provided ample evidence of the questionnaire's reliability. SPSS version 25 was utilized to conduct a statistical analysis of the quantitative data in order to ascertain the questionnaire's reliability.

Results

Results from the questionnaire

The 23-item survey is used to investigate students' perspectives regarding Liveworksheets for self-directed learning. An exploratory statistical analysis was performed to investigate students' perspectives regarding the utilization of Liveworksheets in self-directed study. The results are presented in Table 1.

Table 1: Mean score of students' perspectives on utilizing Liveworksheet for self-study

	N	Minimum	Maximum	Mean (M)	SD
Students' perspectives on utilizing Liveworksheets for self-study	117	3.00	5.00	4.63	0.60

Table 1 demonstrates the mean score of students' views of utilizing Liveworksheet for self-study was 4.63, with a standard deviation of 0.60. This indicates that the level of perception was very high.

An exploratory statistical analysis was conducted to examine the average scores of five groups consisting of perceived utility, perceived simplicity-of-usage, view regarding technology usage, behavioral intent to utilize the system, and contentment. Table 2 shows the outcomes of the examination.

Table 2: Mean scores of five clusters of students' perspectives on utilizing Liveworksheet for self-study

Clusters	N	Minimum	Maximum	Mean (M)	SD
Perceived usefulness	117	3.00	5.00	4.46	.68
Perceived ease-of-use	117	3.00	5.00	4.39	.78
Attitude toward using technology	117	1.00	5.00	4.40	.76
Behavioral intention to use the system	117	2.00	5.00	4.51	.68
Satisfaction	117	2.00	5.00	4.51	.80

Table 2 demonstrates that the participants' average levels of agreement varied between 4.39 and 4.51, indicating a high degree of agreement.

Students' perspectives on utilizing Liveworksheet for self-study in terms of "perceived utility".

According to Table 2, the average score of students' perspectives about the perceived utility of Liveworksheets was highly favorable ($M=4.46$, $SD=.68$).

Table 3: Students' perspectives on utilizing Liveworksheet for self-study with regard to perceived utility

	N	Minimum	Maximum	Mean (M)	SD
1. Utilizing Liveworksheets in self-study will allow me to accomplish tasks more rapidly.	117	3.00	5.00	4.63	.60
2. Utilizing Liveworksheet will boost my self-study skills.	117	3.00	5.00	4.46	.68
3. Utilizing Liveworksheets in self-study will improve my scores.	117	1.00	5.00	4.39	.78
4. Utilizing Liveworksheets will enhance the efficiency of my self-study.	117	2.00	5.00	4.40	.76
5. Using Liveworksheets will facilitate self-study.	117	2.00	5.00	4.51	.68
6. Liveworksheets would be beneficial to self-study.	117	2.00	5.00	4.31	.80

Table 3 reveals that students obtained the maximum agreement score ($M=4.63$, $SD=.60$) regarding their belief that utilizing Liveworksheets for self-study would expedite task completion. Students' self-study abilities were subsequently believed to be enhanced by Liveworksheets ($M=4.46$, $SD=.68$). Following this, the students

($M=4.39$, $SD=0.78$) held the belief that utilizing Liveworksheets would aid in the enhancement of their scores. In addition, the students held the belief that the implementation of Liveworksheets would improve the effectiveness of my independent study ($M=4.40$, $SD=.76$). Then, the students came to the conclusion that Liveworksheets would aid in independent study ($M=4.51$, $SD=.68$). Eventually, the least amount of agreement among students was that Liveworksheets would be advantageous for self-regulated learning ($SD=4.31$, $SD=.80$). Overall, the majority of students held the belief that employing Liveworksheets would facilitate their self-study. *Students' perceptions on utilizing Liveworksheets for self-study with regard to "perceived ease-of-use"*

The data from Table 2 indicates that students had a positive assessment of Liveworksheets use in self-study with regard to perceived ease of usage ($M=4.39$, $SD=.78$).

Table 4: Students' perspectives on utilizing Liveworksheet for self-study with regard to perceived simplicity-of-usage

	N	Minimum	Maximum	Mean (M)	SD
7. I think learning to utilize Liveworksheets for self-studying is effortless.	117	2.00	5.00	4.38	.76
8. I find it effortless to utilize Liveworksheets to self-study.	117	2.00	5.00	4.33	.77
9. Engaging with Liveworksheets is simple and straightforward.	117	2.00	5.00	4.40	.76
10. Liveworksheets would be straightforward and easy to comprehend.	117	2.00	5.00	4.47	.71
11. Mastering the use of Liveworksheets would be an effortless task for me to accomplish.	117	1.00	5.00	4.36	.81
12. I find Liveworksheets effortless to utilize.	117	3.00	5.00	4.54	.64

The data shown in Table 4 indicates that students found it easy to learn how to use Liveworksheets for self-study ($M=4.38$, $SD=.76$). Subsequently, few students believed that utilizing Liveworksheet for self-study was remarkably easy ($M=4.33$, $SD=.77$), which gained the lowest level in agreement. Then, The students perceived engaging with Liveworksheets as uncomplicated and direct ($M=4.40$, $SD=.76$), while they viewed Liveworksheets to be straightforward and easily understandable ($M=4.47$, $SD=.71$). Subsequently, the pupils confidently stated that acquiring proficiency in Liveworksheets would be a straightforward endeavor for them to do ($M=4.36$, $SD=.81$). Ultimately, the students discovered that Liveworksheets was extremely easy to use ($M=4.54$, $SD=.64$), receiving the lowest level of agreement. In summary, most students found Liveworksheets to be user-friendly for self-study.

Students' perspectives on utilizing Liveworksheet for self-study regarding "attitude toward using technology"

As shown in Table 2, students displayed a favorable disposition towards utilizing Liveworksheets for self-directed learning ($M=4.40$, $SD=.76$).

Table 5. Students' perspectives on utilizing Liveworksheet for self-study in terms of view toward utilizing technology

	N	Minimum	Maximum	Mean (M)	SD
13. Utilizing Liveworksheets for self-study is an excellent idea.	117	2.00	5.00	4.32	.73
14. Liveworksheets makes my study more engaging.	117	2.00	5.00	4.42	.69
15. Utilizing Liveworksheets in self-study is enjoyable,	117	2.00	5.00	4.37	.73
16. I enjoy utilizing Liveworksheets in self-study.	117	2.00	5.00	4.42	.75

Table 5 demonstrates that the least amount of respondents agreed that using Liveworksheets for independent study was a wise decision ($M=4.32$, $SD=.73$). Then, with the greatest degree of agreement, the participants claimed that using Liveworksheets for self-study was enjoyable ($M=4.42$, $SD=.75$) and that it made their study more engaging ($M=4.42$, $SD=.69$). The students then expressed a positive perception of using Liveworksheets for self-study ($M=4.37$, $SD=0.73$). In summary, most students had a favorable disposition towards utilizing Liveworksheets for self-study.

Students' perspectives on utilizing Liveworksheet for self-study with regard to "behavioral intent to utilize the system"

As shown in Table 2, the students exhibited a substantially positive behavioral intent to utilize the Liveworksheets ($M=4.5$, $SD = 0.68$).

Table 6: Students' perspectives on utilizing Liveworksheet for self-study with regard to behavioral intent to utilize the system

	N	Minimum	Maximum	Mean (M)	SD
17. I plan to utilize Liveworksheets in the future for self-study.	117	1.00	5.00	4.18	.88
18. I anticipate employing Liveworksheets for self-study in the next three months.	117	1.00	5.00	4.26	.84
19. I intend to employ Liveworksheets for self-study in the next three months.	117	1.00	5.00	4.06	.95

The results in Table 6 denoted that many students ($M=4.18$, $SD=0.88$) expressed their intention to utilize Liveworksheets for future academic purposes. The highest level of accord was then received regarding the students' expectation of utilizing Liveworksheets for self-regulated learning within the subsequent three months ($M=4.26$, $SD=0.84$). A minimal degree of consensus ($M=4.06$; $SD=0.95$) was attained when students indicated their intention to utilize Liveworksheets for self-study in the following three months. All in all, the majority of pupils intend to utilize Liveworksheets in the future for self-study.

Students' perspectives on utilizing Liveworksheet for self-study in terms of "satisfaction"

Table 2 illustrates the high degree of satisfaction ($M=4.51$, $SD=.80$) among students' perceptions of using Liveworkshetes for self-study.

Table 7: Students' perspectives on utilizing Liveworksheet for self-study in terms of contentment

	N	Minimum	Maximum	Mean (M)	SD
20. I am content with Liveworksheet's effectiveness for self-study.	117	2.00	5.00	4.33	.80
21. I am content with the user-friendly interface of Liveworksheets for self-study.	117	1.00	5.00	4.38	.77
22. I am content with the features of Liveworksheets for self-study.	117	2.00	5.00	4.35	.78
23. I support utilizing Liveworksheets for self-study.	117	2..00	5.00	4.47	.68

The findings presented in Table 7 indicate that while students expressed satisfaction with the utility of Liveworksheets for self-study, it obtained the least amount of consensus ($M=5.46$, $SD=1.51$). Similarly, with the least degree of concurrence ($M=3.82$, $SD=.92$), the students reported being pleased with the straightforward nature of Liveworksheet for self-study. They subsequently expressed contentment with the self-study functionalities of Liveworksheets ($M=4.35$, $SD=.78$). The students then voted to support the self-study utilization of Liveworksheets ($M=4.47$, $SD=0.68$). In general, the simplicity of use of Liveworksheets for self-study was appreciated by the majority of students.

Findings from the interviews

To investigate EFL students' perspectives on Liveworksheets utilization for self-study, eight students were interviewed regarding perceptions of the system's utility, usability, attitude toward technology use, behavioral desire to utilize it, and contentment.

Perceived utility

From the interview analysis, eight students concurred that utilizing Liveworksheets is advantageous for self-study. A significant proportion of participants held the view that Liveworksheets could generate an interactive setting, augment information, and improve self-study abilities. The subsequent excerpt provides substantiation for this perspective.

“I find Liveworksheets is beneficial for self-study as it provides me with multiple interactive online exercises with automatic grading. I also enjoy using Liveworksheets because it offers me many types of exercise.” (Participant 1, Interview extract).

Perceived ease-of-use

The interview analysis reported that seven participants found it easy to employ Liveworksheet for self-studying. Most students held the belief that Liveworksheets has a straightforward interface, swift accessibility, and compatibility with diverse technological devices. Student 3 opined:

“Using Liveworksheets is not too complicated. I do believe that it is easy to use Liveworksheets since I only need to select the task by entering keywords and I can access the exercise quickly.”

Student 6, however, held a contrasting perspective.

“Liveworksheets is not easy to use as it offers many types of tasks, so it takes me plenty of time to select the suitable task for my level. Some exercises are too challenging for me.”

Attitude toward using technology

The results revealed that all students held a positive perception regarding utilizing Liveworksheet for self-regulated learning, as it could boost learners’ interest, engagement, and understanding.

“I prefer to utilize Liveworksheets in self-study as it can help me study effectively. I can also practice doing more exercises and check my answers immediately.” (Participant 2, Interview extract).

Behavioral intent to utilize the system

From the interview data, eight participants expressed their intention to maintain using Liveworksheets for self-study due to the significant advantages it offers, including knowledge expansion and revision.

“I intend to support the utilization of Liveworksheets in self-studying in the future because it's both useful and convenient for studying at home. The more I practice doing exercises via Liveworksheets, the more knowledge I have.” (Participant 7, Interview extract)

Satisfaction

Eight students expressed contrary viewpoints when asked to enumerate three advantages of Liveworksheets for self-study. The consensus among all students was that Liveworksheet could facilitate user-friendliness,

immediate feedback, and interactive learning.

“Liveworksheets is not only engaging but also convenient for me self-study. I can boost my knowledge thanks to it.” (Participant 4, Interview extract)

“I can do exercises many times so that I can identify my mistakes from the feedback and learn from it.” (Participant 6, Interview extract)

Concerning challenges, the perspectives of the eight students diverged. The three most frequently cited drawbacks are technological reliance, distraction from advertisements, and absence of interaction.

“The advertisements on Liveworksheets distract me from focusing on doing exercises.” (Participant 3, Interview extract)

“Learners cannot interact with each other when using Liveworksheets. Sometimes, they may not comprehend the given answer key.” (Participant 8, Interview extract)

Discussion and Conclusion

This research examines students' viewpoints regarding the use of Liveworksheets for self-study, categorized as follows: attitude regarding technology usage, behavioral intent to utilize the system, contentment, perceived utility, and perceived simplicity of usage.

As shown in Table 6, a significant proportion of students indicated in Table 6 that they intended to utilize Liveworksheets for studying purposes in the future ($M=4.18$, $SD=.88$). At the pinnacle of consensus ($M=4.26$, $SD=0.84$), the students then anticipated using Liveworksheets for self-study within the following three months. In conclusion, the students who stated their intention to utilize Liveworksheets for self-study within the following three months obtained the least amount of agreement ($M=4.06$; $SD=0.95$). In general, the majority of students express the desire to utilize Liveworksheets for future self-study.

As for the perception of efficacy, the findings from both the survey and interviews suggested that most students supposed that using Liveworksheets for self-study was beneficial. This is because employing Liveworksheets for self-study is a more efficacious approach to involving students in comparison to conventional sheets. As a result, pupils were capable of improving their scholastic achievements. This outcome aligns with the findings reported by Andriyani et al. (2020).

Similarly, in terms of perceived usability, surveys, and interviews showed that students thought Liveworksheets were easy to use for self-study as it allows students to access online, which is in line with the study of Agustina and Cahyono (2023); Valverde (2022). Hence, most of the students were satisfied and they intend to utilize Liveworksheets for self-study in the future.

The results from the investigation demonstrated that the majority of students recognized the significance of

Liveworksheets in self-study across five primary dimensions, encompassing attitude regarding technology usage, behavioral intent to utilize the system, contentment, perceived utility, and perceived simplicity of usage.

A significant proportion of participants hold the belief that incorporating Liveworksheets into self-study is advantageous it can enhance users' interest, engagement, and knowledge acquisition. Concerning the perceived simplicity of usage, the majority of students firmly believed that they would find it effortless to use Liveworksheets for self-study. However, they encountered significant difficulty in choosing appropriate tasks. With respect to their disposition towards utilizing Liveworksheets for self-study, the majority of students hold a favorable view; thus, they ardently advocate for its use. Regarding the attitude towards using Liveworksheets, the majority of students exhibit a favorable disposition towards utilizing Liveworksheets for self-study, thereby expressing significant endorsement for its use. Furthermore, the advantages of Liveworksheets surpass the disadvantages; therefore, it is advisable for teachers to offer guidance on efficient self-study using this platform.

Limitations & Recommendations

Some pedagogical implications can be deduced from the findings. First of all, self-study should be encouraged with Liveworksheets so that students may increase their knowledge and scores. Secondly, several students indicated that they found it difficult to choose the type of exercise that was suitable for their level. Hence, it is imperative that teachers guide locating appropriate assignments and utilizing Liveworksheets for effective self-study. Eventually, school administrators had better provide both instructors and students with training on how to use this platform effectively for lifelong learning.

Nevertheless, this paper has several limitations. First, the study was conducted using a limited sample size obtained from a private Vietnamese university. Hence, future research can be conducted on a more extensive sample size with more diverse levels at different schools. Furthermore, due to the time constraint, this investigation solely concentrates on the students' perspectives regarding self-directed learning. Hence, it is recommended to undertake a study to investigate the alignment between teachers' and students' beliefs regarding Liveworksheets in self-study. Moreover, there has been a scarcity of research completed on Liveworksheets. Therefore, it is imperative for researchers to undertake further studies utilizing Liveworksheets to examine its impacts on education.

Abstract: Despite the rapid advancement of virtual reality (VR) and its integration into educational settings, the adoption of metaverse learning platforms often encounters challenges. These include technical limitations and a lack of understanding of how these platforms impact learning effectiveness and user engagement. Previous studies have revealed mixed outcomes regarding the effectiveness of VR in education, with many platforms failing to meet user expectations in terms of usability and learning outcomes. This uncertainty hampers the broader adoption of immersive learning technologies. Thus, this study aims to investigate what factors contribute most significantly to the effectiveness and user adoption of metaverse learning platforms. Specifically, it examines how perceived usefulness and efficiency influence learners' intentions to use these platforms. Utilizing a Technology Adoption Model specifically adapted for VR in the metaverse, the study conducted a comprehensive survey assessing various constructs such as immersive quality, intuitiveness of the user interface, and functionality of interactive elements in food science education. Linear regression analysis was employed to analyze the data, revealing that perceived usefulness (USE) and perceived efficiency (PERF2) are significant predictors of learners' intent to use the platform, explaining 62.6% of the variance in intent scores. The findings suggest that enhancing the practical utility and optimizing the efficiency of metaverse learning platforms are crucial for improving their adoption and effectiveness. Based on these insights, recommendations for platform developers include focusing on real-world applicability and connectivity with lecture content, improving technical performance, and enhancing user support mechanisms within the platform.

Keywords: Metaverse learning platforms, Virtual Reality education, Food education, Learning engagement

Citation: Geng, P. & Shen, D. (2024). Navigating the Future of Metaverse Education: A Comparative Study of VR and Non-VR Learning Environments. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 850-862), Antalya, Turkiye. ISTES.

Introduction

Traditional educational frameworks often struggle to maintain student engagement and information retention. Bloom et al. (1956) emphasized the need for methodologies that go beyond rote learning to foster higher

cognitive skills. Ebbinghaus (2013) highlighted the inefficiencies of conventional methods with his forgetting curve, which shows significant loss of learned information shortly after instruction. The field of food education faces similar problem. For example, the procedural knowledge acquisition in food processing has traditionally relied on methods such as flow charts and videos, which often fall short in effectively conveying the intricate, sequential nature of food production processes. Consequently, there is a pressing need for innovative solutions that offer students a more engaging and dynamic environment to visualize and comprehend new knowledge. The integration of advanced technologies like the metaverse in food education offers vast potential for educational enhancement. The metaverse is a collective virtual shared space created by the convergence of virtually enhanced physical and digital reality (Mystakidis, S., 2002). Empirical evidence robustly supports the positive impact of immersive environments on education. Pringle et al. (2022) demonstrated how Extended Reality (XR) environments are effectively utilized in forensic science education, providing asynchronous, repeatable, and diverse learning strategies that remain unaffected by external disruptions such as weather or equipment failure. Similarly, Moro et al. (2017) explored the effectiveness of Virtual Reality (VR) and Augmented Reality (AR) in health sciences, highlighting enhanced student engagement and learning outcomes, despite potential adverse effects like disorientation. Chen & Yao (2022) examined the strategic use of immersive media in marketing, offering insights that can be extrapolated to educational settings to understand how telepresence and narrative influence user engagement and learning outcomes.

However, while the metaverse and similar technologies can offer transformative potential for educational environments, there are challenges regarding their efficacy and integration. Dwivedi et al. (2022) discussed the complexities involved in adopting such technologies, which necessitate bridging technological and pedagogical gaps. Checa and Bustillo (2020) provided a critical review of immersive Virtual Reality serious games (VR-SGs), noting that only 30% of studies demonstrated clear enhancements in learning and training compared with traditional methods. This highlights that while VR-SGs can offer novel and isolated learning experiences where students apply and exercise knowledge in new contexts, they often lack integration with broader pedagogical frameworks and do not consistently outperform conventional learning methods. Additionally, the cost of implementing such technologies, particularly sophisticated setups like caves, continues to be a significant barrier, reinforcing the resourcing concerns noted by Maddox & Fitzpatrick (2019). Considering the opportunities and challenges brought by the immersive technologies, this study aims to investigate how education metaverse, especially those accessed via head-mounted VR devices, could be effectively employed to learn food production processes. Meanwhile, the study also investigates whether students prefer using immersive VR or its less immersive counterparts, such as mobile-based learning. To maximize effectiveness, the custom-designed educational metaverse for this study is built with the following features underpinned by theoretical foundations.

AI-driven customization in educational metaverse

Educational metaverse embedded with artificial intelligence (AI) could tailor learning experiences to individual needs, significantly enhancing effectiveness. Hwang & Chien (2022) elaborated on the role of smart non-player

characters (NPCs) that act as peers, tutors, or tutees, adding layers of interaction that mimic real-world educational dynamics and promote social presence. Following this, Sun et al. (2022) illustrated the metaverse's potential in digital medicine, where complex information was made intuitive through collaborative virtual environments, suggesting similar benefits for education in fostering social collaboration and enhancing the learning experience.

Game-based learning

Incorporating game-based elements into immersive learning can significantly enhance the educational experience. Mochizuki et al. (2021) described a game-based model that involves clear rules, defined roles, game mechanics, and problem-solving within a narrative context, which mirrors real-life challenges and encourages active learning and critical thinking. Games also frequently use narrative concepts. Green (2021) explored the use of narrative techniques to promote sustained attention and deeper cognitive engagement. Building upon this, Callaghan et al. (2018) proposed extending the Activity Theory-based Model of Serious Games to integrate game traces and analytics, enhancing engagement through elements like backstory, tutorials, simulations, strategic gameplay, and interactive feedback mechanisms.

Authentic Learning through Real-World Simulation

By engaging students in tasks that mimic real-world challenges, the learning environments provide diverse experiences that mirror the complexity of actual scenarios faced in professional and daily life. Farrell (2020) highlighted the importance of incorporating realistic tasks that offer immediate feedback, require critical reflection, and end with performance assessments. This approach ensures that students are not just passive recipients of information but active participants in a learning process that values practical application over theoretical knowledge.

Method

Metaverse platform design

The study involved an immersive simulation of a corn processing plant using the Classlet Virtual Reality (VR) platform, where participants interacted with 15 distinct avatars or objects representing various stages of the corn wet milling process. This setup facilitated a series of interactive tasks, such as managing steeping conditions, selecting optimal storage for corn, understanding the output materials in each step, and arranging the connection of different equipment to produce desirable final products. Participants engaged with the content through multiple-choice questions, image analysis, grab and drop tasks, video explanations, and text dialogues.

Some avatars within the Classlet platform were integrated by ChatGPT to enhance interactivity, utilizing proprietary prompt templates that managed scenario handling, contextual awareness, and personality traits. This

integration ensured that each avatar's interactions were tightly controlled through customized keywords, limiting their dialogue to relevant topics within the corn processing simulation. This setup provided a focused and relevant educational experience, ensuring that the avatars consistently delivered content pertinent to the learning objectives of the corn wet milling process.

Experimental design

In this experimental study, 33 food engineering students aged 17-19, including 12 males and 21 females, recruited. Twenty-three participants were weekly gamers, while the rest played less frequently. The participants were randomly assigned to either a VR or non-VR group, allowing for a comparison of VR's effectiveness against the less immersive mobile learning methods. Both the VR and non-VR groups received the same educational content but differed in interaction: VR users navigated the virtual space with headsets and controllers, supported by a team for technical assistance, while non-VR participants used iPads with minimal support, reflecting the differing needs of each technology. The two groups were situated in separate rooms to independently engage with the same educational content, ensuring a controlled environment for evaluation. After the learning activity, students completed a Google Form designed to evaluate their experience. This form was based on Fussell & Truong's Technology Adoption Model (Fussell & Truong, 2023), which we adapted specifically with the focus on both pedagogical effectiveness and technological integration in the metaverse. The Google Form survey incorporates various constructs measured on a 5-point Likert scale, covering key aspects such as the immersive quality of the technology (TECH1), the intuitiveness of the user interface (TECH2), and the functionality of interactive elements (TECH3). Additionally, it assesses attitudes towards learning in the metaverse (AT1, AT2), ease of use (EASE1, EASE2), enjoyment (ENJ1, ENJ2), and perceived productivity (PERF1, PERF2). The survey also explores the practical utility (USE), intent to use (INTENT1, INTENT2), independent usability (BEH1, BEH2), and potential health impacts (HEALTH).

Data analysis

Our study's statistical analysis commenced with Cronbach's alpha to evaluate internal consistency, ensuring the reliability of the survey instruments. Descriptive statistics provided insights into the central tendencies and variability of responses. We used the Shapiro-Wilk test to assess normality, addressing non-normal distributions with non-parametric methods. For comparative analysis, we performed Independent Samples T-Test and utilized Spearman's correlation to explore relationships among variables. Finally, linear regression was employed to identify key predictors of learning intent, substantiating the model's efficacy with an F-statistic.

Results

Quantitative results

In assessing the reliability of the scale used in our study, we employed Cronbach's α to estimate internal

consistency. The analysis yielded a Cronbach's α of 0.914, indicating excellent reliability of the scale. Descriptive statistics (see Table 1) revealed notable variability across key independent variables, with the highest mean scores observed for ENJ1 (4.182) and AT1 (4.091), indicating strong enjoyment and positive attitudes towards the technology. Conversely, the lowest mean score was recorded for HEALTH (3.303), reflecting potential concerns or differing perceptions regarding health impacts. The intent to use the technology, a critical measure, showed an average score of 3.909 for INTENT1 and 3.848 for INTENT2. The Shapiro-Wilk tests confirmed non-normal distributions for all variables (all $p < .01$), emphasizing the application of non-parametric statistical methods in our analysis.

Table 1. Descriptive statistics of independent variables

	Valid	Missing	Mean	Std. Deviation	p-value of Shapiro-Wilk
TECH1	33	0	3.606	0.788	< .001
TECH2	33	0	3.485	0.834	< .001
TECH3	33	0	3.455	0.869	0.001
AT1	33	0	4.091	0.678	< .001
AT2	33	0	4.061	0.747	< .001
EASE1	33	0	3.879	0.960	< .001
EASE2	33	0	3.879	0.740	< .001
ENJ1	33	0	4.182	0.683	< .001
ENJ2	33	0	3.848	0.667	< .001
PERF1	33	0	3.909	0.879	< .001
PERF2	33	0	4.091	0.723	< .001
USE	33	0	3.970	0.847	< .001
INTENT1	33	0	3.909	0.678	< .001
INTENT2	33	0	3.848	0.795	< .001
BEH1	33	0	3.515	0.906	< .001
BEH2	33	0	4.000	0.707	< .001
HEALTH	33	0	3.303	1.132	0.005

In an Independent Samples T-Test (see Table 2) conducted to compare the experience of users between Virtual Reality (VR) and iOS devices, a significant difference was found in the intuitive nature of the user interface (TECH2), with a p-value of 0.028. Users of VR headsets reported the user interface to be more intuitive and easier to navigate compared to those using iOS devices. Other than that, no significant difference was observed between VR and non-VR groups.

Table 2. Independent samples T-test of VR and non-VR groups

Construct	Construct details	p-value
TECH1	The resource provides a highly immersive virtual experience.	0.100

TECH2	The user interface of the resource is intuitive and easy to navigate.	0.028
TECH3	Interactive elements within the resource function smoothly and as intended with no significant issues.	0.755
AT1	Using metaverse for learning is a good idea.	0.602
AT2	I feel positively toward using metaverse for learning.	0.437
EASE1	Learning to use metaverse for learning will be easy for me.	0.384
EASE2	It will be easy to gain skills for my subjects using metaverse.	0.256
ENJ1	Using metaverse for learning would be enjoyable.	0.718
ENJ2	I enjoy using immersive simulation technology such as metaverse.	0.345
PERF1	Using metaverse for learning is more productive than other e-learning methods like videos or slides.	0.348
PERF2	Using metaverse for learning will improve my knowledge or skills more efficiently than traditional methods like videos or slides.	0.106
USE	Learning using metaverse will be useful for gaining knowledge in the real world.	0.373
INTENT1	If made available, I am willing to use metaverse for learning.	0.329
INTENT2	If made available, I intend to use metaverse for learning.	0.231
BEH1	I could use metaverse for learning if no one was around to tell me what to do.	0.477
BEH2	I could use metaverse for learning if I had only a virtual instructor guiding me.	0.318
HEALTH	Using metaverse may negatively affect my physical health.	0.360

Spearman's correlation analysis highlighted several significant relationships. Notably, intent to use the metaverse for learning (INTENT1) was most strongly correlated with EASE1 (ease of learning), ENJ1 (enjoyment of use), and PERF1 (productivity over other methods), with coefficients of 0.726, 0.689, and 0.763, respectively, all with p-values < .001. INTENT2 (intention to use if available) also showed strong correlations with these variables, underscoring the influence of ease, enjoyment, and perceived productivity on learner's intent. Regarding USE, which represents the perceived usefulness of the metaverse, there were significant correlations with EASE2 (ease of skill acquisition) and ENJ2 (enjoyment of immersive simulation), with coefficients of 0.713 and 0.612 respectively, indicating that usefulness is closely linked to the ease and enjoyment associated with the technology. PERF2 (efficiency over traditional methods) also showed significant positive correlations with AT2 (positive attitudes towards metaverse learning) and EASE2, with coefficients of 0.673 and 0.681 respectively, suggesting that the perceived efficiency of the metaverse is related to favorable attitudes and ease of skill acquisition. Interestingly, HEALTH, the concern about potential negative health effects, showed a very weak negative correlation with INTENT2 ($\rho = -0.057$), indicating it has minimal influence on the intent to use the metaverse for learning purposes.

Table 3. Spearman's correlation among the studied variables

Variable	BEH1	BEH2	TECH1	TECH2	TECH3	AT1	AT2	EASE1	EASE2	ENJ1	ENJ2	PERF1	PERF2	USE	INTENT1	INTENT2	HEALTH

Note: * $p < 0.05$; ** $p < 0.01$; *** $p < 0.001$

Prior to the regression analysis, assumption tests were conducted to validate the appropriateness of the model. The residuals plot and Q-Q plot indicated that the data met the key assumptions of homoscedasticity and normality, supporting the use of linear regression techniques. The linear regression analysis (see Table 4) reveals that perceived usefulness (USE) and perceived efficiency (PERF2) are significant predictors of the average intent to use the metaverse for learning, explaining 62.6% of the variance in intent scores. With USE yielding a coefficient of 0.484 ($p < .001$) and PERF2 a coefficient of 0.270 ($p = 0.047$), the model shows that these variables significantly influence learner intent. The overall model's predictive power is confirmed by an F-statistic of 27.816 ($p < .001$), indicating a robust fit to the data.

Table 4. Linear regression analysis

Model Summary - Avg INTENT					
Model	R	R ²	Adjusted R ²	RMSE	
H ₀	0.000	0.000	0.000	0.685	
H ₁	0.806	0.650	0.626	0.419

Qualitative results

The open-ended positive comments were grouped into categories as below:

Engagement and interest (Count: 16 mentions): This category highlights how the learning method captures and holds the learner's attention, making the educational process more enjoyable and memorable.

- "It's a more interesting way for learning than playing a video in the lesson."
- "Fun enjoyable and interesting."
- "Interesting, more realistic on knowledge."

Interactivity and practicality (Count: 12 mentions): Feedback in this group focuses on the interactive elements of the learning method that allow for practical engagement and enhanced understanding of the content.

- "Interactive, immersive, interesting."
- "I can memorize things by memorizing the location. More interesting than attending lectures. Not sleepy."
- "Better demonstration and practical on what we learned."

Novelty of learning experience (Count: 7 mentions): Users appreciate the newness of the approach, which diverges from traditional learning methods, offering a fresh perspective and experience.

- "Quite new."
- "New and interesting."
- "New approach to learning corn processing."

The feedback on the learning method's weaknesses were grouped into three primary themes:

Technical issues (Count: 10 mentions): These concerns reflect the functional aspects of the learning platform that affect usability, such as system compatibility and performance issues.

- "System not supporting android system."
- "The video is not too smooth."
- "The game could have a better optimization with multiple users."

Physical discomfort (Count: 10 mentions): Users report experiencing physical discomfort while using the learning platform, which can range from dizziness to headaches, potentially limiting prolonged use.

- "Some people might feel dizzy."
- "Headache for some student."
- "Heavy headset."

User experience (Count: 11 mentions): Feedback indicates that the user experience could be hindered by the learning platform's design and content issues, which could impact the effectiveness of the learning process.

- "Difficult to understand what the next step is."
- "Guideline not very clear, expensive, can't be used for long time."
- "Some people may treat it as a game instead of learning platform."

Discussion

Engagement and predictive factors for learning efficacy

Our study reveals that immersive learning interfaces significantly enhance user engagement, evidenced by high scores for enjoyment (ENJ1 at 4.182) and positive attitudes (AT1 at 4.091). This finding is supported by Kang et al. (2021), who emphasized the positive impact of immersive environments on engagement. Additionally, interactive features and real-world applications are shown to enhance learning efficacy, as indicated by strong correlations for EASE1, ENJ1, and PERF1 with INTENT1 (coefficients of 0.726, 0.689, 0.763). These features' effectiveness in enhancing learning retention and understanding is further highlighted by significant correlations of USE with EASE2 and ENJ2, supported by literature from Kye et al. (2021) and Sun et al. (2022).

Perceived usefulness and efficiency are demonstrated to be strong predictors of learning intent, with regression analysis showing that USE and PERF2 account for 62.6% of the variance in intent scores. This underscores the importance of these factors in influencing user adoption and engagement, as validated by Maddox & Fitzpatrick (2019). Such insights confirm the critical role of perceived benefits in fostering a positive user response towards immersive learning technologies.

While the benefits of immersive learning interfaces and interactive features are well-documented, contradicting evidence suggests that these systems are not without flaws. Some users reported feelings of being "Overwhelming at times, hard to focus," indicating that high sensory input may lower user concentration and engagement, particularly for those sensitive to intensive stimuli. Furthermore, comments such as "Engaging but not always informative" and "Interactions feel forced and do not aid understanding" reveal a gap between user

enjoyment and actual educational value. These contradictions highlight that while the platforms are engaging, they do not consistently translate to effective learning or understanding, pointing to a need for improved alignment of interactive elements with educational goals.

Technical robustness and user experience

Our study uncovered a surprising outcome regarding the intuitiveness of different technological interfaces. Despite the novelty of Virtual Reality (VR) for many participants, VR interfaces were reported to be significantly more intuitive than those of iOS devices, as evidenced by a notable difference in user feedback ($p = 0.028$). This challenges the conventional wisdom that familiarity enhances ease of use and suggests that VR may better align with human cognitive processes for spatial and experiential learning. The immersive nature of VR, allowing for naturalistic interactions in 3D environments, may be instrumental in this perceived intuitiveness. Similar findings were highlighted by Callaghan et al. (2018), who suggested that immersive technologies could pioneer new standards for intuitive design, potentially transforming user interface expectations across digital platforms.

Despite VR's advantages in intuitiveness, technical challenges remain a significant detriment to user experience. Our analysis identified frequent issues such as system incompatibility and optimization problems (10 mentions), which critically undermine usability and learning efficacy. Another major concern affecting the adoption and enjoyment of immersive technologies is physical discomfort. Reports of dizziness and headaches were common, with these issues potentially restricting prolonged engagement with VR systems (10 mentions).

Interestingly, our findings reveal no significant health differences between VR and non-VR users, despite reported physical discomfort, as evidenced by non-significant HEALTH p -values (greater than 0.05). Additionally, none of the three technological variables we studied were significant predictors in our model, challenging assumptions that more immersive VR technology inherently leads to greater discomfort or enhanced user experience. This underscores the complexity of user experiences within immersive environments and emphasizes the need to consider both physiological and psychological factors, as well as the direct impacts of technology features, in the design and implementation of these systems.

Customization, personalization, and gamified learning in immersive environments

Our study has successfully demonstrated the efficacy of immersive learning methodologies, particularly through the application of customizable gamified environments. By integrating smart non-player characters (NPCs) and gamification elements such as quests and role-playing, we have not only enhanced user engagement but also significantly improved educational outcomes. The implementation of these advanced educational tools in our immersive learning platform has been empirically validated to predict learning intent effectively.

The predictive power of our immersive learning model is substantiated by robust statistical evidence. Our

regression analysis indicates that the combined factors of perceived usefulness (USE) and perceived efficiency (PERF2) account for 62.6% of the variance in learners' intent to use the platform. This substantial percentage underscores the effectiveness of our educational approach, aligning closely with the theoretical frameworks proposed by Maddox & Fitzpatrick (2019), who emphasized the importance of perceived benefits in technology adoption within educational settings. The success of our immersive platform in achieving these results not only supports the literature on the impact of gamification and customization in education as noted by Hwang & Chien (2022) and Mochizuki et al. (2021) but also provides a practical blueprint for the future development of educational technologies.

Conclusion

In conclusion, this study illuminates the dual-edged nature of immersive learning platforms in food science education. While they clearly enhance engagement and learning intent through their interactive and gamified features, they also present challenges that can detract from their effectiveness. The issues of technical robustness, such as system incompatibility and performance problems, along with the physical discomfort reported by users, underscore the need for further refinement in these technologies. Despite these hurdles, the high intuitiveness of VR interfaces and the successful integration of customization and gamification confirm the potential of immersive technologies to transform educational experiences. Going forward, addressing the identified technical and user experience challenges will be crucial in harnessing the full potential of immersive learning platforms to create not only engaging but also educationally effective environments. This study paves the way for future research to explore how these platforms can be optimized to balance enjoyment and educational value, ensuring that they fulfill their promise in the educational landscape.

Recommendations

Based on the regression analysis, which highlights the significant predictors of user intent to engage with metaverse learning platforms, the following targeted recommendations can be formulated to enhance both the adoption and effectiveness of these technologies:

Emphasize perceived usefulness:

- Align metaverse content with lecture material: By doing so, the metaverse serves as an extension of the theoretical concepts taught, allowing students to apply and experiment with these concepts in a controlled, immersive setting, thereby solidifying the students' understanding and reinforcing the utility of the metaverse as an integral component of their educational journey.
- Enhance realism in the metaverse: By incorporating detailed simulations of industrial equipment, realistic ingredient handling, and accurate processing protocols, students can gain hands-on experience that parallels actual operations. This heightened realism not only bolsters the students' engagement but also reinforces the relevance of their virtual experiences to future professional endeavors.

Enhance Perceived Efficiency:

- Optimize platform performance: Focus on technical improvements that enhance the platform's performance, such as reducing load times, improving resolution, and ensuring smoother interaction to prevent disruptions in the learning process.
- Simplify user interaction: Redesign user interfaces to be more intuitive and reduce the learning curve, making it easier for new users to start learning effectively right away.

The Degree to Which Students at Shoubak University College Practice the Elements of Digital Citizenship Related to Education

Omar.M. K. AL-Mahasneh

Al-Balqa applied university, Al-Shobak University College, Jordan.  <https://orcid.org/0000-0001-6902-9109>.

Scopus: 5613151100. Researcher ID: D-8705-2017.

Abstract: The study aimed to identify the degree to which students at Shobak University College practice the elements of digital citizenship related to education. The researcher used the descriptive survey method through the electronic questionnaire instrument. The study sample consisted of 163 students from al-Shobak University College who were selected using the available sample method. The results of the study showed that the degree The practice of the students of Shobak University College in the elements of digital citizenship related to education was high, with an average score of (4.24). In light of the results of the study, the researcher recommended those concerned with developing study plans in university colleges to continue developing courses related to the digital society and the ethics of using technology, in addition to holding lectures and educational awareness programs for students about effective practices to achieve the concept of true digital citizenship related to education.

Keywords: Degree of Practices, Elements of Digital Citizenship Related to Education, Students of Shobak University College.

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 863-870), Antalya, Turkiye. ISTES.

Introduction

Scientific and technological developments have contributed to the emergence of the concept of digital citizenship, and the concept of digital citizenship refers to the correct and sound practices and procedures that individuals in digital societies take when dealing and using digital devices. Al-Qayed (2014) defined digital citizenship as the sum of rules, regulations, standards, customs, ideas, and principles followed in the optimal and proper use of technology, which is guidance and protection, guidance towards the benefits of modern technologies, and protection from their dangers. It can be defined as the correct behavior of individuals in the use of technology, whether in the electronic exchange of information, full electronic participation in society, or buying and selling goods via the Internet. And he knows Ribble (2021) Digital citizenship is a series of skills Which all technology users need to work effectively in a digital worldContinuing to develop.

Figure 1 shows the elements of digital citizenship divided by the researcher Michael Ribble (Ripple, 2015). And Believes Ribble That all students should know these nine elements, which he identified in his famous book Digital Citizenship in Schools: Nine Elements All Students Should Know.

Figure 1. Elements of Digital Citizenship

The following is an explanation of the elements of digital citizenship identified by the researcher Michael Ribble as shown in Figure 1:

1. Digital access: This element refers to providing the Internet and modern devices to all individuals in society to facilitate the use of information and communications technology.
2. Digital commerce: This element refers to the ability of individuals in society to carry out buying and selling operations electronically in a documented and correct manner.
3. Digital communication: This element refers to the ability of individuals in society to use ICT to communicate and exchange information with each other and others.
4. Digital literacy: This element refers to providing all individuals in society with the skills to deal with technology and modern devices.
5. Digital etiquette: This element refers to the practice of individuals in society to use information and communications technology in society with respect, politeness, and within ethical rules of conduct.
6. Digital law: This element refers to regulations, laws and legislation that govern the use of technology.

- 7.Digital rights and responsibilities: This element refers to the rights and responsibilities of technology users.
- 8.Digital security: This item refers to preventive measures that all technology users must take to ensure their safety and the security of their networks Purchase anti-virus software.
- 9.The health and luxury digital: This element refers to individuals' awareness of using technology so that it does not affect them mentally, physically, or psychologically.

After reviewing the theoretical literature and previous studies related to the subject of the study, the researcher found only studies related to the subject of the study. Al-Khamis (2023) conducted a study entitled the level of practice of digital citizenship by higher education students in the State of Kuwait in light of some variables. The descriptive approach was used through a questionnaire tool, and the sample consisted of (482) male and female students who responded to the tool electronically. The results revealed that higher education students practice digital citizenship in the education and education axis at a high level, in the axis of protecting oneself and protecting others at a medium level, as well as in the axis of self-respect and respect for others at a medium level.

Ataa, Al-Hadrami, and Al-Ajami carried out (2021) A study that aimed to know the degree of practicing digital citizenship skills among students of the College of Arts and Human Sciences in the Sultanate of Oman, and students of the Sabar College of Education in the Republic of Yemen. The researchers used the descriptive approach through the questionnaire tool. The study sample consisted of 385, and the results of the study revealed that the degree of practicing skills Digital citizenship among students of the College of Arts and Humanities at Al Sharqiya University in the Sultanate of Oman, and students of the College of Education at Sabr at the University of Lahj in the Republic of Yemen, achieved a high overall score, as well as in the six areas: digital law, digital behavior, digital security, digital rights and responsibilities, digital health and safety, and digital communication. . While it ranked moderately in the areas of: digital access, digital culture, and digital commerce.

Al-Omari 2020 conducted a study aimed at knowing the degree of awareness of Jordanian university students about the concept of digital citizenship and its relationship to its axes. The researcher used the descriptive approach. The study sample consisted of 282 male and female students in universities in three regions, North, Central, and South. The results of the study showed that the degree of awareness of the concept Digital citizenship was high among students, and the results also showed that there is a high correlation between the degree of awareness of the concept of digital citizenship and the axes of digital citizenship.

Al-Rashed 2020 conducted a study aimed at finding out the extent to which students in Jordanian public universities possess digital citizenship skills. The researcher used the descriptive approach. The study sample consisted of 5,200 male and female students, and the results of the study showed the degree to which students at Jordanian public universities possess digital citizenship skills came at a high level, Digital safety and responsibility skills It came with a degree Medium.

Some previous studies addressed the issue of the degree to which university students practice digital citizenship, such as the study of Al-Khamis (2023), and the study of Ataa, Al-Hadrami, and Al-Ajami (2021), and some studies focused on examining the degree of awareness of the concept of digital citizenship, such as the study of Al-Omari (2020), and some studies on the degree of possession of digital citizenship by university students, such as the study of Al-Rashed (2020). The current study differs from previous studies in that it attempted to address the degree to which Shobak University College students practice the elements of digital citizenship related to education.

The study problem and its questions

Scientific and technological developments have contributed to the emergence of the concept of a digital society and the occurrence of a massive revolution in the field of information and communications technology. The Corona pandemic has also imposed on educational systems that university college students use educational technology innovations in the educational process. Therefore, students must possess the skills to deal with digital content and practice the elements of digital citizenship related to it. Education, hence this study came to answer the main question:

The main question: To what degree do Shobak University College students practice the elements of digital citizenship related to education?

Methodology

The researcher used the descriptive survey method through the electronic questionnaire tool after ensuring its validity and reliability. The study population consisted of students from Shobak University College, numbering (500) male and female students. The study sample consisted of (162) male and female students who were selected using the available sampling method. The researcher used the means. Mathematical calculations were used to determine the degree to which students at Shobak University College practiced the elements of digital citizenship related to education, and the criterion shown in Table 1 was adopted to judge the degree of use.

Table 1. degree of practice

n	Range of meaning	Practice of degree
1	1-2.33	low
2	2.34-3.66	middle
3	3.67-5	high

Results and Discussion

To answer the study question: To what degree do Shobak University College students practice the elements of digital citizenship related to education? The arithmetic means and degree of practice were found for each item of

the digital citizenship component related to education and the overall arithmetic mean for each item as shown in Tables 2 and 3:

Table No. 2. Computational settings and the degree to which Shobak University College students practice the elements of digital citizenship related to education

n	Elements of digital citizenship	Mean	Rank	Degree of practice
	Digital communication	4.35	1	high
	Digital Health and Welfare	4.31	3	high
	Digital Law	4.25	5	high
	Digital Rights and Responsibility	4.34	2	high
	Digital Security and Privacy	4.30	4	high
	Digital literacy	4.12	6	high
	Digital Etiquette	4.02	7	high
Total		4.24		high

It is clear from Table 2 that the degree of practice of the students of Shobak University College in the elements of digital citizenship related to education was high in all elements of digital citizenship, and Table 3 shows the computational circles. And the degree to which students at Shobak University College practice the elements of digital citizenship related to education.

Table 3 Arithmetic circles and the degree to which students at Shobak University College practice the elements of digital citizenship related to education

n	Elements of digital citizenship/items	Mean	Degree of practice
	Digital communication		
1.1	I make conscious and responsible use of digital communication technologies	4.33	high
1.2	I think carefully about what is sent and written via digital communication technologies	4.39	high
1.3	I monitor children's communication and communication with others using digital technologies	4.28	high
1.4	I use digital communication technologies such as social media to engage in activities and share ideas	4.41	high
	With others		
average		4.35	high
	Digital Health and Welfare		high
2.1	I am aware of the physical risks associated with using technology for	4.52	high

n	Elements of digital citizenship/items	Mean	Degree of practice
	prolonged periods		
2.2	I am aware of the phenomenon of addiction to technology and reducing its effects	4.31	high
2.3	Adhere to the correct posture while using the computer	4.23	high
2.4	Make sure the computer screen and workplace are properly lit to reduce eye strain	4.16	high
2.5	Get some rest and do some physical exercise while working continuously on the computer	4.27	high
2.6	Balance the positive and negative aspects of mental and physical health when using technology	4.37	high
	average	4.31	high
	Digital Security and Privacy		
3.1	Interested in purchasing antivirus software for the smart devices I use	4.60	high
3.2	I avoid talking and playing with strangers through the spider web	4.45	high
3.3	I download the latest spyware protection software for the smart devices I use	4.23	high
3.4	Use a spam filter and do not open suspicious message attachments while using smart devices	4.11	high
3.5	I am aware of the risks of hacking and fraud while using smart devices	4.15	high
	average	4.30	high
	Digital Rights and Responsibility		high
4.1	I am aware of my right to own the rights to my workers' property and to allow my production to be published free of charge over the network for everyone	4.26	high
4.2	Use online resources ethically	4.43	high
4.3	Indicate the source of digital content when making use of it	4.37	high
4.4	I avoid hurting others with irresponsible behavior and words when communicating digitally	4.15	high
4.5	Report irresponsible behavior such as threats, blackmail, and harassment	4.29	high
4.6	Work on enriching digital content with important digital products and works	4.54	high
	average	4.34	high
	Digital Law		high
5.1	Avoid sharing copyrighted digital content with others	4.19	high
5.2	Refer to the source of the digital content when using it	4.18	high
5.3	Respect others on the Internet and do not offend them or infringe on their	4.10	high

n	Elements of digital citizenship/items	Mean	Degree of practice
	rights		
5.4	I avoid sharing immoral digital content	4.35	high
5.5	I am aware of the danger of hacking into the systems and computers of individuals or organizations	4.41	high
	average	4.25	high
	Digital literacy		high
6.1	I verify the accuracy and validity of the information and evaluate various sources on the Internet	4.17	high
6.2	I share the correct information on social media sites	4.07	high
	average	4.12	high
	Digital Etiquette		high
7.1	I adhere to the etiquette of dialogue and conversation during digital communication.	3.90	high
7.2	Avoid hostility when communicating digitally	3.86	high
7.3	I use digital media with proper language	4.20	high
7.8	I avoid sending personal information through digital communication	4.15	high
	average	4.02	high

Tables 2 and 3 showed that the degree to which students of Shobak University College practiced the elements of digital citizenship related to education was high, and the researcher justifies this result by:

The presence of courses in students' study plans that are concerned with educating students about the nature of the digital society and the ethics of computer use.

The shift to using information and communications technology in education as a result of the Corona pandemic has made students aware and aware of their roles in the digital society.

The media focus on the importance of maintaining the confidentiality of personal information and the dangers of electronic commerce has a major role in educating members of society, including university college students.

The result of the current study is consistent with the results of studies Thursday (2023) and the study of Ataa, Al-Hadrami, and Al-Ajami (2021), Al-Omari (2020) and Al-Rashed (2020).

Recommendations

The researcher recommends that those concerned with preparing study plans in university colleges need to continuously update and develop courses concerned with the ethics of computer use and digital society, in addition to educating students about the skills of using information and communications technology in the educational process.

Impacts of Humor as a Communication Strategy for Teachers in the EFL Classrooms

Thy Cao Thi Mai

FPT University, Vietnam,  <https://orcid.org/0009-0003-4882-165X>

Abstract: This research investigates the impacts of humor as a communication strategy for teachers in the context of university English learning. The study employs a mixed-methods approach utilizing questionnaires and interviews. The primary aim is to explore the effects of incorporating humor into the English as a Foreign Language (EFL) classroom. A questionnaire survey was administered to 139 students, supplemented by interviews with six participants. Findings reveal that humor plays a significant role in enhancing student engagement, relaxation, and motivation, while also aiding teacher enthusiasm and classroom atmosphere. However, limitations include the exclusive focus on one institution, small sample size, and reliance primarily on quantitative methods. Future research directions include longitudinal studies to assess sustained impacts, cross-cultural investigations, and mixed-methods approaches to delve into nuances. These findings contribute to understanding how humor can enhance teaching, learning, and overall educational experiences.

Citation: Mai, T.C.T. (2024). Impacts of Humor as a Communication Strategy for Teachers in the EFL Classrooms. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 871-881), Antalya, Turkiye. ISTES.

Introduction

In recent years, humor has emerged as an effective tool in education and L2 learning in particular (Latiff & Daud, 2013), altering the manner in which EFL instructors impart knowledge and instruct. Using humor and laughter helps establish a cheerful and welcoming environment for language learning, capture and maintain students' interest, improve memory of the material, encourage a positive outlook on errors, and encourage both critical and creative thinking in the classroom. In language education, humor lowers stress, enhances classroom atmosphere, boosts enjoyment, and promotes student-teacher relationships (Azizinezhad, M., & Hashemi, M., 2011). According to Ziyaemehr, Kumar, and Abdullah (2011), incorporating humor into the classroom environment enhances instructional efficacy, fosters a welcoming atmosphere, boosts student motivation, and aids in the clarification of course material.

The rationale behind the researchers' emphasis in this paper on the perceptions of Vietnamese EFL learners regarding the use of humor by instructors in the classroom is the paucity of research conducted on the

Vietnamese EFL context (Pham & Le, 2021). The purpose of this paper is to examine the perspectives of Vietnamese EFL students regarding the use of humor by instructors in the EFL classroom. The document provides an elucidation of the benefits of humor by multiple researchers, a definition of humor, a summary of prior research on the use of humor in L2 learning and instruction, and a conclusion that presents the results of a research study and establishes a connection between those results and those of previously conducted studies.

Literature Review

Definition of Humor

Definitions of humor have been offered by a number of scholars. Humor, as described by Wanzer, Frymier, Wojtaszczyk, and Smith (2006), is anything that the teacher and/or pupils find funny or entertaining. According to Faulkner (2011), humor is any purposeful or inadvertent physical gesture or spoken word that causes pupils to laugh, giggle, smile, or exhibit other comparable behaviors.

Types of humor

According to Ziyaemehr & Kumar (2014), comedy can be classified as either nonverbal, vocal, or a combination of the two. Verbal humor includes puns, humorous tales or examples, riddles, wordplay, comic irony, exaggeration, and jokes about specific topics. Nonverbal comedy encompasses various expressions on the face, gestures, and hilarious facial expressions. Satire, monologues, parodies, impersonations, and skits are examples of combined verbal and nonverbal humor. Turkish EFL teachers should be aware of these various categories of humor if they want to create a supportive learning atmosphere for their pupils. As superficial as it may seem, comics, cartoons, and clever jokes are not the only things that fall under the category of humor. It can take many different forms, such as word games, theater, puzzles, and puns. Accordingly, the current study emphasizes that Turkish EFL teachers should become more proficient in comedy by getting to know a variety of humor genres.

Benefits of humor

A number of advantages are associated with humor for EFL learners. Students benefit instructionally from humor because it improves their retention of learning materials, comprehension, and acquisition of the second language (Ziyaemehr, Kumar, & Abdullah, 2011). According to Ravichand (2013), the utilization of humor has the potential to alleviate boredom, reduce tension, and stimulate interest in students. This is attributed to its ability to unwind and reduce tension, humanize the teacher's persona, and increase student interest and enjoyment. The application of humor may be perceived as a beneficial instrument that can foster the sociolinguistic and sociocultural proficiency of pupils (Ziyaemehr et al., 2011). Munoz (2005) emphasizes the following: (a) humor facilitates vocabulary development; (b) humor assists students in differentiating figurative from literal meaning; (c) humor aids in the enhancement of students' visual memory; and (d) humor enhances

students' capacity to resolve linguistic issues. According to Thuy, P. T., & Thao, L. T. (2022), ELF students highly appreciated the benefits of humor in EFL classrooms, particularly in terms of lowering boredom, enhancing teacher-student relationship, lowering tiredness, encouraging students' happiness, raising students' awareness, and resolving conflicts. When teaching in the classroom, language teachers can use humor as a useful teaching tool. Humor can foster a more positive learning atmosphere for kids, making them feel safe and at ease. As a result, they are more likely to engage with the teacher and their peers (Aboudan, 2009; Ocon, 2015; Poirier & Wilhelm, 2014). The use of humor in the classroom can increase student interest in the lesson, foster better relationships between the teacher and the students, and make the teacher more approachable. In terms of instruction, it improves L2 understanding and learning as well as learning materials retention (Munoz, 2005 & Ziyaeemehr et al., 2011).

According to Morrison (2008), incorporating humor into the classroom setting offers several advantages, including the establishment of an ideal learning environment, facilitation of communication, support for the change process, promotion of mental and physical well-being, optimization of cognitive abilities, and enhancement of creativity. Integrating humor into English teaching offers a range of benefits. Firstly, it contributes to fostering a balanced state of mind and body among students, promoting overall well-being. Moreover, humor maximizes brainpower by engaging learners in an enjoyable and memorable manner, making the learning process more efficient and effective. It also plays a pivotal role in supporting the change process, as humor can help alleviate apprehension or resistance to new concepts or language structures. Creating an optimal learning environment is another advantage, as humor cultivates a relaxed atmosphere where students feel comfortable expressing themselves and taking risks with language. Furthermore, humor facilitates communication by breaking down barriers and fostering connections between students and between students and the teacher. Lastly, it enhances creativity by encouraging students to think outside the box and explore language in unconventional ways, leading to deeper understanding and proficiency. Overall, integrating humor into English teaching is not only enjoyable but also immensely beneficial for student engagement and language acquisition.

Benefits of Humor in Classroom (Morrison, 2008)

Related studies

Azizinezhad & Hashemi (2011) investigated humour as a pedagogical tool for language learners. This paper demonstrates the effect(s) of humor and laughter on establishing a laid-back and open environment for language learning, grabbing and maintaining students' attention, improving retention of the material, encouraging a positive attitude toward errors, and promoting both critical and creative thinking in the language classroom. In language classrooms, humor helps to lessen the tension, create a more enjoyable environment, and enhances relationships between students and teachers.

Ziyaeemehr & Kumar (2013) conducted a study about the role of verbal humor in second language education. According to research, incorporating verbal humor into L2 classes might help students have easier access to resources for L2 language and cultural knowledge that are interwoven with lighthearted conversations. Furthermore, the results imply that in order to use humor to engage students and convey more nuanced parts of the L2, L2 instructors need to possess particular sociolinguistic and sociolinguistic humor competency.

A study on Turkish EFL learners' opinions on teachers' use of humor in the classroom was done by Hişmanoğlu (2018). According to the study's interpretation, humor in the classroom had good benefits (e.g., made students feel more relaxed and created a more pleasant and conducive learning atmosphere). Overall, the findings demonstrated the value of humor in EFL classes and the strong consensus among students on the beneficial effects of humor in instruction.

Bakar & Mallan (2023) investigated how students perceive the teacher's use of humour and how it enhances learning in the classroom. The purpose of this exploratory study is to discover more about how students perceive their teachers' use of humor in relation to teaching and learning in a higher education setting. It specifically seeks to investigate students' perceptions of how humor improves learning in the classroom. Ten undergraduate students from a research-intensive university in New Zealand who were taught by award-winning professors participated in one-on-one, in-depth interviews that provided the data. Students gave numerous examples of how humor facilitated their learning process. Among these included using humor to make connections between the material and the students' ability to focus, recall, and comprehend it. A good rapport and an optimistic outlook on education and the instructor were also mentioned as factors that improved the learning environment. According to our research, students thought that instructional humor was a useful strategy for improving both their emotional and cognitive learning.

Method**Participants**

The study was conducted with the participation of 139 EFL learners getting English preparatory education at a private university in Vietnam. The age of the students ranged from 18 to 20. The study involved 139

participants, with a breakdown across different demographic properties. In terms of academic majors, Economics majors constituted the largest group at 37.4%, followed by Engineering majors at 29.5%. Participants studying Languages made up 15.1% of the sample, while other majors comprised 18.0%. Regarding gender, females represented 52.5% of the total participants, whereas males accounted for 47.5%. These demographic properties provide insight into the composition of the study's participants, reflecting a diverse range of academic backgrounds and gender representation.

Table 1. Demographic properties of the participants

Variables		N	Percentage
Major	Economics	52	37.4
	Engineering	41	29.5
	Languages	21	15.1
	Others	25	18.0
Gender	F	73	52.5
	M	66	47.5
Total		139	100

Instrument and data collection

139 students enrolled in an English preparatory program were given a questionnaire derived from Morrison (2008), Askildson (2005), and Pham (2014) to gather information about their opinions regarding the use of humor by teachers in EFL classes. There were two sections to the questionnaire. Teachers were requested to fill out demographic information, including age and gender, in the first section. Twenty items on a 5-point Likert scale (from 1=strongly disagree to 5=strongly agree) about Vietnamese EFL learners' opinions about teachers employing humor in the EFL classroom were included in the second section.

The questionnaire's reliability was assessed using the Cronbach's Alpha Coefficient, which showed a reasonable level of reliability ($\alpha = 0.88$). At a private university in Vietnam, 139 EFL students enrolled in an English preparatory program were given the questionnaire.

Table 2. Reliability statistics of the questionnair

Reliability Statistics		
Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items

Results

Results from the questionnaire

Results from the questionnaire unveiled crucial insights regarding the perception of humor in English Language Teaching (ELT) among students enrolled in English preparatory programs. The findings underscored a noteworthy consensus on the positive impact of humor across various dimensions of language learning and classroom dynamics.

Participants overwhelmingly concurred that humor plays a vital role in foreign language learning (item 1, $M=4.65$; $SD=0.63$), facilitating enhanced learning experiences when integrated into instructional practices (item 2, $M=4.45$; $SD=0.69$).

They acknowledged humor as an essential trait in effective language educators (item 3, $M=4.38$; $SD=0.87$), contributing to a more relaxed and conducive learning environment (item 8, $M=4.41$; $SD=0.77$).

Moreover, students reported feeling emotionally connected to their instructors through the use of humor (item 17, $M=4.28$; $SD=0.87$), which fostered a deeper engagement with the language learning process.

Humor was perceived as a catalyst for cultural understanding and language acquisition, with participants expressing a heightened interest in learning when exposed to native humor (item 18, $M=4.18$; $SD=0.84$).

Additionally, humor was found to enhance concentration during lessons (item 9, $M=4.14$; $SD=0.88$), further reinforcing its positive influence on academic performance.

Some participants expressed uncertainty regarding their preference for English humor in the classroom (item 16, $M=3.84$; $SD=1.00$) and the perception of student-initiated humor as disruptive to the learning environment (item 6, $M=3.59$; $SD=1.24$).

Similarly, there was indecision regarding the desirability of incorporating Turkish humor into English classes (item 15, $M=3.55$; $SD=1.20$) and the difficulty of comprehending English humor in the classroom (item 14, $M=3.10$; $SD=1.16$).

Furthermore, while participants recognized the importance of humor, there was some disagreement regarding its compatibility with a serious learning environment (item 4, $M=3.06$; $SD=1.35$).

Overall, the comprehensive analysis of the questionnaire data underscores the significance of humor in the EFL classroom, with students exhibiting a predominantly positive attitude towards its beneficial effects on language learning and classroom dynamics. Despite areas of uncertainty and disagreement, the findings highlight the pivotal role of humor as a pedagogical tool in enhancing language acquisition and fostering a conducive learning environment.

Table 3. Results from the questionnaire

Items	Mean	Std. Deviation	N
1. Humor is crucial when learning a foreign language.	4.39	.881	139
2. When my foreign language instructor uses humor, I learn more effectively.	4.40	.890	139
3. A sense of humor is a valuable quality in an educator.	4.04	.988	139

4. While humor is valuable, learning necessitates a somber work atmosphere with little room for humor.	3.64	1.077	139
5. My class is not learning if we are joking and laughing.	2.68	1.346	139
6. In Vietnamese education, a student who starts making jokes during class is typically seen as interfering with the learning process.	2.15	1.367	139
7. The humor in the foreign language piques my curiosity about learning it.	4.40	.831	139
8. In my language classroom, humor helps me feel less nervous and more at ease.	4.53	.792	139
9. I find that humor in the classroom helps me focus more intently on the material.	4.22	.917	139
10. Using humor in the classroom wastes valuable instructional time.	1.97	1.251	139
11. I will assume a teacher is not professional if they utilize humor frequently.	2.14	1.292	139
12. It is distracting to employ humor in a class.	2.10	1.175	139
13. Since humor cannot be measured, its applicability to language learning is debatable.	3.06	1.250	139
14. I have trouble understanding classroom humor in English.	2.32	1.205	139
15. I want my English teacher to incorporate Vietnamese humor into our lessons.	3.71	1.170	139
16. I want to see English humor used in my English class by my teacher.	3.84	1.072	139
17. I feel more connected to my teacher when they employ humor.	4.53	.854	139
18. Being exposed to the native humor of a foreign language and culture helps me learn more about it.	4.22	.909	139
19. Humor often makes the learning environment more comfortable and favorable, which helps me learn a foreign language.	4.32	.957	139
20. I prefer teachers who use humor in class over those who don't.	4.34	.921	139

Results from the interview

The interview emphasizes the importance of laughter and relaxation for students during school time, which correlates with questionnaire items indicating that humor in the classroom makes students feel more relaxed (item 8) and helps them concentrate better on the lesson (item 9).

‘I feel relaxed and comfortable during the school time when I study with a teacher who usually makes jokes in the classroom. I have a lot of fun enjoying the jokes with the teacher and friends.’

It also mentions that students enjoy hearing humor from teachers as it makes them feel safer and closer to their teachers, aligning with questionnaire items where students agreed that humor in the classroom increases their interest in learning (item 7) and makes them feel closer to their teachers (item 17).

‘When the teacher uses his/her humor in the classroom, I feel safer and closer to him/her.’

Therefore, I feel comfortable asking questions related to the lesson. If the teacher is so serious, I don't dare to talk to him/her.'

The interview discusses how humor helps teachers maintain enthusiasm and motivation in teaching, which corresponds with questionnaire items indicating that humor is important for teachers to maintain motivation (item 3) and relieve the heavy atmosphere of the class (item 17).

'I feel motivated to learn English in the classroom with the teacher who is humorous.'

It also highlights humor as a communication strategy to engage students and make learning more interesting, which is consistent with questionnaire items indicating that humor generally improves students' ability to learn a foreign language (item 19) and enhances their interest in learning (item 7).

'I love learning grammar knowledge from riddles or jokes because the lesson is more interesting compared to the traditional learning materials like tasks or exercises.'

Discussion

In pedagogy, humor is a fundamental instrument that teachers can use to motivate their pupils and improve their learning in class. Humor has been seen as a classroom learning and teaching catalyst by educational experts for years (Rochmawati, 2011). Interpreting the results of this study, one might conclude that the use of humor in the classroom had beneficial impacts (e.g., improving the atmosphere for learning, helping students feel more at ease). This finding confirmed earlier research by Munoz (2005) and Ziyaemehr et al. (2011).

Previous research by Antilla (2008) and Zebila (2012) revealed the detrimental consequences of comedy in the classroom (e.g., humor being a waste of valuable learning time in the classroom, and using humor during a lesson being distracting). The present study, however, revealed the beneficial benefits of humor in the classroom (e.g., the use of humor raising students' enthusiasm in learning a foreign language, humor making students feel more comfortable in the classroom and humor helping students to better concentrate on the lesson).

The incorporation of humor in the English language classroom has been found to have multifaceted benefits for both students and teachers. Studies such as Azizinezhad & Hashemi (2011), Ziyaemehr & Kumar (2013), Hişmanoğlu (2018), and Bakar & Mallan (2023) collectively demonstrate the positive impact of humor on student learning experiences. These findings align with the results of our study, which revealed that students perceive humor as contributing to a more positive and conducive learning environment. Students across different cultural contexts consistently reported positive attitudes towards their English learning when humor was integrated into classroom instruction. Furthermore, humor was found to enhance teacher-student relationships, improve student engagement and motivation, and foster a relaxed and enjoyable classroom atmosphere. The findings underscore the importance of incorporating humor into English language teaching practices and suggest that humor can serve as a valuable pedagogical tool for enhancing the overall learning experience. As such, it is recommended that English as a Foreign Language (EFL) instructors cultivate their own sense of humor and strategically integrate humor into their teaching practices to optimize student

engagement, motivation, and learning outcomes (Kim, 2012; Saraçaloğlu & Sayar, 2015; Mohammed, 2015; Alavinia, 2016). Moreover, these studies highlight the need for further research to explore the specific mechanisms through which humor influences language learning processes and outcomes, as well as the potential cultural variations in the perception and use of humor in the language classroom.

While there are similarities between the results you provided and the findings from the other studies, there may also be differences in terms of the specific contexts, methodologies, and nuances of how humor is perceived and utilized in the English language classroom. However, the overarching message across all these studies is that humor has a positive impact on student learning experiences and outcomes.

Conclusion

The objective of this study was to explore the impact of teachers' use of humor in the classroom on student learning. The findings revealed that students in the research setting held positive attitudes towards their English learning, attributing this to the recognition of the benefits associated with humor in the EFL classroom. These advantages include enhancing the teacher-student relationship and resolving conflicts. Consequently, it is suggested that EFL instructors incorporate humor into their lessons and cultivate their own sense of humor. Furthermore, the results indicate that humor not only boosts teachers' enthusiasm and creates a positive classroom atmosphere but also significantly enhances student engagement, relaxation, and motivation. Both the interviews and questionnaires underscore the significant role of humor in fostering a conducive learning environment, revitalizing students' energy and motivation, and alleviating stress and fatigue for both students and teachers. The interviews particularly highlight the importance of laughter in improving the learning environment, aligning with the questionnaire findings that demonstrate widespread agreement regarding the positive impact of humor on classroom instruction.

Limitations

While the study provides valuable insights into the perceptions of humor in English teaching among participants from one private university, several limitations should be considered. The exclusive focus on students from a single institution limits the generalizability of the findings to broader populations, while the small sample size of 139 participants may reduce statistical power and limit subgroup analyses. Additionally, the selection of only six participants for interviews may not fully capture the diversity of perspectives within the sample. Relying primarily on quantitative methods supplemented by qualitative insights may restrict the breadth of perspectives explored, and potential social desirability bias in responses could impact the validity of results. Furthermore, the study lacks control for confounding variables, which could affect the interpretation of findings. Addressing these limitations in future research could enhance the comprehensiveness and validity of investigations into the role of humor in educational settings.

Recommendations

Future research directions stemming from the combined findings of the questionnaire and interview could include longitudinal studies to assess the sustained impact of humor in the classroom on various outcomes, cross-cultural investigations to explore cultural differences in perceptions and experiences of humor in education, development and evaluation of teacher training programs focused on humor integration, mixed-methods research to delve into the mechanisms and nuances of humor's effects, examinations of individual differences in humor styles and preferences among students and teachers, exploration of humor's role in digital learning environments, investigations into the effects of humor on special populations and across different subject areas, all aimed at advancing our understanding of how humor can enhance teaching, learning, and overall educational experiences.

EFL Students' Perceptions of Using a Social Constructivist Approach-Based Platform: A Case Study

Minh Ngoc An Pham

Can Tho FPT University, Viet Nam,  <https://orcid.org/0000-0002-0697-4557>

Abstract: The integration of technological advancements into the educational settings of many nations is regarded as a key factor for augmenting pedagogical practices and learning outcomes. Consequently, educational policymakers have made substantial investments in establishing and maintaining Information and Communication Technology (ICT) infrastructure within institutional environments. Recently, a novel educational platform named EDUNEXT has just been developed and implemented across many subjects at a private Vietnamese University. Hence, the present research endeavors to the strengths, weaknesses, opportunities, and threats associated with the platform, involving 30 EFL students. Data were gathered through individual semi-structured interviews with participants and subsequently analyzed utilizing the SWOT method. In addition to discovering EDUNEXT's strengths, weaknesses, opportunities as well as threats through students' perceptions, the findings expect not only to provide a comprehensive perspective for users, educational institutions, and planning and curriculum developers at the research site to enhance the EDUNEXT platform but also serve as a reference for those intending to establish such ICT platforms in their educational institutions.

Introduction

While the 21st century requires learners to be technologically competent and self-directed in response to technological advances, educators have difficulty preparing the younger generation to keep up with this need. Many studies have been carried out with the aim of better understanding the process of applying constructivism in learning and teaching over the years. The underlying idea in the 21st-century constructivist teaching mode is that learning is a student-centered environment where knowledge and meaning are socially constructed (Xu and Shi, 2018). Currently, one of the key goals of education in the era is to prepare well-equipped, competitive individuals with higher awareness (Bedir, 2019).

Although applying constructivism to teaching and learning is not new in many parts of the world, its practical

application seems vague in Vietnam, especially in online learning which has been taking place in Vietnam for nearly 2 years now due to the outbreak of the Covid 19 pandemic. Therefore, Mr. Cao Van Viet, who is one of the key leaders in the EdTech industry and specializes in using technology to create educational products at FPT Corporation, has built the EDUNEXT platform.

The platform was inherited and developed from CodeLearn (the largest programming teaching solution, attracting more than 300,000 users in 25 countries and territories around the world). The core aim of the Edunext platform requires learners to communicate and interact to gain more knowledge in an online learning environment. Specifically, the platform allows the creation of virtual "group lessons" that can be used to supplement classroom instruction. A wide range of functions such as cross-assessment, expert detection, integrated learning linkage, and suggestions to support teachers and students to interact and discuss in a variety of ways in terms of social constructive learning.

The application of constructivist methods in teaching and learning through Edunext in a private university in Vietnam is completely new. The philosophy of the university is to bring and flourish the spirit of learners' autonomy. Therefore, applying social constructivist theory is regarded as a critical method in the process of knowledge acquisition.

Furthermore, this teaching method is expected to bring outstanding results when using technology, especially the Edunext platform which assists students in overcoming traditional learning limitations (one-way transmission/teacher-centered, less interactive learning style) and promoting students' positivity, self-discipline, self-study, and creativity. Although this method seems to meet the requirements theoretically, it is questionable whether it is appropriate and effective or not. Only individuals who have been experiencing it will be able to provide the most impartial comments. Therefore, the purpose of this paper is to explore students' perceptions of Edunext's strengths, weaknesses, opportunities, and threats.

1. What are EFL students' perceptions on the adoption of Edunext in constructivist approach-based courses through the SWOT?

This research is expected to make several contributions. First, lecturers and students would have an opportunity to look back on their teaching styles and learning styles when experiencing social constructivist classrooms on the Edunext platform. Second, the technicians and software developers would make use of the findings to improve the Edunext platform with more innovative features. Finally, the board of curriculum development would have an insightful view of whether or not this method can be effective for all subjects and all majors.

Literature Review

Constructivism

Piaget (1973) postulated that constructivism is the discovery or reconstruction of knowledge by rediscovery.

Piaget said that what children can understand and cannot understand will depend on different stages, different ages and how children develop their cognitive abilities. Moreover, Piaget stated that the learning process does not passively take place, it is built step by step through active participation and that learners must remain active at all stages of development. Even though Piaget's theory captures what children think about at various developmental stages and describes how this commonality changes over time—it tends to ignore the role of context, uses, and media, as well as the importance of individual preferences or styles in human learning and development. That's when Papert's "constructionism" comes in handy.

Unlike Piaget, Vygotsky believed that "learning is an essential and universal part of a culturally ordered development process., is a special function of human psychology." (Vygotsky, 1978, p. 90). To put it another way, social learning tends to come before development. According to Vygotsky, "Any function in a child's cultural development emerges on two levels or twice. It manifests itself first on a social level, and then on a psychological level. It first appeared as a psychological category among adults, and later as a psychological category among children " (Vygotsky in Wertsch, 1985, p. 60). This indicates that education must address not only children's cultural acquisition but also their particular motivation as a result of the encoding process. The basic purpose of education, according to Vygotsky's philosophy, is to develop intellect and rationality beyond conditions.

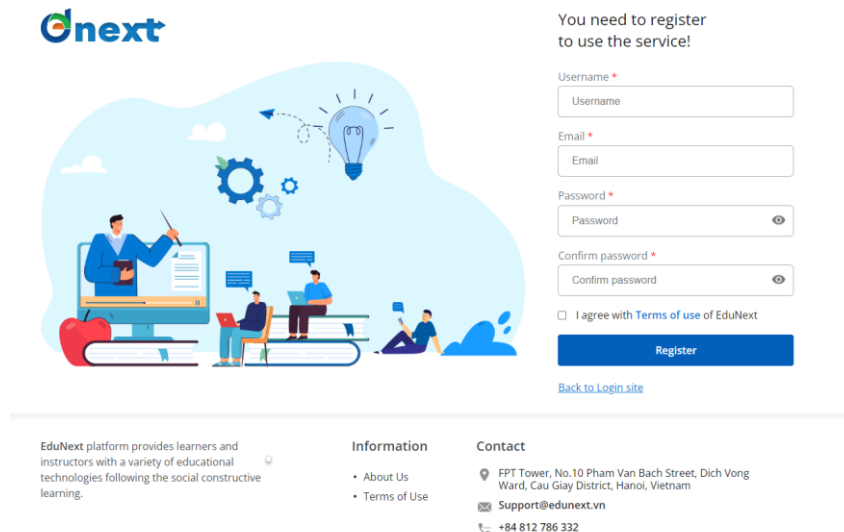

In summary, constructivism is a synthesis of numerous division theories, i.e., the identification of behavioral and cognitive principles. It is understood as "constructing" to learn about the object that the constructivist desires to understand. Besides, constructivism also means founding, creating, and training to meet one's own needs between the existing and the new. If in the past, teachers were the ones to guide and give materials to students to learn passively, now students will rely on existing materials and knowledge to find ways to approach new knowledge in their way. Therefore, this helps students be more self-directed in learning and know how to change their learning methods most effectively, helping to promote creativity and gain experience for themselves. Students are no longer too dependent on teachers or learning methods. Besides, constructivist teaching is not teaching in the form of announcements, given that learners have to actively explore, learn, and discover problems in the learning process.

EduNext Platform

EduNext, a learning platform under the ownership of FPT Education in Vietnam, provides students with a tailored learning experience. Its objective is to facilitate learning aligned with students' abilities and skills, aiding in the discovery and enhancement of their natural talents through efficient learning methods rooted in the social constructivist theory.

Accessible on various devices, EduNext serves as a facilitating tool for learning, engaging students with constructive questions to foster discussion and idea sharing. There are some core features of the platform as it looks like a discussion forum where students are required to answer the questions raised by their instructors;

then students can grade their classmates' responses by star voting, simultaneously the instructors can also post their answers so their students can understand them correctly. To promote the interactive exchange of students in knowledge acquisition, types of chats such as chat, group chat, and chat with class are added to the features of the platform.

SWOT Analysis

SWOT analysis is a framework for assessing an organization's (or a project's) Strengths, Weaknesses, Opportunities, and Threats, which aids in project planning and execution success. A SWOT analysis evaluates

internal and external factors, as well as current and potential future opportunities. SWOT analysis is intended to assist organizations or individuals in having a realistic view of their data, strengths, weaknesses, and initiatives because they require accurate analysis based on the current context rather than arguments or beliefs. This framework has found extensive application in the education context for strategic planning and decision-making as in e-learning settings (Zhu & Justice Mugenyi, 2015). In the current study, the SWOT framework provided a holistic view of Edunext's strengths, identifying its various opportunities for English learning; and providing a clear understanding of its weaknesses to uncover potential threats that users will face in the future. This will assist educators design strategies to effectively manage and remove these threats through students' perspectives.

Previous studies

Gijbels et al. (2006) conducted research titled "New Learning Environments and Constructivism: The Students' Perspective". The purpose of this study is to examine whether or not students in a new learning environment (NLE) have the same perceptions as students in a traditional lecture-based setting. They utilized the Tenenbaum et al's (2001) questionnaire to assess students' views of the existence of constructivist practices and concepts in their learning settings. There were 229 students in this study who were enrolled in a new learning environments-based curriculum and 188 students who were enrolled in a lecture-based curriculum. The results revealed that students in the NLE consider it to be more constructivist than students in a traditional lecture-based setting. In Vijaka Kumari S.N research report about the constructivist approach to teacher education: An integrative model for reflective teaching, that "reflective teaching" is a common feature of all programs, regardless of discipline, and is considered an important part of changing attitudes and perceptions in learning and teacher career development, in addition to teaching experience. The event, recalling the event, and studying and reacting to the event by observation, recording, video, or SWOT analysis are all part of the reflective teaching process. Therefore, the author performed research on the impact of several science teaching techniques on the science accomplishment abilities and attitudes of six standard students with varying levels of knowledge, understanding, application, and retention goals. ANOVA was used to undertake a detailed analysis of the study and to determine the relative effectiveness of Teacher Demonstration, Guided Discovery, and Cooperative Learning Methods of Teaching Science. The 'Verbal Interactive Classification System (VICS) was used to encode the data. Students' achievement, abilities, and attitudes are positively impacted by all three strategies. However, the cooperative learning method of teaching science was significantly more effective than the other two methods in terms of learning outcomes and objectives. As a result, to improve student-teacher teaching skills, the Reflective Teaching Training Model (RTTM) and the Integrated Model for Reflective Teaching (IMRT) should be employed.

In a study called "Evaluation of the effectiveness of a constructivist teacher education program applications" carried out by Bay (2008), it was found that constructivist program applications are more effective in the attitudes of students towards constructivist approach and success. Ekici (2009), in his study "Science Teaching Tendency of Pre-service Teachers of Science and Technology Course", states that when interview and experimental findings of pre-service teachers are compared, it is seen that they haven't fully embraced

constructivism. According to another study called "The Evaluation of Relevancy of Applications in Teacher Training Programs with Constructivist Approach through Pre-Service Teachers' Opinions" by O-uz (2009), there is some effort to employ learning-teaching process within a constructivist framework, however, it is suggested that this is not in a sufficient level. In this regard, in teacher training programs, revealing to what extent learning environments provided to students have the characteristics of constructivism and to what extent pre-service teachers are trained in this approach and the evaluation of the learning-teaching process in terms of the constructivist approach can make a contribution to train qualified teachers. From the above studies, it can be seen that the process of learning and teaching in content knowledge courses includes some parts of the qualities of a constructivist learning environment. The constructivist learning approach is not restricted to the learning environments in which active participation of students is provided, at the same time, it's the environment in which how to construct knowledge also is gained, the qualities of a constructivist learning environment should take place in theoretical courses beside applied ones.

The same with the interest in applying constructivism in practice, Mvududu (2012) conducted a research paper "Constructivism in Practice: The Case for English Language Learners". The study is empirical research and included participants such as inclusive classes, especially English Language Learners. Research showed that while constructivism led to improved academic performance such as making it easier for learners to make connections between old and new knowledge, or deepening their understanding of concepts, it provided many new challenges. First, English Language Learners (ELL) pose a specific challenge to teachers because they represent this kind of wide selection of academic abilities, English language abilities, and academic backgrounds. Additionally, cultural differences may influence the students' power to be successful in the classroom. Second, an inclusive classroom is a class filled with students of different linguistic backgrounds. Students in an inclusive environment will have to use their English skills more regularly. This can help learners to absorb, understand, and reflect on the language better. Thirdly, many ELL students are less inclined to speak up and be involved in a classroom of native English-speaking students, or many ELL students might not be receiving the services, the interest, or the help they require in an inclusive classroom. However, it gives English language learners some opportunities such as instance confidence in their new English language abilities while still maintaining their cultural identity and celebrating their background, their language, and their abilities. At the same time, independent study, autonomy, and self-directed learning can be hugely helpful at a relevant pace assisting students to work on their learning, find material that's in their mind, and invest in their learning.

In Vietnam, Duong and Luong (2021) discussed constructivist teaching, the nature of constructivist teaching, and constructivist teaching methods for teaching costume pattern design to students at Nguyen Huu Canh Technical and Economics Intermediate School in Ho Chi Minh City to practice and improve problem-solving abilities. The problem-solving skills of 33 students in Fashion Design class 17.1 (using constructivist teaching techniques) and 35 students in Fashion Design class 17.2 were investigated using qualitative and quantitative research methodologies (presentation method and re-enactment dialogue). The results of this study showed that students achieved good results in the evaluation criteria of problem-solving skills (including analyzing the problem, proposing solutions, implementing plans, and evaluating solutions) from 51,4 percent to 68,6 percent

in class 17.1. In comparison, none or just 3% to 9.1% of students in the Fashion Design class 17.2 received high ratings in these categories. Using constructivist teaching methods (group teaching, case-based teaching, and project-based learning) in teaching the subject of costume pattern design at the intermediate level at the Technical and Technical Intermediate School, Nguyen Huu Canh has developed students' problem-solving skills: they identify problems, propose solutions, implement solutions, and evaluate them to adjust.

Method

Research design

Using a qualitative approach to gather data to gain insights on students' perceptions of the adoption of Edunext in constructivist approach-based courses. A semi-structured interview was used to provide more depth and context to the data. The strengths of using an interview process are establishing rapport and honing in the details of the interview (Creswell, 2015; Jacobs & Furgerson, 2012; Rudestam & Newton, 2015); getting the participants involved in the process can yield positive results and large amounts of rich data (Creswell, 2015; Maxwell, 2013). Besides, a purposeful sampling method was employed in the current study as it may prove to be effective when only limited numbers of people can serve as primary data sources due to the nature of the research design and aims and objectives (John Dudovskiy, 2018). SWOT analysis was employed in this study to answer the research questions.

Participants

Using purposive sampling, 30 students who experienced at least a constructivist approach-based course on the Edunext platform were selected from different majors such as Hotel Management, Business, Information Technology, English Language,

Data collection procedures

First, interviewers contacted 30 participants to invite them to become a part of the study via social networking. Flexible interviews are created that are based on the participants' time arrangement. All the students who agreed to be interviewed must complete a consent form through a QR code. Before starting the interviews, the researcher presented the purpose and the significance of the study so that the interviewees understood the importance of their answers and valuable contributions to the study. The duration of each interview is 15 to 20 minutes including two main parts. The first part is about participants' personal information like their names, students' code, their email address, and their majors. The rest is that participants are asked about their perceptions of the features of the Edunext. The participants were interviewed individually and in Vietnamese via Google Meet so that the accuracy of information was ensured as well as the participants could not duplicate each other. Moreover, not to miss any information the interviewees provided, all interviews were recorded; the interviewers also listened thoroughly and focused on what the interviewees said to formulate the relevant

follow-up questions. Finally, every interview's content is recorded transcribed, and analyzed by SWOT analysis.

Validity and reliability

Validity

Validity in research is concerned with the accuracy and truthfulness of scientific findings (Le Comple et al 1982). The concept of validity is described by a wide range of terms in qualitative studies. This concept is not single, fixed, or universal, but "rather a contingent construct, inescapably grounded in the processes and intentions of particular research methodologies and projects"(Winter, 2000, p.1). In the current study, to ensure the validity of the study, the author had a pilot interview with 4 students who experienced constructivist classrooms on Edunext platform before starting the interview to collect data. the author started with the initial research questions, shaped the questions during the pilot interview, and continued to revise them until the data collection interview. the author recorded all interviews in order to write down exactly what participants provided. Moreover, the author explored the participants' views instead of imposing their views on the research situation. Moreover, Guest, Bunce, and Johnson (2006) postulated that a minimum of 15 participants is enough for a qualitative study to reach saturation, in the current study 30 students were sampled purposely for the interview.

Reliability

Reliability is concerned with the consistency, stability, and repeatability of the informant's accounts as well as the investigators' ability to collect and record information accurately (Selltiz et al 1976:182). In this study, before beginning the official interviews, the researcher conducted pilot interviews with four students made the interview questions in this research have a high level of consistency and stability. Interviews are used entirely in Vietnamese, after gathering sufficient data, the researcher began translating the data into English. In the process of translating the data from Vietnamese to English, her colleague was invited to double-check the transcript. Furthermore, the transcripts were sent back to all participants for double-checking.

Findings

Edunext's Strengths

Based on the answers of the participants from the interviews, a SWOT analysis of the Edunext platform from the students' lenses was carried out. The results of students' perceptions are presented below.

Perceived easy to use

All participants agreed that Edunext was easy to use, they find it easy to sign in and log in to the platform.

Additionally, when comparing Edunext with other applications such as Google Classroom, and Coursera, Edunext impressed them most because of its user-friendly interface and the "chat box" feature which also helped them easily communicate with each other. "Students can use the chat box to communicate directly with one another. It's more user-friendly than Google's classroom software." S1; "After using many online educational platforms such as Coursera, Google Classroom, and Zoom, Edunext has always been my choice when studying online." S8.

Perceived of usefulness

Half of the participants appreciated it as useful and convenient in reviewing old lessons or consulting others' ideas. Moreover, Edunext was also a place where shy, introverted learners could convey their thoughts to others. "Students can consult everyone's answers and opinions on Edunext." S2; "Edunext helps students review the lesson one more time, when studying in groups, everyone can comment on each other to easily see which answer is best." S10; "If there are some people who are afraid to answer directly, they can upload their answers to Edunext so that the lecturer can understand their opinions as well when they comment, they can read other people's comments to summarize the lesson and learn for themselves."

Edunext's weaknesses

Interface

Although all interviewees agreed that Edunext was simple for users, 17 interviewees also revealed that Edunext's interface was boring, which made them uninterested in learning. "The interface is a bit boring, and not eye-catching, therefore it doesn't attract students." S10; Some students thought that EduNext still lacked some exciting elements to stimulate students' interest, such as humanlike icons, pictures, mind-maps, and lecturer-student interactions. "The utilization of Edunext is easy for GenZ, we need something more challenging and have a compelling look. (S30).

Ethical Concerns

Many of the respondents expressed their concerns about copying the responses from others. Some of the students took use of getting and sharing ideas to copy their peers' answers, which affected their thinking ability and learning quality. "I accidentally discovered my friends' answer is the same as mine." S29, "I usually copy the answers from the internet and paste them on the Edunext." S20.

Limiting applying for all subjects

10 out of 30 students agreed that Edunext was inappropriate for subjects that require a lot of practice, specifically students majoring in graphic design and IT believed that EduNext was currently not very useful because the majors were more practice-oriented. "When lecturers teach on next, students cannot practice regularly through coding exercises as at school." S28. "Studying on Edunext is mainly related to theory, but for

my major, it needs more practical exercises.” S16

Edunext's opportunities

Advancement

21 out of 30 interviewees agreed having explored the platform's strengths and weaknesses offered the opportunity for Edunext to enhance and upgrade. For instance, some learners felt that the interface of this platform should be improved, as well as a few functions such as voice, and document storage need to be added, or the privacy feature should be paid more attention when learners interact with one another through chat boxes. “If Edunext updates with other features, this software has a chance to develop more.” S15. “If Edunext updates with more features and improves the interface, there will be a chance to be used more.” S13

Experiencing a new learning environment

26 out of 30 students interviewed postulated that Edunext provided them with a precious opportunity to be involved in digital classroom activities. Meanwhile, it allowed both students and teachers to access a novel learning environment where they could express their ideas and consult others'. "Answering questions on Edunext allows all of us to share our thoughts and opinions". S1; “I think students and lecturers will have the opportunity to experience a new learning method.” S2. Some participants admitted that introverts engaged more actively and confidently in constructive hours because no one knew their responses except the teachers. “Reserved students can publish responses freely without fear of others knowing their identities or worrying about the correct or incorrect answer.” S17

Edunext's threats

Fairness

7 participants said that voting and security were threats when studying on Edunext, which led to unfairness and made students demotivated. “Voting on Edunext is a threat. If they are close friends and will vote for each other, the voting is not fair and it is not possible to properly assess the capacity of each of the students and the results may be bad.” S25. The problem of copying and cheating in responding to the raised questions was worth considering. “The threat of network transmission, and the possibility of being copied by others.” S13

Teacher-student interaction

Lecturers and students could not interact or settle problems face to face, hence 22 participants stated that the relationship and interaction between lecturers and students would not be closed. As a result of this threat, there was a lack of understanding between students and lecturers, this was also easy to cause boredom in teaching. “The relationship between students and lecturers may be jeopardized since the lecturer may not be able to observe all of the students' answers if the class has too many learners, due to sometimes, you may also be unsure if the response is correct or incorrect.” S21

Discussion

In this qualitative research, SWOT analysis was employed to analyze the strengths, weaknesses, opportunities, and threats of the Edunext which was based on the constructivist approach. For strengths, Edunext is simple to use, the interview discovered that using EduNext is simpler for students when they are given adequate instruction, which is compatible with the prior studies of Mehta et al. (2019) and Tarhini et al. (2017). Additionally, the research site is a technology university and all students have been equipped with basic knowledge of computer skills as well as have a chance to access technology from the first year. Therefore, they find it easy to use Edunext. Similarly, Dandy George Dampson et al (2020) found students' lack of knowledge in the use of ICT was a huge barrier to the use of an online platform - LMS. Hence, to sustain the attractiveness of the users on using a new educational product. As a result, universities should consider making EduNext easy to use while modifying the system, and all users need to be trained to acquire knowledge and skills so that students are inspired to employ it. Moreover, students also recognized Edunext as a useful platform. This is in agreement with the findings by Tarhini et al. (2017). The Edunext platform was created to help learners participate in many learning activities, and freely give opinions in groups and the EduNext community without any restrictions. Associated with COI theory, Lemay et al. (2018) said the perceived usefulness, which can be considered performance expectancy of e-learning technology is impacted by the cognitive and social presence in the e-learning environment. The findings are similar to a study by Abbad (2021) which researched performance expectancy as the construct with the highest perceived level of acceptance among students' approval for the mediating tool, Moddle. For weaknesses, students recognized Edunext's interface as boring because it is still primarily text-based and lacks exciting elements. Therefore, it is necessary to update more humanlike icons, pictures, and mindmaps on EduNext; Therefore, it can become more vivid and exciting for students. Hilli and Åkerfeldt (2020) claimed that student student interactions in their classes, such as mind maps, quizzes, conversations, and peer 63 feedback, encourage social presence. In addition, this platform was only suitable for some subjects that concentrated on theory rather than practice and faced potential issues such as copying and pasting responses. For opportunities, interviewees believed that they would get the opportunity to engage in class activities to express their opinions, exchange information as well as approach a new learning environment. This research indicates that university students thought that their lecturers, and classmates strongly made their use of EduNext effectively. This is in line with previous research (Ain et al., 2016; Tarhini et al., 2017). Moreover, the findings of this study are consistent with the study of Høgheim and Reber (2015) which showed that online learning environments were associated with the opportunity for educators to adapt to education, which entailed tailoring education for every student. For threats, the first threat was that lecturers and students would be unable to communicate or resolve problems face to face, which would have an impact on students-teacher interaction/relationship and students-student interaction. Noteworthy, the lecturer-student interaction feature needs to be drastically improved, thereby increasing student interaction with lecturers since according to Papert (1991), what matters is how people interact with one another, which promotes self-directed learning and aids in the production of new knowledge for students. Thus, interaction is important in teaching and learning, face-to-face dialogue between lecturers and students will help them develop their strengths and even break the

ice. Moreover, Edunext scores based on the number of star votes it receives. Star-voting would not always indicate a student's ability because students can vote for their close friends regardless of quality. Besides voting, security was also a threat that made students feel unpleasant when utilizing this platform because everyone can read the messages, and there are very few people using the messaging feature on Edunext. Noteworthy, the lecturer-student interaction feature needs to be drastically improved, thereby increasing student interaction with lecturers. Likewise, the study by Hilli and Åkerfeldt (2020) suggests that by their school's setting, lecturers may have promoted their social and instructional presence through a variety of methods. About time and location, adult education courses were flexible, making frequent lecturer-student interactions (such as chat, email, and feedback) crucial to establishing a teaching presence.

Conclusion

EduNext is an online training platform that provides learners with a personalized learning experience through constructive learning methods based on the social constructivist theory. The current study's findings indicated strengths, weaknesses, opportunities, and threats of the Edunext platform through students' perceptions. The results revealed that students claimed that the Edunext platform was easy to use with a simple interface. Students also found it useful in their academic learning because they could exchange their ideas with their peers and teachers. However, EduNext had some weaknesses like an unattractive interface as EduNext was still primarily text-based and lacked exciting factors such as humanlike icons, pictures, and mindmaps, especially the lecturer-student interaction feature; unavoidable ethical issues due to copying others' answers; inappropriate for all courses because of the difference between practice-oriented and theoretical subjects.

Regarding the opportunities, Edunext would be improved in the future because of students' feedback. This was also an occasion for students and teachers to experience a novel digital learning platform. Besides, findings showed that introverts are more proactive and confident when it comes to expressing personal thoughts and opinions compared to traditional learning mode. Finally, some threats are discovered. It was Edunext system errors as well as feature limitations that students found unfair and demotivated. The relationship between lecturers and students on a virtual platform was not as highly appreciated as in a physical classroom.

Recommendations

Edunext is a novel platform and social constructive learning has played a key role in education and science research, hence there are several suggestions for further research. First, using EduNext in different majors empirically. Because the nature of each discipline is different, the elements influencing the students' perceptions of using EduNext for each major are also different. Second, the participants in this study only included students, thus future studies should investigate both lecturers' and students' perceptions to explore the similarities and differences between their perceptions to have a complete picture.

Acknowledgments

The author deeply appreciates the assistance and contribution of all participants, and her supporting colleague in this study.

Factors Affecting Undergraduate Student Well-Being in Learning English Online

Minh Ngoc An Pham

Can Tho FPT University, Viet Nam,  <https://orcid.org/0000-0002-0697-4557>

Abstract: Well-being emerges as a pivotal driver influencing student success, a recurrent theme in existing literature highlighting its integral role in education, particularly in the context of online learning. Consequently, the current study scrutinizes university students' perceptions of their well-being and explores factors affecting their happiness in learning English online. This research consisted of 268 undergraduate students who experienced at least one online English course at a private university in Vietnam and adopted a mixed-method approach, incorporating a questionnaire survey including 15 items of the PERMA (Butler & Kern, 2016) along with 6 items of the Academic Resilience scale (Martin & Marsh, 2006) and individual semi-structured interviews. Descriptive statistics and Pearson's Correlation were utilized for the quantitative data analysis while thematic analysis was applied to the qualitative data. Findings reveal students' perceptions of their well-being when learning online were assessed on average; Academic resilience demonstrated a correlation with student well-being and contributed significantly to their well-being; Students' Grade Point Average (GPA) solely impacted academic achievement construct. Notably, findings uncover negative emotions detrimentally affecting student well-being. Besides these insights, the study's limitations and recommendations for future research were also mentioned.

Keywords: Student well-being, online learning, PERMA, academic resilience, higher education

Introduction

In the era of technology development 4.0, learning is recognized as easier, and online learning truly exploded during the recent COVID-19 pandemic. According to Palvia et al., (2018), online education has been developing worldwide because of the combination of new technologies and it's predicted to become widespread by 2025. According to O'Regan (2003), emotions have a significant impact on learning, engagement, and accomplishment in students in online classrooms. Likewise, emotions in the online learning process are important to the success of learners (Torres et al., 2022). Therefore, emotions play a key role in the context of EFL (MacIntyre et al., 2019). Additionally, student well-being is accepted as vital to the positive development of students (Soutter et al., 2014). As a result, developing student well-being is a crucial aspect of education

(Govorova et al., 2020). Moreover, Chapman (2014) indicated that well-being in education is of great importance for educational achievement, health, socialization, social values, and human intelligence. Kern et al., (2015) used the PERMA model to measure student happiness in Australia. The study's findings showed that the PERMA model provides a wealth of well-being information to enable teachers to better meet the needs of their students, resulting in the lesson's success. In addition, Au and Kennedy (2018) adopted the PERMA model to evaluate the education program performance in Hong Kong; the results revealed that to increase student well-being, schools may include positive psychology in the curriculum. Furthermore, Kovich et al., (2022) carried out a well-being assessment of university students in the Midwestern United States. This study gave a deeper understanding of features to promote and improve undergraduate student well-being. According to Alqarni (2022), EFL learners with a high sense of well-being and tenacity were more likely to succeed in learning a foreign language. The results of this study confirmed that positive psychology is important for language learners and can help them succeed in learning foreign languages. From the above-mentioned studies, Seligman's well-being is extensively utilized in various nations. To evaluate the PERMA model as a potential tool to measure student well-being for schools, Kern et al., (2015) explored and evaluated well-being in a multidimensional way based on the PERMA model. It is concluded that the PERMA model is suitable for application in the field of active education.

In the previous literature study by Pearce (2021) on learning with technology, research results based on well-being theory and the PERMA model showed that learning with technology reinforces teaching and learning experiences such as creating positive learning attitudes with adequate training in learning with technology, affecting the promotion of student cooperation and social networks, and its contribution to personal well-being. Unlike the previous study, a study conducted by Al-Kumaim et al., (2021) in Malaysia determined whether online learning platforms used by university students pose any barriers to their learning. The results revealed that online learning harms student well-being. In addition, the study by Rogers (2022) investigated the effectiveness of positive psychology interventions (PPIs) in learning English students. Interventions based on the PERMA model for well-being. The result showed that the participants felt more positive because of the interventions. Pietarinen et al., (2014) studied "students' emotional and cognitive engagement as the determinants of well-being and achievement in school." The results indicated that student well-being experience was an important mediator for emotional and cognitive engagement and contributed to students' academic achievement.

One of the factors affecting student well-being is academic resilience. In other words, students who become resilient may have high subjective well-being when dealing with challenges in online learning during the COVID-19 pandemic (Eva et al., 2021). Likewise, Nashori and Saputro (2020) showed that during the COVID-19 pandemic, resilience maintains psychological well-being and strengthens amid existing limitations. This agrees with the study by Safitri and Nugraha (2021). Furthermore, academic resilience can help students transform difficult environments into an origin of motivation by keeping trust, orienting themselves with plans, and having problem-solving skills (Utami, 2020). Besides, Shaw (2020) believed that resilience is a process of adapting and controlling difficulties to improve subjective well-being qualities during a pandemic. Thus,

resilience plays an essential role in subjective well-being.

In Viet Nam, plenty of studies were undertaken to investigate student well-being in online learning environment. Nguyen et al., (2022) conducted a study to assess the well-being factors (positive emotions, engagement, relationships, meaning, accomplishment, and other extended factors negative emotions, physical health, and loneliness) of students in University Foreign Languages – Ha Noi National University (VNU) during the period of social distancing due to the impact of the Covid 19 pandemic. In the study of Dinh and Le (2021) on measuring the well-being of university students in Da Nang, Vietnam, the study uses five components of the PERMA model for implementation. The results show that university students' perception of their level of well-being is quite high. In addition, Tran et al., (2022) examine the perceived effects of the pandemic on well-being and possible factors related to university students' preferences for online class participation at two institutions in Vietnam. The results have shown that the impact on the mental aspect of well-being is higher than on the students' general health.

From reviewing previous studies above, it can be seen that even though many studies in the field of positive psychology have applied the PERMA theory (Magare et al., 2022), and the application of the PERMA model to measure well-being is taking place in many countries (Lee et al., 2017; Giangrasso, 2018; D'raven & Pasha-Zaidi, 2016; Watanabe et al., 2018), a literature review by Aulia et al., (2020) showed that much more research should have been done on well-being in the school settings. Therefore, the current study was conducted to investigate undergraduate students' perceptions of their well-being in learning English online. Moreover, the current research is expected to discover factors affecting student well-being via their online learning process. Hence, our research questions are:

RQ1: What are students' perceptions of their well-being in learning English online through the PERMA model?

RQ2: What is the relationship between students' GPA, academic resilience, and student well-being each other?

This research has three substantial contributions. First, in addition to exploring factors affecting student well-being during online learning time, the current study provided students with an opportunity to speak out about their actual sense of well-being when they learn English online. Second, instructors may deepen their understanding of students' thoughts to find ways to get students' attention and make the lesson entertaining and effective. Third, the results of the current study also contributed to the flourishing empirical literature on emotions in online learning settings.

Literature Review

Definition of Terms

Well-being

The term well-being can be defined in several ways. Ryff and Keyes (1995) suggested six components of well-being included environmental mastery positive relationships with others, autonomy, self-acceptance, purpose in life, and personal growth. According to Engels et al., (2004), student well-being is defined as a positive

emotional state that is associated with context-specific elements and the individual's expectations and desires for the school. In 2011, Seligman provided five elements including positive emotions, engagement, relationships, meaning, and accomplishment to assess people's well-being indexes. Huppert and So (2013) indicated ten flourishing matters that contrast significantly with popular anxiety and depression symptoms. Well-being is essential to everyone's existence. In the current study, well-being is defined based on five elements identified by Seligman (2011). First, positive emotions are revealed through students' happiness, optimism, positivism, and satisfaction when studying English online. Second, engagement means that the students are interested in and devote time and effort to online English study. Third, the relationship is evaluated through students' feelings of being cared for by their instructors and their friends as well as students-teacher interaction, and students-student interaction when studying English online. Fourth, meaning is that learning English online involves objectives and direction for learners to build the appropriate learning goals. Finally, accomplishment implies that when students study English online, they experience progress and complete the learning goals that they establish for themselves

Academic resilience

According to Wang et al., (1994), academic resilience is defined as a higher likelihood of success in school and other life performance in the face of environmental obstacles brought by early features, conditions, and experiences. Likewise, academic resilience is defined by Martin and Marsh (2003) as the ability of learners to dare cope with setbacks, issues, or pressures in the educational environment. In addition, Hendriani (2018) showed that academic resilience shows how learners overcome numerous challenging situations or troubles that are vast, urgent, and obstructive during the learning process, allowing them to adapt and stand to any academic demands well.

PERMA Model

Seligman (2011) created the PERMA model of well-being with five elements consisting of positive emotion (P), engagement (E), relationships (R), meaning (M), and accomplishment (A). Seligman believes that the five primary elements of the PERMA model are what people need to be able to achieve a positive sense of well-being, contentment, and happiness in life, which can lead to realizing life's real meaning. To begin with, positive emotions include any pleasant feeling such as peace, gratitude, satisfaction, enjoyment, inspiration, hope, or love. Positive emotions are undeniably the most direct approach to happiness. For example, positive emotions improve work performance, improve physical health, develop relationships, and inspire optimism in the classroom or workplace. According to Seligman (2011), there are two components of positive emotion: happiness and life satisfaction. As humans feel positive, their way of thinking will most likely change in a positive direction. The model's second element is engagement. According to Seligman, engagement is defined as "being one with music," which is similar to the notion of "flow" proposed by Csikszentmihalyi (1990, 1997), one of the co-founders of positive psychology. Engagement refers to a deep psychological attachment to an activity in particular. As an illustration, when humans focus on something they love or are interested in, they are

likely to lose track of time; to put it another way, they are entirely involved with it. As a result, being in the flow state and engaging in life are vital components of well-being (Seligman, 2011). The model's third element is relationship. According to Seligman (2011), humans are essentially social beings, which refers to feeling supported, loved, and respected by others. Without any doubt, human beings possess a need to connect and become members of a group or organization. One can say that building strong connections is thought to be the key to well-being. Besides, there is evidence that relationships with others could be good for health as they promote chronic illness self-management and lower suicidal inclinations (Tay, Diener, & Gonzalez, 2013). Relationships are crucial for humans because problems with relationships or social interactions affect people's well-being. The model's fourth element is meaning. Meaning refers to having a feeling of purpose and direction in life as well as being able to access the good in every moment more easily. According to Seligman (2011), life has meaning when one "belongs to and serves something that you believe is bigger than the self." Moreover, having a purpose helps humans focus on what is important in situations of significant difficulties or challenges. It is associated with improved physical health, a lower chance of death, and increased life satisfaction (Boyle et al., 2009; Ryff et al., 2004; Steger, 2012). The last element in the model is achievement. On the one hand, achievement is in chase of the sake or aims of the individual (Seligman, 2011). Also, accomplishment has a positive association with health and happiness, and it is also a predictor of academic achievement (Tansey et al., 2018). On the other hand, accomplishments do not result in positive emotions, meaning, or relationships (Seligman, 2011). According to Butler and Kern (2016), achievement is a sense of being directed toward completing goals, proficiency, and efficiency in finishing tasks. According to Waters (2011), the usefulness of the PERMA model is acknowledged to support schools. Likewise, White (2016) not only noted that the application of positive psychology in the educational context is called positive education, which appeared very early also affirmed positive psychology needed more and more, and the development of student well-being became an 11 operational goal of the educational system. Furthermore, today's schools must consider well-being as a priority to be incorporated into school elements to adjust dominant paradigms to advance education (Kern, 2022). Likewise, Oxford and Cuéllar (2014) have shown that the components of the PERMA model are necessary for learning in general and language learning in particular and that it has potential for second language research.

Previous Studies

PERMA model Kern et al., (2015) used the Perma model to measure student happiness in Australia. The study's findings showed that the PERMA model provides a wealth of well-being information to enable teachers to better meet the needs of their students, resulting in the lesson's success. In addition, Au and Kennedy (2018) adopted the Perma model to evaluate the education program performance in Hong Kong; the results show that to increase student well-being, schools may include positive psychology in the curriculum. Furthermore, Kovich et al., (2022) carried out a well-being assessment of university students in the Midwestern United States. This study gives a deeper understanding of well-being features to promote and improve undergraduate student well-being. According to Alqarni (2022), EFL learners with a high sense of well-being and tenacity are more likely to succeed in learning a foreign language. The results of this study confirm that positive psychology is important

for language learners and can help them succeed in learning foreign languages. According to the above studies, Seligman's well-being is extensively utilized in various nations. In a study by Prasath et al., (2021) about university student well-being at the time of Covid 19, the results from 806 students in the United States showed that one of the most affected PERMA factors in students' experiences was positive emotions. Correspondingly, Rogers (2022) investigated the effectiveness of positive emotion interventions based on the PERMA model for well-being in learning English for students; responses gathered through post-semester surveys and interviews indicated that the student's responses to the lessons were overwhelmingly positive. Likewise, Mustika et al., (2021) explored that students' positive perceptions towards online learning strongly correlated with their level of well-being. In other words, the level of students' awareness of online learning is directly proportional to their level of well-being. In addition, the results discovered that participating students had moderate levels of negative emotions during online learning. Tytler et al., (2008) argued that the degree of student engagement in a language class was very important because it can predict the progress of learners and facilitate education, and it had an important function in building students' critical thinking abilities, and problem-solving abilities. Notably, the survey results of Lan & Saad (2020) found that the engagement factor is rated at the highest level in contributing to the well-being of EFL students in China in the English learning process. On the contrary, research results by Prasath et al., (2021) revealed among the factors in PERMA-Profiler, engagement and physical health are the least affected ones on student well-being during online learning by Covid-19. Nguyen et al., (2022) investigated that positive relationships contribute to students being happier and more well-being in life and school. Moreover, students' relationships with families, teachers, and classmates are closely linked to student engagement and academic achievement at school (Furrer & Skinner, 2003). Besides, well-being is based on the quality of the relationship as well as the balance between giving and receiving, which is being present for someone, sharing, listening, and accepting at the most needed times (Kern, 2022). It may be advantageous to incorporate relationships in models of student well-being because Diener and Seligman (2002) discovered that extremely happy college freshmen had stronger social and romantic relationships. In addition, the data in the study of Kovich et al., 13 (2022) demonstrated that relationships with staff and teachers in universities improve the well-being of college students. Siek-Piskozub and Jankowska (2018) found a link between meaning and intrinsic motivation of English students to help them be more well-being and develop their ability to use English. Also, the research results of Nguyen et al., (2022) have shown that the meaning factor including valuable, meaningful, oriented life, and maintaining purpose had a significant impact on student well-being in online learning. To achieve meaning, people often pursue to accomplish something important such as improving health, taking part in charitable activities, or building relationships with family and others (D'raven & Pasha-Zaidi, 2016). In Kovich's (2020) literature review of the meaning element in the PERMA model, he concluded that meaning was a significant factor throughout the college experience. The research results of Lan and Saad (2020) showed that achievement is a factor impacting the well-being of English language learners. More importantly, achievement is considered to have an impact on student well-being in online learning (Nguyen et al., 2022). Additionally, Cheng and Chen (2021) investigated that applying the PERMA model to learning English had a positive impact on college students' English learning, specifically improving their English listening and speaking ability. Furthermore, achievement can also be an external reward, but it increases student well-being when they have a meaningful and intrinsically motivating goal for learning a foreign language (Min,

2021). To investigate the correlation between academic resilience and student well-being, the study on 200 university students in Malaysia by Idris et al., (2019) on the impact of resilience on psychological well-being demonstrated that resilience was a student's well-being predictor. The result also showed that resilience positively correlated with psychological well-being. In other words, students with a high degree of resilience would also have a high level of well-being. Besides, in the study by Safitri and Nugraha (2021) on exploring the impact of academic resilience and online learning readiness on the subjective well-being of 200 Junior High School Students learning online during the COVID-19 pandemic, the results revealed that both factors were concurrently valuable in identifying and predicting students' subjective well-being. Meanwhile, the level of resilience was recorded mainly at medium (40%) and high (44.5%). In addition, Ko et al., (2020) surveyed to investigate whether or not subjective well-being is influenced by academic resilience and perfectionism; The results of 245 university students in Korea confirmed that socially prescribed perfectionism negatively correlated with subjective well-being, but academic resilience positively correlated with subjective well-being. Specifically, the three factors identified as having an influence on subjective well-being in this study are school life satisfaction, academic resilience, and socially prescribed perfectionism. In the study by Rahmi et al., (2019), research was carried out on 87 students in Ma'had Daarut Tahfiz Al-Ikhlâs Islamic boarding schools. The results indicated that academic resilience has an impact on the subjective well-being of students and that they are positively correlated. In addition, the results showed that academic resilience affects subjective well-being with a value of 14.6% ($R^2 = 0.146$), and the rest due to factors outside the limits studied in this study with a value of 85.4%.

Method

Research Design

This present study employed a mixed method to answer the research questions. According to Morse and Niehaus (2009), mixed methods research often employs qualitative and quantitative methodologies. This approach was selected because it provides broader and more detailed results regarding a phenomenon than using only qualitative or quantitative research (Hurmerinta-Peltomäki and Nummela, 2006). In the quantitative analysis, the questionnaire used to collect sample data consists of 21 items. It is used to examine students' overall perceptions of well-being in learning English online. The questionnaire is divided into three parts. Part 1 is about students' demographics; Part 2 is about student well-being in learning English online adapted and adjusted from PERMA (Butler & Kern 2016) to match the research objective and test reliability by officially using an 11-point Likert scale ranging from "Never" to "Always" with 15 items; Part 3 is about academic resilience adapted from Academic Resilience Scale by Martin and Marsh (2006) which consists of 6 items using a 5-point Likert scale ranging from "Strongly disagree" to "Strongly agree". In the qualitative research, the study team used individual semi-structured interviews to acquire deep insights into the factors of student well-being via learning English online.

Data Collection Procedures

In the quantitative phase, for piloting the questionnaire, 40 participants who have experienced English courses through online learning were invited to undertake the questionnaire (both English and Vietnamese versions) to test the reliability of the questionnaire before administering it. Quantitative data were collected by asking participants to complete a consent form via QR scanning, and then finish the questionnaire. Besides that participants were encouraged to ask questions during the process of questionnaire completion to clarify any misunderstanding. In the qualitative phase, ten random participants from a total of 268 respondents had personal interviews and they understood that the information they provided was chosen to conduct one-on-one interviews kept confidential and used for research purposes only. The interview consists of 6 questions. The interview time was about 15 minutes for each person. The interview was held on the Google Meet platform because of the convenience and flexibility of location, time frame, and time-saving for participants. At the beginning of the interview, participants answered questions related to their information such as their full name, age, major, and the number of times they experienced English courses. Followed by more in-depth related questions about their feelings and experiences of learning English online. Vietnamese was used for information exchange during the interview because the participants. Besides, to understand the meaning of the question more clearly as well as confidently express their views. Therefore, the content presented is also richer and more varied. The interview data were recorded, translated, and analyzed the data through thematic analysis.

The validity and reliability of data

Regardless of quantitative data, taking the results of the pilot test on 40 students to run Cronbach alpha. If the loading factor is ≥ 0.60 , the questionnaire is valid and accepted according to Hair et al., (2010). The validity of the questionnaire was checked by the author and double-checked by her colleague.

Table 1. The reliability of the questionnaire

No.	Name of variables	No. of items	Cronbach's Alpha	No. of participants
1	Positive emotion	3	.806	40
2	Emotion	3	.731	
3	Relationships	3	.822	
4	Meaning	3	.683	
5	Achievement	3	.803	
6	Academic resilience	6	.849	

Regarding qualitative, the cross-check approach can help the researcher increase the accuracy and reliability of their research (Creswell, 2018). To validate the qualitative data, the author re-read the interview content and translated it into English. The second step was to send the translated interview content to her colleague who specialized in the research field for review. After the content had been checked by the colleague, The author sent it back to the participants through their email to determine if the translated content matched what the

participants provided.

Results

Quantitative Phase

Students' perceptions of well-being in learning English through online learning

Figure 1. Students' perceptions of well-being (N=268, Likert Scale 0 = never, 10 = always)

Figure 1 depicts students' perceptions of their well-being in learning English through online learning with a total of 268 participants with a 15-item questionnaire according to the Likert Scale from 0 = never to 10 = always. In general, students were quite happy when learning English online (A=5.578). The first is about positive emotions, it could be seen that students feel happy through learning English online. In addition, they also felt positive, optimistic, and satisfied (A=5.73). The second is about engagement, students have regularly completed activities in online English classes. Moreover, students also found it interesting through this online English learning process (A=5.07). The third is relationships, the results showed that students are often supported by others when learning English online. For example, when students have faced certain difficulties, they usually ask for help from their peers or instructors. Furthermore, students also feel cared for and satisfied by those relationships (A=5.45). Fourthly, in terms of meaning, students felt that learning English online has helped them be more proactive and achieve their goals. In addition, students also said that learning English online helps them adapt to working remotely (A=5.94). The last one is achievement, students felt that they have achieved their goals such as improved presentation skills, teamwork skills, and higher scores through an online English course (A=5.7). Student well-being in learning English online is frequent and sometimes. This is evident from the average score of 5.578.

Correlation of student well-being

To examine the relationship between variables of students' well-being, academic resilience (AR), and GPA. Hence, we conducted the Pearson correlation.

Table 2. Correlation of student well-being (N=268)

		WB	AR	GPA
WB	Pearson Correlation	1	.477**	.178**
	Sig. (2-tailed)		.000	.003
AR	Pearson Correlation	.477**	1	.033**
	Sig. (2-tailed)	.000		.588
GPA	Pearson Correlation	.178**	.033**	1
	Sig. (2-tailed)	.003	.588	

From the results of Table 2, there was a positive correlation between AR(academic resilience), GPA, and students' well-being in learning English online. The results indicated that the more difficulties in the learning environment students could overcome, the happier they were (Sig = .000). Besides, the higher grades students got, the happier they felt (Sig = .003).

Qualitative Phase

After confirming the data's validity, The author found that the results of a total of 10 participants which were analyzed by using thematic analysis (Braun and Clarke, 2006). In addition to supporting the results of quantitative findings, the results also revealed other factor related to student well-being in their learning English process through online setting.

Positive emotions

Over half of the total respondents agreed that they feel quite satisfied, excited and positive with the online English learning program. "When I study English online, I tend to feel comfortable and active in participating in lesson development ..." (S10) "I feel excited when learning English online and when learning English online is as effective as learning in class" (S7)

Engagement

All participants who took part in the interviews stated that they always engaged in groupwork activities or

individual tasks like English games, presentations, ... Moreover, they sometimes voluntarily answered teacher's questions. "I often engage in answering questions on Edunext. Besides, the topics that I understand, I will volunteer to answer more questions." (S4) "I always fully engage in the activities of the online English class when my teacher gives me a quiz game or asks me to discuss a given task with my friends." (S8)

Relationships

Most of the interviewees said that they got help from friends and lecturers whenever they were in need. When they had problems like answering questions, missing information, expressing their ideas, or facing mental pressure, they often shared these with their friends and teachers. "My class teacher and friends have supported me in the process of learning English online. If there's something I don't understand about the lesson, I'll message the teacher or ask my classmates to seek the answers." (S3) "I will often ask friends for coming up with ideas for topics that are beyond my capabilities as well as my understanding. Besides, the teacher also supports me with vocabulary provision as well as grammar correction so that I can speak or write correctly and use the right words." (S5)

Meaning

Most interviewees shared that they had set goals regarding scores, English skills, grammar, and vocabulary. They felt that learning English online was very convenient in terms of time and study location. Besides, it brought confidence in communication, improved skills, self-discipline, and self-study. "I also have a learning goal that the end of the course, my score will be above 8.0. Truly, I achieved the goal of studying at the end of the semester above 8.0, gained more knowledge, and improved my ability to concentrate on studying. I feel that learning English online is very convenient because I can study anywhere, anytime. It also gives me more knowledge as well as skills so that later I can attend or teach an online class, I will know how to teach more effectively." (S1)

Achievement

Qualitative data also revealed similar quantitative results that all the participants obtained certain achievement in the process of learning English online. They share that they got good GPA, improved their English skills, and gained more knowledge. "I achieved the goal of studying at the end of the semester above 8.0, gained more knowledge, improved my ability to concentrate in studying. During the course of the teacher instructing or answering questions, I will note the mistakes that have been corrected so that I can correct my own work to improve my skills." (S1) "I improved my presentation skills in English. Moreover, my grades have improved compared to the previous semester." (S3) "I achieved the goal that I set out, which is that my scores at the end of the course is above 8.0 overall. I have also enhanced my presentation skills, teamwork skills and gained more knowledge from this course." (S4)

Academic resilience

The results of the qualitative data show that all participants had the academic resilience to access well-being. Even though they experienced certain difficulties such as weak internet connections, mental health, conflicts of teamwork, and bad grades, they always find ways to overcome them to move towards. This is proven by the following evidence: “If I get bad grades, I’ll ask my teacher for reasons and ways to improve it. When I am stressed, I will share those difficulties with my friends to overcome them.” (S1) “If I the network connection is not good, I will register for 3G for keep joining online English lesson. Regarding scheduling a group appointment, I will message to group mates to make an appointment in advance. If everyone is busy, I will spend 10-15 minutes in a quick meeting to discuss and solve the problem.” (S10)

GPA

It is proven again through qualitative data that GPA had an impact on the fifth factor of Perma, achievement. 8 out of 10 interviewees stated that they got the achievement through their improved GPA. When they participated in learning English online, their scores range from 6.5 to 9, and they are happy with this achievement. “I have an average score of about 6.5 – 7.5.” (S9) “After I study English online, my score is improved and better. My score can be quite good, my average score at the end of last semester is 8.5.” (S6) “When I study English online, I feel my grades are quite good and improved. Specifically, my average score reached to 9.0, which is 1 point higher than the previous semester.” (S10)

Another factor related to student well-being

In addition, the study also discovered another factor, negative emotions, which affected students’ happiness through online English learning. Out of 10 interviewees, 7 participants said that negative emotions appeared in their online English learning experience such as sense of boredom, distraction, and lack of interaction. “I don’t like learning English online because it’s boring, uninteresting. When I study English online, I feel sleepy, it is difficult for me to concentrate because learning online is more difficult to interact with others than traditional learning.” (S5) “Sometimes online learning has a little disadvantage. For example, when the network is weak, I find it very difficult to reconnect with the instructor so the interaction with the instructor is slightly reduced.” (S4).

Discussion

The current study aimed to investigate the perceptions of undergraduate students on their well-being whilst learning English online, then discover factors affected theirs utilizing the PERMA model.

Students’ perceptions of their well-being

The more optimistic, happy, and satisfied the student feels, the higher their degree of well-being when learning online. Similarly, optimistic university students easily gained academic success, which leads to high levels of psychological well-being (Burris et al., 2009). This is also in agreement with the study by Roger (2022), whose findings revealed that students respond positively to learning English. It is suggested that educators should be more regardful of learners' positive emotions, such as psychological well-being; design an enjoyable virtual learning environment increase learners' engagement like incorporating podcasts and videotapes into learning in online contexts. By doing so, student well-being will be enhanced, leading to improving their learning outcomes and boosting their interest in English language learning.

Additionally, students are engaged, spend time and effort on the assignment, or participate in group activities in learning English online. Similarly, Dincer et al., (2019) found that several activities, including accomplishing tasks, classroom participation, and connecting with teachers by asking and answering questions, are connected to student EFL engagement in class. Likewise, the survey results of Lan and Saad (2020) revealed that engagement element is top of the score in affecting the well-being of EFL students in China. It is recommended that teachers have active virtual simulations, and online games (preview vocabulary through quiz, booklet) to boost student engagement when learning English online program.

Moreover, students receive assistance and advice from others, which improves their well-being and reduces their stress levels when learning online. It is in the same vein that Graham et al., (2016) found that relationships with instructors are very important and can enhance student well-being by encouraging their growth and supporting them with challenges. Likewise, positive interaction between instructors and learners contributes to increasing students' enthusiasm for learning as well as enabling them to feel well-being in online learning (Xiao et al., 2023). Hence, teachers need to establish positive relationships with students through regular communication, feedback, and showing genuine care and interest in their progress.

Furthermore, students recognized the importance of setting goal and orientation of learning English online, which can encourage and engage them in the learning process. Similarly, the study by Siek-Piskozub and Jankowska (2018) discovered the relationship between meaning and intrinsic motivation of EFL students. This indicates that when students have a specific learning objective, their future life orientation gets better. Likewise, the study of Nguyen et al., (2022) discovered that the more meaningful, oriented and purposeful the students' lives were, the more valuable their lives were. Therefore, to enhance student well-being in learning English online, it's important to emphasize the meaning and purpose of acquiring English language skills. This can be done by connecting language learning to real-life situations, providing meaningful and relevant content, and highlighting the benefits and opportunities that come with proficiency in English.

In addition, achievements in online learning had a significant positive effect on student well-being. In other words, the more achievement students gain, the happier they are. Similarly, Pearce (2021) showed that students' overall well-being has significance for effective learning experiences, educational satisfaction, and academic achievement. Likewise, Alqarni (2022) emphasized the significance of well-being as a psychological element in

improving EFL learners' academic achievement. Indeed, achievement is a strong motivation for students in their English learning.

The correlation between Students' GPA, academic resilience, and student well-being

The higher students' GPA, the more achievement they gain. Likewise, the study by Steinmayr et al., (2018) indicated that GPA was used to measure the academic achievement of students. It is suggested that teachers may design some knowledge-related activities (educational games on online platforms) during lectures to stimulate students' involvement as well as give them bonus points. As a result, they could gain a higher GPA at the end of the course.

Academic resilience refers to students' capacity to recover from schoolwork pressures, setbacks, and failures such as bad marks or unfavorable comments on their work, leading to enhanced student well-being in learning online. Likewise, the research by Eva et al., 2021 showed that academic resilience permits students to confront challenges or negative emotions to adjust to online learning during the COVID-19 pandemic, which also contributes to enhanced student well-being. Similarly, the study by Safitri & Nugraha (2021) found that the higher the level of academic resilience in online learning, the better the subjective well-being of students. The research also recognized that the academic resilience element contributes to the development of students' self-efficacy and confidence in learning English online. It is suggested that when students have low scores or do not pass a test, teachers should give them some advice or encourage them to keep moving to boost their academic resilience and to learn English better. In addition, the board of leaders of the university should invest in school infrastructure, namely improving internet speed.

More significantly, the study discovered that another element impacting student well-being in learning English via online setting is negative emotions. Negative emotions mean that when students learn English online, they feel unhappy, distracted, and lack interaction. Likewise, according to Sazdovska-Pigulovska (2021), student learning online leads to a lack of "connectedness" (lack of physical contact with teacher and peers) in class, which hurts their emotional well-being, and for some students, it also has a negative impact on their physical well-being. It is proposed that a helpful and inclusive learning environment be created, as well as clear instructions and the promotion of positive feedback and encouragement.

Conclusion

In summary, the study found that the perceptions of undergraduate students on their well-being in learning English via online environment were at the medium level with an average score of 5.578 by descriptive analysis. Hence, educators need to pay more heed to student well-being to strengthen their positive emotions, engagement, relationship, meaning, and achievement as well. Additionally, findings also discovered that GPA and academic resilience influenced student well-being. Furthermore, through qualitative analysis, the author

discovered a different element influencing student well-being when learning English online, which is negative emotions referring to feeling depressed, lacking attention, and lacking interaction when learning English online. Therefore, teachers should incorporate interactive learning activities, enhance interaction to alleviate negative emotions, and promote students' overall well-being in their foreign language learning process.

Recommendations

The well-being of students in online learning can be influenced by many factors in different settings. Therefore, it is advisable that future studies should be undertaken in different contexts like secondary school and high school to provide a more comprehensive view of differences in the well-being of students at varied levels. In addition, the qualitative results in this study also found that there was a correlation between negative emotions and student well-being. That means negative emotions also significantly influenced student well-being. As a result, further studies need deeply research other aspects of negative emotions affecting student well-being.

Acknowledgements

I acknowledge the support and approval from my institution, which enabled the execution of this research. Furthermore, I would also like to express our appreciation to my students for their assistance with data collection that significantly enriched this study.

Abstract: In recent decades, there has been substantial interest in the mental well-being of educators, as they contribute to the establishment of societal and psychological safety within schools. Our research employed various assessment tools including the Maslach Burnout Inventory (MBI-ES), Folkman-Lazarus Coping Strategies, Beck's abbreviated Depression Inventory, MOS SSS-H, and the Psychological Immune System Survey (PIF). A total of 301 individuals occupying educational roles participated in the study during 2021/2022. We investigated the primary factors impacting their burnout, such as the level of depression characterizing them and the criteria by which individuals fall into categories of burnout. Based on our findings, our sample exhibited low to moderate levels of burnout, only five teachers were affected by high burnout. The average age of the group was 47 years, representing the most active life stage. They tend to respond to challenges with higher levels of coping strategies, perceiving them as less threatening. Depression was also prevalent, with only 19% falling within the normal range. 12% experienced moderate depression, 2% (5 individuals) suffered severe depression, while the largest group (202 individuals) exhibited mild depressive states. Furthermore, 98 individuals lacked instrumental support, indicating a lack of assistance when needed. According to the PIF, they scored particularly low in the Approaching-Monitoring subsystem, suggesting a reduced understanding of their environment and monitoring positive outcomes. We also examined the prevalent coping strategies among educators and the psychological resources they could leverage for support and mobilization. Our research suggests that educators are greatly impacted by burnout symptoms, underscoring the necessity for their involvement in preventive training programs. These programs should prioritize reducing depression and enhancing coping mechanisms.

Introduction

The well-being, and professional and individual satisfaction of teachers at work is an outstanding factor from a socio-economic point of view, because psychosomatic problems, diseases, and disturbances in social relations affect children and young people in the complicated context of the school environment, and also affect workplace efficiency. International and domestic research unanimously confirms that teachers are generally exposed to a high level of stress and are at risk of burnout (Chaplain, 2008; Jagodics et al. 2020; Kyriacou 2001; Mihálka & Pikó, 2018; Schwarzer & Hallum, 2008; Szabó & Jagodics, 2016; Szigeti & Di Blasio, 2022; Yu et al. 2015). The burnout of teachers is also increased by risk elements such as environmental changes, war and other extreme global events. The purpose of our research is to map the mental state of teachers and to identify their psychological resources that can be mobilized to deal with difficulties for the sake of a prevention training to be developed later. Our study undertakes a comprehensive examination of the factors imperiling the mental well-being of special educators, presenting the findings of our research conducted in 2022. Delving into the individual manifestations of burnout, our research aims to design workplace interventions tailored to the unique needs of these professionals. Given the multifaceted nature of special education work, it is imperative to delve deeper into the factors undermining well-being, which, in turn, impact personal and professional efficacy, constituting crucial domains for psychological and pedagogical intervention.

Theoretical Background

The Characteristics of Burnout Syndrome

In the scientific literature, we can primarily find definitions related to the context-dependent concept of burnout. Herbert J. Freudenberger was the first to write about the phenomenon of burnout, who studied the phenomenon in crisis intervention centers, medical institutions, and self-help communities. According to the previously presented definition, burnout is „a state of physical, emotional and mental exhaustion that occurs as a result of chronic emotional strain and stress, which is accompanied by feelings of hopelessness and incompetence, the loss of goals and ideals, and which is characterized by negative attitudes towards one's own person, work and others are characterized” (Freudenberger, 1974, in Fekete, 1991:17). In another wording, the burnout syndrome means a change in the relationship to work, which appears in the clinical symptoms of emotional exhaustion, depersonalization, and a decrease in personal effectiveness. It mostly affects those who work with emotionally saturated human relationships during their work, so in addition to doctors, health professionals, pastors, and social workers, it can especially affect teachers (Bordás, 2010). Christina Maslach and Susan E. Jackson (1981), the developers of the Maslach Burnout Questionnaire, define burnout as a set of symptoms that develop in response to chronic emotional and interpersonal stress processes. According to their idea, in addition to the unique characteristics of individual stress perception, the context of social relations at work and organizational characteristics also play a significant role in the process (Maslach and Jackson, 1981).

According to a further approach, the burnout syndrome is a psychosocial disease related to helping work that

appears in welfare societies. Its three main symptom groups are the feeling of emotional exhaustion, depersonalization and the feeling of a decrease in personal effectiveness at work. When experiencing emotional exhaustion, the person cannot get emotionally involved in their work, depersonalization means the development of negative attitudes and emotions related to clients. According to some ideas, emotional exhaustion and depersonalization show a close connection (Fülöp and Gábris, 2022). During the feeling of a decrease in personal effectiveness, helping professionals believe that their performance is not enough to perform their tasks properly, and they are dissatisfied with the results they have achieved (Montero-Marín et al., 2009).

According to Michel (2016), the most significant effect of burnout is that it prevents healthy professional development, and the chronic psychosocial stress characteristic of burnout impairs the personal and social functioning of those affected by burnout, overloads their cognitive abilities and the neuroendocrine system, which ultimately leads to characteristic changes in the anatomical in formulas and how the brain works.

DSM-5, the Diagnostic and Statistical Manual of Mental Disorders - which is the classification system developed by the American Psychiatric Association - does not classify burnout syndrome as an independent mental illness, but believes that burnout can mostly be caused by the complexity of work tasks (American Psychiatric Association, 2013).

BNO-11 (ICD-11) does not define burnout as a disease, but classifies it as „Factors affecting health status or contact with health services” and defines it as a syndrome resulting from chronic work stress, which is caused by insufficient stress management contributes. Its three characteristics are the feeling of exhaustion, emotional distance from work, and the development of a reduced sense of professional efficiency. According to the WHO, the phenomenon of burnout can specifically apply to the occupational dimension, not to other areas of life (World Health Organization, 2019).

At the same time, researchers who support the context-independent concept of burnout distinguish between client-related and personal burnout, and believe that personal burnout can also be experienced by people who do not work, such as students or retirees, but also by parents who stay at home to care for their children (Kristensen, Borritz, Villadsen, & Christensen, 2005).

From a differential diagnostic point of view, burnout must be separated from acute stress disorder, post-traumatic stress disorder and adjustment disorders (Lubinski, 2012), and especially from depression (Oquendo, Bernstein, & Mayer, 2019), so that those affected are appropriate for the diagnosis. receive treatment.

Although the burnout syndrome can be interpreted not only on an individual level, but also in a broader social context, and - as a social problem - is closely related to employment and even to the economic issues of individual countries, still only a few countries have burnout prevention and/or intervention with strategy. Health and social support for those struggling with burnout would be an important state task, for which exemplary models have been found in Sweden and the Netherlands in recent decades (Van der Klink and Van Dijk, 2003;

Friberg, 2006; Kiss, Polonyi and Imrek, 2018).

Factors of teachers' psychological safety

Teaching comes with multiple responsibilities. The responsibility goes beyond the simple delivery of the curriculum, the creation of the curriculum, the assessment of competence, and many administrative tasks (Astrauskaite et al., 2011; Comber & Nixon, 2009). Teachers typically work with diverse groups whose ages, cultural backgrounds, motivations, and social competence can be very different (Comber & Nixon, 2009). According to researchers, teachers' socio-emotional skills are essential for maintaining an optimal classroom environment, managing conflicts, providing support and responding adequately to individual needs (Jennings & Greenberg, 2009; Schonert & Reichl, 2017). It is assumed that stress management, flexibility, positive organizational and motivational attitudes are predictors of professional success. They also draw attention to the importance of identifying and measuring the attitudes, qualities and motivations that can contribute to both job satisfaction and retention in the teaching profession (Hollett, McMahon & Monson 2021).

According to the prosocial education model (Jennings & Greenberg, 2009), teachers who possess certain social and emotional competencies are better able to cope with the demands of the profession while avoiding burnout. The lack of these competencies can lead to a loss of professional motivation and turnover, but their presence can strengthen the professional efficiency and commitment of teachers and reduce the likelihood of stress and burnout (Jennings et al., 2017). Research results also confirm that there is a strong relationship between teacher stress, negative emotional reactions, coping mechanisms and personality characteristics (Montgomery & Rupp, 2005). These characteristics are self-awareness, social awareness, self-management, relationship skills and responsible decision-making (Zins et al., 2004). In terms of socio-emotional skills (e.g. self-awareness, motivation, perseverance, self-control, self-evaluation, etc.), there are many important qualities that are valuable for fulfilling the role of a teacher and professional perseverance. In order to avoid emotional exhaustion and respond to the needs of others, teachers must effectively regulate their own emotions, be reflective and able to identify the intentions of others (Jennings et al., 2017). Empathy, kindness, extraversion, and honesty are also traits that can increase the likelihood that a teacher can maintain their well-being or protect their own health by building support networks at work and avoiding stress. People who are people pleasers can be described as cooperative rather than competitive and genuinely interested in others (Barrick et al., 2002; Liao & Chuang, 2004). The ability to collaborate showed a positive moderate correlation with satisfaction, which can be explained in part by the efforts of individuals to maintain a positive workplace climate through their interactions with colleagues (Matzler & Renzl, 2007; Mount et al., 2006; Zimmerman, 2008).

In the other hand, there are also characteristics that can undermine well-being and the workplace climate. For example, neurotic people are assumed to worry a lot, be nervous, insecure, and emotionally unstable. They can also be characterized by impatience and vulnerability (Bastian et al., 2017), which probably reduces their self-efficacy and increases their risk of burnout (Maslach et al., 2001). Conscientious people are assumed to show self-discipline, perseverance, reliability, and are generally well-organized, goal-oriented, and hard-working.

Teacher self-efficacy is also claimed to be particularly important in protecting against stress and burnout and in effective coping (Schwarzer & Hallum, 2008). Workplace stressors exhaust teachers emotionally, which ultimately reduces their coping resources (Blasé, 1982; Jennings et al., 2017). A growing discrepancy between the resources required for coping and the demands of the work environment leads to stress (Maslach et al., 2001). Organizational commitment is one of the most frequently measured variables in organizational development and is closely related to satisfaction and job retention. Importantly, in the case of teachers, organizational commitment correlates positively with satisfaction and negatively with intention to leave the workplace (Conley & You, 2009; Zeinabadi, 2010; Bos et al., 2016).

Coping strategies

The characteristic features of personality functioning are coping mechanisms with stressful situations. During the process of coping, we try to resolve the conflict that causes stress, through cognitive, behavioral and emotional efforts (Pikó, 1997). Three factors play a role in coping with stress (Csíkszentmihályi, 2001):

- available external support, especially the social network,
- individual psychological resources,
- and coping strategies for overcoming stress.

Coping mechanisms are grouped by the authors according to several aspects, but coping strategies are usually used in a mixed manner. According to the division of Lazarus and Launier (1978), we can talk about emotion-focused and problem-focused coping mechanisms. In the case of the former, the goal is to reduce the negative emotional state associated with the stressful situation, so that it is possible to move on to a strategy focused on problem solving, in which case the goal is to eliminate the stressor or avoid the threatening stimulus. Lazarus and Folkman (1986) separated eight more strategies within the forms of coping, confrontation, distancing, regulation of emotions and behavior, search for social support, acceptance of responsibility, planning of problem solving, avoidance-escape and positive meaning. search. Compas et al. (2001) separate the coping categories of approach - mobilizing the individual towards the stressor and avoidance - moving away from the stressor. Approach coping mechanisms, such as problem solving and cognitive restructuring, correlate with better psychological adaptation, however, coping strategies (social withdrawal, avoidance behavior, self-blame, wish-driven thinking) can only be adaptive in the short term (Hamvai & Pikó, 2013).

Method

About the research

In our research, we addressed pedagogues/special pedagogues, the questionnaire was distributed among professional pedagogical services and unified special pedagogy methodological institutions, as well as on social media platforms and specifically in public education institutions maintained by the Kaposvári Education Center, so the largest proportion of answers - but not exclusively - came from the county of Somogy they arrived. The

questionnaire was distributed with the aim of getting to know the mental health needs of the target group as accurately as possible. The data was collected through an online, anonymous and voluntary, self-reported questionnaire survey, using the snowball method. With the snowball method, we ask the found person to recommend the questionnaire to other potential respondents (Bacsá-Bán, 2019). We received valid responses from N: 301 people to the sent questionnaire. The investigation was conducted between December 2021 and March 2022. The statistical analysis was performed with SPSS version 28.

Sampling

Data collection for our research took place in 2021/2022 after the pandemic subsided, the tests were completed online, anonymously, on a voluntary basis, among employed as public servant teachers, N: 301 people. The proportion of women was 91%, that of men was only 9% (27 people). The average age is 47 years, standard deviation 10.1. Since there were only 27 men in our sample, we did not examine gender differences.

Figure 1. Distribution by age

72% of those who complete the questionnaires live in cities, 28% live in villages, 38% work in educational services, 33% in elementary schools, 15% in EGYMI, and the remaining 14% in high schools, vocational schools, and kindergartens. 45% are special education teachers, 27% are teachers, 14% are teachers, 10% are psychologists, and 4% are kindergarten teachers. According to education, 1% have a PhD degree, 57% have a master's degree and/or professional exam, and 42% have a college degree.

Measurement Instruments

In addition to recording demographic data, we used the following tests in our structured questionnaire cross-sectional study:

To examine burnout, the Maslach Burnout Inventory (MBI) questionnaire, which examines emotional exhaustion, depersonalization, and a decrease in personal performance in the form of a 22-item, easy-to-fill test. The items refer to the extent to which the individual feels his work is stressful, and how often or how strongly he experiences various physiological states (Maslach & Goldberg 1998).

A shortened version of the Coping Methods Questionnaire developed by Lazarus and Folkman was used to explore coping strategies (Lazarus–Folkman 1984). Coping is the result of the dynamic interaction of personal characteristics and environmental factors, which shows the amount of effort required to implement the selected coping strategy (Rózsa et al. 2008).

With the abbreviated version of the Beck Depression Questionnaire, we assessed the psychological state of the teachers and the symptoms of depression. The scale maps the degree and forms of emotional, cognitive, physiological and behavioral reactions to everyday stress (Purebl et al. 2006).

Using the MOS SSS-H Questionnaire, we undertook to measure social support (Sz. Makó et al. 2016), which plays a significant role in maintaining psychological well-being, in difficult, stressful life situations, in overcoming illnesses and in coping with stressors.

Psychological Immune System we examined the development and efficiency of the psychological immune system of teachers with a survey, and identified their abilities that help them cope with stress. The questionnaire consists of 80 items and 16 subscales (Oláh 2005).

The analysis was performed using IBM SPSS Statistics version 28.

Research Questions

RQ1: How is the well-being of the teachers, how much are they at risk of burnout and depression?

RQ2: How do teachers cope with stress?

RQ3: To what extent and in which areas does the psychological immune system of teachers support them in sustaining the effects of stress?

RQ4: What correlation of strength and direction does the result of the selected measurement procedures show with the degree of burnout?

RQ5: What factors should prevention training focus on in terms of burnout prevention?

Results

RQ1: How is the well-being of the teachers, how much are they at risk of burnout and depression?

Our examined sample was characterized by medium and low burnout, high burnout affected 5 subjects (2%) (Figure 2). Moderate burnout affects 51% of the respondents, the degree of burnout in the sample is noteworthy. The average score for burnout is 43.9 (SD=18.58), which is a medium value. The mean score of the emotional exhaustion subscale is 23.9 (SD=11.26), the depersonalization subscale is 4.3 (SD=4.41), and the mean score of the personal effectiveness subscale is 15.7 (SD=6.97). In our sample, the total score of burnout and the total scores of the three subscales show a significantly lower value everywhere ($p=0.05$) compared to the analysis

conducted in the same period (in 2019), also among teachers (Kapus et al. 2021). The percentage of the high burnout group is similar in both samples, but in our sample the percentage of the medium burnout group is much lower. The average age of the group with moderate burnout is 46 years, and that of the low burnout group is 49 years. In our sample, however, there was no relationship between professional years and the total burnout score ($r=0.007$).

Figure 2. The level of burnout among teachers (Maslach)

The depression are also typical of the examined group, only 19% of respondents fall into the normal range (Figure 3).

Figure 3. Severity of Depression according to the Beck Depression Inventory

12% of the respondents are moderately depressed, 2% (5 people) are severely depressed, and the largest group (202 people) is mildly depressed. In our sample, there is no linear relationship between depression and age ($r=-0.091$). 5 out of 5 people (2-2%) affected by high levels of burnout and severe depression are not the same people.

RQ2: How do teachers cope with stress?

Among the ways of coping, problem analysis, asking for help and choosing purposeful action as a strategy seem to be typical (Figure 4).

Figure 4. Lazarus Coping Strategies

This suggests that teachers tend to respond to challenges with high-level coping methods and perceive them less as an attack. Emotionally motivated actions as a coping strategy are less effective in coping with difficulties, and this is the least characteristic of the interviewed teachers. However, it seems that even high-level coping methods do not sufficiently protect against the development of burnout and depression, which may be due to the fact that problem-focused strategies do not work in practice in the current, multifaceted pedagogical environment, and the negative reactions of interaction partners may also hinder their implementation.

Higher social support is moderately associated with higher psychological well-being, positive affectivity, and lower depressive and anxiety symptoms (Sz. Makó et al. 2016). In the case of our studied population, 47 people lack emotional and informational support, they feel that they have no one to turn to for spiritual help and advice (Figure 5).

Figure 5. MOS SSS-H social support levels

98 people feel that they lack instrumental (tangible) support, that is, there is no one to help them if they need support or physical help. Relatively few, 29 people, feel that they do not have enough positive human relationships, that they have no one to relax with or share their emotions with. Finally, according to the global index of social support, 45 people have low support, even though it could help them cope.

RQ3: To what extent and in which areas does the psychological immune system of teachers support them in sustaining the effects of stress?

“The concept of the psychological immune system is used to indicate the personality resources that enable the individual to withstand the effects of stress for a long time, to effectively deal with threats, so that the integrity, operational efficiency and development potential of the personality are not damaged...” (Oláh 2005: 85). The teachers of the examined sample achieved a particularly low level in the approach-monitoring subsystem, that is, their understanding of the environment and monitoring of positive consequences is at a weak level (Figure 6).

Figure 6. Psychological Immune System, mean score in subsystems in sample vs. standard

This includes positive thinking, experiencing constant development and a sense of control over life situations. The self-regulatory subsystem and the mobilizing-creative-executive subsystem are offered as psychological resources to be exploited, in which they perform at a high level.

Examining the correlations of the different tests provides the answer to our fourth research question.

RQ4: What correlation of strength and direction does the result of the selected measurement procedures show with the degree of burnout?

The results of the examination tests are related to burnout and have a predictive function. That is, based on the results of the Lazarus coping methods, the abbreviated version of the Beck Depression Questionnaire, the MOS SSS-H and the Psychological Immune System Survey, the results of the Maslach burnout questionnaire can be predicted to some extent. According to neither the Kolmogorov-Smirnov nor the Shapiro-Wilk normality test,

the distribution of any of the examined factors cannot be considered normal ($p < 0.01$), so we used non-parametric tests (Table 1.)

Table 1. Normality test

Normality test

a. Lilliefors Significance Correction

The total score of the Beck Depression Questionnaire and Maslach's burnout test has a positive and strong relationship ($p < 0.001$; $Rho = 0.682$) i.e., in accordance with literature data, a higher level of burnout is associated with a higher level of depression.

The total score of the Maslach burnout test shows a negative, weak relationship among the Lazarus coping modalities with problem analysis and seeking help ($p < 0.05$; $-0.3 < Rho < -0.1$), a positive, weak relationship with coping ($p < 0.05$; $0.1 < Rho < 0.3$), a positive, moderate relationship with emotionally motivated action ($p < 0.05$; $0.3 < Rho < 0.5$), and a negative, moderate relationship with purposeful action ($p < 0.05$; $-0.5 < Rho < -0.3$). There was no significant relationship between the total burn-out test score and the other coping modalities (emotional balance, withdrawal) ($p \geq 0.05$).

RQ5: What factors should prevention training focus on in terms of burnout prevention?

Using multivariable multiple linear regression with the Stepwise technique, we examined to what extent the Lazarus coping strategies, the shortened version of the Beck Depression Inventory, the MOS SSS-H, and the

Psychological Immunization Inventory could predict the total score of the Maslach Burnout Inventory. The regression model fitted to special education teachers (eight model) is globally significant based on the F-test results ($p < 0.001$) (Table 2).

Table 2. Fitted multivariate linear regression model

ANOVA ^a						
Model		Sum of squares	df	Mean square	F	p
8	Regression	365,813	8	45,727	58,409	<0,001 ^a
	Residual	228,599	292	0,783		
	Total	594,412	300			

Model	R	R ²	Adjusted R ²	St. error of the estimate
8	0,784 ^a	0,615	0,605	0,88480

a. Predictor variables: Depression (0-10), Approach-monitoring subsystem (0-10), Goal-oriented action (0-10), Adaptation (0-10), Help-seeking (0-10), Emotional-informational support (0-10)

The multiple determination coefficient of the explanatory variables included in the model (depression, approach-monitoring subsystem, purposeful action, adaptation, help-seeking, emotionally motivated action, instrumental support, self-regulation subsystem) and the total score of Maslach's burnout is 0.784, so the relationship between the above explanatory variables and burnout is between, positive and tight. These variables, i.e. depression, the approaching-monitoring subsystem, purposeful action, adaptation, help-seeking, emotionally motivated action, instrumental support and the total score of the self-regulatory subsystem together explain 60.5% of Maslach's burnout the dispersion of the total score in the case of teachers. Based on the standardized beta values, depression has the greatest effect on the development of the burnout score, while the PIF approach-monitoring subsystem is the second, and the purposeful action coping method is the third most influential factor. Fourth is the self-regulatory subsystem, fifth is asking for help, sixth is emotionally motivated action, seventh is instrumental support, and eighth is adaptation (Table 3).

Table 3. Fitted multivariate linear regression model

Coefficients ^a						
Model		Unstandardized B	Standard error of coefficients	Standardized beta coefficient	t	p
8	(constants)	5,033	0,497		10,124	<0,001
	Depression (0-10)	0,319	0,046	0,357	6,904	<0,001
	Approach-monitoring subsystem (0-10)	-0,234	0,048	-0,259	-4,851	<0,001
	Purposeful action (0-10)	-0,097	0,029	-0,153	-3,365	0,001
	Self-regulatory subsystem (0-10)	-0,135	0,055	-0,141	-2,467	0,014

	Help-seeking (0-10)	0,100	0,039	0,112	2,586	0,010
	Emotionally motivated action (0-10)	-0,069	0,022	-0,123	-3,191	0,002
	Instrumental support (0-10)	0,073	0,028	0,106	2,599	0,010
	Adaptation (0-10)	0,069	0,030	0,092	2,350	0,019

a. Dependent variable: Burnout (0-10)

If the depression total score increases by 1, then, on average, according to the model, the burnout total score increases by 0.32, holding all other factors in the model constant. If the score of the approach-monitoring subsystem of the PIF increases by 1, then, according to the model, the total score of burnout decreases by 0.23 on average. If the score of the purposeful action coping method increases by 1, the total score of burnout decreases by 0.10 on average, according to the model. If the score of the self-regulatory subsystem of the PIF increases by 1, the burnout total score decreases by 0.14 on average, according to the model. If the coping method of emotionally motivated action increases by 1, then, on average, according to the model, the total score of burnout increases by 0.10, assuming the other factors in the model remain unchanged. If the help-seeking coping method score increases by 1, on average, according to the model, the total burnout score decreases by 0.07. If the instrumental support score increases by 1, then, on average, according to the model, the burnout total score will increase by 0.07, and finally, if the adaptive coping score increases by 1, then the burnout total score will increase by 0.07.

Since there were only two categories in the sample – apart from five exceptions –, moderate or low burnout, we also examined to what extent the included explanatory variables predict the degree of burnout of the given person using multivariate binary logistic regression (Forward Conditional procedure) (Table 4).

Table 4: Forward Conditional procedure

Combined test of model coefficients				
		Chi-square	df	p
5. iteration	Iteration	5,875	1	0,015
	Block	168,828	5	<0,001
	Model	168,828	5	<0,001

Model summary			
Iteration	-2 log likelihood	Cox & Snell R ²	Nagelkerke R ²
5.	240,853	0,435	0,580

The model is globally good based on the result of the Chi-square test ($p < 0.001$). The included variables together explain 58.0% of belonging to Maslach's burnout group (Table 5).

Table 5: Classification of the Forward Conditional model

Classification table	
Measured value	predicted value

		Level of burnout		Találati
		moderate	high	arány
5. iteration	Level of burnout low	115	26	81,6
	moderate	31	124	80,0
	Összes (%)			80,7

However, with the help of the fitted multivariate binary logistic model, the involved explanatory variables together can predict which burnout group a given teacher will belong to in 80.7% of cases. In terms of burnout, the level of depression (0-10) affects which group the given teacher belongs to, followed by purposeful action (0-10), followed by instrumental support (0-10), the approaching-monitoring subsystem (0-10) and asking for help (0-10) ($p < 0.05$). Of these, depression and instrumental support act in such a way that, with a higher value of the variable, it is more likely to be classified into the „moderate” burnout category instead of „minor” burnout, while in the case of asking for help, purposeful action and the approach-monitoring subsystem, the variable is smaller value, it is more likely to be classified as „moderate” burnout instead of „minor” burnout. In the case of Depression (0-10), the teacher with one higher score is 3.772 times more likely to have „medium” burnout, i.e. he is 277% more likely to fall into this category than his colleague with one lower score. In the case of Instrumental support (0-10), the teacher with one higher score is 1.490 times more likely to have „medium” burnout, that is, he is 49% more likely to fall into this category than his colleague with one lower score. In the case of the Approach-monitoring subsystem (0-10), a teacher with a score one higher has a „higher” chance of having „medium” burnout by 0.582 times, i.e. he has a 42% lower chance of falling into this category than his colleague with a score one lower. In the case of Purposeful Action (0-10), a teacher with a score one higher has a „higher” chance of having „medium” burnout by 0.751 times, i.e. a 25% lower chance of belonging to this category than his colleague with a score one lower (Table 6).

Table 6. Classification of the Forward Conditional model

		Included explanatory variables

Limitations of the Study

The methodological limitation of the study is that our sample is not representative. The participants in the research mainly live and work in Somogy County, the measurement results may be influenced by regional

factors that we have not taken into account here. The factor endangering the research was the COVID-19 pandemic, which data collection took place immediately after its abatement. One of the consequences of this could be a lower level of willingness to complete, as we returned to our usual lives with dangerously depleted psychological reserves. Our measured data may reflect the exhaustion associated with the pandemic. Due to the above, it would be worthwhile in the future to ask again the group of participants in the study, and to extend the study to the school's organizational functioning as well.

On the other hand, since our main goal was to explore the background of burnout prevention and to determine the most important factors affecting burnout, the large number of burned-out teachers can also be interpreted as an advantage, we obtained a larger number of "burned out" samples.

Conclusion

After the pandemic, nearly half of the teachers (N: 301) showed low burnout, the other half showed moderate burnout, and there was hardly any high burnout. Our results are somewhat similar to previous Hungarian measurements (Jagodics et al. 2020; Kapus et al. 2021; Mihálka & Pikó 2018; Szabó & Jagodics 2016; Szigeti 2021). The degree of burnout did not show any relationship with our widely taken demographic factors, nor with age or the number of years spent on the job. However, with the help of the other tests taken, we can predict which burnout group the given teacher belongs to in 80.7% with a linear regression model. According to the model, the total score and standard deviation of burnout with depression, the PIF approach-monitoring subsystem, the Lazarus purposeful action coping method, the PIF self-regulation subsystem, the Lazarus help-seeking and emotionally motivated action, the MOS SSS-H instrumental support, and shows a strong connection with the Lazarus adaptation. Among them, the degree of depression affects burnout the most, followed by instrumental support and then purposeful action.

This supports the fact that in burnout treatment, the main focus should be on reducing depression. In addition to depression, the frequent use of emotionally motivated actions and adaptation, which are part of Lazarus' emotion-focused coping methods, also increase the level of burnout, so prevention interventions must also focus on techniques that support proper emotion regulation and self-assertion. Purposeful action and the coping method of asking for help is a protective factor against burnout, so the trainings should develop openness to cooperation, asking for help and accepting help in addition to motivation and goal orientation. The high-level functioning of the approach-monitoring subsystem and the self-regulatory subsystem of the PIF also works against burnout, which emphasizes the need to support emotional and cognitive control functions, as well as tuning in to possible positive consequences (Oláh 2005). It is a surprising result that higher values of MOS SSS-H instrumental support predict a higher level of burnout, as literature data emphasize the pronounced health-supporting role of all forms of social support (Reblin & Uhino 2008, Stefaniak et. al. 2012, Sz. Makó et al. 2016, Sándor, Látos & Csabai, 2020). The need for instrumental support is of paramount importance during fallen and sick conditions, this may explain the coexistence of high burnout and the need for instrumental

support, however, reducing the need for instrumental support cannot be part of the training.

Kulikova and Maliy (2017) showed that the level of development of teachers' professional and personal qualities is related to the elements of psychological safety, such as emotional stability, normative behavior, low anxiety level, creative thinking and self-reflection. The poor psychological condition of the investigated teachers suggests that the decrease in their professional and personal efficiency represents a real threat both in terms of their own psychological illness and their adequate performance in the educational environment, which in the long term can make the implementation of safe education more difficult on several levels. The problem of teacher burnout is now a general societal issue that cannot remain in the exclusive field of interest of psychology.

The Use of The GoIro Semantic Mapping Method Enhances Composition Writing Skills Among Secondary School Elementary Japanese Language Students

Siti Rehana Isnin

SMK Iskandar Shah, Melaka, Malaysia

Abstract: Japanese is an international language subject offered as an additional language in secondary schools in Malaysia. Japanese language subject begins from Form 1 to Form 5 at the age of 13 to 17. However, composition writing often becomes a problem among students in Japanese language classes due to insufficient mastery of vocabulary and sentence construction. This action research aims to examine the impact of using the GoIro Semantic Map method on composition writing skills among Form 5 Japanese language students at SMK Iskandar Shah, Melaka, Malaysia. The study was conducted using the action research model adapted from Kemmis and McTaggart (1988). The GoIro Semantic Mapping is an intervention that combines the use of semantic mapping concepts with color psychology to help students memorize vocabulary and phrases focused on specific topics more quickly. The GoIro Semantic Mapping method was used to enhance students' skills in writing based on specific topics. The study involved three Form 5 Japanese language students at SMK Iskandar Shah. Data were collected through marking the respondents' composition writing, interviews with the respondents, and classroom observations. The study was conducted over two weeks in Form 5 Japanese language classes. Respondents reacted positively to the use of the intervention during essay writing exercises. They also stated that this method helped them understand and memorize words and sentences more easily and quickly. The respondents' writing scores also improved compared to before using the intervention. Thus, this study has proven that the use of the GoIro Semantic Mapping method has a positive effect on enhancing Japanese composition writing skills. This method can be used as an alternative in language learning to improve students' skills. Further research can be conducted to track the effectiveness of this method over a longer period.

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 937-950), Antalya, Turkiye. ISTES.

Introduction

International languages were first introduced in Malaysian Ministry of Education (KPM) schools starting in the 1970s. The first international languages introduced were French and Arabic followed by Japanese which was

first introduced in secondary school in 1984 (Dayang, 2022). In 2005, International language subjects including Japanese were expanded in regular day secondary schools as one of the elective subjects after more than two decades of being offered only in fully residential schools (BPK, 2005). Until 2021, a total of 130 schools in Malaysia offer Japanese from Form 1 to Form 5. I am an International Language Teacher (Japanese) at SMK Iskandar Shah, Jasin, Malacca, Malaysia. I have been teaching Japanese since 2008, with 15 years of experience in the field of Japanese language teaching and 22 years as a teacher. SMK Iskandar Shah is a rural school in Melaka that offers Japanese as an elective subject from Form 1 to Form 5 (Age 13 to 17). Japanese classes at SMK Iskandar Shah started in 2016 as the only school in the Jasin district that offers this subject. However, students in Form 4 and 5 will be selected to continue learning Japanese after they finish Form 3 and the students will sit the Ujian Pencapaian Bahasa Antarabangsa (UPBA, translated as International Language Achievement Test) in Form 5. Japanese, like other languages, requires students to have oral, listening, writing and reading skills. Writing skills in Japanese include the ability to write compositions based on a specified theme and title. However, students usually have problems writing good compositions, especially in assessment. I have done various levels of observation and I found that students with poor vocabulary and sentence structure will face problems when writing compositions. Form 5 students in the Japanese language class take the UPBA every year. One of the components in UPBA is writing a composition which accounts for 15 marks out of 50 total marks. If students cannot write compositions well, they will not reach the minimum level of mastery in writing skills.

Study Focus

The purpose of this action research is to improve the composition writing skills of Form 5 Japanese language students.

The objectives of this study are:

- a) Improving the composition writing skills of Form 5 Japanese students by using the GoIro Semantic Mapping method.
- b) Increase students' interest and confidence in mastering the Japanese language.

The research questions of this research are:

- a) How effective is the use of the GoIro Semantic Mapping method to improve Japanese composition writing skills?
- b) Can the implementation of this intervention increase students' confidence and interest in mastering the Japanese language?

Method

This research is an action study using an adaptation of the Kemmis and McTaggart (1988) Action Research

Model. In this research model, the process used is the process of observing, reflection, planning and action.

Figure 1. Adaptation of Kemmis and McTaggart Action Research Model

This study involves the following sequence of steps:

- a) Identify the issue
- b) Make preliminary observations
Collect data through:
 - observation
 - interviews
 - composition marking
- c) Reflection based on observation
- d) Planning
 - i. Interventions:
Planning the use of GoIro Semantic Mapping method to improve students' vocabulary
 - ii. Indicators / indicators of intervention success:
 - Assessment of student composition writing performance.
 - Less mistakes in the use of vocabulary in the composition.
 - Students' motivation and confidence in writing compositions.
- e) Perform an action
 - The action is carried out during Japanese class.
 - Actions are carried out according to plan with the use of GoIro's semantic map method.
- f) Observation
- g) Reflection
 - Reflect on the effectiveness of using GoIro to improve Japanese composition writing skills.

The respondents were three students in the Japanese language class in Form 5.

Planning

Intervention

In this action research, I have used the intervention of the GoIro method which uses the concept of a semantic map combined with the use of color. I have used this concept for the students of Japanese language class Form 5 in 2022 in writing their compositions. Based on the findings of previous studies, this concept of semantic mapping is effective in improving students' vocabulary mastery, and further makes it easier for them to write Japanese compositions.

Semantic mapping is a strategy to represent concepts graphically. Semantic mapping for vocabulary allows students to expand their vocabulary by using new words. The word used is connected with a phrase or sentence structure that fits the word. Heimlich & Pittelman (1986) define a semantic map as a diagram that helps students see how a word is related to each other.

Students build a concept map based on the chosen topic. In this study, I gave the theme まち which means city. Through these words, for the first layer, the students have to list some vocabulary that can be associated with the city. For example, the students list the words as in Table 1.

Table 1. Vocabulary examples

Vocabulary	Meaning
おおきい	big
ひと	people
たてもの	building
たべもの	food
みち	street

Students use the Vocabulary List provided to check unfamiliar words. They can also write the meaning of the word if necessary. The words chosen are not limited, and students can write as many words as they can think of.

Table 2. Examples of sentence / phrase structure based on vocabulary

Vocabulary	Sentence / Phrase Structure
おおきい	この まちは おおきいです。
ひと	マラッカのひとは 多くて、やさしいです。

たてもの ふるい たてものが たくさん あります。
たべもの 「アサムパダス」というたべものは ゆうめいです。
みち マラッカの みちは ひろくて、にぎやかです。

Students write the sentence structure or examples that can be used with the words on the third layer.

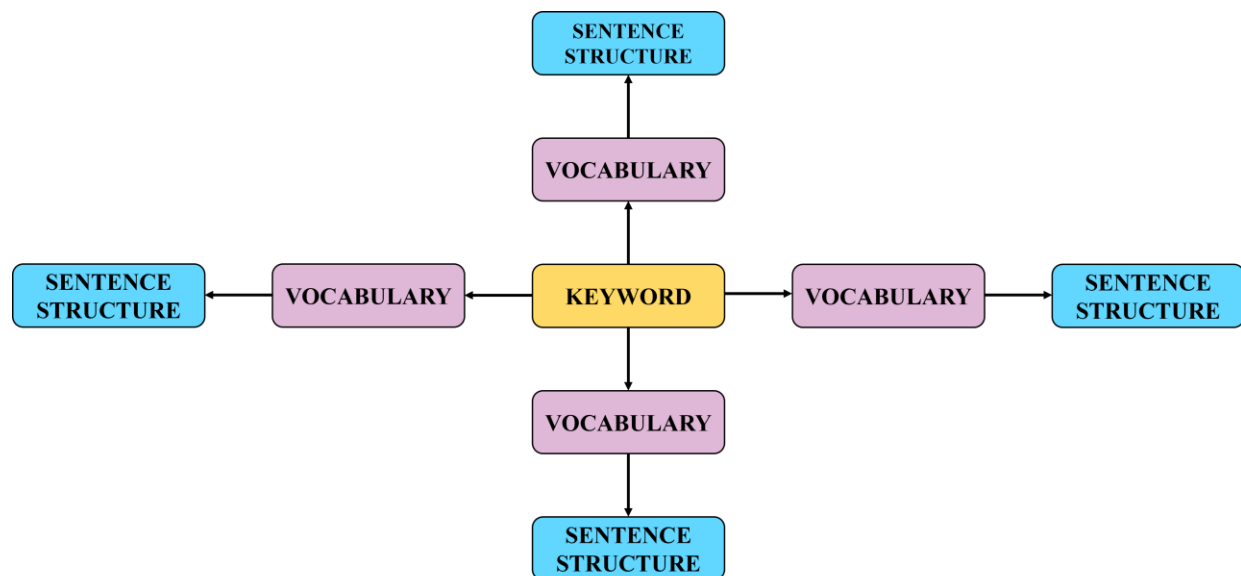

Figure 2. Mapping using GoIro Semantic Mapping Method

Based on the mapping made, the students will draft their compositions using the vocabulary and phrases that have been selected.

Actions and Observation

Observations and Reflections

Based on my observations in the Form 5 Japanese class, I have built an observation and reflection table as stated in Table 3.

Table 3. Observations and Reflections

Observation	Observational Evidence	Reflection
The students were unable to answer the composition question with the title学校の休み(School	Student 1: Answered the question but strayed from the title	• Students cannot answer composition questions if they do not understand what the question requires
	Student 2:	• Students will not

Observation	Observational Evidence	Reflection
Holiday)	Did not answer the question - left the answer field blank Student 3: Answered with one sentence	understand if there are words they do not understand or cannot guess the purpose of the composition (if they do not understand the words)
When discussing the test questions, I asked the students why they couldn't answer the composition questions.	Student 1: <i>"I don't understand the meaning of school"</i> Student 2: <i>"I don't understand at all, sensei!"</i> Student 3: <i>"I don't know either, sensei."</i>	<ul style="list-style-type: none"> Students need to understand the purpose of the composition The students are still not able to master the vocabulary, especially those used in compositions according to the topic
Students face difficulties in writing compositions because they do not know the vocabulary used in the context of the composition	Student 1: <i>" Sometimes I don't remember the kotoba (vocabulary) I want to use."</i> Student 2: <i>" I don't understand, sensei. There's a kotoba in the question that I don't understand."</i> Student 3: <i>" I don't know what to do. I don't remember kotoba."</i>	<ul style="list-style-type: none"> Students need to be given a method that makes it easier for them to improve their vocabulary in a fast and focused time The students only have 5 months left before the exam, they need to remember the vocabulary quickly
Student 2 and Student 3 lacked focus when doing composition exercises	Student 2 and Student 3 tend to chat with each other during writing practice, causing their compositions to often not be completed on time Student 2 and Student 3 also use the dictionary to find words they	<ul style="list-style-type: none"> I need to use methods that can motivate students to focus on the task being carried out I need to set different topics so that I can cover each theme ie myself,

Observation	Observational Evidence	Reflection
	<p>don't understand, but they often choose the wrong word because of the similarity in meaning. They also take a long time to find words.</p>	<p>family and friends, school, city and country</p> <ul style="list-style-type: none"> I need to control the vocabulary used by students by using the Vocabulary List taken from the Curriculum and Assessment Standard Document

Implementation of Actions

Learning Standard

特定のトピックに関する短い（簡単な）パラグラフを書くことができる。

(Students can write short paragraphs for specific topics)

Implementation of Activity 1

In activity 1, there are three things that students need to do. First, the students were given the titleわたしのまちand were given small cards with three different colors. Second, the students have to write the wordまち(*machi*) which means 'city' on the first card as the title. Finally, the students have to use the ことばリスト(*kotoba risuto*) which is the Vocabulary List used for learning Japanese from Form 1 to Form 5. The students are given the freedom to use any word that can describe the chosen city, as long as the word is on the list.

Finally, the students write words that can be used to describe the 'city' they have chosen. These words depend on the framework of their composition. Examples of words that are used areみち、ひろい、たべもの、おおきい、しみた. These words are written on the second layer card. Students can also write the meaning of the word if necessary.

Implementation of Activity 2

For Activity 2, the students attach the card to the word card using a *ring file* . Next, the students write sentence structures or sentence examples that can be used for the words chosen on the third color card. They can also write a phrase that they think is appropriate for the word. These sentence structure cards are also attached to the

word cards and form a mapping for the title. Finally, the students will refer back to the composition questions and start writing compositions based on the mapping that has been done.

Figure 3. Student 1 starts writing an composition while Student 2 and Student 3 improve their GoIro cards

Observation Activity 1

The students looked excited when I pulled out the colored cards. All three students are female students, and they like to use colors during learning. At first the students did not understand the concept of mapping using cards in the GoIro method, but when I explained more, they were excited to use the cards.

The students also use the Vocabulary List provided well. They seem more focused and interested in finding the right words. Student 1 organized the words that have been written faster. I heard Student 1 muttered, "*I can arrange the kotoba more clearly,*" while arranging the cards.

Student 2 and Student 3 were still carrying out the activity by chatting but I could see they were more focused on this activity. Even their conversation revolved around the title of the composition. I also heard Student 2 and Student 3 discussing how to arrange the words chosen for this composition. They also asked Student 1 sentence structures and phrases that can be used in an composition.

However, I found that the students faced problems when using the file rings to join the cards. The rings were difficult to open and causing pain to their fingers.

Figure 4. Students are more focused during activities

Reflection Activity 1

I found that the students were interested in doing this method because they were mapping using color cards. As I expected, the female students were more excited to use soft colors. However, I need to change the way I join the cards so that it is easier and less painful for the students. The file rings also took a long time to install because they were difficult to open so I decided to replace the rings with cellophane tape.

I saw a significant change in attitude in Student 2 and Student 3 when using this method. They were more focused and more serious than when using the old method. In the previous method, I also used the concept of semantic mapping, but using only blank paper and the students drew their semantic map as if it were a mind map.

In addition, I was also excited to see the interest of these students increasing. The students also suggested suitable topics to be used as a semantic map after this. I acknowledged this as a good development, and shows that students want to be directly involved in planning their learning.

Observation Activity 2

Student 1 wrote the composition earnestly, while Student 2 and Student 3 hesitated to start writing. However, having found momentum, they realized what needed to be done, and reviewed their GoIro semantic map before drafting the composition. Occasionally I could see the students discussing their compositions with each other. They also chatted less casually but are more diligent in writing compositions. However, due to limited time, the students were unable to complete their compositions within the allotted time in class, and were asked to continue their writing as homework.

Reflection Activity 2

Students are given 45 minutes to write their compositions. At this time, I found it easier for the students to write because the words prepared in advance helped in drafting the composition. In addition, the words chosen are focused on the topic, so it helps students to use only certain vocabulary without having to force themselves to remember other vocabulary. Each topic has specific words associated with it, so this activity helps students write compositions in a more structured way.

I also found that the students were more interested and confident in completing the task of building sentences for compositions. They were more determined to complete the composition and did not procrastinate as compared to before the intervention. In addition, I found that students understand more with constructed composition sentences. In my opinion, they could easily recognize the sentence form used based on the mapping made.

Results

The findings of the study show that the implementation of this intervention has been able to improve the composition writing skills of the respondents. This research is evaluated through the number of sentences constructed in the set time to test the extent to which the students' sentence writing skills can be improved.

Before the intervention, I set a time of 15 minutes for the students to write sentences based on the given title. I gave the title yangまち(city) and asked them to build as many sentences as they could based on the word. After the intervention, I have given the same time with the same title for the students to build sentences and make a comparison between the number of sentences that have been built.

Table 4. The Difference in the Number of Sentences Constructed by Respondents in 15 Minutes

No	Student	Number of Sentences	
		Before Intervention	After the Intervention
1	Student 1	6	12
2	Student 2	2	7
3	Student 3	2	8

Based on Table 4, there is an increase in the number of sentences constructed by students in the set time. This increase is quite significant for the level of students in this class because in composition writing, they need at least 30 minutes to write a grammatical and structured composition.

Through interviews with the respondents, the students enjoyed using the GoIro method because it made it easier for them to draft a composition based on a specific topic. The following are excerpts from the students' interviews:

Student 1: " *I think this is easier sensei. I used plain paper before, so it looked plain and normal... When I use this card, I can see what words I have to use. And then, I know which is kotoba, which is sentence...* "

Student 2: " *I like it because I like the color of this card. It's a little fun to see which kotoba to use, which sentence structure to use...* "

Student 3: " *I didn't really understand at first, but now I understand how to use it. After this, use it for another theme, sensei.* "

Through my observation as well, the students become more interested and confident when writing compositions. Although at first they were a bit confused about what to do, after I explained more carefully, they were able to complete the given task. Even the students also gave ideas to make their GoIro semantic map easy to store.

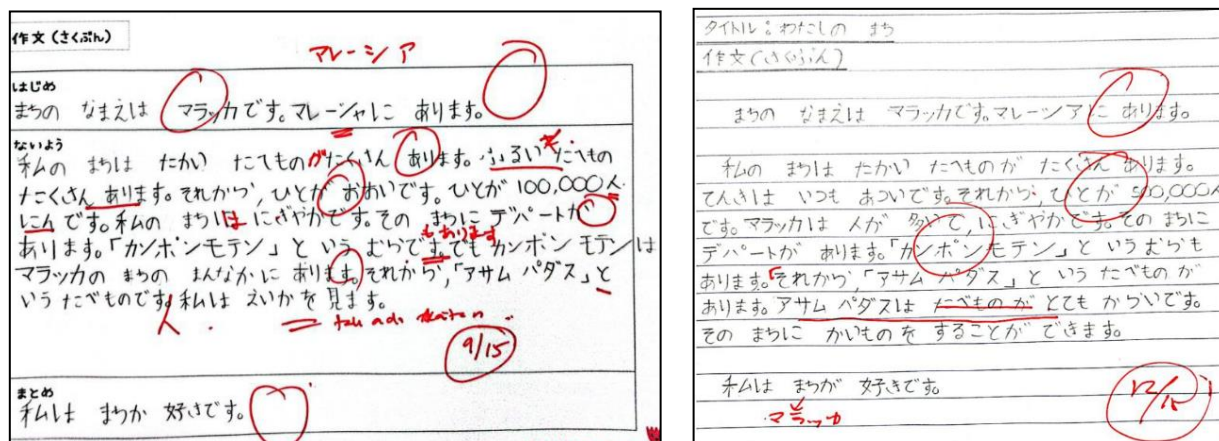

Figure 5. Student writing results before (left) and after the intervention (right)

Conclusion

Based on the research carried out, I have made a conclusion that the use of the GoIro method can improve the Japanese language composition writing skills of students in the Japanese language class of Form 5 of this school. It has a positive impact on the students especially to solve the problem of lack of vocabulary which causes them to face a deadlock when writing compositions. The students are also more confident to write their compositions after using this intervention.

Implications for Students

I chose this method of semantic mapping so that the students can remember only the necessary vocabulary to write an composition based on the topic. Students who use semantic mapping show significant improvement in reading comprehension, writing and vocabulary development (Zaid as stated in Thuwaibah, 2019).

The students' composition writing skills improve with the increase in the number of sentences that the students can construct in the given time. The constructed sentence is also more grammatical and uses the correct sentence structure. They also no longer procrastinate and seem lost when I give composition assignments. Through observation and interviews with the students after the intervention, they seem more confident when drafting compositions because they only have to focus on one topic and vocabulary related to that topic. Their writing results are more structured and use correct sentences compared to before the intervention activity. The students also gave a good response when I used color cards which are a concept of combining semantic and

psychological color maps in GoIro. They show interest in completing the composition because they feel easier and confident when building the composition outline.

Keller & Grimm (2005) stated that the use of color as a graphic tool can reduce search time and allow students to find information quickly. The first color layer shows the topic, the second color layer is the vocabulary and the third color layer is the sentence structure. This allows students to quickly identify their mapping. One of the advantages of the GoIro method is that students can make their own topic cards. They can make self-learning by building a GoIro Semantic Map based on the target topic, and use it when necessary. GoIro's Semantic Map is stored in a box that can be accessed at any time.

Figure 6. GoIro Card that has been folded

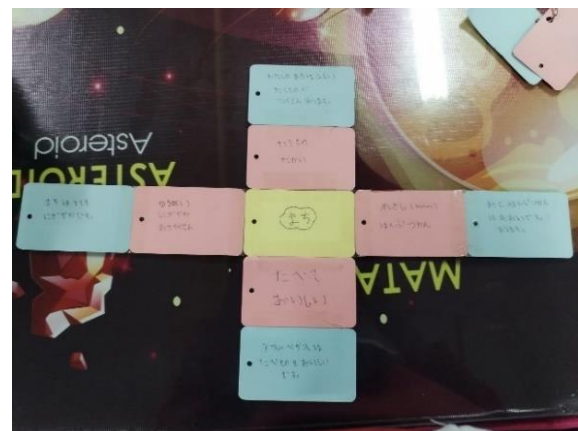

Figure 7. GoIro Card

Implications for the Researcher

After seeing the response given by the students, I feel excited to continue this method with Japanese language students in Form 4. I reflected on my previous teaching method, and felt that I did not take the students' needs into account when doing composition writing exercises. I should ask the students and take into account their opinions about the most appropriate way for them to learn.

I also plan to implement the expansion of this method for reading comprehension training of linear and non-linear texts for Japanese language classes. As stated by Buzan (2000), semantic mapping can be used to take notes, improve memory, generate and develop ideas. In addition, in his study, Ghuzayyil (2016) stated that by using semantic mapping as a remembering tool, memory retention of the meaning of words increases. Semantic mapping is also useful as an assessment method to measure student learning. So, as a continuation, I will use this concept of semantic mapping in the assessment of students' vocabulary development.

Impact on the Institution

I have shared the results of this study with other teachers, especially language teachers. I received a response from the English teacher at my school who expressed concern about the students not remembering English vocabulary. I share with these teachers the GoIro Semantic Mapping method that I use to apply in learning English. In addition, I have shared with several teachers of other subjects such as Malay Language, Chemistry, Biology and Science. As a result of the sharing, the teachers have given a positive response and expressed their interest in using this method.

"...(I) can use this concept to teach thermochemistry, it's easy to use..." – Ms. Wan, Chemistry teacher

"... useful for students who do not master vocabulary." – Ms. Zu, Malay Language teacher

This intervention can also help Japanese language students at school to master writing skills, especially in constructing sentences and compositions. This will give an idea for improving the teaching and learning of Japanese in this school in particular and the subject in general.

Suggested Improvements

I will continue this method in teaching and learning Japanese in the future. In addition, I will also improve the use of the GoIro Semantic Mapping method toward the production of innovative products in the form of interactive and digital materials, in line with the development of digital education technology today.

As a suggestion for future improvement, I would like to create a digital application that allows students to choose words from the Vocabulary List provided. Once the words are selected, this application will help students to build sentences based on their needs. For example, if the students choose a topic such as *好きなこと* (things they like), the application will list the words related to that title or topic. As an example, this application will display the word *花* (flower), the meaning of the word as well as suggested sentence structures that can be used with the word such as *花（はな）はないです / わたしは 花（はな）が なりみすきです*. This application can be used by students to revise vocabulary, enrich vocabulary, and improve the skill of constructing sentences correctly.

Acknowledgement

I would like to express my appreciation and gratitude to Bahagian Perancangan dan Penyelidikan Dasar Pendidikan, Ministry of Education, Malaysia for the opportunity given and Yayasan Guru Tun Hussein Onn for the grant funding for this research to be presented.

Special appreciation goes to Norhafizah Mohd Yusoff for her supervision, coaching and continuous support, and Sabiah Ninggal for her suggestions and feedback. My gratitude also goes to Jabatan Pendidikan Negeri Melaka for making things happen and for their constant trust in the teachers.

This endeavour would not have been possible without the continuous support and prayers from the only one Md Zaid Ali.

On the Causes of EarthQuake Lights

Bendaoud Saâd

National School of Applied Sciences of Safi, Cadi Ayyad University, Morocco

 <https://orcid.org/0000-0002-6075-0722>

Abstract: EarthQuake Lights (EQLs) has been observed in the Nature a long time ago but it was only in the last century that their study really began. The search for an explanation for the EQLs phenomenon, which only appears during certain strong earthquakes, was the aim of several studies. Today, there are many hypotheses but none of them is able to explain the EQLs phenomenon. However, in recent years, videos of EQLs have been increasingly broadcast on social media and websites due to the growing use of security cameras. In this work, our goal is to expose our explanation for the EQLs. For this, after analyzing data recorded in all videos that we were able to collect, and by correlating them with corresponding earthquake seismograms, we were able to find finally the causes of earthquake lights. So, for EQLs to occur, two conditions occur during the seism activity at the same time, the presence of clouds in the sky on the epicenter area and a magnitude greater than $M_w=4.0$; these are their causes. Clouds act as in thunderstorm lightings and the magnitude M_w of earthquakes is, as we will see, closely in relation with the amplitude of the vibrations of the seismic S-waves and their frequency.

Introduction

Earthquake lights (EQLs) has been observed in the nature for several centuries. Since seismology began as a science in the 19th century, numerous reports have been published on this phenomenon. The first photographers of the earthquake lights – the blue bluish-white lightings that accompany the earthquakes – were taken between 1965 and 1968 in Japan's earthquakes (**Derr, 1973**). Several research studies confirm that EQLs really occur in the Nature but only during some strong earthquakes of magnitude greater than M_w 4.0 (**Thériault et al., 2014; Fidani, 2010**). Currently, several explanations for their occurrence exist. Most proposed mechanisms require assumptions such as violent low-level air oscillation (**Yasui, 1973**), piezoelectric effect generated by stresses on quartz into the rocks (**Finkelstein & Powell, 1970 & 1971**), flow of positive charges in air produced by stresses on rock such quartz (**Thériault et al., 2014; Whitehead & Ulusoy, 2015**), surface charge density (**Takeuchi & Nagahama, 2002**), grain charging (**Cofield, 2014**), the presence of special minerals, gases, organisms or soil dust; or multiple other causes (**Torabi & Fattahi, 2019**) may be operating in different circumstances. All has difficulty explaining the cause of the EQLs appearance. Indeed, the only causal connexion that seems possible is

that the seismic strains of the earthquake somehow cause an electric field in the air, which in turn produces lightnings. What is the mechanism of this "seismoelectric effect" ?

We propose that all the EQLs are not the product of stress accumulation on rocks induced currents or shear rupture dynamics in fault zones, but rather result from interactions between the vibrations of atmospheric air and quaking clouds that have been essentially shaken by the transversal S-waves produced by the earthquake. A seismic S-wave is simply an earthquake generated sound wave in a solid or fluid such as water or air; hence the EQLs are essentially an atmospheric electrical phenomenon due to a large scale point discharge, it is a situation analogous to thunderstorm lightnings, but their causes are quite different. An EQL occurs in the lower-level part of the atmosphere in contact with the earth's surface in the vicinity of the epicenter where the electrical conditions are favorable, i.e., high electrical voltage occurrence. We strongly believe that the EQL phenomenon may be generated by charge electric separation exactly as thunderstorm lightnings but in the case of EQLs, the cause is the quaking clouds by seismic S-waves propagation in atmospheric air occurring at time of the earthquake. This requires of course the presence of clouds in the sky above the epicenter area.

Materiels: EQLs Videos evidences

Earthquakes are unpredictable, and EQLs recorded in rare videos that captured haphazardly by security cameras or cell phones have made studying them relatively easier. Indeed, the permanent presence of security cameras almost everywhere resembles a bit of an open-air laboratory. Twenty years ago, this was impossible. The increasing use of new technologies such as surveillance cameras during the last two decades has confirmed that EQLs does really occur but only during some earthquakes. Along our research work on EQLs phenomenon motivated by the Moroccan's earthquake of 8 September 2023, we found all videos recorded by chance from security cameras that have been broadcast on different websites and TV channels since 2007 until today (see Table 1). A certain number of videos on EQLs have been reported in some recent articles (**Heraud & Lira, 2011; Whitehead & Ulusoy, 2019**).

Videos from 1 to 5 in the Table 1 are on EarthQuake Lights of the September 8, 2023 Al Haouz, Morocco M_w 6.8 earthquake; videos 6 to 10 are on EQLs of the M_w 7.8 earthquake of February 6, 2023 in Turkey; video 11 and 12 are on EQLs of the M_w 7.3 earthquake of March 16, 2022 in Japan; videos 13 and 15 are on EQLs of the M_w 7.1 earthquake of September 7, 2021 in Mexico; videos 16 and 17 are on EQLs of the M_w 8.2 earthquake of September 7, 2017 in Mexico; the video 18 is on EQLs of the M_w 7.8 earthquake of November 24, 2016 in Romanian; videos from 19 to 22 are on EQLs of the M_w 7.8 earthquake of November 14, 2016 in New Zealand. The video 23 is on EQLs of the M_w 7.8 earthquake of April 16, 2016 in Ecuador; videos 24 and 25 are on EQLs of the M_w 6.0 earthquake of August 24, 2014 in Napa; the video 26 concerns the M_w 8.8 earthquake of February 24, 2010 in Chile. The videos on EQLs used by **Heraud and Lira (2011)** in their article on the M_w 8.0 earthquake that occurred on August 15, 2007 in Pisco, Peru here are videos 27 to 30. The authors are based their study essentially on data in the video 27, earthquake seismograms and some eyewitness. All earthquake lights

into these 30 videos are short blue bluish-white flashes seen in the night. The analysis of the videos in Table 1 shows that EQLs are coseismic phenomena as we will see.

Table 1. Videos of EQLs recorded in the world over the past two decades.

The video # 1 contains a 27 s length part of the September 8, 2023 Morocco M_w 6.8 earthquake which lasted in total about 2 min starting at 23:11:00 local time. The video presents a sequence of three EQLs that occurred on the earthquake epicenter area, their color is blue to bluish-white like that of thunderstorms lightings. The 1st EQL occurred at 23:11:15, the 2nd at 23:11:23 and the 3rd at 23:11:25. Also, there are clouds in the darkness sky in the video # 1, probably mid-level and low-level clouds. Moreover, EQLs rise and extend from the epicenter to the clouds, which mean that their size is of the order of a kilometer and even more.

The maximum illumination of the 3rd EQL in the video # 1 is shown in figure 1. As we see, the earthquake light is surrounded by the red dashed ellipse at the top of the photo by the left. Clouds are visible in the sky by scattering the light of the Agadir city streets during the September 8, 2023 Morocco earthquake.

Figure 1. The 3rd EQL from the video # 1, 3, the clouds are visible there.

The video # 4 cited in the table 1 also contains four EQLs from the same September 8, 2023 Morocco M_w 6.8 earthquake captured by a video camera very far from the epicenter. This video contains a sequence of the same EQLs as in video # 1. The 1st EQL occurred at 23:11:15, the 2nd at 23:11:17, the 3rd at 23:11:19, and the 4th at 23:11:40. Furthermore, the peak brightness of the 3rd EQL is shown in figure 2. This EQL is surrounded by the red dashed ellipse on the top of the picture by the left. Moreover, as we can see in the video # 4, clouds are invisible in the darkness, but they become visible only when they scatter earthquake lightning during the September 8, 2023 Morocco earthquake. So, the clouds are there.

The data analysis shows that the 2nd and 3rd EQLs are the same in videos 1 and 2 even though their instants appear as if they are different. Also, the EQLs appear blue to bluish-white in the video # 4 as that of thunderstorms lightings and are a few kilometers in size, they even penetrate the clouds. These new observations

overturn completely the seismoelectric effect advanced by **Thériault et al. (2014)** because, e.g., when we apply the conservation of energy theorem to their positive ions, it doesn't work. In addition, to product seismoelectric effect, the authors needs vacuum by analogy, e.g., with the photoelectric effect.

Figure 2. The 3rd EQL from the video # 4, 3, the clouds are visible there.

Figure 3. An EQL from then video # 6, the clouds are visible there.

The video # 6 contains a part of the M_w 7.8 Turkey earthquake of 6 February 2023. The EQLs from this

earthquake extend from the epicenter until it penetrates low- and mid-level clouds, see figure 3. Thus, compared to their position in the troposphere, the size of EQLs is estimated to be about 2 km in altitude. The clouds in the video # 6 aren't visible in the darkness, but they become visible under the EQL illuminance as daylight.

Figure 4. An EQL from the video # 13, the clouds are visible there.

Figure 5. An EQL from the video # 19, the clouds are visible.

The video # 13 cited in the table 1 shows that clouds were present also in the Mw 7.1 earthquake of September

7, 2021 in Mexico. EQLs from this earthquake are also blue to bluish-white and extend from the epicenter until it penetrates mid-level clouds probably in the sky, see figure 4. Compared to their position in the troposphere, the size of EQLs is about 3 km in altitude. The video # 19 on EQLs of November 14, 2016 New Zealand M_w 7.8 earthquake contains also clouds. The image of the max illumination of an EQL during this earthquake is presented in the figure 5, the clouds are in the sky. In the video # 19, the clouds aren't visible in the darkness sky, but they become visible only under the EQL illuminance as daylight, see figure 5. Moreover, the EQLs from this earthquake extend from the epicenter until they penetrate probably mid-level clouds in the sky. Compared to their position in the troposphere, the size of EQLs is about 3 km.

In addition, all videos on EQLs up to mid-2017 cited by **Whitehead and Ulusoy (2019)** contain clouds at various altitudes. Therefore, clouds exist during all EQLs events, even if they are not visible in some videos such as the video # 27 and # 28 that **Heraud and Lira (2011)** used in their article on the EQLs of the Pisco, Peru 2007 M_w 8.0 earthquake, clouds must exist there. Indeed, e.g., the clouds are clearly seen in video # 1 but they hardly appear in video # 4 cited in the table 1, yet these video-cameras were pointed by chance towards the same epicenter region and recorded the EQLs of the same Morocco earthquake of the September 8, 2023 but from two different directions, the camera 01 is situated near Agadir City but the camera 04 near Marrakesh city. It should be noted that half of the lightning in the case of thunderstorms occurs between clouds separated by a distance of more than 10 km; sometimes the electrical discharge goes so far that it reaches an open area and becomes the proverbial "lightning in the blue sky" (**Benson, 1996; Plonus, 1978**) as is the case of some thunderstorms due to the cloud-quakes. By analogy, this explains why EarthQuake Lights can occur also in some places far from the epicenter area.

Data Analysis and Results

By analyzing the thirty videos in the table 1 on EQLs of the earthquakes of recent years, we discovered that the first cause for an earthquake light to occur is the presence of clouds on the epicenter region whatever their type. The earthquake light phenomenon isn't like thunderstorms' lightings that require large and voluminous clouds such as cumulonimbus clouds. Indeed, non-bulky clouds are balanced by the strong air disturbances due to the seismic activity's energy. Nevertheless, the presence of clouds is a necessary condition, but alone is not sufficient. Thus, for cloudless earthquakes there would be no lightning, and this partly explains why lightings do not occur during a large percentage of earthquakes even when they are very strong. The second cause is the occurrence of the earthquake itself, but that is also not enough. Indeed, for earthquake light to appear, the earthquake should be sufficiently strong. In effect, the magnitude of the earthquake must be greater than M_w 4.0 and EQLs only appear for 10% of earthquakes (**Thériault et al., 2014**). The failure to meet these two conditions together explains why EQLs only occur in about 10% of earthquakes. This percentage is a low limit given that many EQLs (those that are not filmed or occur during sunny days) were never reported in the literature. Definitely, EQLs do not occur during earthquakes that do not satisfy both of these two conditions at the same time. In effect, the first cause is imposed by the weather conditions which prevail during the

earthquake's day. And to clarify the origins of the second cause, the seismogram of the M_w 6.8 earthquake of September 8, 2023 in the High Atlas Mountains of Morocco is from the San Pablo seismic station in Spain is shown in figure 6 hereinafter. By using the Tectoglob3D software available on the EduMed-Obs website, a good correlation was found between the time difference of the EQLs obtained particularly from video # 4 and the main peak seismic S-wave trains of the seismogram. The obtained results show that instants of all EQLs from the video # 4 are located during the earthquake occurrence. Seismic P-waves are push-pull waves that travel quickly and cause little damage. Seismic S-waves are up-and-down waves that travel slowly and cause significant damage. Deeper in the ground, seismic waves get smaller, this is why P-waves are completely attenuated when reached the San Pablo seismological station in Spain.

Figure 6. Seismogram from the San Pablo station in Spain of the September 8, 2023 Morocco earthquake.

As we see, there is neither pre-seismic nor postseismic lightning with respect to the seismogram, and this is why EQLs are essentially coseismic phenomenon as previously reported by **Heraud and Lira (2011)**. Additionally, the EQL ① that appear on the seismogram in figure 6 occurred after the passage of the 1st seismic S-wave train or even a little before its end, the EQL ② also occurred after the passage of the 2nd seismic S-wave train, the EQL ③ after the 3rd S-wave train, and the EQL ④ after the 4th S-wave train. This means that each train of seismic S-waves produces just one EQL and only one. The frequency of the 1st seismic S-wave train is high compared to that of the other three subsequent wave trains, but its amplitude is much smaller than that of these

S-wave trains. This is how we discovered the relationship that exists between the amplitude and frequency of seismic S-waves and the EQLs occurrence, that is to say that an EQL does not occur until after a certain number of seismic S-wave cycles have exited the earthquake epicenter and reached the clouds. As result, the EQL occurrence essentially depends on the amplitude and the frequency of the S-wave train that produces it; and then, the second cause is now made explicit by knowing that the cause of EQLs occurrence is the oscillations of air (**Yasui, 1973**) above the epicenter area due to the seismic activity.

The vibrations of the air can be modeled by spherical wave fronts emerging from the epicenter source and rising towards the ionosphere. Deeper in the troposphere layer, strength seismic waves get smaller, see figure 7, but since the clouds are closer to the epicenter than the ionosphere layer, then the air vibrations cause the clouds to shake before reaching the ionosphere layer, resulting in a situation similar to that of thunderstorms or more especially for large earthquakes. Thus, the separation of the electric charges occurs subsequently to the various interactions in the sky between the vibrations of the air and the shaking clouds, and then the negative electric charges develop in the bottom of the clouds and the positive charges on the epicenter by induction phenomenon like during thunderstorms lightings. Simultaneously, an electric field which becomes increasingly strong develops between the epicenter and the clouds, once it reaches the disruptive field value which is $\sim 3.6 \times 10^6$ V/m for the atmospheric air (**Plonus, 1978; Benson, 1996**), an electric current density instantaneously and spontaneously circulates from the epicenter towards the clouds while causing excitation and ionization of air molecules, which is by the reverse process, ultimately produce an AQL. Just after the EQL occurrence, the cloud-epicenter physical system becomes electrically neutral and the process repeats due to the subsequent seismic wave train for as long as conditions are favorable. According to the seismogram in figure 6 above, the electric field reaches its disruptive value after a certain number of vibration cycles occurrence.

The electromagnetic energy density in air that gives EQLs or equally thunderstorms lightings is that which corresponds exactly to the disruptive field given by equation 1,

$$u_{em} = \frac{1}{2} \epsilon_0 E^2 \quad (1)$$

where $\epsilon_0 = 8.85 \times 10^{-12}$ F/m is the vacuum permittivity.

Then, the electric energy density filling the space between clouds and epicenter area before appearance of an EQL is $57.35 \mu\text{J}/\text{cm}^3$ which is the cutoff value.

The volume density of the mechanical energy (sum of kinetic and potential energies), e (in J/m^3), imparted to air host medium by one vibration cycle of a seismic wavefront is given in the book of **French (1971); Kasahara (1981)** or equally into the letter of **Johnston (1991)** in Nature letters:

$$e_{cycle} = 2\pi^2 \rho (A_0 / \tau_0)^2 \quad (2)$$

where ρ is the density of the air and A_0 and τ_0 are the displacement amplitude and period of the seismic wave respectively. The frequency of seismic wave train is $\nu_0 = 1/\tau_0$. The **amplitude** is the height of the wave relative to the baseline showed on the seismogram in figure 6 above. It depends on the amount of energy carried out by the seismic S-wave of the earthquake.

Figure 7. The Morocco earthquake's intensity of the September 8, 2023 from the epicenter.

According to the analysis of data obtained from the DAICHI-2 satellite by the Geospatial Information Authority of Japan, the earthquake of September 8, 2023 of Al Haouz, Morocco caused an uplift of 20 cm of the earth's

surface around the epicenter (**NHK World-Japan, 2023**). It follows that from the seismogram above, the values for A_0 are 1 to 10 cm and τ_0 of 0.05, 0.1 and 0.2 s for seismic P-wave train causing the EQL ①, seismic S-wave train causing EQLs ② and ③, and seismic S-wave train causing the EQL ④ respectively. These obtained values in the case of the September 8, 2023 Moroccan earthquake agree well with those already mentioned by Johnston in his article in the journal Nature (**Johnston, 1991**). The air density is $\sim 1.29 \text{ kg/m}^3$ under Standard Conditions of Temperature and Pressure, i.e., $T = 15^\circ\text{C}$ and $p = 1 \text{ atm}$. By using $A_0 = 10 \text{ cm}$ and $v_0 = 10 \text{ Hz}$ particularly for EQLs ② and ③, this yields seismic S-wave energy densities into air of about $25.46 \text{ }\mu\text{J/cm}^3$ by cycle. So, seismic S-waves are capable of supplying pressure changes and energy densities by causing air vibrations.

However, since the average energy density of seismic waves is about $25 \text{ }\mu\text{J/cm}^3$ per vibration at $\tau_0 = 0.1 \text{ s}$, i.e., $v_0 = 10 \text{ Hz}$, this shows that the energy density of one cycle of the seismic S-waves is insufficient to produce only one earthquake light type EQLs ② and ③ s, regardless of its amplitude. Nevertheless, the September 8, 2023 Al Haouz Morocco earthquake seismogram in figure 6 shows that it takes about ten cycles by second of large seismic S-wave amplitude before producing the EQL ② or ③, and more than the double of this frequency for low amplitude seismic vibrations causing the EQL ① occurrence and only the half for EQL ④. For lightning to occur, the energy density must reach at least the threshold value of $57.35 \text{ }\mu\text{J/cm}^3$. Thus, within the air volume shacked by seismic S-waves, EQLs would arise as the integrated energy density in electric field from numerous vibrations albeit energy density of seismic spherical wavefronts get smaller from the epicenter, see figure 7, deeper in altitude in the atmosphere. In the case of the September 8, Al Haouz Morocco earthquake, the number of cycles, e.g., for EQL ② or ③ occurs is ~ 20 cycles during two seconds, i.e., $v_0 = 10 \text{ Hz}$.

The rate of doing work, as described by the mean energy density input E , is obtained by taking equation 2 above for the work per cycle and multiplying it by the number N of cycles ($E = e_{\text{cyc}} \times N$). We recognize E as being equal to the total electric energy that the seismic wave adds to the clouds-air-epicenter capacitor system by seismic waves train. The energy is not retained at the epicenter source; it flow along the atmospheric air, which acts as the medium for the transport of energy sequentially from one point in the atmosphere to another, the speed of the transport being equal to the wave speed $v \approx 343 \text{ m/s}$ (**French, 1971**). It then follows that the accumulated energy density during these two seconds is about $510 \text{ }\mu\text{J/cm}^3$ which is obviously an amount of energy several times greater than the required $57.35 \text{ }\mu\text{J/cm}^3$ which is the cutoff value. That is to say, when the seismic wavefront rises in altitude towards the clouds, it attenuates due to the effect of spherical wavefront broadening, see figure 7; and consequently its energy density decreases with altitude. Therefore, the energy density diminishes with altitude to certain percentage with respect its initial value. Obviously, this percentage depends on the amplitude and the frequency of the seismic S-wave train in question. In the case of the EQL ② or ③ and by taking possible losses into account, the percentage of energy density accumulated during twenty oscillations is only 11,25% of its initial value at the epicenter level. It is principally these coseismic surface wave trains which caused more than 2960 deaths and irreparable material disaster during the Morocco earthquake of the September 8, 2023. The percentage of energy missing (88.75%) from the initial seismic wave train probably serves to shake the troposphere and the ionosphere, the atmospheric air is an adiabatic thermodynamic system, its temperature and

entropy increase, and this effect favors the thermal agitation of air molecules from the warm epicenter to cold clouds in the sky and enhances their excitation and ionization process.

The 4th seismic S-wave train which is the cause of the production of the EQL ④ is a surface seismic wave damped according to the seismogram in the figure 6 above. Its frequency is ~ 5 Hz only and its amplitude is damped from ~ 7.5 cm to less than 1 cm as we can see in figure 6. Hence, the energy density per cycle is also decreasing, and consequently the EQL ④ was occurred with a delay of 21 s starting from the instant of the EQL ③ occurrence, see figure 6. This is exactly the time needed for the accumulated energy to reach the ultimate cutoff value of $57.35 \mu\text{J}/\text{cm}^3$. This delay of 21 s is the interval needed for the interaction between the vibrating air and the shaking clouds to accomplish the work allowing the electric field to reach the disruptive value triggering the electric discharge. On the other hand, the amplitude of the seismic S-waves of the first train which produced EQL ① vibrates between 0 and ~ 2 cm with a frequency of 20 Hz according to the seismogram in figure 6. The accumulated energy into the electric field between the epicenter and the clouds due to air vibrations caused by seismic S-waves finally produced the EQL ① at time 23:11:15 local time. The amplitude of the seismic S-waves of the 1st train is smaller than that of subsequent S-wave trains, and this explains why in video # 4, the brightness of EQL ① is a little low compared to those of EQLs ②, ③ and ④. Therefore, an EQL is generated by the accumulation in time of energy densities of several consecutive seismic vibrations in air occurring at the time of the earthquake. Thus, seismic S-waves are capable of supplying pressure changes and energy densities that exceed the energy densities values (cutoff values) that induce disruptive electric fields. The remaining percentage of the energy (11.26%) that accumulates in the epicenter-air-cloud condenser system is almost transformed into lightning during the earthquakes from the excited and ionized air molecules, the EQL arise always from a single wavefront train. The wave train can be short or long depending on the amplitude and frequency of the seismic wave in question. If electromagnetic energy density put into the cloud-epicenter capacitor system is more than the ultimate $57.35 \mu\text{J}/\text{cm}^3$ cutoff value, then it is sufficient for reproducing, for example, several times a luminous flux equivalent to full moonlight of ~ 0.5 lux ($0.5 \text{ lm}/\text{m}^2$) as reported for EQLs in Japan (**Musya, 1931**). The brightness of the EQLs was so intense that the clouds appeared as if it were daytime even though it was dark during, e.g., the darkness nights of the earthquakes of February 6, 2023 in Turkey, September 7, 2021 in Mexico, and November 14, 2016 in New Zealand, this by watching the corresponding videos in the table 1 above in the present article.

Discussion

As we see, in the presence of clouds, there must be a compromise between the amplitude and frequency of the vibrations for the value of the disruptive field to be achieved. The charge of the clouds-air-epicenter capacitor natural big system by interaction and friction between the shaking air and the quaking clouds as well as the subsequent development of the electric field between the epicenter area and the quaking clouds in the sky is all the more rapid and more efficient as amplitude and frequency of the seismic S-waves are greater. This explains why the earthquake lightning only appears after a certain number of successive seismic trains of vibrations. In

other words, it is impossible to observe an earthquake light after one cycle of the seismic vibration train whatever its amplitude. So, to observe an EQL, the earth's surface must vibrate several times depending on its amplitude, because the electrical charges created by interaction and friction between the vibrating air and the quaking clouds build up as the earth shakes, since the space filled by the air existing between these two media is adiabatic and electrically a perfectly insulating layer. The increase in electrical charges in clouds is due to *the accumulation effect of energy provided by several cycles of seismic S-wave train*. Thus why the earthquake lights cannot occur before the seismic activity starting, first of all, the earth must start to shake and here again the appearance of EQLs is not certain, this undoubtedly explains why they does not appear in most earthquakes in the word. This is why the EQLs are necessarily co-seismic lighting, and therefore it is impossible to rely on EQLs to predict the date an earthquake occurs because it begins before seeing an EQL.

The occurrence of electric charges in the clouds accumulates in the clouds- epicenter Earth's surface physical capacitor system, and their accumulation takes a certain time, it depends on the wave amplitude of the seismic vibrations and their frequencies; but if the wave amplitude of the seismic vibrations is very small, lightning will not be unlikely to produce because the work brought by these kind of seismic waves is insufficient to achieve the conditions of lightning, which explains why lightning does not occurs during earthquakes with magnitude less that M_w 4.0. The accumulation of an electric charge in the clouds and an identical charge but of opposite sign in the epicenter surface sufficient to produce the disruptive field to excite and ionize the atmospheric air requires the production of consecutively several cycles of the seismic vibrations before. If the frequency of the seismic waves becomes very small like what happened with the EQL ④ during the Morocco earthquake of the September 8, 2023, the EQL ④ only appeared after 21 seconds after the EQL ③ occurrence, this is due at the frequency which has become low as well as the amplitude of the seismic waves which is attenuating exponentially, because it is the last phase of the earthquake.

On the contrary, the amplitude and frequency of the seismic vibrations which produced the EQLs ② and ③ are significantly greater than those of the vibrations which produced EQL ④ (see figure 6), and this explains why their illuminations are more intense than that of the EQL ①. Thus, seismic surface waves are capable of supplying pressure changes and energy densities that exceed thunderstorm energy density values that induce a lightning by cumulative effect of electric charges into the physical system of clouds. Within the atmospheric air volume shacked by seismic S-waves, EQLs would arise as the integrated electric charges separation between the ground and the clouds reaches the disruptive electrical field cutoff value after a certain number of the cycles of seismic vibrations. The time necessary for the disruptive field ($\sim 3.6 \times 10^6$ V/m) to be developed between clouds located in the sky in the vicinity of the epicenter and the surface depends strongly on the wave amplitude of the propagating seismic waves and their frequencies. It is the Earth's surface located in the region of the epicenter of the earthquake that communicates the energy density of seismic vibrations to the air. For an EQL to be emitted, definitively the earth must vibrate several times. One cycle is still not sufficient to produce it, and so its occurrence is impossible.

Conclusion

The object that I have set for myself in this research work is to discover the causes of EQLs, that is, to explain the earthquake lights phenomenon. The causes of the earthquake lights exposed in this article are valid for the explanation of any earthquake lightning on land as well as on seas and oceans. They are general. The causes are now comprehensive so it remains only to summarize them. Two conditions must be met at the same time for an earthquake lightning to occur: (1) the presence of clouds in the sky above the epicenter region, and (2) a magnitude of the earthquake greater than M_w 4.0. The presence of clouds (or not) is always imposed by meteorological conditions (wind speed, humidity, sunshine, season, etc.) and weather thermodynamic variables (pressure, temperature, entropy, air density, etc.) which prevail in the epicenter region during the day of the earthquake. The causes of the magnitude of the earthquake are found in the amplitude and frequency of the seismic vibrations coming out of the epicenter. The magnitude of an earthquake is all the greater as the amplitude of the seismic S-waves producing it and their frequency are large. Cloudless earthquakes over the epicenter region, even if their magnitude exceeds M_w 4.0, do not produce any earthquake lightning. In addition, EQLs can occur day or night, on land or seas and oceans, but only for earthquakes meeting these two conditions. EQLs can form regardless of the type of clouds and the altitude at which they are found in the atmosphere.

The mechanism for producing electric charges in clouds and their separation concerning the EQLs occurrence is identical to that involved in thunderstorms lightings, except that the causes of the energy input are completely different. The cause of lightning during thunderstorms is known. In the case of EQLs, the cause of the disruptive electric field development in the space between the epicenter and the clouds is the shaking of the clouds by air vibrations as well as their interaction, i.e., friction between air molecules, ice micro-crystals and micro-droplets of water. As we see, the occurrence of EQLs is a coseismic phenomenon and will not make it possible to predict the date when an earthquake will strike. When an EQL was occurred, the earthquake has started before, and the damage has already been done. And to be able to predict earthquakes and thus save human and material losses, we must continue to research a physical law that we will use to predict when and where an earthquake will strike and which will found probably by studying the evolution of seismograms coming from seismological stations which continually capture the movement of techtonic plates.

Teachers' And Students' Perspectives on Using English-Only Instruction in EFL Classrooms: A Case Study at A University in The Mekong Delta

Thi Viet Nguyen

FPT University in Cantho, Vietnam,  <https://orcid.org/0009-0009-9077-4360>

Abstract: The recent focus on Communication Language Teaching (CLT) seems to have fueled a belief in an English-only classroom. It appears to have fostered the notion that English should be taught exclusively in classrooms. In EFL classes, however, the views of teachers and students towards the use of English-only instruction have received a comparatively small amount of attention. The purpose of this article is to investigate Vietnamese university teachers and non-majored students' perspectives to the use of English-only instruction in EFL classes, as well as their agreement with potential barriers to its use in these settings. As a result, major obstacles have been identified, and solutions to overcome them have been proposed. A mixed quantitative and qualitative analysis of questionnaires and interviews with 56 university instructors and 135 students reveals that they do not support English-only classrooms. Furthermore, they come to in agreement with potential obstacles that prevent the use of English-only in EFL classrooms. They argue that including Vietnamese in the curriculum could be viewed as a solution to English-only classes. The findings of the study drew out certain consequences for pedagogy as well as the implications for more research in the future.

Keywords: English-only instructions, English-only in classrooms, English-only instructional policies, language perspective, language of instruction impact

Introduction

English as a Foreign Language (EFL) classrooms offer an exclusive environment for language acquisition and competency development. The usage of English-only classrooms has caused much interest and debate. In recent years, educators and academics have become more interested in the impact of using English as the only medium of teaching in EFL contexts.

Smith and Johnson (2018) report a movement in EFL education towards English-only classrooms. This transition goes beyond language to language instruction's pedagogical philosophy. Language choice in the EFL classroom shapes the learning environment and language learners' cognitive processes (Brown, 2019).

Based on Decision No. 4159 issued by the Ministry of Education and Training of Vietnam on December 6, 2023, regarding the training and certification of foreigners teaching English at foreign language and computer centers in Vietnam, creating favorable conditions for native English teachers is being prioritized. On other words, the demand for improved English communication in the community and EFL schools is expanding.

To achieve that goal, it is vital to consider teaching methods and language policies. On December 11, 2023, Education First (EF) announced that Vietnam ranked 58th out of 113 in worldwide English proficiency for adults, up two points from 2022. According to giaoducthoidai.vn, the University of Vietnam-France in Northern Vietnam, Duy Tan University in Central Vietnam, RMIT and Viet Duc University in Southern Vietnam, and the FPT educational system at all levels are also using English as the medium of instruction for various disciplines. Most graduates from these universities possess proficient English language skills and are capable of working in an international environment. It is a demonstration of the wide extent of English-only in teaching and learning English in Vietnam.

The researcher works at a Mekong Delta university with a CEFR level B1 language competency requirement for students. However, students' background knowledge makes it challenging to meet this requirement. In order to assist students, the teacher needs to reconsider her methods and change her approach. English instructions will replace bilingual ones.

According to past studies, English-only instruction in class can assist students improve their English. The current researcher's main issue is teachers' and students' perspectives on English-only instruction in EFL classrooms. She wants to know if teachers and students embrace this approach and what obstacles stand in its way. Therefore, the researcher wants to do this investigation based on the following research questions:

1. What are the teachers' and students' perspectives on the use of the English-only instruction in EFL classrooms?
2. To what extent do teachers and students agree with the possible impediments hindering the use of English-only instruction in EFL classrooms?

Literature Review

Review of Relevant Studies on EFL Classroom English-Only Perspectives

Many studies have examined various topics, but none have examined teachers' and students' views on English-only EFL classrooms. Research shows that some teachers and students support English-only environments while others disagree. After a private Japanese foreign language institution implemented a language policy, McMillan & Rivers (2011) analyzed teachers' views towards "English-only." This essay examines 29 native-speaker EFL teachers' viewpoints. Contrary to government policy, many teachers found that using students' native language

wisely by both teachers and students improved second language (L2) learning in a communicative framework, as shown by quantitative research.

Additionally, Saito (2013) assessed instructors' English-only policy views and practices. This article analyzed Japanese university lecturers' monolingual teaching methods. A Tokyo private school forced all first-year students, regardless of major, to take a year of English conversation. A qualitative analysis of video-taped observations and interviews with two Japanese university teachers indicated that all six classrooms followed the institutional English-only policy, regardless of student level. The 2013 Ceo-DiFrancesco report analyzed world language school instructor target language use. Teachers like using the target language with students, but self-reported use didn't work. The qualitative findings covered 237 language teachers' classroom realities and limits on target language employment. This study also suggested classroom target language use to improve student acquisition and help teachers achieve their goals.

Sa'd and Qadermazi (2015) conducted research with sixty Iranian EFL students. Their study discovered a significant proclivity among participants to use their native language (L1) and its beneficial effects on language learning when used selectively under specified settings. The overall outcomes of this study revealed that a deliberate, intermittent, and limited incorporation of L1 is a more successful technique for conducting and managing EFL classes than total inclusion or exclusion. Furthermore, the study emphasized the advantages of using L1 to clarify classroom instructions and solve other linguistic issues.

Yang and Jang (2020) found that establishing a policy requiring teachers to use only English in daily contact is a complex process including discussions of interconnected ideologies and identities related to nativism, gendered nationalism, and professionalism.

Promoting L1 in EFL Classrooms

Using students' mother tongue in EFL classes is controversial. Monolingual advocates say removing the native language improves target language learning. Cook (2001) recommends minimizing L1 use and maximizing L2 use. Researchers like Rivers (2011) and Lightbown & Spada (2013) advocate L1 use in EFL courses. These proponents believe L1 aids L2 learning. It is obvious that L1 is used in EFL lessons for many reasons.

According to Auerbach (1993, p. 19), "Starting with the L1 gives learners security and confirms their lived experiences, allowing them to express themselves. Thus, the student is willing to try English." Correspondingly, Silvani (2014) points out using the mother tongue properly can help students and teachers learn English, which can aid language learning. For instance, it helps students communicate, share ideas, and construct meaning and concept in group discussions. Besides, the first language helps simplify instruction, pronunciation, and irritation or issues (Kasim et al., 2019).

Hawa et al. (2021) suggest that teachers can use the mother tongue to provide instructions, explain grammar or complex concepts, introduce new vocabulary, assess student comprehension, and maintain a conducive

classroom environment. Additionally, Yusuf (2009) and Cudi et al. (2014) found that the mother tongue improves foreign language learning efficiency and productivity. Since its benefits are obvious and natural in EFL courses, neglecting the mother tongue is advised.

L1 lowers student anxiety (Atkinson, 1993). Schweers (1999, p. 13) states that “Bringing L1 into the English classrooms has made learning English appear to be less of a threat to their vernacular.” Firsthand learning allows the two languages to coexist. It shows that utilizing L1 improves attitudes toward learning English and encourages learners to learn it. When presented with too much incomprehensible input (e.g., elaborate instructions, abstract terminology, and complex grammar rules), most students become irritated, disappointed, and negative about learning English (Farrel, 2012). Auerbach (1993, p. 20) stated that L1 reduces anxiety, improves the affective learning environment, considers socio-cultural aspects, incorporates learners' life experiences, and enables for learner-centered curriculum development.

Most significantly, it lets language be used to make meaning and language acquisition become a method of communicating ideas rather than an end in itself.” Yavuz (2012) discovered that teachers preferred using the native language (L1) to reduce learners' anxiety and overcome psychological hurdles before beginning instruction in a study evaluating the perspectives of English instructors. Furthermore, Oga-Baldwin and Nakata (2013) observed Japanese English as a Foreign Language (EFL) learners in North America using L1 to build a healthy classroom culture. As their mother tongue, L1 encourages and enables students to speak comfortably in class (Khejri, 2014). To improve classroom anxiety, L1 should be used effectively, selectively, and wisely.

Schweers (1999) liked using the L1 to clarify difficult topics, verify comprehension, define new language, and joke about with students. Prodromou (2001) advised using L1 to describe dialogue background, class methods, lesson goals, and errors for low-level students. Mee-ling (1996) listed three other permissible uses of L1 in EFL classrooms: reprimanding, drawing attention, and delivering announcements. Cook (2001) found false assumptions about L1 avoidance in EFL classrooms and recommended using L1 to convey meaning, explain grammar, organize the class, scaffold students, and use it for collaborative learning and individual use. Mitchell (1988) was beneficial for disciplining students, clarifying activity directions, and providing background information, depending on teachers' L1 use preferences. These areas allowed L1 use.

Overuse of L1 in EFL Classrooms

The foregoing examples show that using L1 in EFL lessons is permissible to some extent. L1 has been misunderstood in most language situations. Mouhanna (2009) warned that overusing L1 will hinder second-language development.

To guarantee students comprehended abstract words or difficult grammar, switching to L1 worked well (Turnbull, 2001). Since students had little interaction with the target language outside of class and only short times of access in class, teachers were advised to use it as much as possible. He believed that depending too

much on the L1 when program design limited instructional time would waste time and discourage students from speaking that TL.

In any case, excessive mother tongue dependence should be avoided (Atkinson, 1987). The author advised ‘profitable usage of only 5% L1 in the EFL classroom’ (Mouhanna, 2009). Translate into the first language if the teacher or students don't understand something. In nearly the same scenario, the teacher or students failed to distinguish between form, semantic, and pragmatic equivalency and oversimplified to the point of crude and erroneous translation. Case showed relative requirement for L1 support. If students could chat to teachers about a course but didn't, it would be an overuse of L1. Alternatively, they knew that classroom activities must be in English but nevertheless used their mother tongue.

Khejari (2012) studied “Teachers’ attitudes towards the use of mother tongue as a language on instruction in lower primary schools in Hamisi district, Kenya”. The mother tongue as a language of instruction hinders English acquisition, according to one study. Using the first language hinders English acquisition. The mother tongue writing system differs from English writing. Thus, using L1 hinders English learning.

By employing L1, teachers may appear lethargic or unable to regulate students (Burden, 2000, p. 5). Polio (1994) warns that overusing L1 can lead to overreliance, oversimplifying differences between languages, student laziness, and failure to maximize English (Atkinson, 1987). Ellis (1997) explained that second language or foreign language professors who overused L1 robbed students of TL evaluation.

L1 is a useful tool for some EFL teachers but a hindrance for others. Monolingual advocates value English-only use. The following theoretical viewpoints discuss the EO policy (monolingual approach), justifications for employing EO instruction, and potential barriers to its usage in EFL classrooms.

Promoting English-Only Instruction in EFL Classrooms

Using English as the only language of instruction in EFL classrooms provides a number of advantages that enhance the overall language learning experience. The following are the primary benefits of using English exclusively in the classroom. Research by Lee et al. (2020) indicates that sustained exposure to English significantly correlates with increased language abilities among EFL learners. Engaging students in an English-only setting allows them to be exposed to the language on a regular basis. This immersion enhances language comprehension, vocabulary acquisition, and overall language proficiency.

One researcher joins monolingual advocate Krashen. He believed that L1 should not be used in the classroom to maximize target language exposure (Krashen, 1987). The monolingual approach advocated teaching all lessons in L2 and claiming that comprehensible input in L2 led to competency (Krashen, 1985). Ellis (2005) also claimed that L2 exposure accelerates learning. EFL students rarely use L2 because it is not part of their daily lives. Thus, teachers naturally deliver L2 input as much as feasible in class.

Excessive use of the mother tongue may impede English participation or target language communication (Sharma, 2006). This may limit learners' exposure to the target language (Sipra, 2007). Because learners must cognitively translate between English and their native language when using their mother tongue, they may struggle with real-world texts.

Turnbull (2001) believed that ignoring the target language in the classroom would not convince students that it could be used for communication. Tsukamoto (2011, p. 146) stated, "It is only through the actual usage that the students acknowledge its worth." Monolingual proponents believe that teaching the L2 lesson in L2 maximizes exposure and learning. According to Phillipson (1992, p. 185), "English is best taught monolingually; the ideal teacher of English is a native-like speaker; the earlier English is taught, the better the results; the more English is taught, the better the results; if other languages are used many standards of English will drop".

Larrea (2002) supported two claims that English was the main language in communicative language EFL classrooms. She argues that students should be exposed to the target language as often as possible to allow acquisition since language class is the only time they can use it in their L1 setting. Another idea is that preventing L1 use in class forces students to think and speak English, which helps them understand and negotiate meaning. Larrea (2002) recognized the importance of learning environment in teaching and learning. Pennycook (1994, p. 169) believed that "the monolingual teaching with authentic communication in L2 was the best way to learn a language."

Following Cook (2001, p. 412), he stated that "the learning of an L2 should model the learning of an L1, successful learning involves the separation and distinction of L1 and L2; students should be shown the importance of the L2 through its continual use." The first viewpoint supports the idea that more L2 exposure increases target language teaching (Ellis, 2005). Regarding Cook's second issue, monolingualists said that translating between L1 and L2 can be problematic since it promotes the idea that the languages are interchangeable (Pacek, 2003). They thought the languages should be independent. Cook's final point was likely that "the use of L2 only in the classroom does help to demonstrate the L2's importance and could portray the language being studied" (Pachler & Field, 2001, p. 86).

Lee (2013) suggests that the EO classroom should simulate real-world situations by providing an L2 language-rich experience with real-world communication and language use. Students must negotiate meaning in English since teachers insist on English-only. Students are encouraged to rephrase, try other styles, and accept mistakes to improve communication. Language is L2, not L1. This will challenge students' language skills. Meaning negotiation is key to purchase, according to EO.

This strategy assumes that students will not have a teacher or use L1 when they have communication challenges, thus they must develop independence and coping skills. Rethinking failed language teaches students methods. For this, teachers must provide as much target-language input as possible. Teachers should also teach limited-language students how to use the L2.

Possible Barriers to English-Only Education in EFL Classes

Before competence, more foreign language intake increases proficiency. Second language acquisition research and ideas show that meaningful language exposure affects students' language growth. Krashen (1985) calls this "comprehensible input". Students' linguistic progress is expected to increase as they utilize the target language in meaningful contexts and in practical situations. Students are reluctant to speak the target language again if they are not trained and expected to. Other professors want students to hear, understand, and use the target language exclusively from day one. Dickson (1992, p. 1) noted that "using the target language promotes natural acquisition and that use of the mother tongue (L1) undermines this process by diverting attention from the object of students' learning."

A typical English-only EFL classroom uses the L2 extensively, according to Lee (2013). L2 usage should be the teacher's medium and the subject. Ryan (2002) stated that students' L1s were not used in class to offer them more chances to utilize the target language. The requirement for first language equivalents lessens as students' English proficiency develops. They grow more fluent in English and utilize the first language less (Al, 2012).

Following the above result, EO use may enrich input and improve student communication. To give students enough input, Krashen (1985) advised intensive exposure. Lack of exposure makes L2 acquisition improbable. More L2 exposure is thought to help kids learn faster. In actual life, native speakers change their language when speaking to foreigners, according to Ellis (1997). Based on status, the teacher can imitate real-life communication in the classroom with adjusted input. Simple, slow, and short language were used to provide this input. The teacher's output encouragement allows contextualized, meaningful L2 use. When communication fails, students must 'negotiate' their output to be understood, which enhances language development (Long, 1996). The more authentic communication students have, the higher their risk-taking and communicative confidence (Leane, 2006).

Another result found that using the EO could boost students' confidence by giving them many communication opportunities to exchange meaning through risk-taking and sometimes without any preparation (Lee, 2013). The goal is to create a classroom culture that promotes speaking and mistakes. Teachers must teach students that mistakes are part of authentic English communication, which will boost student confidence in communication. English-only teachers also claim that classroom L2 input must be intensive and rich to foster L2 learning because learners have little L2 exposure outside the classroom. English use must be maximized in the classroom because students rarely speak English outside of class.

Tsukamoto's (2011) study on students' perception of teachers' language use in an EFL classroom found that EO use affects students' listening skills, speaking skills, word usage, and collaborative learning environment. The same author also noted a "role model" benefit. Although the teachers' native language is not English, all contacts with students were in English, which enthused and motivated them. Littlewood (1992, p. 45) argued

that students will not accept the foreign language as an effective means of communication if professors do not use it in the classroom. Through classroom use, students recognize the language as a communication tool.

Burden (2000) advised teachers not to utilize the L1 when discussing grammar, directions, class rules, why students are undertaking the assignment, testing, or assessing understanding. Lee (2013) noted that teachers' use of L1 to explain grammar or other conceptual language issues is beneficial because students struggle to understand grammar explanations in the second language. Many EFL teachers don't speak their students' L1 well enough to explain grammar, causing uncertainty. The use of L1 to explain grammar may be partly owing to limited teacher knowledge or expertise in L2 clarification-of-meaning abilities like those above, resulting in wasted opportunities to improve L2 exposure by using critical classroom time for teacher-centered L1.

Strategies for EFL Teachers Using English-Only Instruction

There have been various strategies helping teachers deal with the English-only approach. Prior to the policies, Ceo-DiFrancesco (2013) recommended teachers to frequently communicate student learning with parents and the community. Teachers should inform administrators and community members about language learning goals and how word language studies prepare students academically. Teachers can inform constituents about their effective target language communication approaches through information sessions, newsletters, and meetings. The argument promotes English and seeks administration, community, and parent support. Moreover, teachers' strategies play a significant role here. Grammar instruction in the target language is recommended by Ceo-DiFrancesco (2013) and Polio (2007). The use of organized scenarios in conjunction with presentational tools, animation, and real-world context promotes form-meaning linkages. Total Physical Response (TPR) approaches, such as gestures and props, improve verbal comprehension. Maintaining cultural relevance is an issue that can be overcome by using cultural images and establishing explicit classroom rules in the target language. From the outset of the school year, teachers build an immersive environment with context, gestures, and cognates.

Students can benefit from learning the target language in class, says Ceo-DiFrancesco (2013, p. 8). Teach metacognitive and cognitive abilities such effective practice, learning style preferences, organisation, and self-monitoring. Students must be reminded they don't need to comprehend everything. Teachers can help students manage stress and anxiety by listening for keywords, sharing success stories, and reducing anxiety to improve cognitive performance.

Dickson (1992) suggests target language promotion methods. First, teach basic language and classroom directions, then set routines and help kids. Language ladders and graphic prompts help daily language use. Make the target language part of daily duties. Use gestures and paraphrase to compensate. Ask regular questions daily to create habits and confidence, especially for non-verbal learners.

Method

This non-experimental descriptive survey employs both qualitative and quantitative research methods, commonly using surveys in educational studies (Cohen & Manion, cited in Nunan, 1994). The study utilizes a questionnaire and semi-structured interviews. The survey involves 56 English teachers at a Mekong Delta university. Among them, 29 teachers hold a B.A., 26 an M.A., and one a Ph.D. Additionally, 135 non-major students, majoring in IT, Applied Math, and Technology Management, enrolled in General English 3 at the same university volunteered for the research.

Questionnaire

The author modified Ceo-DiFrancesco's (2013) questionnaire, which included 21 closed-ended questions (Kumar, 1999) with the Cronbach's Alpha = .77. The questionnaire is divided into three pieces. Part 1 includes a "Yes/No" question and a rating scale where participants discuss potential barriers to English-only (EO) instruction in EFL classes. Part 2 has students rate 21 reordered items across three areas on a 5-point Likert scale from strongly disagree to strongly agree. Items 2, 5, 8, 11, 14, 17, 18, 19 are barriers outside teacher control in Domain 1. Domain 2 handles instructional training obstacles (1–21). Domain 3 includes student-related obstacles (3, 6, 9, 12, 15). The final portion collects research participants' name, email, phone number, gender, age, teaching and learning experience, and academic qualifications.

Table 1. Categories of the Questionnaire

Domains	Items
Impediments beyond teacher control	2, 5, 8, 11, 14, 17, 18, 19
Impediments involving teacher training	1, 4, 7, 10, 13, 16, 20, 21
Impediments involving student factor	3, 6, 9, 12, 15

Semi-structure

Semi-structured interviews facilitate oral engagement within a relevant environment, which improves the investigation of participants' perspectives, opinions, and thoughts (Bryman, 2004). This method is adaptable, allowing researchers to pose follow-up questions to get more thorough data (Kvale, 2007; Patton, 2002). In this study, the questionnaire dominated the semi-structured interview. The interview was used to check study participants' questionnaire responses, acquire insight into their opinions toward EO instruction in GE3 classrooms, and learn EFL teachers' EO instruction methodologies.

Results

Quantitative Findings

A quantitative and qualitative analysis of questionnaire and interview data showed that research participants

prefer bilingual EFL instruction (Vietnamese and English) to monolingual EFL instruction at pre-intermediate level. Teachers and students understand the need of English-only instruction for communicative goal achievement. By examining teachers' and students' agreement on various hurdles to EO instruction in EFL classes, it was discovered that language proficiency barriers are the biggest. The interview also showed that most participants preferred Vietnamese-English to English-only.

Teachers' Perspectives on the Use of English-Only in EFL Classrooms

Table 2. below shows that 51.8% of instructors support using EO in General English (GE) 3 classrooms (pre-intermediate level), while 48.2% oppose it. Most teachers feel that English-only is essential to teaching English and should be utilized in GE3 classes for communicative purposes. However, when asked if EO use in classrooms could be difficult, 87.5% of instructors think that English-only in GE3 classes would be difficult, while 12.5% disagree (see Table 3). The evidence shows that teachers feel EO implementation in GE3 classrooms will be difficult, regardless of their support or opposition.

Table 2. Teachers' Support for the Use of the English-Only in EFL Classrooms

Question 1: Do you support the use of the English-only in General English 3 classrooms (cf., Pre-intermediate level)?		
Responses	Yes (51.8%)	No (48.2%)

Table 3. Teachers' Support for Possible Impediments Hindering Teachers from Using the EO in EFL Classrooms

Question 2: Do you agree with the use of the English-only in General English 3 classrooms (cf., Pre-intermediate level) could meet impediments?		
Responses	Yes (87.5%)	No (12.5%)

Students' attitudes toward the use of English-only instruction in EFL classrooms

Percentages of student replies to both questions were calculated in a descriptive statistics test. Student perceptions toward EO instruction in EFL courses are shown in Tables 4 and 5. Interestingly, 69.6% of students don't want their teachers to teach in English. Most students (88.9%) in the current study feel that EO instruction in General English 3 classrooms would overcome the obstacles. This may indicate that General English 3 students oppose EO instruction since it would cause obstacles.

Table 4. Students' Opposition to the EO Instruction in EFL Classrooms

Question 1: Do you support the use of the English-only instruction in General English 3 classrooms (cf., Pre-intermediate level)?		
---	--	--

Responses	Yes (30.4%)	No (69.6%)
-----------	----------------	---------------

Table 5. Students' Level of Agreement with Possible Impediments Hindering the Use of the EO Instruction

Question 2: Do you agree with the use of the English-only in General English 3 classrooms (cf., Pre-intermediate level) could meet impediments?

Responses	Yes (88.9%)	No (11.1%)
-----------	----------------	---------------

Participants' Agreement on Potential Barriers to EO Instruction in EFL Classrooms

Table 6. Mean Score of Participants' Level of Agreement with the Possible Impediments Hindering Teachers from Using the EO Instruction

Domains	N	Min.	Max.	Mean (M)	SD.
1. Impediments beyond teacher control	191	1.38	4.38	3.07	.57
2. Impediments involving teaching training	191	1.75	4.50	3.21	.53
3. Impediments involving student factors	191	1.40	5.00	3.20	.80
General Mean	191	1.71	4.14	3.16	.47

Table 6 shows that the participants' questionnaire mean score is somewhat higher than scale 3 in the five-degree scale ($M = 3.17$). A one-sample t-test was used to see if participants' mean ratings were significantly different from 3.0, the established mean for potential difficulties. The sample mean ($M = 3.06$, $SD = 0.40$) differs considerably from the average point (3.0) ($t = 1.09$, $df = 40$, $p = .28$). The results show that participants agree on the barriers to EO instruction in GE3 classrooms. The mean scores of these domains are similarly above medium. Thus, these domains hinder EO instruction in GE3 classrooms. However, obstacles beyond teacher control are not substantially different from 3.0 ($t = 1.74$, $df = 190$, $p = .08$), indicating that this domain inhibits GE3 English instruction at an average level. The computed mean score underlying teachers' and students' agreement level for possible EO impediments may be: teaching training ($M = 3.21$), student factors ($M = 3.20$), and beyond teacher control ($M = 3.07$).

Comparison of the Order of Domain Prioritized by Teachers and Students

Table 7. A Comparison of the Order of Domains Prioritized by Teachers and Students

Domains	Min.	Max.	Mean (M*)	SD.
1. Impediments beyond teacher control	1.63/1.38	4.13/4.38	3.00/3.10	.57/.57
2. Impediments involving teaching training	2.00/1.75	4.38/4.50	3.29/3.18	.53/.53
3. Impediments involving student factors	1.60/1.40	4.80/5.00	3.28/3.17	.64/.86

(*): teachers/students

Table 7 depicts the agreement between teachers and students on potential impediments to English-only (EO) instruction in General English 3 (GE3) classrooms. The most emphasized domain is "Impediments involving teaching training" ($M = 3.00$, $M = 3.18$), while the least valued is "Impediments beyond teacher control" ($M = 3.00$, $M = 3.01$). The range between the highest and lowest mean scores for both teachers and students is minimal.

In conclusion, study participants agree that these domains hinder EO education in GE3 classes. Instructors slightly emphasize "Impediments involving teaching training" and "Impediments involving student factors" as the greatest hindrance to EO instruction, but both instructors and students evaluate them moderately. Nearly comparable perspectives on "Impediments beyond teacher control".

Qualitative Findings

After analyzing the questionnaire data, the researcher interviewed 10 participants - four teachers and six students - based on their support or opposition to English-only (EO) instruction in General English 3 (GE3) classrooms. These interviews were used to evaluate questionnaire responses, understand participants' perspectives on EO education in GE3 classrooms, and learn teachers' EFL implementation tactics. The interviews asked four main questions about EO instruction and teachers' ways to overcome obstacles. The first interview question showed 50% support for EO instruction in GE3 classrooms, while the rest opposed it.

Promoting English-Only Instructions in EFL Classrooms

EO advocates said they used EO training in GE3 classes to *create an English environment, improve language proficiency, and boost communication confidence*.

Teacher and student participants agreed on the first reason for implementing EO instruction in GE3 classrooms: *developing an English environment*.

Teacher 2 stated: I support the use of the English-only instruction in GE3 classroom because of several reasons. Firstly, it creates English environment with massive amounts of English. [...]

Student 1 said: I favor EO education in GE3 because it creates an English-communicative setting that helps students speak and think in English. The atmosphere may be crucial to students. Creating an EO environment motivates students to learn English.

With regard to the second reason, improving students' language proficiency, Teacher 1 explained:

I support EO instruction in EFL classrooms, especially pre-intermediate levels, because I believe that once students can practise English in an EO environment, they will try harder to communicate in the language of instruction, improving their language proficiency.

Teacher 2 supplemented: [...]. Second, EO instruction can help students think in English rather than translating from their mother tongue to the target language. If they can accomplish it, students can easily improve their language skills. [...]

Teacher 2 said the third purpose for using EO training in GE3 classrooms is to boost students' communicative confidence:

[...]. Additionally, it boosts students' confidence in utilizing English outside of class. Finally, EO education encourages teachers to speak more English in class.

Students thought EO instruction in GE3 classrooms was reasonable. Their explanation:

Yes. Pre-intermediate students may not understand all of the teacher's classroom instructions, but they can understand listening English lessons. We eventually speak Vietnamese intuitively without thinking about it. Thus, we can converse well in real life. (Student 2)

I favor EO instruction in GE3 classes because it improves vocabulary and natural language. If we are taught in an EO setting, we won't be bashful while speaking English outside of class with native speakers. (Student 3)

Possible Impediments When Using the English-Only Instruction in EFL Classrooms

The interview data analysis identified two groups of impediments: *teaching training* (e.g., teachers' proficiency, tendency to use Vietnamese, lack of methodology teaching training, classroom management ability) and *student factors*. According to participants, *barriers beyond teacher control* do not affect EO use in EFL courses. Specifically, Teacher 1 said:

Due of students' diverse backgrounds, merely speaking English in class may cause confusion. In an English-only classroom, weak students may not speak. Since most Vietnamese students are passive learners, just speaking English in class may isolate weak students. They study English to pass the test.

Teacher 2 said that English-only training requires a lot of repetition if students don't understand. English is only a subject, making it hard for professors to motivate non-English majors.

Weak students would find the EO complicated and time-consuming. These non-English-majored students don't study English, so they're surprised when they hear English in class. Consequently, they avoid speaking in class. Since GE3 is not required, I don't think students are motivated to study everything in English.

Students had different ideas on EO's potential drawbacks in EFL classrooms. Student 1 and 2 said teaching training is the main reason EO instruction is difficult, whereas Student 3 said they are significant causes.

Student 1 explained:

One obstacle to using EO in class is that some ideas are hard to describe in English. I get trapped and lose interest in English. My teacher is biased since he thinks we all understood the material.

Student 2 supplemented: Students are confused by teachers' British-American accented pronunciation. Also, my teacher doesn't teach in English only.

Student 3 disagrees with two above students. She stated:

Our English timidity and poor speaking and listening limit EO instruction in my class. Communication in English requires more than fundamental knowledge. Also, kids don't cooperate with teachers. Lessons are rarely prepared well.

The evidence suggests that EO education in EFL classrooms advocates are English-only advocates who acknowledge the challenges.

Objection the EO Instructions in EFL Classrooms

EO instruction in EFL classrooms is opposed by this group for many reasons, including student variables (proficiency, learning aim, motivation, etc.), instructor components (teaching technique, motivation, classroom management, etc.), and others.

Teacher 3 shared:

I disagree that General English 3 uses English exclusively for several reasons. First off, children lack the English vocabulary to comprehend teacher directions. Students struggle to learn new and difficult facts in their native language due to a lack of vocabulary to help them understand. General English topic is also difficult to study. Second, students' unfamiliarity with English speaking and listening makes class communication challenging. [...]

Teacher 4 continued:

I struggle to support EO lessons in my class. First, my students cannot speak English inside and outside the classroom. Second, student psychological block for non-native English teachers caused EO instruction to fail. Despite using English in class, I cannot unify the language. Cultural classes usually require Vietnamese. [...]

Students thought EO education for causes in GE3 classrooms was impossible.

Student 4 said:

I oppose English-only instruction in my class for various reasons. We have limited pre-intermediate English, therefore EO teaching makes it hard to grasp. Second, EO instruction requires time. To ensure comprehension, my teacher spends a lot of time translating things into Vietnamese. [...]

Student 5 contributed to the idea of objection the EO instruction in EFL classrooms. He shared:

My teacher rarely uses EO to explain difficult systems and abstract concepts. EO teaching is unfamiliar to us, thus it bores us even when it puts us behind proficiency friends. [...]

Students get bored and thrilled learning English with EO education, so I don't support it. We won't comprehend the lesson because students' English listening and speaking skills are unknown. Specialized terminology are hard to learn. (Teacher 6)

Discussion

In Figure 1, teachers and students in General English 3 classrooms rate EO education differently. Only 30.4% of students disapprove with EO education, but 51.8% of teachers do. These findings differ substantially from McMillan & Rivers (2011). McMillan & Rivers (2011) discovered that most EFL teachers at a private Japanese school where English is not the official language disliked the EO policy. These advocates believed selective use of students' L1 may boost L2 communicative learning. Teachers' backgrounds may affect these findings. All

McMilan & Rivers (2011) participants were native-speaker EFL teachers who comprehended L1-L2. However, all teachers in this study are Vietnamese and speak the same language as students. They want an EO classroom to encourage students to speak the required language. Tsukamoto (2011) and Saito (2013) found that most university students preferred EO over Japanese in class, although recent results differ. Vietnamese and Japanese students differ in language policy and goal. All Japanese universities are English-only. Students understand English's value in education and community through this policy. Japanese students want good communication, while Vietnamese students learn English for the exam. This demotivated and made EO instruction less appealing.

Figure 1. Teachers' and Students' Perspectives on the use of the EO Instruction in EFL Classrooms

Conclusion

In General English 3 classrooms, teachers and students had various perspectives toward EO, although both strongly agreed that the specific use of EO education will have hurdles (Figure 1). Table 2 reveals 51.8% of teachers support EO and approximately 90% realize the challenges. They match Ceo-DiFrancesco's (2013) poll. Same author examined if EFL teachers' target language use goals and practical use differed. Surveys discovered disparities between teachers' goals and use. Two hundred thirty-seven teachers recognized EO classroom challenges. The results showing instructors' and students' views toward EO instruction in General English 3 classrooms demonstrate the English-only approach's challenges.

Recommendations

The current study was undertaken at one university, thus its conclusions may not apply to others. Each university has unique teachers, students, instructional environments, and so on, which might lead to varied results. For this reason, comparable research should be conducted with participants from several institutions in

Can Tho city and elsewhere in Vietnam to generalize its findings to all English professors and non-major students at universities. Since the study is a survey, subsequent experimental studies to verify and prove the efficacy of EO training in EFL classrooms in genuine research contexts will make its results more significant and reliable.

Acknowledgements

This study was made possible by the continuous support from Can Tho University.

The Awareness and Attitudes Towards Plagiarism in Academic Writing of English Major Students: A Case Study in Higher Education in Vietnam

Kim Nguyen Thi My

English Language Department, FPT University, Vietnam,  <https://orcid.org/0009-0005-8607-3618>

Abstract: Plagiarism is seen as a significant and extensively discussed matter in academic environments. This research aims to investigate the perception and attitudes of English major students towards plagiarism in academic writing. It seeks to explore the existing knowledge about the concept of plagiarism among English major students at a university in the Mekong Delta and offer suggestions for avoiding plagiarism. This research is conducted as a descriptive survey with 205 participants, a 5-point Likert scale questionnaire is employed to assess the extent of students' understanding. Based on data collected by using this instrument, the outcome revealed that students possess knowledge in some forms of plagiarism. Nevertheless, due to some internal and external reasons, students have not known full information related to plagiarism, so they plagiarize unintentionally sometimes. This study also suggested some strategies to enhance students' comprehension of plagiarism and offer some effective methods to avoid it, thereby enhancing academic quality.

Keywords: plagiarism, academic writing, EFL learners

Introduction

English has become an international language of great relevance in the modern world, so learning the language is crucial. In the framework of Vietnam, the language plays a vital part in promoting advances in a number of fields, including the sciences, politics, culture, technology, and the global community. Gaining proficiency in English involves developing both productive (speaking and writing) and receptive (reading and listening) skills. All these abilities are essential as mastery of any one of them always improves the others. Writing appears as an essential ability within this range of abilities, which enables better English comprehension and efficient self-expression in social interactions.

Academic writing is the primary basic that expresses the ability of a person in work, study, and knowledge about English. Because of the requirements of our society and studies, the role of academic writing is considered indispensable. Moreover, our country has been integrating into the world economy, so we have more and more chances to cooperate with the foreign, English becomes useful. Consequently, Academic writing also becomes

more necessary. Writing is important, and writing in one's own words is more important. It shows one's ability. It is true that intellectual study is considered an important issue that many researchers have been concerned about. "Academic honesty and respect of intellectual property are areas of considerable concern to tertiary institutions worldwide" (Weedon, 2000, Groak et al., 2001). In fact, in most countries, plagiarism is considered very serious, people have many ways to explore how a person plagiarizes and punish plagiarists. Plagiarism has been troubling the academic world for a long time. With the invention of electronic resources like the Internet in recent times, it has become easier and more accessible for students than ever before. Students who have limited time to devote to studying plagiarism matters and honing their writing skills may inadvertently engage in plagiarism. Plagiarism is, in fact, a critical and imperative issue. It requires constant attention from not only publishers, researchers, and academic institutions, but also students and instructors. Whether deliberately or unintentionally, authors who engage in plagiarism commit criminal offenses.

Particularly, English major students do not often have many chances to discuss about plagiarism. They often use the knowledge from studies and research without acknowledgment nor knowing that they plagiarized already. If students have a full understanding of plagiarism, and believe that plagiarism will be penalized, students will avoid it and have better writing. There have been a few studies focusing on the learner's awareness and attitudes toward plagiarism in Vietnam so far. Although plagiarism is not a novel issue, it remains a persistent concern that will likely continue to escalate over time. Furthermore, the various forms of plagiarism are becoming increasingly diverse and sophisticated. For these reasons, this study is conducted to explore the issue more deeply, to find out how much students are aware of plagiarism and make some suggestions to avoid it.

Research Aims

The purpose of this research is to explore students' awareness and attitudes toward plagiarism in academic writing of English majors. Therefore, the research aims are:

- To explore English major students' existing knowledge about plagiarism.
- To identify common citation strategies used among students.
- To make suggestions for avoiding plagiarism.

Research Questions

The study seeks the answers to these following questions:

- What is the existing knowledge about plagiarism among English major students?
- What are the common citation strategies used by students?
- What are the suggestions to help students avoid plagiarism in academic writing?

Literature review

Definition of "Plagiarism"

Plagiarism is a serious problem in the educational community. Jones (2011) mentioned concepts of plagiarism: it is a form of cheating that constitutes the academic equivalent of thief. Indeed, the word plagiarism comes from the Latin Plagiarus, which means “kidnapper” (Bejan, 2019). Helgesson, G., & Eriksson, S. (2015). also provide a definition that for learners using English to study other subjects, plagiarism is the act of copying another person’s ideas, words or works and pretending they are your own; something that has been copied in this way” In the course book Academic Writing – A Handbook for International Students, Stephen Bailey (2011) admits that “In academic work, ideas and words are seen as private property belonging to the person who first thought or wrote them.” Therefore, if writers take someone’s ideas to apply in their writing without acknowledging, the writer will be considered plagiarizing. From another point of view, plagiarism is the incorporation of someone else’s work – including their language and ideas – without providing adequate credit. The University of Cambridge defines plagiarism as: “submitting as one’s own work, irrespective of intent to deceive, that which derives in part or in its entirety from the work of others without due acknowledgement.” (As cited in Wikipedia: Plagiarism, 2024). Sometimes, acknowledgement in a wrong way is considered plagiarizing. It is unintentional plagiarism.

According to definitional model of plagiarism of Pecorari (2002), Plagiarism is defined as (1) an object (i.e., language, words, text) (2) which has been taken (or borrowed, stolen, etc.) (3) from a particular source (4) by an agent (5) without (adequate) acknowledgement (6) and with or without intention to deceive”.

In brief, each researcher has his own point of view about plagiarism. Plagiarism means as a form of copying and paraphrasing other people’s works or ideas into your own work without full acknowledgement. Plagiarism does not simply involve copying a result and a product, or borrowing the ideas basically of someone but plagiarism means taking ideas or words from a source without giving acknowledgement to the author(s). Therefore, plagiarism is seen as a kind of theft and considered an academic crime.

Types of Plagiarism

Plagiarism manifests in various forms. Barnbaum (2006) identifies several types of plagiarism, which can be categorized into five distinct classifications.”

(1) Copy and paste plagiarism

It means “copying word to word textual contents” (Hermann, Franks & Bilal, 2006) or with only minor changes from Internet, a book, or any other sources. Similarly, when we use the whole sentence or significant phrases from the source and forget to use quotations marks and reference the sources, we are also considered a plagiarist.

(2) Word switch plagiarism

If we take a sentence from a source and change some words, it is still called plagiarism. Therefore, if we want to quote a sentence, then we need to put it in quotation marks and cite the author and article. But quoting the

source articles should only be done if what the quotation says is particularly useful in the point you are trying to make in what you are writing." In many cases, paraphrasing and then citing the original sources is a better option. Translated plagiarism is a part of this kind. It means crossing language content translation and use without reference to original work.

(3) Style plagiarism

It is also plagiarism when writers follow a source sentence by sentence or paragraph by paragraph, even though writers change around a few words. It is the author's style that we copy.

(4) Metaphor plagiarism

Using the ideas from the original sources and making them more clearly by paraphrasing without quotation are also considered plagiarism. "Metaphors are used either to make an idea clearer or give the reader an analogy that touches the senses or emotions better than a plain description of the object or process" (Barnbaum, C., 2006)

(5) Idea plagiarism

It means using similar concepts or opinions which are not common knowledge. Writers have the same or similar ideas as others, but the ideas have been published in books, papers, and research by others. If writers use these ideas without acknowledgement, they are also plagiarizing.

Rhoten (1997) at California State University has another idea. He categorized plagiarism into:

(1) Word by word: the submission of material authored by another person but represented as the student's own work is plagiarism although that material is paraphrased or copied in verbatim or near-verbatim form.

(2) Improperly paraphrasing: Improper acknowledgment of sources in essays, papers, or presentations includes failure to use quotation marks or indentations if words are directly quoted.

(3) Fail to cite the original source: with this type, it is better to paraphrase other people's ideas by using your own words, but students must acknowledge the person from whom you borrowed the ideas. If writers cite in a wrong way or lack information, readers cannot find out the source, which means we are plagiarizing. In some cases, acknowledge in a wrong way is considered plagiarizing. These mistakes consist of various kinds. First, the forgotten footnote. It means the writer mentioned the name of author but missed the exact information such as published year, page, the name of the chapter, etc. Second, misinformation means the writer gives wrong information related to the source that made reader hard to find out the source. Third is the too-perfect paraphrase: giving enough information for the study but forgetting to use quotation mark when citing. After that the researcher will be considered not to respect the origin and translate information wrongly. Fourth, writers acknowledge all of sources, paragraph, and full citation. It is a resourceful Crime.

Factors causing plagiarism among students

There are many reasons making students plagiarize. Chris Hackett & Deborah Eerkes (2013) discover that students plagiarize because of their poor writing and research skills; and misunderstanding key concepts which are presented below.

For the first reason, writers lack research skills. Many undergraduate students do not know how to search library catalogue databases for journal articles or use other reference sources. The second one is the problems evaluating the internet sources. Many students do not know how to critically evaluate Internet sources. This can affect the research process and the student's writing. It is important to remember that there is no quality control on the internet. Subsequently, students get confusion between plagiarizing and paraphrasing. Some students cannot distinguish between plagiarizing and paraphrasing text. The inability to distinguish between plagiarized text and paraphrased text, and incorrectly citing sources, are often the root causes of unintentional plagiarism.

Another reason for poor writing and research skills causing plagiarism is careless note taking. When we are taking notes of the contents, we usually take note of the information and forget to cite the sources or lack information about the references. In addition, students may have written incomplete or incorrect bibliographic information.

Misunderstanding key concepts is also considered a serious factor causing plagiarism. It consists of misconception of plagiarism – students lack knowledge about plagiarism or misunderstand misconception of common knowledge - students may not have the ability to distinguish what materials, facts, and ideas are considered common knowledge.

According to these researchers, plagiarism is not only caused by the reasons above but also by many other factors. The first factor is the pressure from family, competition for scholarships and jobs. The expectation of family and oneself can make students maintain the thinking of high marks so they can do anything, including plagiarism. These things often happen when they are competing for jobs, scholarship, and others. It is considered external factors. By contrast of external factors, students also plagiarize by internal factors (Bowden, 1996). Undergraduate students do not often manage time well and have a lack of organization skills to complete a large research paper. Therefore, they may become overwhelmed in learning.

In another viewpoint, the main reason causing plagiarism is lack of experience and knowledge about plagiarism (Hackett, 2013). The researchers denoted that “Inexperience and ignorance has been identified as the main clause of plagiarism” (Dodou, D. & Joost C. F., 2011). Students do not have many chances to study plagiarism, so their information and knowledge are limited. Therefore, they plagiarize easily without being recognized.

In conclusion, students usually plagiarize intentionally (poor time management, not good at writing so they are not confident enough to write by their own words, their friends plagiarize, and they do too, teacher do not care

about plagiarism, desire high marks, etc.), and unintentional (unaware of plagiarism, unknown the sources, citation confusion, etc.)

The negative effects of plagiarism on students' writing performance

Because of many reasons, students often ignore long-term implications of plagiarism and other forms of cheating. They plagiarize, which affects learning and the teacher's perception about students. If students considered the impacts and consequences of this form of cheating, they wouldn't likely copy another writer's work and use it as their own. Plagiarism affects college students in a number of tangible and intangible ways."

First, plagiarism makes writers limit their creativity because plagiarism is an imitation, which is opposite to creativity. Creativity is the ability to develop or generate something original and unique. This researcher admits that if students are acquainted with copying and imitating, they will gradually become lazy to think about new things. Thus, plagiarism limits thought, research and critical thinking involved in developing original papers or studies.

Besides, Kokemuller (2007) expressed that plagiarism has a negative effect on the college community. It may damage the relationships among professors - students, teachers – students, and students-students, i.e. If the original author (professors, teachers, friends, i.e.) finds that a student has used his work without citation, the plagiarist can easily become desolate from groups and society. If an instructor finds a student copies his work without citation, he would have become more critical going forward.

Furthermore, the reputation of plagiarist and his school may be damaged when plagiarism is found. Students routinely plagiarize; the education value of this school will be decreased. This affects all students on finding good careers after their graduation. If students usually plagiarize and do not try to develop their critical thinking and creativity, their skills and writing performance will be affected.

According to this researcher, the most impact of plagiarism for the students is the consequences on studying. Academic disciplines can be done by the students plagiarizing. Penalties can include grade lowering for the assignment as well as the course. Additionally, in serious cases, students may face criminal and civil penalties for plagiarism if they copy the copyright studies. Fines and even imprisonment are possible in these cases.

Strategies for avoiding plagiarism

General strategies for avoiding plagiarism

Because of the negative effects of plagiarism above, students must avoid plagiarism by anyway. Steven B. (2011) noted that copying the works of others will not help students develop their understanding. By avoiding plagiarism, students can show that they understand the rules of the academic community. Moreover, plagiarism is easily detected by teachers and computer software. Seriously, plagiarism may lead to the failure of the courses

or even the leaving from school. For these reasons, if writers borrow some factors from the others, they must show that you have done this by providing the exact acknowledgement. There are many ways to do this. For instance, summarizing, paraphrasing with quotation, citation, etc. Especially, students can avoid plagiarism by developing good study habits. Steven B. (2011) suggested some general strategies to avoid plagiarism. Firstly, writers should take responsibility for learning. This means writers need to put significant efforts into study, minimizing social activities and part-time jobs. When writers spend time concentrating on study, they can get good results and no error in plagiarism. Secondly, educating oneself about plagiarism. By reading and exploring the information related to plagiarism, writers can get more knowledge to understand plagiarism and find out good methods to avoid plagiarism. Besides, to avoid plagiarism, we should manage the assignment carefully. Furthermore, because limited time is one of the reasons causing plagiarism, managing time well and reasonability from the start is a good idea for avoiding cheating.

Specific strategies to avoid copying among peers

Plagiarism is not only by a person from the sources but also from a person to others, for instance, between students. It usually happens in group work. Therefore, besides general ways, we should have some strategies to avoid copying among students. They avoid copying from others and ensure that other students do not copy from other students. The simple way is to do by own work and cover own work.

Specific strategies to avoid plagiarism from the internet and other text sources

The sources that students usually use are from the internet, books, articles, and other texts. Therefore, it is necessary to have specific strategies to avoid copying from these sources. First of all, Zuckerman (2003) suggested that one way to avoid copying or paraphrasing too closely is to avoid looking at the original while writing or typing assignments. Secondly, try to summarize the ideas of the original in your own words. Writers can also develop their writing skills from this work. If students want to use material from the Internet or other sources, they need to acknowledge it correctly. Writers should never use others' opinions, ideas or copy word-for-word in writing without using quotation marks or formatting conventions and correcting in-text citation. If writers use the information from the sources, they need to quote, paraphrase, reference, cite or acknowledge. There are some ways below to avoid plagiarism in academic writing.

Using the precise words of someone else to support your ideas or the point writers are making.

Devlin (2005) defined quotation is to reproduce, in our own written work, the precise work that someone else has written or spoken. In academic writing, students are encouraged to use the ideas of masters and researchers in their field by quoting or using the precise words of the scholar to support the student's own ideas or to emphasize a point the student is making. If students want to use the work of another person, they need to acknowledge what the original author meant to provide a reference or citation. An acknowledgement is when writers provide information that the words, ideas or concepts represented in our writing have come from another

person.

Reporting the ideas of someone else in our own words

When writers use the words and ideas of others in academic writing, writers should do two things. Firstly, writers should paraphrase the words and ideas in the original text. Paraphrase means to re-phrase or rewrite the words or ideas of the others by own words within students written work. Sometimes, when students want to refer to the work of others, students can summarize the main ideas we have learned from those studies. It is necessary to acknowledge the author of the ideas they have summarized.

How to acknowledge what we have used from someone's work or ideas

Rhoten (1997) argued that if writers have used another person's words or ideas, they have to acknowledge by referencing and citation. Reference has three meanings, all of which are important. (1) To reference is to provide an acknowledgement, within students' assignment, that the words used, or the ideas written about, in their work are not theirs and belong to someone else. (2) To reference is to provide an acknowledgement, at the end of students' assignment, of the original sources from which their quotes and paraphrases were taken. This second acknowledgement usually comes in the form of a list of all the original sources used for their assignment. (3) Each of the original sources writers have used is called a 'reference'. Besides, citation has the same meaning as "Reference". Writers cite a reference when we provide the details of it within, or at the end of, students' assignment. Each of the original sources that the writer has used can be called a "citation".

Using checking plagiarism tools from the Internet

One effective strategy for preventing plagiarism is the use of online plagiarism detection tools. These tools provide a methodical way to detect cases of content copying by comparing submitted work with an extensive database of pre-existing texts. By integrating these tools into learning procedures, educators and institutions can enable students to participate in responsible research methods while promoting a culture of academic honesty. Additionally, these tools serve as educational aids, helping students understand the importance of proper citation and attribution while providing immediate feedback on their work. Consequently, the integration of plagiarism checking tools not only serves as a proactive measure against academic misconduct but also cultivates a deeper understanding of ethical writing practices within the scholarly community.

Research Methodology

Research design

This research is conducted in the form of a descriptive survey. By collecting data from a big number of participants, the research can obtain information about the awareness and attitudes towards plagiarism in

academic writing of English major students at the same time.

Participants

The study involved 205 participants majoring in English. These participants were drawn from various classes and courses, including freshmen, sophomores, juniors, and even seniors. The selection and division of participants were based on specific criteria. All of them were English majors, which provided them with ample opportunities to study and practice writing skills. The groups differed in terms of their educational background and knowledge of academic writing. Freshmen and sophomores, who had limited exposure to academic writing and strategies for incorporating others' work, were included to explore common perceptions among students without specialized expertise in this area. In contrast, juniors and seniors, who had more experience in writing, possessed a deeper understanding of methods for utilizing existing studies

Data collection

For a collection of sufficient reliable and valid data for the study, questionnaires were administered to 205 English – major students.

A questionnaire is a tool used to gather information about phenomena that are not easily observable, such as attitudes, motivations, and self-concepts (Nunan, 1992). It is an instrument for collecting data, typically in written form, that includes both open-ended and closed-ended questions, as well as other prompts that require a response from the participants. A questionnaire is an appropriate method for doing research on the social problem of plagiarism due to the following reasons. Firstly, surveys are timesaving for researchers. Researchers can efficiently and expeditiously obtain information from a multitude of individuals. Furthermore, by concealing the identity of the respondent in questionnaires, individuals are more inclined to express their thoughts and opinions without reservation. As a result, researchers will obtain authentic findings. Questionnaire suits this study for above reasons.

In this study, questionnaire has developed based on the background of the related literature and the results of previous studies. The questionnaire comprised of 42 items in total to collect data about:

1. Definition of plagiarism
2. Reasons accounted for making plagiarism
3. Appropriate citation
4. Consequences of not applying appropriate citation

All the items in the questionnaire are designed in the form of 5-Point Likert Scale. Each item includes a statement about plagiarism. Following the statement is a five-point scale, the scale ranges from 1- indicating “strongly disagree” to 5-indicating “strongly agree”. In between, there are three points: 2, 3, and 4, which correspond to the increasing values of truth of the items to the respondents.

The questionnaire was designed originally in English. However, English may sometimes be difficult to participants because of hard vocabulary. Therefore, to make sure that students understand the questionnaire, questionnaire is translated into Vietnamese – the participants’ mother tongue. Finally, the questionnaires with two versions were delivered to students.

The questionnaire takes about 15 minutes to complete. More than 205 completed questionnaires were collected and used after some unqualified questionnaires were excluded.

Results

Descriptive statistical analysis in a research sample

To assess awareness and attitudes regarding adherence to writing conventions in academic essays among English major students, the researcher conducted a survey with 205 students using a questionnaire

Descriptive statistical analysis of students’ gender.

In academic writing, gender can influence how English major students perceive and react to the issue of plagiarism. Some studies suggest that women and men may understand and evaluate the act of “borrowing ideas” from different sources differently. This difference is not only reflected in how they recognize instances of plagiarism but also in their attitudes toward this behavior.

The results describing the gender distribution of students are presented in the following table:

Table 1. Descriptive statistical analysis of students’ gender

Gender					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	127	62.0	62.0	62.0
	Male	78	38.0	38.0	100.0
	Total	205	100.0	100.0	

The results in Table 1 indicate a significant gender distribution difference within the research sample, with 62% being female students and 38% male students. The study suggests that females tend to excel in language skills compared to males. They demonstrate better vocabulary development, more accurate grammar, and smoother communication abilities. Females may have an advantage due to their tendency toward collaboration and effective communication, leading to greater participation in language-related academic activities.

Based on survey data, the author will conduct a test to determine whether there are differences in perception and attitudes toward plagiarism between male and female students. To perform this test, the author will analyze

mean values (compare means) and conduct a One-way ANOVA. The results of this test are as follows:

Table 2. Test of Homogeneity of Variances

Test of Homogeneity of Variances				
	Levene Statistic	df1	df2	Sig.
PL	20.975	1	203	.000
RE	28.637	1	203	.000
AP	4.818	1	203	.029
CO	7.396	1	203	.007

The results of the analysis in Table 2 indicate that the significance level (Sig.) for the factors “Plagiarism means” (PL), “Reasons accounted for making plagiarism” (RE), “Appropriate citation” (AP), and “Consequences of not applying appropriate citation” (CO) in the Levene test are all < 0.05 . Therefore, there is a variance difference between male and female students regarding their perception and attitudes toward plagiarism. We will utilize the results of the Welch test from the “Robust Tests of Equality of Means” table.

Table 3. Robust Tests of Equality of Means

Robust Tests of Equality of Means					
		Statistic ^a	df1	df2	Sig.
PL	Welch	81.432	1	119.940	.000
RE	Welch	34.853	1	202.822	.000
AP	Welch	31.455	1	137.420	.000
CO	Welch	3.999	1	134.832	.048

The Welch test results in Table 3 indicate that the significance levels (Sig.) for the factors “Plagiarism means” (PL), “Reasons accounted for making plagiarism” (RE), “Appropriate citation” (AP), and “Consequences of not applying appropriate citation” (CO) are all less than 0.05. This implies that there is a statistically significant difference in the average perception and attitudes toward plagiarism between male and female students. Therefore, we can assert that the perception of plagiarism significantly differs between male and female students.

Male and female students may have distinct perceptions regarding the importance of citation and plagiarism in academic writing. The evaluation of plagiarism behavior could be influenced by gender and individual perspectives on its ethical implications. Additionally, there might be variations in academic writing skills between male and female students, affecting how they apply citation principles and avoid plagiarism. Some studies suggest that female students tend to pay more attention to proper citation and adhere to higher academic writing standards compared to male students. Social and cultural factors may also impact the perception of plagiarism among male and female students, with regional differences based on ethical and academic norms.

Descriptive statistics on student groups

The total number of students participating in the survey was 205. Among them, there were 52 Freshman students, accounting for 25.4% of the total student population; 43 Sophomore students, representing 21.0% of the total; 47 Junior students, making up 22.9% of the total; and 63 Senior students, comprising 30.7% of the total. The statistical results describing students' study time are presented in the following table:

Table 4. Descriptive statistics on student groups

Groups of Students					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Freshmen	52	25.4	25.4	25.4
	Sophomores	43	21.0	21.0	46.3
	Juniors	47	22.9	22.9	69.3
	Seniors	63	30.7	30.7	100.0
	Total	205	100.0	100.0	

Based on the survey data, the author will conduct an analysis to determine whether there are differences in perception and attitudes toward academic writing among the student groups (Freshman, Sophomore, Junior, Senior). To perform this test, the author will compare means and conduct a One-way ANOVA. The results of this statistical test are as follows:

Table 5. Test of Homogeneity of Variances

Test of Homogeneity of Variances				
	Levene Statistic	df1	df2	Sig.
PL	4.848	3	201	.003
RE	9.095	3	201	.000
AP	11.917	3	201	.000
CO	2.964	3	201	.033

The analysis results in Table 5 indicate that the significance levels (Sig.) of the factors "Plagiarism means" (PL), "Reasons accounted for making plagiarism" (RE), "Appropriate citation" (AP), and "Consequences of not applying appropriate citation" (CO) in the Levene test are all < 0.05 . Therefore, there are variance differences among the student groups (Freshman, Sophomore, Junior, Senior) regarding their perception and attitude toward academic writing. To address this, we will utilize the results from the Welch test in the Robust Tests of Equality of Means table.

The Welch test results in Table 6 indicate that the significance levels (Sig.) for the factors "Plagiarism means" (PL), "Reasons accounted for making plagiarism" (RE), "Appropriate citation" (AP), and "Consequences of not

applying appropriate citation” (CO) are all less than 0.05. This implies that there are statistically significant differences in perception and attitude toward academic writing among the student groups (Freshman, Sophomore, Junior, Senior). In other words, there are clear distinctions.

Table 6. Robust Tests of Equality of Means

Robust Tests of Equality of Means		Statistic ^a	df1	df2	Sig.
PL	Welch	56.164	3	106.034	.000
RE	Welch	18.216	3	109.063	.000
AP	Welch	23.120	3	99.671	.000
CO	Welch	2.876	3	106.649	.040

Each student group (Freshmen, Sophomores, Juniors, Seniors) typically exhibits unique characteristics related to their educational level, experience, and cognitive maturity. These factors can influence how they perceive issues related to academic integrity and citation practices:

Freshman (First-year students): Freshmen are often new to university life and may not be familiar with academic writing principles. They might benefit from specific and detailed guidance on using and citing sources.

Sophomore (Second-year students): Sophomores have experience writing academic papers since their first year. They likely have a better understanding of citation practices and plagiarism avoidance. They have begun to grasp and apply basic academic writing skills.

Junior (Third-year students): Juniors have more experience with complex academic writing. They may have developed a deeper awareness of the importance of proper citation and plagiarism prevention.

Senior (Fourth-year students): Seniors have the most experience in academic writing and consistently practice thorough source citation. They likely have a high level of awareness regarding maintaining authenticity and ethical standards in their academic work.

Results of assessing the reliability of the scale using Cronbach's Alpha

The reliability assessment results for the factors “Plagiarism means” (PL), “Reasons accounted for making plagiarism” (RE), “Appropriate citation” (AP), and “Consequences of not applying appropriate citation” (CO) are presented in the following table:

The analysis results reveal the presence of four factors with 41 observed variables included in the reliability assessment. After evaluating the reliability, seven observed variables were deemed unreliable and were

consequently excluded from the measurement scale. The remaining 34 observed variables were used in the exploratory factor analysis (EFA)

Table 7. Evaluate the reliability of the scales

Scale name	Observed variables after evaluation	Cronbach's Alpha
Plagiarism means (PL)	PL1, PL2, PL3, PL4, PL7, PL8, PL9, PL10, PL11, PL12, PL14	0.945
Reasons accounted for making plagiarism (RE)	RE1, RE2, RE3, RE4, RE5, RE6, RE8, RE9, RE10	0.941
Appropriate citation (AP)	AP1, AP2, AP5, AP7, AP8, AP9, AP10	0.932
Consequences of not applying appropriate citation (CO)	CO1, CO2, CO3, CO4, CO5, CO6, CO7	0.924

Results of EFA exploratory factor analysis

The results of EFA exploratory factor analysis are as follows:

The analysis results from Tables 8 and 9 indicate that the four factors used by the author to measure students' perception and attitude toward plagiarism are independent. These factors collectively explain 69.076% of the issues under investigation, while the remaining 30.924% depend on other unmentioned factors in this study.

The results of assessing students' perceptions and attitudes toward various factors.

The 5-point Likert scale is a common tool in research for collecting data on students' perceptions and attitudes toward academic integrity. The mean value of Likert scores is calculated by summing the scores of all

respondents and dividing by the number of respondents.

Mean from 1.00 to 1.80: Students are completely unaware of academic integrity.

Mean from 1.81 to 2.60: Students have limited awareness of academic integrity.

Mean from 2.61 to 3.40: Students are somewhat aware about the concept of academic integrity.

Mean from 3.41 to 4.20: Students are moderately aware what constitutes academic integrity.

Mean from 4.21 to 5.00: Students consistently demonstrate accurate awareness of academic integrity.

The specific results of students' awareness assessment are presented in the following table.

Table 10. Assessing students' awareness and attitudes about plagiarism

Items	Students' awareness and attitudes about plagiarism	Mean	Results
PL1	Adapting the original structure without acknowledgement	3.82	Moderately aware
PL2	Using common knowledge; it is not necessary to cite	3.61	Moderately aware
PL3	Citing information without acknowledgement	3.63	Moderately aware
PL4	Copying some words from the sources without quotation	3.92	Moderately aware
PL7	Only giving name of the author in writing acknowledgement	3.78	Moderately aware
PL8	Mixing some studies to make a new one without acknowledgement	3.79	Moderately aware
PL9	Referring to get ideas from the internet, books or any other source when writing essay	3.83	Moderately aware
PL10	Using another person's idea, opinion, or theory	3.76	Moderately aware
PL11	Using and edit some words from the original study	3.74	Moderately aware
PL12	Using synonym to rewrite the original study doesn't require acknowledgement	3.68	Moderately aware
PL14	Giving incorrect reference for information I used	3.79	Moderately aware
RE1	Lack of time to finish writing.	3.52	Moderately aware
RE2	Lack of knowledge about plagiarism	3.57	Moderately aware
RE3	Lack of knowledge for citation, quotation and acknowledgement.	3.67	Moderately aware
RE4	Finding hard full information of the source	3.75	Moderately aware
RE5	Unbelieving in oneself writing skill	3.67	Moderately aware
RE6	To get high marks in writing course	3.55	Moderately aware
RE8	Copying unintentionally the information	3.65	Moderately aware
RE9	Plagiarism will never be recognized by readers.	3.60	Moderately aware
RE10	No rule for penalizing plagiarist.	3.76	Moderately aware
AP1	Acknowledgement must be full and clear	3.37	Somewhat aware

	Providing exact references so that the reader can find out the	3.30	
AP2	original studies.		Somewhat aware
AP5	Trying to rewrite by own word when using the original words.	3.05	Somewhat aware
AP7	Managing time well and right from the start	3.40	Moderately aware
AP8	Acknowledge when using any information from the sources	3.48	Moderately aware
AP9	Putting direct quotes into quotation marks.	3.34	Somewhat aware
	Citing any facts, any pieces of information that are not common	3.29	Somewhat aware
AP10	knowledge		
CO1	Plagiarize can limit creation	4.29	Extremely aware
CO2	Plagiarism can be discovered anyway.	4.41	Extremely aware
CO3	Plagiarism makes unfair	4.35	Extremely aware
CO4	Plagiarism may damage relationships	4.33	Extremely aware
CO5	Plagiarist can easily become desolate in groups and society	4.29	Extremely aware
CO6	Plagiarists can be punished.	4.21	Extremely aware
CO7	Plagiarism destroys academic integrity	4.26	Extremely aware

The provided data indicates that awareness of plagiarism and related difficulties in proper source citation remains insufficient. The mean scores reveal that students tend to have clear awareness of specific issues, such as failing to credit the original source (PL1), copying without proper citation (PL4), and borrowing ideas from others (PL10). However, there appears to be uncertainty regarding the need for comprehensive and precise citations (AP1), accurate reference provision (AP2), and correctly placing direct quotations within double quotation marks (AP9).

On the other hand, variables CO1 through CO7 demonstrate that students possess a high understanding of the consequences of plagiarism, including stifling creativity (CO1), the risk of detection (CO2), and potential harm to relationships (CO4). High scores in this group reflect a deep awareness of the negative impact of plagiarism on individuals and the academic community.

In summary, the data highlights significant awareness of plagiarism, emphasizing the necessity for further education on proper citation and attribution to avoid undesirable consequences. This underscores the importance of educating students about academic ethics and writing skills.

Strategies to support students in avoiding plagiarism

According to the research findings, several solutions are provided to assist students in preventing plagiarism. Primarily, it is imperative for all of us to enhance education. It is necessary for educators to arrange workshops and courses on academic ethics, correct citation practices, and the utilization of plagiarism detection systems. Secondly, offering educational resources: Establish an internet-based repository containing comprehensive

instructions on precise citation and reference. Furthermore, it is advisable to recommend the use of plagiarism detection software to assist students in their writing. By promoting the utilization of plagiarism detection software, students have the opportunity to review their work prior to submission. In addition, learners require instructor help. Faculties have the ability to designate time for teachers to provide explicit and precise instructions to students on how to write and properly cite sources throughout the learning process. Lastly, facilitating collaborative learning also plays a crucial part in aiding pupils. Teachers can foster collaborative learning among students to enhance their understanding of citation and attribution abilities, as well as to cultivate their ability to provide constructive comments and engage in self-revision of their own work.

Conclusions

Based on the data you provided, it can be concluded that within the academic environment, awareness of plagiarism and proper citation practices remains limited. Students seem to understand specific instances of plagiarism and their consequences, but they still struggle with the correct methods of citation and attribution. This highlights the need for greater efforts in educating students about academic ethics and writing skills, enabling them to avoid unnecessary mistakes and develop their creativity in a healthy and fair manner. Accurate and comprehensive awareness of plagiarism is key to maintaining integrity and fairness in the academic setting.

Limitations

The study faces several limitations. First, the sample size is relatively small, which affects the representativeness of findings. Second, the factors investigated account for only 69.067% of students' perception of plagiarism, leaving room for unexplored variables. Additionally, the research scope remains narrow. Lastly, due to limited research knowledge and experience, there may be inherent shortcomings in the research process.

Recommendations

In order to have a thorough understanding of the extent of plagiarism in academic environments, it is crucial to assess both its occurrence and severity among students. This can be accomplished by methodically examining a representative sample of academic literature, such as essays and assignments, to determine the prevalence and different forms of plagiarism that are present. Utilizing a mixed-methods approach will enhance this analysis by integrating both quantitative and qualitative data. Structured questionnaires can be used to collect comprehensive data on the occurrence of plagiarism, including its frequency, underlying causes, and resulting consequences.

Simultaneously, conducting comprehensive interviews will yield useful qualitative insights on students' attitudes, motivations, and perspectives around plagiarism. This dual approach will provide both a strong statistical basis and a clear knowledge of the complex psychological and contextual aspects that influence

student behavior. As a result, it will contribute to a deeper comprehension of plagiarism in educational institutions.

The Effects of Spelling Bee Game on EFL Young Learners' Vocabulary Learning

Cuc Thi Huynh

FPT University, Vietnam

Abstract: Vocabulary plays an important role in learning English. However, due to the difference between English and their mother tongue, many students find it difficult to remember the English vocabulary. This research aims at investigating whether Spelling Bee Game has any significant effects on EFL young students' vocabulary learning. The research followed a quasi-experimental design with the participation of 25 EFL grade-three learners in a primary school in the Mekong Delta. Three research instruments namely a vocabulary screening, a vocabulary test, and a semi-structured interview. The findings from the tests showed that there was a huge change between students' pre-test and post-test scores. It means students significantly improved their vocabulary before and after the treatment. Besides, most of the participants held positive attitudes toward learning vocabulary with Spelling Bee Game. The participants claimed that the use of Spelling Bee Game helps them to improve their vocabulary, increase their spelling, and pronunciation skills, helps them learn vocabulary in a fun and interesting way, and increase their self-confidence as well. The researcher suggests that further studies should consider a larger sample size to obtain a better picture of the reality of the effect of Spelling Bee Game on vocabulary learning.

Keywords: Spelling Bee Game, young learners, vocabulary learning, , attitudes, spelling

Introduction

In learning English, vocabulary plays a fundamental role since it supports four skills including receptive skills namely listening and reading skills, and productive skills namely speaking and writing skills (Masruddin, 2019). However, students usually find difficulties in learning vocabulary (Wafaa, 2017). Related to students' problems with vocabulary learning, using games is a good solution to help students improve their vocabulary. The use of games in teaching vocabulary makes the lessons more interesting, enjoyable, and effective (Azar, 2012). In addition, games are motivating because they are entertaining and stimulating, and they can be practiced in all language skill tasks (Ersöz, 2000). However, in Vietnam generally and in Can Tho City specifically, many studies have been carried out on teaching vocabulary using games, but very few existing studies focus on using Spelling Bee Game in teaching vocabulary to young learners (Haeri, 2019; Masruddin, 2019; Megawani, 2020).

Besides, the second problem is that just a few investigations have been carried out to investigate EFL learners' attitudes toward the use of Spelling Bee Game (Megawany, 2020, Rohmawati, 2015). Considering the problems faced, the researcher found the motivation and necessity to conduct this study to examine the possible effects of using Spelling Bee Game on EFL young learners' vocabulary and learners' attitudes toward of the use of Spelling Bee Game.

Literature Review

The importance of vocabulary learning

Krashen and Terrell (1983) stated that learners should be able to employ vocabulary to convey the meaning of the words if they would like to express their ideas or like to ask for information. In addition, Furnas et al. (1987) claimed that if there are no sufficient words, the speakers and listeners may not understand and convey what they would like to communicate. Likewise, based on Nation's (1990) view, if learners lack vocabulary knowledge, they will have problems in both receptive and productive language use. Thus, vocabulary is the basic factor for communication competence and a lack of vocabulary may lead to unsuccessful communication. Richard (2002) stated that vocabulary is a core component of language proficiency and provides much of the basis for how well learners speak, listen, read, and write. Moreover, Carpenter and Olson (2011) emphasize that vocabulary is an essential component in language learning because it is needed for expressing ideas and conveying thoughts through receptive and productive skills. Vocabulary embraces all the words, we must know to express our ideas and communicate effectively (Sedita, 2005). Besides, Schmitt (2000) indicated that a learner with limited vocabulary in a second language will find it difficult to communicate. The more words that students know, the more they understand what they hear and read; therefore, the better they express what they want (Shoebottom, 2007). Therefore, learning vocabulary is a crucial part of learning a language. In teaching English vocabulary, there are various methods and techniques that could help the students to enrich and improve their vocabulary. The teacher had to choose an appropriate method for teaching vocabulary because it was not easy to teach English, especially vocabulary without using a suitable method. One of the methods to develop students' vocabulary is using a language game which will be presented in the following section.

Using Spelling Bee Game in teaching vocabulary to young learners

Spelling Bee Game comes from the Spelling bee Competition, a kind of competition where "participants are required to spell words (Sebba, 2009). Ranga (2003) also defined Spelling Bee Game as a competition in which a competitor who spells the word wrongly will be eliminated. Spelling Bee Game can help build a strong foundation in learning spelling and vocabulary (Payra & Cardona, 2016) since the purpose of this game is in line with two language components of English vocabulary and spelling. Umulaika (2019) suggested some advantages of using Spelling Bee Game in teaching vocabulary. First, Spelling Bee Game makes vocabulary learning more meaningful and memorable because students can experience the vocabulary directly by themselves and therefore it helps to memorize the vocabulary well. Second, Spelling Bee Game brings

relaxation and fun for students; therefore, it helps them retain new words more easily. These create the motivation for learners to get involved actively in vocabulary learning. Third, learning vocabulary using Spelling Bee Game brings real-world context into the classroom and encourages students to use English flexibly and communicatively. The procedures of conducting Spelling Bee Game in the EFL classroom have been proposed by several researchers. Mcmillan (2012) said that there can be several ways to conduct Spelling Bee Game in the classroom because it is easy to set up. First, the teacher divides students into several groups. They work together and practice spelling the words. Next, they are asked to stand in lines based on their groups and receive a word card. After that, they are given time to memorize and understand the words in order that students do not misspell the words. When students are ready, the game gets started. If the student spells the word correctly, he/she will stay in the game, but if they misspell the word, they get out of the game. The correct words will get one score and zero for incorrect spelling. The next student will follow this way. At the end of the game, the group that has more scores will be the winner. Similarly, Ilham and Humaira (2020) suggested the procedures for conducting Spelling Bee Game in the ELF classroom. First, the teacher divides the students into several groups. Second step, the teacher gives the collection of words to the students in the form of a paper on one topic, then distributes it to each student and gives time for students to memorize and understand the words in order that they do not misspell the words. After that, the teacher asks the students to follow her to spell the words correctly. Next, the teacher prepares some words that were written on a piece of paper and rolls them. Then, the teacher asked students if they were ready to play or not. After ensuring that the students were ready to play that game, the teacher asks students to stand up or sit down and make a line based on their groups. Then, the game will begin from the first group until the last group. Every group will spell the word based on their choice. If they spell the word rightly, they will stay in the game, but if they spell the word incorrectly, they get out of the game. The correct words will get five scores and zero for incorrect spelling. The next group will follow this way. Finally, at the end of the game, the group that had more scores will be the winner.

Research Methodology

Research questions

The aims of the current study were to investigate the effects of using Spelling Bee Game on EFL young learners' vocabulary learning and the attitudes of EFL learners towards the use of Spelling Bee Game in learning vocabulary. The current research seeks answers to the following two questions:

1. What are the effects of Spelling Bee Game on young learners' vocabulary learning?
2. What are young learners' attitudes towards the use of Spelling Bee Game?

Research design

The study mainly followed quasi-experimental research. To collect quantitative data for the study, the pre-test and post-test which were designed in the form of vocabulary achievement tests were administered. In order to collect the qualitative data for the study, the semi-structured interviews were conducted to document in-depth information about the students' attitudes towards the use of Spelling Bee Game in vocabulary learning. The

intervention of the study lasted 10 weeks. During the intervention, students received traditional face-to-face instruction of English from unit 6 to unit 10 of the coursebook (Family and Friends Grade 3). Besides, the implementation of Spelling Bee Game was implemented and monitored during the study.

Participants

The participants of the study were 25 grade-three EFL learners from a primary school in Can Tho city chosen by using a cluster sampling technique. All the participants were assigned to the experimental group. Moreover, after the treatment, six participants were selected based on their final scores to attend the semi-structured interview.

Material

Students were provided with the “Family and Friends Grade 3” (Special Edition) which was written by Naomi Simmons and published in Vietnam in 2015. This textbook is current used in student’s class. The book is divided into four parts Words, Grammar, Phonics, and Skills. Part one Words is the main focus of this study.

Research instruments

In this research, vocabulary screening, the vocabulary test, and the semi-structured interview were employed. Firstly, vocabulary screening was performed to select target words for the intervention. In this study, vocabulary screening was crucial and efficient in assisting the researcher in identifying words that students have no awareness of. The vocabulary screening of the study consisted of 45 words selected from the six units from unit 6 to unit 11 of the course book - “Family and Friends Grade 3” (Special Edition). Students were asked to give the Vietnamese meanings of these 45 words within 20 minutes. Based on the result of the vocabulary screening, no words were excluded from the vocabulary pre-test and post-test because all the students had no ideas with these words. Thus, the vocabulary screening helped shape the focus of the treatment on these unknown words and ensured the reliability and validity of the pre-test and post-test.

Second, the vocabulary test which was used as the pre-test and post-test was administered to collect the data. The pre-test was used to measure students’ vocabulary before the treatment. The post-test was conducted to measure the vocabulary of students after they experience the ten-week treatment. The vocabulary test has 45 words that are selected from six units of the course book “Family and Friends Grade 3” (Special edition). The level of difficulties each word was the same. These words were unknown words to students, based on the result of the vocabulary screening. Each item of the vocabulary test includes a picture which are attached to a word in the coursebook and jumbled letters. The students look at the jumbled letters and a picture to write down the correct answer. The vocabulary test was carefully explained so that the participants can easily comprehend them. Then, it was given to twenty-five EFL learners from the experimental group. The researcher thoroughly observed the participants avoid cheating. The score for each correct answer is 01 and a score of 0 was given for

incorrect answers. The post-test of the study had the same content as the pre-test. Before the administration of the pre-tests, the tests were examined and assessed by two professional teachers who have experience in this field to test the reliability and the validity of the instrument. As a result, the reliability and validity of the post-test would be strengthened as well.

The third instrument was the semi-structured interview. Six participants were involved in the semi-structured interviews which were conducted to deepen students' attitudes towards the use of Spelling Bee Game. Before the actual study, interview questions were piloted by three EFL learners in the first week of the study. These three learners were not the target participants of the current study. The researcher interviewed those learners in Vietnamese so that their ideas and opinions were best conveyed in Vietnamese. According to the piloting learners' feedback, it was shown that they were able to understand most interview questions clearly. Therefore, these interview questions could be used for actual interviews in this present study. Additionally, piloting for interviews enables the researcher to gain experience in conducting in-depth interviews. After the post-test was carried out, the semi-structured interview was administered to give the researcher a deeper understanding of the entire process of students' vocabulary learning with Spelling Bee Game as well as students' attitudes toward the use of using Spelling Bee Game in learning vocabulary. Before the interviews, interviewees were informed about the purpose of the study and the importance of their participation in the current study. The researcher interviewed 6 out of 25 students. The six students were 2 students who got the highest scores, 2 students who got the average scores, and 2 students who got the least in the vocabulary post-test. The participants were expected to comment on the benefits of using Spelling Bee Game, the drawbacks of using Spelling Bee Game, the challenges of using Spelling Bee Game, and give some suggestions for using Spelling Bee Game in teaching vocabulary in the future. To analyze the quantitative data, the computer Statistical Package for the Social Sciences (SPSS) version 20 was employed. Second, a Descriptive Statistics Test and One Sample tTest were run to examine the mean scores of students' pre-and post-test.

Data collection

The procedure lasted ten weeks with 40 sessions, each session lasting 35 minutes. Before the treatment, all students were instructed to complete the pretest by looking at 45 pictures and jumbled letters, then writing the correct words. They would not be penalized for incorrect answers in the scoring process, but they would be given one point for every correct answer. Students' total scores were recorded for later data analysis. During the treatment, the class was divided into 5 teams; each group consisted of 5 students. Before the game started, each group had 5 minutes to learn how to spell the words together. After that, one student who stood in front of the line would get a word card from the teacher. The student pronounced the word, then spelled it out, and then pronounced it again. For example, "lake... l-a-k-e...lake". Then, the student wrote the word down on the board and moved to the end of the line. If the student could spell, pronounce, and write the word correctly, they would get 10 scores. On the contrary, the student who misspelled a given word were allowed to play again but get no score. This way is followed by the next student and the student who finished the spelling, pronouncing, and writing turned to the back line. The group that had the highest score in the game was the winner. The game was

repeated eight times during the treatment. At the end of the treatment, the same test was given again as a posttest to examine young learners' vocabulary gains. Finally, the interviewees were asked four planned questions and two more unplanned questions to investigate their attitudes toward the use of Spelling Bee Game in vocabulary learning. Each interview took approximately 8-10 minutes. These interviews were recorded by a portable recorder, then transcribed and translated into English for later analysis data (see Appendix N).

Procedures of the study

The data was collected in the second semester of the academic school year 2021- 2022 (as outlined in Table 3.2).

Table 1. An overview of data collection procedures

Week	Activities
1	Vocabulary screening
	Delivering the vocabulary pre-test
2	Analyzing the vocabulary pre-test
3 - 8	Applying Spelling Bee Game to teaching vocabulary
9	Analyzing the vocabulary post-test
	Conducting the semi-structured interviews
10	Analyzing the data from the semi-structured interviews

Results

Students' vocabulary scores before and after the treatment

The score on the vocabulary tests ranged from 1 to 45 points. Scale Tests were run to check the reliability of these tests. Table 4.1 below displays the results of the Scale Tests.

Table 2. Descriptive Statistic for the pre-tests and the posttests

	Cronbach's Alpha	N of Items
Pre-test	0.700	45
Post-test	0.895	45

It can be seen from Table 4.1 that the reliability of the pre-test and the post-test were acceptable ($\alpha=0.700$, $\alpha=0.895$ respectively). Accordingly, these tests were reliable enough to be used as instruments in this research. Depdikbud (2012) introduced the Standard Quality of the Vocabulary Test as follows.

Table 3. Standard Quality of the Vocabulary Test

No	Range of score	Criteria
1	96-100	Excellent
2	86-95	Very Good
3	76-85	Good
4	66-75	Fairly Good
5	56-65	Fair
6	46-55	Poor
7	0-45	Very Poor

In this current study, due to the differences in the number of questions and the score for each question, the researcher adopted the Standard Quality above and created a new one suitable for the current research.

Table 4. Current Standard Quality of the Vocabulary Test

No	Range of score	Criteria
1	41-45	Excellent
2	36-40	Very Good
3	30-35	Good
4	25-29	Fairly Good
5	20-24	Fair
6	15-19	Poor
7	0-14	Very Poor

The results of the pre-tests are presented in Table 4.4.

Table 5. Frequency distribution of the pretests

Score Interval	Frequency	Criteria	Percentage
41-45	0	Excellent	0%
36-40	0	Very Good	0%
30-35	0	Good	0%
25-29	0	Fairly Good	0%
20-24	0	Fair	0%
15-19	0	Poor	0%
0-14	25	Very Poor	100%

Table 4.4 shows that students' competency in vocabulary was less satisfactory in the pre-test. In the pre-test, 25 students got the very poor scores. This indicates that students still had little knowledge about the vocabulary being learned in class.

The results of the post-tests are presented in Table 4.5.

Table 6. Frequency distribution of the post-tests

Score Interval	Frequency	Criteria	Percentage
41-45	20	Excellent	80%
36-40	3	Very Good	12%
30-35	2	Good	8%
25-29	0	Fairly Good	0%
20-24	0	Fair	0%
15-19	0	Poor	0%
0-14	0	Very Poor	0%

In the post-test, there were 20 students who got excellent scores, 3 students got very good scores, 2 students got good scores. The number of students who very poor scores in the pre-test decreased significantly in the post-test.

For comparison, the scores of the pre-test and post-test were combined. It can be seen that the pre-test scores start from very poor scores ranging from 0-14 achieved by 19 students. Meanwhile, in the post-test, the score started from the good scores ranging from 30-35, which was achieved by 2 students, very good scores (36-40) by 3 students, and excellent scores (41-45) by 20 students. From this calculation, it can be inferred that there was a difference in students' scores before and after getting the treatment.

In other words, the improvement of students' vocabulary from the pretest to the post-test was obvious after they were taught by using Spelling Bee Game. The Descriptive Statistic Test was performed to identify the mean score of each test. These scores are illustrated in Table 4.6.

Table 7. Mean score of students' vocabulary gain before and after the treatment

	N	Min	Max	M	SD
Pre-test	25	.4	3.6	1.924	0.9884
Post-test	25	3.6	10.0	8.504	1.5151

Table 4.6 shows the mean score of participants' pre-test and post-tests. Particularly, the mean score in the pretest was Min= 0.4, Max=3.6, M=1.924; the mean score in the post-test was Min= 3.6, Max=10.0, M=8.504.

Figure 1. Summary of participants' vocabulary mean score before and after the study

It can be clearly seen from figure 4.1 that there was a significant difference in vocabulary scores of the pre-test and post-test from 1.924 in the pre-tests to 8.504 in the post-tests.

Table 8. Comparison of participants' vocabulary after and before the treatment

Paired Samples Test										
		Paired Differences					t	df	Sig.	
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				(2-tailed)	
					Lower	Upper				
Pair 1	Pre - Post	-6.5800	1.3229	.2646	-7.1261	-6.0339	-24.870	24	.000	

In Table 4.5, a paired samples T-test was applied to measure whether there was a significant difference between the participants' vocabulary in the pre-test and post-test. The results showed that the participants' vocabulary in the pre-test and post-test was significantly different ($t=-24.870$, $df=24$, $p=0.000$). It can be concluded that students' vocabulary was highly improved after eight weeks.

EFL young learners' attitudes towards using Spelling Bee Game in learning vocabulary

The students mentioned that Spelling Bee Game is fun and helps them to learn new words because they can learn and play at the same time.

"I find Spelling Bee Game funny because I can learn and play together. I felt really happy when I spell the words correctly and then I want to do more".

(Participant 1, line 9)

Besides, one student said that it was fun and encouraging because he could play with his friends, especially in a team rather than alone.

"I find this activity interesting because I have many opportunities to practice spelling the words with my friends."

(Participant 2, line 27)

On the other hand, Spelling Bee Game is considered a good way to learn vocabulary easily and quickly and remember words longer which means helps them improve their vocabulary.

"I believe that I can learn vocabulary faster and improve my spelling skills with this game."

(Participant 1, line 5)

"The most beneficial thing I have to say is that it helps me to remember words more easily."

(Participant 4, line 75)

"I think I can remember more vocabulary than before."

(Participant 6, line 115)

Additionally, during the interviews, students also revealed that the use of Spelling Bee Game can improve their spelling and pronunciation skills.

"Besides, I can improve my spelling skills and pronunciation."

(Participant 4, line 75)

"To tell the truth, I think I have improved a lot, especially in my vocabulary, spelling skills, and pronunciation."

(Participant 5, line 92)

Furthermore, students also stated that they became more confident and fluent in spelling and pronouncing words. At first, they felt nervous and embarrassed about spelling and pronouncing words. After 10 weeks, they felt really confident to spell and pronounce words in front of the class.

"Definitely yes. Before, I used to be afraid of making mistakes, but after participating in Spelling Bee Game, I feel more confident when spelling and pronouncing words."

(Participant 3, line 58)

"Yes, of course. Now I feel quite confident to spell words in front of my friends."

(Participant 5, line 98)

On the other hand, participants also revealed some challenges that they encountered while learning vocabulary with Spelling Bee Game. According to one participant's opinion, he found some of the words are so long that he could not remember them. As a result, he was quite confused to spell in front of the class.

"Yes, some words are too long with so many characters, so I find it difficult to remember and spell them correctly."

(Participant 1, line 19)

One more challenge felt by other students is that there are so many words that he could not remember all of them.

“My difficulty is that there are many words to remember, and I must spell them very carefully. Therefore, I sometimes feel a little bit stressed and worried.”

(Participant 3, line 62)

In terms of suggestions for better use of Spelling Bee Game in the future, students have various ideas and opinions to assist the researcher use this activity better in the future. They are (1) supporting students with long and complicated words, (2) giving students more time to learn and work with their friends, (3) the teacher should spell and pronounce words slower and louder, and (4) conducting this game more frequent.

“In order to use Spelling Bee Game better, I think the teacher should support students more with long words.”

(Participant 2, line 43)

“In my opinion, in order to practice Spelling Bee Game better, the teacher should give us more time to work together.”

(Participant 3, line 68)

“Well, I think I need help from the teacher, she should pronounce and spell long words many more times.”

(Participant 4, line 85)

“I think the teacher should spell words slower and louder so that all the students can hear clearer.”

(Participant 5, line 106)

“I think the teacher should conduct this game more often because I find this game interesting and beneficial.”

(Participant 6, line 127)

Discussion

The effects of Spelling Bee Game on students' vocabulary

The Independent Samples t-test was run to compare the post-test mean scores between two groups with the sig. = .000. Therefore, we could conclude that the results of the Independent Samples t-test show that there was a statistically significant difference in the vocabulary scores. This means that Spelling Bee Game has substantially influenced students' vocabulary learning. Explicitly, students' vocabulary scores in the experimental class have changed by more than 6 points from 1.924 to 8.504. Besides vocabulary gain, students' pronunciation and spelling improved as well. The pretest mean score was 1.924 ($M = 1.924$), and the post-test mean score was 8.504 ($M = 8.504$), this indicates the mean difference was -6.58 and the Sig for the comparison of the average scores of the pretest and post-test was as $p = 0.00$. Thus, there was a statistically significant difference in the pretest-posttest scores. The researcher could tell from the means that post-test scores were higher. Before applying Spelling Bee Game, the student's competence was very different. Most of students were in the lowest levels, and none of them were in good and highest scores. Meanwhile, after applying Spelling Bee Game,

students showed an improvement in their vocabulary scores. Most of them were in the excellent scores, only three students with very good scores and two with good scores. The results of the pre-test and post-test showed that Spelling Bee Game gave a positive impact on students' vocabulary learning. These results were similar to the results obtained in Yusuf et al. (2017), Wafaa (2017), Haeri (2019), Jusnining (2019), Masruddin (2019), Qomariyah and Nafisah (2020), Wedhanti et al. (2021). According to these authors, the learners sometimes have difficulties writing the words correctly because they cannot remember their spelling. After learning vocabulary with Spelling Bee Game, they could easily remember the words, which points out that Spelling Bee Game created more opportunities for them to learn new vocabulary easily. Therefore, this treatment could help learners to improve their vocabulary.

Student's attitudes toward the use of Spelling Bee Game in vocabulary learning

The findings revealed that students had positive attitudes toward using Spelling Bee Game in learning vocabulary. This is seen from the results of semi-structured interviews. All students agree that the use of Spelling Bee Game in class can help them to increase their vocabulary, spelling, and pronunciation skills. During the game, students tried their best to remember the spelling and pronunciation of words so that they can spell and pronounce them correctly to get a score for their team. Unconsciously, they remember the spelling and pronunciation of the words. This was reinforced by the results of the research conducted by Yunisrina et al. (2017) that the use of Spelling Bee Game in the classroom improved students' vocabulary, spelling, and pronunciation. In addition, Yusuf et al. (2017) stated that Spelling Bee Game makes students remember words easier. In this study, students claimed that thanks to Spelling Bee Game they could learn the words quicker and easier and remember them longer. Besides, they also mentioned that Spelling Bee game helps them learn vocabulary better than learning vocabulary in traditional ways. This phenomenon is in line with the study conducted by Sari (2017). She stated that Spelling Bee Game helps students in remembering and memorizing the vocabulary easily and carefully and improves students' accuracy in pronouncing words and increases their motivation in learning English. Spelling Bee Game is used as a tool to create a relaxing and fun atmosphere. Based on students' views, this game helps them enhance their vocabulary by learning in a fun and interesting way. It was reported by Nguyen and Nga (2003) that Spelling Bee Game can facilitate learners to enjoy the fun atmosphere, the spirit of competition, and the great increase in motivation. For example, students were divided into several groups and when the game started students in each group tried to answer the teacher's question as quickly as they could. They tried to collect as many scores as they could to show that they were the best team among all of them. This phenomenon is in line with the study conducted by Ningsih (2013). She stated that the implementation of Spelling Bee Game is recommended for teachers to build an amusing and competitive atmosphere for students in learning vocabulary. Not only improve students' vocabulary, but Spelling Bee Game can also increase their self-confidence. Based on the results of the interview, students stated that they became more confident in spelling in front of the class. In the same vein, Megawany (2020) believed that Spelling Bee Game can improve students' confidence and fluency. Before the use of Spelling Bee Game, they felt nervous and embarrassed in spelling and pronouncing words, but after using Spelling Bee Game they felt more confident. The present study also revealed a challenge that some words are too long or too complicated to

remember; in fact, students said that they easily make mistakes with these words. In addition, another challenge is that the students did not have enough time to remember words; as a result, they claimed that they need more time to learn the spelling and pronunciation of words before they join the game. Some students also suggested various ways to help the researcher to conduct Spelling Bee Game in a better way. First, with long and complicated words, the teacher should spell slower and louder so that the students can hear better and remember them easier. Second, the teacher should support students who have problems with long and complicated words. For example, they can guide individual students rather than the whole class or group. Next, the teacher should give students more time to revise words and discuss with their friends.

Conclusion and Suggestions

The scores of the post-test were significantly higher than the scores of the pre-test. Therefore, it can be concluded that there was a significant improvement in students' vocabulary. Besides, the findings from the semi-structured interviews showed that students have positive attitudes toward the use of Spelling Bee Game in learning vocabulary. To sum up, teaching vocabulary by using Spelling Bee Game could help students improve their vocabulary, enhance their spelling and pronunciation abilities, and make students enjoy the learning process. It means that there is a significant effect of using Spelling Bee Game on young learners' vocabulary learning.

Based on the research that had been calculated, some suggestions are presented for the teachers, students, and other researchers who are interested in this particular field.

For the English teachers

English teachers should be more creative in delivering the activities in the classroom as use the Spelling Bee Game as a tool to increase students' vocabulary. It makes students interested and not feel bored in the teaching-learning process. Thus, teachers can use Spelling Bee Game with the good step-steps to operate that roles play.

For students

The researcher highly expects that students can use the results of this study to overcome their difficulties in learning vocabulary. Students are suggested to be more active and study hard in the teaching and learning process. To improve students' knowledge of the English vocabulary, they do not have to just study seriously with many exercises, but they can also apply the various strategies in order to help them in learning vocabulary. Furthermore, they should study more vocabulary by using Spelling Bee Game to help them relax so that they do not feel bored.

For readers

The researcher expects that the result of this study can be additional information for future researchers who are interested to conduct a study on a similar topic. For the other readers, the researcher hopes that the result of this study can be useful as a reference for future research concerning English vocabulary. Moreover, a quasi-experimental method is needed to enable the researcher to have a valid conclusion and to see the improvement of the researcher's findings whether the result is consistent or not. Hence, the next researcher should develop the study using media and good strategies to create the capability of students.

Abstract: The contemporary social environment, and especially the technological and media environment, contributes to creating great intergenerational differences. In contrast to previous periods, when the young would learn from the old and when the context of values, resources, and access to knowledge and information was known to everyone and passed on from one generation to another much more slowly than today, the contemporary social and media environment increases intergenerational differences. Therefore, it is not surprising that the importance, role, and types of intergenerational learning are being increasingly promoted and researched in the context of lifelong learning. In contemporary society, intergenerational learning implies the mutual exchange of knowledge, values, and resources between two or more generations, whereby members of different generations learn from each other. The main goal of this paper is to analyze the features, types, role, and importance of contemporary intergenerational learning as an integral part of the concept of lifelong learning, with regard to the informal context of learning (primarily family and workplace learning) and in the process of non-formal and formal education.

Keywords: Intergenerational learning (IGL), Lifelong learning, Informal learning, Non-formal and formal education

Introduction

In terms of the development of civilization, intergenerational learning is the oldest way of learning and teaching. Ever since the earliest cultures, knowledge had been acquired, expanded, and upgraded when older generations would teach younger generations passing on their knowledge, values, attitudes, and rules and teaching them the skills needed in everyday life (Faure et al., 1972; Gadsden and Hall, 1996; Jarvis, 2004; Jelenc Krašovec and

Kump, 2012; Kump and Jelenc Krašovec, 2014). Moreover, in earlier societies, intergenerational learning was informal, mostly familial and transmissive, meaning that the older generations transmitted their knowledge, values, attitudes, and skills to the younger generations. In this sense, Faure et al. (1972) point out that, despite not being included in a formal education system, each adult was to a greater or lesser extent a teacher to the younger generations.

The same trend continued with the development of education systems and formal education, whereby it was implied that the teacher teaches students the curriculum-prescribed knowledge and skills, including values, attitudes, and rules depending on the respective social system and the degree of democracy in society where education took place (Knowles, 1970; Pivac, 1995; 2009). This way of educating the younger generations was self-evident, as confirmed by analyses of rich older pedagogical and didactic literature in which it is impossible to come across the concept of intergenerational learning because it was implied that the younger would learn from the older. Ultimately, the entire contemporary student-centered co-constructivist education system was created as a reaction to the insufficiency of the traditional imitative and reproductive education paradigm (Pivac, 2009), which emphasized the transmissive role of teachers and consequently the passive role of students (Faure et al., 1972; Pivac, 2009; Koludrović, 2013).

Only in the last decades of the 20th century, the concept of intergenerational learning emerged as a sporadic topic in pedagogical, andragogical, and didactic literature. In recent decades, which saw the development of the knowledge society and demographic and generational changes (Mannion, 2016; Schmidt-Hertha et al., 2014; Newman and Hatton – Yeo, 2008), intergenerational learning as part of lifelong learning became an interesting concept in research and theory, differing greatly from the intergenerational learning of earlier societies. Contemporary intergenerational programs and projects sprung up in the late 1970s and early 1980s to help build relationships between different generations, facilitate exchanges of ideas and learning resources (Mannion, 2016), and be used as social planning models that would create connections between younger and older generations who are not connected in a familial or biological way (Newman and Hatton Yeo, 2008). The goals of the first contemporary intergenerational projects and programs also included the promotion of social growth, lifelong and mutual learning, and emotional stability, which traditionally characterize relationships between younger and elder family members (Newman and Hatton Yeo, 2008).

Following the development of the knowledge society and in particular lifelong learning in the 21st century, intergenerational learning has become a relevant topic for scholars and researchers increasingly applied in the context of non-formal and formal education. Accelerated technological development, including the development of modern media, which create additional differences between different generations, has further contributed to the research of intergenerational learning and especially the application of intergenerational programs. While the content that the young generations would learn and use was known to the old several decades ago, today the situation is significantly different due to the accessibility of modern media. Namely, a large part of the social relations among younger generations is inaccessible and unknown to members of other generation groups. Furthermore, the set of media content and social networks that young people follow and participate in is very

often unknown, and thus inaccessible to members of other generations. The use of social networks has changed the relationships and knowledge of different generations and has certainly deepened the differences between them in a way that different generations do not know the content that other members of the generation use. Consequently, this situation affects the quality of communication among participants of different generations. The affirmation of contemporary intergenerational learning has certainly been reinforced also by changes in the family structure as families have become increasingly geographically distant from each other and ever smaller in size. In other words, the past typical multigenerational family relationships have become increasingly disjointed, and families have become smaller. In this context, intergenerational learning is seen as a way of effectively connecting different generations that are not necessarily in a familial relationship.

Considering the diversity of social and other circumstances that determine contemporary society and the quality of life of its members, intergenerational learning is becoming an essential and relevant scientific topic. Therefore, the main objective of this paper is to analyze the features, types, role, and importance of contemporary intergenerational learning as an integral part of the concept of lifelong learning, taking into account the informal, non-formal, and formal context of learning and education.

Intergenerational learning seen from the perspective of the contemporary social and economic environment and lifelong learning concept

Almost all authors who study and research intergenerational learning in the contemporary social and educational context agree that this concept is related to the development of the knowledge society and the concept of lifelong learning, as well as contemporary demographic, social, and economic trends (Granville, 2002; Newman and Hatton – Yeo, 2008; Findsen and Formosa, 2011; Learning for Active Ageing and Intergenerational Learning: Final Report, 2012; Schmidt – Herta et al., 2014; Mannion, 2016).

At the macro level, the development of the knowledge society and moving away from an industrialist lifestyle and education have enabled an understanding that lifelong learning and education can help societies and economies to be more efficient and foster personal, social, and professional well-being in individuals so that they can improve their knowledge and skills, change jobs and qualifications, and be successful in different areas and sectors compared to the initial qualification they acquired during formal education. The development of the concept of lifelong learning produced an understanding that it can contribute not only to the professional but also to the personal and social well-being of all members of society, especially adults and the elderly, i.e., those who completed formal education at a young age (Knowles, 1970; Jarvis, 2004; Koludrović, 2018).

The importance of adopting lifelong learning with a special emphasis on learning in adulthood and older age was also contributed by demographic changes at the end of the 20th century when the Western world faced an increasingly aging population, followed by a more systematic thought of increasing the quality of successful aging and the importance of adult education (Older American Act, 1988; Jarvis, 2004; Newman and Hatton Yeo, 2008; Findsen and Formosa, 2011; Schmidt – Hertha et al., 2014; Mannion, 2016). These changes at the

macro level also redefined the traditional understanding of the definition of generation, while the development of intergenerational learning, as an integral part of lifelong learning, was influenced by changes in the family structure (Newman and Hatton – Yeo, 2008). Extended families have been increasingly replaced by nuclear families, and subsequently by various modern family structures of ever smaller sizes with the increase of single-parent families, and at the same time modern families have been geographically more and more distant from other family members and relatives. Such a way of structuring the family did not only affect the younger generations, but also the older ones when their vulnerability was revealed in terms of their personal, social, and financial well-being (Older American Act, 1988; Learning for Active Ageing and Intergenerational Learning: Final Report, 2012). Jarvis (2004) points out that the development of contemporary society also changes the perception of culture as the totality of knowledge, skills, beliefs, rules, and other elements of a social group, which ultimately affects all members of society. Newman and Hatton Yeo (2008) claim that geographic family separation causes loss both on part of younger and older generations because the young lack the support and values of the elderly and their worldview, while the elderly remain deprived of social support and insights of the younger generations, love, new knowledge, skills etc. The consequence is the development of different subcultures, excessive individualization, and existential anxiety (Jarvis, 2004) in which the promotion and application of different models of intergenerational learning can play a key role.

In such social and cultural environment, intergenerational learning ceases to be understood as the transmission of knowledge, values, and rules from older generations to younger ones and acquires new definitions, models, and roles as an integral part of the concept of lifelong learning. Contemporary intergenerational programs can be defined as “learning initiatives that increase cooperation, interaction, or exchange between any two generations that involve the sharing of skills, knowledge and experiences” (Findsen and Formosa, 2011, p. 5). A similar definition can be found in Mannion (2016, p. 5) who sees intergenerational learning as an inclusive and reciprocal process that connects different generations through purposeful and beneficial activities for all members that promote mutual understanding and respect between generations and contributes to building more cohesive communities. Other authors offer similar definitions of intergenerational learning, agreeing that it is an integral part of lifelong learning, that it is reciprocal and transactional, that it contributes to the personal and social well-being of all stakeholders and greater inclusion (Springate et al., 2008; Schmidt – Hertha et al., 2014).

Some of the goals and thus the benefits of contemporary intergenerational learning are to use different activities to increase the connection, inclusion, and security of the community made up of members of different generations who are not necessarily connected in a familial way. Intergenerational learning also aims at increasing the understanding and tolerance of different generations, breaking stereotypes, and enabling positive role models, learning values and about values, preventing undesirable behaviors etc. (Granville, 2002; Schuller, 2010; Learning for Active Aging and Intergenerational Learning: Final Report, 2012; Schmidt – Hertha et al., 2014). Mannion (2016) points out that intergenerational encounters are seen as a force for challenging age-segregation and diverse forms of ecosocial injustices.

Consequently, it is necessary to scientifically examine and analyze the types and ways of achieving the

effectiveness of contemporary intergenerational learning. Although this concept is indisputably important in contemporary society, as confirmed by its definitions, importance, and effects presented in this text, it is clear that we deal with a theoretically and organizationally very complex concept that requires deep reflection and continuous (re)definition. Based on the analyses of the rich literature, it is almost impossible to come across a systematic classification of intergenerational learning. Therefore, contemporary concepts, approaches, and types of intergenerational learning will be analyzed below with regard to:

- (1) the type of formality of IGL application (in the context of informal learning; within programs and projects in non-formal education; in the context of formal education);
- (2) the degree of intentionality;
- (3) the context in which intergenerational learning takes place (family, workplace, non-formal, formal);
- (4) social relations and communication dynamics (transmission or transactional intergenerational learning).

Considering the type of *formality of application*, today's literature offers the terms of informal intergenerational learning, non-formal intergenerational education carried out within non-formal programs and various project activities, and intergenerational education in the formal education system. As for the degree of *intentionality*, intergenerational education in the context of formal and non-formal education is always intentional. On the contrary, informal learning can be intentional and unintentional. While intentional intergenerational learning is typical of the professional environment and the mentoring process in the professional environment as well as informal learning in the community, intergenerational informal family learning is often unintentional. Nevertheless, the degree of intentionality in all types of intergenerational learning and education can vary depending on their purpose and context. When analyzing *the purpose and context* in which intergenerational learning take place, it is clear that there are no limitations and that the only criterion is the presence of at least two different generations. The place and reasons for intergenerational learning can range from a completely familial and unintentional context to a fully programmed context that takes place in an institutional setting. Considering *social relations and communication dynamics*, we distinguish between the transmission and transactional forms of intergenerational learning. While the intergenerational transmission approach is characteristic of traditional informal intergenerational learning and the traditional education system, transactional intergenerational learning is typical of contemporary intergenerational learning.

Intergenerational learning in the context of informal learning

As already stated, informal intergenerational learning is the first way of (non – formal) teaching, characterized by the transmission of knowledge, attitudes, values, skills, rules, and all other life elements from older generations to younger ones ever since the first civilizations. Contemporary intergenerational learning in the informal context, however, is expanding and acquiring some new elements and forms. In scientific and research terms, informal intergenerational learning is a multidisciplinary topic that requires connecting numerous scientific disciplines such as developmental psychology in a lifespan perspective, pedagogy, andragogy, gerontology, sociology, medicine, and many others (Gadsden and Hall, 1996; Bostrum et al., 2000). For example, it is possible to come across many studies, which are not primarily andragogical or pedagogical,

examining the impacts of generational connections of older family members on younger ones. Such research is primarily related to psychology and important for understanding intergenerational learning in a familial context. Contemporary research in economics and organizational psychology provides some new insights into generational differences in the working or professional environment that have traditionally not been put in the context of intergenerational learning at all. Sociological research is important because it questions the meaning and definitions of generation as a scientific construct in a dynamic social and cultural environment. Therefore, when studying intergenerational learning in an informal context, one should not forget that the definition of generation is changing and that it no longer refers only to chronological differences between individuals and differences among family members including not only age but also attitudes, culture, and values (Mannion, 2016). In contemporary society, generation as a construct is determined also in a social sense, i.e., different generations, who do not necessarily have to have significant age differences, can belong to different social groups (Mannion, 2016).

Informal intergenerational learning in leisure and family context

In order to understand contemporary intergenerational learning in an informal context, it is important to consider the development of a lifelong learning paradigm that results in changes in the perception of intergenerational learning that have occurred over only a few decades. For example, older literature on intergenerational learning often focuses on the transactional and familial model of defining intergenerational learning. Thus, Gadsden (1995) primarily sees intergenerational learning as ways in which older family members contribute to the development of children, i.e., younger generations. In his later work, the author shifts away from such attitudes extending the definition of intergenerational learning to non-biological participants of different ages (Gadsden and Hall, 1996). Newman and Hatton Yeo (2008) therefore distinguish between familial and extrafamilial intergenerational learning, while Springate et al. (2008) and Granville (2002) point out that modern intergenerational learning has an important characteristic of members not being connected in a familial sense. Granville (2002) states that familial connection in intergenerational learning activities can also have a negative effect on intergenerational learning outcomes due to stereotypes and family relationships. Similarly, Gadsden (1995) confirms that intergenerational learning in the family was influenced by younger generations' relationships with peers and the external environment, which often contradicted the values and attitudes transmitted in the family context. On the other hand, research by Ho (2010) and Jelenc Krašovec and Kump (2012) found that in connected and quality families, social learning of all generations is strong and transactional. Jelenc Krašovec and Kump (2012) also showed that in such families, the younger generations learn about honesty, diligence, respectiveness, preservation of family tradition, and practical skills, while the older generations experience joy of life, optimism, and fearlessness in this mutual process. We can conclude that intergenerational learning in the family is primarily informal and it is a scientifically multidisciplinary and dynamic field of research, that it can be both intentional and unintentional, and that depending on the culture, values, personal experiences of parenting and family, and the quality of family relationships, it can be both transmission and transactional.

In addition to the family context, informal intergenerational learning can certainly include all those activities that do not relate to implementing a specific program but contribute to the personal, social, and, in some cases, professional well-being and learning of an individual. According to Gadsden and Hall (1996), intergenerational learning is not only focused on the family context but also on learning in other informal contexts such as the church where elders help young people understand religious concepts and involve them in church community activities. Informal intergenerational learning certainly includes, for example, reading and library discussions, as well as numerous other activities involving relationships between different generations. For example, Giuliani et al. (2005) claim that older people find it harder to cope with modern technologies and are prone to give up when they encounter difficulties. Intentional, but structure-wise informal intergenerational learning activities in the local community (for example associations and libraries) could be devoted to the exchange of experiences, whereby the young would teach the old about the use of modern technology and media, their values, etc. while older people could contribute to younger people with their life experience and values. Such informal activities would certainly contribute to the inclusiveness and well-being of different members of the community, fostering socio-emotional learning, family and social values, respect, understanding etc. In this regard, activities between adults in home for the elderly and children in kindergartens and schools are particularly important. The research conducted by Lyndon and Moss (2023) showed that activities such as singing, unstructured moments, continuity et al. contribute to meaningful interactions between children and older people. All of the above shows how contemporary informal intergenerational learning is characterized by an intentional transaction and includes members of different generations who are not in a familial relationship.

Although stakeholders of contemporary informal intentional intergenerational learning do not necessarily know all the scientific assumptions, results, and benefits of this form of learning, it is vital that (potential) organizers of such activities – such as librarians, gerontologists, teachers, educators, andragogues, educators, psychologists, doctors, and many other experts who can provide activities of participants of different generations – are educated about the role, importance, opportunities, and benefits of intergenerational learning for different community members (Yasunaga et al., 2016; Lyndon and Moss, 2023). This is confirmed by Lyndon and Moss (2023) who showed that the benefits in terms of emotional rewards also include practitioners who participate in the organization of projects and activities that encourage intergenerational informal learning and that experts who organize and implement such activities should have essential competencies of flexibility and openness to change.

Informal intergenerational learning in the professional context

Compared to earlier research on informal intergenerational learning, which was mostly focused on relationships within the family, informal intergenerational learning extends to the professional context nowadays. Thus, informal intergenerational learning in the professional context is an insufficiently studied construct. Intergenerational learning gains importance with adopting the work-based learning model (WBL) as an integrative part of formal secondary and higher education. Formal process of education increasingly promotes work-based learning as a model that connects educational institutions and the labor market with the aim of

overcoming the sluggishness of the education system in relation to the modern fast and changing labor market (Rainbird et al., 2005; Raelin, 2008; Avis, 2010; Heyler, 2015). Although the activities of work-based learning are mostly prescribed by the curriculum, the success of the organization and implementation of WBL depends on the competencies of mentors and students who approach practical work in the institution. In this sense, WBL certainly has the features of intentional informal learning because the point is to familiarize an inexperienced person with everyday work performed by people with experience. In this sense, it would be necessary to scientifically explore the competencies, relationships, and types of intergenerational learning between mentor and student during the implementation of the WBL. It seems that transactional intergenerational learning would benefit both groups because young people come with new values, knowledge, and information, and older people have experience and skills. For example, Mohabuth and Ahmad (2015) showed that in a mentoring relationship in WBL, trust is key, followed by empathy and openness, respect, honesty, care, and loyalty. Nevertheless, numerous personal and social dimensions remain unexplored that would clarify the best ways of intergenerational learning during WBL but also at work after completing formal education.

After an individual gets employed, informal intergenerational learning becomes an integral part of introducing a younger person into the labor market. Yet, the concept has not been sufficiently researched, especially from an andragogical perspective. Ropes (2013) defines intergenerational learning in institutions in the field of the labor market as an effective way of dealing with increasingly older workers in a positive and constructive way in the workplace. However, in this process, one should keep in mind the transactional approach that is characteristic of contemporary society. Baily (2009) states that generational differences in the business world can be a big problem and points to the importance of applying the reverse model of intergenerational learning. At best, the relationship should be mutual, which means that the main criterion is not only the amount of information, knowledge, and skills that members of one generation bring, but the quality of what they have learned in different generations and the quality of their relationships. Polat and Yilmaz (2020) studied barriers to intergenerational learning in the workplace in Turkey and found that intergenerational learning is influenced by personal, relational, and managerial factors. In this research, personal factors related to different generations were expressed primarily through the understanding of knowledge and experience as a source of power and lack of motivation and commitment. The same research showed that communication problems are the most important predictor of the relational factor, while insufficient support or not being supported or encouraged by management were the most significant factor at the managerial level and proved to be an obstacle in the implementation of contemporary intergenerational learning.

Intergenerational learning in the context of non-formal programs and the formal education system

Intergenerational learning has been most studied in the framework of the success of various projects aimed at determining and examining the importance and effectiveness of intergenerational learning. Given the degree of formality for the purposes of this paper, we will distinguish between non-formal intergenerational programs and intergenerational learning in the context of formal education. Non-formal programs have a curriculum, are elaborated didactically and based on pedagogical and andragogical principles of learning and education, but do

not include acquiring a formal qualification. We distinguish such programs from IGL in the context of formal education, which is mandatory or leads to a qualification, and in which, for various pedagogical and andragogical reasons, participants in the learning and teaching process are members of different generations. Bostrum et al. (2000, p. 3) point out the importance of applying and researching intergenerational programs in the formal education system, stating that “intergenerational programs are vehicles for the purposeful and ongoing exchange of resources and learning among older and younger generations for individual and social benefits”. As stated in the previous passages, today this context certainly extends to the professional field as well.

Intergenerational learning in the context of non-formal education

In the context of non-formal education and project activities, there is an increasing number of projects that include the implementation of programs whose at least one of the goals is to promote intergenerational learning. The implementation of such programs generally leads to success and well-being for participants of all generations (Bostrum et al., 2000; Hatton – Yeo et al., 2000; Yasunaga et al., 2016; Gualano et al., 2018; Guidelines on Implementing Intergenerational Learning Programmes, 2018; Gulyas and Kovacz, 2023). Such projects and programs should be didactically designed (Guidelines on Implementing Intergenerational Learning Programmes, 2018; Gulyas and Kovacz, 2023) and based on transaction rather than transmission, and active learning of all participants (Bostrum et al., 2000). Important features of such programs are flexibility, respect, trust, respect for the opinions and prior knowledge of all participants (Kaplan, 2002; Kaplan et al., 2017; Guidelines on Implementing Intergenerational Learning Programmes, 2018; Gulyas and Kovacz, 2023). The analysis of the relevant literature shows that the topics of intergenerational programs can be diverse and multidisciplinary but always useful and important to all participants in the learning process. Bostrum et al. (2000) see intergenerational programs as a solution to social problems in the form of connecting separated generations, encouraging active cross-generational working and social life including dealing with social problems, developing lifelong learning, and sharing experiences between different generations as fundamental features of intergenerational learning. The report Guidelines on Implementing Intergenerational Learning Programmes (2018) stresses that all participants should understand the importance of IGL, and that consequently intergenerational programs must become the norm, and not just an interesting and fun experience. It is extremely important that intergenerational programs are organized by professionals with appropriate competencies in the application and implementation of IGL (Hatton – Yeo et al., 2000; Guidelines on Implementing Intergenerational Learning Programmes, 2018). The results of the research suggest that the providers of intergenerational programs themselves experience a number of benefits (Yasunaga et al., 2016; Gualano et al., 2018). Some of the mentor’s key competencies and actions in the implementation of adult education programs are performance and skill in motivating participants, creating a pleasant and supportive environment for learning, encouraging participants to engage in activities, effectively leading a group so that no one feels excluded and so that no one dominates the learning process (Wlodkovsky, 2003; Gulyas and Kovacz, 2023). Ultimately, in the implementation of intergenerational learning programs, all the basic rules for organizing adult education programs that are well substantiated in the literature apply, including respect for all

participants, respect for participants' diversity, prior knowledge, interests, experiences, needs, and opportunities, self-directed learning and learning in a team, linking learning content with practical examples, a quality learning atmosphere, applying non-traditional didactic strategies such as problem and project learning (Knowles, 1970; Wlodkowski, 2003; Jarvis, 2004).

Intergenerational learning in the context of formal education

Intergenerational learning in the context of the formal education system is certainly an insufficiently researched topic in theory and practice. Previous research has mainly studied the application of IGL in the context of contemporary education showing how older volunteers are involved in student education programs. The results obtained from the research of various authors confirm many benefits of applying intergenerational programs in the system of formal education. Hatton – Yeo et al. (2000) state that one of the advantages of such programs is that it can reduce teacher overload in the teaching process and teaching administration provided that members of the older generation are well acquainted with their assignments. Cohen-Mansfield et al. (2016) also found that the quality of implementing intergenerational programs at school is influenced by the preparedness of all participants in the teaching process, especially members of the older generation. In the same study, the results showed positive effects of applying intergenerational programs on children with regard to the academic, emotional, and social domains (Cohen – Mansfield et al., 2016). Large meta-research conducted by Park (2015) also confirmed the benefits of intergenerational learning for all generations. This research showed that students generally exhibit greater prosocial behaviors and that the quality of the teaching atmosphere improves, but also that applying intergenerational programs reduces stereotypes towards older people, increases students' respect for them, and contributes to a better mutual understanding (Park, 2015). Similar results were obtained by Cumming et al. (2008) where it was shown that students who participated in intergenerational programs had, as expected, better attitudes towards the elderly, but also that they achieved better academic success compared to students who followed the same curriculum, but not within the intergenerational program. Hatton – Yeo et al. (2000) analyzed the numerous advantages of intergenerational programs in school and concluded how school-based intergenerational programs can contribute to the individualization of the teaching process, collaborative learning, but also improve material and social relations in school. The application of the intergenerational programs in the context of formal education including different generations evidently points to numerous benefits for all participants. Nevertheless, there is surprisingly little scientific literature on the features of the curriculum in formal education in which IGL is applied. Furthermore, although the authors suggest the importance of good preparedness of older volunteers, further research should certainly examine the age as well as educational and motivational structure of older participants in order to apply these programs as successfully as possible. Exploring the effects of intergenerational learning on many aspects of academic, emotional, and social life and examining the features of group dynamics in IGL would certainly contribute to better understanding and quality, and consequently greater application of intergenerational programs in formal and non-formal education. Such research results would also contribute to the quality of developing curricula that enable IGL.

Although the following type of intergenerational learning in the context of formal education is well-researched in the literature and extremely represented in practice, it is often not observed in the context of lifelong and intergenerational learning. This is because research on lifelong learning, comprising intergenerational learning as its integral part, mainly takes into account the population that has outgrown childhood. By analyzing the definition of generation in this paper, it was pointed out that the main criterion for defining generations is not only the age difference of participants or social groups when performing an activity, but also how in modern society a generation also means social differences between participants of different generations. Precisely in the formal education system we can find examples of organizing the school and teaching process including children of different ages. Although children in the formal education system are close in age, compared to the age differences between older and younger generations shown in the examples above, they are nevertheless generationally different in terms of their developmental characteristics. Such examples can be found in Montessori kindergartens and schools and the Jena plan concept (Matijević, 2001; Alwi et al., 2021). There are similar examples in early childhood education and care systems in many countries. Researches point to a number of benefits of this type of intergenerational learning with regard to better social skills, strengthening self-esteem and self-perception, better attitude towards educators, and many others (Whaley and Cantor, 1992; Gmitrova et al., 2009; Katz and McClellan, 2005; Alwi et al., 2021). Šindić et al. (2022) confirmed the importance of applying a constructivist approach in pedagogical work, the familiarity of educators with the concept of intergenerational learning, and in particular the importance of learning and thinking about ways of designing and implementing intergenerational programs in the context of non-formal and formal education and informal learning in order to achieve the full quality of applying intergenerational learning in early and preschool education institutions.

Ultimately, in non-formal education programs, which are often implemented within various project activities, it is noticeable that intergenerational learning is a relevant and research-intensive topic. Nevertheless, in the context of the formal education system, not all possibilities of applying intergenerational learning are sufficiently explored. The available research points to the well-being of all participants in this process, while still bearing in mind the importance of defining the roles of participants in the formal education process at the level student – teacher – adult. Furthermore, the competencies that teachers and elders should have in such programs should certainly be examined. Finally, in the school context, it is necessary to plan and organize the curriculum well and carefully plan in which activities, when, and to which students such ways of intergenerational learning should be offered, whereby it is crucial to prepare all participants for this type of education.

Conclusion

Intergenerational learning has become an increasingly relevant topic in the context of lifelong learning, and as analyzed in the paper, it is possible to implement it within the framework of informal learning and nonformal and formal education. It is certainly a scientifically insufficiently researched topic, considering both the

characteristics of the participants in intergenerational learning and also the didactic characteristics of curriculum planning and realization of the learning process. It has been explained and confirmed that intergenerational learning is a dynamic field that depends on the social, economic, familial, personal, and professional context and that it is constantly changing and becoming more complex. Intergenerational learning is also the oldest way of learning and teaching. However, while it used to be characterized by the transmission of knowledge, values, rules, and culture in general from older generations to younger ones, transaction-based intergenerational learning is increasingly accepted in contemporary society. The amount and type of transactional learning are conditioned by the individual characteristics of the participants in the learning process, but also by the context in which intergenerational learning takes place. Furthermore, intergenerational learning can be unintentional as well as intentional and can be realized in leisure time, but also in the context of non-formal programs and projects and in the formal education system. The results of previous research on the impact of intergenerational learning interventions on different generations generally show numerous benefits for participants of all generations. Contemporary intergenerational learning can also be multigenerational, that is, several generations can participate in the learning process. Here, one should keep in mind the meaning of the term generation, which, in addition to the age difference, today also includes social differences between groups of people who are not necessarily very far apart in age.

Finally, based on the analysis of rich literature, the paper offers a contemporary classification of intergenerational learning, with regard to the type of formality of IGL application (in the context of informal learning; within programs and projects in non-formal education; in the context of formal education); the degree of intentionality (from completely unintentional to completely organized/intentional); the context in which intergenerational learning takes place (family, workplace, informal, formal); and social relations and communication dynamics (from transmission to transactional intergenerational learning). However, it is essential not to dichotomize or polarize the divisions (for example, regarding the degree of intentionality, one should consider the context, characteristics of the participants, etc., and not offer rigid options) and organize activities respecting the individual characteristics of all participants. Ultimately, researches suggest that successful IGL requires the pedagogical-andragogic-didactic training of moderators or facilitators of learning (mentors, teachers) and their constant professional development. We can agree with the authors of the Guidelines on Implementing Intergenerational Learning Programs (2018, p. 38), who pointed out that intergenerational programs should be viewed as a norm, not just an interesting, fun experience.

Abstract: The increase of gender diverse workforce can affect the reputation of an organization and help in fulfilling the employment shortage. Many construction organizations fail to recruit and retain female employees, and this has become one of the main reasons in causing the shortage of employment. However, limited studies were conducted regarding the importance and barriers of gender diversity in the construction industry. Therefore, this study aims to identify the importance and barriers to gender diversity among construction practitioners in the construction industry. The objectives of this study were (i) to identify the importance of gender diversity; (ii) to identify the barriers in improving gender diversity; and (iii) to determine the solutions in improving the gender diversity among the construction practitioners in the construction industry. Quantitative research method was adopted in this study and the data were collected through a questionnaire survey. A total of 103 construction practitioners in the Klang Valley, Malaysia involved in this research. The findings indicated that male respondents rated achievement of effective leadership, whereas female respondents rated drove of project performance as the most significant importance of gender diversity. Both male and female respondents rated negative stereotyping thinking as the major contributor to the barriers in applied gender diversity. Male respondents rated counter-negative stereotyping thinking, whereas female respondents rated organizational support as the most effective solution in improving gender diversity. Besides, this research also carried out an inferential test and found that there are no significant differences between male and female construction practitioners regarding the importance, barriers and solutions of gender diversity. This research provides a guide for the exploration of gender diversity in the Malaysian construction industry. This research also points to the need of construction organizations in engaging the solutions for improving gender diversity to assist the

employees in achieving a gender-diverse workforce.

Keywords: Gender diversity, Construction industry.

Introduction

Gender diversity was defined as the involvement of both male and female employees, without the domination of the male employees in construction industry. The diversification of the existing industry's recruitment base was relatively important in resolving the employment shortage which has historically relied upon men to form the vast majority of the workforce. A gender-diverse workforce in a workplace tends to enhance the feasibility and quality of a project. The increment of gender diverse workforce can be direct and in-directly affecting the reputation of an organization and help fulfill the employment shortage. But there were some organizations reputed to apply gender diverse workforce within their organization due to a lack of awareness of gender diversity. Nevertheless, according to Shibani et al. (2021), there were only around 10% of female employees involved in the construction field in the United Kingdom. Many skilled female employees do not involve themselves in the construction industry due to some reason such as lack of working opportunities.

Literature Review

Gender diversity in the workplace tends to enhance the profitability of the organization by enhancing the ability to attract talented employees, improving customer satisfaction and orientation, and alleviating hostility as well as business-customer relationship (Amy, 2020). Companies with more women tend to outperform their competitors on a variety of financial metrics, including return on equity, sales, and return on capital, as well as share performance and stock price growth. Other than that, Kebede (2017) also found out that effective leadership skills can be achieved in the workplace with a gender-diverse workforce.

According to Petra (2017), dangerous, hard and difficult have been used to describe the construction workplace because in commonly almost all of the construction activities will be done outdoor. Thus, gender diversity is hard to accomplish in construction work due to some barriers presented in this modern era. The barriers in achieving gender diversity can be divided in terms of characteristics of construction projects and sexist attitudes.

The characteristic of the construction workplace was relatively tough. Construction often involves working at height, inside and outside of buildings. Thus, the construction workplace will be dangerous and difficult as there was a potential for risks coming from the roofs, scaffolds, ladders and stairways. Equipment failure, negligence, and harsh weather can drive the occurrence of risk in the construction workplace. Thus, least of the female practitioner will be given a chance in joining the construction site but only in construction offices. Besides, the working hours in the construction workplace were relatively long. The working hours may be extended due to late supplies, the occurrence of default in supplies, insufficient times allocated, bad weather and other issues. The arise of limited time-off and lack of flexible working shifts in the construction workplace as the tasks must be completed according to the schedule of the working plan will form the gender gap (Maikweyana et al., 2019; Khairul et al. 2017).

Other than the characteristic of the construction projects, the barriers which impede gender diversity in the construction workplace in terms of sexist attitudes included the bad job culture. First and most, sexual harassment plays the most unforeseeable barrier in hindering the gender diverse workforce among the construction practitioner in the construction workplace (Petra, 2017; Maikweyana et al., 2019; Khairul et al., 2017; Cathrine and Maria 2020; Adedeji et al., 2019). Unfortunately, sexual harassment in the construction industry is typical poses a greater threat compared to employee safety than many executives are aware. According to Debra et al. (2018), there were 66% of the targeted survey respondents from 1248 of the total respondents had experienced sexual harassment and gender bias in the workplace. Sexual harassment such as inappropriate personal requests, questions, jokes or innuendo which brings the uncomfortable feeling to the other practitioner is prohibited and may lead to the form of criminal cases.

Methodology

In this research, information and perceptions regarding gender diversity among the construction practitioners in the construction industry were collected via questionnaires via online method. A structured questionnaire that allowed the targeted respondents to complete the questionnaire by filling out the form through the internet was applied. The targeted respondents for this research were construction practitioners who work in the Klang Valley, Malaysia. Since the sample in the population is difficult to reach, the non-probability sampling method was applied for this research.

According to the concept of the Central Limit Theorem (CLT), sample sizes which equal to or greater than 30 are often considered sufficient for the CLT to hold (Akhilesh, 2021). Thus, the minimum number of the questionnaire required for this research was a number greater than 30 for each group (male and female).

Results and Discussions

A total of 180 sets of self-administered questionnaires were distributed to the construction company located in

Klang Valley, Malaysia. The total number of questionnaires received from the targeted respondents was 103 sets. The detail of the response rate is shown in Table 1. The overall response rate for the research is 57.22%. According to Lindsay (2022), a survey response rate of 50% or higher was considered excellent in most circumstances. Thus, this research has obtained an excellent response rate. Most of the respondents involved in this research were contractors while the least of the respondents from developer companies.

Table 1. Respondents' Demographic Profile

Profile	Descriptions	N	Frequency (%)
Gender	Male	56	54.4
	Female	47	45.6
Age	20-30	23	22.3
	31-40	40	38.8
	41-50	20	19.4
	51-60	14	13.6
	61 & above	6	5.8
Current job position	Architect	21	20.4
	Engineer	34	33.0
	Quantity Surveyor	46	44.7
	Others: Project Manager	2	1.9
Nature of the company	Consultant	33	32.0
	Contractor	46	44.7
	Developer	24	23.3
Working experiences	0 to ≤ 2 years	13	12.6
	>2 to ≤ 5 years	14	13.6
	>5 to ≤ 10 years	29	28.2
	>10 to ≤ 15 years	22	21.4
	>15 to ≤ 20 years	10	9.7
	>20 to ≤ 25 years	4	4.9
	> 25 years	10	9.7

The perceptions of male and female respondents toward the importance of gender diversity in the construction industry were ranked to investigate whether there is a significant difference in terms of gender. The six importance of gender diversity were ranked based on their mean value.

Based on Table 2, the data collected indicated that most of the male respondents ranked higher marks on the statement of effective leadership could be achieved if gender diversity was applied among the construction practitioners in the construction industry. While most of the female respondents ranked the highest marks

toward the importance regarding the performance of the construction project could be attained if gender diversity was applied among the construction practitioners. In short, all of the statements stated were agreed by the majority of the respondents. All of the statements obtained a mean value higher than 3.00. Mann-Whitney U test was used to analyze the significant difference between gender and the solutions to improving gender diversity. The significance level for this research was 0.05. The results are shown in Table 3.

Table 2. Rank on Statements of Gender Diversity in Workplace

Statements	Mean	Standard Deviation	Overall Rank	Male (N=56)		Female (N=47)	
				Mean	Rank	Mean	Rank
Different view point	3.500	0.850	5	3.390	6	3.620	5
Attract more talents	3.650	0.813	1	3.570	2	3.740	3
Fulfil employee shortage	3.610	0.910	3	3.480	5	3.770	2
Drive project performance	3.650	0.882	2	3.540	3	3.790	1
Achieve of effective leadership	3.650	0.882	2	3.660	1	3.660	4
Better reputation	3.570	0.986	4	3.520	4	3.640	4

Table 3. Mann-Whitney U Test on Gender Verification for the Importance of Gender Diversity in the Workplace

Statements	Mean Rank		p-value
	Male (N=56)	Female (N=47)	
Different view point	47.34	57.55	0.064
Attract more talents	48.24	46.48	0.110
Fulfil employee shortage	47.62	57.22	0.081
Drive project performance	47.49	57.37	0.066
Achieve of effective leadership	51.56	52.52	0.862
Better reputation	50.50	53.79	0.556

All of the importance of gender diversity had a p-value more than 0.05 ($p > 0.05$). This result supported the null hypothesis (H_0) to be accepted that both male and female respondents have similar perceptions in recognizing the importance of gender diversity. Thus, this shows that the variance in the genders of construction

practitioners toward the importance of gender diversity has no significant difference. The ranking of means for male and female respondents' rate of agreement toward the barriers in applying gender diversity among construction practitioners was analyzed respectively and will be ranked.

Table 4. Rank on the Barriers in applying Gender Diversity in the Workplace

Barrier	Mean	Standard Deviation	Overall Rank	Male (N=56)		Female (N=47)	
				Mean	Rank	Mean	Rank
Dangerous and tough working environment	3.580	0.902	5	3.500	6	3.680	3
Long and inflexible working hours	3.680	0.807	2	3.660	3	3.700	2
Sexual harassment	3.550	0.936	6	3.610	5	3.490	5
Negative stereotypes thinking	3.790	0.893	1	3.750	1	3.830	1
Lack and unequal job opportunities	3.660	0.858	3	3.700	2	3.620	4
Bad organization culture	3.560	0.976	4	3.640	4	3.680	3

Both the male and female respondents ranked negative stereotypical thinking as the top barrier with a mean value of 3.750 and 3.830 respectively. The male respondents ranked lack and unequal job opportunities (mean = 3.700) and long and inflexible working hours (mean = 3.660) as second place and third place. While female respondents ranked long and inflexible working hours (mean = 3.700) and bad organizational culture (mean = 3.680) as second place and third place respectively. In short, all of the barriers stated were agreed upon by the majority of the respondents. This is because none of the barriers was ranked under the mean value of 3.000 as the mean value under the 3.000 was considered as disagreed by the respondents.

Table 5. Mann-Whitney U Test on Gender Verification for the Importance of Gender Diversity in the Workplace

Barrier	Mean Rank		Asymp. Sig p-value
	Male (N=56)	Female (N=47)	
Dangerous and tough working environment	48.34	56.36	0.146
Long and inflexible working	50.40	53.90	0.515

hours

Sexual harassment	53.68	50.00	0.506
Negative stereotypes thinking	50.50	53.70	0.544
Lack and unequal job opportunities	52.87	50.97	0.728
Bad organization culture	51.63	52.44	0.886

The barriers to gender diversity stated in this research had a p-value of more than 0.05 ($p > 0.05$). This result indicated the null hypothesis (H_0) which stated that both male and female respondents have similar perceptions in recognizing the barriers to gender diversity. Thus, this shows that the variance in the genders of construction practitioners toward the barriers to improving gender diversity has no significant difference. The ranking of means for male and female respondents' rate of agreement toward the solutions to improve the gender diversity among construction practitioners was analyzed respectively and was ranked.

Table 6. Rank on the Solutions to Improve Gender Diversity in the Workplace

Statements	Mean	Standard Deviation	Overall Rank	Male (N=56)		Female (N=47)	
				Mean	Rank	Mean	Rank
Formulate flexible working options	3.720	0.857	3	3.700	3	3.740	3
Perceived organizational support	3.740	0.863	2	3.660	4	3.830	1
Counter negative stereotyping	3.790	0.946	1	3.790	1	3.790	2
Mentoring and networking	3.620	0.887	4	3.710	2	3.510	4

All of the solutions in improving gender diversity in the construction industry were agreed upon by the majority of the respondents by obtaining a mean value greater than three. The mean value greater than three would be classified as agreeable by the respondents. It also showed that majorities of male respondents had ranked counter negative stereotyping thinking (mean = 3.790) and organized program mentoring and networking (mean = 3.710) as first place and second place. While female respondents ranked perceived organizational support (mean = 3.830) and counter negative stereotyping thinking (mean = 3.790) as first place and second place respectively. These results have shown that both male and female respondents had a deep perception in agreeing the improvement of gender diversity in the construction industry could be achieved through the settlement of negative stereotyping thinking. The formulated flexible working options were ranked at the third place by both female respondents (mean = 3.740) and male respondents (mean = 3.700).

The Mann-Whitney U test was used to analyze the significant difference between gender and the solutions to improving gender diversity. The significance level for this research was 0.05.

Table 7. Mann-Whitney U Test on Gender Verification for the Importance of Gender Diversity in the Workplace

Barrier	Mean Rank		Asymp. Sig p-value
	Male (N=56)	Female (N=47)	
Formulate flexible working options	50.57	53.70	0.566
Perceived organizational support	48.96	55.62	0.208
Counter negative stereotyping	51.62	52.46	0.879
Mentoring and networking	54.73	48.74	0.277

It is shown that all of the solutions in improved gender diversity were obtained a p-value greater than 0.05 ($p > 0.05$). This result revealed that the null hypothesis (H_0) was shown in this research in which both male and female respondents have similar perceptions in recognizing the solutions in improved gender diversity. Thus, this shows that the variance in the genders of construction practitioners toward the solutions in improved gender diversity has no significant difference.

Conclusion

For the importance of gender diversity, most of the male respondents rated achieved of effective leadership, whereas female respondents rated the drive of project performance as the most significant importance of gender diversity. There is no significant difference between male and female for all the rated importance of gender diversity. While for the barriers in improving the gender diversity, both male and female respondents rated negative stereotyping thinking as the major contributor to the barriers in applied gender diversity. There is no significant difference between male and female for barriers in applying gender diversity. Male respondents rated counter negative stereotyping thinking, whereas female respondents rated that provided of organizational support as the most effective solution in improved the gender diversity. There is no significant difference between male and female for solution in improved gender diversity.

Recommendations

The recommendation for future research is to compare the viewpoint and perceptions of construction practitioners in the whole of Malaysia, even in other developing countries such as Thailand, Dubai and

Indonesia. Future research was also suggested to apply a mixed method by distributing the questionnaire. By doing so, the researchers could have an extra view for further understanding of comprehensive knowledge and evidence from various viewpoints. Besides, an in-depth exploration of the perceptions through the interview further enhances the findings on perceptions toward gender diversity. The future research also was recommended to conduct in more focus on a particular profession such as focus on the quantity surveyor. Last but not least, the sample size for future research should be enlarged for more generalizable findings.

Abstract: Times are changing classes from in-person to online training. Students can or cannot be prepared for this new order of education. Self-learning regulation (SLR) is essential for upcoming students and graduates in professional development and training. In addition, psychology and medicine students are in a unique position as they start their education, which already consists of autonomous learning outside the classrooms, even in undergraduate settings. Therefore, both characteristics, resilience and SLR, are essential to study and develop for healthcare workers. This study aims to determine if there is a correlation between resilience and self-learning regulation among the medicine and psychology graduates in Metropolitan Lima. This study was conducted, and 100 (68 women) medicine and psychology graduates from private and public universities across Lima participated. Three questionnaires were applied: (1) a sociodemographic questionnaire, (2) the Walding & Young resilience scale, and (3) the International Test Commission self-regulation of learning scale, both scales validated for Latin America. Both scales showed good internal consistency, Cronbach's alpha = .87 and .77, respectively. The self-regulation scale was comprised of two subscales: autonomy and self-control. Both showed high consistency Cronbach's alpha .80 and .85. Pearson correlations were carried out. Results showed that overall scales of Self-Learning Regulation (SLR) and Resilience were not correlated ($r(99) = .10, p = .32$). However, resilience was significantly associated with the subscale of autonomy even after controlling for age and years of experience ($r(96) = .49, p < .001$). A hierarchical multiple regression, controlling for age and gender, showed that autonomy also explained a significant proportion of variance in resilience ($R^2 = .25, F(3, 96) = 10.82, p < .01$). Understanding the dynamics present in the healthcare graduates will help us construct strategies to fulfill the necessities of this important population, crucial for strength healthcare system of the country.

Keywords: Self-regulation, Resilience, Autonomy, Health, and Mental health graduates.

Introduction

Learning outside the classroom used to be related to careers; nowadays, it is much more common and, therefore, an essential topic in education. However, medicine and psychology continue to be a group that takes a critical aspect of their careers into practice outside the classroom, often far from teachers. Thus, students should be able to self-regulate their learning and continue to find motivation regardless of the day they had. On the one hand, resilience supports the student in overcoming adversity, overcoming difficulties, and confronting them with confidence and optimism (Boekaerts, 1996). Lack of resilience is equivalent to the absence of a protective factor against stress (Bandura, 2005). Therefore, a higher level of resilience would have a greater capacity to respond to stress. On the other hand, developing the capacity for self-regulation of learning supports the student in leading their education by monitoring, controlling, and regulating themselves while studying (Bandura, 2005).

Some studies have explored the relationship between online learning, self-regulation strategies, and how learning guides can help higher education students act autonomously (Losoi et al., 2013). Al-Hawamleh (Losoi et al., 2013) conducted a quantitative study with 40 master students. They were distributed into two groups of 20 students each; the first group attended online classes with their instructor, and the second group received online classes alone and the learning guide to enhance their autonomy. The measurement instruments were a questionnaire and a performance test. The learning guide provided to one group aimed to help them identify specific learning strategies for online learning. Analyses were carried out to compare the estimated performance scores with the actual ones, and the study concluded that providing students with a learning guide helps regulate their learning effectively. This study shows the importance of autonomy for different learning environments, especially outside the classroom, such as training in health care settings or online learning. In both cases, students spend most of their time without the instructor supporting their decisions.

Research on students' self-regulation ability has revealed high correlations with academic achievement (Luo et al., 2022). However, although research findings strongly support the importance of students' self-regulation, there are few teachers or research studies that prepare students to learn independently (Menzin et al., 2020). Thus, it is crucial to understand the bigger picture and explore how these characteristics may impact learning in different educational settings, especially outside the classroom when teachers have less contact with their students.

This paper aims to explore the correlation that could exist between resilience and learning self-regulation. Both characteristics are usually attributed to doctors and psychologists. However, to our knowledge, this is the first paper to study this correlation in this population.

The existent studies show the validation of the presented scales in different countries and their application in diverse populations or the analysis of scale variants or shorter versions (Kang, 2021). Still, the application in health professionals was primarily related to the students of medicine or psychology but not after they graduated (Aguirre-Raya et al., 2016). Different factors, such as schedules, could be associated with the difficulties of studying these populations. The virtuality and the close contact with the studied populations allowed us to use this survey among the participants.

Furthermore, the article invites education professionals to reflect on these concepts, not only for mental and healthcare students but for every student who takes education outside the classroom and may be alone to make decisions and to motivate themselves. For example, it would be interesting to understand if virtual education and mentoring rely on resilient and highly motivated students who would appreciate deciding when to study (in asynchrony education, for example). These concepts involve intrinsic and extrinsic factors that can modulate how we mentor students or professionals and the probable consequences that could affect the learner. Understanding these concepts and their relation could prevent the spread of stress-related diseases among students and healthcare workers by providing knowledge and tools to educators (Matos-Fernández, 2009).

Method

This quantitative study draws from a single group of participants at a single testing point. It seeks to explain the relation between two relevant factors for healthcare graduates to overcome stressful career and training situations.

The following sections describe how the participants were invited to the study and their characteristics, measurements, procedures taken, and ethical considerations.

Sample

A non-probabilistic and intentional strategy was employed to access recent graduates, such as alum mailing lists, LinkedIn groups, and other databases. The snowball strategy was used to reach as many graduates as possible from different universities in Lima.

Power calculations were carried out using the G-Power (Kang, 2021); it was determined that a sample of 100 graduate students was required to carry out a Pearson correlation with a statistical power of 0.80, an alpha of 0.05, and a two-tailed significance test.

100 (68 women) graduate students from 14 universities in Lima-Peru agreed to participate, with a mean age of 27.92 years old ($SD=3.85$), a mode of 26 years old, a minimum age of 21, and a maximum of 44 years old. 57% of the participants were medicine graduates, and 43% were psychology graduates. More than 50% of the

participants finished their studies on or after 2020. More than 60% of the participants studied at private universities. A summary is presented in Table 1.

Table 1. General Characteristics of The Studied Population

NUMBER (N=100)		
Gender	Male	32
	Female	68
Degree	Psychology	43
	Medicine	57
Born Town	Lima	87
	Outside Lima	13
Year of Graduation	Before 2020	41
	After 2020	59

Measures:

Three measures were used; two were scales validated in Spanish and applied to diverse student populations in other studies, usually involving groups of students and graduates of different careers, such as engineering and administration. To our knowledge, no previous studies have evaluated medicine or psychology alums.

Sociodemographic questionnaire

This questionnaire aimed to collect information such as age and years of experience, as these factors could influence resilience and self-regulation.

Walding & Young resilience scale

It was adapted by Aguirre-Raya and colleagues (Aguirre-Raya et al., 2016). It comprises 25 items presented as a Likert-type scale, each offering seven alternatives ranging from 1 (Totally disagree) to 7 (Totally agree). All of them explore people's resilience by correlating the emotions and reactions of the surveyed. The scale is rated positively, with a maximum possible score of 175 and a minimum of 25. It can be applied individually or collectively to adolescents, adults, and older adults. Total application time: approximately 20 minutes. In this study, it was used separately for adults. For example, the first item of the questionnaire asks about the capacity of the surveyed to maintain interest in the subjects they are reviewing, questioning the individual's ability to react to his environment.

International Test Commission Self-Learning Regulation (SLR)

Adapted by Matos (Matos-Fernández, 2009) comprised autonomy and control subscales. For example, the first item of the survey questions the participation in classes to improve skills and comprehension of the studied

subject content. On the other hand, item number 4 comments about the person's drive to do things, asking about the possible underlying motivation or control of the person to participate in the class or subject. In this setting, items 1,2,3,6, 9, 11, and 12 are components of the Autonomy sub-scale; those not included in the previous numbers correspond to the control sub-scale.

Procedure: The survey took four months to be completed. First, graduates were contacted directly through different alum databases and LinkedIn groups. All participants were asked to participate voluntarily and were given information to agree and provide their consent to participate by voluntarily filling in three questionnaires. Their data will only be used for academic purposes and kept confidential.

Procedures and ethics aspects

The procedure that was developed was as follows: first, the instruments were designed to be applied through Google Forms, diverse diffusion media channels were selected, and informed consent was developed. Then, a pilot study was conducted to achieve the public's objective; four people were elected to review the wording and experience during the formulary resolution and evaluate the access and feasibility of filling out the questionnaires. In addition, contacts of the alumni were reached distributing the surveys among them with a snowball recruitment technique. Also, social media groups were selected as an alumni Facebook group, LinkedIn, and WhatsApp alumni groups. The total length of the data recollection was about five months.

Data analysis design

Once the participants' responses were obtained, it was verified that all the questions were answered. Then, the statistical process was done with the statistical program SPSS 24, achieving the descriptive analysis, the confidence analysis, and the inferential analysis.

Results

This section presents descriptive results, including the scales' reliability and the means of each scale. The inferential analyses were Pearson correlation, a partial correlation controlling for age and gender, and hierarchical multiple regression.

Descriptive analysis

Reliability

All measures showed good internal consistency; the resilience scale showed a Cronbach's alpha of .87 (25 items), and the self-regulation of learning scale led to a Cronbach's alpha of .77 (14 items). The self-regulation scale comprised two subscales of autonomy and self-control; both also showed high consistency in Cronbach's

alpha .80 and .85.

Means and Standard Deviation (SD)

The mean of the scales was calculated based on the Likert scale summative according to the responses. Table II shows the standard of the resilience scales comprising the 25 scale items. The SLR scale includes 14 items; first, the mean of the whole scale is presented, and then the means of the two subscales, autonomy and self-control, are shown.

The resilience represents a mean punctuation of 120.99 with an SD of ± 11.84 . The SLR scale had a mean punctuation of 59.66 and an SD ± 10.57 . A subscale analysis was performed. The mean for the autonomy subscale was 33.03 with an SD of ± 5.56 , and the control subscale had a mean of 26.64 with an SD of ± 8.81 , indicating the variability of the distribution of the means when the subscales are analyzed separated.

Table 2. Means of the Scales and Components of Them

Means	Scales		
	Scale or sub-scale	Minimum-Maximum	Mean (SD)
	Resilience	89-148	120.99 (11.84)
	Complete Scale of Self-regulation of learning (SLR)	34-88	59.66 (10.57)
	SR - Autonomy	14-42	33.03 (5.56)
	SR - Control	10-52	26.63 (8.81)

Normality analysis was conducted, the Kolmogorovo-Smirnov test was done finding that the resilience, self-regulation, and the subtest of control accomplish a normal distribution. All the scales were converted to the Z-scores, with this, all of them represent a normal distribution. Non-parametric testing was done to corroborate the results and the same results were obtained.

Confidence analysis

The confident analysis of the instruments was presented, and then the results of this research at descriptive, normality, correlational, and comparative levels.

Both instruments had an adequate liability coefficient. The Resilience Scale had an alpha of Cronbach =.87 (20 items), and the Self-Learning Regulation (SLR) questionnaire had an alpha of Cronbach=.77 (14 items). The confidence of the autonomy subdimension had a Cronbach alpha=0.8 (items 1, 3, 6, 9, 11, and 12), and the control subscale obtained a Cronbach alpha=.85 (items 2, 4, 5, 7, 8, 10, 13, 14).

Inferential analysis

Correlations

Two Pearson correlation analyses were conducted to find if resilience and self-regulation correlate among medicine and psychology graduates. The first correlation was between overall scales of SLR and Resilience; results showed these were not significantly correlated ($r(99)=-.10$, $p=.32$). Further partial correlations between resilience and self-regulation sub-scales controlling for age and years of experience showed that resilience was significantly correlated with autonomy ($r(96)=.49$, $p<.001$). There was no significant correlation as per the Pearson coefficient for autonomy and control, showing a negative correlation between both variables ($r(96)=-.19$, $p=.06$).

Table 3. Pearson Correlation Between SLR and Resilience

	Resilience	Autonomy	Control
Resilience	1		
Autonomy	.49**	1	
Control	-.19	.03	1

** . The correlation is significant at the level 0.1 (bilaterally).

Due to the slight non-normal distribution of the autonomy subscale, an inferential analysis of Spearman was conducted. In this case, we did not include the control variables. The first results found similar findings to the Pearson correlation between autonomy and resilience, a significant correlation, $r(99)=0.47$, $p<.001$. All the results of the Spearman correlations are presented in Table 4.

Table 4. Spearman Correlation Between SLR and Resilience

	Resilience	Autonomy	Control
Resilience	1		
Autonomy	.47**	1	
Control	-.23*	.01	1

** . The correlation is significant at the level 0.1 (bilaterally).

* . The correlation is significant at the level 0.05 (bilaterally).

Hierarchical multiple regression

A hierarchical multiple regression, controlling for age and gender, showed that autonomy explains a significant proportion of variance in resilience ($R^2 = .25$, $F(3, 96) = 10.82$, $p < .01$).

Discussion

Results suggest that resilience and self-regulation of learning are not correlated; there are no previous

comparisons of these scales, neither with the original scales nor the validations. Although these were expected to be correlated, I would have been because of the correlation between resilience and autonomy due to the nature of doctors' and psychologists' daily decisions. Making decisions with autonomy would reassure their resilience, and vice versa.

The significant correlation between autonomy and resilience aligns with the hypothesis formulated by Glittell (Gittell, 2016), who proposes that autonomy could be correlated with resilience and that the development of autonomy in doctors will help increase resilience.

Worldwide research on the two study samples has included students from undergraduate and graduate levels. For example, Al Hawamleh et al. (Al-Hawamleh et al., 2022) studied the effect of online learning, self-regulation strategies, and how the learning guidelines help master students develop autonomously. The sample was 40 students, who were distributed into a team A and a team B of 20 students. The first group did an online course with an instructor, and team B did just online classes. The measurement instruments included a standardized questionnaire and a benchmark test. In addition, a study guideline was given to help them identify the specific strategies for each context. The results compared the benchmark scores with the real ones. The study concluded that providing a guideline helps students regulate their learning effectively.

Another study conducted by Gaxiola and Gonzales (Gaxiola Romero et al., 2019) states that the SLR is essential for academic success. The objective of this study was to evaluate the role of the received support, social and educational, and their relationship with the students' resilience and adolescent academic goals under the SLR. About 227 high school students were evaluated using a questionnaire with a Likert scale. They found that the perceived social and educational support correlated with a positive resilience attitude and better SLR.

Dias and Cadime (2017) explored whether the SLR is mediated by protective factors, such as the school, the family, the community, their contemporaries, and resilience. The sample consisted of 393 undergraduate school adolescents. The instrument used was the Healthy Kids Resilience Assessment. It evaluates four protective factors: environment (school, family, community, and contemporaries) and resilience. Also, the Short-Regulation Questionnaire was included, and they could evaluate two dimensions: self-regulation—established objectives and impulse control. They found that the students that had a good family environment, community and also predicted better resilience levels and impulse control. Regarding the mediator effect of the self-regulation dimensions related to the protector factors and resilience, the latter was a moderate effect.

The sub-scale of SLR control is not significantly correlated to resilience. This could be explained by analyzing the questions on the control scale. These questions were focused on grades and recognition in the classroom. However, most medical and psychology students are highly self-motivated; their intrinsic motivation may not be related to a distinction in class or grades (De la Fuente, Jesús et al., 2020). De la Fuente had as per objective to determine the association relation or interdependence between the personal autoregulation (self-management or meta capability) with other variables of strategic-motivational, affective-motivational or emotional nature, one

of them the resilience. The sample was composed by 121 students in the 2nd and 4th class of psychology in an University of Spain. The instruments used were the Self-regulation Questionary (SRQ), in the Spanish version, CAR (De la Fuente, 2003) and validated by Pichardo et al. (2014) (Pichardo et al., 2014); Revised Two-Factor Study Process Questionnaire (R-SPQ-2F) by Biggs, Kemberm and Leung (2001) (Biggs et al., 2001) in the Spanish version by De la Fuente (De la Fuente, 2003); the resilience was measured with the CD-RISC inventory by (Connor & Davidson, 2003), also validated with Spaniard population sample. Finally, to evaluate the anxiety, they applied the Test Anxiety Inventory (TAI 80). The results showed a differential significant relationship between personal self-regulation and each type of learning focus, positive for tenacity and resilient control, negative for worrisome. They conclude that the obtained result is correlative with the hypothesis that the lack of resilience is equivalent to the lack of a protection factor against stress. Therefore, if there is a major level of resilience, there will be a better response against stress. Also, they reported a strong association between the SLR and the resilience-associated factors.

Another Peru study by Tello Field (Tello Quispe, 2021) used a sample of 177 psychology students from a private university in Lima to find a high correlation between resilience and SLR ($p=0.61$) and, specifically, with the executive processing, the cognitive process, the motivation, and environmental control. The specialist suggested that the students there is need programs that work on both concepts early in their careers.

On the other hand, Villalba and Avello Field (Villalba-Condori & Avello-Martínez, 2019) had as their objective to identify the level of resilience and satisfaction with the life of the students of a public university in Arequipa against unfavorable situations in their lives. They studied a sample of 40 participants (aged between 18 and 36 years old), with a resilience scale of (Wagnild & Young, 1993) and the satisfaction life scale of Diener et. Al (Diener et al., 1985). They found that the students had a mean above average and had a great capacity to upfront the problems that came by. There is a high significant resilience level and life satisfaction in these environments.

As per the review above, when SLR and resilience correlate, there is a relation between variables (Tello Quispe, 2021), and both are learning mediators. Also, there is a better resilient disposition, involving the planning capacity and facing life problems, using this to achieve educative goals (Romero et al., 2013). The studies were done with adapted or validated in the study context (Hernández Barrios & Camargo Uribe, 2017). The relation between the two proposed variables in the study is limited, and there is even less information on the physicians and psychologist population, as some of them approach the resilience and the burnout (Wang et al., 2022). Still, there is no analysis in the SLR.

It is essential to recognize that during their last year of studies and practice, medicine and psychology students are characterized by working independently, and autonomy is an appreciated asset (Hand et al., 2022; Suleimany et al., 2022). It is important to note that the past pandemic could have affected the results as the health workers developed a different perspective of life and the constant practice of resilience in their work and personal lives (Van Wert et al., 2022). Moreover, autonomous work was valued during the pandemic and could have been a priority to develop, adding to the constant resilience mindset. Considering the increase of

independence that graduate students must have, for example, online studies, which may have synchronic but asynchronous work, resilience, and autonomy, with intrinsic motivation, will become an essential topic for educators to understand and acknowledge within their students. As well as to support development. Thus, exploring and understanding ways of evaluating and promoting these characteristics among students is vital.

As a result, the present research is justified in the three areas. First, on the social, it offers scientific evidence, so the educative institutions generate policies that promote the actions to strengthen the SLR as it is the most crucial variable that supports academic success and the autonomy component in medicine and psychology formation, by the characteristics of their professional exercise, requires a better resilience. In addition, in the theoretical, the study offers new information about the involved variables, determining their association and characteristics in a population not well studied in the country or outside it. After the study is realized, this will be one of the first associations for SRL and resilience in the proposed population. Finally, in practice, it can be included in the medicine and psychology curriculums, as well as strategies to strengthen the abilities of the SLR and the resilience level.

Conclusion

This study shows that resilience and SLR were not significantly correlated among medicine and psychology graduates in Lima. There was a significant correlation between the sub-scale of SLR autonomy and resilience; it also accounted for a significant proportion of the variance of resilience. This provides empirical evidence for the theoretical proposal that autonomy and resilience are correlated concepts. It should be noted that more studies are recommended to continue studying these topics.

Recommendations

It is suggested that studies be developed with graduate populations in larger samples; this will allow extrapolation of more conclusions, considering transcultural aspects. In addition, it is suggested to continue observing the described population along their development to observe the outcomes as their resilience changes in the following years or is affected during observation. It is suggested to do an independent analysis by career to identify proper characteristics among each of them.

Acknowledgments

We are grateful to Manuel Francisco Rodriguez Villegas, leader and founder of the master's in education program at the Universidad Peruana de Ciencias Aplicadas (UPC). We also thank our classmates for their friendship and support throughout our lectures. We are very grateful to the Direccion de Investigacion of Universidad Peruana de Ciencias Aplicadas (UPC) for supporting this research.

RESILIENCE SCALE

Authors: Wagnild and Young (1993)

Instrucciones: En este cuadernillo te vamos a presentar unas frases que te permitirán pensar acerca de su forma de ser. Deseamos que contestes a cada una de las siguientes preguntas con una X la casilla que mejor represente la frecuencia con que actúas, de acuerdo con la siguiente escala.

	Nunca			Siempre		
1. Es importante para mí mantenerme interesado en las cosas.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
2. Dependo más de mí mismo que de otras personas.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
3. Me mantengo interesado en las cosas.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
4. Generalmente me las arreglo de una manera u otra.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
5. Puedo estar solo si tengo que hacerlo.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
6. El creer en mí mismo me permite atravesar tiempos difíciles.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
7. Tengo la energía suficiente para hacer lo que debo hacer.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
8. Cuando estoy en una situación difícil generalmente encuentro una salida	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
9. Mi vida si tiene significado.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
10. Me siento orgulloso de haber logrado cosas en mi vida.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
11. Cuando planeo algo lo realizo.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
12. Algunas veces me obligo a hacer cosas aunque no quiera.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
13. Generalmente puedo ver una situación en varias maneras.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
14. Soy amigo de mi mismo.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
15. No me lamento de las cosas por las que no puedo hacer nada.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
16. Acepto que hay personas a las que yo no les agrado.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
17. Tomo las cosas una por una.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
18. Usualmente veo las cosas a largo plazo.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
19. Tengo autodisciplina.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
20. Siento que puedo manejar varias cosas al mismo tiempo.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
21. Rara vez me pregunto cuál es la finalidad de todo.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
22. Puedo enfrentar las dificultades porque las he experimentado anteriormente.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
23. Soy decidido(a)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
24. Por lo general, encuentro algo en que reírme.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
25. En una emergencia soy una persona en quien se puede confiar.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

The Psychological Resources of Special Educators in Preventing Burnout in Hungary

Barbara Di Blasio

 <https://orcid.org/0000-0002-8840-4274>

Abstract: In our study conducted in 2022, we investigated the mental well-being and burnout levels among Hungarian special education teachers, with a sample size of N: 134. Our aim was to identify the psychological resources that positively influence coping with challenges. We employed various measurement tools including the Maslach Burnout Inventory Educators Survey (MBI-ES), the Brief COPE (Coping Orientation to Problems Experienced) Questionnaire developed by Lazarus and Folkman, the Beck Depression Inventory-Short Form (BDI-SF), the Multidimensional Scale of Perceived Social Support (MOS SSS-H), and the Psychological Immune System Scale (PIS) by Attila Oláh. The findings of our study support the conclusion that prevention interventions targeting burnout should primarily focus on alleviating depression. Purposeful action and seeking help coping strategies, as well as the Approach-Monitoring subsystem of the Psychological Immune System—indicating weak levels of understanding the environment and monitoring positive consequences—emerged as protective factors against burnout. Therefore, preventive programs should concentrate on enhancing realistic situation assessment, creative problem-solving skills, the ability to mobilize internal and external resources, emotional and cognitive control functions, and fostering a mindset tuned into potential positive outcomes.

Introduction

Our study undertakes a comprehensive examination of the factors imperiling the mental well-being of special educators, presenting the findings of our research conducted in 2022. Delving into the individual manifestations of burnout, our research aims to design workplace interventions tailored to the unique needs of these professionals. Given the multifaceted nature of special education work, it is imperative to delve deeper into the factors undermining well-being, which, in turn, impact personal and professional efficacy, constituting crucial

domains for psychological and pedagogical intervention.

Despite the proliferation of studies among educators over the past two decades, research on the mental health of special educators remains scant in the domestic literature. Conversely, on the international stage, there has been a marked increase in scholarly discourse addressing the mental health of special educators since 1979. Particularly from the mid-2000s, this discourse gained prominence, notably in the United States, where the success of initiatives like the No Child Left Behind (2001) program hinged significantly on the presence and preparedness of special educators. In Europe, the effectiveness of special educators is pivotal for the successful implementation of integration and inclusion in schools, highlighting the relevance of this profession. Notably, special educators operate within a uniquely challenging sphere, navigating anthropological, sociological, psychological, and pedagogical complexities.

It is an undeniable truth that educator attrition rates are on the rise both globally and domestically, posing multifaceted challenges to the educational landscape. Moreover, the compounding effects of global socio-economic shifts, 21st-century challenges, and the COVID-19 pandemic further exacerbate these challenges, necessitating nuanced and proactive approaches to safeguard the well-being of special educators and, by extension, the efficacy of the educational system.

Interest in psychological safety arises as a necessary response to the practical challenges of our time. Psychological safety has various levels: from a national security perspective, it can primarily be observed within the structure of society, secondarily within the social environment—such as family, immediate surroundings, reference groups, and workplace communities.

The literature offers specific interpretations of the concept: national, educational, organizational, and other security functions. Chen et al.'s (2018) research shows that these layers of security interact with each other, meaning that a psychologically safe organizational environment significantly influences a person's satisfaction with their work and career, and experiencing success and fulfillment in their work and profession leads to psychological well-being (Chen et al., 2018). According to Singh et al. (2018), the organization and community serve as sources of social support for the individual, and the need for belongingness is crucial, indirectly affecting the individual's psychological safety. From a societal perspective, safety contributes to the development and survival of individuals and communities. However, from the individual's side, characteristics such as will, determination, mindset, and behavior potentially protect the individual from external and internal threats. External threats are risks associated with the environment that hinder human life, violate fundamental rights and freedoms, and impede the realization of vital needs. Internal threats include risks related to the individual's (community, society) abilities and capabilities, manifested in the absence of individual motivations and interactions among members of the community and society. The lack or loss of psychological safety weakens an individual's adaptability, making it difficult to adhere to the rules of social coexistence or, in more severe cases, violating them.

The psychological safety of the educational environment lies in preserving the well-being of participants and creating safe working and learning conditions. Psychological safety entails maintaining a positive self-image, emotional, intellectual, personal, and social well-being within specific social and psychological circumstances, as well as the absence of situations that cause psychological harm.

Theoretical Background

The Characteristics of Burnout Syndrome

According to the framework proposed by Maslach, Schaufeli, and Leiter (2001), burnout among educators, including both general educators and special educators, can be understood as a phenomenon resulting from the interaction of prolonged stress, individual personality traits, emotional regulation, and coping mechanisms.

Among the causative factors leading to burnout among educators are:

1. Excessive Administrative Obligations: Demands for administrative tasks beyond the scope of teaching responsibilities can contribute to feelings of overwhelm and exhaustion among educators.
2. Challenges in Time Management: Difficulties in balancing work and family expectations, exacerbated by the high frequency of stressful situations, can lead to heightened stress levels and emotional exhaustion.
3. Imbalance Between Effort and Reward: When the efforts invested in teaching exceed the rewards received, educators may experience a sense of disillusionment and emotional depletion.
4. Overcommitment: A tendency to take on excessive responsibilities and work beyond one's capacity can exacerbate stress levels and contribute to burnout.

These factors are further complicated by the socio-economic environment, which presents numerous challenges for individuals and communities, emphasizing the detrimental effects of globalization.

Christina Maslach's (2003) multidisciplinary approach characterizes workplace burnout as a psychological syndrome resulting from prolonged responses to workplace stressors. Maslach traces the concept of workplace burnout back to the novel "A Burnt-Out Case" (Greene, 1961), which depicts an architect who resigns from his job due to emotional turmoil and retreats to the African jungle. This literary depiction resonates with similar psychological phenomena described in the literature, such as extreme fatigue, loss of idealism, and passion for work.

The approach to burnout as a societal problem was recognized by social scientists long before psychologists acknowledged it as a phenomenon. The vulnerability of educators to burnout is not a new issue. Over the past decade and a half, the topic has intermittently surfaced in the literature, yielding numerous scientific findings. Previous research predominantly focused on burnout among helping professionals, with educators receiving comparatively less attention. Burnout syndrome entails a change in one's relationship with work, manifested in

clinical symptoms of emotional exhaustion, depersonalization, and reduced personal accomplishment. It primarily affects individuals engaged in emotionally demanding human interactions in their work, including doctors, healthcare professionals, clergy, social workers, and notably, teachers. However, university students undergoing teacher training, who are preparing for similarly demanding careers and spend significant time in educational settings, have not received adequate attention. They encounter similar stressful environments, where feelings of professional incompetence may further hinder their ability to maintain emotional balance.

Research on burnout addresses the phenomenon from individual, interpersonal, and organizational perspectives. The individual approach focuses on personality traits predisposing to burnout and individual symptoms of burnout. Interpersonal perspectives examine the relationships between helping professionals and their clients, while organizational research emphasizes the specific characteristics of the workplace, job roles, and organizational context.

Challenges Faced by Special Educators in the Classroom

The level of burnout is associated not only with stress management and emotional regulation but also with another factor: the effectiveness of teachers in coping with students' behavioral difficulties (O'Neill & Stephenson, 2011; Skaalvik & Skaalvik, 2007). Often, students' behavioral problems lead to teacher burnout (Hastings & Brown, 2002), and the ratio of students with emotional and behavioral disorders in the classroom correlates with higher levels of burnout (Nichols & Sosnowsky, 2002). Interestingly, research by Pullis (1992) indicates that teachers dealing with emotionally and behaviorally disturbed students did not perceive their students' behavior as a significant challenge, nor did they identify it as the primary source of stress. Ruble et al. (2011) found that the quality of classroom management was associated with burnout among teachers of students with autism spectrum disorder, but there was no correlation with the amount of administration or support received from colleagues.

Notably, Irvin et al. (2013) found a reverse relationship between the number of adults allocated to students with autism spectrum disorder and burnout, suggesting that higher levels of burnout are more prevalent in models with multiple teachers. Embich (2001) found that high levels of burnout were observed among teachers co-teaching for one hour daily, indicating potential challenges between special educators and mainstream teachers that may strain the workplace environment. It is likely that smoother professional collaboration occurs with students facing more severe issues (Giangreco, Suter, & Hurley, 2013). In domestic professional circles, the possibility of a two-teacher model is becoming increasingly prominent. However, experiences suggest that the methodological background of this collaborative form must be meticulously developed to ensure the success of integration.

Given the diversity of results, it would be worthwhile to examine how factors such as the type of disability and environmental variables (e.g., administrative support, inclusive pedagogical environment) influence the mental well-being of special educators.

Role Ambiguity and Role Conflict

Role ambiguity refers to situations where the job role and expected responsibilities do not clearly align (Brunsting, Sreckovic, & Lane, 2014). On the other hand, role conflict arises when an individual's responsibilities clash with the tasks to be fulfilled, or when it is not possible to fulfill them in a reasonable time and manner. Both role conflict and role ambiguity significantly contribute to the burnout of special educators, considering factors such as teacher age, gender, professional experience, and qualifications (Crane & Iwanicki, 1986).

The age of students also influences the extent of teacher burnout. Longitudinal studies spanning five years have shown that special educators working with students aged 13-19 experience higher levels of burnout, characterized by depersonalization and emotional exhaustion (Weber & Toffler, 1989; Carlson & Thompson, 1995; Frank & McKenzie, 1993). Another study found that working with intellectually disabled and autistic students can be taxing for teachers, even when the number of support adults allocated to the students is higher than average (Irvin et al., 2013). Additionally, resource shortages exacerbate the increasing burden of administrative tasks, organizing parent meetings, collaborating with parents, and performing tasks outside of school (Embich, 2001).

Other studies have focused on the emotional needs of special educators. These needs include feelings of security (both personal and broader dimensions), social support, feelings of appreciation, autonomy, and opportunities for self-realization (Carlson & Thompson, 1995). Concerning burnout, the frequency and variety of stressors particularly endanger novice special educators, often leading to attrition (Fimian & Blanton, 1986). This phenomenon has already been hinted at in domestic contexts.

Leadership attitude also influences the level of burnout among colleagues. Several studies have shown that supportive leadership in the workplace and the quality of collegial relationships are inversely correlated with burnout (Weber & Toffler, 1989; Zabel & Zabel, 2002; Embich, 2001; Ruble & McGrew, 2013). Typically, parents of children with disabilities visit teachers less frequently with their problems. However, if parental relations are supportive and cooperative, they can act as factors against teacher burnout (Zabel & Zabel, 2002).

Internationally, there is scarce scientific evidence regarding proactive prevention of burnout among special educators. Cooley and Yovanoff (1996) designed a targeted intervention focusing on stress and colleague support. They included a control group in the experiment, where no targeted intervention took place during this period, only participation in measurements. The intervention lasted for ten weeks, consisting of two-hour sessions weekly. For five weeks, the focus was on coping with stress, aiming to develop the following skills: (a) problem identification and solution, (b) physiological coping (e.g., muscle relaxation), and (c) cognitive coping (e.g., self-awareness and positive meaning-making). In the second phase, over five weeks, teachers practiced problem-solving related to school in pairs in a four-step process: (a) clarifying the problem, (b) summarizing the problem, (c) planning intervention, and (d) evaluating the outcome of the intervention. Participants in the

intervention group experienced significant positive differences in emotional exhaustion, personal accomplishment, workplace satisfaction, and organizational commitment. In contrast, teachers in the control group did not experience any change in emotional exhaustion or workplace efficiency. In another study, Jennett, Harris, and Mesibov (2003) found that teachers' commitment to targeted supportive interventions was inversely correlated with emotional exhaustion and personal achievement. Commitment also explained 17.8% of the variability in personal performance, indicating that teachers who commit to a (psychoeducational) training may achieve greater success in reducing burnout. As burnout arises from the interaction of long-term stress, individual characteristics, and coping strategies (Maslach et al., 2001), research on burnout among special educators may identify certain characteristics, emotions, or perceptions as important targets or aspects for interventions (Brunsting et al., 2014).

The literature on teachers' emotional states and burnout has generally suggested that emotional regulation may be a promising target for interventions. Given the results of Cooley and Yovanoff's (1996) task-oriented coping and emotional regulation-focused intervention, experts call for further research on teacher emotional regulation to improve the effectiveness of interventions aimed at reducing teacher burnout (Park & Shin, 2020). In the future, studies should be conducted to generalize the results for teacher and educator training, as well as training for teachers and leaders' professional development.

Method

About the research

In our research endeavor, we engaged with the cohort of special educators, assessing various dimensions pertinent to their psychological well-being. Data acquisition was conducted through meticulously structured online surveys, predominantly targeting educational support services and unified special education methodological institutions, albeit not exclusively so. Participation was solicited anonymously and voluntarily, predicated on self-disclosure. After data collection, a rigorous regimen of statistical analysis was undertaken to derive meaningful insights.

Our research inquiries were tailored to delineate the post-pandemic landscape of burnout prevalence among special educators, discern the emergence of depressive symptomatology, identify salient psychological immune competencies amenable to preventive interventions, and unravel the repertoire of coping strategies employed by this cohort. Of particular interest was the correlation between burnout indicators obtained through the Maslach Burnout Inventory and other measurement parameters.

By elucidating the mental health dynamics of special educators, we endeavored to chart a course towards tailored interventions aimed at bolstering their psychological resilience and professional efficacy. This included envisaging burnout prevention workplace training initiatives, strategically designed to align with the psychological needs discerned from our empirical findings.

Sampling

The number of respondents was N: 134. The survey was conducted in 2022. In terms of age, the majority were between 39 and 60 years old, with an average age of 46 years. Among the respondent special education teachers, 85 worked in Pedagogical Services, 8 in primary schools, 38 in Special Education Needs Resource Centers and 3 as psychologists in kindergartens. The respondents worked in Southern Transdanubia region, Hungary. In terms of residence, 42% of the respondents lived in county seats, 32% in cities, and 26% in villages.

We asked whether they engage in other supplementary employment besides their main job, to which 49% or 65 respondents answered yes. Forty-three percent of the respondents had a bachelor's degree, while 57% had a master's degree; none had a doctoral degree.

Measurement Instruments

In addition to collecting demographic data, in our structured questionnaire-based cross-sectional study, we used the following tests:

Maslach Burnout Inventory Educators Survey (MBI-ES): This questionnaire assesses emotional exhaustion, depersonalization, and reduced personal accomplishment. It consists of 22 items and provides a measure of burnout among educators. Items inquire about the perceived stressfulness of one's work and the frequency or intensity of experiencing various physiological states (Maslach & Goldberg, 1998).

Brief COPE (Coping Orientation to Problems Experienced) Questionnaire: This instrument, developed by Lazarus and Folkman (1984), explores coping strategies. Coping is the result of the dynamic interaction between personal characteristics and environmental factors, indicating the effort required to implement the chosen coping strategy.

Beck Depression Inventory-Short Form (BDI-SF): The BDI-SF measures psychological status and depressive symptoms. It assesses emotional, cognitive, physiological, and behavioral reactions to everyday stress (Purebl, Rózsa, & Kopp, 2006).

Multidimensional Scale of Perceived Social Support (MOS SSS-H): This questionnaire measures perceived social support, which plays an important role in maintaining psychological well-being (Sz. Makó et al., 2016).

Psychological Immune System Scale: This instrument assesses the development and efficiency of the psychological immune system, identifying abilities that aid in coping with stress. It comprises 80 items and 16 subscales (Oláh, 2005).

Finally, we examined the relationships between various measurement data, particularly regarding factors influencing burnout. Data analysis was conducted using IBM SPSS Statistics version 28.

Results

In response to our first research question, our measurement results are depicted in Figure 1. Those suffering from burnout syndrome tend to be less tolerant of challenging situations, displaying impatience, negative attitudes, and cynicism. These characteristics can also hinder cooperation within their environment (Maslach & Goldberg, 1998).

RQ1: What is the extent of burnout among special education teachers following the concluded pandemic?

Figure 1. The extent of burnout among special education teachers (Maslach)

The examined sample demonstrates mild to moderate levels of burnout, with three individuals experiencing high levels of burnout, indicating the typical presence of burnout symptoms, often referred to as the epidemic of our time, among responding special education teachers.

The normalized (divided by the number of relevant questions) average score for burnout is 1.85 (SD=0.77), slightly high. The normalized average scores for emotional exhaustion, depersonalization, and personal accomplishment subscales are 2.50 (SD=1.18), 0.76 (SD=0.82), and 1.80 (SD=0.79) respectively. The average age of the group with moderate burnout is 44 years, while that of the group with mild burnout is 48 years. No trend between years of professional experience and the overall burnout score was observed in our sample ($r=-0.016$; $p=0.858$), and marital status did not affect the level of burnout.

RQ2: What level of depression characterizes special education teachers?

11% of the respondents are in a moderately severe state of depression, with no one characterized by severe depressive conditions, and the largest group (93 individuals) is characterized by mild depressive conditions (see Figure 2). 20% of the respondents fall within the normal range. In our sample, there is a slight negative correlation between depression and age ($r = -0.16$).

Figure 2. Severity of Depression according to the Beck Depression Inventory

Depression significantly reduces an individual's ability to perform their work and makes it difficult for them to cope with the tasks of everyday life (Ádám–Nistor–Nistor–Cserhádi–Mészáros, 2015). Both genetic and environmental factors play a role in the development of depression (Hidaka, 2012). Among environmental factors, high job demands, low control over work, and lack of social support are noteworthy, significantly increasing the risk of depression (Bonde, 2008). In terms of symptom similarity, it can be observed that both conditions are characterized by a decrease in emotional responses to others' problems, significant anhedonia, social withdrawal, difficulties in recalling information, and making decisions (Ádám et al. 2015; Kulcsár 1998). The decrease in activation level is not as pronounced in burnout as it is in depression. People experiencing burnout appear more vital than those with depression (Shirom–Ezrachi, 2003). They have a more realistic perception of their responsibility in specific situations, and their guilt is also less than that of those struggling with depression (Benninkmeyer, 2001). In terms of symptom differences, those experiencing burnout only have impaired feelings of reciprocity in workplace relationships, while those with depression have all their intimate relationships affected (Bakker et al. 2000). Furthermore, burnout is specifically linked to the work environment, while depression is context-independent and extends to all areas of life, including the workplace (Leiter–Durup, 1994).

RQ3: How do special education teachers cope with environmental challenges?

Special education teachers tend to respond to challenges with higher levels of coping strategies, and they perceive difficulties less as attacks (see Figure 3). Emotionally driven actions as coping strategies are less effective in dealing with challenges and are less characteristic of the surveyed special education teachers. However, it appears that even high-level coping strategies do not sufficiently protect against the development of burnout and depression. This could be because problem-focused strategies may not function effectively in the current complex educational environment, and negative reactions from interaction partners may also hinder their implementation. Nevertheless, it is encouraging that among special education teachers, goal-directed action,

seeking help, and problem analysis are more characteristic coping strategies, as reflected in previous research. Thus, if we operationalize the problem as an obstacle rather than a barrier, we may be more successful in coping with it psychologically.

Figure 3. Lazarus Coping Modes

RQ 4: What are the characteristics of seeking social support among special education teachers?

Figure 4. Attributes of Social Support

Attributes of social support are depicted in Figure 4. Forty individuals feel they lack instrumental (tangible) support, meaning they have no one to assist them when they need support or physical help. Relatively few, 12 individuals, feel they lack sufficient positive human relationships, lacking someone to unwind with or share their emotions. Finally, according to the global index of social support, 19 individuals have low support. Overall, the special education teachers in our sample exhibit varied patterns of seeking support, which can be significant in coping with burnout. Higher social support is moderately associated with higher psychological well-being, positive affectivity, and lower formation of depressive and anxiety symptoms (Sz. Makó et al., 2016).

RQ 5: What are the characteristics of special education teachers' psychological immune system?

Using the shortened version of the Psychological Immune System Survey, we can characterize the components of an individual's psychological immune system along three dimensions: Approach Subsystem, Self-regulating Subsystem, and Mobilizing-Creative-Executive Subsystem (Oláh, 2005). The measured values pertain to the special education teachers we surveyed, while the other dataset represents the national standard (see Figure 5).

Figure 5. Components of PIS

In each component, the deviation is significant at a significance level of $p=0.05$, except for "Challenge, Flexibility", "Social Creativity", "Persistence" and "Inhibition of Excitation". In fact, in the other cases, except for "Social Monitoring, Empathy," the differences are significant even at a significance level of $p=0.01$ (see Figure 6).

Among the scores of the immune competence scale, there is a deviation from the Hungarian average in the following components: Emotional Control, Persistence, Social Creativity, Challenge-Flexibility, and Growth Sense. However, the following components perform better than the national average: Impulse Control, Synchronicity, Social Mobilization Ability, Self-Efficacy, Ingenuity, Social Monitoring Ability, Empathy, Self-Esteem, Sense of Coherence, Sense of Control, and Positive Thinking (see Figure 5). These latter components can serve as significant resources against burnout.

A weaker level of these abilities compared to the average suggests that these components are less effectively mobilized in coping with stress:

Emotional Control: Indicates how well an individual can control anxiety caused by threats, dangerous situations, and failures. Individuals with lower scores find it more challenging to control their negative emotions and invest less energy in constructive behavior.

Persistence: Measures how well an individual can delay gratification of needs and continue determined behavior in the face of obstructive factors. Individuals with below-average scores are less assisted by lower frustration tolerance.

Social Creativity: The scale measures how well a person can discover abilities in oneself and others that are not necessarily obvious but useful in coping with stress. Individuals with lower scores tend to try to solve their difficulties alone.

Challenge-Flexibility: Refers to the inclination to follow changes and sensitivity to them. Individuals with lower scores are less open to change and less receptive to novelty.

Growth Sense: Measures the perceived extent of a person's own psychological development. Individuals with lower scores find it harder to define themselves as capable of renewal.

On the other hand, the following components, in which the scores are higher than average, indicate the following abilities:

Impulse Control: Individuals with high scores rationally control their behavior and choose the most appropriate behavior for the situation.

Synchronicity: The individual with a high score is able to concentrate his or her mental energy on his or her activity. He or she can control his or her attention and consciousness.

Social Mobilization Ability: Indicates how successful a person is in persuading, motivating, and directing others. Individuals with high scores are able to control others and persuade them to support their goals.

Self-Efficacy: Indicates how well a person can actualize learned or self-produced plans and solution proposals. The individual with a high score feels capable of carrying out behavior conducive to achieving the set goal.

Ingenuity: Measures the creative, innovative capacity of the personality and the propensity for constructive and original relationships.

Social Monitoring Ability, Empathy: The scale measures social openness. Individuals with high scores can selectively perceive and use environmental social information.

Self-Esteem: This scale measures how much we value ourselves. Individuals with high scores appreciate themselves, are proud of themselves, and their achievements.

Sense of Coherence: The ability to understand events. The scale has three main components: perception, management of resources, and meaningfulness. The individual with a high score treats life's difficult moments as challenges to be overcome. He or she seeks the meaning of a given situation and does not flee from trials and challenges.

Sense of Control: The scale measures how much control we have over our lives. Lower scores indicate that the individual is less able to activate his or her psychological strength to maintain or acquire control.

Positive Thinking: Refers to how well an individual can anticipate favorable changes. The individual with a high score is optimistic and success-oriented, even in difficult situations (Oláh, 1996).

The various components can be classified into three subsystems. Among the educators, particularly low levels are achieved in the Proximity-Monitoring subsystem, meaning that their understanding of the environment and monitoring of positive consequences is weak, while in the Self-Regulatory and Mobilization-Creative-Executive subsystems, their indicators significantly exceed standard values (see Figure 6).

Figure 6. Subsystems of PIS

Based on the results of the other measurements, predicting the extent of burnout highlights the need to design prevention training with a problem-focused approach rather than conducting interventions of uncertain efficacy. Our sixth research question addresses this issue.

RQ 6: What factors should prevention training focus on in terms of burnout prevention?

Using multivariable multiple linear regression with the Stepwise technique, we examined to what extent the Lazarus coping strategies, the shortened version of the Beck Depression Inventory, the MOS SSS-H, and the Psychological Immunization Inventory could predict the total score of the Maslach Burnout Inventory. The

regression model fitted to special education teachers (sixth model) is globally significant based on the F-test results ($p < 0.001$) (Table 1).

Table 1. Fitted multivariate linear regression model.

ANOVA ^a						
Model		Sum of squares	df	Mean square	F	p
6	Regression	132,466	6	22,078	31,589	<0,001 ^a
	Residual	88,762	127	0,699		
	Total	211,228	133			

Model	R	R ²	Adjusted R ²	St. error of the estimate
6	0,774 ^a	0,599	0,580	0,83601

a. Predictor variables: Depression (0-10), Approach-monitoring subsystem (0-10), Goal-oriented action (0-10), Adaptation (0-10), Help-seeking (0-10), Emotional-informational support (0-10)

Based on the variables included in the model, such as Depression (0-10), Approach-Monitoring subsystem (0-10), Goal-oriented Action (0-10), Adaptation (0-10), Seeking Support (0-10), and Emotional-Informational Support (0-10), the multiple determination coefficient of the explanatory variables is 0.774, meaning that these variables collectively account for 58.0% of the variance in the Maslach Burnout Inventory score among special education teachers. According to the standardized beta values, Depression has the greatest impact on the burnout score, followed by the Approach-Monitoring subsystem as the second most influential among coping methods, Goal-Directed Action as the third, Seeking Support as the fourth, Adaptation as the fifth, and Emotional-Informational Support from the MOS SSS-H as the sixth most influential factor (see Table 2).

Table 2. Fitted multivariate linear regression model.

Coefficients ^a						
Model		Unstandardized B	Standard error of coefficients	Standardized beta coefficient	t	p
6	(constants)	3,902	,614		6,353	<,001
	Depression (0-10)	,535	,069	,541	7,744	<,001
	Approach-monitoring subsystem (0-10)	-,247	,065	-,263	-3,797	<,001
	Goal-oriented action (0-10)	-,117	,036	-,200	-3,262	,001
	Adaptation (0-10)	,099	,037	,154	2,644	,009
	Help-seeking (0-10)	-,083	,031	-,162	-2,707	,008
	Emotional and informational support (0-10)	,100	,043	,152	2,305	,023

a. Dependent variable: Burnout (0-10)

Therefore, it can be stated regarding special education teachers that if the Depression total score increases by 1

point, the burnout total score increases by an average of 0.54 according to the model, with all other factors in the model remaining constant. If the Approach-Monitoring subsystem score increases by 1 point, the burnout total score decreases by an average of 0.25 according to the model. If the Goal-Directed Action coping mode score increases by 1 point, the burnout total score decreases by an average of 0.12 according to the model. If the Adaptation coping mode score increases by 1 point, the burnout total score increases by an average of 0.10 according to the model, assuming all other factors in the model remain constant. If the Emotional-Informational Support score increases by 1 point, the burnout total score increases by an average of 0.10 according to the model (*ceteris paribus*). Finally, according to the model, if the Seeking Support coping mode score increases by 1 point, the burnout total score decreases by 0.08 on average.

Limitations of the Study

The methodological limitation of the study lies in the non-representative nature of our sample. The research participants predominantly reside and work in Somogy County, in Hungary. It is possible that the measurement outcomes could be influenced by regional factors that have not been accounted for in this study. Additionally, a significant factor impacting the research was the COVID-19 pandemic, as data collection occurred immediately after its abatement. This is likely to result in a decreased willingness to complete surveys, as individuals returned to their regular routines with potentially depleted psychological resources. Consequently, our measured data may reflect a heightened level of exhaustion. Thus, it would be valuable to conduct future follow-up surveys with participants and expand the study to encompass organizational functioning in educational and workplace settings.

Conversely, given that our primary objective was to investigate the antecedents of burnout and identify key influencing factors, the substantial proportion of “burned out” special education teachers could be construed as advantageous. This affords us a larger sample size of individuals experiencing burnout.

Conclusion

The level of burnout among special education teachers showed no correlation with the demographic factors we examined, including age and years of work experience. The results of the conducted studies support the conclusion that prevention interventions against burnout should primarily focus on reducing depression. The Emotion-Centered coping mode of Adaptation also increases the level of burnout, so supportive techniques should also focus on strengthening the ability of self-assertion among special education teachers. Based on the literature, we expected that any form of social support would counteract burnout; therefore, our result that stronger Emotional-Informational Support leads to an increase in burnout level - albeit to a lesser extent - is somewhat surprising. Despite our findings, we believe that prevention training should continue to reinforce the role of social support in promoting well-being. Goal-Directed Action and Seeking Support coping modes emerge as protective factors against burnout, as well as the Approach-Monitoring subsystem of the PIS.

Accordingly, preventive programs should focus on enhancing realistic situation assessment, creative problem-solving, the mobilization of external-internal resources, emotional and cognitive control functions, and tuning into possible positive outcomes. With these results in mind, targeted planning of preventive interventions for the mental health preservation of special education teachers can be realized. The management and prevention of burnout can be planned at both individual and organizational levels. The initial steps of prevention can already be implemented at the level of teacher training: through self-awareness groups, the application of self-awareness practices, and clarifying professional motivational goals. In organizational settings, the reduction of stress levels can be achieved through the establishment of a supportive network of relationships, case discussions, and consultations (Fekete, 1991; Vári, 2020). Self-care in mental hygiene, stress reduction, sharing responsibility, and revaluing the role of the community can play an important role in prevention, and reducing the level of depression will be a key task of prevention in our present day.

Employers' Requirements for Bachelor Graduates of English Translation and Interpretation Program: A Case in the Mekong Delta of Vietnam

My Thi Diem Tran

FPT University, Vietnam

Abstract: Universities need to capture the current status of graduate employability from both the graduates' and employers' perspectives if they are to effectively respond to industry skill and knowledge requirements. Graduate employability is a concept that is gaining traction in the higher education sector around the world. Therefore, the purpose of this paper is to investigate what employers' requirements for bachelor graduates of English translation and interpretation, as well as employers' and alumni's personal perspectives on the constraints of the current curriculum framework. As a result, shortcomings of the current curriculum framework were discovered and solutions to bridge over them were suggested. A mixed quantitative and qualitative analysis of questionnaires and interviews with 23 employers at various companies, offices or other places and 48 English translation and interpreting alumni of a university in the Mekong Delta reveals the attributes that are important for the job market, are emphasized in curriculum, and those that graduates need more training on. The findings will provide light on whether present approaches in translation and interpretation student training bridge the gap between professional market concerns and academic studies, as well as instructional consequences and implications for future study.

Keywords: employer, employability, translation, interpretation, graduate attributes

Citation: Tran, M.T.D. (2024). Employers' Requirements for Bachelor Graduates of English Translation and Interpretation Program: A Case in the Mekong Delta of Vietnam. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1078-1094), Antalya, Turkiye. ISTES.

Introduction

In today's modern society, the expansion of the global economy, globalization, as well as the expansion of higher education (HE) provision are influencing employers' hiring demands (Al-Harthi, 2011; Cai, 2013). Students and universities alike have recognized the changing nature of employability patterns and are attempting to incorporate employability attributes into degree program provision (Cai, 2013). As a result of this awareness, studies have been conducted to determine which employability attributes (EAs) are sought by employers in a given context. Employers' concerns about GE attributes have grown more pronounced in Vietnam, as they have elsewhere (Hager & Holland, 2006; Tran & Swierczek, 2009; OECD, 2012). Although employers in Vietnam have expressed concern about the lack of EAs among graduate students, no research has been conducted to

investigate the EAs that are important and necessary for job performance; those attributes that should be included in curriculum; and those in which graduate students require additional training. As a result, the goal of this research is to examine the demand for graduate attributes (GAs) in Vietnam as perceived by English Translation and Interpretation (ETI) alumni and employers. This is the gap that the current study is attempting to bridge. This study aims to investigate the employability attributes employers require for bachelor graduates of an ETI program in the Mekong Delta of Vietnam. In addition, it also explores the suggestions of these employers for the ETI program in the Mekong Delta of Vietnam.

Literature review

Employer

Employer has been defined in various ways. According to Heathfield (2019), an employer can be an individual, an agency, a small business, a store, an institution, a professional services firm, a government entity, or a non-profit association. The employer is also the organization or company which puts to work, employs or hires the services of the employee. They are entitled to rights and bound to perform duties. An employer is a purchaser of labor and uses his/her power in a workplace to control the labor process (Edwards, 1986; Braverman, 1974). Managerial, supervisory, or executive employee is also frequently considered part of an 'employer' as they often act as an agent of their employer in controlling or managing the other who is called a staff member or an employee.

Translation and Interpretation (T&I)

T&I are familiar topics to many researchers and there are numerous conducted relating to these two topics. Besides, there are a lot of websites, articles as well as books about translation and interpretation, in which many definitions of T&I are given out.

Definition of Translation

As according to Wilss (1982), translation is a transfer process that aims at the conversion of written source language text into the equivalent target language text and that requires the semantic, syntactic, analytical processing and pragmatic understanding of the source language. In the same vein, Bell (1991) defines it as an expression in another language (the target) of what has been presented in one language (the source), preserving stylistic and semantic equivalences. This author continues to make problems of equivalence very plain. Text in many different languages can be equivalent in many different degrees (partly or full different), in respect of many different levels of presentation (in respect of semantics, grammar, lexis, context, etc.) and at many different ranks (word-for-word or phrase-for-phrase, or sentence-for-sentence). Translation, ultimately, by dictionary definition, including changing from one form or state to another, to turn into another's language (The Merriam – Webster dictionary, 1828).

Definition of Interpretation

Similar to translation, interpretation can have a wide range of meanings for many people based on their training, experience or background in the interpretive profession. According to Nolan (2005), interpretation as a process of transmitting message in which meaning of a speaker is best expressed in his/her mother tongue but is best understood in listeners' languages. Besides, MacFarlane (1994) suppose that interpretation is a “process of communication” (cited in Hall & McArthur, 1993). The author also emphasized that as a bridge-builder between languages, the interpreter supports speakers make them understood as well as satisfy the demand of understanding what is being said from listeners.

Employability

Employability skills are in vogue in higher education (HE) context and have intensely been the center of attention in literature since 1980 (Zaharim et al., 2009). However, there is no common definition of this term in the literature. The term "employability" have been defined differently in various studies. Some studies focus more on student ability to get and maintain a job after graduation. As Yorke (2010) supposes that the term "employability" as the ability of graduate students to find and retain a graduate-level job as well as the ability to move between jobs if required.

Graduate attributes (GAs)

In literature, GAs are variously referred to as generic attributes (Wright, 1995), employability skills, and soft skills (Business, Industry and Higher Education Collaboration Council [BIHECC], 2007), key competencies (Mayer, 1992), transferable skills (Assiter, 1995), key skills (Drew, Thorpe, & Bannister, 2002). In the rapid change of the information and knowledge-intensive economy, workers not only need to maintain and develop skills and knowledge, which are specific to their own discipline and occupation, but also have to achieve "generic" skills, attributes and dispositions that are transferable to lots of occupational situations. These generic skills are defined as “those transferable skills which are essential for employability at some level for most” (Kearns, 2001). Generic skills have also been variously known as ‘core skills’, ‘key competencies’, ‘transferable skills’ or ‘underpinning skills’ (Mayer, 1992).

In short, GAs are emphasized in HE as incentives to attract both employers and learners. GAs are viewed as increasingly essential in the changing context of contemporary life. Moreover, they are considered important to make graduates prepared and ready for success in the rapid change of working environment today.

Graduate employability (GE) in the world and in Vietnam

In Western countries, employability is still a complex and controversial issue without an obvious solution in higher education institutions (HEIs) (Rae, 2007, p. 605). In the UK, USA, Australia, and in other developed

countries in Europe, employability is still high on the agenda for HEIs, and many students in the countries become more selective in choosing their courses and institutions (Rae, 2007). Enhancing GE seems to remain a challenge to HE culture and curriculum as well as has not yet received the support of most HE scholars (Harvey, 2000; Yorke, 2006). Nevertheless, Rae (2007) claims that, these activities are “unconnected” in the students' minds (p. 608). Furthermore, the higher educational system (HES) focuses more privilege theory and conceptual knowledge than practical application (pp. 608-609). Many academics remain see the university mission is not relevant to the adoption of the employment agenda. (Bates, 1999; Harvey, 2000; Rae, 2004; Billett, 2009). However, according to Mason, William, & Cranmer (2009), under the requirement and pressure of governments, there has been more evidence of the cooperation between enterprises and HEIs with the purpose to shorten the “learning curves” of graduate students when they start profession after graduation. Most importantly, the nature of learning and teaching practices in developed countries is aimed to develop students to be effective learners and workers, with interactive and personal attributes (e.g., teamwork and interpersonal skills or communication) on the agenda (Harvey, 2000, 2005).

On the other hand, in Vietnam, the recent issue has emerged when HEIs respond to the demands from the internal economy. Besides, the number of unemployed or underemployed graduate students has become alarming (Pham, 2008; Tran & Swierczek, 2009; Tran, 2010b). According to George (2010), although Vietnam has performed the economy liberalization policy (Doi Moi policy) for more than 20 years as well as economy of the country has moved on to the market economy with the socialist orientation, the progression of both its economy and higher education system (HES) is at a much lower stage. “Work-readiness” is the concern of most stakeholders: students and their families, employers, HEIs; however, there seems to be no connection between enterprises and HEIs in the country.

Employability in Translation and Interpretation

Obtaining a university diploma is not eligible to get an occupation (Harvey, 2002). Rather there are a range of external and person-centered factors which provide a conceptual foundation of employability: gender or ethnicity, age, personal attributes as for instance open-mindedness, empathy, flexibility, etc., and external factors like the sector- or region-specific economic situation that have a strong impact on recruitment and employability. Turning specifically to the issue of employment in the field of T&I, the above-mentioned factors should not be ignored, is influenced by the discipline area. According to Harvey (2002), program areas tend to be more active in promoting employment because their aim is to enhance particular employability attributes or because of a demand to ensure engagement with the world of profession. In addition, many researchers (Hillage and Pollard, 1998; Sewell and Pool, 2010) also suppose that some other important aspects: knowledge, attitude and skills; that is to say more accurately, disciplinary content knowledge, generic (transferable) competencies, soft skills (personal attributes), disciplinary competencies and skills. These employment assets are complemented by job finding as well as job-getting skills or profession management skills. According to Schnell & Rodríguez (2017), applying the above-mentioned employment assets to the domain of T&I as well as drawing on the specific and generic competencies will help graduates to find occupations in T&I field.

Method

In order to investigate employers' requirements for bachelor graduates of ETI Program in the Mekong Delta of Vietnam, the researcher attempted to find out the answers for the following questions:

1. Which employability attributes do employers require for bachelor graduates from ETI program?
2. Which suggestions for the university's curriculum framework do they have for the ETI training program at the universities?

The study was conducted at a university in the center of the Mekong Delta of Vietnam. Being a multi-disciplinary university, the institution provides 98 Bachelor programs, 45 Master programs and 16 Doctorate programs. The Bachelor Program of English Translation and Interpretation (ETI) is administered by the School of Foreign Languages of the institution and follows a credit-based system of 140 credits and consists of 3 main groups of knowledge namely general knowledge, fundamental knowledge, and domain-specific knowledge. There are 38 credits in the first group and consists of courses: Physical Education, Marxism-Leninism, National Defense Education, French and so on. In the second group, there are 48 credits and contains courses with the aim of equipping students with English language knowledge of grammar and pronunciation as well as language skills like listening, speaking, reading and writing. 54 credits in the last group are aimed to provide students with specialized knowledge of English language, literature, and culture as well as useful skills for future jobs and life-long learning such as translating, interpreting and researching.

The current study is designed as a descriptive survey which includes a questionnaire and a semi-structured interview for 71 participants (23 employers, 48 alumni). Among them, 7 employers and 8 ETI alumni were invited to participate in the interview. The employers include 10 males and 13 females in the current study work for various offices, enterprises, companies, etc. in the Mekong Delta of Vietnam. Most of them were from 41 to 50 years old and have more than 10 years of working experience. Aside from employer participants, 48 alumni (18 males, 30 females) of ETI training program at the institute took part in the study. Most of them are employees and their ages mainly range from 24 to 30 and have less than 5 years of working experience.

On the one hand, the questionnaire was the key instrument in the current study. The questionnaire was adapted from the study by Álvarez-Álvarez and Arnáiz-Uzquiza's (2017) research. The adaptations are in conjunction with the ETI curriculum framework used at the university being investigated. The version of the questionnaire, which consists of 9 items in the thirteenth sentence of the employer's questionnaire form and the eighth sentence of alumni questionnaire form of part 1, was delivered to 71-target population in the study (23 employers and 48 alumni). The collected data, then, were entered into the SPSS program to analyze for the scale reliability. The result showed that the reliability coefficient of the questionnaire is reliable ($\alpha = .809$).

On the other hand, the semi-structured interview was based mainly on the questionnaire. The interview was employed to verify participants' answers of the questionnaire in the study, to gain more insights into participants' viewpoint toward EAs that employers require when recruiting in order to offer the most appropriate

solutions or strategies to improve the university's curriculum framework as well as the current social demands. This interview was carried out via two ways: face-to-face, and email interview.

Results

Translation and Interpretation employability attributes required by employers.

Perspectives of employers

Table 4 shows the tasks that the employers assigning for ETI students primarily focus on translation capabilities. In particular, "translation of original material in Vietnamese into the foreign language" task and "translation of original material written in the foreign language" task are two of the most assigned tasks for students (account for 82.6% and 78.3%) which shows that the employers consider these tasks are the two most important and necessary tasks. Otherwise, only a very small minority of the employers (4.3%) assign "review of translations performed are machine translation systems" and "language consultant" tasks to ETI students. Besides, 4 out of 23 employers (17.4%) have other tasks for ETI students (presented in the 'other' category) such as: selling, studying documents on diplomatic profession, working with foreigners in the field or attending international conferences and workshops.

Table 4. Tasks (per number of employers' responses) completed by ETI students during work placements

Tasks of ETI students at employers' workplaces	Frequency	Percentage (%)
Translation of original material written in the foreign language	18	78.3
Translation of original material in Vietnamese into the foreign language	19	82.6
Translation practices of already translated material	9	39.1
Review of texts in a foreign language	11	47.8
Review of translations performed are machine translation systems	1	4.3
Writing texts in foreign languages (reports, business letters, emails, etc.)	8	34.8
Communication with clients in a foreign language	10	43.5
Interpreter	6	26.1
Language consultant	1	4.3
Administrative tasks	12	52.2
Other	4	17.4

After surveying about the tasks that they assigned to ETI students, a broad majority of the respondents replied that they were satisfied (65.3%) or very satisfied (13.0%) with the performance as well as the working style of

ETI students.

As can be seen in Table 5 below, employers are satisfied and highly appreciate students who have "a studious and progressive spirit" and "a sense of responsibility to, complete assigned tasks" ($M = 3.83$) at employers' companies. In contrast to this, ETI students' personal qualities (flexibility, dynamism, and capability to coordinate in activities) are rated slightly lower than others, it is also one of the ETI students' personal qualities are evaluated from "Fairly good" to "Good" ($M = 3.52$).

Table 5. Employers' detailed assessment of ETI students' personal attributes

Items	Min.	Max.	Mean (M)	SD.
Students have a studious and progressive spirit	3	5	3.83	.650
Students have a sense of responsibility, complete assigned tasks.	3	5	3.83	.717
Students have flexibility, dynamism, and capability to coordinate in activities.	2	5	3.52	.790

In addition, according to the employers' viewpoints, English linguistic knowledge and computer skills for office work (e.g. excel, word, etc.) are focused frequently in the training process, followed by Vietnamese linguistic knowledge, and "knowledge and skills about revision and post editing". On the other hand, they supposed that two both "knowledge and skills about project management" and "knowledge on writing technical texts" that students are rarely taught in the curriculum. Therefore, regarding essential knowledge, and skills, employers stated that the following knowledge, and skills should necessarily be developed within the training program: Cultural knowledge (73.9%), knowledge and skills about revision and post-editing (65.2%), followed by knowledge about terminology and documentation, knowledge about strategies for interpretation, and social skills (teamwork, negotiation and dealings with clients, etc.) with the same percentage (60.9%). It is found that the overwhelming majority of the employers (17 out of 23 employers) would like to see Cultural knowledge developed within the curriculum. It is a significant factor for communication with people of diverse custom, race, and ethnicity (see Table 6).

Table 6. Employers' perceptions of the knowledge/skills needed by ETI students

Knowledge/Skills should be strengthened in the training program	Frequency	Percentage (%)
English linguistic knowledge	10	43.5
Vietnamese linguistic knowledge	12	52.2
Computer skills for office work (Excel, Word, etc.)	10	43.5
Knowledge and skills about specific software (software for localization, audiovisual translation, terminology management, etc.)	9	39.1
Knowledge on strategies for translation	13	56.5

Knowledge about strategies for interpretation	14	60.9
Cultural knowledge	17	73.9
Professional knowledge	13	56.5
Social skills (teamwork, negotiation and dealing with clients, etc.)	14	60.9
Knowledge and skills about revision and post editing	15	65.2
Knowledge and skills about project management	12	52.2
Knowledge on writing technical texts	11	47.8
Other	0	0.0

Perspectives of alumni

Table 7 below shows the tasks that the ETI students have been required to perform in their job mainly focusing on writing texts in foreign languages (e.g. reports, business letters, emails, etc.)" (77.1%) and communicating with clients in a foreign language (75.0%). In addition, according to alumni's responses, "language consultant" is the least assigned task in employers' companies (12.5%). Apart from that, 4 out of 48 alumni are also given a number of tasks (presented in the 'other' category) related to support and serve customers as well as support new employees to translate and edit documents at their workplaces.

Table 7. Tasks (per number of alumni responses) completed by themselves during work placements

Tasks of alumni at work placements	Frequency	Percentage (%)
Translation of original material written in the foreign language	32	66.7
Translation of original material in Vietnamese into the foreign language	30	62.5
Translation practices of already translated material	13	27.1
Review of texts in a foreign language	25	52.1
Review of translations performed are machine translation systems	15	31.3
Writing texts in foreign languages (reports, business letters, emails, etc.)	37	77.1%
Communication with clients in a foreign language	36	75.0
Interpreter	26	54.2
Language consultant	6	12.5
Administrative tasks	30	62.5
Other	4	8.3

Similar to employers, after surveying the tasks they have performed, when asking about their perspectives on their work placements, more than half of respondents acknowledged they were satisfied (56.3%) and very satisfied (8.3%) with their own working performance.

Besides, 39 out of 48 alumni participants supposed that they possess enough the necessary knowledge to work in the employers' companies/units. In addition, alumni also suggested that "English linguistic knowledge" is one

of the most fully provided knowledge in ETI training program. Knowledge and skills about project management, knowledge on writing technical texts, and knowledge about strategies for interpretation are supposed to be rarely provided in the training program. Therefore, they suggested that social skills (e.g. teamwork, negotiation and dealing with clients, etc.) are one of the most important skills, should be add in the curriculum (72.9%) followed by computer skills (e.g. excel, word, etc.) (accounted for 64.6%). Besides, they supposed that cultural knowledge is also essential in real life, particularly in ETI field (62.5%) as listed in Table 8. Apart from 12 strategies put in the questionnaire, one out of 48 alumni also offer a suggestion (presented in the ‘other’ category) that it should be based on the reality of the demands of ETI domain.

Table 8. Alumni’s perceptions of the knowledge/skills needed by ETI students

Knowledge/Skills should be strengthened in the training program	Frequency	Percentage (%)
English linguistic knowledge	24	50.0
Vietnamese linguistic knowledge	24	50.0
Computer skills for office work (Excel, Word, etc.)	31	64.6
Knowledge and skills about specific software (software for localization, audiovisual translation, terminology management, etc.)	29	60.4
Knowledge on strategies for translation	26	54.2
Knowledge about strategies for interpretation	28	58.3
Cultural knowledge	30	62.5
Professional knowledge	29	60.4
Social skills (teamwork, negotiation and dealing with clients, etc.)	35	72.9
Knowledge and skills about revision and post editing	25	52.1
Knowledge and skills about project management	27	56.3
Knowledge on writing technical texts	27	56.3
Other	1	2.1

Suggestions to improve the ETI program

Employers’ perspectives

Twenty-three employer participants were asked to report their responses to each item on a five-degree scale ranging from 1 (Highly undesirable) to 5 (Highly desirable). Their responses were used for statistically analyzing via the software the Statistics Package for the Social Sciences (SPSS) version 20.

The results in Table 9 show that employers come to a desire that suggestions involving curriculum design and development in order to make the ETI training program more compatible with the labor market needs. They suggested that the training programs should invite experts in the fields of ETI to come and talk in the classroom ($M = 4.43$), help students to take positions in translation and interpretation domain ($M = 4.39$) and have extra-curricular lessons to help students be confident and train them through practical practice ($M = 4.39$). Although, the use of electronic tools (mainly translation memory software) for translation teaching activities is desired, it is

one of the least concerned criteria ($M = 4.09$). Besides, other criteria need to be added into the ETI training process, are listed in Table 9 below.

Table 9. Employers' desires for future English translation and interpretation training programs

The training program of ETI should	Min.	Max.	Mean	SD.
Strengthen academic subjects of professional translation on the market	1.00	5.00	4.35	.573
Employ professional translators/ interpreters as academic staff	1.00	5.00	4.22	.795
Use real-world texts for assessment activities	1.00	5.00	4.30	.703
Use electronic tools (mainly translation memory software) for translation teaching activities	1.00	5.00	4.09	.733
Help students to take positions in translation and interpretation domain	1.00	5.00	4.39	.656
Invite people from the profession to talk in the classroom	1.00	5.00	4.43	.662
Organize educational activities in collaboration with professional bodies	1.00	5.00	4.35	.647
Focus more on speaking skills for students	1.00	5.00	4.30	.765
Provide extra-curricular lessons to help students be confident and train them through practical practice	1.00	5.00	4.39	.891

Alumni's perspectives

With regard to the survey of desire for the future ETI training programs, a five-degree scale ranging from 1 (Highly undesirable) to 5 (Highly desirable) are also used in order to collect alumni's responses data. The findings in the current study showed that most alumni are highly desirable for the training programs which should have been added extra-curricular lessons to help students be confident and train them through practical practice ($M = 4.77$). Besides, they also suggested the training programs should focus more on speaking skills for students ($M = 4.65$), followed by strengthening academic subjects of professional translation on the market as well as helping students to take positions in translation and interpretation domain is also the criteria that alumni interested in, some others are also listed in Table 10.

In conclusion, participants in the current study pointed out the shortcomings of the training program and the employers also showed their own views on the strengths and weaknesses of ETI students in order to offer some aspects that should be changed or implemented in ETI training program. Particularly, both employers and

alumni suppose that communication and cultural knowledge are two of the most important aspects, which should be added into the curriculum.

Table 10. Alumni's desires for future English translation and interpretation training programs

The training program of ETI should	Min.	Max.	Mean	SD.
Strengthen academic subjects of professional translation on the market	1.00	5.00	4.58	.498
Employ professional translators/ interpreters as academic staff	1.00	5.00	4.40	.574
Use real-world texts for assessment activities	1.00	5.00	4.44	.580
Use electronic tools (mainly translation memory software) for translation teaching activities	1.00	5.00	4.17	.859
Help students to take positions in translation and interpretation domain	1.00	5.00	4.54	.504
Invite people from the profession to talk in the classroom	1.00	5.00	4.46	.713
Organize educational activities in collaboration with professional bodies	1.00	5.00	4.38	.640
Focus more on speaking skills for students	1.00	5.00	4.65	.483
Provide extra-curricular lessons to help students be confident and train them through practical practice	1.00	5.00	4.77	.425

Qualitative data from interviews

After collecting and analyzing the data from questionnaire, the researcher interviewed 15 out of 71 participants of two groups, 7 employers and 8 ETI alumni. This interview aimed to verify participants' answers of the questionnaire in the study, to gain more insights into participants' perspectives on recruitment, training of translators and interpreters as well as to find out employers' suggestions for the university's curriculum framework. The following 7-core interview questions were asked to seek the requirements of employers and find out some suggestions to have an appropriate training program for the labor market.

The data obtained from the interview question 1 revealed that most interviewees (nearly 80%) suppose that it is important and essential to possess a diploma in T&I. Nevertheless, the others have the opposite views and suppose that English proficiency is the one of the most important factors when applying for a job.

Participants' perceptions for recruitment

In the current study, possessing a diploma in T&I has two opposite views. a minority of respondents who suggested that there is no difference between a student with diploma in translation and interpretation and a

student who does not have, and the recruitment focuses on graduates' English linguistic competency instead of the diploma in T&I.

Employer 1 stated:

Most of the recruitment of translators or interpreters is based on language competence. It is also not required to graduate from T&I training program that is because graduates have to complete an exam before working in the company.

In contrast, for others who supposed that possessing a diploma is the most essential factor when looking for a job. Alumnus 3 stated:

The employers in my company only recruit graduates who have the diploma in T&I. I have been working with colleagues who possess the diploma in T&I (including me).

Regarding main criteria for recruiting ETI students, most respondents stated that English proficiency is one of the important criteria which is required by employers. In addition, the confidentiality is considered necessary in employers' criteria. As employers 1 and 5 said:

[...] the main criteria to ensure: information security, implementation time, and specialized knowledge.

Besides, an ETI graduate need to have a good health and a solid social and cultural knowledge.

Participants' perceptions for training of translators and interpreters

To improve quality recruitment in the labor market, both employers and alumni point out that there are some contents missing in the undergraduate programs, which should be taught both at school and on the job. On the one hand, respondents consider that linguistic skills (foreign language), specialized translation contents and interpreting-related competences should be added to their curriculum in order to improve ETI students' employability opportunities. Specifically, employers 1, 3, 7 shared the same suggestions for ETI curriculum. They shared:

[...] At universities, lecturers should focus mainly on teaching specialized vocabulary, specific software skills (e.g. software for localization, audiovisual translation), computer skills (e.g. excel, word, etc.) at the proficiency level. At workplaces, translators and interpreters need to learn from shortcomings in their work, learn more about IT to support and develop their work.

Participants' perceptions for interaction with translator and interpreter training institutions

For the purpose of developing the training programs to improve cooperation with the labor market, employers 2, 3 and 7 highlighted:

[...] invite lecturers of professional interpreters and translators, design lectures in analyzing and commenting on approved translations, and create opportunities for final-year students to attend international conferences.

Altogether, both employers and alumni specified the general linguistic competence in their native and foreign language (especially English) and technological skills and subject field knowledge are important and essential aspects that should be added in the future training program. Furthermore, they supposed that this cooperation will help the labor market to be more competitive, expand job opportunities for students as well as reduce employers' training time when receiving a new graduate. Students will learn valuable practical knowledge and skills. At the same time, it creates opportunities for them to get more knowledge, experience and confidence in life.

Discussion

Employers' and alumni's perspectives on ETI curriculum

An overall look at the employers' and alumni responses provides a summary of their views about ETI curriculum, employers' main criteria in recruiting translators and interpreters as well as suggestions for ETI undergraduate training programs as in the following Figure 1

Figure 1. Employers' and alumni's perceptions on ETI students' capabilities

The results from FIGURE 1 reveal that there is no marked difference between employers' and alumni perceptions between knowledge and the practice time of ETI students. Although, more than half of participants

supposed that ETI students have enough knowledge to develop (84.50%), they still suggest that students should have more practice time or internship time to improve students' professional skills and knowledge (nearly 95%). These findings are similar to the research of Álvarez-Álvarez & Arnáiz-Uzquiza (2017). Almost 90% of the graduates in Álvarez-Álvarez & Arnáiz-Uzquiza's research (2017) are conscious of the demand to improve their professional skills which are very much aware of the relevance of employment in the (post)graduate training process. However, the findings of Schnell and Rodríguez' study (2017) indicated that possessing the disciplinary knowledge and specific competencies of T&I graduate students only moderately develop and there is even a minority thought that they are only slightly developed. All of the employers and T&I graduates in Álvarez-Álvarez & Arnáiz-Uzquiza's research (2017) were satisfied with the performance of ETI students/themselves, who were mainly assigned translation tasks. On the contrary, all employers in the current study were the same perceptions with those; however, alumni in this study were mainly assigned writing texts in foreign languages or communication with clients in a foreign language. Additionally, the current results are dissimilar to Schnell and Rodríguez' study (2017) in which most of employers focused on cultural and social knowledge rather than knowledge and skills of translation.

Suggestions to improve the ETI program

When surveying about employers' and alumni's suggestions of possessing a diploma when applying a job, the current study is compatible with Harvey, (2002,2005). Similarly, many researches previous studies (Wilss, 1982; Bell, 1991; Nolan, 2005) share the same findings with the present one, which suggest Vietnamese linguistic knowledge should be strengthened in the training program to help students transmit message accurately and clearly without violating professional ethics. By the way, knowledge on strategies for translation and interpretation is essential in the ETI curriculum (Bui and Dang, 1997) which the participants in the current study suggest to strengthen in the training process. Furthermore, cultural knowledge is one of the most essential criteria, which should be provided in the ETI curriculum. Participants suppose cultural knowledge diversities are significant factors for communication with people of diverse custom, race, and ethnicity. It is as the key to successful communication. Moreover, the employers in the current study are contrary to Gracés and Toudic (2012) who share the same findings with the alumni in the present one which suggest knowledge and skills about specific software (e.g. software for localization, audiovisual translation, terminology) should be strengthened in the training program to response the employers' needs.

Conclusion

The current study was conducted to investigate the employability attributes which employers require for bachelor graduates from ETI program. Furthermore, participants also point out the shortcomings of the current ETI training program, and to give some suggestions for universities in order to have an appropriate curriculum to solve employment issues. The findings of the current study show that ETI students not only reinforce contents and knowledge learned at university (such as English linguistic knowledge, professional knowledge), but also

have to develop ‘key’ employability skills (e.g. social and cultural skills, as well as communication skills) which are not commonly included in the university curriculum (Chouc and Calvo 2011). In conclusion, training programs should cooperate with the labor market in order to solve employability issues.

Recommendations

It is suggested that similar studies can be carried out with the subjects of a variety of universities in the Mekong Delta and even many locations in Vietnam so that results can be generalized for all students at universities. Because the study is just survey, moreover, its results will be more significant and more reliable if future experimental studies should focus on whether professionally oriented teaching methods are applied in other content categories in T&I curriculum or whether they remain restricted to professional contents category. The findings presented in the current study together with future results are expected to rise awareness about an importance of including professional competences in ETI curriculum to solve the challenges of employability.

Amount of Deposit Insurance System Scheme Based on “Risk” Scheme

Catarina Manurung

Bina Nusantara University, Jakarta, Indonesia

Abstract: Banking is the lifeblood of a country's economy. The government's role is urgently needed to maintain public trust in banking. Therefore, the Government issued Law Number 24 of 2004 and Government Regulation Number 66 of 2008 concerning the amount of deposit guaranteed by the Deposit Insurance Corporation. The risks faced by banks from the Risk Profile factors include among others: credit risk, market risk and liquidity risk. The risks faced by banks in "The Essentials of Risk Management", include Credit Risk and Market Risk. In addition to the risks faced by each bank, what needs to be emphasized is the level of soundness of each bank and the criteria for a healthy bank. The author will use normative legal research methods with a related statutory approach, with the hypothesis: the current deposit insurance system scheme, namely a flat premium system of 0.1% (one per thousand) with a guarantee limit of up to 2 billion rupiah, is no longer sufficient. This means that the premium amount does not cover the entire deposit amount. It is time to switch to a deposit insurance system scheme based on the “Risk” scheme. Each bank has different risks and the soundness level of each bank is also different. So, it is unfair for depositors, if the premium payment system scheme treatment is made flat at 0.1% (one per thousand) for all banks. It's time to switch to a deposit insurance system scheme based on the “Risk” scheme.

Keywords: Banking 1, Trust 2, Risk 3 Deposit Insurance Corporation 4.

Introduction

According to the Big Indonesian Dictionary (KBBI), the standard form of the word is risk. In KBBI, risk means an unpleasant (harmful, harmful) result of an action or action. In English, the noun "risk" means, danger; possible loss; risk. "Risk" verb (verb) means to take a risk. Conclusion: according to the Indonesian English Translation Dictionary, the meaning of the word risk is danger. Another meaning of risk is the possibility of loss. <https://kii.lektur.id/risk>

In addition, there are several definitions of risk according to some experts, including: Jorion (2007) defines risk as, "The volatility of unexpected outcomes, which can represent the value of assets, equity, or earnings." According to Uyemura and Deventer (1993) defining risk is, "The volatility (standard deviation) of net cash flows of a business unit." Meanwhile, according to Mun (2006) defining risk is, "Any uncertainty that affects a

system in an unknown fashion whereby the ramifications are also unknown but bears with it great fluctuations in value and outcome."

Of the three concepts described by the experts, the risk contains something that is uncertain in the future, can be measured, is also unknown and can be stated in research on assets, income and others.

Therefore, this risk can be defined as follows: "Losses experienced by an Institution due to unclear events will occur in the future where risks can be measured and minimized. According to Adler (2017) Banking Financial Risk Management, pp. 38-39.

The risks faced by banks from the Risk Profile factors include among others: credit risk, market risk and liquidity risk.

Meanwhile, according to the provisions on bank capital stipulated by Bank Indonesia which refers to the provisions of Basel II, particularly in Pillar 2 which emphasizes that the amount of bank capital must be in accordance with the risks faced by the bank so as to enable the bank to cover its risks properly. This pillar encourages that the calculation of risk factors is not only credit risk, but also considers other risk factors, such as market risk and operational risk so that all of these risks are taken into account in calculating the minimum capital adequacy risk.

The risks are divided into two major groups, namely financial risk and business risk. Prior to 1997, prior to the financial crisis that hit Thailand, Korea, Indonesia and several countries in Asia, the types of risks that were always discussed were: (1) Interest-rate risk, which was the main risk that was most often faced by investors. The occurrence of this risk is due to an increase in the applicable interest rate. This risk is also often called market-risk; (2) Reinvestment risk, is the risk that must be faced as a result of investing on interest earned through the reinvestment strategy implemented. Interest-rate risk and reinvestment risk have an offsetting effect. The strategy based on this elimination is called immunization; (3) Call-risk, is the risk faced by investors, the bond issuer has the right to buy back (call) the bonds; (4) Default-risk, is the risk faced by investors or holders of financial assets because these financial assets are unable to pay the principal at maturity; (5) Inflation risk, is the risk faced by investors due to inflation so that the cash flow received by investors varies in purchasing power; (6) Exchange-risk, is the risk faced by investors due to changes in exchange rates, usually this risk is found in financial assets denominated in foreign currency; (7) Liquidity risk, is the risk faced by investors in order to sell financial assets as soon as possible in the market. The measure of liquidity can be seen from the difference between the buying and selling value of the financial asset; (8) Validity risk, is the risk faced by investors because bonds are associated with options that depend on interest rates. One of the influencing factors is the volatility of interest rates.

Investors should always view trading as a risky financial asset. Even though the financial assets of bonds issued by the government still have risks, they do not have the risk of default (default) so that investors also view all

financial assets as having risks.

Lam (2014) states that there are 7 types of risk, including: (1) Strategic risk is the risk where corporate and business strategies (mergers and acquisitions), growth strategies, product innovations are not executed effectively; (2) Business risk is the risk that the annual financial and operating results do not meet the expectations of management and shareholders of the Company; (3) Market risk is the risk that the price of interest rates will move which has negative consequences for a Company; (4) Credit risk is the risk that consumers, other parties or providers of goods and services will fail to fulfill their obligations; (5) Liquidity risk is the risk that a company cannot get cash to meet its demands in a timely and cost-effective manner; (6) Operational risk is the risk that humans, processes or systems will fail or events outside the company will have a negative impact on the company; (7) Compliance risk is the risk that the company does not comply with legal and regulatory requirements.

The risks disclosed by Lam (2014) are generally aimed at financial institutions (including banks, even microfinance institutions). There is even another risk that should be considered, namely "reputation risk" which is often not taken into account but is very much taken into account for these banks.

Method

The author will use a normative legal research method with a related statutory approach. As for bank risk based on the Theory of Economic Analysis Of Law. According to Richard A. Posner, the terms "value" and "efficiency" are technical terms. "Efficiency" means exploiting economic resources in such a way that "value" - human satisfaction as measured by aggregate consumer willingness to pay for goods and services - is maximized.

We can see this if $\text{Benefit} > \text{Cost} = \text{Efficiency}$. This means that if the benefits obtained are greater than the costs incurred, it is called efficiency. Or $\text{Cost} < \text{Benefit} = \text{Efficiency}$, meaning that if the costs incurred are smaller than the benefits/benefits obtained. Efficiency (Efficiency) = Justice (Justice) means that if efficiency has been achieved it means justice is also achieved. Justice (Justice) = Social Welfare Maximization (Community Welfare), meaning that if justice is achieved, so will social welfare.

The Risks Faced by Each Bank

The risks faced by banks (Chart taken from Michel Crouhy, Dan Galai and Robert Mark. 2006. The Essentials of Risk Management, page 26) includes Credit Risk and Market Risk, as shown in the following chart:

Due to the wide range of risks faced by banks, banks must place one director who is the controller, even the regulators also want this position at the bank. If observed carefully, a bank that is always faced with financial

risk will face two risks that become financial risks, namely Credit Risk and Market Risk.

Bagan 6: Esensi Pengelolaan Risiko

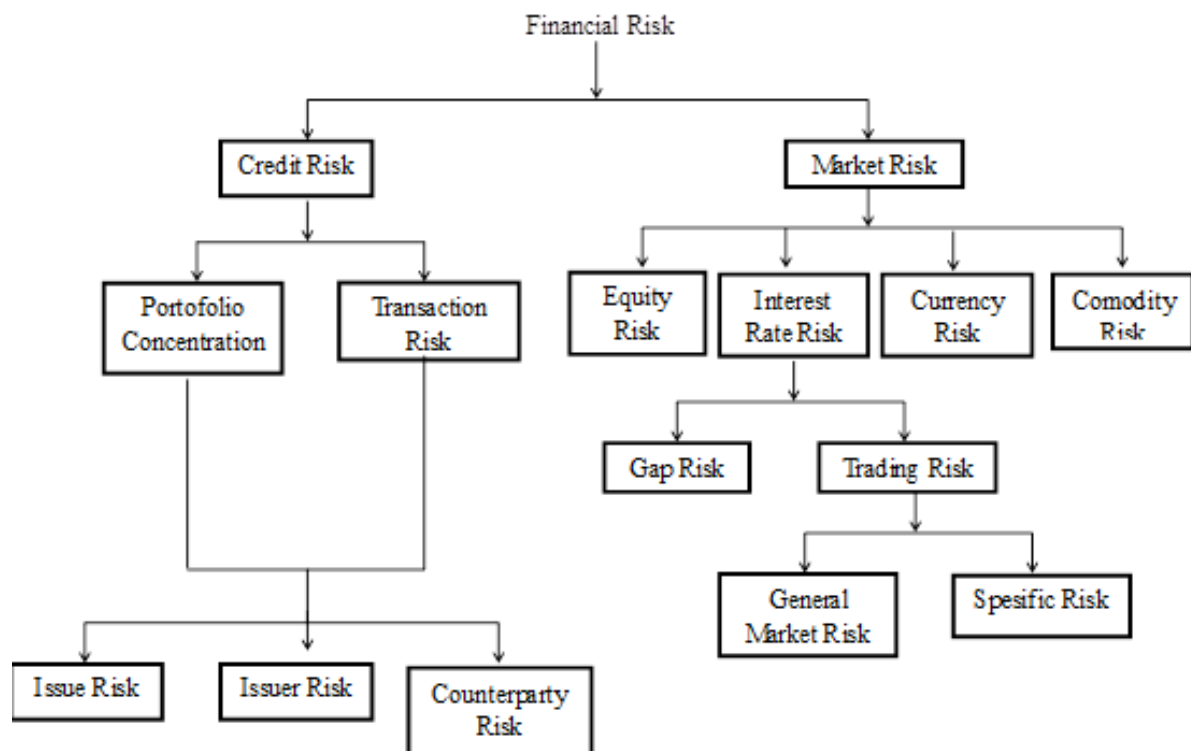

Chart 1: Essentials of Risk Management

Development of Risk Management

In the beginning, what was always discussed were two types of risk, namely financial risk and business risk. But over time, financial risk continues to grow. Company sales in the form of foreign exchange will have problems in terms of fluctuating foreign exchange prices, so the company will hedge, so that the value of the foreign currency does not decline. The cost of raw materials purchased with foreign currencies, the company will carry out forwards or futures or also options on these foreign currencies. The company enters into SWAP contracts with other parties to improve foreign exchange held either as income or debt or investment. However, it is realized that risk management by means of hedging with derivative tools such as forwards, futures, SWAPs and options, is not the best way. It is possible to do hedging but it does not generate benefits for the company. Because of this, the concept of risk management has been the choice for the last 10 years since the Asian financial crisis that occurred from 1998 to 2000, and America experienced it in 2008 due to the collapse of Lehman Brothers, which had existed for more than 100 years.

Waring and Glendon (1998) concept of Risk Management as follows: “As a field of activity seeking to eliminate, reduce and generally control pure risk (such as from safety, fire, major hazards, security lapses, environmental hazards) and to enhance the benefits and avoid detriment from speculative risk (such as financial investment,

marketing, human resources, IT strategy, commercial and business risk.”Adler (2017, pp. 44-45).

This concept aims to carry out risk management to reduce the risks that will be faced so that these risks are not as big as possible. To manage corporate risk, there are several stages of the process that will be carried out. Crouhy et al (2006) state the process of managing risk as follows: (1) Identify risk exposures that may occur; (2) Measuring and estimating the risk exports; (3) Assessing the effects of exposure; (4) Forming risk mitigation; (5) Evaluating performance.

When measuring risk, other activities are carried out, namely searching for instruments and moving facilities to transfer the risk. And when assessing the effects of exposure there are also actions taken, namely assessing the costs and benefits of the instruments that have been found in the previous stages.

Risk Tools And Measures

Table 1. Risk Measures by Assets

Number	Asset	Risk Measure
1.	Man	Number of errors
2.	Technology	The number of stops/stops
3.	Law	Number of disputes/disputes
4.	Bonds	Duration and Convection
5.	Credit	Ratings and Failed Models
6.	Shares	Volatility, Correlation and beta
7.	Derivatives	Delta, Gamma and Vega
8.	Foreign exchange	Target Zone

Companies or financial institutions have various assets. The question is how to measure it? One of the assets owned by the company. Humans can create risks, both intentional and unintentional. Humans who carry out activities can measure their risk based on the number of mistakes they make. Each mistake made can be measured in value so that the number of mistakes made can also be assessed in terms of money (monetary) value.

The company also has technology and it is often used for business purposes, in addition to support and for products. In the legal field, risk can also be measured through disputes that occur and activities carried out. Every activity in which a dispute occurs has a monetary value, so the loss from legal risks constitutes the total expenditure for resolving the dispute. Bonds as financial assets have risks that are calculated by duration and convection. Credit can also be measured the risk that will be experienced through the number of defaults paid even with this credit rating can be measured unpaid credit. Stocks as financial assets can also be calculated at risk where the size is well known, namely the standard deviation is expanded with volatility and beta both individually (single asset) and as a portfolio. Financial assets for hedging are known as Derivatives, where the

risk can be measured by various measures known as "Greeks". If an investor owns foreign currency, the risk can be calculated, which is known as the Target Zone.

Table 2. Evolution of Risk Management Tools

Number	Year	Method
1.	1938	Bond duration
2.	1952	Markowitz Mean-Variance Framework
3.	1963	Sharpe's Capital Asset Pricing Model
4.	1966	Multiple Factor Model
5.	1973	Black-Scholes Option Pricing Model, "Greeks"
6.	1979	Binomial Option Model
7.	1983	RAROC, Risk Adjust Return
8.	1986	Limits on Exposure by Duration Bucket
9.	1988	Risk-Weighted Assets for Bank Limits on "Greeks"
10.	1992	Stress Testing
11.	1993	Value at Risk (VAR)
12.	1994	Risk Metrics
13.	1997	Credit Metrics, Credit Risk+
14.	1998	Integration of Credit and Market Risk
15.	2000	Enterprise-Wide Risk Management

Source: Jorion Improvement (2007).

Furthermore, what is discussed is the development of measuring instruments of risk that exist today where these measures continue to develop gradually or evolve, from year to year up to 2000. Initially the risk measure started with the duration method for bonds and standard deviation for shares, which was introduced in 1952. During this period, only two well-known products were known, namely bonds and stocks. The risk of these two products was raised by academics Harry Markowitz (Mean - Variance Framework) for stocks and duration by F. Macaulay (1938) for bonds. Beta as a measure of risk for financial assets was put forward by academics namely Sharpe (1964), Lintner (1965) and Mossin (1966), mentioning a measure of stock risk associated with variations in the movement of the stock market as a whole. If stock risk is associated with various factors, the Multiple Factor Model is used. There are also derivatives with option products that also have a measuring tool, namely "Greeks" and continued with the Binomial Option Model. In 1983, the rate of return on investment (Return) but adjusted for risk was known as RAROC (Risk Adjusted Return On Capital). Financial institutions that provide loans to their customers or other financial products and are always in contact with the market which consequently have risks. Market factors that can affect owned financial assets are known as stress testing. The size of the risk continues to grow with the failure of the credit provided. The measurement tools are: VaR, Risk Metrics, Credit Metrics and Credit Risk+. Furthermore, the development of measuring instruments for risk with the view that the company will face risks is due to the fact that companies or financial institutions have many

activities carried out with various strategies designed by company management. In order to understand this risk, a tool known as Enterprise Wide Risk Management was created in 2000. The development of this risk measuring instrument was mostly in credit extended by financial institutions.

The risks faced by companies can occur only once and can also occur repeatedly. The risk itself can be of fairly small monetary value and it can also be of enormous value. The risk grouping is based on the probability of occurrence and the amount of loss, so there are actions to be taken, namely: avoiding risk, reducing risk, transferring risk to other parties such as insurance and accepting or ingesting the risk.

Frequency/ Probability	Tall	REDUCE	AVOID
	Low	ACCEPT	TRANSFER
		Low	Tall

The Magnitude of the Loss (Consequences or Severity)

Chart 2. Risk Management in terms of Frequency and Losses

Based on chart 2, decision makers can take action to deal with the risks experienced by the business being managed.

The risks faced can also be seen from the perspective of the Company's Economic Capital. Expected losses can usually be transferred to customers by increasing product prices or already being part of the product price.

Soundness Level of Each Bank

Healthy Bank Criteria

Bank Indonesia Regulation Number 13/1/PBI/2011 concerning Soundness Rating of Commercial Banks.

A. Setting background

(1) Changes in business complexity and risk profile, implementation of consolidated Supervision, as well as changes in the internationally applied approach to assessing the condition of a Bank affect the approach to assessing a Bank's Soundness Level; (2) In order to increase the effectiveness of the Bank's Soundness Level assessment to deal with the changes referred to in letter a, it is necessary to improve the Bank's Soundness Rating using a risk-based approach.

Bagan 9: Model Financial Risk Management pada ERMCP (2016)

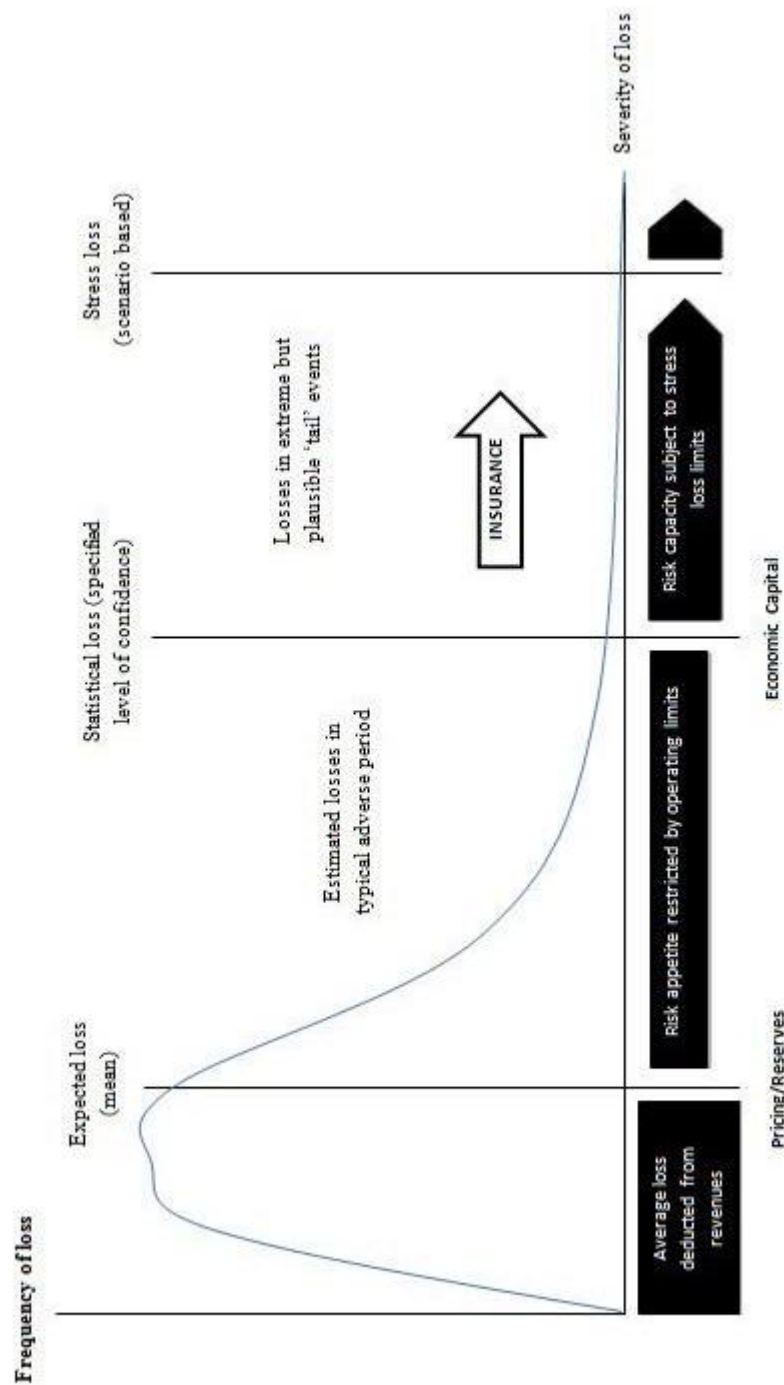

Chart 3. Financial Risk Management Model in ERMCP (2016)

B. Regulatory Substance

1. The main provisions in this PBI are as follows:

(a) Banks are required to conduct an assessment of the Soundness Level of the Bank both individually and in consolidation using a risk approach; (b) Assessment of Bank Soundness Level on a consolidated basis is carried out for Banks that exercise control over Subsidiaries; (c) The assessment period is carried out at least every semester (for positions at the end of June and December); (d) Factors for assessing the Bank's Soundness level consist of: Risk profile, Good Corporate Governance, Earnings, and Capital; (e) Each factor is ranked based on a comprehensive and structured analysis framework; (f) The composite rating is determined based on a comprehensive and structured analysis of each factor's rating by taking into account the materiality and significance of each factor, as well as considering the Bank's ability to deal with significant changes in external conditions; (g) Composite Rating Category is Composite Rating 1 to Composite Rating 5. A lower Composite Rating sequence reflects a healthier Bank condition; (h) In assessing the soundness level on a consolidated basis, the rating determination mechanism for each assessment factor and the determination of the Composite Rating as well as the rating categorization for each assessment factor and composite rating must refer to the mechanism for determining and categorizing individual Bank ratings; (i) The Board of Directors, Board of Commissioners and/or shareholders are required to submit an action plan to Bank Indonesia in matters based on the results of an assessment of the Bank's Soundness Level conducted by Bank Indonesia and/or a self-assessment by the Bank; (j) Time for submission of Bank Soundness Level self assessment; (k) Time for submitting the Bank Soundness Level action plan; (l) Action plan implementation report; (m) In preparation for the effective implementation of the Bank's Soundness Rating, the Bank is required to carry out a trial run of the Bank's Rating; (n) Bank Supervision.

2. This Bank Indonesia Regulation has been effective since 1 January 2012, namely for the assessment of Bank Soundness Level at the end of December 2011 and on the date of its entry into force simultaneously revokes Bank Indonesia Regulation Number 6/10/PBI/2004 concerning the Rating System for Commercial Banks.

Results

Bank health is in the interest of all parties (stakeholders), namely bank owners, bank management, the community as users of bank services and the government as a regulator. This is intended as a benchmark for bank management, whether they run the bank's business in accordance with applicable regulations, so as to avoid problems that occurred in the past. Public trust and monetary stability in Indonesia are factors that are influenced by this. Permana (2012) A healthy bank is a bank that can carry out its functions properly such as being able to maintain public trust, being able to carry out the intermediary function, being able to help smooth payment traffic, and being able to carry out monetary policy.

The soundness level of a bank is a qualitative assessment of various aspects that affect the condition or performance of a bank through a quantitative and/or qualitative assessment of the factors of capital, asset quality, management, earnings, liquidity and sensitivity to market risk. After considering the element of judgment based on the materiality and significance of the assessment factors and the influence of other factors

such as the condition of the banking industry and the national economy.

Banks can assess the soundness of their own banks using the method recently issued by the government in Bank Indonesia Regulation Number 13/1/PBI/2011 article 2, it is stated that banks are required to assess the soundness of a bank using a risk approach (Risk Based Bank Rating) both individually or consolidation. This regulation replaces the previous valuation method, namely the method based on Capital, Assets, Management, Earning, Liquidity and Sensitivity to market risk or what is called CAMELS. The RBBR method uses an assessment of four factors based on Bank Indonesia Circular Letter Number 13/24/DPNP namely: Risk Profile, Good Corporate Governance, Earning and Capital (RGEC).

From the Risk Profile factor using the calculation of credit risk, market risk and liquidity risk. The GCG factor takes into account the assessment of the application of self-assessment. Earning factor or profitability is measured by indicators of profit before tax to total assets (ROA), net interest income to total assets (NIM). The Capital factor is measured by the CAR ratio. With the RGEC method as a whole it has a very healthy predicate.

Discussion

In Bank Indonesia regulation No. 13/1/PBI/2011 article 2, it is stated that banks are required to evaluate the soundness of a bank using a risk approach (Risk Based Bank Rating) either individually or in consolidation. In this method there are several indicators as a reference, namely:

1. Risk Profile

According to Bank Indonesia Regulation No. 13/ 1/ PBI/ 2011 risk profile is an assessment of inherent risk and the quality of risk management implementation in bank operations carried out on 8 (eight) risks namely, credit, market, liquidity, operational, legal, strategic, compliance and reputation risks. This study measures credit risk using the Non Performing Loan (NPL) ratio and the Loan to Deposit Ratio (LDR) ratio to measure liquidity risk.

Credit risk using the Non Performing Loan (NPL) ratio is calculated by the formula:

$$\text{NPL} = (\text{Non-Performing Loan})/(\text{Total Credit}) \times 100\%$$

Table 3. Criteria for Determining Risk Profile Rating (NPL)

Rating	Information	Criteria
1	Very healthy	$\text{NPL} < 2\%$
2	Healthy	$2\% \leq \text{NPL} < 5\%$

3	Healthy Enough	$5\% \leq \text{NPL} < 8\%$
4	Unwell	$8\% \leq \text{NPL} < 12\%$
5	Not healthy	$\text{NPL} \geq 12\%$

Source: Bank Indonesia Circular No. 6/23/DPNP of 2004.

Liquidity risk using the Loan to Deposit Ratio (LDR) is calculated by the formula:

$$\text{LDR} = (\text{Amount of Credit Provided}) / (\text{Third Party Funds}) \times 100\%$$

Table 4. Criteria for Determining Risk Profile Rating (LDR)

Rating	Information	Criteria
1	Very healthy	$\text{LDR} \leq 75\%$
2	Healthy	$75\% < \text{LDR} \leq 85\%$
3	Healthy Enough	$85\% < \text{LDR} \leq 100\%$
4	Unwell	$100\% < \text{LDR} \leq 120\%$
5	Not healthy	$\text{LDR} > 120\%$

Source: Bank Indonesia Circular No. 6/23/DPNP of 2004.

2. Good Corporate Governance (GCG)

By analyzing reports on Good Corporate Governance (governance) which are guided by Bank Indonesia Regulation No.13/1/PBI/2011 by searching for published annual reports and determining the assessment made by the bank based on a self-assessment system.

Table 5. Criteria for Determining GCG Ratings (Self Assessment)

Rating	Information
1	Very good
2	Good
3	Pretty good
4	Not enough good
5	Not good

Source: Bank Indonesia Circular No. 15/15/DPNP of 2013.

3. Earning (Rentabilitas)

Earnings (profitability) assessment is measured using the Return On Assets (ROA) ratio using the following formula: $ROA = (\text{profit before tax}) / (\text{average total assets}) \times 100\%$.

Table 6. Criteria for Determining Earning Rating (ROA)

Rating	Information	Criteria
1	Very healthy	$ROA > 1,5\%$
2	Healthy	$1.25\% < ROA \leq 1,5\%$
3	Healthy Enough	$0,5\% < ROA \leq 1,25\%$
4	Unwell	$0\% < ROA \leq 0,5\%$
5	Not healthy	$ROA \leq 0\%$

Source: Bank Indonesia Circular No. 6/23/DPNP of 2004.

4. Capital

Riyadi (2006:171) says that every bank operating in Indonesia is required to maintain the Minimum Capital Adequacy Requirement (KPMR). The level of Minimum Capital Adequacy Requirement or CAR of a bank will be influenced by 2 main factors, namely the amount of capital owned by the bank and the amount of Risk Weighted Assets (RWA) managed by the bank. This is because the assessment of the capital factor is based on the ratio of Capital to Risk Weighted Assets (RWA). Capital factor assessment is measured using the Capital Adequacy Ratio (CAR) with the following formula: $CAR = (\text{Bank Capital}) / (\text{Risk Weighted Assets}) \times 100\%$.

Table 7. Criteria for Determining Capital Rating (CAR)

Rating	Information	Criteria
1	Very healthy	$CAR > 12\%$
2	Healthy	$9\% \leq CAR < 12\%$
3	Healthy Enough	$8\% \leq CAR < 9\%$
4	Unwell	$6\% < CAR < 8\%$
5	Not healthy	$CAR \leq 6\%$

Bank Risk Based on "Economic Analysis of Law" Theory

Some of the fundamental concepts of economics are: rationality, value choice, efficiency, utility, game theory, and transaction costs. These concepts are related to one another and also complement each other. Example: efficiency, not stand alone. All of these concepts explain and complement each other, and the most important thing is to derive the following concepts.

The concept of rationality is the main framework for understanding human behavior. In economics human rationality is more emphasized on the equality of human desires. This desire is a human effort to meet their needs and achieve satisfaction so that humans are said to be rational maximizers. This human endeavor involves choices. Humans are able to calculate (according to their level of rationality) the available choices and then make the decision that they feel is best for them. The ability to choose like this is also said to be human rationality. Humans as rational maximizers tend to achieve their goals in the most efficient way.

In general, people want more of the resources that are available and possible to have. This is the concept of scarcity: the limited resources available because humans use them to meet their needs. Scarcity forces humans to make the most worthwhile choices. This emphasizes that if people cannot choose the right option, then humans will choose the next best alternative. The definition of a "right" choice varies from person to person, again based on their rationality and needs. From an economic point of view, an option can be said to be correct if it is right on target in economic activities that end with the most valuable results, in this case satisfying.

Legal and economic experts have differing descriptions of the concept of efficiency which are built based on different definitions. According to the Pareto theory, efficiency generally concerns individual satisfaction and preference as one of the concepts of efficiency that is widely applied in law and economics, and Kaldor-Hicks efficiency is also often used. Garner divides Pareto efficiency into two types, the first is Pareto superiority as an economic situation in which an exchange can be made that benefits someone and injures no one. When this economic situation cannot occur, it can be said that efficiency is Pareto optimality, namely an economic situation in which no person can be made better off without making someone else worse off. While the Kaldor-Hicks efficiency concept: a situation in which all possible wealth-maximizing changes have Occurred. Walth maximization is defined as: a situation resulting from a change in the allocation of resources if the change benefits the winner. Concepts of efficiency of this kind lead to elements of justice in law.

There is a very important relationship between efficiency and utility. For economists, utility reflects the benefits and benefits of economic goods. If someone believes that his actions were successfully efficient, then at the same time he concludes the results are satisfactory. This satisfying result signifies the effectiveness behind its actions. Satisfying results like this also reflect human satisfaction over the fulfillment of desires which also have a monetary and/or non-monetary nature. Human satisfaction can be categorized as monetary and/or non-monetary economic benefits.

The concept of utility in Law and Economics is used in a quite different sense, especially in its meaning in economics and utilitarian teachings. For most economists, utility is generally used to distinguish uncertain costs

from certain ones. Utility is also usually referred to as expected utility which results in risk analysis, while utility in the sense used by philosophers of utilitarianism is happiness.

In Law and Economics, utility in the elaboration of Economic Analysis on Law is narrowly defined as usability or function to seek uses or benefits from economic goods that produce or provide benefits, even broadly it can be interpreted as welfare. The diversity of definitions from various scientific perspectives has the same element, namely as a human effort to increase profits for the sake of self-satisfying prosperity.

The meaning of the word profit has a wide range of contexts, namely in terms of monetary and/or non-monetary terms. Utility is one of the economic considerations as a basis for making decisions by humans who basically want to get benefits or advantages, according to their expectations. The decision taken is said to be rational, because humans can clearly distinguish between definite and uncertain gains and losses. Something that is not certain this is economic risk as well.

To make decisions, comes game theory, which is basically the study of how people behave in situations where their actions can affect the reactions of others. This situation should be like a game, a game that requires strategy. This game theory has a much wider application, some economists say it is coordination theory. Wessels explained that game theory extends the tools of economic analysis to any situation where humans must coordinate their actions with one another, whether in the family, at work, in social groups, even in the relations of a country with other countries. Two important frameworks in game theory. First, the emphasis on human rationality in formulating strategies consisting of choices, so that this kind of rationality is categorized as a well-ordered human preference. Second, he connects the causality of these strategies, so that they cause reactions, impacts, and consequences for others.

All considerations of costs are scrutinized by humans. These costs are known as transaction costs or transaction costs. Generally, transaction costs are all costs incurred due to external factors in interacting or acting, in this case to make decisions. The word cost has the broad meaning as: monetary and/or non-monetary expenses, impacts, risks, deficiencies, weaknesses. The decision taken with all these considerations is a strategy.

According Richard A. Posner, The terms “value” and “efficiency” are technical terms. “Efficiency” means exploiting economic resources in such a way that “value” -human satisfaction as measured by aggregate consumer willingness to pay for goods and services - is maximized. Willingness to pay, the basis of the efficiency and value concepts, is a function of many things, including the distribution of income and wealth.

We can see this if $\text{Benefit} > \text{Cost} = \text{Efficiency}$. This means that if the benefits obtained are greater than the costs incurred, it is called efficiency. Or $\text{Cost} < \text{Benefit} = \text{Efficiency}$, meaning that if the costs incurred are smaller than the benefits/benefits obtained. Efficiency (Efficiency) = Justice (Justice) means that if efficiency has been achieved it means justice is also achieved. Justice (Justice) = Social Welfare Maximization (Community Welfare), meaning that if justice is achieved, so will social welfare.

“...that economics has both a normative and a positive role in the study of law and legal institution. The claim that economics is a tool of normative as well as positive analysis of law and legal institution – that is a source of criticism and reform as well as understanding – is only superficially inconsistent with the point stressed in the first chapter that the economist is not the ultimate arbiter of social choice.”

Instrumental Economic Analysis of Law are: (1) Risk Risk Analysis; (2) Cost Analysis; (3) Multi Criteria Analysis; (4) Sensitivity Analysis; (5) Fiscal Impact Analysis; (6) Regulatory Impact Assessment; (7) Cost Effective Analysis; (8) Cost Benefit Analysis.

Risk-Based Schemes in Other Countries

Several methods are widely used by Deposit Insurance Corporations (LPS) in the world, in resolving bank bankruptcy, or managing troubled banks to bring the bank back to health, including: (a) Liquidation and payment of customer deposits' (b) Purchase-and-assumption transactions; (c) Open-bank financial assistance.

The first method, namely the liquidation and payment of customer deposits or often called the paybox system, is to pay bills for depositors after the bank's business license has been revoked. In this system has no responsibility for supervision and regulation or the authority to intervene. This paybox system, requires adequate authority to make payments immediately. This system also requires access to customer information and adequate funding.

The second method is the Purchase-and-Assumption transaction (P & A) method, which is a method that can minimize risk (risk minimized method). In carrying out this method, the deposit guarantor relatively must have broader authority. These powers include: the authority to grant and revoke membership permits, the authority to assess and manage risk and the authority to conduct or request bank checks. This system can provide financial assistance in solving troubled banks. This system is also authorized to issue regulations and carry out settlement activities for troubled banks. With this method, the deposit guarantor transfers ownership of the troubled bank to a healthy bank or a newly established bank. The bank that receives the ownership buys the troubled bank's deposits and takes responsibility for all of its obligations (except subordinated loans). The Deposit Insurance Corporation will then restore the troubled assets. The third method is open bank financial assistance, which is a method of providing financial assistance to troubled banks to restore the bank's health.

Table 8. Comparison with Other Countries, Amount of Deposit Protection System Schemes

No	Country	Premium	Strength	Weakness	Guarantee Limit
1	Indonesia	0.1 % (one thousandth)	-	a. Flat system premium. b. The	Rp.2.000.000.000,- (two billion rupiah)

				premium amount does not cover the entire deposit amount.	
2	United States of America	Max Insurance Coverage is: US \$ 5.000 (1934) US \$ 10.000 (1950) US \$ 15.000 (1966) US \$ 20.000 (1969) US \$ 100.000 (now)	a. Premium Based Risk. b. From year to year, there has been a significant increase in the premium amount. c. All deposits are covered/guaranteed	-	The FDIC allows banks to cease their business activities and pay out all FDIC-insured deposits.
3	Thailand	The highest is 0.5% of the deposit amount.	a. Set the highest limit for the amount of premium. b. All deposits are covered/ guaranteed .	-	Overall guarantee (blanket guarantee) - 1997.
4	German	0,03 % from obligations.	a.. Set the highest limit for the amount of premium. b. The guarantee coverage limit is set at 90 million Euros.	-	All non-bank deposits are guaranteed a maximum of 30% of the capital obligation of troubled institutions. The minimum banking capital is 5 million Euros, the maximum guaranteed is 1.5 million Euros (50x Germany's per capita income). With the size of the Equity of a

					commercial bank of 295.5 million Euros, the guarantee coverage limit is 90 million Euros.
--	--	--	--	--	--

We can see the strengths and weaknesses of the "risk-based premium payment system" used in other countries compared to Indonesia, which uses a premium payment system with a "flat system", even though each bank's risk is different and each bank's soundness level also different.

Table 9: Systematically Compiled Formulation of Reformulation

No.	Current Formulations	Reformulation Formula	Information
1	Guaranteed deposits include demand deposits, time deposits, certificates of deposit, savings, and or other equivalent forms	Idem	
2	Article 11 of Law Number 24 of 2004 concerning LPS: The guaranteed deposit value for each customer at one bank is a maximum of IDR 100,000,000.00 (one hundred million rupiah).	Guaranteed deposit value for all deposits.	
3	PP No. 66 of 2008 concerning the amount of deposit guaranteed by LPS, Article 1 Guaranteed deposit value for each customer at one bank which was originally based on Article 11 paragraph (1) of Law no. 24 of 2004 concerning LPS, it is determined that a maximum of Rp. 100,000,000.- (one hundred million rupiahs), based on this PP, is changed to a maximum of Rp. 2,000,000,000.00 (two billion rupiahs);	Guaranteed deposit value for all deposits.	
4	a. Determination of the amount of premium, membership contribution is set at 0.1% (one per thousand) of the bank's paid-up capital and must be deposited into the LPS account no later than 90 (ninety) calendar days from the time the bank conducts operational activities. b. According to the LPS Law, Article 1 paragraph (1) The premium for each period	Some suggestions that could be considered include: a. Determination of premiums based on Risk. b. For deposits up to 2 billion rupiah , the premium rate is set at 0.1% (one per thousand), a flat rate.	

	<p>referred to in Article 12 is set the same for each bank at 0.1% (one per thousand) of the average monthly balance of total deposits in each period; paragraph (2) The premium rate as referred to in paragraph (1) can be changed if at least one of the following criteria is met: (a) there is a change in the value of guaranteed deposits for each customer at one bank as referred to in article 11 paragraph (1); (b) the accumulation of guarantee reserves has exceeded the target level of 2.5% (twenty five percent) of total deposits in each bank; or; (c) there is a change in the level of risk of failure (exposure) in the banking industry; (3) Changes in the premium rate as referred to in paragraph (2) are consulted with the House of Representatives; (4) The results of the consultation as referred to in paragraph (3) shall be further stipulated by a Government Regulation.</p>	<p>c. For deposits above 2 billion rupiah, the premium amount is determined based on risk (risk based premium), taking into account:</p> <ul style="list-style-type: none"> - health of each bank. - risks faced by each bank. 	

Conclusion

The current deposit insurance system scheme is a premium payment using a flat system of 0.1% (one per thousand) with a guarantee limit of up to 2 billion rupiah. This means that the amount of the premium does not cover the entire amount of customer deposits. Each bank has different risks and the soundness level of each bank is also different. So it is unfair for depositors, if the premium payment system scheme treatment is made flat at 0.1% (one per thousand) for all banks. It is time to switch to a deposit insurance system scheme based on the "Risk" scheme, for deposits above two billion rupiah. Of course plus considering: the health of each bank and the risks each bank faces.

Recommendations

I recommend the results of this research to be applied to the Deposit Insurance Corporation (LPS) in Indonesia.

-Each bank has different risks and the soundness level of each bank is also different. So it is unfair for depositors, if the premium payment system scheme treatment is made flat at 0.1% (one per thousand) for all banks.

-It is time to switch to a deposit insurance system scheme based on the “Risk” scheme, for deposits above two billion rupiah. Of course, plus considering: the health of each bank and the risks each bank faces.

Acknowledgements

I would like to express my thanks to honorable Prof. Dr. Suhariningsih and the whole kind team.

Fundamentals of an Integrated Performance Management Model in The Public Sector

Daniella Mihalik- Kucsma

University Of Miskolc, Hungary,  <https://orcid.org/0000-0002-6518-1901>

Abstract: Performance management is nowadays a very popular topic in the international arena. In my article I will attempt to present the basics of a possible conceptual framework. Among other things by using models that are already known from the literature. I will seek answers to the question which areas are important for the implementation of an effective system and which elements can be used to increase efficiency. After all, a valid performance management model should provide the expected efficiency, both for the owners (management) and for the users. In my article, I have chosen publicly funded hospitals as the sector specification, as healthcare is a priority area both domestically and internationally. It is essential to use models that have an established basis and can be adapted to the chosen specification. In my written work, I will not only cover the literature, but also areas that I believe are necessary to create a methodology that can be of help in practical application. In my article, I look for solutions that could be the basis for a possible conceptual model.

Keywords: Performance management, framework model, hospital area

Citation: Mihalik- Kucsma, D. (2024). Fundamentals of an Integrated Performance Management Model in The Public Sector. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1114-1131), Antalya, Turkiye. ISTES.

Introduction

The key role of performance assessment and management was first recognised by large companies (Bass, 1972), which achieved significant success, effectiveness and efficiency by operating processes and implementing appropriate systems. This is reflected in the growing body of literature and publications on the subject. The importance of the topic is also demonstrated by the fact that several publications (Gergely, 2011; Révész, 2015; Imreh 2002; Gaál, 2012) have also examined the performance management systems and tools of the public service sector. My choice of topic and its relevance is justified by the importance of the health sector and the increasing prominence of the quality of its services, which means that, like the business sector, the public sector needs to adapt successful methodological solutions from the business sector.

A well implemented and operated performance management system not only results in customer satisfaction, but can also provide a competitive advantage, organisational competence and capability over peers that has a positive impact on the management and positioning of the organisation. In my view, a structured analysis of this

sector can provide information and methodologies that can help performance management to become a management philosophy for these organisations (Kucsma, 2021, Dózsa, 2010; Csákvári, 2012).

The focus of my research is to present the advantages and disadvantages of performance management systems in the public sector, the mapping of which can provide important results for improving efficiency. In addition, it can serve as a starting point for defining research questions and identifying elements that can be adapted to a new support model. Krasz (2008) has focused on the existence of fairness in the study of performance systems, and has concluded that the role of trust and impartiality is important, and I will address this factor.

All of this identifies a research gap that can be specified for organisational performance management in healthcare institutions. Following the literature review, it can be concluded that there is no comprehensive synthesis study that focuses on performance measurement and evaluation and comparative analysis of the effectiveness of publicly funded health care institutions. There are, of course, some studies that describe the basics of a possible system, but the full analysis is not presented. Thus, the basics of this model concept are presented in this article.

Literature Summary

I will first systematise the understanding and approaches to performance and performance management in the public sector. In reviewing the literature for my research, I have sought to provide a comprehensive overview of performance management, which will also help to go into more detail. I also consider it important to present the general and public sector-specific characteristics of performance management. During the review of national and international literature, I will consider theoretical and practical issues that contribute to the logical structure of my research. The backbone of my dissertation is performance management, but due to its link to strategic management, I will also cover this topic area in the theoretical basis of my research / The source of sustainable competitive advantage is not only financial indicators or innovative technology, but also people (Veresné Somosi et al,2023), so it is worthwhile to integrate qualitative factors into my analysis based on these ideas. In this part of my research, I will also focus on health systems.

In this chapter, I systematise the understanding and approaches to performance and performance management in the public sector. In the literature review for my research, I have sought to provide a comprehensive picture of performance management, which will also help to go into more detail. I also consider it important to present the general and public sector-specific characteristics of performance management. During the review of national and international literature, I will consider theoretical and practical issues that contribute to the rationale and understanding of my research. The source of sustainable competitive advantage lies not only in financial indicators or innovative technology, but also in people (Veresné Somosi, et al. 2023), so it is worthwhile to integrate qualitative factors into my analysis based on these ideas. In this part of my research, I will also focus on health systems.

Performance Definitions

Based on the literature screening (PRISMA) carried out, the definition given by Szűts (1983) is that performance is nothing more than the achievement of objectives and the amount of effort that has been expended to achieve the expectations set. In this concept, it is not only the desire to achieve something that is reflected but also the calculation of the economic indicators that are at the forefront of how much effort is required to achieve it.

In conclusion, there is no generally accepted definition, and even those authors who deal with performance measurement or performance management in the literature do not define the concept, assuming its meaning to be common knowledge (Wimmer, 2001). However, because of the topic of this dissertation, it is necessary to talk about the concept of performance in the public sector. After reviewing the literature on performance definitions, it can be stated that there are two approaches to performance in the public sector (Van Dooren, 2006). One approach is that performance is seen as a value, and the other approach is that it is intended behaviour. In my work, the value approach is better suited to the understanding of performance, so an overview of performance management is the next step.

Approaches To Performance Management

The defining concepts of performance management are presented in Table 1. For comparability, I have tried to present each approach according to the same factors, but here the dimensions and novelty were not clear, as with the performance approaches, so I have only included the definitions and limitations. This conceptual presentation is also a conceptual typologisation of performance management and performance appraisal, which I have prepared using the PRISMA method. If I look for correlations between performance management, I can identify two important elements: effectiveness and efficiency. In the health sector, the economy is not a top priority, but the efficient management of public funds is the focus of operations.

The three components of performance management are:

- performance,
- performance management,
- benchmarking.

Table 1. Performance Management Approach

<i>Author(s)</i>	<i>Key content elements of the definition</i>	<i>Barriers</i>
Cleveland (1989)	There are four criteria that a performance management system must meet. Comparability of individuals, the availability of individual information.	Competency-based assessment is not considered. It is difficult to compare everyone based on the same elements.

	Human Resources system maintenance and compliance with the administration.	
Randell (1994)	Performance measurement and evaluation is a tool that forms the basis for pay and is also used to assess future potential. It is a process whereby the work done by an employee is observed, assessed, recorded, and reported on.	The focus is on examining processes; it is not certain that the performance of an employee is uniform.
Neely, Gregory and Platts (1995)	Performance measurement is the process of measuring the effectiveness and economy of an activity.	-
Statterfield (2003)	It is a strategic position, with alignment with the business or organisational strategy as its primary responsibility. He also aligns culture shaping with this.	A well-designed model contributes to the achievement of the organisation's objectives, but not in an individualised way.
Szakály (2005)	A complex multi-factorial process based on performance planning, where the manager receives feedback on the employee, department and organisation being evaluated. On the other hand, it is a feedback process for improvement.	The representation of future possibilities does not consider possible current errors.
Author(s)	Key content elements of the definition	Barriers
Bokodi (2007)	It is based on the objectives and levels set by the organisation within an agreed framework.	Employees are encouraged to maximise their competences and are not optimised for organisational performance.
Root, Finna (2008)	Measure the extent and manner of contribution to the performance of the organisation.	The organisational goals appear as the main objective.
Juhász (2013)	It has three main objectives: feedback, the effectiveness of selection, relative merit rating.	He considers human relationships to be the most important.
Gulyás (2012)	It is a measure of the performance and perception of an employee in an organisation over a given period, which is one of the key elements of the organisation's effectiveness.	It does not show continuity, it focuses on a specific period.
Government Decree 10/2013 (I.23)	A process for establishing performance based on specific metrics, results, and indicators.	In public services, it is not just the specific metric that is important.

Strategy

Because of the complex approach used in my research, in addition to the basics of performance management, it is necessary to examine the strategic trends and schools of thought. The relevance of this line of thought is that performance management, transferred from strategic management, can eliminate self-serving.

For an organisation to fit properly into both its economic and legal environment, it must have a reasonable start-up strategy. Most generally, therefore, the strategy defines the directions of adaptation to anticipated changes and the long-term objectives to be achieved. "Strategy" means the long-term objectives set by the company and the ways and means of achieving them. Strategic management, on the other hand, is management based on strategy formulation, implementation, and feedback" (Bartek-Lesi, et al. 2007 58pp.).

When we talk about health, it is important to mention that the strategy sets out how we intend to contribute to meeting the needs of users and society in each of the organisational units.

I have tried to depict the structure of the strategic process in a way that is well-aligned with the objectives I have set, and I have shown the methodological combinations I have used to investigate them in each phase of my research.

Strategy And Performance Management

Until the late 1980s, the theoretical literature on strategy formulation and strategic management, and the practical problems it addressed, focused on considerations of competitive advantage, and hence on consumer value. The corporate practice and theoretical literature of the 1990s turned to the value of ownership, exemplified by the work of Rappaport (Rappaport, 2002). What should be mentioned is that many authors try to integrate and link strategy and performance management into their work, based on organisational strategy. This can be seen in the books of the authors Kaplan– Norton, where the Balanced Scorecard integrated metrics system forms the basis of organizational strategy (Kaplan, Norton 1998, 2002). It can also be seen in the work of Nelly et al. on Performance Prism (Bartek-Lesi et al, 2007). In recent years, there has been a welcome increase in the number of research, publications, and practical applications of the relationship between organizational strategy and performance.

Comparison Of Performance Management Models

I have formulated the following elements as criteria for comparability:

- efficiency
- relevance and core elements of models
- applicability of models
- clarity and consistency.

These elements have been formulated based on my studies, but they need to be supplemented for better comparability. When we come across the word "barrier", we assume that some element or factor stands in the way of something being achieved. Since the performance evaluation models, I have used tend to come from the business management field, this implies a constraint and requires a transformation. In the following, I am looking for an answer to the question, if I want to investigate model comparability or to define a limit, which elements I should add to the elements I have already summarized above? When considering the model application, I think one of the fundamental elements is the issue of playability, how this factor appears in parallel with implementation and use, and what is it that needs to be looked at.

Table 2. Comparison of performance management models

Virginia Performance	Building consensus. Adapting to a planned strategy.	An adaptive system that considers the significant or limited influence of the state on each indicator.	Be accessible to local levels, the public and legislators to be properly informed and to make informed decisions on local issues.	The system automatically inserts the necessary data from the Performance Budgeting system and other databases.	The results-based approach implies a fundamental change of approach, which is the task of the current management.
Scotland Performance	To be a constantly evolving yet transparent source for evaluating government performance.	At its apex is an overarching vision, a vision that government action and state resources should serve the goal of becoming an even more successful country become.	From a methodological point of view, it is important to note that both the individual objectives (e.g.: economic growth) and the national indicators (e.g.: increasing exports) are structured in a coherent way.	From the value factor (positive or negative) assigned to the indicators expresses an assessment of the direction of change.	The indicators are validated by an evaluation team of senior civil servants and analysts.

Source: own editing

A well-implemented performance management system not only results in customer satisfaction, but also provides a competitive advantage over peers that affects the management and the market position of the

organisation. The key role of performance management was first recognised by large companies, which have achieved significant success, efficiency and effectiveness by operating the processes and systems associated with it. This is reflected in the growing body of national and international literature and publications on the subject.

However, the effective use of these management systems is less common in public service organisations. This is due to a number of factors, such as compliance with legislation, the specific characteristics of public service bodies and, not least, their management. There are a number of issues that arise in this context which also form the basis of this chapter. What are the keys to success? What factors contribute to the implementation and use of effective performance management in public service organisations? Can a performance management system become a management philosophy? In thinking about these questions, I asked myself how much of a role performance management plays in the life of a healthcare organisation and how it can be linked to customer needs. I looked at which framework models are applicable in the healthcare sector, which models have innovative elements, and what are their advantages and disadvantages. This is presented in detail in Table 2 above as a basis for literature research, but in a summary figure it is worth reviewing the models I have already analysed and compared.

Of particular importance to me were flexibility, the parallel treatment of organisational and individual values, and implementability.

What stands out is that all models have novel features that suggest that any model could be applied in a hospital's performance management system. However, this choice required more investigation, as it was not only the analysis of advantages, disadvantages and novelty content that determined the choice, but also good practices. The implementation of a system, both in time and economically, leads to high indicators, so I also conducted an international and domestic review, as the systems already implemented and the criticisms against them helped me to make the final choice.

Adapting performance models to a hospital

The performance management models and methodologies I have examined have relevance for the adaptation of a performance management system in a publicly funded hospital. My primary goal is to select a model that can be the basis for a combination of methodologies that will allow a hospital to choose performance indicators that are adapted to the nature of the institution. Thus, the Balanced Scorecard's balanced scorecard system of indicators was chosen as the primary basis for a future "indicator bank". The development of a framework model also adds complexity, so additional methodologies were subsequently incorporated into the framework model.

The BSC system, when properly selected, provides clarity and at the same time measurability of the strategic directions of the organisation's strikes (Lipták, Musinszki 2022). In parallel, it utilises the correlations supported

by motivational theories that goals influence the behaviour of the organisation (Horváth- Partners, 2007). Strategic goals are composed of two important elements, the vision and core strategic objectives, and are therefore considered key and critical elements for success in the organisation. To ensure that these objectives are met and can be monitored, financial and non-financial indicators are assigned to them and the planned and actual values of the indicators are compared. The name of the model developed by the Kaplan Norton authors is revealing, as it assumes a balanced set of indicators that clearly sets out to demonstrate the performance of an organisation. The four perspectives of the method:

- Financial perspective,
- customer perspective,
- operational process perspective,
- learning and development perspective.

The fundamental question is what the owners expect from the organisation, i.e. what needs to be done to make the company successful in the owners' perception. The other question is how the customers expect the organisation to perform, and here we need to look at success from the customer's perspective (Szívós, 2007). The learning and development perspective is also important, as it is important to focus on how we can achieve customer satisfaction, what are the key processes in which the organisation needs to excel, and what are the areas where the organisation needs to optimise. And by this perspective, we also mean how to sustain the improvement in the future, what the company needs to improve, what the organisation needs to learn. Performance improvement and management is emphasized, as this perspective helps the organization to achieve excellent results in other segments (Jarjabka, et al 2010) This not only emphasizes the role of the organization, but also the individual, and the role of motivation is emphasized, as it increases organizational effectiveness. All four perspectives are important, because if we want to define an effective organisation, all elements contribute to achieving this, but if we look at what areas are covered and what indicators can be placed under each pillar, the model needs to be completed.

According to the OECD statement in 2010, social innovation has a crucial role to play in improving public sector performance (OECD, 2010). (OECD, 2010) Furthermore, in 2018, the OECD has taken on the task of developing a set of indicators to help assess the performance of services and the organisation, however, this set of indicators is still under development, i.e. in the pilot phase. A number of articles and studies mention to us that public sector processes are not the same as those in the competitive sector. It is worth mentioning the contribution of performance, both to individual development and to organisational goals, in both the competitive and the public sector (Dajnoki, 2007) The concept of New Public Management is often mentioned in innovation studies in the public sector, and in this field the following elements have also been given a prominent place: effectiveness, quality, economy and competitiveness. (Halász, 2016) Based on the elements formulated, one could say that it is easy to define metrics based on these elements, but it is not so trivial.

The main objective is the GoodLife Impact, as it is necessary to provide a high quality service to society, but what does this mean? In my research I set out to assess what this might mean from a user or patient perspective,

but repeated attempts were not successful as everyone defined this element(s) differently. In my opinion, the most important are quality health promotion and health restoration services (Kocziszky et al. 2015)

In addition, effectiveness and efficiency were also included, although these concepts are very general, according to Gajduscek (2011), effectiveness is a concept of a measure of how well an organisation has achieved its goals. Efficiency, on the other hand, is nothing more than the amount of resources that are put into the goals, i.e. the effort required to achieve these goals. Thus, these concepts are also the key ones in my research (Gajduscek, 2011).

The third level includes both soft and hard factors, which can be associated with the development of an indicator system, so these factors are also important in the goal hierarchy.

- Limited use of resources: the potential of public service bodies is limited, as they use public money, but it is worth noting that in this sector the ultimate goal is not to maximise profit, but as they use public money, they should focus on efficient and economical operation (Csath, 2016)
- Lean thinking and approach is very important, as optimising the sequence of care and examining patient care pathways is important and essential for an institution.
- Raising service standards: although we are talking about public service organisations, one of the characteristics of public service organisations is that their clientele is the whole population, so they must not only serve a certain segment of the population, but almost everyone comes into contact with this type of organisation in some way during their lifetime (Lannert, 2004)
- Leveraging organisational capabilities, as performance management systems focus primarily on these elements, this should also be given priority as it is important in defining the vision and also in achieving the elements defined at the first two levels.

I have attempted to draw a hierarchy of objectives that could be a possible solution in a publicly funded hospital, illustrated in Figure 2.

Figure 2. Possible hierarchy of objectives for public service enterprises

Relationship between the framework model and strategy

A framework should provide an objective way for hospital managers to measure the hospital's performance. It is a complex task, involving both content, quantitative and qualitative indicators. To achieve this, the framework should allow the hospital's mission and strategy to be broken down into specific indicators according to different aspects, and the evaluation of the indicators should provide feedback to the hospital's managers on the functioning of each department. The benefit of this lies in the fact that the strategic objectives and indicators help to ensure that the objectives are accompanied by quantifiable results (Bakó, 2021).

What should the framework provide?

It must include meeting the demands of taxpayers and patients on the organisation to varying degrees (Hollósy, 2017). This is where the issue of efficiency and effectiveness, mentioned earlier, comes in, i.e. what resources are used and what results are achieved. All taxpayers want to know how the tax they pay is being used, and this is coupled with the concept of transparency, in addition to the two key definitions at the second level of the hierarchy already mentioned above. Sustainable development can be seen as a broader social requirement, of which environmental awareness and respect for the natural environment as far as possible are an integral part.

Patients' basic expectation of a hospital is that they should receive the high quality, state-of-the-art care available there. Ensuring equal opportunities and the enforcement and protection of patients' rights is not only a professional but also a legal obligation under the provisions of Act CLIV of 1997 on health care. Patients should prefer to spend as little time as possible in hospital and have their basic comfort needs met during their stay.

The question is how performance management can help and contribute to this. The framework used must answer the question of which processes to focus on and in which areas an institution needs to excel. The framework should take account of opportunities for improvement. For example, the hospital should organise training courses for its own staff, or conferences where medical professionals can share their expertise and experience (Takács, 2014), including the possibility of clinical research in the hospital, the need for continuous IT development with the advent of digitalisation, and aspects of increasing staff motivation. To define the strategic objectives, I consider it useful to use the strategic map often used today. In the following I will present the basics of a framework model, which can be the basis for a multilevel framework model and to which indicators can be linked.

Conclusions, Results

My summary of the literature illustrates that performance management without strategy does not work. Thus, it is essential to create a model and represent it at one level of a multi-level model that can also map a strategy. However, the existence and development of a strategy in health care institutions is not straightforward, since the

link to the hierarchy of objectives is not comparable to that of a competitive sphere.

And comparing performance models is a challenge in this area because specifications often affect both the goals of the organisation and the effectiveness of the organisation. However, in order to measure the implementation of strategy in a functioning institution, it is worth looking for a methodology that shows us that there is goal-oriented management in the institution, i.e. that operations are aligned to goals and have a strategy. One possible solution could be to use the model I have designed first almost when performing a parametric analysis of the organization, both at the strategy and organizational level, as shown in Figure 3 below.

Figure 3 First level of a multi-level model

Source: Own editing

This level is what is known as an exploratory level, which shows how the organisation relates to the objectives, how it should adapt to the performance indicators formulated, and helps to select a performance management methodology for the given institution that best measures the organisation in relation to its environment and its capabilities.

This is particularly important in the holistic sector, as the parameters of institutions vary, both in terms of the number of beds and the number of wards, so there is a need to provide a choice that seeks to measure the most efficient way. In what follows I will present the specifics of the second level of my model, which focuses on the models identified in the literature base, so it is worth seeing how each model specification can be assigned to each of the individual properties, following of course the preliminary first level analysis. Figure 4 shows us.

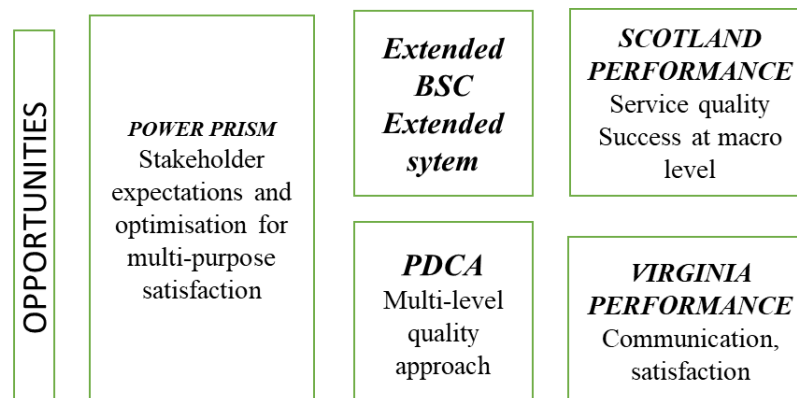

Figure 4 Modell Summary

Source: Own editing

My plan is to link to this level a so-called indicator bank, where the hospital management can select specific indicators for their institution and thus be able to measure them within the organisation.

Conclusion

In the context of this research, I focused on the challenges of managing healthcare institutions. My research had its difficulties, as in many cases the data was limited and the process took longer. It was necessary to filter by the parameters of the institutions in order to have the same research conditions. My aim in writing this article was primarily to show that performance management in the public sector, and specifically in the life of public hospitals, is as much an area of focus as it is in a competitive sector. I think this deeper rather literature insight is in part a demonstration of the primary steps of a model to justify what I have set out to do.

A hospital will always have a prominent role in the life of a society, a country, a city, since all members of society encounter the institution during their lifetime, so it is worth focusing not only on measurability and improvement, but also on the possible need for a management system management philosophy in the life and functioning of an institution.

Strategy for Improving Marketing Skills Through Internship Program in the Property Industry

Catarina Manurung

Bina Nusantara University, Jakarta, Indonesia

Abstract: The property industry is one of the economic sectors that is growing rapidly. To face increasingly fierce competition in marketing, development companies must have a competent team. Internship programs have emerged as an effective way to improve marketing skills in this industry. This research aims to analyze strategies for improving marketing skills through an internship program in the property development industry. The results of this research show that the internship program has become an integral component in the marketing skills development strategy in the property industry. This strategy includes several stages. First, choose internal candidates who have the appropriate interest and background in marketing. Second, provide intensive training that involves in-depth understanding of property products, market understanding and communication skills. Third, place it in an active marketing team, so you can apply knowledge in real situations. Fourth, provide ongoing guidance and feedback to internals throughout the program. The results show that the internship program is effective in improving internal marketing skills, to increase the company's ability to market property more efficiently. The program also provides additional benefits in the form of networking and valuable practical experience. The strategy of increasing marketing skills through an internship program is a smart step for developer companies to face challenges in the dynamic property industry.

Introduction

The property industry is one of the economic sectors that is experiencing rapid growth in various parts of the world, including Indonesia. In recent decades, demand for residential, commercial and infrastructure has driven the growth of this industry significantly. Along with this growth, competition in the property industry is getting tighter, forcing developers to innovate in various aspects, including marketing.

Marketing is a social and managerial process in which individuals and groups get what they need and want by creating, offering, and exchanging valuable products with others (Kotler, 2005). According to W. Stanton, marketing is a business unit that aims to design, evaluate and market goods and services that can satisfy the

needs of buyers and potential buyers. WY Stanton explains that marketing is a comprehensive system of business activities that aims to design, evaluate, promote and distribute goods and services that can satisfy the needs of buyers and potential buyers. The American Marketing Association (2009) explains that marketing is an organizational function that aims to benefit the organization and its stakeholders by creating, communicating, and providing value to customers in order to manage customer relationships. Based on the definitions above, it can be concluded that marketing is an activity to offer goods or services and create individuals or groups whose aim is to obtain reciprocity in the form of profit.

Marketing has a very important function in business activities. With marketing, business actors sell their products and services to consumers. By understanding the function of marketing, business people can make maximum use of it so that it can benefit their company. According to Kotler (2001), marketing functions are: (1) Collecting potential information in the marketing environment regarding current customers, competitors and other forces; (2) Attracting buyers by developing and disseminating persuasive communications; (3) Agree on the price and other terms so that the transfer of ownership of the goods can be carried out; (4) Marketing assumes the risks of carrying out marketing channel functions; (5) Manage product movement to customers and storage.

Apart from marketing, there is also marketing communications. Marketing communication is the process of disseminating messages, the process of disseminating information and messages to communicators through communication means and channels. In accordance with their nature, humans always communicate to perfect their knowledge so they can adapt to their environment. Communication is the process of transferring information from one person to another and vice versa (Cangara, 2015). Promotion is part of the entire marketing communications process. Advertising helps marketers improve information sharing relationships with others. Feedback is another part of the communication process. This feedback shows the effectiveness of your communications and provides an opportunity to adjust your promotional efforts to market preferences.

Marketing is a key element in property business success. The ability to market a property effectively creates opportunities for profitable sales. Therefore, it is very important for developers to have a qualified and skilled marketing team. One method implemented by developer companies to improve marketing skills is through an internship program.

There are several kinds of understanding of strategy from experts. Marketing strategy is a way of dealing with changing environmental and competitive conditions by establishing a series of policies, rules and objectives that can provide direction to help companies carry out marketing efforts from time to time (Assauri, 2013). Meanwhile, according to Kotler, 2002, marketing strategy is to achieve profitable relationships with customers through the value created by the company for customers. From this understanding it can be concluded that marketing strategy is the establishment of policies or rules that are created to help companies gain or achieve profits.

The internship program is an opportunity for students or individuals who want to gain practical experience in the world of work. In the context of the property industry, this program allows students or interns to engage in property marketing activities, learn about the property market and develop their communication skills. The use of internship programs as a strategy to improve marketing skills in the context of the property industry still requires deeper understanding.

At the same time, there are several problems that need to be overcome in using internship programs to improve marketing skills. First, developers often face difficulties in selecting internal candidates who have interests and backgrounds that suit the property industry. Appropriate criteria in internal selection are crucial so that the internship program can provide maximum benefits. Second, development companies need to ensure that interns actually gain valuable practical experience, not just carry out routine tasks. Good practical experience, helping them develop a deeper understanding of the dynamics of the property industry. Third, there is a need to align internship programs with ever-changing market needs and continuously developing technology. This means that these programs must be constantly updated and adapted to be relevant to the latest developments in the industry. Apart from that, another problem that may arise is the lack of adequate guidance and feedback to internals during the program. This can hinder their development and reduce the benefits of the internship program. Therefore, it is important to evaluate the strategy and implementation of internship programs in the property industry holistically.

The Special Region, which is known as a city of education and tourism, has its own charm with its rich culture, arts and culinary delights which can attract new arrivals who want to visit, study and even open a business. This causes a large demand for houses, both as private residences and to open businesses. The need for housing has led to the rapid development of the property industry. Many property developers and sales individuals have emerged who are marketing houses in the area. However, there are also many property developers who collaborate with property sales to market their products. Because many property sales sell several similar housing units, this often leads to unhealthy competition between salespeople. The pandemic has increasingly caused the housing industry's performance to decline, causing competition to become increasingly fierce.

Given these problems, we can identify ways to increase the benefits of internship programs in this industrial context. This research will attempt to explore effective strategies in improving marketing skills through an internship program in the property industry. It is hoped that this research can provide valuable insight for developer companies, educational institutions, and the government in developing more effective and relevant internship programs in the future.

Goals

This research aims to investigate in depth strategies for improving marketing skills through an internship program in the property development industry. The property industry has become one of the most dynamic and significant economic sectors in many countries, including Indonesia. This rapid growth has given rise to

increasingly fierce competition, and has encouraged developer companies to look for innovative ways to increase their competitiveness. In this context, the role of marketing in communicating and marketing property products becomes very crucial.

The main objectives of this research are:

Identify effective internal candidate selection strategies.

One important aspect of the internship program is the selection of the right intern candidates. Therefore, it is necessary to create criteria and methods used by developers to select internal candidates who have appropriate interests and backgrounds. The aim is to help developer companies find interns who have the potential to develop in the marketing field.

Analyze internal practical experience.

It is important that internship programs provide valuable practical experience to interns. This aims to understand the types of tasks and projects given to interns during the program, as well as how these experiences contribute to the development of marketing skills. This is useful to help evaluate the effectiveness of existing internship programs.

Evaluate the program's relevance to market and technological needs.

As the property industry continues to change, it is important to ensure that internship programs are aligned with evolving market needs and changing technology. It is necessary to identify how the development company maintains the relevance of its programs by ensuring that interns gain an accurate understanding of the latest developments in the property industry.

Study the factors that influence the success of an internship program

It is necessary to analyze the factors that influence the success of the internship program in improving marketing skills. This includes factors such as guidance support and feedback to interns during the program, work environment, as well as collaboration between developer companies and educational institutions that organize internship programs.

Provide recommendations for improving the internship program.

Based on the research results, the final goal is to provide concrete and practical recommendations to developer companies, educational institutions and the government to increase the benefits of internship programs in developing marketing skills in the property development industry.

Through achieving these goals, it is hoped that we can provide a deeper understanding of the role of internship programs in developing marketing skills in the property industry. It is hoped that this research can make a positive contribution to the development of this industry and help developer companies to compete more effectively in an increasingly tight market.

Method

This research will use a qualitative approach. The qualitative approach allows researchers to explore and understand strategies for improving marketing skills through internship programs in industry. Qualitative research is very helpful for digging deeper insights into internal experiences, the views of developer companies, and the dynamics of internship programs.

a. Place and time of research.

This research was conducted at several property development companies in Indonesia. The selection of companies is made by considering various factors, including company size, reputation in the industry, and the diversity of projects being carried out. This research was conducted for six months, starting from the beginning of the year to the middle of the year, covering various stages of the ongoing internship program.

b. Sample selection.

Sample selection was carried out purposively. Selected were developer companies with a reputation in Indonesia, which had an internship program in marketing. Those selected were a number of interns who had participated in the program. This provides multiple perspectives for analysis.

c. Research sample.

The research sample consists of several leading developer companies that are actively implementing internship programs in the marketing field. In each company, interns will be involved who are undergoing a property marketing internship program during the research period. Those selected are interns who have diverse backgrounds and interests to obtain a more holistic view. In addition, interviews were conducted with marketing managers, internal supervisors and related staff to get a more comprehensive perspective.

d. Data collection technique.

Data was collected through in-depth interviews with interns, marketing managers, internal supervisors and related staff at each developer company. Participatory observation was carried out to understand the intern's practical experience during the program. Also given the opportunity to access documents and training materials

provided to interns. All interviews will be recorded and analyzed by transcript.

e. Data analysis

The collected qualitative data will be analyzed using a thematic analysis approach. This analysis will involve identifying the main themes that emerged from the interviews and observations. Data will be compiled, categorized and analyzed to identify patterns, similarities and differences in strategies for improving marketing skills through internship programs at various developer companies. Data analysis will be used to answer research questions and achieve the stated research objectives.

f. Validity and reliability.

To ensure the validity and reliability of the research, triangulation techniques were used by comparing results from various data sources, such as interviews with interns, marketing managers, and internship program documentation. In addition, a member-checking technique was used, and initial results were confirmed back to participants to ensure that the interpretation of the data was in line with their experiences.

This qualitative research method was chosen because it allows for an in-depth understanding of strategies for improving marketing skills through an internship program in the property industry. By exploring the views and experiences of various stakeholders, this research is expected to provide valuable insights and concrete recommendations for developing more effective internship programs in the future.

Results

With the increasing need for housing in the form of decent housing, conducive, cheap to operate, and not limited to certain areas, this has encouraged more and more businesses and investors to emerge in the real estate sector. The property business is a very attractive business option for investors because this business sector serves the increasing needs and demand for land and housing. Real estate investment is a profitable and promising business because it grows every year.

Real estate investments are investments in land, buildings, parts of buildings, or facilities managed by businesses to generate rental income. Opportunities and challenges Real estate investment has the potential to support national development by increasing wealth both directly and indirectly (through contributions to national GDP) while generating income from central and regional governments. In addition, along with the increase in land and building prices, more and more buildings such as flats, apartments, access centers and other real estate projects are emerging. The increase in land prices after the property is built is also a profit that can be taken for these business people. It cannot be denied that the increase in land prices, which can double, is one of the sources of profit for property developers. In addition, the increasingly scarce availability of land causes

prices to increase.

Discussion

A. Selection criteria for internship candidates

In the context of the dynamic and competitive property industry, selecting the right internal candidate is a crucial first step in the strategy to improve marketing skills through an internship program. Good internal candidate selection criteria will ensure that this program provides maximum benefits for the developer company, students or individuals who participate.

This research discusses in depth the relevant and effective internal candidate selection criteria in the property development industry in the form of:

Interest and passion in the property industry.

One of the main criteria in selecting internal candidates is their interest and passion for the property industry. Intern candidates who have a strong interest in this industry are more likely to be dedicated and enthusiastic participants in undergoing an internship program. They have an intrinsic motivation to understand the dynamics of the property market, property products and marketing strategies used.

Relevant educational background.

Another selection criterion is the educational background of prospective interns. Preference is given to those with an educational background relevant to marketing or the property industry. Students who have completed related study programs such as marketing management, business management, or property studies have a more solid knowledge base to contribute to the internship program.

Strong communication skills.

Good communication skills are an important aspect of marketing. Therefore, prospective interns must have strong communication skills, including the ability to write, speak and communicate effectively with various parties. This is important because interns will be involved in marketing activities that involve interactions with clients, colleagues and the community.

Analytical and creative abilities.

In the property industry, analytical skills to understand market trends, property data and consumer behavior are invaluable. Internal candidates who have good analytical skills can help developer companies make decisions

based on data. Apart from that, creative abilities are also important in designing innovative and attractive marketing strategies.

Adaptability and openness to learning.

The property industry is always changing, therefore, prospective interns must have the ability to adapt quickly to changes. They must also be open to learning and personal growth. This includes a willingness to master ever-evolving digital marketing tools and new trends in the industry.

Ability to work in a team.

Property marketing often involves a multidisciplinary team. Therefore, the ability to work in a team is an important criterion in selecting internal candidates. The ability to collaborate, share ideas, and work together with other team members is a determining factor in the success of a marketing program.

Problem solving abilities.

The ability to identify a problem, analyze it and find a creative solution is something that is highly valued in the property development industry. Internal candidates who have good problem solving skills can make a positive contribution in overcoming complex marketing challenges.

The selection criteria for internal candidates that have been explained are very helpful for developer companies in selecting the most suitable individuals for the internship program. In this way, the program can provide greater benefits for all parties involved, and improve the quality of the marketing workforce in the property development industry.

B. Practical intership experience

Intern practical experience plays a central role in the success of internship programs in the property industry. In this context, practical experience includes various tasks, projects, and interactions experienced by prospective interns during the program period. This experience is invaluable as it provides interns with the opportunity to apply their theoretical knowledge in real-world situations, deepen their understanding of the property development industry, and develop skills that are highly valued in property marketing.

One important aspect of an intern's practical experience is their involvement in the day-to-day activities of the developer's company. This includes participating in marketing team meetings, understanding the property's product offerings, and observing ongoing marketing strategies. Over the course of the program, interns are involved in collecting and analyzing market data, understanding consumer behavior, and identifying relevant

trends. In doing so, they will have the opportunity to develop the strong analytical skills that are essential in property marketing.

The intern's practical experience also includes involvement in concrete marketing projects. This includes designing property marketing campaigns, developing promotional materials, or designing digital marketing strategies. Interns can be directly involved in interacting with clients or prospective property buyers, providing a valuable opportunity to improve their communication skills and interpersonal skills. Practical experience can also enable interns to understand legal and regulatory aspects related to the property development industry, such as licensing regulations, zoning regulations, or environmental regulations. This knowledge is important because errors in understanding and complying with regulations can have a serious impact on a property development project.

The intern's practical experience also includes learning about the technology used in property marketing. This includes the use of marketing software, social media platforms, and data analysis tools. With the rapid development of technology in this industry, internals must be able to adapt to these tools to support effective marketing strategies. During the internship program, interns also have the opportunity to work with a diverse team in a developer company. This includes working with experienced professionals in marketing, sales, architecture, law, and other related fields. This not only provides a different perspective on the industry, but also helps in developing collaboration skills and team working abilities, which are highly valued attributes in the world of work.

Internal practical experience in the property industry internship program is an important stage in developing marketing skills. This provides a real-world context that cannot be simulated in an academic setting. This experience provides deeper insight into industry dynamics, allows interns to develop relevant skills, and prepares them for the challenges they face in the world of work after completing the internship program. It is important to ensure that the program is well designed and provides useful practical experience for prospective interns.

C. The relevance of the internship program to market and technological needs

In the fast-growing property industry, it is important for internship programs to be in line with changing market needs and increasingly advanced technological developments. The relevance of the internship program to market and technological needs is key to ensuring that prospective interns gain an accurate understanding of industry trends and the skills needed in a dynamic world of work. Adjusting the internship program is necessary to make it relevant to current market conditions and technology as a priority.

The property market is constantly changing in response to changes in licensing policies, changing consumer trends and other external factors. Therefore, the internship program must be able to keep up with market developments. The internship program must provide opportunities for prospective interns to observe and

participate in marketing strategies that are in line with the latest trends. For example, internal candidates must be given a strong understanding of how online property marketing functions, because this is the dominant trend in reaching potential property buyers.

In addition, internship programs should also enable prospective interns to understand changes in regulations and permits that affect the property development industry. Government policies, such as zoning regulations or environmental regulations, can have a significant impact on property development projects. It is important for internship programs to cover legal and regulatory aspects in the training of prospective interns. With a strong understanding of these regulations, prospective interns can help development companies comply with the rules and avoid potential legal problems.

The relevance of the internship program to technological developments is also very important. Technology continues to advance in the property development industry, from sophisticated marketing software to powerful data analysis tools. Internship programs should provide opportunities for prospective interns to interact with these technologies. This may include training in the use of digital marketing software, social media platforms, or data analysis tools used in understanding consumer behavior. When internship programs reflect relevance to the latest technology, prospective interns will be better prepared to face challenges in an increasingly connected and digital world of work. They will have the skills necessary to design effective marketing campaigns online, track campaign performance, and make data-driven decisions.

The relevance of the internship program to technological developments also includes an understanding of the latest trends in property construction. For example, understanding the concept of sustainable buildings and green technology is very relevant in this industry. Prospective interns who gain exposure to these concepts will be more valued in a workforce that is increasingly concerned with sustainability.

In order to maintain the relevance of the internship program to market and technological needs, developer companies and educational institutions must collaborate closely. This allows the internship program to keep up with the latest developments in the property development industry and ensures that prospective interns gain an accurate understanding of market dynamics and technology. Internship programs can play an important role in preparing the next generation of property marketing professionals for success in a dynamic and changing world of work.

D. Factors that influence the success of the internship program

The success of an internship program in the property development industry is greatly influenced by a number of factors involving various parties involved in the program. These factors are determining factors in ensuring that the internship program provides maximum benefits for the developer company, students or individuals who take part in the program.

In this context, the factors that influence the success of the internship program can be described as follows:

Leadership and commitment of the developer company

The role and commitment of the developer company is very important in determining the success of the internship program. Company management must consider the internship program as an investment in human resource development and must be ready to provide the necessary support, both in terms of human resources and budget. The company's seriousness in supporting this program will be reflected in internal experience.

Structured program design

A structured and well-organized internship program design is the key to achieving success. The program should have clear objectives, a well-crafted training agenda, and assignments relevant to marketing skills. A clear guide will assist interns in directing their efforts and ensure that they gain a comprehensive understanding of the property development industry.

Adequate guidance and support

Adequate guidance and support from a mentor or supervisor is an important factor in the intern experience. Mentors must be prepared to provide guidance, provide feedback, and assist interns in overcoming challenges they may face. This mentorship will help interns feel valued and supported in developing their skills.

Active internal involvement

The success of an internship program also depends greatly on the involvement and motivation of prospective interns. They must be proactive in taking initiative, asking questions, and actively participating in all aspects of the program. Strong engagement from internals will increase the benefits they get from this experience.

Accurate understanding of industry challenges

Prospective interns must have an accurate understanding of the challenges faced by the property development industry. This includes understanding changes in regulations, competition in the market, and consumer trends. The better their understanding of the industrial environment, the better they can contribute to overcoming those challenges.

Continuous evaluation and feedback

Continuous evaluation and feedback during and after the internship program is important. This allows development companies to measure internal progress and provide necessary feedback for their development.

Constructive feedback will help interns identify areas where they can improve their skills.

Collaboration with educational institutions

Good cooperation between developer companies and educational institutions that organize internship programs is also a key factor in the success of this program. Educational institutions must provide support in the selection of suitable internal candidates and ensure that their educational curriculum is relevant to industry demands.

In order to achieve a successful internship program in the property industry, it is important for all parties involved to understand these factors and contribute actively to ensure that this program provides maximum benefits for all parties involved. The success of the internship program is not only in understanding and mastering marketing skills, but also in providing prospective interns with a deep understanding of this dynamic industry, which will be a valuable provision in their future careers.

E. Recommendations for improving the internship program

Increasing internship programs in the property industry is a very important step to ensure this program provides optimal benefits for developer companies, prospective interns, and also to support the growth of this industry as a whole

.

The following recommendations can help improve the quality and relevance of internship programs in this sector.

First, increasing closer cooperation between developer companies and educational institutions that organize internship programs is key. This includes the initial stage of selecting internal candidates which focuses more on criteria relevant to the property industry. With closer collaboration, development companies can provide input about the abilities and skills they need from prospective interns. Instead, educational institutions can integrate practical elements in their curriculum that suit today's industry demands. This will ensure that students participating in the internship program have relevant knowledge that can be applied directly in the work environment.

Second, monitoring and feedback needs to be improved during the internship program period. The appointed supervisor or mentor must be actively involved in supervising and guiding prospective interns. Providing regular feedback will help prospective interns identify areas where they need to improve their skills and knowledge. In addition, good monitoring will ensure that this program runs according to plan and provides maximum benefits.

Third, in order to maintain relevance with technological developments and market demands, the internship program must integrate a strong digital marketing component. The world of property marketing is increasingly shifting towards online, and therefore, aspiring interns must gain a solid understanding of digital platforms, data

analysis tools and online marketing strategies. Development companies can provide access to the latest marketing software and provide training in its use. Additionally, interns should be involved in designing and executing online marketing campaigns as part of their program.

Fourth, developer companies can consider increasing transparency and communication regarding the objectives and benefits of internship programs to prospective interns. This helps in motivating them and ensures that they have a clear understanding of what is expected of them during the program. This understanding will help interns manage their expectations and maximize the benefits of this experience.

Fifth, to ensure that the internship program has a long-term impact, developer companies can consider building a network of internship program alumni. This can create opportunities for interns who have completed the program to stay connected with the developer company and with their peers. This alumni network can be a valuable resource in a prospective intern's future career and assist them in identifying job opportunities or business collaborations.

In order to realize the full potential of internship programs in the property industry, collaboration between developer companies, educational institutions and prospective interns is key. By implementing these recommendations, internship programs can become a powerful instrument in developing marketing skills relevant to this industry and supporting the sustainable growth of the property sector. All parties involved must work together to create an internship program that provides optimal benefits for all parties involved.

F. Challenges and opportunities

Internship programs in the property industry have various challenges and opportunities, which can influence the success of the program and the benefits provided to all parties involved. Understanding these challenges and taking advantage of existing opportunities is key to optimizing internship programs in this fast-growing industry.

Challenge

1. Dynamic changes in the property industry

One of the main challenges is the rapid changes in the property industry. Market fluctuations, changing regulations, and rapid technological developments can make it difficult for internship programs to stay relevant. Intern candidates need to be able to adapt to these changes and internship programs must be flexible in responding to them.

2. Selection of the right internal candidates

Selecting internal candidates who suit the development company's needs can be a challenge. Identifying

students or individuals who have interests, skills and backgrounds that suit the real estate industry can be a complex task. Errors in selecting internal candidates can result in a lack of program benefits.

3. Providing adequate guidance

Providing adequate guidance and supervision to prospective interns is another challenge. Supervisors or mentors who do not have enough time or knowledge can reduce the benefits of the internship program. Active involvement from the developer company in guiding internals is the key to overcoming this challenge.

4. Unrealistic expectations

Sometimes, prospective interns or developer companies can have unrealistic expectations about what can be achieved during an internship program. This can cause disappointment and frustration. It's important to communicate clear and realistic expectations from the start.

Opportunity

1. In-depth education

The internship program provides opportunities for prospective interns to gain a deep understanding of the property industry. They can see how property projects are developed from inception to completion. This can create a strong knowledge base for their future career.

2. Professional connections and networks

Internship programs also provide opportunities to build valuable professional connections and networks. Interns can interact with experienced professionals in the property industry and create relationships that can help them in their future job searches or business collaborations.

3. Significant work experience

The internship program provides significant work experience for prospective interns. They can get involved in real projects, contribute to marketing strategies, and face real-world challenges. This gives them an edge in finding a job after graduation.

4. Improved practical skills

The internship program provides the opportunity to develop practical skills in property marketing. By getting involved in the day-to-day tasks of the developer company, interns can strengthen their abilities in data analysis, digital marketing strategy, and interpersonal communication.

5. Positive contribution to the developer company

The internship program also provides opportunities for developer companies to get positive contributions from prospective interns. They can assist in the implementation of marketing projects, provide fresh perspectives, and present innovative ideas. This can increase the effectiveness and creativity of the marketing team.

In facing challenges and taking advantage of opportunities in an internship program in the property industry, it is important for all parties involved to work together effectively. With a strong commitment to overcoming challenges and maximizing opportunities, internship programs can be a powerful tool for developing superior property marketing talent and supporting the sustainable growth of the property industry.

Conclusion

In the competitive and growing property industry, internship programs are one of the most effective strategies for improving marketing skills. This program opens the door for prospective interns to gain an in-depth understanding of how property marketing works in the real world, and at the same time gives development companies access to young talents full of potential. In this context, there are a number of key strategies that can be used to improve marketing skills through internship programs in the property industry.

First, the internship program must be well designed and structured. This means having clear goals that cover the key skills the prospective intern wants to improve. This strategy must begin with a strong understanding of what is required in the property development industry, such as an understanding of the market, marketing strategies and technology used. With the right goals and understanding, an internship program can direct a prospective intern's efforts in the most relevant direction. The internship program should include a variety of tasks and projects that reflect the developer company's daily needs in terms of property marketing. Intern candidates must be involved in designing marketing campaigns, managing social media, analyzing market data, and communicating with clients or potential property buyers. This practical experience will help them develop strong marketing skills.

The internship program should allow prospective interns to learn from experienced professionals at the development company. Mentoring by those who already have experience in the property industry is an effective way to transfer valuable marketing knowledge and skills. Discussions, feedback and direct guidance from mentors will provide valuable insight into how the industry works. The internship program must also include an understanding of the importance of technology in property marketing. Prospective interns should be involved in the use of digital marketing tools, data analysis and social media platforms relevant to the property industry. This will give them an edge in facing increasingly digital marketing trends.

Communication skills development is another important aspect of this strategy. Internal candidates must be given the opportunity to interact with various parties, from colleagues to clients or potential property buyers.

Training in interpersonal communication, presentation, and writing are important steps in improving these skills. Internship programs can also take advantage of innovative marketing projects. Intern candidates may be tasked with designing creative marketing campaigns, using the latest technology, or identifying new opportunities in the property development industry. This program can encourage creative thinking and innovation in property marketing. Throughout the internship program, ongoing evaluation and feedback should be an integral part of the strategy. This allows prospective interns to track their progress, identify areas for improvement, and receive constructive guidance from their supervisor or mentor. This feedback is an important instrument in the learning process.

In the dynamic property industry, a well-designed internship program is one of the best ways to improve marketing skills. With a strategy that includes a deep understanding of the industry, practical experience, mentoring, training in the latest technologies, and an emphasis on communications, this program can provide significant benefits to prospective interns and help development companies develop top-notch marketing talent. Through the implementation of this strategy, the internship program can become a platform for creating the next generation of successful property marketing professionals.

Recommendations

I recommend the results of this research to be applied to improve the internship program in the future, in particular in property industry.

First, increasing closer cooperation between developer companies and educational institutions that organize internship programs is key.

Second, monitoring and feedback needs to be improved during the internship program period.

Third, in order to maintain relevance with technological developments and market demands, the internship program must integrate a strong digital marketing component.

Fourth, developer companies can consider increasing transparency and communication regarding the objectives and benefits of internship programs to prospective interns.

Fifth, to ensure that the internship program has a long-term impact, developer companies can consider building a network of internship program alumni.

Acknowledgements

I would like to express my thanks to honorable coordinator and site supervisor internship and the whole kind team in company.

A Cross-Sectional Analysis of Teachers' and Students' Attitudes Towards Digitally-Mediated Reading Courses in The "New Normal" Landscape

Lam Ngoc Dieu Dang

FPT University, Vietnam

Lam Ngoc Khanh Dang

Can Tho University

Abstract: The purpose of this research was to gauge how COVID-19 has shifted the mindsets of students and teachers toward online education. In March and April of 2022, researchers at a university used Google forms to conduct a prospective cross-sectional online poll. A total of 265 students and 18 teachers from universities in Southern Vietnam participated in the online survey. The significant indicators of success are the students' levels of familiarity and satisfaction with digitally-mediated reading courses and their perceptions of the challenges they face in putting the technology to use. In contrast to the greater consensus among faculty members, most students had a poor impression of the ease with which digitally-mediated reading courses was used. When asked about the benefits and advantages of digitally-mediated reading courses, the vast majority of students responded negatively. Poor internet access (80%) and computer proficiency (74%), for example, are obstacles to online learning by students and educators. Most students (43.5%) would instead take their final written exams on paper in the study rooms. Paper exams in the classroom were favored by 32.7% of professors, while 30.6% chose online exams, and 34.1% wanted to postpone exams till the following year. Given the widespread disruption to education caused by the COVID-19 pandemic, solid technological and institutional underpinnings are crucial for effective digitally-mediated reading courses, particularly during social distancing measures.

Keywords: Students, teachers, digitally-mediated, reading course, "new normal" landscape

Citation: Dang, L.N.D. & Dang, L.N.K. (2024). A cross analysis of teachers' and students' attitudes towards digitally-mediated reading courses in the "New normal" landscape. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1149-1159), Antalya, Turkiye. ISTES.

Introduction

The use of the internet to further education implementation is a novel concept that is gaining popularity quickly. It allows students to study when and where it is the most convenient for them at a much more economical way. It enables students to make effective use of both offline and online resources. Studies indicate that the

appropriate combination of digitally-mediated reading courses, in conjunction with traditional classroom training is able to maximize the benefits of both learning environments (Shabila et al., 2021). As stated by Barteit et al. (2021), globalization and the unpredictable and digital transformation world have created urgent needs of a more flexibility of teaching and learning, serving to promote the educational process. More progress was made toward this goal especially in the “New normal” phase (Srinidhi et al., 2021). It may originate from the fact that students and teachers have getting accustomed to the online learning mode due to the eaducational mode shift during the Covid-19 pandemic.

In Vietnam, this mode of learning reading has increasingly gained popularity, especially in the “New normal” landscape. Shaping into English language learning, digitally mediated reading courses are educational programs that incorporate digital tools and technologies to enhance and facilitate the teaching and learning of reading. Platforms such as LMS, Moodle, Blackboard are integral to digitally mediated reading courses. The purpose of this research was to assess the current level of understanding of digitally-mediated reading courses amongst teachers and students, as well as to identify any future needs for digitally-mediated reading courses implementation.

Research questions

1. What are the students’ attitudes towards the digitally-mediated reading courses?
2. What are the teachers’ attitudes towards the digitally-mediated reading courses?
3. What are the differences between teachers’ and students’ attitudes the digitally-mediated reading courses?

Method

The study employed a total of 265 students and 18 teachers. Participants in the study were informed of the objectives of the research and given assurances that their confidentiality would be maintained. An electronic invitation to take part in the survey was sent to a selection of students and instructors selected at random. In order to take part in the study, the participants were required to electronically provide their consent.

It was decided that a new study questionnaire was to be developed in order to facilitate the data gathering procedure and make it less difficult. Earlier surveys' responses were used to inform the development of this study's questionnaire, which was then sent out to respondents. A survey form hosted on Google was used in order to collect the necessary information. Once the material had been accepted by the researchers, who are professionals in the area of education, and assessed by those researchers, it was sent to the participants by email and many other social media platforms. This questionnaire was divided into five sections that are entirely distinct from one another. The demographic information of both the students and the teachers was the focus of the first section of the survey, which was meant to collect responses from both groups. The second section of the

test required the students to respond to four questions pertaining to digitally-mediated reading courses. The purpose of this section was to determine the students' overall level of knowledge on the topic. The third component of the survey consisted of seven questions, and its purpose was to study the techniques and motivations of respondents about digitally-mediated reading courses. A total of five questions were asked in the last phase of the survey to evaluate the respondents' familiarity with digitally-mediated reading courses platforms, their level of internet use, and the types of electronic devices they owned. In addition, we questioned them on the difficulties they anticipated coming across while putting digitally-mediated reading courses into action in their organizations. On a scale that went from "strongly agree" to "strongly disagree," students were given a variety of assertions and asked to indicate how strongly they agreed or disagreed with each of the claims. The appendices provide the findings of the survey that was carried out as part of this investigation.

A first test, or pilot study, was carried out in order to determine the most effective way to carry out the survey. It has been determined that the reliability of the questionnaire has an approximate value of 0.79, and that the amount of internal consistency it has, as determined by Cronbach's alpha, has an approximate value of 0.84. In order to complete the research project, the statistical software designed for the social sciences was used (IBM SPSS Statistics). The information was characterized based on the frequency of occurrence and the proportion of total occurrence, respectively. When calculating the totals for knowledge, practice, and attitude, the sum of the scores that respondents provided on the several test items for each category was added to the overall score for that category.

Results

Figure 1 compares the students' and teachers' attitudes towards three primary factors including the digital literacy, strengths, and challenges. Generally, both students and teachers did not have positive attitudes towards their digital-mediated reading course experiences. The mean attribute scores for both groups are lower than 2.5. This implies a significant level of dissatisfaction and discomfort with the current implementation of these reading course. When comparing between the two groups, it can be recognized that teachers have more positive attitudes than their counterpart in both of the aspects. A detailed description of each participant group's attitudes towards specific aspects will be presented in the following parts.

It can be concluded in table 1 that the vast majority of students had a negative view of the ease with which they might learn to utilize and become proficient in digitally-mediated reading courses. The majority of respondents (77.6%) expressed their opinion that they did not find digitally-mediated reading courses to be simple to implement. The majority of students were not of the opinion that digitally-mediated reading courses has many benefits, including the ability to facilitate group discussion on complex topics (63.5% of students), the ease of access, the flexibility of course scheduling, the ease of acquiring new skills (63.1% of students), and the ease of gaining access to digitally-mediated reading courses materials (61% of students). According to Table 2, the vast majority of students who participated in the survey either strongly agreed or agreed that digitally-mediated

reading courses presents challenges. When asked about the most significant challenges, respondents cited issues with internet access (74.3%), computer literacy (72.4%), and access to computers and cellphones (68%) as the most common ones.

Figure 1. Comparison between students' and teachers' attitudes towards the digitally-mediated reading courses

Table 1. Perspectives on digitally-mediated reading courses amongst undergraduates (n =265)

Attitude	Strongly disagree/Disagree (%)	Neutral (%)	Strongly agree/Agree (%)
Digitally-mediated reading courses usage			
Easy-to-use digitally-mediated reading courses	59.3%	27.3%	15.4%
Using digitally-mediated reading courses is simple to pick up.	55.4%	23.5%	23.6%
Acquiring expertise in the use of digitally-mediated reading courses is simple.	55.7%	22.8%	22.8%
Digitally-mediated reading courses is user friendly	77.6%	15.3%	10.6%
Strengths			
Courses are readily available online	56.4%	24.1%	20.9%
An interactive mode	60.7%	25.5%	14.5%
Cost-effective	38.9%	24.9%	36.8%
The accomplishment of a goal in a shorter amount of time	50.8%	26.8%	23.6%
Increase level of expertise	59.3%	24.6%	18.8%
Acquire better skills	63.1%	23.4%	15.2%
Easy accessibility, flexibility, and interactivity	61.0%	22.5%	16.4%
Group discussion on a complex topic	64.2%	22.8%	14.5%

A supplemental tool	55.6%	26.0%	20.6%
Prefer a blend of digitally-mediated reading courses and in-person instruction	52.3%	25.7%	25.2%

Challenges

Lack of computer and smartphone	21.6%	13.1%	68.0%
Poor internet connectivity	14.5%	11.3%	74.3%
Computer literacy	15.1%	14.9%	72.4%
Additional burden	22.8%	39.7%	39.9%
Time scheduling challenges between instructors and students	20.1%	17.3%	64.0%
Lack of understanding and information on digitally-mediated reading courses	17.7%	21.0%	64.7%

Table 2 depicts teachers' perceptions towards the digitally-mediated reading courses. When asked about their thoughts on digitally-mediated reading courses, the vast majority of faculty and staff employees said that it was simple to pick up and start using. On the other hand, there was a more good discussion around the question of whether or not digitally-mediated reading courses was user-friendly (47.5%). About one-third of professors and workers were in agreement with the majority of views on e-strengths, while more than half of respondents regarded digitally-mediated reading courses to be a supplemental tool and pushed for a mix of digitally-mediated reading courses and face-to-face learning. The largest and most significant percentages of professors and staff members believed that digitally-mediated reading courses was cost-effective (47.2%), preferred to utilize it as a supplement to regular classroom training (51.3%), and chose to employ both digitally-mediated reading courses and traditional classroom instruction (58.1%). The majority of the teaching staff and administration are of the opinion that digitally-mediated reading courses does have certain drawbacks. The results presented in Table 3 demonstrate that the majority of respondents agree that low levels of internet access and computer literacy are a problem.

Table 2. Teachers' attitude about digitally-mediated reading courses use (n = 180)

Attitude	Strongly disagree/Disagree	Neutral	Strongly agree/Agree
Digitally-mediated reading courses usage			
Easy-to-use digitally-mediated reading courses	31.0%	41.6%	39.4%
Using digitally-mediated reading courses is simple to pick up.	22.3%	34.8%	44.7%
Acquiring expertise in the use of digitally-mediated reading courses is simple.	22.7%	35.3%	54.3%

Digitally-mediated reading courses is user friendly	47.5%	28.5%	35.5%
Strengths			
Courses are readily available online	25.7%	37.9%	39.1%
An interactive mode	32.2%	39.5%	31.8%
Cost-effective	19.6%	35.3%	47.2%
The accomplishment of a goal in a shorter amount of time	27.5%	43.2%	41.3%
Increase level of expertise	29.1%	35.8%	37.5%
Acquire better skills	32.0%	36.4%	34.2%
Easy accessibility, flexibility, and interactivity	33.4%	38.0%	35.7%
Group discussion on a complex topic	35.0%	35.3%	32.0%
A supplemental tool	19.8%	32.2%	51.3%
Prefer a blend of digitally-mediated reading courses and in-person instruction	17.2%	25.3%	58.1%
Challenges			
Lack of computer and smartphone	8.1%	14.8%	80.0%
Poor internet connectivity	10.6%	20.6%	72.5%
Computer literacy	14.9%	42.7%	45.2%
Additional burden	18.7%	24.8%	60.0%
Time scheduling challenges between instructors and students	10.4%	29.0%	62.6%
Lack of understanding and information on digitally-mediated reading courses	20.5%	22.3%	60.4%

Discussion

Recent developments in digitally-mediated reading courses have significantly altered the traditional classroom environment, necessitating adjustments on the part of both students and teachers. The COVID-19 pandemic has only intensified this trend. This supports the claim that very little research has been done on online education. Multiple investigations have shown this to be the case (Dewi et al., 2021). This is the first research of its type to examine how online education is seen, understood, and felt by students, teachers, and administrators under a lockdown situation.

Most of our students have access to and sometimes use the internet, but less than half of them actually use laptops. This means that a solid grounding in information technology is necessary to launch an digitally-mediated reading courses program. The same results were found in another research, which digital natives should be able to guess (Parrubia-Lozano et al., 2021).

More than a third of students were looking for information on how to get started with digitally-mediated reading courses, but only around a third were familiar with the idea. However, around two-thirds of pupils knew that their university had access to online learning materials. In keeping with the results of earlier research, less than one-third of its customers really made a connection this way. To wit: (Okocha & Odinko et al. 2021) One probable explanation is that the university, like many others, sees digitally-mediated reading courses more as a cool technological experiment than as a serious tool for teaching and learning. - (Erkinovna, 2022). (Despite the fact that two-thirds of them understood the potential advantages of digitally-mediated reading courses, they were not convinced that it would be beneficial for them to participate in it. These advantages included the fact that digitally-mediated reading courses could provide an interactive, approachable, and flexible platform appropriate for discussion on complex subjects and enhance their skills. Their negative views of the media did not shift. Numerous academics have investigated students' perspectives, and some have arrived at findings that are consistent with ours. Some have speculated that the study's less-than-satisfactory findings may have been different if only seasoned e-learners had participated. There's no reason to think that wouldn't have been the case with our findings, either. Studies that asked people who had plenty of past experience with digitally-mediated reading courses what they thought found that they were generally positive.

Most of our teaching staff was already familiar with and making use of the institution's electronic learning resources. When asked about the benefits of e-potential learning, faculty members offered a wide range of perspectives. Nearly 60% of participants indicated they would choose a program that offered both in-person and online instruction. On the other hand, a separate research found a more favorable reaction. It's possible that the faculty's ongoing attempts to provide new teaching materials, on the one hand, and the students' time constraints, on the other, have led to this seemingly paradoxical reaction. Respondents also cited more cognitive learning, more free time in class, and the possibility of covering more advanced material. Additionally, respondents noted that less time was spent on pre-lab explanations in laboratories and skills labs.

When questioned about their feelings regarding online and digital learning, the vast majority of college-level learners reported feeling uneasy. Students in higher education faced several challenges, the most important of which were insufficient technology, a lack of access to the internet, and a lack of suitable connection and involvement with other students and professors. The swift shift from traditional classrooms and studying face-to-face to online learning has resulted in a completely different educational experience for today's students. The great majority of students are unable to learn online because they lack access to fast, reliable internet connections. Limited funding meant that only a few of universities were able to get their online courses up and running during the first few months of COVID-19. The research shows that students face additional challenges, such as a loss of campus community, challenges with group study, and slow responses from faculty. The majority of poll takers thought that traditional classroom settings were the most productive for students, as opposed to online courses or distance learning. One would assume that online education would not be successful in poor countries since the vast majority of students in these countries lack access to the internet owing to budgetary and technical restrictions. One of the most neglected aspects of online learning is the need of sustained interest and effort. Traditional classrooms encourage greater student engagement in classwork because

of the personal interaction students experience with both the instructor and their peers. Seventy percent of students preferred learning in a conventional classroom setting over learning online because they found it more inspiring to learn in a group setting. The vast majority of student's report feeling comfortable with online time management and completing assignments on schedule, yet they are unable to take full classes via this medium. Learning via online lectures requires not only the capacity to keep up with the quick pace of online courses, but also proficiency with computers and other technological tools. Only in this manner can we guarantee the efficacy and success of an online program. Students in this situation can and do manage their time for studying efficiently. Nonetheless, 45% of respondents reported that these same students had a hard time completing group tasks without regular in-person meetings amongst group members.

The study shows that there are several obstacles to the general adoption of digitally-mediated reading courses, including a deficiency in resources (such as money and human capital), expertise, institutional methods, and support. The biggest technological barriers to digitally-mediated reading courses were cited by both students and teachers, and they included poor internet connections and a lack of suitable technology. Others have come to similar conclusions. Multiple researchers in the field have (Almaiah et al., 2020) Digital libraries and learning management systems (LMSs) are two instances of technical roadblocks. In order to reference: (Shafiei Sarvestani et al., 2019) An up-to-date technology basis, ready access to qualified staff, and clearly articulated rules and procedures for both students and teachers are the pillars around which effective digitally-mediated reading courses may be built. To wit: (Rosenblit et al., 2018).

Disruption in universitys all across the world has been attributed to the COVID-19 pandemic. Our faculty and students agree with that assessment. Because of the epidemic, universitys throughout the world have had to cancel courses. Even in the direst of situations, there is reason to hope. Because of the pandemic, teachers worldwide had to become inventive.

To secure the long-term viability of educational and assessment systems, many have resorted to the internet. Half of our students, according to research by Subashini et al. (2022), were doubtful that digitally-mediated reading courses could totally replace classroom education, particularly in the theoretical components. Sixty percent were receptive to taking part in practical exercises, whereas seventy-five percent were unconvinced that computer-based learning could be as effective as actual experience. Responses from faculty members were quite similar. Either our students and faculty have a generally negative outlook on digitally-mediated reading courses, or the immediate unpleasant effect of the pandemic is making for a muted response. Researchers found that 24% and 27% of their students were significantly affected by the epidemic's discomfort (Hasan & Bao, 2020).

Conclusion

The majority of students expressed doubts about the usefulness of online education, in contrast to the majority of professors, who supported it wholeheartedly. Lack of access to the internet and a lack of computer skills were

the primary barriers that needed to be overcome in order to successfully adopt digitally-mediated reading courses. According to the results of the poll, the vast majority of students would rather take their final written examinations on paper and in the study rooms. The choices of the teaching staff, on the other hand, were fairly equally divided between giving paper examinations in the classroom, taking online assessments, and delaying evaluation until the next academic year. According to the findings of this study, neither our students nor our educators are equipped for online learning. The lack of preparation and support from institutions is one possible factor, as is the presence of technical impediments. Additional data indicating that the COVID-19 outbreak has had a significant influence on universities. In light of this, having solid technical and institutional frameworks for digitally-mediated reading courses is very necessary, especially when dealing with social distance measures.

The traditional teaching approach used in educational institutions all around the globe was significantly altered as a result of COVID-19. As an additional option for students to continue their education, the administrators of universities, colleges, and universities have elected to use online lectures and courses. Even if online learning is proven to be useful in protecting the health of students and faculty members during the COVID-19 epidemic, the effectiveness of online learning is not on par with that of traditional learning. Learning using the internet cannot provide the expected effects in developing nations because the great majority of students in these countries do not have access to the internet for a variety of reasons, including financial constraints and technological barriers. This research compared the efficacy of conventional classroom instruction with that of online instruction specifically for students enrolled in higher education.

Students reported experiencing a number of additional challenges in addition to those pertaining to technology and finances. These challenges included a lack of engagement with the teacher, an extended response time, and an absence of typical classroom interactions. 45% of students have said that the absence of opportunities for socialising on campus has made it more difficult for them to participate in group projects that take place via distant learning. The findings of this research also suggested that educational institutions have to work on enhancing the substance of their curricula and developing suitable material for use in online lectures. In light of the challenges outlined above, fifty percent of students voiced their opposition to the idea that it could be possible to successfully finish whole courses via online learning. 78% of students, when asked to compare the efficacy of traditional learning to that of online learning, believed that having face-to-face interaction with their teacher was vital for successful learning, which is something that is lacking in the distant learning mode. As per the directives of the WHO, we are now required to make adjustments to our day-to-day activities with COVID-19 for at least some period of time. This means that educational institutions are required to design content that is appropriate and effective, arrange an effective delivery system, and provide digital literacy training to their current faculty in order to achieve improved learning outcomes.

Abstract: The objective of this research was to determine the factors and actors involved in the emotional support of children in Peruvian elementary schools. Based on a descriptive design with a qualitative approach, the system was analyzed with the participation of six educational leaders using a structural analysis and cross-impact matrices (a prospective tool for consensus building). The results show the system to be highly unstable, with the most driving and dependent factors being the institutional curriculum and the incorporation of emotional education (EE) in the academic content. Both factors show the importance of the dimension of the curricular proposal in relation to the socio-family environment or governmental policies. The most influential actor turns out to be the Ministry of Education of Peru as the one responsible for conducting EE, ensuring the well-being of children. This study provides elements of strategic curricular planning for local and regional children's EE from a systemic perspective.

Keywords: emotional education, emotional containment, educational planning, primary education, Peru.

Introduction

Globalization has significantly impacted education throughout history, sparking debates about educational models focused on students' cognitive and academic development until the late 20th century (Pérez-López et al., 2021). However, in a constantly changing society, it is challenging to establish a specific model due to scientific, technological, and social advancements, which complicates the determination of relevant content for future citizens (Viloria, 2005).

In response to this reality, in recent decades, a more comprehensive and holistic pedagogical approach has emerged, such as Emotional Education (hereafter EE), which enables the continuous development of emotional competencies as a fundamental complement to cognitive development (Bisquerra, 2000). This is based on studies demonstrating that knowledge, management, and emotional self-regulation are crucial for facilitating meaningful learning and mental processes (Salovey & Mayer, 1990; Gardner, 1995; Goleman, 1995). This relationship between cognition and emotion enhances an individual's adaptive capacity to address various challenges in different areas of their life (Garcia, 2012).

However, due to the global crisis caused by the COVID-19 pandemic, education was directly affected by the closure of schools and universities. In 2020, over 170 million students in Latin America and the Caribbean stopped attending schools to prevent the spread of the virus (World Bank, 2021). Governments implemented social distancing measures leading to school closures for periods of time in various regions (United Nations Educational, Scientific, and Cultural Organization [UNESCO], 2021). Latin America and the Caribbean were among the most affected regions and took longer to resume in-person education. Countries in the region were tasked with establishing distance education models to mitigate the future consequences of school closures (Pinho De Oliveira, 2021).

In this vein, the pandemic has impacted students' nutrition, sleep, mental health, and social skills (World Bank, 2021). The relationships between teachers and students have been affected due to the limitations of the educational process and the lack of established face-to-face interaction between them (Albalá & Guido, 2020). Faced with these consequences, Emotional Education (EE) has emerged as a proposal to address this new post-pandemic reality and to pay greater attention to emotional support. In various contexts, EE has been directed towards working with teachers, school administrators, and education professionals, as well as students' experiences, with the aim of promoting personal and collective well-being (Milicic et al., 2013).

Emotional containment refers to individuals' ability to hold the emotions of others, especially children and adolescents, providing safe spaces to express emotions without judgment (Centro de Perfeccionamiento, Experimentación e Investigaciones Pedagógicas [CPEIP], 2020). This enables them to learn to manage their emotions properly and develop coping skills for the future. Additionally, it is considered the capacity to facilitate and promote emotional development in others, understanding the expression of their affections,

feelings, and distress (Slapak, 1998). Teachers, precisely, play a fundamental role in providing emotional containment in educational settings for students at all levels.

Emotional containment is achieved through two main components. Firstly, active listening involves paying attention to another person's message to understand its meaning and respond appropriately (Archundia, 2011). Therefore, it is important to respect each individual's pace when sharing their experiences, as not everyone is prepared in the same way. Secondly, empathetic attitude is highlighted, which involves putting oneself in the other person's shoes and interpreting their perspective and feelings. Lack of empathy can lead to rejection and misunderstanding; therefore, it is essential to create safe conditions and acknowledge fear or distrust as valid signals in vulnerable individuals.

In school settings, it is crucial to create a safe space for students where they can healthily release their emotions, individually or in groups. Saenz and Delfino (2022) propose working on various emotional competencies for relevant containment, such as emotional awareness, emotional management, emotional autonomy, social competencies, resilience, and a sense of purpose. To achieve this, playful strategies should be employed, such as psychoeducation, for emotional self-regulation and containment (Rosas, 2018). Research conducted in Colombia, Mexico, Chile, Spain, and Venezuela proposes approaches to preserve emotional stability in schools (Bolaños, 2018; Alfonso, 2020; Bächler et al., 2020). In Colombia, the correlation between emotional education, academic performance, and student development was demonstrated, highlighting the influence of emotions on personality construction, self-esteem, and interpersonal relationships (Alfonso, 2020).

Studies conducted in Mexico highlight the importance of emotional competence in teacher education and how teachers' interventions affect the emotional climate and relationships among students (Bolaños, 2018). Additionally, there is mention of the need to reconfigure the school curriculum, emphasizing the affective-motivational domain and establishing standards for teachers and educational managers (Gaona, 2020). In Chile, new curricular guidelines were implemented in early childhood education starting in 2019, promoting a transversal and comprehensive approach focused on students' personal and social development. However, there is a scarcity of research on the initial emotional training of teachers, despite its importance in students' emotional development (Bächler et al., 2020). In Spain, intervention programs have been implemented in the Canary Islands, Catalonia, and the Balearic Islands, involving theoretical training and practical activities (Marrero, 2019). However, limitations in the understanding of basic EE concepts by teachers and students were revealed, highlighting the need to update and develop cross-cutting programs in the curriculum (Barrientos et al., 2019).

Based on the foregoing, Figure 1 presents a set of dimensions regarding emotional education, contextualized for the Peruvian case, along with the factors that constitute them for a better understanding of the system under study.

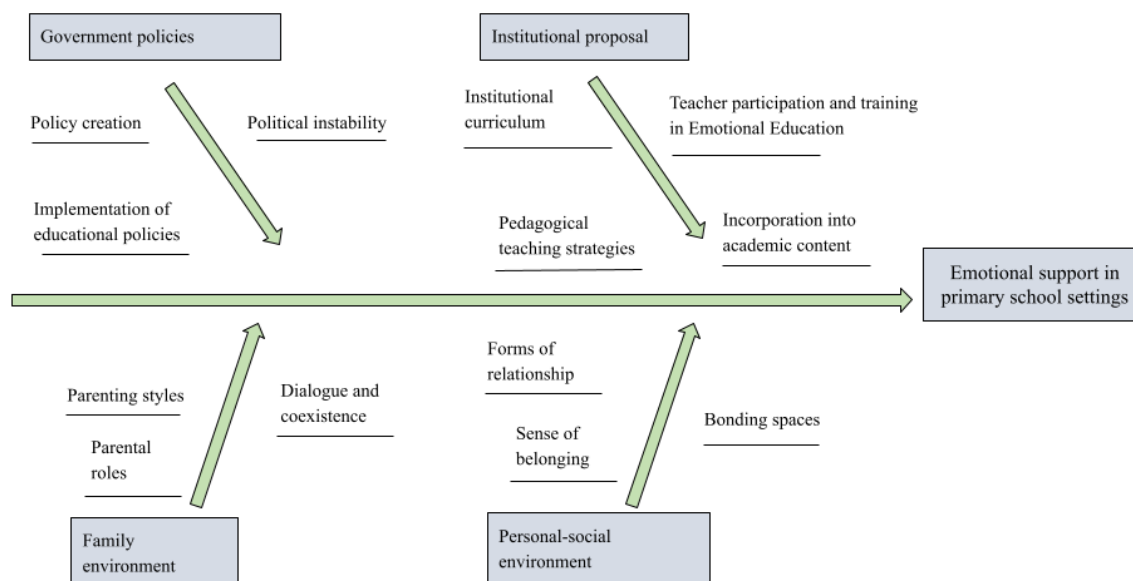

Figure 1. Dimensions and Factors of Child Emotional Containment (Author's own elaboration)

In 2020, the *Consejo Nacional de Educación* (National Council of Education) (CNE) of Peru updated the *Proyecto Educativo Nacional* (PEN) (National Educational Project) for 2036, establishing four purposes: citizenship, inclusion and equity, socio-emotional well-being, and productivity, prosperity, research, and sustainability. Indeed, the purpose of socio-emotional well-being has gained greater relevance today due to the challenges accentuated by the pandemic. Despite this framework, efforts to implement educational policies in Emotional Education (EE) have been limited and discontinuous in recent years (Congress of the Republic of Peru, 2018). In 2018, Bill No. 3523 was introduced, aiming to incorporate emotional and social education into the curricular content of Regular Basic Education. However, in 2019, the project's opinion did not acknowledge its relevance and requested its reformulation for ideological reasons. In the same context, political disagreements and governmental instability have hindered the implementation of various educational policies. Cabinet changes, corruption, and other factors have influenced the direction and approval of public policies, as evidenced in the case of Bill No. 3523 on EE.

The implementation of educational policies to foster emotional containment in the educational context necessitates curricular adaptation in each school institution. In 2021, the *Ministerio de Educación del Perú* (Ministry of Education of Peru) (Minedu) presented specific documents for schools with the aim of strengthening knowledge and pedagogical practices in EE. As part of this effort, materials were produced and distributed to state institutions in Lima, prior to March 1, 2021 (Cadillo, 2021). Additionally, the *Dirección de Formación Docente en Servicio* (DIFODS) (Directorate of In-Service Teacher Training) established partnerships with other directorates of Minedu and organizations to create the 2021 informational booklet, to facilitate the teacher's role in the new educational reality (Minedu, 2021). In 2022, Minedu published the socio-

emotional guidance booklet for teachers, entitled "My Toolbox for Well-being" (Minedu, 2022). Furthermore, a *Guía de Soporte Socioemocional* (Socio-Emotional Support Guide) for student care was published (Regional Directorate of Metropolitan Lima [DRELM], n.d.). Although there are documents and resources to dedicate spaces for emotional containment in schools, it is important to integrate this proposal across academic content in each institution (Mestre et al., 2017). While there is no specific information on curricular changes in Peruvian schools, it would be important to develop them to determine their relevance in students' lives.

Parents play a fundamental role in the development of their children's emotional competencies by teaching them about values, emotions, and the appropriate coping mechanisms (Huayamave et al., 2019). However, each family has its own dynamics and parenting style that define their behaviors and beliefs regarding important issues such as their children's health and education (Jorge & González, 2017). For the analysis of the Peruvian case, the results of the study conducted by Villacorta (2019) targeting university students in the city of Juliaca, Puno region, were contrasted. This study evaluated parenting styles based on three dimensions proposed by Darling and Steinberg (1993), determining the influence of commitment, psychological autonomy, and behavioral control.

Indeed, a relationship between the parenting style of psychological autonomy and the need for approval was evidenced, as greater autonomy provided by parents to their children leads to a reduced need for approval from others. Likewise, it was found to be associated with a decreased pursuit of perfectionism. Both findings underscore the emotional well-being benefits entailed by employing the aforementioned parenting style within the family dynamic (Villacorta, 2019).

Interpersonal relationships maintain a direct influence on the individual development of each student. Various studies have supported this assertion, demonstrating that the affective bond and the quality of relationships influence self-perception by 44.7% (Arias et al., 2018). Additionally, it fosters the development of social skills, which lead to emotional self-regulation and adaptation to the environment (Barrientos & Yamanija, 2018). In the specific case of education in Peru, schools play an important role as spaces for differential socialization due to existing diversity, where norms and values are adjusted to the culture and local context.

Methodology

The research employed a methodology based on tools of strategic foresight from the French school (Godet & Durance, 2007; Arroyo & Ruiz-Ruiz, 2023). This technique analyzes the key factors of a system and develops strategies aimed at the most suitable future scenario (Munck & McConnell, 2009). Additionally, it focuses on the collective work and reflection of experts to find solutions and create the desired future. The research scope was descriptive, utilizing structural analysis to examine the key factors determining the studied system. The methodological design consisted of four subsequent phases, detailed in the following Table 1.

Table 1. Phases of the Research

Phase	Scope	Technique	Validation
Phase 1: Identification of factors and social actors associated with the child emotional containment system	Recognize the factors linked to governmental policies, institutional proposals, family environment, and social context that, along with the responsible actors, impact the studied system.	Documentary review and open interviews	Expert judgment and confirmation with interviewees
Phase 2: Expert panel invitation	Deepen the information based on the vision and expertise of experts regarding the study system.	Purposeful sampling	Review of professional and academic profiles
Phase 3: Structural analysis for determining key factors and actors in child emotional containment	Assess the motoricity and dependency relationships among key factors and their interrelation with social actors.	Structural analysis (MICMAC)	Expert confirmation through successive rounds
Phase 4: Analysis and discussion of results	Compare, contrast, and discuss the results obtained in previous studies with those obtained in the research.	Comparative documentary review and open interviews.	Methodological review cues

In the initial phase of the research, dimensions and factors characterizing the child emotional containment system in Peru were enumerated. A documentary review was conducted using databases such as Scopus, Scielo, and Web of Science, as well as digital repositories from the Ministries of Education in Latin American countries. The identified factors were classified into four dimensions: governmental policies, institutional proposals, family environment, and personal-social context. This was validated by three experts in Peruvian education, considering a regional perspective, through ongoing open interviews, where the mentioned factors were corroborated, and additional factors were added emergently.

In the second phase, a call was made to six additional experts in the field of emotional containment with knowledge of the Peruvian and regional context, from both the public and private sectors. Table 2 presents the general profiles of the aforementioned experts. For confidentiality reasons, their names are not disclosed.

Table 2. Profile of the experts convened for the second phase

Code	General Profile
E1	Clinical Psychologist from the Pontifical Catholic University of Peru (PUCP) and specialist in Child and Adolescent Development, Learning and Socioemotional Education, Well-being, Parenthood, Parenting, and Positive Discipline. She has over 20 years of experience as a teacher, trainer,

Code General Profile

consultant, and lecturer in the field of education for various national and international institutions, such as the Ministry of Education of Peru, the Secretariat of Public Education (SEP) and the United Nations Development Programme (UNDP) of Mexico, the Dutch Bernard van Leer Foundation, the World Bank, UNICEF, among others.

E2 Coach, Educator, and Master in Development, with extensive experience in leadership and management of social and educational projects at the national and international levels. She has served as Basic Services Manager, Senior Education Advisor, and Education Leader for Latin America at SNV (Netherlands Development Organisation). Consultant for international organizations such as the Telefonica Foundation, and for the State, such as the Regional Directorate of Education of Metropolitan Lima (DRLEM). She is a researcher with a vast publication of modules and articles on childhood and youth issues, evaluator and supervisor of social and educational projects and programs.

E3 Educator and executive director with experience in academic and formative leadership of nationally recognized schools. Additionally, she has experience as a school and university teacher. She holds a master's degree in educational center management and administration of education, as well as a diploma in management and direction of educational companies.

E4 Psychologist, coach, and consultant with over 10 years of experience, providing a strategic and systemic vision to the development of individuals and teams from individual well-being. Master's in Education with a specialization in Higher Education Teaching and Learning Management facilitating topics related to emotional intelligence, stress and conflict management, leadership, people management, among others.

E5 Clinical-educational psychologist, systemic or psychoanalytic family psychotherapy with experience in various national private schools. She holds a master's degree in collaborative and dialogical practices and certification in autism detection and intervention from the neurodiversity paradigm.

E6 Coach, consultant, and educator expert in organizational transformation based on socio-emotional skills/tools for leadership. She holds a master's degree in Promotion of Reading and Children's Literature and is a lecturer at universities such as the University of the Pacific (UP), Peruvian University of Applied Sciences (UPC), among others.

In the third phase, a structural analysis was conducted to determine the key factors and actors in emotional containment, through a relational matrix and with the aid of the software Matriz de Impactos Aplicados a una Multiplicación (MICMAC) (Labrín & Ruiz-Ruiz, 2022). This process involved the rating of the six experts regarding the levels of influence among the thirteen factors defined in the first phase. Consensus among the

experts was achieved after three successive rounds, enabling the evaluation of influence relationships among key factors and their interrelation with social actors.

Finally, in the fourth and last phase, the results were compared and contrasted with previous studies, leading to an analysis and reflection that allowed for discussing the characterization of the child Emotional Containment system for the Peruvian case.

Ethical Considerations

This study was conducted with the aim of contributing to knowledge in an ethical and responsible manner towards all involved parties. All participants were informed about the purpose and procedures of the research. The collected data were handled confidentially and used exclusively for the study. Additionally, codes - instead of real names - were used to preserve the participants' privacy. Similarly, an attitude of transparency was maintained throughout the data collection, analysis, and presentation process. The results were presented accurately and without data alteration. This approach of honesty and rigor in the methodological tracks followed ensures the objectivity of the results and contributes to the integrity of the research.

Results

Following the methodological phases outlined in the previous section, during the first phase and based on a literature review, the dimensions and factors promoting adequate emotional containment in primary schools in Peru, as well as the involved social actors, were defined. Four dimensions were identified to group the factors: governmental policies, curriculum proposal, family environment, and personal-social environment; which were validated through critical judgment by six experts. For a better understanding of the dimensions and their associated factors, Table 3 is presented below.

Table 3. System of Emotional Containment for Children in Peru

Factor	Scope
Dimension: Government Policies	
(F1) Policy Creation	Government policies in Peru for the promotion and development of emotional education in schools.
(F2) Implementation of Educational Policies	Ability to carry out educational policies, as well as to lead and evaluate their continuity.
(F3) Political Instability	Influence of current political instability that hinders the creation, promotion,

and continuation of normative foundations for emotional containment.

Dimension: Curricular proposal

(F4) Institutional curriculum	Integration of emotional education into institutions in a cross-cutting and coherent manner with the national curriculum proposed by the MINEDU to provide quality education and develop well-rounded citizens.
(F5) Pedagogical teaching strategies	Appropriate use of pedagogical strategies to foster the development of emotional containment in children within educational institutions.
(F6) Teacher participation and training in EE (Emotional Education)	Performance of teachers in their educational and leadership roles related to emotional education in schools.
(F7) Integration of EE into academic content	Relevant use of pedagogical strategies to foster the development of emotional containment in children within educational institutions.

Dimension: Family environment

(F8) Parenting styles	Choice of parenting style aimed at providing emotional containment for achieving well-being.
(F9) Parental roles	The presence of emotionally stable parents to provide emotional containment for their children.
(F10) Dialogue and coexistence	Assertive and democratic communication as a tool to foster dialogue between parents and children.

Dimension: Social Environment

(F11) Forms of interaction	Aspects of the forms of relationship among students that promote emotional containment.
(F12) Sense of belonging	It is associated with the bond between the student and the educational institution, allowing them to identify with the school's values and objectives.
(F13) Bonding spaces	Relevant use of spaces in schools to establish interpersonal relationships that foster appropriate emotional containment.

Subsequently, based on open interviews with the experts convened in a second phase, the relationship of social actors participating in the studied system was defined. Using a relational matrix, experts rated the degree of influence of one actor over another, following the same principles of structural analysis as mentioned in the

methodology. Based on the defined values, the actors were classified according to their degree of power. The relationship among them, along with their hierarchical order, is presented in the following Table 4.

Table 4. Hierarchy Level of Social Actors in the Characterization of Emotional Containment in Primary Schools.

Hierarchy	Social Actor	Description
Very High Power	(A1) <i>Ministerio de Educación</i> (MINEDU) (Ministry of Education)	Governing body of national educational policies, which exercises its leadership through intergovernmental coordination with local and regional governments, in order to ensure quality education as a conducive factor for the country's development.
	(A2) <i>Ministerio de Desarrollo e Inclusión Social</i> (MIDIS) (Ministry of Development and Social Inclusion)	System responsible for social development, poverty alleviation, promotion of inclusion and social equity, as well as the protection of individuals in populations at risk and abandonment.
High Power	(A3) United Nations Children's Fund (Unicef)	International organization whose purpose is to promote the fulfillment of the rights of children and adolescents worldwide, especially the most disadvantaged. Additionally, it contributes to improving health, nutrition, education, and protection against all forms of violence.
	(A4) School Directors	Individuals responsible for managing and sustaining administrative and pedagogical structures within the educational institution, as well as internal processes that enable the development of institution members.
Medium Power	(A5) Teachers	Individuals who are professionally dedicated to teaching, accompanying students in the processes of generating internal, cognitive, and socio-emotional structures to maximize their competencies and talents and play an active role in society.
Low Power	(A6) Parents	Individuals responsible for ensuring the protection of the rights and duties of children, instilling values, love, and support to achieve their development in a secure environment.

In the third phase of the study, a structural analysis was conducted to assess the key factors of the system. The

MICMAC software was used to process the data obtained from the group of experts and determine the relationships between the factors. Influence between the factors was rated on a scale from zero (0) to four (4), where zero (0) indicates no influence and four (4) indicates very high influence. The software generated a Cartesian plane showing the location of the factors in terms of dependence and driving power. This plane considers both direct and indirect impacts, as presented in Figure 2 below.

F1: Policy creation	F7: Incorporation of EE in academic content
F2: Implementation of educational policies	F8: Parenting styles
F3: Political instability	F9: Parental roles
F4: Institutional curriculum	F10: Dialogue and coexistence
F5: Pedagogical teaching strategies	F11: Forms of interaction
F6: Teacher participation and training in EE	F12: Sense of belonging
	F13: Bonding spaces

Figure 2. Projection of factors on the Cartesian plane (indirect impacts)

According to Godet and Durance (2007), findings of this nature depict an unstable system with an interconnection among the studied factors. Any change in one of them may impact the entire system. To address emotional containment in primary schools in Peru, it is vital to understand its dynamics and relationships. According to the critical judgment of experts, the most important factors are institutional curriculum (F4) and the integration of EE into academic content (F7), due to their high degree of motricity and dependency. Similarly situated are teacher participation and training in EE (F6), school bonding spaces (F13), teaching pedagogical strategies (F5), and student sense of belonging (F12). Factors such as forms of interaction (F11), parenting styles (F8), parental roles (F9), and parental dialogue and coexistence (F10) are highlighted to a lesser extent. On the other hand, policy creation factors (F1) exhibit low motricity and medium dependency, while

political instability (F3) shows high motricity and low dependency. The presented plane and the hierarchy of social actors are essential for the analysis and discussion of the interrelationships in the system of emotional containment in primary schools.

Discussion

Any effort aimed at fostering relevant EE for children in primary schools must address the key factors described above in a systemic manner, considering their varying degrees of motricity and dependency. As observed in Figure 2, the vast majority of factors are absolutely important and pivotal; however, the most relevant ones are those located in the upper right quadrant: F4 and F7; namely, institutional curriculum and the integration of EE into academic content, respectively.

The motricity and dependency of the first factor are related to the assessment of curriculum objectives in each institution following the pandemic experience (OECD, 2020), which should prioritize the health and well-being of students and educational staff, providing emotional support as needed. While the National Curriculum for Basic Education (NCBE) includes socio-affective tutoring, the allocated hours are minimal for relevant EE (0 hours for preschool and 2 hours for primary and secondary levels per week). In this regard, De Romaña (2021) emphasizes the importance for school leaders to understand the educational reality and gaps in EE to promote better development from their curriculum foundations.

The second factor that exhibits high dependency and motricity is the incorporation of Emotional Education into academic content (F7), aligning with Bisquerra's proposition (2011), who asserts that EE should not be confined to a weekly session but should permeate across all subjects to promote emotional management in daily life. This will develop emotional competencies that impact student development (Fernández, 2019; Saenz & Delfino, 2022).

In light of this, the Ministry of Education, responsible for ensuring equitable access to quality education for all citizens, can integrate emotional education as an integral component within the standards and learning objectives outlined in the national curriculum. By establishing clear and specific criteria, it will provide a framework for curricular planning and the implementation of EE-related educational programs. In this regard, by officially recognizing it as an essential dimension of students' integral development, EE gains greater visibility in national policies. This ensures quality in EE implementation in institutions, as defining minimum learning standards guarantees that all students have access to quality emotional education.

Additionally, the Ministry can articulate specific strategies for the effective integration of emotional education into institutional curricula. These strategies may encompass guidance on relevant topics to address, pedagogical approaches to adopt, and available teaching resources. Their formulation is envisioned as a valuable resource for the entire educational community, providing a coherent framework that would facilitate the promotion of

students' holistic well-being. However, it is essential to consider the prevailing cultural, social, and economic diversity in society, as it requires a flexible approach to respond to the needs of each educational community and promote greater community participation.

On the other hand, four factors with high motricity are identified, albeit of lesser magnitude compared to the two previously mentioned factors. The first of these is teacher participation and training in EE (F6), in which, as outlined by Pacheco-Salazar (2017), teachers with knowledge and interest in EE promote collaborative work, assertive relationships, and good classroom coexistence. Additionally, authors such as Basurto and Farías (2022) highlight the relationship between EE, educational quality, and performance. It is necessary to have a solid education in EE that allows teachers to understand the different emotional needs of students based on their age, socioeconomic, cultural, and personal context, and to adapt their interventions appropriately. Likewise, it is necessary to possess emotional regulation skills so that teachers can manage their own emotions in the classroom assertively and guide their students with emotionally intelligent behavior. On the other hand, for greater participation, it is essential to provide teachers with access to resources and institutional support for the implementation of programs and activities related to EE, as well as for collaboration with school psychologists to systematically address the emotional needs of students.

Regarding students' bond spaces at school (F13) and their sense of belonging (F12), various studies have demonstrated that school bonds provide containment and refuge for students, fostering a sense of belonging and strengthening their security and confidence to face adversity (Hurtubia et al., 2021; Chagnollaud, 2013). Consequently, in relation to pedagogical teaching strategies (F5), the significant influence and dependency become evident, as teachers recognize the need to adapt teaching practices and approaches to address students' emotional needs post-confinement (Basurto & Farías, 2022). It is necessary to consider these factors systematically to promote emotional containment.

Finally, another factor that needs to be highlighted, due to its higher motricity and low dependency for the studied system, is the political instability of the country (F3). According to Echaiz (2019), educational policies are often influenced by political interests, hindering the resolution of the country's problems. Political instability in countries like Peru prevents the realization of educational proposals and affects the quality of services (Oliart, 2011). This instability impacts the lack of progress in pending curricular educational areas, such as Emotional Education.

Conclusion

The evidence found allowed characterizing the key factors that comprise the system of emotional containment in primary schools, which are distributed across governmental policies, school curriculum, family environment, and personal-social context. It was crucial to understand that the actions taken by the involved actors (Ministry of Education, school administrators, teachers, and parents) have a notable influence on the management and

handling of the educational system, thus requiring an approach to the promotion of emotional containment from a systematic perspective.

The research emphasizes focusing on the factors located in the quadrant corresponding to the area of highest motricity and dependency on the graph: the institutional curriculum and the integration of EE into academic content. This leads to reflection on the need to create safe spaces in the classroom to develop the personal dimension and address not only cognitive processes but also to promote social, emotional, and behavioral skills in school practice. This integration prevents it from becoming an isolated and recurring EE program and is convenient following the mandatory confinement of a few years ago, which had a direct effect on students in all their dimensions.

In line with the foregoing, school leaders and educators play a significant role in promoting emotional well-being within the school environment. In this regard, their actions should be geared towards strengthening emotional competencies with the aim of fostering the holistic development of students in contemporary times. Such promotion can be achieved through the implementation of systematic and structured educational strategies, such as the conception and execution of projects and activities designed specifically to facilitate the acquisition and understanding of these competencies. Additionally, it is essential to consider everyday practices, even when they are not directly related to the educational sphere, given their impact on the cultivation of emotional skills. For example, attention should be paid to the nature of interactions between students and teaching staff, as well as to the channels and modalities of communication used in the school context.

Similarly, disseminating the importance and integration of these competencies within the framework of the Institutional Educational Project (IEP) will demonstrate a significant impact on the quality of life, both for students and the educational community as a whole. On the other hand, parents also play a crucial role in this regard. Although collaboration between the family and the school may be limited, it is imperative to strengthen these collaborative relationships in order to expand understanding of the role of parents in the emotional support of their children.

Finally, this characterization of childhood emotional containment in primary schools provides foundational information to develop a strategic plan that prepares schools to address Emotional Education (EE) in childhood. While there is a lack of updated literature on the specific demands of primary school children, it is relevant to gather information on students in the region and their emotional development in a post-pandemic context. Identifying these key factors allows schools to guide themselves to address the needs of new generations and ensure environments conducive to emotional containment, starting from the earliest ages of schooling.

Abstract: Corrective feedback (CF) is regarded as a controversial topic, especially in writing skill. Some researchers have found it to be both meaningless and harmful, while others have researched the effects of different types of CF and found it to be good for language development in several ways. This made me interested in conducting a study focusing on what perceptions and practices teachers have concerning CF. This study attempted to explore the perceptions and practices of teachers' corrective feedback on EFL young learners' written performance. The method used was descriptive, and the data were obtained through questionnaire administered to 35 EFL teachers at a foreign language in Cantho city, and interview submitted to 5 teachers who were chosen randomly from interviewees. Beside that, there were 5 teachers selected to observe in real class to find out the relationship between their perception and practices. The general results indicated that teachers' perceptions and practices of corrective feedback were positive although the level of perceptions and practices were not high. Moreover, the surveyed teachers agreed that corrective feedback can bring some benefits to improve learners 'writing.

Keywords: Corrective feedback, EFL Teachers' perceptions and practices, Young learners, Writing performance

Introduction

Rationale

In this chapter, the rationale undergoing the current study is presented. Accordingly, the research aims and significance of the study will be also pointed out. The chapter ends with the description of the organization of the thesis.

In recent times, the popularity of the English language has been steadily rising. The number of individuals pursuing English studies increases annually. Due to the global prominence of English, several countries have incorporated English language training into their educational curriculum. Several countries initiate language education at the primary level, with kids starting to study the language at increasingly younger ages (Jenkins, 2009). Due to these factors, the practice of instructing English to young students is more prevalent. Out of the four fundamental skills in English, namely listening, speaking, reading, and writing, it is undeniable that writing is one of the most challenging talents for students to acquire (Vig Iuditm-Zsuzsi, 2017). Writing assignments can be particularly exhausting and anxiety-inducing for individuals in this age range, as they may not have developed strong writing skills in any language yet. Additionally, receiving appropriate feedback is crucial for their learning process. In addition, Ferris (1999) authored a paper affirming that providing corrective feedback could indeed be advantageous for second language (L2) authors. Throughout our English instruction, we have observed many educators providing a range of feedback to students. Some educators provide oral feedback, some offer written feedback, and some employ a combination of both modalities. However, there are some professors who solely assign grades to their pupils without providing any form of feedback. This finding piqued our curiosity regarding the underlying ideas and timing behind the comments they provide. Given the current dispute regarding the use of corrective feedback (CF) in the second language (L2) writing classroom, we are particularly interested in examining whether teachers offer this type of feedback to young learners as part of their formative assessment.

Undoubtedly, providing corrective feedback for the writing performance of young learners in the Vietnamese setting poses significant challenges due to various factors.

One primary factor is that writing poses a significant challenge for young learners to acquire proficiency in. Furthermore, the function of writing in English is predominantly confined to educational institutions in Vietnam. Students are typically required to occasionally compose guided and/or restricted paragraphs. In my opinion, it is imperative to provide students with additional avenues to actively engage in English language practice and foster communicative skills both within and beyond the confines of the language classroom. Therefore, establishing an environment, such as the Pen-pal projects, where students may effectively utilize the language, they acquire in the classroom poses a difficult task for an English instructor.

In addition, as stated by Lightbown & Spada (2006), writing assignments can be highly fatiguing and anxiety-inducing for this particular age group, as they have not yet developed strong writing skills in any language. Moreover, if feedback is provided in an inappropriate manner, it can demotivate children to such an extent that they lose all enthusiasm. The age of learners is a crucial determinant in the process of providing corrective feedback. During this stage, children are undergoing conceptual development, transitioning from concrete to abstract thinking (Clark, 1990, p. 6-8). Hence, educators must carefully choose and implement appropriate forms of corrective feedback for their intended students.

Numerous studies have been undertaken to examine the impact of employing corrective feedback in the writing of English as a Foreign Language (EFL) learners. However, research on this topic in Vietnam is still scarce. This study tries to fill the existing gap. The study investigates the beliefs and behaviors of EFL teachers on the provision of corrective feedback to young learners' writing.

Aims of the research

The study aims to investigate what EFL teachers think about corrective feedback and how they deliver it to young learners in writing skills. The study aims at: (1) investigating teachers' perceptions of using corrective feedback; and (2) figuring out how teachers deliver corrective feedback.

Significance of the study

Through the result of the study, it is hoped that EFL teachers will get some positive benefits for their teaching. Firstly, the findings of this research can help EFL teachers raise their awareness of giving feedback to their target learners such as young learners. Also, it is believed that the results of the research could enhance EFL teachers' recognition about the importance of corrective feedback in writing skill. Finally, this research might be helpful to the EFL teachers who are teaching young learners in EFL classrooms.

Organization of the study

In this study, the report of the study is organized into five chapters: (1) Introduction, (2) Literature review, (3) Methodology, (4) Results, and (5) Discussions and Conclusions.

For Chapter 1, the research problems and background of the study, research aims and the significance of the study are presented.

In Chapter 2, relevant literature is reviewed to address the theoretical and empirical background of the current study. Accordingly, the findings from previous related studies are also presented and discussed. This review is aimed to give the readers the opportunities to understand more about teachers' thinking and awareness as well as their action towards to feedback when they are giving to their young learners in writing.

Chapter 3 presents the research methodology of the study. The chapter starts with research questions and research hypotheses. Next, research design and participants are described in detail. The chapter continues with the description of the materials and research instruments. Last, the procedures of data collection and data analysis of the study are also discussed.

Chapter 4 presents the results of the study. The chapter reveals the results of data analysis on EFL teachers' perceptions and practices towards giving corrective feedback to young learners.

Chapter 5 concludes the reports of the study. The chapter starts with the summary of the results of the study. Then the researcher draws out the conclusion of the study. Next, pedagogical implications are suggested. The chapter ends by presenting the limitations of study and some suggestions for further research.

Literature Review

This chapter examines the theoretical and empirical literature on the application of corrective feedback in the context of English as a Foreign Language (EFL) for young learners' writing. The process commences with establishing the precise definitions of the pivotal phrases that are pertinent to the investigation. The chapter also presents the categorization of the many forms of corrective feedback. Next, the chapter examines the existing body of literature that focuses on teachers' perspectives and methods about the significance of employing corrective feedback to improve learning outcomes and enhance writing proficiency. The chapter finishes by providing an overview of the current state of teaching and learning writing in primary school within the Vietnamese setting. It also includes a review of past research that is relevant to the present study.

Definition of key terms

Writing performance

Writing poses a formidable obstacle for many learners of foreign or second languages. Language is a crucial element in both schooling and daily life, particularly for individuals who struggle to communicate their emotions verbally. These individuals rely on words and letters to convey their feelings, ideas, and thoughts. Chomsky (1965) distinguishes the terms competence (as knowledge of language) and performance (as actual use in specific situations). In fact, competence refers to knowledge of grammar and other aspects of language whereas performance mentions actual use (Canale & Swain, 1980). From the theory of the terms, writing competence is understood as knowledge of content, knowledge of organization, knowledge of language and grammar. Thus, writing performance is the ability to perform writing competence in written texts.

The types of writing that are concerned in this study are sentence and paragraph writing because the target participants are EFL young learners, not adults.

A paragraph is a cohesive section of an essay that conveys a well-developed concept. A paragraph is composed of multiple sentences that serve to elucidate and clarify the notion for the reader. The first paragraph presents the context of the subject matter and acquaints the reader with the central concept of an essay. The concluding paragraph provides a concise summary of the entire article.

Bringing the sense of reality of classroom can be challenging and the purpose of writing tasks is to practice and display (Jessica, 2005). Therefore, classroom writing performance would tend to have students practice and display knowledge of content, knowledge of organization, knowledge of language and grammar on written texts.

In the present paper, writing is considered as one of the major language skills performed by the young language learners with the instruction of their teacher.

Perceptions

According to James Rowland Angell's definition (1906, p.122-140), perception can be described as "the awareness of specific physical objects that are currently being sensed." Perception, in reality, encompasses more than what this definition initially suggests. This is because we are constantly conscious of additional sensory activities beyond the ones we typically associate with perception. These activities primarily involve the internal processes of our own body and exist in the background of our consciousness. Psychologists view perception as an abstraction, similar to feeling.

Perception, as described by Sainn and Ugwuegbu (1980), refers to the process by which humans derive significant information from physical stimuli. "It is the manner in which we perceive and understand our sensations," as stated on page 90. Sainn et al emphasize three crucial aspects regarding perception. Perception is influenced not only by the stimulus but also by an individual's experience, intention, and social needs. Furthermore, the perceiver is not merely a passive and apathetic observer while seeing something. Instead, they actively engage in the process by selectively gathering information and constructing hypotheses to accurately determine the true nature of the situation.

Furthermore, perception is a cognitive process that enables an individual to construct a mental representation of their surroundings, facilitating the ability to foresee future events and respond to them effectively. Hence, the sensory receptors of an individual provide only a restricted amount of data and cannot be comprehended without further information obtained from past experiences and memory. After the physical sensations are accurately processed, they will transform into the perceptions of an individual. It is widely debated that instructors' behaviors in the classroom are influenced by their perceptions.

In her paper on student perceptions and language acquisition, Horwitz (1989) emphasized the significance of teachers being mindful of how their students perceive them in the classroom. This is crucial since students' impressions may clash with teachers' personal beliefs and attitudes towards teaching. She emphasizes that teachers often perceive their classrooms as being centered around communication or focused on grammar, with a dominant presence of teacher speak. However, students are more likely to categorize their courses as either difficult or easy, and their professors as either rigorous or lenient (p. 61). The perspectives of teachers and pupils might often be completely opposite. Teachers tend to prioritize the transmission of essential learning abilities, whereas students are often more concerned with their teachers' grading methods, assignment deadlines, and workload.

In the current study, perception refers to teachers' belief and understanding about something, more specifically, their belief about the role of using corrective feedback in enhancing EFL young learners' writing performance.

Practice

In common sense, practice is often used to refer to what people actually do on daily basis to serve a specific purpose. Practice is often associated with either occupational doings or personal domains. In teaching process, teachers' belief is important influences on the way which teachers practice their teaching in the classroom, and even leads to the methods they applied to teach their students. Practice means teachers' action or performance through their belief and understanding in the classroom. Belief and practice has a mutual relationship in learning/ teaching process. Many studies have described aspects of teaching practice which are related to effective classroom learning and student outcomes (Brophy and Good, 1986; Wang, Haertel and Walberg, 1993). In the classroom, teachers' practice could be positive feedback and comments, and even it could encourage the students take risks or make errors in learning process. Practice is known as key aspects of "direct or indirect instruction"— have generally been shown to have a positive impact on student achievement. That means the teacher provides learning opportunities, these must be recognized and utilized by the student to be effective.

In the present research, practice refers to what teachers do consistently and repeatedly in their teaching performance on a daily basis.

Young language learners (YLLs)

Young language learners (YLLs) encompass students ranging from five years old to approximately 12/13 years old, which aligns with the typical age range for primary school instruction, particularly in Europe. The uniqueness of YLLs mostly stems from their status as children. Hasselgreen (2000, pp. 262-3) enumerates several characteristics that distinguish YLLs and place them in a unique position. These characteristics encompass their fervor and receptiveness towards acquiring new languages, while simultaneously necessitating tailored instructional approaches in the classroom. The learners constitute a distinct population, and their teachers frequently lack expertise in language or language acquisition. Additionally, the language created by young language learners (YLLs) in their second language (L2) is distinct from that of adults, similar to how their first languages (L1s) differ. At a young age, children initially start categorizing words related to tangible items. When incorporated into the L2 classroom, learners require highly specific terminology that is directly related to tangible objects they can physically interact with or see (Cameron 2001, p. 81). On the other hand, adult learners possess the ability to handle abstract concepts (ibid). YELLs lack the ability to understand intellectual concepts, such as language. Bourke (2006, p. 280) observes that young learners lack an understanding of concepts such as components of speech, discourse, and phonology. Attempting to elucidate these abstract concepts to young individuals is likely to result in their confusion. To circumvent the need to engage with conceptual notions, Cameron (2001, p. 53) suggests addressing subjects that youngsters are acquainted with, such as familial and social relationships or educational experiences. Within the context of this document, the term "young language learners" specifically denotes Vietnamese kids between the ages of 6 and 12. They are acquiring English as a second language at language facilities in Can Tho city.

Error

Multiple definitions of the term "error" exist. Lennon (1991) defines an error as a linguistic form or combination of forms that would not likely be created by native speakers in the same context and under identical production conditions as their counterparts (p.182). The errors made by learners are highly significant as they offer valuable insight into the extent of a learner's language acquisition progress and indicate the amount of further learning required by the learner (Ringbom, 1987, p.69).

Throughout the course of human history, mistakes made by learners have typically been viewed as a detrimental consequence, often leading to punishment throughout the learning process. The positive aspects of errors are mostly unexplored. Nevertheless, an increasing number of recent studies indicate that the error has advantageous benefits. Jabeen (2015) demonstrated that errors are not inherently negative, but rather they play a vital role as integral components in the language acquisition process. These findings may shed light on the intricate mechanisms of language development, while also offering a methodical approach to recognizing, describing, and explaining pupils' errors. Errors can also contribute to a deeper comprehension of the second and foreign language acquisition process.

In the realm of English language learning and instruction, errors and mistakes are frequently employed phrases to describe the incorrect performances of students in the language. It is crucial to differentiate between errors and mistakes. An error is perceived as a consequence of the learner's inadequate understanding of grammar, and the mistake is attributed to the failure to correctly utilize a familiar system.

In his 1997 work, Ellis proposed two methods for differentiating between an error and a mistake. One purpose is to assess the coherence of the learner's performance. If a student inconsistently employs the accurate structure and occasionally employs an incorrect structure, then it constitutes an error. However, if he or she consistently uses it wrongly, it becomes a mistake. The second approach involves prompting the student to attempt to rectify their own wrong form. If they are unable to do so, it is classified as an error. Conversely, if they are successful in correcting it, it is considered a mistake.

Corrective feedback

The concept of corrective feedback (CF) has consistently been defined in a comparable manner across various periods of time. Chaudron (1977) provides an initial definition of corrective feedback as "any response from the teacher that visibly changes, disapprovingly refers to, or requires improvement of the learner's utterance" (p. 31). Similarly, Ellis (2008, p.958) also defines that corrective feedback is information which learners are given in order to acquire their interlanguage. Therefore, CF can be explicit or implicit. In addition, according to Lightbown and Spada (1999, p.172), corrective feedback is as "an indication to the learners that his or her use of the target language is incorrect". Through corrective feedback, teachers can assist their learners to realize their errors and mistakes in various ways, maybe directly or indirectly.

In their respective studies, Loewe (2012) and Sheen (2007) provide a definition of corrective feedback as the provision of information to the learner regarding a linguistic error. Nevertheless, it is crucial for teachers to consider corrective feedback as an essential aspect of their teaching practice. They must carefully determine when, how, and if they should correct their students' errors, as these decisions are influenced by their broader teaching and learning theories.

From those definitions provide evidence that CF is effective in an EFL context and encourages teachers to reflect and give feedback to bring beneficial effects on learners' production. In this study, CF is defined as teacher's explicit response and comments on students' writing.

Young language learners

Characteristics of young language learners

In order to be an effective English teacher for young learners, it is imperative for the teacher to have a comprehensive understanding of the cognitive, linguistic, and emotional aspects of the students. This understanding will greatly influence the teacher's lesson planning, ensuring that the students are fully engaged in the learning process and that the objectives of the lesson are successfully achieved. Additionally, the teacher's ability to respond to the students will be greatly enhanced. Clark (1990: 6-8) outlines five distinctive attributes of young learners:

- Children undergo conceptual development, transitioning from concrete to abstract thinking.
- Children lack developed linguistic abilities, unlike adult learners who possess specific goals for language acquisition, such as improving employment prospects. In contrast, children seldom have such motivations when learning a foreign language. They acquire knowledge in the subjects that the school offers.
- Children are in the process of maturing, acquiring fundamental abilities such as turn-taking and the use of nonverbal communication.
- Young children exhibit a high degree of egocentrism, since they primarily focus on themselves.
- Children have a tendency to become easily bored. Children are compelled to attend school without any option. The absence of choice necessitates that class activities be as enjoyable, captivating, and stimulating as possible through the implementation of engaging tasks.

According to Halliwell (1992: 3-5), children possess the ability to interpret meaning even without fully comprehending each individual word. They demonstrate impressive proficiency in utilizing language creatively within the constraints of their limited vocabulary. Children often acquire knowledge indirectly rather than through direct instruction. They derive enjoyment from discovering and inventing amusement in their activities, and they possess a readily accessible imagination.

Ultimately, teachers must familiarize themselves with the attributes of the young learners they instruct, since this will directly impact the efficacy of language acquisition. By taking into account the aforementioned features, it is expected that the instructor will be able to select the most effective teaching tactics to ensure that young learners comprehend the topic thoroughly.

Young writing learners

Teachers have encountered significant difficulties in the classroom specifically related to writing. Typically, pupils, particularly young learners, exhibit a lack of interest in writing due to a lack of encouragement or enjoyment in the activity. Roseli Serra, the recipient of the Teaching English monthly blog award, discusses strategies for fostering a passion for writing in English among children learning the language. As mentioned, the focus on writing among young learners in many schools is extremely minimal. Typically, pupils frequently convey their ennui when teachers assign them writing projects.

Proficient young students exhibit a strong inclination to engage in the activity of tracing letters and words, displaying a keen desire to acquire the skill of writing their own names, as well as the names of their siblings, pets, toys, and classroom items. We aim to sustain our pupils' enthusiasm for writing while they further enhance their English writing abilities. However, acquiring the talent of writing can be a significant challenge for children. Writing is typically an individual endeavor that is carried out in silence, requiring considerable exertion and consuming a significant amount of time. Mastering the art of writing can be challenging, even for exceptionally young learners. Nevertheless, engaging in written communication in any language can be highly enjoyable.

Teaching writing is the hardest talent among all four skills. Specifically, teaching writing to young learners poses a serious challenge for teachers. Developing language skills from an early age is crucial. Young learners lack motivation to engage in writing activities and instead prefer to focus on oral communication in an ESL classroom. Within our educational system, pupils are not afforded sufficient opportunities to exercise their autonomy in writing. Certain educational institutions provide creative writing courses that provide students with the opportunity to engage in unrestricted writing. At the elementary level, teachers have a crucial role in cultivating writing proficiency.

*Errors in writing**Error types in writing*

Within the literature on second language learning, various categories of errors have been discovered. There are two distinct categories that arise from analyzing learners' oral and written performance. The term used to describe this type of error is intralingual/developmental error. Richards (1974) states that these errors are made by learners and do not represent the structure of their native language. Instead, they are overgeneralizations based on little experience to the target language. Overgeneralization often includes the production of one deviant structure in place of two standard structures, for example, "He can sing", "We are hope", "it is occurring". Furthermore, interlingual/transfer errors pertain to the detrimental influence of the learner's first language habits (Selinker, 1974). For instance, numerous English as a Foreign Language (EFL) learners tend to rely on their native language and employ literal translation when expressing themselves orally or in writing in their second language (L2) and so make errors.

The types of error learners usually have made including grammatical errors, lexical errors, semantic errors and mechanics errors. Grammatical errors are errors related to Verb tense, Sentence structure, Coordination, Relative clause, Singular/plural, Verb omission, Subject omission, S-V agreement, Fragment. Lexical errors are often associated with Noun, Pronoun, Verb, Adjective, Adverb, Article, Preposition, Word form, Interjections. Semantic errors are more about Word choice (Meaning) while mechanics errors often involve Punctuation, Capitalization, and Spelling.

Common errors in sentence and paragraph writing

In a further study conducted by Hengwichitkul (2006), mistakes were examined at the level of complete sentences. The faults were categorized as subject-verb agreement, tenses, parts of speech, participial phrases, relative clauses, passive voice, parallel structure, punctuation, run-ons, and fragments. In a similar manner, Runkati (2013) classified the errors identified in her research into two primary categories. The first category addressed problems at the level of individual sentences, including fragments, run-ons, subject-verb agreement, word order, tenses, capitalization, and punctuation. The last one consisted of errors at the lexical level, including articles, prepositions, word selection, nouns, and numbers.

In a study conducted by researchers from a Thai university and released in February 2017, the focus was on faults in English sentences. The study found that Thai EFL students commonly made errors in fragments, subject-verb agreement, word order, tenses, capitalization, and punctuation. The other worrisome problems at the lexical level were articles, prepositions, lexical choices, nouns, pronouns, and verbs. Additional forms of analysis, such as addition and omission, were also classified as subcategories of errors occurring at the sentence level and word level. The primary sources of the errors were identified as interlingual interference, intralingual interference, insufficient grasp of English grammar and vocabulary, and student carelessness.

Corrective feedback in teaching writing

Theoretical perspectives of corrective feedback

Early Perspectives on Error and CF in SLA.

Since the mid-20th century, a key focus of SLA research has been the examination of learner errors and how they are addressed, a topic greatly impacted by linguistic viewpoints. This section examines common methodologies, such as Contrastive Analysis, Error Analysis, and Krashen's (1985) Monitor Model, which address the importance of errors and corrective feedback in second language (L2) learning and acquisition.

According to Krashen's (1985) Monitor Model, Written Corrective Feedback is deemed useless due to the distinction between learning and acquisition. Learning is a conscious process that involves teaching, while acquisition is a subconscious process that occurs naturally. As a result, corrective feedback, which is a conscious process, does not contribute to the growth of learning.

Recent Perspectives on Error and CF in SLA.

In the past twenty years, research has emphasized the importance of CF in language learning, highlighting its cognitive and societal benefits. These two lines of research utilize a diverse range of arguments that have a significant impact due to their explicit and implicit incorporation of the role of cognitive function in the process of second language acquisition (SLA). Prior to delving into the empirical research, it is imperative for us to thoroughly examine these viewpoints, specifically Processability Theory, Skill-based Theory, Interaction Theory, and Sociocultural Theory.

Processability Theory, formulated by Pienemann (1998) and his associates (Pienemann & Johnston, 1987; Pienemann, Di Biase, & Kawaguchi, 2005), posits that the cognitive capacity of L2 learners to comprehend and generate language is limited by a language processor. It suggests that these constraints, organized in a hierarchical manner, give rise to discernible stages of advancement in L2 acquisition.

The work of Anderson (1983, 1985), McLaughlin (1987, 1990), and DeKeyser (2003, 2007a) provides the most comprehensive representation of Skill-based Theory. The theory is primarily applicable to the acquisition of sophisticated cognitive skills, such as mathematics, and has also been expanded to encompass language learning, as stated by the theory. Simply said, Skill-based Theory views CF as a catalyst in the process of converting information.

The interaction approach encompasses language acquisition through the processes of input, output, and feedback, all of which take place during interaction (Gass & Mackey, 2006; Long, 1996). Among various ways that examine the role of CF, whether directly or indirectly, the interaction approach is widely regarded as the one that extensively investigates CF.

Sociocultural Theory, primarily grounded in the research of Vygotsky (1978, 1981), examines cognitive functioning from a distinct perspective. This perspective acknowledges that cognitive processes, such as language acquisition, are facilitated by the social interactions between learners and individuals who possess more knowledge and skills.

The significance of corrective feedback

Hopefully, recent studies and findings have made a contribution to increase teachers' awareness of corrective feedback to EFL young learners' writing.

The corrective feedback has a lot of advantages. Using an appropriate feedback correction can potentially boost pupils' motivation. It motivates the student to persist in their learning, particularly when they are aware that their output yields accurate results. Furthermore, if the learner discovers that their output is inaccurate, they should acknowledge their own accountability for their performance and strive to improve in subsequent attempts. An

additional advantage is that proficient utilization of correction feedback by professors can enhance students' proficiency and enhance their writing aptitude. It provides the learner with information about their learning trajectory and the level of progress they have made in their written performance. The learner will receive a comprehensive assessment on their primary deficiencies and will have the opportunity to seek potential solutions to improve their performance.

Types of corrective feedback in writing classes

Various forms of feedback can be given to students to identify and rectify faults in their writing. These recommendations have been extensively examined in numerous researches, which have offered evidence indicating the types of feedback that can enhance language acquisition. Hence, written corrective criticism can be classified into two primary categories: direct and indirect (Bitchener & Ferris, 2012).

Direct corrective feedback encompasses several forms, including: a) cross-outs, where the teacher eliminates any incorrect additions from the students' original texts, b) rewrites, where the teacher provides the correct spelling, structure, or form by rewriting a word, phrase, or sentence on the students' original texts, and c) additions, where the teacher includes any missing elements on the students' original texts, such as prefixes, suffixes, articles, prepositions, or words.

Indirect corrective feedback refers to the practice of the teacher identifying flaws in students' original texts by underlining, circling, or highlighting them, without actually correcting them. Students are required to analyze their mistakes and rectify them (Ferris, 2002). Indirect corrective feedback prioritizes the involvement of students in comprehending and rectifying their faults, rather than simply receiving the corrections. Indirect feedback is implemented by highlighting the flaws in pupils' writing, so conveying to them the presence of an issue that requires rectification. Teachers can employ various methods such as lines, circles, or highlighting to denote the precise position of errors. In addition, they must determine the level of explicitness of indirect feedback, taking into consideration the objectives they aim to accomplish through the provision of feedback.

In addition, when students are tasked with writing, they typically prioritize the content over the form. They then align their interests with the organization, presentation, and ultimately the purpose of language forms (grammar, vocabulary, spelling, and punctuation). Most teachers primarily provide comments on language forms, which may lead children to believe that grammar is the sole aspect to consider in writing. Nevertheless, numerous educators concur that equal attention should be devoted to both form and content, as the acquisition of writing proficiency necessitates the cultivation of both aspects. Raimes (1983; cited in Khalil, 2008) proposes that the teacher's primary emphasis should be on the substance of the writing during the initial phases of drafting, and thereafter on the structure and organization. Furthermore, when students are making numerous errors, teachers' focus is directed towards rectifying these mistakes, which are both time-consuming and labor-intensive. According to Gulcat and Ozagac (2004), it is suggested that one should prioritize fluency in students before emphasizing correctness (p.26).

The situation of early English education in Vietnam

The education system in Vietnam is structured into three stages, spanning 12 grades. The primary level caters to children aged 6 to 10, covering grades 1 to 5. The secondary level is designed for children aged 11 to 15, including grades 6 to 9. Lastly, the high school level is intended for students aged 15 to 18, covering classes 10 to 12.

From 1982 to 2002, English was mandatory at high school and optional at secondary school in Vietnam, where it was taught as a foreign language. The English textbooks primarily focus on grammar, while also incorporating reading comprehension and spoken proficiency. Furthermore, teachers primarily dedicate their time to instructing grammar and its rules, aiming to assist pupils in acquiring and mastering the English language for effective communication.

Since the early 1990s, the teaching of English in Vietnam has undergone considerable changes as a result of the influence of English as a global language. In early 2002, the Vietnamese Ministry of Education and Training (MOET) initiated the development of a new curriculum and the creation of new textbooks for all academic areas. In contrast to the time span from 1982 to 2002, the current general curriculum mandates the inclusion of English as a mandatory subject in both secondary and high school, while at the elementary level it is offered as an optional subject. Nguyen (2007) states that English is presently acknowledged as the preeminent and crucial foreign language incorporated at all educational levels in Vietnam. The importance and prevalence of English education have significantly increased, and currently, English Language Teaching in Vietnam is receiving elevated recognition. According to recent survey data, 99.1% of junior secondary schools teach English, whereas just 0.6% teach French, 0.2% teach Russian, and 0.1% teach Chinese (Loc, 2005).

The curriculum

The curriculum guidelines, which are also mandated by the Vietnamese Ministry of Education and Training, offer explicit instructions for the specific duration that teachers and students should allocate to each segment of a 40-minute class. Teachers are urged to enhance these lesson plans, but they must obtain authorization through a teacher assessment program in order to modify or substitute them. English was implemented as an optional course beginning in the second semester of Grade 3, with two 40-minute sessions per week. Starting in 2006, English will be mandatory, with four 40-minute sessions per week. MOET implemented an English curriculum for primary schools in the academic year 2003-2004. The program places a strong emphasis on the initial development of speaking and listening abilities, among four other skills.

The role of writing in the primary curriculum

Despite its crucial role in developing the four fundamental language abilities, writing has been consistently overlooked in Vietnamese elementary schools. As per the national test pattern, reading ability continues to be

considered the foremost competence. Formative and summative assessments do not incorporate writing, which poses a challenge in motivating students to engage in writing activities throughout class. Writing is regarded as more intricate to instruct in comparison to the other three skills. Certain educators lack self-assurance in their English proficiency and avoid creating writing assignments or encouraging students to engage in writing beyond just grammar exercises. Occasionally, educators may lack a sufficient number of ideas to assist students.

Typically, the majority of teachers adhere strictly to the requirements outlined in the textbook duties and do not go beyond them. They may even permit pupils to replicate the models from the aforementioned "How to" book. It is apparent that teaching writing is not considered a priority in Vietnamese upper-secondary English schools, as it is given a lower level of importance. Unsurprisingly, the emphasis on reading and the focus on exam performance have detrimental impacts on upper-secondary graduates, who often get numerous complaints about their inadequate listening, speaking, and writing abilities.

In the setting of Vietnamese primary schools, there has been a longstanding custom for instructors to assume the responsibility of revising their students' written work. Consequently, students primarily write with the intention of impressing their teachers rather than expressing themselves, leading to teachers being the sole recipients of the writing experience gained by students. Consequently, writing instructors frequently face the burden of providing comments and rectifying students' written work. Consequently, teacher-controlled feedback continues to prevail in Vietnamese English writing schools.

Review of previous research on the relationship between corrective feedback and writing performance.

Within the field of second language acquisition (SLA) research and theory, there has been ongoing debate on the impact of corrective feedback on language acquisition. Some proponents argue that corrective feedback is useful in enhancing learners' writing correctness, while others contend that it is ineffective or even detrimental. The following discussion will go into these contrasting viewpoints.

Extensive study has been carried out in Western settings to elucidate the efficacy of corrective feedback on writing. Krashen's (1985) Monitor Model suggests that WCF is not effective because to the distinction between learning and acquisition, with the latter being an unconscious process. Furthermore, learners systematically acquire the linguistic characteristics of the second language in a predetermined sequence that remains unaffected by the order in which it is taught. Hence, the deliberate act of providing incorrect feedback does not contribute to the development of pupils' acquired knowledge. Nevertheless, the interaction theories proposed by Long (1996) and Swain (1985, 1995) provide evidence in favor of the beneficial impact of written corrective feedback (WCF).

In 1996, Truscott published a critical essay contending that providing corrective feedback on writing by L2 students was not only ineffective but also potentially detrimental. He contended that error correction was irrelevant in writing classes, as evidenced by his study and the insights from second language acquisition (SLA)

research. Nevertheless, Ferris (1999) discovered that the empirical data provided in Truscott's study was restricted, and the methodology employed in previous investigations were flawed. According to Ferris (2002), indirect feedback is often more suitable and efficient than direct input. The potential peril of providing immediate feedback is that educators may misconstrue the intended message of students and inadvertently impose their own words upon them. According to Ferris (2002), direct feedback is suitable in the following situations: (1) when dealing with beginner students, (2) when errors cannot be easily corrected by the students themselves, such as errors related to sentence structure and word choice, and (3) when teachers want to highlight other error patterns that require correction by the students.

According to Chandler (2003), indirect corrective feedback is not helpful because it does not offer learners with enough information to fix complicated errors, such as grammatical faults. In addition, Chandler (2003) contended that whereas learners who receive direct corrective feedback are able to immediately internalize the proper form offered by their teacher, learners who receive indirect corrective feedback are uncertain about the accuracy of their own hypothesized corrections. In addition, Bitchener and Knoch (2010b) proposed that only direct corrective feedback provides learners with the explicit information necessary for evaluating hypotheses about the target language.

Lee (2011, 2013) conducted a study to examine how corrective feedback can enhance the accuracy of students' writing. The study explored the individual reactions to both focused feedback and peer feedback, as well as the individual elements that influence these reactions. The study's findings indicate a decrease in the number of mistakes committed by students, along with an increase in the number of errors corrected. Additionally, proficient pupils were capable of evaluating their classmates' written work. The study revealed that linguistic proficiency could potentially influence students' adoption of WCF.

Summary

This chapter has reviewed theoretical perspectives for conducting the current study. It covers key terms, previous studies about corrective feedback. Throughout reviewing the related studies on the effects of corrective feedback on students' writing the researchers (Krashen, 1985; Truscott, 1996) show that corrective feedback is both useless and ineffective to learners' acquisition and writing performance. While, there were many studies supported the role of corrective feedback to learners' improvement such as the researchers (Long, 1996; Swain, 1995; Ferris, 2002; Chandler, 2003; Lee, 2011 & 2013).

Our review has shown that the perceptions and practices of EFL teachers towards delivering corrective feedback to young learners' writing. First, this study would like to investigate how EFL teachers understand and aware of using corrective feedback in their classes; and the second is figuring out how teachers deliver corrective feedback.

This shows the need to investigate the gap in previous studies in terms of participants and research contextual

background. In most of previous studies, target participants were adult students with intermediate or high level at high schools and universities. Few studies on delivering corrective feedback to young learners' writing have been conducted with low English proficiency students. Beside that, almost all of these studies are conducted in countries with great differences of cultural and linguistic background as well as assessment trend in comparison with those in Vietnam in general and in Cantho city in particular. Hence, the current study was worth conducting on young learners who are learning English as a foreign language to enrich empirical findings as well as explores the perceptions of EFL teachers who are teaching at foreign languages in Cantho city toward delivering corrective feedback.

Methodology

This chapter presents an overview of research methodology of the study. The chapter starts by introducing research questions. Next, research design and participants are described in detail. The chapter continues with the description of the materials and research instruments. Last, the procedures of data collection and data analysis of the study are also presented.

Research questions

This study seeks to investigate the perspectives and methodologies employed by English as a Foreign Language (EFL) teachers in providing corrective feedback on the writing of young learners in Can Tho City. The study was specifically designed to ascertain the answers to two specific questions:

- (1) What are EFL teachers' perceptions of delivering corrective feedback on young learners' writing?
- (2) How do they deliver corrective feedback on young learners' writing?

Research approach

The present study is structured as a descriptive study that employs a combination of quantitative and qualitative methodologies. The study employed a blend of quantitative and qualitative methodologies to gather and analyze data, as well as address the two research inquiries. The quantitative approach enables the acquisition of numerical data analysis by means of collecting surveys. Data is typically presented in numerical and statistical formats, sometimes organized in tables, charts, figures, or other visual representations that facilitate clear comprehension of the outcomes of your investigation.

Furthermore, the researcher might utilize this strategy to obtain a substantial sample size. The utilization of qualitative methodology, involving interviews and observations, yields substantial, intricate, and reliable facts that significantly enhance the comprehensive comprehension of an authentic setting. Furthermore, this approach examines certain variables in order to obtain more dependable data.

Research methods

The quantitative method consisting of a questionnaire aims to explore the EFL teachers' perceptions of using corrective feedback for young learners in performance. Furthermore, it helps to identify the types of corrective feedback which teachers find the most useful for them to provide their learners. The qualitative method includes interviews in order to find out strategies that teachers deliver corrective feedback to their young learners' writing.

The interview is a qualitative method by its nature, frequently employed to collect profound information from the interviewee rather than superficial details. According to Kvale (2009), a qualitative research interview aims to address both factual information and the deeper meaning behind it (p. 30). The interviewer possesses the ability to actively listen to the interviewee's descriptions and analyze their statements to derive both explicit and implicit messages (Kvale, 2009, p. 30).

Table 2.1. Descriptions of the research design

Research questions	Methodology	Instruments
1. What are EFL teachers' perceptions of delivering corrective feedback on young learners' writing?	Descriptive study with qualitative and quantitative approaches	Questionnaire
2. How do they deliver corrective feedback on young learners' writing?		Interview& Observation

Participants

Questionnaire respondents

For the purpose of the present study, the participants in the research included 35 EFL teachers at English language centers are delivered questionnaire form.

The teachers are teaching in English centers in Can Tho City. They included 35 (5 males and 30 females) teachers aged from 25-35 years old. Their major is English Education and most of them graduated from Cantho University. The teachers who are working at private English centers are offered more benefits than others teaching at public English centers. Firstly, the number of students is limited around 20 for each class in private centers, while there are about or over 30 learners per class in public centers.

These teachers have been teaching more than two years to young learners aged from 6-12 years old. Moreover, they had got level from B2 to C1 of Vietnamese Standardized Test of English Proficiency (VSTEP).

Interviewees

In this study, two focused group interviews were conducted with 6 participants who majored in English Education in order to collect further information about their attitudes and preferences on the types of corrective feedback and how they deliver corrective feedback to specific ages of young learners. These interviewees also participated in answering the questionnaire. In interview group 1, participants teach their learners at the ages from 6-8 years old, while in the second group their target learners are students from 9-12 years old.

In this research, the interview was designed and focused on 1) the definitions of error correction 2) types of corrective feedback 3) strategies of using corrective feedback 4) practices of delivering corrective feedback. The interview was designed in English and prompts were also prepared to elicit the responses in case the participants could not provide the appropriate answers.

Observed participants

Five EFL teachers who are teaching young learners were observed and they were chosen purposely from responding the questionnaire. After that, they will be divided into two observe groups based on their textbooks and students' level.

In group 1, there are two female teachers who are teaching two different classes but the same textbook "Smart Start 3". The first teacher has 4 years in teaching young learners and she got level B2 of VSTEP. Her class size is 10 students with ages from 8-11 years old. While the second teacher has also 4 teaching experience years but she got C1 level of VSTEP. There are 12 students ages from 7-12 years old in her class.

In group 2, there are three female teachers who are teaching the same text book "Smart Start 5" but in different classes. Their teaching experiences to young learners are from 3-5 years and their levels are B2 and C1 of VSTEP. Their number of students in each class range from 10 to 15 students. The students' ages are from 9-12 years old.

Data collection instruments

Designing the questionnaire

The questionnaire is a main tool to collect data. It consists of three main parts. The first part was to find out the information related to EFL teachers who are teaching young learners including their gender, teaching duration, teaching experiences and teaching qualification.

The second part was to explore EFL teachers' perceptions of delivering corrective in young learners' writing in terms of teachers' understandings of basic concepts of errors and corrective feedback, strategies on delivering corrective feedback.

The last part was to explore EFL teachers' practices of delivering corrective in young learners' writing to find out frequency of using corrective feedback and types of corrective feedback that teachers usually applied in their classes.

The questionnaire consists of 39 questions including 25 questions for teachers' perceptions of errors and corrective feedback, 14 questions for teachers' practices of corrective feedback (Appendix 1).

A five-point Likert scale ranging from Strongly disagree to Strongly agree was employed within teachers' perceptions. The participants had to decide whether they strongly disagree, disagree, neutral, agree and strongly agree. Toward teachers' practices of corrective feedback, the Likert frequency scale ranging from Never to Always was applied. In these sections, the participants had to decide whether they practice corrective feedback Never, Rarely, Sometimes, Often or Always. In addition, because all the participants were Vietnamese teachers teaching English language, the questionnaire was presented in English. The items were arranged according to constructs to facilitate the participants' understanding.

Piloting the questionnaire

The questionnaire was designed and given to the researcher's colleagues for comments. The researcher chose the teachers who had experience in conducting research in order to assure its original validity and ease of use to the participants. Some adjustments or corrections were implemented in order to be more understandable for participants. Then, the questionnaire was piloted with 20 EFL teachers who are teaching young learners. A reliability test was run with the Cronbach alpha of .933. This result reveals that the questionnaire is reliable enough to collect official data for the study.

Administering the questionnaire

The questionnaire was delivered to the participants who are teaching young English learners in EFL classes where teachers used corrective feedback in their students' writing. Next, the researcher summarized the purpose of the questionnaire and explained the measure to respond to the questionnaire in order to make sure that the participants understand how to put a check on the questionnaire. This step helped the researcher collect the data more correctly. Each questionnaire was completed within approximately 15-20 minutes.

Interview

Designing the interview

With the aims of finding more information to support the findings of the questionnaire and the whole research, to get more in-depth of what teachers apply corrective feedback in practical contexts as well as viewing the possible differences in teachers' perceptions and practices, a semi-structured interview was employed. The interview used in this study as a secondary data collection tool was composed of eight main questions

(Appendix2). The interview was given to the researcher's colleagues for comments and feedback to make sure it was easy for interviewees to understand and answer.

Collecting data from the interview

The interviews were carried out during two weeks after contacting the participants via facebook or phone call. All interviews took place at language centers in Cantho city after teaching time. There are six EFL teachers who participated in responding questionnaire were chosen to answer the interview.

Four interviews were performed in tranquil and unoccupied classrooms, while the remaining two had to be completed remotely by phone call due to the researcher's inability to personally interview these professors. Each interview had a duration of 25-40 minutes and was conducted exclusively in Vietnamese. This decision was made in an effort to foster a more casual and uninhibited atmosphere among the participants. Based on our expertise, conversing in a language different from one's customary can result in certain ideas or thoughts being left unexpressed. This may occur due to a sense of discomfort or a lack of proficiency in effectively conveying one's true emotions. Due to the interviews being conducted in Vietnamese, it was necessary to translate the transcribed portions into English prior to using them in this essay. The researchers conducted the translations. The interviews were conducted as in-person dialogues following the administration of the questionnaire. The interviews were recorded, transcribed, and subsequently translated into English.

Observation

Designing the observation

The study analyzed the interaction in the classroom between the teacher and students, specifically looking at the feedback provided to affirm accurate answers and rectify bad ones. Feedback data were obtained through class observation to ascertain the types and frequency of feedback provided by teachers.

The researcher sought consent from many EFL teachers to participate in classroom observations. Five 45-minute lessons taught by five English as a Foreign Language (EFL) teachers were watched for a duration of four weeks. The decision to employ observation as a qualitative method for gathering data was motivated by the necessity to ascertain the specific feedback tactics employed by teachers in their actual classroom settings.

Collecting data from the observation

The data were subsequently subjected to qualitative analysis to comprehend the various forms of feedback employed in the classroom. Additionally, quantitative analysis was conducted to quantify the data according to a certain scheme. Prior to the observation, a predetermined observation protocol was established to assist the researcher in maintaining attention on specific characteristics that required investigation. The methodology encompassed many forms of feedback anticipated to transpire in the classroom, including teacher feedback, peer

feedback, direct feedback, indirect feedback, and any additional input not explicitly listed. Each feedback type was marked with a tick to quantify the frequency and type of feedback used by each teacher. This was performed subsequent to the collection of the data.

Data analysis methods

To go in line with the data analysis, quantitative and qualitative analysis were combined together. The questionnaire's quantitative data was inputted into a computer and evaluated using the computer software Statistics Package for the Social Science (SPSS 22 for Windows). A Descriptive Statistic test was used to analyze the attitudes of EFL students regarding teachers' utilization of authentic material for training in medical English terminology. To obtain qualitative data, the interview was examined utilizing interview methods.

Findings and Discussion

This chapter presents the results of the study. It describes and whenever relevant interprets the results of data analysis on EFL teachers' perceptions and practices of delivering corrective feedback on young learners' writing. Data analyzed include questionnaire, interview and observation. The final part of this chapter discusses the major findings emerging from the study.

Data of teachers' perceptions and practices of delivering corrective feedback to young English learners.

Prior to evaluating the questionnaire data, the reliability of the data acquired from 39 questionnaire items with 35 participants was assessed. The Cronbach's alpha coefficient was calculated to be .898 ($\alpha=.898$), indicating a high level of reliability for the questionnaire. This allows for the use of a Descriptive Statistic Test in SPSS to collect the average mean score of 35 instructors' views and practices on corrective feedback. The test outcome is displayed in Table 4.1.

Table 4.1 General teachers' perceptions and practices of delivering corrective feedback to young English learners at a language center in Cantho city.

	N	Minimum	Maximum	Mean	Std. Deviation
General	35	2.69	4.13	3.3927	.33822
Valid N (listwise)	35				

The average score of the questionnaire is displayed in Table 4.1, with a mean value of 3.3927. A one-sample T-test was conducted to compare the average score of instructors' views and practices of corrective feedback with the specified values of 3.0 (representing neutrality) and 4.0 (representing agreement). The findings indicate that

the average score of instructors' perceptions and practices of corrective feedback significantly deviates from both 3.0 ($t=6.869$, $p=.000$) and 4.0 ($t=-10.623$, $p=.000$).

A one-sample T-test was conducted with a test value of 3.5. The findings revealed that there was no statistically significant disparity between the average score of general instructors' perceptions and practices of corrective feedback ($M=3.3927$) and the test value of 3.5 ($t=.729$, $p=.069$). The study revealed that EFL teachers often demonstrated above-average perceptions and practices when it came to providing corrective comments on the writing of young English learners.

Teachers' perceptions of corrective feedback in young learners' writing

Teachers' perceptions of the role of young learners' errors in writing

To collect data about the perceptions of EFL teachers of the role of young learners' errors in their writing performance, a well-designed questionnaire was employed. After the procedure of data collection through questionnaire, the data were analyzed and the general result is shown in Table 4.2.

Table 4.2 Teachers' perception of the role of young learners' errors

	N	Minimum	Maximum	Mean	Std. Deviation
Error	35	1.75	4.38	3.1893	.56667
Valid N (listwise)	35				

A one-sample T-test was conducted on the average score of EFL teachers' views of errors made by young learners, with a test value of 3.5. The analysis indicates a disparity between the average rating of teachers' observations on errors made by young learners ($M=3.1893$) and the benchmark value of 3.5 ($t=3.244$; $p=.003$). EFL teachers' judgments of young learners' blunders can be deemed as mediocre. The teachers under investigation possess unfavorable beliefs on the significance of faults made by their students in writing. Nevertheless, the comprehensive examination of the data provides other insights.

Aiming at comparing the level of each perception listed in the questionnaire, the Frequency Test was run. The results are illustrated in Table 4.3.

Table 4.3 Teachers' perception of young learners' errors

No.	Item	Agree (%)	Disagree (%)	No idea (%)
1	Learners' errors are necessary in language learning progress.	86.8	2.6	2.6
2	Learners' errors can help teachers know how much more the learner needs to learn.	86.9	0.0	5.3

3	Errors are both useless and harmful for learners.	5.3	68.4	18.4
4	Errors have no role in writing skill.	0.0	86.9	5.3
5	Errors may also help to better understand the process of second and foreign language acquisition.	71.1	10.5	10.5
6	Learners' errors have been generally considered as a negative effect or result, even to be punished in learning process.	0.0	86.9	5.3
7	Young learners can realize their errors and correct those errors by themselves.	28.9	47.4	15.8
8	Young learners can realize their errors pointed out by their teachers more easily.	85.2	0.0	10.5

For the perceptions of EFL teachers of the role young learners' errors play in learning progress, most of the teachers investigated agree that errors play an important role and essential part in language acquisition. It can be seen clearly in their response to item 1 and 2. Nearly 87% (33 participants in total 35) believe that errors are to be corrected by teachers as an effective way which helps to recognize what the learners have already mastered or what issues or structures still remain problematic for them. Moreover, also nearly 87% of the participants disagreed that errors do not have any role in writing skill, the investigated teachers have positive attitudes towards the fact that errors are useful in giving teachers the chance to help learners improve young learners' writing. In comparison between item 7 and 8, the majority of EFL teachers (nearly 85%) thought that it is more effective when teachers point out errors for the young language learners. Only 29% of the investigated teachers believe that young learners can recognize their errors by themselves.

Teachers' perception of delivering corrective feedback on young learners' writing

The second cluster of the questionnaire includes a set of questions aimed at gathering more evidence regarding EFL teachers' perspectives of providing corrective feedback to young learners' writing. The overall outcome of teachers' perceptions on the provision of corrective feedback for young learners' writing is presented in Table 4.4, following the process of data collection and analysis.

Table 4.4 Teachers' perception of delivering corrective feedback to young learners' writing
Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
CF	35	2.50	4.75	3.7321	.57534
Valid N (listwise)	35				

One sample t-test on the second cluster was run in order to analyze the data. With the Mean score $M=3.7$ ($p=.00$) when it was compared with the test value (4.0), the result shows that there is a difference between the mean score of EFL teachers' beliefs about corrective feedback ($M=3.7$) and the test value 4.0 ($t=-5.445$, $p=.000$). It can be concluded that EFL teachers' perceptions about delivering corrective feedback to young learners' writing is just above average. However, it can be confirmed that the investigated teachers recognize the role of delivering corrective feedback to young learners' writing and what types of corrective feedback delivered to their learners.

To gain insights into the perception of EFL teachers of giving error correction and feedback in writing skill, the test of frequency was run.

In this part, based on the response of the participants, their beliefs of the mutual relationship between corrective feedback and writing improvement is found. All of the investigated teachers (100%) believed that providing corrective feedback can help improve students' writing accuracy (in item 11). The implication of this result is that the participants absolutely believe in the advantage of making corrective feedback available to young learners, that is it could help enhance learners' writing performance.

Moreover, no participants denied the role of corrective feedback in promoting English learning. Although delivering corrective feedback is believed to help improve young learners' writing skill, the response of nearly 50% of the participants has shown that to them writing is not a major skill to young EFL learners. What could be inferred from this result is that these teachers would not focus too much on writing skill as well as learners' writing performance in their classes, which is actually a good decision because the theory of child language acquisition emphasizes that children should be developed in terms of oral skills moving from listening then to speaking first; reading and writing should come much later in the process.

Concerning the types of corrective feedback between direct and indirect feedback, the questionnaire data have indicated the investigated teachers had a tendency to apply direct feedback as a result of their consideration the young age of their learners and their low level of proficiency.

Up to 72% of teachers showed they prefer chose direct feedback to because their students are young learners, so their levels are low. Over a half of the number of the participants agreed that direct feedback would be applied in class effectively.

It is obvious that most of the surveyed teachers shared nearly similar views of the role of errors and of providing corrective feedback. The majority of the teachers believed that corrective feedback is useful in keeping a record of their young students' learning progress. In addition, learners' errors can help students know their own strengths and weaknesses in learning writing.

The teachers in the interview data also believe that they can adapt their teaching, modify the lesson to help students write better. Although the motivation was rarely mentioned in the interviews by teachers, some teachers do believe that corrective feedback can be used to motivate students' learning.

Teachers' strategies on delivering corrective feedback to young learners.

In order to deliver corrective feedback successfully and efficiently, there are various of strategies that teachers should follow when they apply for their students. The data of exploring the teachers' beliefs of ways on giving correct feedback were collected through questionnaire. After the procedure of data collection and data analysis, the general result of teachers' perceptions of strategies of corrective feedback is shown in Table 4.5.

Table 4.5 Teachers' strategies on delivering corrective feedback

	N	Mean	Std. Deviation	Std. Error Mean
Strategies	35	3.7238	.28820	.04871

A one-sample T-test was conducted to evaluate the average score of EFL teachers' beliefs regarding corrective feedback procedures ($M=3.72$) against a test value of 4.0. The outcome revealed a significant disparity between the average score and the test value ($t=-5.670$, $p=.000$). Based on the data analysis, it is evident that teachers' perception varied in relation to the tactics they employed for providing corrective feedback.

The Descriptive Statistic Test was conducted to provide further understanding of the variations in instructors' attitudes regarding specific tactics for providing corrective feedback. Table 4.6 displays the results.

Table 4.6 Teachers' beliefs in strategies of giving corrective feedback

No.	Items	N	Minimum	Maximum	Mean	Std. Deviation
	17. The teacher should mark only MAJOR errors because it's too time consuming to mark all errors.	35	2.0	4.0	3.200	.8677
	18. The teacher should mark all errors at first,	35	2.0	5.0	3.771	.8432

	then focus on repeated ones.					
	19. First the teacher should respond to content and organization, then on final draft mark errors.	35	2.0	5.0	3.600	.7746
	20. The teacher should only mark some errors, and make general comments at the end.	35	2.0	5.0	3.200	.9010
	21. Teachers should give positive feedback and comments to young learners	35	2.0	5.0	3.914	.9813
	22. Teachers could encourage the students take risks or make errors in learning process.	35	4.0	5.0	4.086	.2840
	23. Teachers should give the complete explanation of the error and the proper rule or pattern	35	2.0	5.0	3.857	.6482
	24. Grammatical errors were also frequently corrected in Writing tasks.	35	2.0	5.0	3.943	.5392
	25. Spelling errors were also frequently corrected in Writing tasks.	35	3.0	5.0	3.943	.4161
Total		35				

The results indicated that teachers' beliefs toward specific types of corrective feedback were rather high. The types of errors such as grammatical and spelling errors ($M=3.943$) were the most common errors that teachers corrected in Writing tasks.

Teachers' practices of delivering corrective feedback to young learners' writing

Teachers' frequency on delivering corrective feedback to young learners' writing

The second research question is aimed at investigating EFL teachers' practices of delivering corrective feedback on young language learners' writing. The research question has two focuses. Firstly, it explores which errors that teachers mainly focused on correcting. Secondly, it focuses on the ways that the teachers applied when delivering corrective feedback in their teaching context. Two research instruments were used to collect data for answering the question. These include questionnaire at first and interview later in the process. In the questionnaire, the participants were required to respond never, rarely, sometimes, very often, always to the items developed. After the collection and analysis of the questionnaire data, the result is shown in Table 4.7. It is important to remember that these data show the reflections of the teachers' practices rather than provide empirical evidences of their actual practice through observation or recording. As such these data are reflective in nature.

Table 4.7 Teachers' reflection of the frequency of their delivering corrective feedback to young learners' writing

	N	Minimum	Maximum	Mean	Std. Deviation
Frequency	35	2.75	5.00	3.9000	.52580
Valid N (listwise)	35				

The one sample T-test was run to compare mean score of teacher's reflected practices of the types of errors they often give and the test value 4.0. The result has shown that there is no difference between the mean score and the test value ($t=-1.125$, $p=.268$). It can be concluded that the surveyed EFL teachers' practices of error types are fairly above average.

Teachers' practices on delivering corrective feedback to young learners' writing

This part is aimed at investigating ways of giving corrective feedback that EFL teachers claim they use in their teaching context. The data received through the questionnaire are complimentary by the interview data. After the questionnaire data collection and data analysis, the result is shown in Table 4.8.

Table 4.8 Teachers' reflective practices of delivering corrective feedback to young learners' writing

	N	Minimum	Maximum	Mean	Std. Deviation
Practices	35	1.80	4.30	2.7829	.64008
Valid N (listwise)	35				

The average score of instructors' overall reflective practices of corrective feedback was compared to the test value of 3.0 using a one-sample T-test. The analysis indicates that there is no statistically significant disparity

between the test value and the average score of instructors' overall reflective practices for corrective feedback ($t=-2.007$, $p=.053$). The teachers' overall practices of corrective feedback can be deemed as mediocre.

Aiming at getting more detailed information about how participants responded to every item in the questionnaire, the test of Frequencies was run.

One corrective feedback which is claimed by the participants is typically used to improve young learners' writing is direct feedback. There are 31 teachers (nearly 90%) who said they often or always use this type of corrective feedback to assess their young students' writing. Other 4 participants (nearly 11%) admitted they rarely applied this type of feedback in their feedback to young learners' writing. It can be concluded that the frequency of use of direct corrective feedback as reflected by the teachers is fairly high.

The next type of corrective feedback used to assess students' writing performance is indirect feedback. Concerning indirect corrective feedback, 12 participants (nearly 34%) claimed they sometimes employ this strategy. Other 3 participants (nearly 14%) said they very often use reading aloud task. The number of participants who rarely or never applied indirect corrective feedback through underlining or circling the errors without any comments, however, is rather large. There are 14 participants (nearly 40%) who rarely or never applied this type of corrective feedback in their teaching context.

Comparing the frequency of using teacher feedback to peer feedback in writing classes, 27 teachers (nearly 77%) claimed they very often had this type of corrective feedback applied in their classroom. Eight participants (nearly 22%) said they sometimes use it.

Regarding using peer feedback, there are 17 participants (nearly 50%) saying they sometimes implement peer feedback in writing assessment, while one participant (nearly 3%) never applied this type in writing correction. The data from the questionnaire about teachers' practices of delivering corrective feedback were also supported by teachers' answers in the in-depth interview.

Firstly, the interviewed teachers said that there were 4 main kinds of corrective feedback that they applied in their teaching context. These include direct and indirect feedback, teacher and peer feedback.

The data have indicated that most of the investigated teachers in the interview used various kinds of corrective feedback to respond to their young learners' writing. This conclusion is in line with the data obtained by means of the questionnaire. It can be seen that direct and indirect feedback were mentioned by most interviewed, teacher 1, teacher 3 and teacher 4, which means these types are commonly used. The least mentioned is peer feedback. Secondly, in order to examine whether the teachers usually use direct or indirect feedback in their classrooms, there are two different ideas. The first group said that they preferred indirect feedback to direct feedback because the former help learners recognize their errors by themselves and they can remember for long time. However, if students are young learners and low levels, teachers should use direct feedback because it should be

more useful and effective. The other group suggested that the decision of giving direct or indirect feedback should depend on each situation and learners' proficiency as shown in the following explanation:

"I think that it depends on each case so that the teacher can decide to give the students indirect or direct feedback. For example, if the sentences are easy to understand or simple, the teacher can deliver them indirect feedback. Also, the students' level can affect the type of corrective feedback. For weak students, we should give them direct feedback and vice versa" (Teacher 1).

Teachers' practice of delivering corrective feedback from empirical evidence

As said above, while the questionnaire and interview data can provide some relevant information about teachers' practices, they are reflective by nature and may not provide a comprehensive picture of what teachers really do in practice. In order to find out more empirical evidences for EFL teachers' practices of using corrective feedback to young learners' writing, some observations were carried out. After the procedure of observation collection, there are some major findings established.

Firstly, the observed EFL teachers always correct their students' errors both in sentences or paragraphs. They mainly focused on correcting grammatical and lexical errors like tenses, structures, spellings and so on because their target learners are young learners. Secondly, most of observed teachers used teacher feedback more than peer feedback because as they said in the interview that it could help them to save time and it is easy for their young students to realize the errors. Moreover, there was one teacher who was captured to apply different types of corrective feedback. She combined both group and individual correction, teacher and peer feedback, direct and indirect feedback. She took advantage of peer feedback effectively through asking her students to write their own writing based on her writing model and then she stuck their writing on the blackboard. After that, the students went around the classroom to read and vote the best writing through their stickers. The students also could correct some basic errors on their classmates' writings. This activity not only created an interesting atmosphere but also became a useful way to provide corrective feedback.

Discussion of the research results

EFL teachers' perceptions

The numerical data obtained from the questionnaire are utilized to address the initial study inquiry. The examination of the questionnaire data indicates that the participants hold predominantly positive attitudes regarding the role of corrective feedback in young learners' writing. The majority of experts concur that learners' faults are vital in the process of learning and teaching, particularly in the context of teaching and learning writing skills. This assertion is strongly corroborated by the works of Ringbom (1987) and Jabeen (2015). These studies have demonstrated that errors need not necessarily be seen negatively, but rather as integral and essential components of the language acquisition process. Errors can also help teachers' comprehension of the second and foreign language acquisition process. Nevertheless, the participants' level of mistake awareness is low.

Along with the positive perception of learners' errors, the participants also appreciated the effects of corrective feedback on writing performance.

Consensus was reached among all participants that the provision of corrective feedback has the potential to enhance the accuracy of students' writing. The participants' questionnaire replies indicated that the adoption of corrective feedback helped their learners to recognize their flaws and blunders in different ways, either directly or indirectly. The study has revealed that the teachers who were examined believe that both direct and indirect feedback can enhance language acquisition, particularly in the context of writing skills.

EFL teachers' practices

The practices of delivering corrective feedback on writing performance in terms of specific features including strategies and practices.

The results from the study have indicated that in the teachers' opinions, error correction is not always time-consuming. It depends on the techniques which teachers apply in their classes, for example, highlighting some major errors to give their students feedback in front of the class. Beside that, the type of error is an influential factor for the strategy or technique used. Therefore, teachers should be flexible in selecting the errors and choosing correction method suitably. Additionally, in order to deliver feedback effectively, the teachers should give positive feedback and comments to young learners to enhance their motivation in learning writing. Teachers also encouraged student to make errors in learning process because they could learn many things from these errors.

The study has shown that the participants did pay more attention to these specific errors such as when giving correction. They focus more on grammatical and semantic errors than taking care of semantic and mechanic errors. During the observation time, learners did some semantic and mechanic errors but teachers did not realize or chose to ignore these errors, which might affect the way the students wrote. In general, there was a notable alignment between teachers' perception and their actual practices for direct and indirect feedback. This suggests that the instructors' actions in the error correction task were consistent with what they had previously said in the teacher questionnaire and interview.

Conclusion And Implications

This chapter summarizes major findings of the study. It also discusses pedagogical implications and identifies limitations of the study. From these issues, some suggestions for further research are presented.

Major findings

The study sought to examine the perspectives and methodologies employed by English as a Foreign Language (EFL) teachers when providing corrective feedback on the writing abilities of young learners at a language center in Cantho city. The investigation focused on two primary areas: the teachers' conceptions of corrective feedback and their actual implementation of corrective feedback strategies. The overall findings demonstrated that English as a Foreign Language (EFL) instructors have a favorable understanding of the significance of errors and corrective feedback in relation to learners' writing skills and language learning as a whole. In addition, the majority of teachers concur that providing corrective comments can be beneficial in enhancing students' writing accuracy and improving their writing performance. Nevertheless, the degree of perceptions and practices was rather low. Teachers possessed knowledge on corrective feedback in relation to errors made by young learners, various forms of corrective feedback, techniques for delivering corrective feedback, and the implementation of corrective feedback in their teaching setting. Concerning the connection between perceptions and practices, there was a significant link observed between teachers' perceptions and their implementation of corrective feedback.

Pedagogical implications

Implications for administrators

The findings from the research revealed that EFL teachers held positive beliefs of corrective feedback. Moreover, their perceptions were translated into their practices. There was a positive correlation between teachers' beliefs and practices.

Positive beliefs are fundamental to the practices. In the current study, although teachers' beliefs of corrective feedback were positive in general, the level of beliefs was not really high. In addition, teachers were doubtful of many beliefs, which may affect their teaching experiences in general and corrective feedback in specific. Because of these problems, administrators should hold training programs, seminars, workshops to provide teachers with knowledge in the field of corrective feedback. Through training programs, seminars, workshops, teachers might change or adapt their beliefs as well as get updated with changes in the field of giving correction and feedback to make better teaching and learning.

Implications for EFL teachers

Based on this research, EFL teachers can investigate the important role of corrective feedback to learners, especially young English learners. Moreover, effective correction and feedback could bring many benefits in teaching and learning, especially it could improve young learners' writing abilities. However, in order to master and deliver corrective feedback effectively, teachers could follow these suggestions.

First and foremost, educators should prioritize the utilization of many forms of feedback within their instructional setting. Due to variations in student intelligence, it is not feasible to provide the same feedback to all students. Therefore, feedback often needs to be tailored to individual students. Hence, teachers should offer

feedback that is most efficacious for the kids. Furthermore, educators should possess knowledge on the benefits of feedback and the most effective methods for its implementation and delivery to their pupils.

An important aspect is for teachers to motivate their students by encouraging them to take risks and providing positive feedback, either orally or in writing (such as praising their work as good or excellent, and acknowledging their excellent word choice). Additionally, teachers can offer rewards to those who perform exceptionally well, and provide extra marks to students who provide correct answers.

Furthermore, teachers could talk or discuss problems in error correction and feedback with colleagues, share experiences in assessing students' writing skill. These activities would make teachers' teaching better and benefit students' learning.

Limitations

The current research has reached its aims. However, it has limitations due to the time constraint.

The first point is the study was conducted with a small size of participants (35 participants for questionnaire and 5 participants for interview). With more participants, the research findings could gain more reliability.

The existing research on corrective feedback in writing has not comprehensively addressed all areas, hence limiting our understanding of EFL teachers' attitudes and practices in this area. This is due to the vast scope of the topic of language assessment and corrective feedback.

Suggestions for further research

As far as the researcher is aware, no studies on providing corrective feedback to young learners in the Mekong Delta have been conducted. Hence, the researcher aspires that the outcomes of this study can serve as a point of reference for future investigations conducted in the same region or comparable circumstances.

Further studies can be conducted on corrective feedback towards other English skills such as speaking, listening, and so on in order to contribute valuable source in teaching career.

Hopefully, the current study and other future research will lead to greater awareness of giving correction and feedback to make better teaching and learning.

Acknowledgements

The research paper would not have been completed without the supports from many people. On this occasion, I would like to extend my deepest gratitude to all of them.

I am deeply thankful to the colleagues who participated with pleasure to fill the questionnaires and cooperated in the interviews and observations.

I would like to send my sincere thanks to my family, especially my parents, who were always by my side and provided me with everything to gain the valuable achievement for my study.

Appendices

Appendix 1

Dear Teachers,

I am Vu Thi Ly, a lecturer of the university in Mekong Delta. I am conducting a study on the topic of how English as a Foreign Language (EFL) teachers perceive and implement corrective feedback in order to improve the writing performance of young learners. The subsequent questionnaire holds significant significance in my investigation. There is no definitive answer. Indicate the column that corresponds to your knowledge and expertise. The responses you provide will serve as the fundamental data for my research. Your information will be securely safeguarded and utilized solely for research purposes.

A. Participants' information

1. Gender: ☐ Male ☐ Female
2. Age:years old.
3. Your English proficiency: (B1, B1, C1 & C2).....
4. You have taught English foryears.
5. Your English center:
6. Your students' age:
7. Your class size:

The questionnaire

This questionnaire consists of 39 statements. Please read each statement and put a check (✓) to indicate your agreement on each.

N.o	Statements	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
I	Teachers' perceptions toward young learners' errors					
1	Learners' errors are necessary in language learning progress.					
2	Learners' errors can help teachers know how much more the learner needs to learn.					
3	Errors are both useless and harmful for learners.					
4	Errors have no role in writing skill.					
5	Errors may also help to better understand the process of second and foreign language acquisition.					
6	Learners' errors have been generally considered as a negative effect or					

	result, even to be punished in learning process.					
7	Young learners can realize their errors and correct by themselves.					
8	Young learners can realize their errors by their teachers.					
II	Teachers' perception towards corrective feedback in young learners' writing					
9	Corrective feedback is essential in promoting L2/FL learning					
10	In your opinion, writing is the major language skill to young learners.					
11	The effect of corrective feedback can improve students' writing accuracy					
12	Teachers should correct ALL errors that learners make in class, so that they can write correctly.					
13	Teachers should correct learners' errors CLEARLY in the process of writing English.					
14	Through corrective feedback, teachers can assist their learners to realize their errors and mistakes in various ways, maybe directly or indirectly.					
15	Direct corrective feedback is more effective than indirect corrective feedback.					
16	Direct feedback is appropriate for beginner students					
III.	Teachers' strategies on delivering corrective feedback					
17	The teacher should mark only MAJOR errors because it's too time consuming to mark all errors.					

18	The teacher should mark all errors at first, then focus on repeated ones.					
19	First the teacher should respond to content and organization, then on final draft mark errors.					
20	The teacher should only mark some errors, and make general comments at the end.					
21	Teachers should give positive feedback and comments to young learners					
22	Teachers could encourage the students take risks or make errors in learning process.					
23	Teachers should give the complete explanation of the error and the proper rule or pattern.					
24	Grammatical errors were also frequently corrected in Writing tasks.					
25	Spelling errors were also frequently corrected in Writing tasks.					
N.o	Statements	Never	Rarely	Sometimes	Often	Always
IV	How often do you give these kinds of corrective feedback?					
26	Grammatical errors					
27	Lexical errors					
28	Semantic errors					
29	Mechanics errors					

1. Grammatical errors: Verb tense, Sentence structure, Coordination, Relative clause, Singular/plural, Verb omission, Subject omission, S-V agreement, Fragment.
2. Lexical errors: Noun, Pronoun, Verb, Adjective, Adverb, Article, Preposition, Word form, Interjections.
3. Semantic errors: Word choice (Meaning)
4. Mechanics errors: Punctuation, Capitalization, and Spelling.

N.o	Statements	Never	Rarely	Sometimes	Often	Always
-----	------------	-------	--------	-----------	-------	--------

V	How often do you give your corrective feedback?					
30	By indicating only the place where the errors occurred by underling /circling.					
31	By indicating only the place where the errors occurred by underling /circling and give correct form.					
32	By making only comments without correcting errors.					
33	By correcting errors without giving comments.					
34	By letting the student evaluate each other's work in pairs or with whole place.					
35	By discussing the written errors with students.					
36	By correcting errors and writes comments for each student's writing work.					
37	By correcting repeated errors to the whole class.					
38	By correcting only MAJOR errors and ignore other errors.					
39	Teacher ignores students 'errors.					

Appendix 2

Interview (English version)

1. How long have you taught children?
2. What ages of young learners do you usually teach?

Teachers' perceptions
In your opinion, what is error correction? Is it necessary for children?
Do you think a teacher should correct ALL or SOME errors in student' writing? Why?
Do you think error correction takes a lot of time?
Do you think your students like to be corrected by their teacher or their friend? Why do you know that?
Teachers' practices
How do you correct young learners' writing in class?
What types of corrective feedback do you usually use in class?
Do you prefer direct feedback or indirect feedback? Why?
What types of errors in writing do you usually correct for young learners?

Appendix 3

Interview (Vietnamese version)

A. Nhận thức của giáo viên về lỗi và sửa lỗi cho trẻ em
1. Theo ý kiến của bạn, sửa lỗi là gì và việc sửa lỗi này có cần thiết cho trẻ em không?
2. Bạn nghĩ là giáo viên nên sửa tất cả các lỗi hay chỉ một số lỗi trong bài viết của học sinh và tại sao? Bạn có nghĩ việc sửa lỗi thì mất thời gian không?
3. Bạn nghĩ là học sinh của bạn sẽ thích được sửa lỗi từ giáo viên hay từ bạn cùng lớp. Tại sao bạn lại nghĩ như vậy?
B. Thực hành của giáo viên về sửa lỗi và đưa ra nhận xét
4. Bạn thường sửa lỗi bài viết của học sinh là trẻ em như thế nào?
5. Loại sửa lỗi nào mà bạn thường áp dụng trong lớp? sửa lỗi trực tiếp hoặc gián tiếp?
6. Bạn thích loại nào hơn: sửa lỗi gián tiếp hay sửa lỗi trực tiếp? Tại sao?
7. Những loại lỗi nào trong bài Viết mà bạn thường xuyên sửa lỗi cho đối tượng học sinh là trẻ em.

Appendix 4: Interview Transcript

Interview 1: Giáo viên 1

Người phỏng vấn: Chào bạn, hôm nay mình xin bạn một ít thời gian để trao đổi một số vấn đề về đề tài mình đang thực hiện. Đề tài về việc sửa lỗi và đưa ra nhận xét trong bài viết của đối tượng là trẻ em. Bạn cho mình hỏi:

Bạn đã dạy cho đối tượng trẻ em được bao lâu rồi? Đối tượng giảng dạy chính của bạn ở độ tuổi nào vậy?

GV 1: Em đã đi dạy được 4 năm rồi chị. Em dạy nhiều cấp độ khác nhau, dạy trẻ con thì em dạy các bé từ độ tuổi 9-10 tuổi.

(Câu hỏi 1)

Người phỏng vấn: Theo ý kiến của bạn, sửa lỗi là gì và việc sửa lỗi này có cần thiết cho trẻ em không?

GV 1: Em nghĩ là sửa lỗi là giúp các bé sửa những lỗi mà chúng gặp phải trong quá trình học. E nghĩ sửa lỗi thì rất cần thiết đối với con nít đó chị để giúp các bé cải thiện các kỹ năng.

Người phỏng vấn: Vậy theo em sửa lỗi cho trẻ con thì rất quan trọng và cần thiết đúng không em?

GV 1: Dạ đúng.

Người phỏng vấn: Trong lớp em có thường xuyên sửa lỗi cho các bé không em?

GV 1: Dạ có chị.

(Câu hỏi 2)

Người phỏng vấn: Theo em, là giáo viên thì mình nên sửa hết tất cả các lỗi cho các bé hay chỉ sửa 1 vài lỗi nào đó thôi?

GV 1: Theo em nghĩ, giáo viên chỉ nên sửa 1 vài lỗi thôi chị, không nên sửa hết bởi vì chỉ cần chú trọng vào các lỗi chính quan trọng thôi và sau đó đưa ra nhận xét hoặc góp ý cho học sinh.

Người phỏng vấn: Em có thể cho biết lý do tại sao em chỉ sửa 1 số lỗi chính?

GV1: Em nghĩ nếu giáo viên sửa tất cả các lỗi sẽ làm cho học sinh cảm thấy mất động lực học tập và cảm thấy sợ hãi khi mắc lỗi. Với lại, em cũng nghĩ nếu giáo viên đưa ra những nhận xét mang tính động viên và thân thiện để khuyến khích các em trong việc học tiếng Anh.

(Câu hỏi 3)

Người phỏng vấn: Em có nghĩ là sửa lỗi rất mất thời gian?

GV1: Em nghĩ sửa lỗi không mất quá nhiều thời gian bởi vì em chỉ chú trọng sửa 1 số lỗi chính và đưa ra nhận xét chung cho cả lớp. Nó giúp giáo viên tiết kiệm được nhiều thời gian.

Người phỏng vấn: Vậy theo em, nếu chúng ta sửa tất cả các lỗi sẽ mất rất nhiều thời gian?

GV 1: Dạ đúng vậy.

(Câu hỏi 4)

Người phỏng vấn: Em nghĩ là học trò của em thích được em sửa lỗi cho hay thích được bạn bè cùng lớp sửa lỗi?

GV1: Em nghĩ là đa số đều thích được nhận sửa lỗi và nhận xét từ giáo viên hơn bởi vì các em nghĩ là Giáo viên là người có kiến thức nhiều về Tiếng thì có thể sửa lỗi cho các em tốt hơn.

Người phỏng vấn: Tại sao em biết được điều đó?

GV1: Em biết được do đọc 1 số nghiên cứu trước đây về sửa lỗi và đưa ra nhận xét, loại sửa lỗi được học sinh thích là teacher feedback hơn là peer feedback.

Người phỏng vấn: Theo em học trò của em có thích được em sửa lỗi hơn các bạn trong lớp không?

GV1: Em nghĩ là có.

(Câu hỏi 5)

Người phỏng vấn: Chị sẽ hỏi em về 1 số cách mà em áp dụng để sửa lỗi trong lớp. Em trao đổi và chia sẻ với chị nha?

GV 1: Dạ. E sẵn sàng nói những gì em biết cho chị.

Người phỏng vấn: Trong lớp, em sửa lỗi cho phần Viết của học sinh như thế nào?

GV 1: Dạ, nó còn phụ thuộc vào từng câu, vì vậy em có nhiều cách sửa lỗi và đưa nhận xét khác nhau. Ở trong lớp, em thường dùng phương pháp lập lại để sửa lỗi cho học sinh.

Người phỏng vấn: Em có thể nói cụ thể và cho ví dụ được không em?

GV 1: Ví dụ khi học sinh nói về những sự việc đã xảy ra trong quá khứ, các em thường quên chuyển từ “go” thành “went” thì lúc đó sẽ áp dụng phương pháp lập lại.

Ví dụ học sinh nói: I go to Nha Trang last vacation. Thì em sẽ lập lại câu đó lần nữa và nhấn mạnh vào chữ go và em sẽ nói You GO to Nha Trang last vacation. Em sẽ đưa ra gợi ý để học sinh có thể tự sửa lỗi của mình trước.

Người phỏng vấn: Vậy là em sử dụng cách lập lại và nhấn mạnh lỗi để học sinh có thể tự nhận ra và tự sửa lỗi trước?

GV 1: Dạ đúng vậy.

(Câu hỏi 6)

Người phỏng vấn: Những loại corrective feedback nào mà em hay sử dụng trên lớp.

GV1: Em thường áp dụng sửa lỗi gián tiếp, trực tiếp và cho học sinh sửa lỗi cho nhau.

(Câu hỏi 7)

Người phỏng vấn: Em thích sửa lỗi trực tiếp hay gián tiếp hơn?

GV1: Em nghĩ là cũng tùy vào trường hợp, giáo viên có thể đưa ra sửa lỗi trực tiếp hay gián tiếp. Ví dụ, nếu đó là câu dễ và đơn giản, giáo viên có thể đưa ra gợi ý và sửa lỗi gián tiếp.

Người phỏng vấn: Em có nghĩ là cấp độ của học sinh cũng ảnh hưởng đến việc lựa chọn loại corrective feedback?

GV1: Em đồng ý, cấp độ của người học sẽ ảnh hưởng đến việc lựa chọn loại corrective feedback cho phù hợp. Ví dụ, đối với học sinh yếu thì em chọn sửa lỗi và đưa ra nhận xét trực tiếp và ngược lại.

(Câu hỏi 8)

Người phỏng vấn: Trong phần viết, thì những loại lỗi nào thì em sẽ thường xuyên sửa cho trẻ em?

GV1: Em thường sửa lỗi về ngữ pháp như các thì, cấu trúc câu hay chính tả.

Người phỏng vấn: Như vậy, việc sửa lỗi thì cần thiết cho học sinh là trẻ em và em thường xuyên sửa lỗi trong lớp. Bên cạnh đó, thì em chỉ tập trung 1 số lỗi chính và đưa ra nhận xét chung cho cả lớp vì em nghĩ điều này giúp em tiết kiệm được thời gian sửa bài. Khi đưa ra nhận xét thì giáo viên nên đưa ra những nhận xét mang tính động viên và góp ý để giúp các em tiến bộ hơn. Theo em, thì học sinh thích được sửa lỗi và nghe nhận xét từ giáo viên hơn là bạn cùng lớp vì sẽ chính xác hơn.

Đối với những phương pháp sửa lỗi trong lớp thì em áp dụng phương pháp lập lại và nhấn mạnh vào lỗi để giúp học sinh có thể tự nhận ra và sửa lỗi. Trên lớp thì em áp dụng các loại sửa lỗi như sửa lỗi gián tiếp, trực tiếp và cho các bạn cùng lớp sửa lỗi với nhau. Theo em, thì việc lựa chọn áp dụng loại sửa lỗi nào thì tùy thuộc vào

loại câu dễ hoặc khó, trình độ của người học. Trong phần Viết, thì em tập trung vào sửa lỗi ngữ pháp, cấu trúc câu, các thì và chính tả.

Cảm ơn em thật nhiều về buổi phỏng vấn hôm nay!

Interview 2: Giáo viên 2

Người phỏng vấn: Chào bạn, hôm nay mình xin bạn một ít thời gian để trao đổi một số vấn đề về đề tài mình đang thực hiện. Đề tài về việc sửa lỗi và đưa ra nhận xét trong bài viết của đối tượng là trẻ em. Bạn cho mình hỏi:

Bạn đã dạy cho đối tượng trẻ em được bao lâu rồi? Đối tượng giảng dạy chính của bạn ở độ tuổi nào vậy?

GV 2: Chào chị, em dạy kids từ lúc e mới ra trường, cũng được 5 năm rồi chị. Em dạy cho các bé từ 5-10 tuổi.

(Câu hỏi 1)

Người phỏng vấn: Theo ý kiến của bạn, sửa lỗi là gì và việc sửa lỗi này có cần thiết cho trẻ em không?

GV 2: Theo em, sửa lỗi là tìm ra những lỗi mà học sinh mắc phải trong quá trình học, sau đó đưa ra nhận xét vào phần bài làm của học sinh. Điều đó là hoàn toàn cần thiết cho quá trình học.

(Câu hỏi 2)

Người phỏng vấn: Theo em, là giáo viên thì mình nên sửa hết tất cả các lỗi cho các bé hay chỉ sửa 1 vài lỗi nào đó thôi?

GV 2: Theo em thì Giáo viên nên sửa tất cả các lỗi bởi vì trẻ em thì còn rất nhỏ để nhận ra lỗi. Sửa lỗi giúp cho chúng phát triển đặc biệt là cải thiện kỹ năng Viết.

(Câu hỏi 3)

Người phỏng vấn: Em có nghĩ là sửa lỗi rất mất thời gian?

GV 2: Theo em là có

(Câu hỏi 4)

Người phỏng vấn: Em nghĩ là học trò của em thích được em sửa lỗi cho hay thích được bạn bè cùng lớp sửa lỗi?

GV 2: Em thấy đa số là học trò sẽ thích Giáo viên sửa bài hơn vì các em sẽ tin tưởng vào khả năng của Giáo viên hơn là bạn bè của chúng.

Người phỏng vấn: Em có thể dẫn chứng cụ thể cho chị được không?

GV 2: Sau khi cho các bé thực hành viết 1 đoạn văn, em áp dụng peer feedback trước, có nghĩa là cho các bé sẽ sửa lỗi bài của nhau. Trong quá trình đó, em thấy các bé có vẻ không tự tin khi sửa bài cho bạn, luôn luôn nhờ Giáo viên giúp tìm lỗi sai hoặc không biết sửa như thế nào là đúng. Và sau khi đã nhận lại bài viết từ bạn, thì các bé sẽ luôn thắc mắc về những lỗi sai đó và nhờ Giáo viên kiểm tra lần nữa.

(Câu hỏi 5)

Người phỏng vấn: Chị sẽ hỏi em về 1 số cách mà em áp dụng để sửa lỗi trong lớp. Em trao đổi và chia sẻ với chị nha?

GV 2: Em thường áp dụng cách gạch dưới những lỗi sai. Nếu em thấy những lỗi đó khá dễ thì em chỉ gạch dưới và không đưa ra hình thức đúng. Và ngược lại, khi đó là những lỗi khá khó thì em sẽ vừa gạch dưới và vừa sửa lại cho đúng.

(Câu hỏi 6)

Người phỏng vấn: Những loại corrective feedback nào mà em hay sử dụng trên lớp.

GV 2: Hai loại em hay sử dụng nhiều nhất là Peer feedback & Teacher feedback

(Câu hỏi 7)

Người phỏng vấn: Em thích sửa lỗi trực tiếp hay gián tiếp hơn?

GV 2: Theo em thì em thích sửa lỗi gián tiếp bởi vì em nghĩ sửa lỗi gián tiếp sẽ giúp học sinh tự nhận ra lỗi của mình và sẽ nhớ được lâu hơn.

(Câu hỏi 8)

Người phỏng vấn: Trong phần viết, thì những loại lỗi nào thì em sẽ thường xuyên sửa cho trẻ em?

GV 2: Em thường sửa lỗi về từ loại như chủ từ, động từ, tính từ Vì em thấy trẻ em hay mắc những lỗi này nhiều khi viết bài.

Người phỏng vấn: Như vậy, theo bạn việc sửa lỗi là tìm ra lỗi của người học mắc phải trong quá trình học và hoàn toàn cần thiết cho đối tượng người học là trẻ em. Đặc biệt, đối với người học là trẻ em thì Giáo viên nên sửa TẤT CẢ các lỗi mà các em mắc phải bởi vì độ tuổi của các em còn nhỏ chưa tự nhận thức được lỗi của bản thân. Bạn cũng nhận thấy là việc sửa lỗi thì mất nhiều thời gian. Theo quan sát của bạn trong quá trình sửa lỗi thì học sinh của bạn thích được Giáo viên sửa lỗi hơn là được bạn cùng lớp sửa vì các em tin tưởng vào khả năng và kiến thức của Giáo viên đứng lớp. Đối với việc sửa lỗi trong bài Viết của trẻ em thì bạn áp dụng hai cách để sửa: đối với những lỗi đơn giản và dễ thì bạn chỉ gạch dưới để tạo cho người học có cơ hội tự nhận ra lỗi; tuy nhiên, nếu đó là những lỗi phức tạp thì bạn sẽ vừa gạch dưới và vừa đưa ra hình thức đúng. Hai loại corrective feedback mà bạn thường áp dụng thường xuyên trong lớp là Teacher feedback & peer feedback. Bên cạnh đó, thì bạn cũng thích sử dụng sửa lỗi gián tiếp vì bạn nghĩ rằng điều này sẽ giúp học viên nhớ sâu và lâu hơn. Trong phần sửa lỗi bài viết, những lỗi bạn hay tập trung nhiều nhất là về từ loại vì bạn nhận thấy học sinh của bạn mắc lỗi phần này là nhiều nhất.

Cám ơn bạn thật nhiều về buổi phỏng vấn hôm nay!

Interview 3: Giáo viên 3

Người phỏng vấn: Chào bạn, hôm nay mình xin bạn một ít thời gian để trao đổi một số vấn đề về đề tài mình đang thực hiện. Đề tài về việc sửa lỗi và đưa ra nhận xét trong bài viết của đối tượng là trẻ em. Bạn cho mình hỏi:

Bạn đã dạy cho đối tượng trẻ em được bao lâu rồi? Đối tượng giảng dạy chính của bạn ở độ tuổi nào vậy?

GV 3: Chào bạn, mình ra trường năm 2009, nhưng mình chỉ mới đi dạy trẻ em khoảng 5 năm. Và đối tượng giảng dạy chính của mình là trẻ em từ 5-10 tuổi.

(Câu hỏi 1)

Người phỏng vấn: Theo ý kiến của bạn, sửa lỗi là gì và việc sửa lỗi này có cần thiết cho trẻ em không?

GV 3: Theo mình thì sửa lỗi là tìm ra những lỗi mà học sinh hay mắc phải trong quá trình học và sửa những lỗi đó sẽ giúp cho các em hiểu nhiều hơn và sử dụng một cách chính xác. Sửa lỗi thì cần thiết cho người học vì khi giáo viên sửa lỗi thì người học có thể tránh những lỗi đó cho lần sau.

(Câu hỏi 2)

Người phỏng vấn: Theo bạn, là giáo viên thì mình nên sửa hết tất cả các lỗi cho các bé hay chỉ sửa 1 vài lỗi nào đó thôi?

GV 3: Giáo viên nên sửa TẤT CẢ các lỗi trong bài viết của học sinh bởi vì kỹ năng Viết đóng vai trò quan trọng trong việc học Tiếng Anh. Học sinh có thể thể hiện ý tưởng, cách dùng từ vựng và ngữ pháp chính xác nếu Giáo viên giúp chúng sửa hết các lỗi.

(Câu hỏi 3)

Người phỏng vấn: Bạn có nghĩ là sửa lỗi rất mất thời gian?

GV 3: Theo mình, việc đó còn tùy thuộc vào loại lỗi mà học sinh mắc phải trong khóa học. Nếu chúng là những lỗi bình thường, thì chỉ cần ít thời gian để sửa thôi. Nhưng nếu đó là những lỗi phức tạp như Ngữ pháp, thì sẽ mất nhiều thời gian để sửa.

(Câu hỏi 4)

Người phỏng vấn: Bạn nghĩ là học trò của bạn thích được bạn sửa lỗi cho hay thích được bạn bè cùng lớp sửa lỗi?

GV 3: Mình nghĩ, học trò của mình thích được mình sửa lỗi hơn bởi vì các em nghĩ Giáo viên có nhiều kiến thức và tin tưởng và những gì Giáo viên dạy. Còn về bạn bè, các em có thể học hỏi nhiều từ bạn bè của mình nhưng kiến thức của các bạn cùng lớp cũng chỉ có giới hạn thôi và chỉ có thể sửa những lỗi nhỏ.

(Câu hỏi 5)

Người phỏng vấn: Bạn cho mình hỏi về 1 số cách mà bạn hay áp dụng để sửa lỗi trong lớp. Bạn vui lòng trao đổi và chia sẻ với mình nha?

GV 3: Trong lớp, mình thường dùng viết chì để sửa lỗi bài viết của học sinh. Nếu học sinh mắc lỗi, mình thường gạch dưới lỗi đó và sửa lại ở bên trên. Nếu trong một câu mà có nhiều lỗi sai, mình sẽ ghi chú lại và viết lại câu đúng hoàn chỉnh ở bên dưới.

(Câu hỏi 6)

Người phỏng vấn: Những loại corrective feedback nào mà bạn hay sử dụng trên lớp?

GV 3: Mình thường áp dụng Teacher feedback, đa số trong lớp thì mình đều áp dụng cách này vì mình nghĩ nó hiệu quả với học sinh của mình và tiết kiệm thời gian.

(Câu hỏi 7)

Người phỏng vấn: Bạn thích sửa lỗi trực tiếp hay gián tiếp hơn?

GV 3: Nó tùy thuộc vào đối tượng người học. Nếu người học của mình là người lớn thì mình sẽ thích áp dụng sửa lỗi và đưa ra phản hồi gián tiếp hơn bởi vì ở độ tuổi này thì người học có thể tự nhận ra lỗi của mình, nhìn lại lỗi và tránh lặp lại những lỗi đó.

Còn đối với trẻ em thì, mình sẽ áp dụng sửa lỗi trực tiếp cho từng học sinh. Mình sẽ chỉ rõ và giải thích kỹ những lỗi đó để các em có thể nắm rõ. Mình nghĩ đối với trẻ con, nếu bạn sửa lỗi gián tiếp, chúng ra rất dễ dàng quên và phớt lờ những lỗi đã được sửa.

(Câu hỏi 8)

Người phỏng vấn: Trong phần viết, thì những loại lỗi nào thì bạn sẽ thường xuyên sửa cho trẻ em?

GV 3: Thật ra, trong bài Viết có rất nhiều lỗi mà người học mắc phải như ngữ pháp, từ vựng, chính tả, từ loại, Đặc biệt đối với trẻ em thì chúng thường mắc những lỗi về chia thì, giới từ, cách chọn từ,

Người phỏng vấn: Như vậy, theo bạn việc sửa lỗi là tìm ra lỗi của người học mắc phải trong quá trình học và việc sửa lỗi sẽ giúp cho học sinh hiểu nhiều hơn và sử dụng chính xác hơn nên việc sửa lỗi là hoàn toàn cần thiết, đặc biệt là với trẻ em. Hơn thế nữa, Giáo viên nên sửa TẤT CẢ các lỗi mà trẻ em mắc phải trong bài Viết vì kỹ năng Viết rất quan trọng trong quá trình học tiếng Anh. Việc này sẽ giúp các em viết đúng và tránh được những lỗi sai trong bài Viết tiếp theo. Theo ý kiến của bạn, việc sửa lỗi có mất thời gian hay không thì còn phải tùy thuộc vào đó là lỗi đơn giản hay phức tạp. Bên cạnh đó thì bạn nhận thấy là học sinh của bạn thích được

Giáo viên sửa lỗi hơn là các bạn cùng lớp vì các em tin tưởng vào kiến thức của Giáo viên. Cũng từ lý do trên, thì bạn thường áp dụng Teacher feedback trong quá trình sửa lỗi. Bên cạnh đó, đối với đối tượng người học là trẻ em thì bạn sử dụng sửa lỗi và đưa ra phản hồi một cách trực tiếp cho từng em.

Cuối cùng, các lỗi mà bạn thường sửa trong bài Viết của trẻ em thì liên quan đến ngữ pháp và từ loại như cách chia thì, cách dùng từ cho đúng.

Cám ơn bạn thật nhiều về buổi phỏng vấn hôm nay!

Interview 4: Giáo viên 4

Người phỏng vấn: Chào bạn, hôm nay mình xin bạn một ít thời gian để trao đổi một số vấn đề về đề tài mình đang thực hiện. Đề tài về việc sửa lỗi và đưa ra nhận xét trong bài viết của đối tượng là trẻ em. Bạn cho mình hỏi:

Bạn đã dạy cho đối tượng trẻ em được bao lâu rồi? Đối tượng giảng dạy chính của bạn ở độ tuổi nào vậy?

GV 4: Em đã đi dạy được 7 năm rồi chị. Em dạy trẻ con ở các độ tuổi từ 8-13 tuổi.

(Câu hỏi 1)

Người phỏng vấn: Theo ý kiến của bạn, sửa lỗi là gì và việc sửa lỗi này có cần thiết cho trẻ em không?

GV 4: Theo em, sửa lỗi là sửa những lỗi mà trẻ em mắc phải trong quá trình học và nó rất cần thiết.

(Câu hỏi 2)

Người phỏng vấn: Theo em, là giáo viên thì mình nên sửa hết tất cả các lỗi cho các bé hay chỉ sửa 1 vài lỗi nào đó thôi?

GV 4: Em nghĩ giáo viên chỉ nên sửa MỘT VÀI lỗi mà học sinh mắc phải thôi, vì nếu giáo viên sửa lỗi quá nhiều sẽ làm cho các em thiếu sự tự tin và mất đi động lực học tập.

(Câu hỏi 3)

Người phỏng vấn: Em có nghĩ là sửa lỗi rất mất thời gian?

GV 4: Thật ra sửa lỗi không thật sự mất thời gian đâu, nó còn tùy thuộc vào từng loại lỗi và lỗi đó nghiêm trọng như thế nào.

(Câu hỏi 4)

Người phỏng vấn: Em nghĩ là học trò của em thích được em sửa lỗi cho hay thích được bạn bè cùng lớp sửa lỗi?

GV 4: Em nghĩ là các em thích được em sửa lỗi cho vì em có thể quan sát được điều đó để thể hiện trên khuôn mặt của các em.

(Câu hỏi 5)

Người phỏng vấn: Chị sẽ hỏi em về 1 số cách mà em áp dụng để sửa lỗi trong lớp. Em trao đổi và chia sẻ với chị nha?

GV 4: Em thường gạch dưới các lỗi và sửa chúng. Thành thạo em chỉ gạch dưới và để cho học sinh tự sửa lỗi.

(Câu hỏi 6)

Người phỏng vấn: Những loại corrective feedback nào mà em hay sử dụng trên lớp?

GV 4: Em sử dụng cả 2 cách: sửa lỗi và đưa ra nhận xét trực tiếp và gián tiếp.

(Câu hỏi 7)

Người phỏng vấn: Em thích sửa lỗi trực tiếp hay gián tiếp hơn?

GV 4: Em thích sử dụng đưa ra nhận xét gián tiếp hơn, nhưng đối với trẻ em thì chúng ít khi tự nhận ra được lỗi của mình vì vậy em sử dụng cách sửa lỗi và đưa ra nhận xét trực tiếp.

(Câu hỏi 8)

Người phỏng vấn: Trong phần viết, thì những loại lỗi nào thì em sẽ thường xuyên sửa cho trẻ em?

GV 4: Em thường sửa những lỗi về Ngữ pháp, Tự vựng và Ngữ nghĩa.

Người phỏng vấn: Như vậy, theo bạn thì sửa lỗi là sửa những lỗi mà trẻ em mắc phải trong quá trình học và nó rất cần thiết. Tuy nhiên, giáo viên chỉ nên sửa một số lỗi mà học sinh mắc phải thôi, vì nếu giáo viên sửa lỗi quá nhiều sẽ làm cho các em thiếu sự tự tin và mất đi động lực học tập. Ngoài ra, bạn cho rằng sửa lỗi thì không thật sự mất nhiều thời gian, nó còn tùy thuộc vào mức độ nghiêm trọng của lỗi đó. Theo bạn quan sát thì học trò của bạn thích được bạn sửa lỗi hơn là từ các bạn cùng lớp. Thông thường, khi sửa lỗi bạn sẽ gạch dưới và sửa lại lỗi đó, nhưng đôi khi bạn chỉ gạch dưới và để cho học trò tự nhận ra và tự sửa lỗi. Trong quá trình sửa lỗi và đưa ra nhận xét thì bạn áp dụng cả 2 cách là trực tiếp và gián tiếp. Đặc biệt, đối với đối tượng là trẻ em thì bạn sử dụng sửa lỗi và nhận xét gián tiếp nhiều hơn vì các em ít khi tự nhận ra được lỗi của mình. Khi sửa lỗi bài Viết của các em, bạn thường sửa những lỗi về Ngữ pháp, Tự vựng và Ngữ nghĩa.

Cám ơn bạn thật nhiều về buổi phỏng vấn hôm nay!

Abstract: Horror films are a trend currently attracting film lovers' attention worldwide and in Indonesia. This trend not only affects the market but also people's understanding of what they enjoy. This people's understanding is based on previous research revealing that horror films influence human perspective. Most Indonesian horror films use folklore, included in the rural-occult sub-genre, as the story's core. In the rural-occult subgenre, the concepts that always appear in the story are religious, ghost, and spiritual concepts. Therefore, this research aims to explain people's conceptions of religion, ghosts, and spirituality using Indonesia's rural-occult horror film approach. This research uses survey and interview methods to extract data. Apart from that, this research uses statistical correlation tests and literature analysis. This research shows that rural-occult horror films in Indonesia can logically reduce spiritual concepts. Reduction in spiritual concepts is reinforced by scenes or backgrounds in rural-occult horror stories, which directly show a reduction in religious, and ghost concepts.

Keywords: Horror film, Religious, Ghost, Spiritual

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1227-1236), Antalya, Turkiye. ISTES.

Introduction

Horror films are a film genre that is popular throughout the world. In Indonesia, horror films are produced

yearly to meet market demand for tense entertainment. Like other entertainment, horror films are produced in various media, including horror films, series, and even reality show video content on YouTube. Horror is a film genre that expresses discomfort and disturbing feelings (Strinati, 2000). Horror films focus on evoking emotions of fear, horror, and tension (Indriani, 2019). These films aim to bring out one or more specific negative impacts. The negative impact in question is terror, disgust, supernatural and vile things which, paradoxically, can still be digested and enjoyed by the audience (Hick, 2022). This means that each negative effect is related to each other. This negative effect is caused by feelings of discomfort or fear, which are one of the characteristics of humans. This type of human fear can be classified under the horror film subgenre. There are nine horror genres, including rural, cosmic, apocalyptic, crime, erotic, occult, psychological, surreal, and visceral (Prohászková, 2012). In this research, the film boundaries we will include as parameters are the occult horror and rural horror subgenres. Occult horror is a horror that focuses on exorcism, the arrival of the antichrist or anti-God, cults, spiritualism, curses, and so on, usually referred to as the occult. Meanwhile, rural horror is a horror that focuses on attacks by ghosts or demons that occur in people's daily lives, usually in village communities. These two horror subgenres are included in the folklore horror category because these stories contain familiar stories originating from society. These two genres intersect because rural horror can be included in its story content about occult horror.

In Indonesia, of the many film genres that have developed, horror is one of the most developed (Sukatno, et.al., 2016). This is supported by a survey conducted by Saiful Mujani Research and Consulting (SMRC), which was presented in 2020 at a film discussion event with the theme Indonesian Youth and Film Watching Behavior. The survey results show that the horror film genre in Indonesia ranks second in national and foreign film genres that young Indonesians like. Horror films in Indonesia are proliferating, this is because the fundamental basis of Indonesian society is religious, so horror films with occult horror themes are easily accepted by Indonesian society. Apart from that, Indonesia also has many folk tales related to mystical matters, so horror films with rural horror themes are a theme Indonesian people like. These two horror sub-genres are the most popular because these two sub-genres are closely related to the daily life and culture of Indonesian society. Some of the films that are popular in Indonesia are Pengabdian Satan 1 (2017), Pengabdian Satan 2 (2022), Makmum: The Movie (2019), Makmum 2 (2021), and Khanzab (2023). Occult and rural horror themes are more popular because they have film settings or stories close to society. People can better feel the horror presented in these films.

In general, the reason people like horror films is that they give rise to specific feelings. This type of feeling is explained by Martin in the concept of excitation transfer, for example, that humans obtain pleasure through feelings of tension (this theory might also explain the enjoyment of films other than those in the horror genre that involve tension) (Martin, 2019). Horror films often present a tense feeling, as if the audience feels threatened by supernatural or spiritual phenomena. Indirectly, the horror felt in horror films, especially those with rural and occult horror sub-themes, is that people accept part of the story as the experience of the characters in the film who are connected to another world or what in general public understanding is called the spiritual world. When a threat in a horror film has ended, the negative feelings within us change to euphoria (feelings of joy) because the tension is over. An essential aspect of this theory is that enjoyment is derived from the level of

adverse effects formed while watching a horror film and from the positive effect resulting from ending the threat in the film.

In another article by Yang and Zhang, there are three reasons why people like horror films. The first reason is to experience stimulation. The stimulation can occur when someone watches a horror film, and several nerve impulses become active. Fear can trigger the release of adrenaline, causing a surge of energy sensations in the body. The second reason is that when watching a horror film, someone gets a new experience. When watching a horror film, the experiences do not happen in real life. The third reason is that horror films can help us (in a safe way) satisfy our curiosity about the dark side of the human soul or things that might exist in a world other than the human world (Yang & Zhang., 2021).

Apart from that, people may like watching horror films because horror films have an appeal that is closely related to the soul of Indonesian people. The soul of Indonesian society is considered to be attached to Eastern culture in the form of mysticism, taboos, spiritualism, and the existence of supernatural beings and events. This is based on the assumption that each region and ethnic group in Indonesia has superstitious beliefs and mystery stories telling supernatural events; some film producers consider horror stories to form a cultural characteristic and even become an asset to Indonesian culture (Heeren, 2012).

Apart from superstition, Indonesian people also have a close bond with divinity. Even the use of religious devices (tools and human activities) in the form of religion is always present in Indonesian horror films. The existence of religious power is the center of problem-solving in Indonesian horror films, namely, to get the film passed by the Film Censorship Board. This happened in the new order, especially to maintain the nation's moral values so that they were by the ideology in Indonesia, namely "belief in the one and only God" (Heeren, 2017). Even after the New Order, religious values remained in Indonesian horror films. However, there is a changing depiction of things related to religiosity; for example, religious leaders who are defeated by the power of Satan, when they pray, Satan remains disturbed so that during prayer, they can become possessed by Satan. This happened because many censorship regulations and New Order guidelines for film production became obsolete during the Reformation or post-New Order era (Debby, 2021).

From several explanations regarding the closeness of Indonesian society to horror films, three concepts always exist in Indonesian society, namely ghosts, religion, and spirituality. Ghosts are manifestations of dying people (Baker & Bader, 2014). Furthermore, religion is a belief in divine nature or invisible power, which includes nature, manifestations, and everything that happens to living creatures (Chuhwanglim et.al., 2016). Lastly, spirituality is the quality and meaning of human life, which can connect with God, nature, and other things around us (Paul & Treschuk, 2020). From this definition, religion can be interpreted as part of human spirituality.

Furthermore, from several Indonesian people's conceptions regarding horror films, the aim of this research is first to conduct an examination of Indonesian people's conceptions regarding religion, ghosts, and spirituality.

The second objective is to explain that some scenes or background stories in Indonesian rural-occult horror films show a reduction in religious, ghost, and spiritual concepts. The third aim is to show that if the reduction of religious concepts in rural-occult horror films is related to Indonesian society's conception of religion, ghosts, and spirituality, this will have implications for the reduction of spiritual concepts.

Method

This research is based on two methods: first, a quantitative method to understand or conceptualize Indonesian society regarding ghosts, religiosity, and spirituality in two genres of horror films widely shown in Indonesia. These two genres are essential considerations in this research because the percentage of occult and rural horror film genres are Indonesia's two most prominent genres.

Data was collected through an online questionnaire survey of Indonesian people who watched horror films. The analysis of this data used the chi-square correlation test between propositions stating the concepts of ghosts, religiosity, and spirituality. The second method is qualitative to see whether there is a reduction in ghosts, religiosity, and spirituality in rural-occult horror films selling well in Indonesia. Data collection using this method is based on film studies and literature studies regarding horror films.

Results

Horror Film Data 2020-2023

The percentage appears from tabulated data from 76 Indonesian horror films in cinemas and subscribed screening media in 2020-2023. There are at least 48.7% of horror films in the rural genre, 38.2% of horror films in the occult genre, 6.6% of horror films in the crime genre, 5.3% of horror films in the visceral genre, and 1.3% percent in other genres such as psychological horror and erotic horror. Rural and occult horror films reach the highest numbers because they are close to the audience's daily lives, such as a connection with traditional customs, the spread of folklore, or urban legends, which are still spread by word of mouth or are still discussed on podcasts or YouTube.

Figure 1. Percentage of Indonesian horror genre in 2020-2023.

Data on the Indonesian people's conception of the relationship between religiosity, ghosts and spirituality

Based on the online questionnaire survey, there are two primary questions regarding the concept of ghosts, religiosity, and spirituality. The first question was, "Do you feel that belief in ghosts or creatures other than living creatures indicates belief in other existences such as God, angels, and so on?". This question contains the proposition, "If you believe in the concept of ghosts, then you believe in religious concepts (God, angels, and so on)." Symbolically, it can be written as " $G \rightarrow R$ " for "G" is the ghost concept and "R" is the religious concept. The results of the first question are then related to the second question. The second question was, "Do you agree that belief in ghosts and spirits is part of the development of belief in a spiritual world?" This question contains the proposition, "If you believe in spiritual concepts, then you believe in ghost concepts." Symbolically it can be written as " $S \rightarrow G$ " for "S" is a spiritual concept and "G" is a ghost concept. The results of the questionnaire can be seen in Figure 2.

Figure 2. Questionnaire results and relationship between 3 variables.

Based on Figure 2, it can be seen that the acceptance rate for the proposition " $G \rightarrow R$ " is 74%, meaning that 74% of respondents stated that it was true that "if you believe in the concept of ghosts, then you believe in religious concepts (God, angels and so on)." Meanwhile, the acceptance rate for the proposition " $S \rightarrow G$ " was 60%, meaning that 60% of respondents stated that it was true that "if you believe in spiritual concepts, then you believe in ghost concepts." The results of accepting the proposition " $G \rightarrow R$ " and the proposition " $S \rightarrow G$ " are pretty significant, but there is a difference of 14%. So the results of accepting this proposition also need to be tested to see whether the proposition " $G \rightarrow R$ " and the proposition " $S \rightarrow G$ " have a relationship (respondents who state that the proposition " $G \rightarrow R$ " is true also state that the proposition " $S \rightarrow G$ " is true or vice versa respondents who stated that the proposition " $G \rightarrow R$ " was true also stated that the proposition " $S \rightarrow G$ " was false).

The SPSS chi-square test was conducted to determine the relationship between these propositions. The hypothesis in this test is H_0 : There is no relationship between the proposition "if you believe in the concept of ghosts, then you believe in religious concepts (God, angels, and so on)" and the proposition "if you believe in spiritual concepts then you believe in the concept of ghosts" and the alternative hypothesis (H_a): there is a

relationship between the proposition "if you believe in the concept of ghosts then you believe in religious concepts (God, angels and so on)" and the proposition "if you believe in spiritual concepts then you believe in the concept of ghosts." The results of the chi-square test can be seen in Table 1.

Table 1. Chi-Square Test Result

	Value	df	Asymptotic Significance (2-sided)
Pearson Chi-Square	7.242 ^a	1	0.007

a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 6.45.

Table 1 in the information section shows that the chi-square test assumptions have met the requirements. No cells have an expected frequency below five, and the lowest expected frequency is 6.45. From Table 1 we also get an Asymptotic Significance (2-sided) value of 0.007, which means the Asymptotic Significance (2-sided) value is smaller than the critical limit value of 0.05. Based on these data, a decision can be made that H₀ (initial hypothesis) is rejected and H_a (alternative hypothesis) is accepted. Thus, it can be concluded that there is a relationship between the proposition "if you believe in the concept of ghosts, then you believe in religious concepts (God, angels, and so on)" and the proposition "if you believe in spiritual concepts, then you believe in the concept of ghosts."

Discussion

In this research, we try to prove that if the reduction of religious concepts in rural-occult horror films is related to Indonesian society's conception of religion, ghosts and spirituality, this will have implications for the reduction of spiritual concepts. In short, reducing the concept of religiosity also reduces the concept of spirituality. The initial assumption of the thesis is that horror films influence various human perspectives (Rieger & Hofer, 2017). Apart from influencing people's perspective, horror films often also influence the real life personal experiences of the audience (Khan, et.al., 2020). More specifically, films even play an important role in forming the spirituality of the audience (Rossiter, 1996). Departing from the increasing prevalence of religious devices (tools and people) used to strengthen the terrifying impression of Indonesian horror films. This terrifying impression has implications for the reduction of religious concepts in Indonesian occult horror films. Meanwhile, the next thesis is in accordance with the findings of this research, stating that the respondents believe in the concept of ghosts and therefore believe in religious concepts (God, angels and so on). Thus, it can be concluded that initially society's acceptance of horror films was a sign that society had confidence in religious teachings. The public does not have a problem with scenes of prayer, supplication and the use of prayer devices in rural-occult horror films. However, because some films highlight religious teachings inappropriately as explained above, some films actually position the teachings of reduced religiosity.

The next thesis was also obtained from the findings of this research, it was stated that the respondents believed

in spiritual concepts and therefore believed in the concept of ghosts. In this way, it can be explained that the spiritual concept is the concept that underlies the concept of ghosts or that all types of beliefs about ghosts are rooted in spiritual beliefs. Spiritual beliefs are deeply rooted in Indonesian society, several rituals are carried out to summon ghosts as a medium of communication with ancestors (Leong, 2022). Apart from that, the closeness of Indonesian society to mythological beliefs also indicates a strong belief in spiritual entities (Kurniasih & Krismonita, 2023).

The reduction of the concept of religiosity, for example, is shown in the scene where religious equipment (tools and people) are only used to ward off ghosts. In fact, several films show scenes that religious equipment (tools and people) are inferior to the power of ghosts. One clear example is in the film *Makmum* (2019) which depicts that ghosts can participate in the congregational prayer process, and even carry out terror while humans are praying. Apart from that, there are many features where it is depicted that holy locations such as mosques or prayer rooms can be locations of terror from ghost figures. From this kind of depiction it appears that the ghost figure that appears together with certain religious equipment (tools and people) seems to be above the power of religion, or at least weakens the religious equipment so that the religious equipment loses its sacred value.

The reduction of the concept of ghosts is a phenomenon that has occurred even before the film medium became popular. One example occurred at the end of the 19th and early 20th centuries in Australia when there was an unusual social practice, namely 'playing the ghost'. These social phenomena are forms of deviation from the teachings of eschatology and belief in life after death (Waldron & Waldron, 2016). This research further shows that ghost films that are commonly watched in Indonesia reduce people's understanding of ghosts. Ghosts are generally believed to be spirits or souls of deceased humans. Various religions have teachings specifically regarding post-life spirits, including dogmas regarding heaven, nirvana, purgatory, and so on. Beliefs about ghosts help us explore the possibilities of human limits and help us to face the reality of death (Clack, 2023). However, in horror films, ghosts can interfere in human affairs, even in the form of violence such as terror and attacks. Ghosts or spirits of deceased humans who are believed to be a journey towards purity and peace of mind are constructed as other things that can be a terror for humans living in the world (Noer, 2021). This allows horror films to reduce religious teachings as well as reduce the general public's view of human spirits or ghosts. Further evidence in this research is that when the meaning of religiosity and the concept of post-life souls (ghosts) is reduced, the value of spirituality is also reduced through rural-occult horror films. This can be seen through the depiction of rural-occult horror films that depict death as a frightening thing. In the general conception of Indonesian people who adhere to religion, death is the fate of all living creatures. It is the gateway from the natural world to the afterlife or reincarnation. This is also similar to the conception of death according to indigenous tribes in Indonesia (Maruf & Tanduk, 2021). Apart from that, a form of reduction of spiritual concepts is also shown in the scene where local belief rituals are used to summon ghosts. One clear example is in the film *Mangkujwo* (2020), which uses Javanese religious rituals to summon ghosts. Javanese rituals are principles or forms of guidance that help to connect with and observe the existence of God (Wasisto, 2021). This is a form of misappropriation of the meaning of Javanese culture (Amaliyah, 2021).

The previous explanation explained that there is a reduction in religious, ghost, and spiritual concepts in rural-occult horror films. Next, we try to prove logically that if the reduction of religious concepts in rural-occult horror films is related to the Indonesian people's conception of religion, ghosts, and spirituality, this will have implications for the reduction of spiritual concepts. This means that we need to assume that there is indeed a reduction in the concept of religion in Indonesian society. This reduced religiosity teaching can be symbolized as "-R," meaning a reduced religious concept. If this reduction of the religious concept is linked to the proposition " $G \rightarrow R$," then logically, based on modus tollens, it can be concluded that "-G" means the concept of ghosts is reduced. The reduction of this ghost concept is "-G" if it is linked to the proposition " $S \rightarrow G$," then logically, based on modus tollens, it can be concluded that "-S" means a reduced spiritual concept. Briefly, this argument can be written with the following premises:

1. -R
 2. $G \rightarrow R$
 3. $S \rightarrow G$
- \therefore -S

Conclusion

This research shows that the two horror subgenres, rural horror and occult horror (folklore horror) in Indonesia, feature scenes or story backgrounds that reduce religious concepts. Suppose this reduction in religious concepts is linked to the proposition of ghosts and spirituality in Indonesian society. In that case, it will have implications for reducing the concept of ghosts and spirituality. This reduction is reinforced by scenes or backgrounds in rural-occult horror stories that show a reduction in religious, ghost, and spiritual concepts.

Limitation and Recommendations

Several limitations to this study need to be addressed. First, this research collected data through an online questionnaire survey of 62 Indonesian people. The number of questionnaire respondents may influence the level of analysis of conditions close to reality. Second, the questionnaire did not discuss or ask the respondents' level of reduction in religious, ghost, and spiritual concepts. This research only discusses accepting the relationship between religious, ghost and spiritual concepts in Indonesian society. This means this research does not discuss the quantity of reduction in religious, ghost, and spiritual concepts in society. Therefore, further research needs to be carried out that discusses the relationship between watching rural-occult horror films and the level of reduction in religious, ghost, and spiritual concepts in Indonesian society on a broader scale.

Acknowledgements

This research could be carried out thanks to the 2022 Bina Nusantara University Internal Grant. Without support and assistance from agencies, this research would not produce conclusions and proposals for the world of

education.

Exploring the Role of TikTok and Instagram in Promoting Environmental Health and Wellbeing

Juliana Berewot

Bina Nusantara University, Indonesia

Abstract: The qualitative study explored into the influential roles of TikTok and Instagram in promoting environmental health and well-being through the dissemination of user-generated content. Acknowledging the potential of these platforms to facilitate extensive information transmission and engage diverse audiences, the research was meticulously conducted. Thematic and content analysis methods were utilized to systematically scrutinize the data. The primary objective was to explore the underlying motivations, experiences, and impacts on both content creators and users involved in discussions related to environmental health. The richness and diversity of the data were ensured through regular hashtag searches, content sampling techniques, and rigorous data collection methods. Valuable insights into the perspectives and experiences of content creators and users in the realm of environmental content development and engagement were obtained through a series of interviews. The study's findings highlighted the capacity of TikTok and Instagram to promote environmental awareness, instigate significant behavioral changes, and foster virtual communities focused on environmental issues. This research significantly advanced the understanding of these platforms as effective tools for environmental communication, promoting sustainable behaviors, and nurturing a collective sense of responsibility towards the well-being of our planet.

Keywords: Tiktok, Instagram, Environmental Health, Wellbeing

Citation: Berewot, J.(2024). Exploring the Role of TikTok and Instagram in Promoting Environmental Health and Wellbeing. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1237-1253), Antalya, Türkiye. ISTES.

Introduction

Social media platforms such as TikTok and Instagram have become influential tools for disseminating information, fostering relationships, and shaping public opinion in the digital communication landscape (Kirby & Özkula, 2023). With billions of users globally, these platforms have evolved beyond entertainment and social connection to actively engaging individuals, communities, and organizations in dialogues and initiatives related to social and environmental issues (Cohen et al., 2019). In the context of environmental health and wellness, these platforms play a significant role in promoting public awareness, involvement, and action (Han & Xu, 2020). They offer promptness, availability, and the capacity to engage diverse audiences, making them effective for disseminating environmental knowledge and fostering sustainable practices (Lalancette & Raynauld, 2017).

TikTok, known for its short-form video content and user-generated engagement, has gained popularity, particularly among younger demographics, and serves as a forum for discussions on environmental subjects and sustainability (Perea et al., 2021). On the other hand, Instagram has transformed into a versatile platform encompassing various media forms, enabling the dissemination of information on sustainable lifestyles, environmentally friendly products, and conservation initiatives (Lee & Weder, 2021). Both platforms rely on user-generated content, providing diverse perspectives on environmental health and well-being, and employing novel and captivating approaches to advocacy (Radzitskaya, 2024). Scholarly investigations have highlighted the capacity of social media, including TikTok and Instagram, to enhance environmental consciousness, provide instruction, and activate individuals and groups (Zhu et al., 2022). However, the dynamic nature of social media platforms constantly redefines the realm of online environmental discourse, making it essential to understand the influence of user-generated information for effective environmental communication (Skinner et al., 2023). These platforms have emerged as prominent tools for environmental communication due to their focus on visual narratives and user-generated content, making them valuable for understanding public opinion on environmental issues (Fagerholm et al., 2023). In conclusion, TikTok and Instagram have significantly impacted the promotion of environmental health and wellness through their capacity to engage diverse audiences, disseminate information, and foster sustainable practices. Understanding the influence of user-generated content on these platforms is crucial for developing effective strategies for environmental communication.

Research Questions

This study is driven by the following overarching research inquiries:

1. To what extent do TikTok and Instagram facilitate the advancement of environmental health and wellbeing via user-generated content?
2. What are the primary storylines, themes, and patterns observed in the dissemination of environmental information on the social media platforms TikTok and Instagram?
3. What is the influence of user-generated environmental material on TikTok and Instagram in terms of enhancing knowledge and shaping behaviours pertaining to environmental health and well-being?

Research Objectives:

The objective of this study is to:

1. Perform an extensive qualitative analysis of environmental information provided by users on the social media platforms TikTok and Instagram.
2. Analyse and classify the narratives, themes, and patterns that are commonly seen in environmental content on various social media platforms.
3. Evaluate the extent to which user-generated environmental content on TikTok and Instagram contributes to the promotion of environmental health and welfare.

To achieve these objectives, this study employed a qualitative analysis approach, incorporating methods such as content scraping, thematic analysis, and interviews users. By exploring the role of TikTok and Instagram in environmental communication, this research aimed to provide valuable insights into the evolving landscape of social media's impact on environmental health and wellbeing, contributing to both academic scholarship and practical efforts to address environmental challenges.

Literature Review

The Role of Social Media in Environmental Communication

Social media platforms have revolutionized communication, information sharing, and engagement with environmental issues. This comprehensive analysis explores the pivotal significance of social media in environmental communication and its influence on promoting environmental awareness and education. Social media serves as a swift and extensive medium for distributing environmental information, keeping the general population informed about significant occurrences and preservation initiatives (McComas & Trumbo, 2001). Additionally, it plays a crucial role in promoting public participation, mobilizing support, organizing events, and facilitating debates for environmental organizations and activists (Hansen & Machin, 2018). Moreover, social media platforms, such as Twitter, are utilized for real-time environmental monitoring, providing vital information during catastrophes (Mendoza et al., 2010). Furthermore, social media platforms facilitate the humanization of environmental narratives through the sharing of personal anecdotes, visual representations, and audiovisual content, fostering proactive engagement (Stephens & Koontz, 2017). They empower citizens to become environmental advocates and reporters, exposing environmental injustices and holding polluters accountable (Hester & Gibson, 2017). Social media influencers have become influential figures in environmental communication, bridging the gap between experts and the general public (Jin et al., 2019). However, challenges such as the spread of misinformation and fake news on social media pose significant obstacles (Peters et al., 2018). Misinformation can hinder public understanding of complex topics like climate change, emphasizing the importance of countering misinformation and promoting credible sources. Ethical considerations regarding user privacy and data ethics also arise in the context of environmental campaigns and organizations (Levin et al., 2017). In summary, social media platforms have transformed environmental communication by providing accessible, interactive, and engaging avenues for information dissemination and public engagement. They empower individuals, humanize environmental stories, and facilitate real-time monitoring, but challenges like misinformation and data ethics must be addressed.

Environmental Awareness and Education Through Social Media

Environmental awareness and education are crucial components of addressing environmental challenges. Social media platforms have become dynamic tools for increasing environmental literacy, reaching diverse audiences, and fostering informed decision-making. Social media platforms offer diverse content formats, from text to videos and infographics, catering to different learning preferences (Walker et al., 2019). They enable targeted messaging, allowing organizations to tailor content to specific audiences (Molnar & McManus, 2017).

Gamification techniques, like quizzes and challenges, engage users and facilitate experiential learning (Hamari et al., 2014). According to Robbins and Krueger (2019), the utilisation of visual storytelling on platforms such as Instagram and TikTok has proven to be highly effective, since it enhances the relatability of environmental issues.

In addition, social media platforms facilitate the establishment of virtual communities and discussion forums, enabling users to engage in information sharing and seek guidance pertaining to environmental subjects (Hartmann et al., 2015). Citizen science programmes involve the active participation of individuals who contribute data to scientific study, as highlighted by Newman et al. (2012). Nevertheless, the copious volume of data available on social media platforms might result in an overwhelming influx of information, hence underscoring the imperative for individuals to possess media literacy and critical thinking abilities (Koburger et al., 2021). Assessing the effects of environmental education conducted through social media platforms presents a formidable yet necessary task. Metrics such as engagement rates offer valuable insights into the transmission of content. However, in order to evaluate long-term changes in behaviour and attitudes, it is necessary to employ more thorough methodologies (Cheng et al., 2021). Wang et al. (2020) utilise surveys, assessments, and qualitative interviews as research methods to evaluate the efficacy of environmental education initiatives facilitated through social media platforms.

In summary, social media platforms provide a wide range of accessible tools that facilitate environmental awareness and education. These platforms effectively distribute different content, engage users, and facilitate knowledge exchange and citizen research. Nevertheless, enduring obstacles such as the overwhelming abundance of information and the necessity for comprehensive assessment of outcomes continue to underscore the significance of employing evidence-driven methodologies in environmental education via social media platforms.

Previous Studies on the Role of Social Media in Promoting Environmental Health and Wellbeing

Social media platforms have undergone significant transformations, becoming dynamic arenas where individuals, groups, and organisations engage in the creation and dissemination of user-generated content (UGC) pertaining to diverse subjects, such as environmental health and wellbeing. This section examines the impact of user-generated content (UGC) on platforms such as TikTok and Instagram, as well as provides an overview of prior research that has investigated the role of social media in advancing environmental health and overall well-being. User-generated content (UGC) pertains to the production and dissemination of content by individuals, as opposed to established media entities or institutional bodies. Social media platforms such as TikTok and Instagram have demonstrated a notable propensity for user-generated content (UGC) owing to their user-friendly interfaces, multimedia functionalities, and emphasis on narrative construction. This subsection delves into the impact of user-generated content (UGC) on these platforms on environmental knowledge, behaviours, and attitudes. The user's text might be rewritten as follows: Content generated by users on TikTok and Instagram frequently demonstrates a commendable ability to effectively communicate environmental

concerns in a manner that is relatable and easily understood by a wide audience. According to Waldron et al. (2020), content creators utilise colloquial language, personal narratives, and visually captivating storytelling methods in order to captivate and involve their audience. According to Belleflamme et al. (2014), user-generated content (UGC) plays a crucial role in enhancing comprehension of intricate environmental subjects by fostering authenticity and approachability. This quality enables UGC to effectively engage a wide range of audiences.

In addition, user-generated content (UGC) has the remarkable ability to elicit emotional responses and foster empathy among its audience (Hannibal & Hui, 2018). The utilisation of emotive storytelling, attractive visuals, and music is a common strategy employed in environmental content seen on TikTok and Instagram, as it allows for the establishment of deep emotional connections (Nabi et al., 2018). Emotional engagement has the potential to operate as a powerful motivator, prompting individuals to actively participate or provide assistance to environmental initiatives (Nabi & Gustafson, 2018). Moreover, UGC on TikTok and Instagram often experiences viral dissemination, reaching expansive and diverse audiences (Lapponi et al., 2020). The strategic use of hashtags, challenges, and collaborations serves to amplify the reach of environmental content (Kapoor et al., 2019). Virality extends beyond mere awareness-raising, actively encouraging user participation in environmental challenges and movements (Bruns & Moe, 2014). UGC frequently showcases individuals embracing eco-friendly practices, a phenomenon that can influence social norms and behaviors (Schultz et al., 2007). Witnessing peers on TikTok and Instagram adopting sustainable actions can motivate others to follow suit, ultimately normalizing eco-conscious behaviors (Milfont & Duckitt, 2010).

Many UGC creators use TikTok and Instagram as platforms to issue potent calls to action, urging viewers to participate in environmental initiatives or endorse specific causes (Papacharissi & Oliveira, 2020). These calls to action span a spectrum of involvement, from engaging in clean-up events to signing petitions or supporting environmentally conscious brands (Hollebeek et al., 2019). UGC's interactive nature facilitates direct engagement with environmental initiatives.

Additionally, UGC often fosters a sense of community and co-creation. Users on TikTok and Instagram can readily collaborate, exchange tips, and share information related to environmental health and wellbeing (Sarkar et al., 2020). The formation of a community comprising like-minded individuals not only provides emotional support but also amplifies the impact of environmental actions (Whitburn et al., 2020). Nonetheless, UGC is not without its challenges. Misinformation and inaccuracies can spread rapidly on platforms like TikTok and Instagram, posing a significant concern for the veracity of environmental information (Vraga et al., 2020). Therefore, ensuring the accuracy and reliability of environmental content in UGC remains an ongoing priority. The creation and sharing of UGC often involve considerations of personal data and privacy (Bucher & Helmond, 2018). Users may inadvertently share sensitive information, giving rise to ethical concerns regarding data usage and consent (Marwick & Boyd, 2014). In navigating these ethical considerations, environmental campaigns and content creators are called upon to uphold responsible and data-conscious UGC practices.

Theoretical Framework

In this section, we will discuss the theoretical framework that guides the research on the role of TikTok and Instagram in promoting environmental health and wellbeing through user-generated content. The selected theoretical framework combines the Uses and Gratifications Theory and the Diffusion of Innovations Theory to provide a comprehensive understanding of how social media platforms influence users' behaviors and attitudes regarding environmental issues.

Uses and Gratifications Theory (UGT)

The Uses and Gratifications Theory (UGT) is a well-established communication theory that centers on the proactive role of media consumers in choosing media content to satisfy specific needs and gratifications (Katz, Blumler, & Gurevitch, 1974). This theory asserts that individuals are not passive recipients of media messages; rather, they actively interact with media to fulfill their psychological and social requirements. UGT comprises four fundamental components. Firstly, it adopts a user-centered approach, presupposing that media consumption is steered by users' motivations and intentions (Palmgreen et al., 1985). In the context of social media platforms like TikTok and Instagram, users actively seek out and engage with environmental content because it meets specific needs and gratifications. Secondly, UGT identifies various gratifications that media users pursue, encompassing information, entertainment, personal identity, social integration, and surveillance (Katz et al., 1974). In the context of environmental content, users may search for information concerning sustainable practices, derive entertainment from eco-friendly challenges, reaffirm their environmental values as a part of their personal identity, connect with like-minded individuals to fulfill social integration needs, and employ social media for monitoring environmental news and updates.

Thirdly, UGT posits that individuals are selective in their media consumption, opting for content that aligns with their motivations and gratifications (Rosengren et al., 1985). TikTok and Instagram users actively choose and engage with environmental content that resonates with their values and interests, thereby contributing to the dissemination of such content. Lastly, UGT underscores that media audiences are not passive but rather active participants in the communication process (McQuail, 2010). In the context of environmental content, users on TikTok and Instagram often create their content, contribute to discussions, and share their perspectives on environmental issues, actively molding the discourse surrounding environmental health and wellbeing.

Diffusion of Innovations Theory (DOI)

The Diffusion of Innovations Theory, introduced by Rogers (2003), delves into the process of how innovations, in this context environmental practices and ideas, permeate social systems over time. DOI identifies distinct elements within the diffusion process, including innovators, early adopters, early majority, late majority, and laggards. Additionally, it underscores several characteristics of innovations that play a pivotal role in

influencing their adoption. Firstly, relative advantage holds that innovations offering distinct benefits over existing practices are more likely to gain acceptance (Rogers, 2003). Environmental content on TikTok and Instagram often champions sustainable practices and lifestyles as advantageous, effectively swaying users towards embracing eco-friendly behaviors (Katz et al., 2021). Secondly, compatibility hinges on the extent to which an innovation aligns with the values, experiences, and needs of potential adopters, influencing its acceptance (Rogers, 2003). Environmental content that harmonizes with users' preexisting values and lifestyles is more likely to resonate and find adoption (Greer & Ferguson, 2016). Thirdly, complexity suggests that innovations that are easy to grasp and implement stand a better chance of being adopted (Rogers, 2003). User-generated environmental content on TikTok and Instagram frequently simplifies intricate environmental issues and offers practical tips, thereby diminishing the perceived complexity of embracing sustainable behaviors (Fogg et al., 2001). Fourthly, observability revolves around the visibility of the results of adopting an innovation to others and its impact on its adoption (Rogers, 2003). Social media platforms like TikTok and Instagram provide high visibility for eco-conscious actions and behaviors, prompting users to exhibit their environmentally friendly choices (Rheingold, 2002). Lastly, trialability accentuates the ability to experiment with an innovation on a limited basis before fully committing to its adoption, which can significantly influence its diffusion (Rogers, 2003). TikTok and Instagram users often partake in challenges and experiments related to sustainability, allowing them to test eco-friendly practices before incorporating them into their daily routines (Vorderer et al., 2016).

Integrating UGT and DOI for Environmental Communication on TikTok and Instagram

By integrating the Uses and Gratifications Theory and the Diffusion of Innovations Theory, we gain a comprehensive understanding of how users on TikTok and Instagram actively engage with and disseminate user-generated environmental content. The Uses and Gratifications Theory focuses on users' motivations for seeking environmental content, aligning with the gratifications they seek, such as information, entertainment, social interaction, and personal identity (Palamidovska-Sterjadovska & Ciunova-Shuleska, 2020). This theory helps explain why users are drawn to environmental content and how they engage with it. Simultaneously, the Diffusion of Innovations Theory sheds light on the factors that influence the adoption of eco-friendly behaviors, including relative advantage, compatibility, complexity, observability, and trialability (Murray, 2009; Long & Liao, 2022). The integration of these theories recognizes the dynamic and active role of users in shaping the environmental discourse on social media platforms (Murray, 2009). emphasizes that the Diffusion of Innovation Theory describes the process through which new innovations and ideas become diffused and adopted within wider social networks (Long & Liao, 2022). further support this by highlighting how Roger's diffusion of innovation theory helps understand how environmental innovations are diffused in society.

Moreover, provide insights into the incentives for social media users' engagement, aligning with the Uses and Gratifications Theory, which analyzes motivators of users' engagement with brand-related content. Additionally, the study by Szeto et al. (2021) on dermatologist influencers on social media platforms such as Instagram Reels and TikTok interactive short videos demonstrates the practical application of these theories in understanding

user engagement with content. This study provides valuable insights into the types of content and engagement strategies that are effective in capturing users' attention and fostering interaction. In conclusion, the integration of the Uses and Gratifications Theory and the Diffusion of Innovations Theory offers a robust framework for understanding user engagement with environmental content on TikTok and Instagram. This theoretical framework not only explains users' motivations and engagement with environmental content but also provides valuable insights into the factors influencing the adoption of eco-friendly behaviors. It underscores the potential for positive changes in attitudes and behaviors related to environmental health and wellbeing through the active participation of users in shaping the environmental discourse on social media platforms.

Methodology

In this section, we explored into the methodology employed for conducting qualitative analysis in our study, including the research design, sampling strategy, data collection methods involving in-depth interviews, and data coding and analysis procedures, which encompass thematic analysis. Research design primarily adopts a qualitative approach, well-suited for exploring into complex social phenomena like the influence of user-generated content on environmental health and wellbeing, allowing us to explore participants' perspectives and experiences deeply (Creswell & Creswell, 2017).

Our sampling strategy was meticulous, combining various methods for content selection on TikTok and Instagram. We initiated extensive searches targeting hashtags, keywords, and profiles associated with environmental health, sustainability, and wellbeing within an environmental context. This involved both purposive and random sampling, with purposive sampling aimed at selecting content directly related to our study objectives, while random sampling diversified our dataset. We collected various content types, such as videos, images, captions, and user profiles, systematically cataloging them along with engagement metrics and timestamps to track content evolution. Moreover, our data collection expanded to include in-depth interviews with creators and users, shedding light on their motivations, experiences, and perceptions related to environmental content on these platforms. Participant selection for interviews involved a combination of purposive and snowball sampling, ensuring a diverse group of content creators and users was represented. Semi-structured interviews provided a platform for participants to share their insights openly. In terms of data analysis, we utilized two distinct but complementary procedures: thematic analysis and content analysis. Thematic analysis allowed us to identify, analyze, and report patterns or themes within qualitative data, involving steps like data familiarization, initial coding, theme development, theme review, and reporting findings. In contrast, content analysis involves a methodical examination of textual, visual, or multimedia material. The research encompassed various stages, including content sampling, the development of a coding scheme, the coding process itself, and the subsequent analysis and interpretation of data. These steps were undertaken to identify and analyse trends in the delivery of signals related to environmental health and wellbeing (Braun & Clarke, 2006; Krippendorff, 2018). The adoption of this comprehensive methodology

guarantees the acquisition of substantial knowledge regarding the influence of TikTok and Instagram in the advancement of environmental health and overall well-being through the creation of content by users.

The utilisation of data triangulation was employed in order to augment the credibility and dependability of the research outcomes. Data triangulation is the utilisation of several data sources and methodologies in order to validate findings and provide a more comprehensive comprehension of the research subject (Denzin, 1978). The methodology employed in this research entailed the utilisation of data triangulation, which encompassed the comparison of insights obtained through in-depth interviews with the findings derived from content analysis. The amalgamation of several data sources facilitated a stronger and more comprehensive basis for our conclusions. The project we are conducting focuses on the pivotal role of collecting TikTok and Instagram content in increasing the understanding of user-generated content's impact on environmental health and wellness. The initial step of our procedure involved the identification of pertinent hashtags, which play a vital role in the organisation and exploration of material on these platforms. A thorough exploration of hashtags was undertaken, with a focus on keywords pertaining to environmental concerns, sustainability, and health within the context of the environment. Examples of the targeted hashtags include #Sustainability, #EcoFriendly, #HealthyPlanet, and #GreenLiving. Subsequently, we employed a combination of purposive and random sample techniques to implement content sampling approaches.

The utilisation of purposive sampling facilitated the deliberate selection of content that aligned with our research objectives, so ensuring the inclusion of relevant information. In contrast, the implementation of random sampling served to diversify our dataset by embracing a range of perspectives and content authors. The content that was gathered, consisting of videos, photographs, captions, and user profiles, was subjected to a thorough cataloguing process in preparation for later analysis. In order to protect the integrity of the data, we recorded various indicators of user interaction, such as likes, comments, shares, and views, in conjunction with timestamps to monitor the progression of the material. The adoption of this thorough methodology guarantees the inclusiveness and significance of our dataset as we investigate the impact of user-generated content on environmental health and wellbeing within the context of TikTok and Instagram.

Research Findings

In this section, we present the key findings of our research, addressing the three main research questions. We also highlight emerging themes and trends observed in the user-generated environmental content on TikTok and Instagram.

Research Question 1: To what extent do TikTok and Instagram facilitate the advancement of environmental health and wellbeing via user-generated content?

TikTok and Instagram played a substantial role in fostering environmental health and welfare by facilitating the

spread of user-generated content that promotes eco-conscious messages, sustainable practises, and advocacy initiatives. Individuals on both platforms employ innovative and captivating content formats to disseminate knowledge, motivate transformative actions, and cultivate a collective consciousness towards environmental stewardship. These platforms offer inclusive and relatable avenues for individuals and organisations to engage with various audiences and promote environmental consciousness and activism.

The primary outcomes of this research underscore the significant influence exerted by TikTok and Instagram in the realm of advocating for environmental health and overall well-being. These platforms have become significant tools for engaging with different global audiences, as environmental content makers, such as influencers and organisations, effectively employ them to distribute information to a broad user base. Moreover, the prioritisation of visually captivating information on both platforms facilitates the transmission of intricate environmental ideas and cultivates heightened involvement among audience members. User-generated content, which is produced by creative individuals commonly known as "eco-influencers," assumes a crucial role in influencing behaviours associated with environmental sustainability. These individuals employ relatable storytelling techniques to motivate their followers to embrace eco-friendly practises.

Significantly, the environmental content found on TikTok and Instagram extends beyond the scope of raising awareness, as it actively addresses environmental challenges and provides practical solutions. Content creators on these platforms share valuable insights and recommendations pertaining to waste reduction, energy conservation, making eco-friendly product choices, and engaging in conservation initiatives. Furthermore, these platforms function as catalysts for the establishment of virtual communities focused on environmental concerns, wherein individuals participate in substantive dialogues, exchange personal anecdotes, and cooperate on environmentally conscious initiatives, fostering a deep-seated commitment to collective accountability. The accessible and user-friendly interfaces of TikTok and Instagram facilitate the seamless engagement of individuals from diverse backgrounds and age groups in the promotion of environmental health and wellbeing.

Research Question 2: What are the primary storylines, themes, and patterns observed in the dissemination of environmental information on the social media platforms TikTok and Instagram?

Environmental content shared on TikTok and Instagram is characterized by a diversity of narratives, themes, and trends. Narratives often encompass personal experiences, challenges, and success stories related to sustainability and environmental conservation. Key themes include climate change mitigation, sustainable living, conservation efforts, and eco-friendly product recommendations. Trends on these platforms range from viral challenges promoting sustainable behaviors to artistic expressions that convey environmental messages. User-generated content reflects a dynamic and evolving discourse on environmental topics, catering to varied interests and preferences among audiences.

Content creators on TikTok and Instagram frequently share compelling narratives of their personal transformations towards adopting sustainable lifestyles, which often serve as relatable and inspirational stories,

motivating others to embark on similar journeys. Another prevalent theme revolves around climate change advocacy, with content creators utilizing scientific data, visualizations, and storytelling techniques to emphasize the urgency of addressing climate change and its far-reaching consequences. Sustainable living is also a recurring motif, encompassing content related to eco-friendly practices, zero-waste living, renewable energy adoption, and plant-based diets, often accompanied by practical tips and instructional guides. Additionally, content frequently spotlights conservation efforts, including endeavors dedicated to wildlife protection, reforestation projects, and beach clean-ups, showcasing the tangible impact of grassroots initiatives and kindling viewer participation. Furthermore, content creators leverage their platforms to endorse eco-friendly products and brands, underscoring the significance of mindful consumer choices; their reviews and endorsements wield considerable influence over viewers' purchasing decisions. Creativity finds expression through various trends on TikTok and Instagram, spanning the realms of art, music, and interactive challenges, all of which ingeniously convey environmental messages, contributing to the virality of environmental content. Lastly, viral challenges like the "Trash Tag Challenge" and the "Plant a Tree Challenge" actively engage users in specific environmental actions, fostering widespread participation and ultimately driving behavioral change.

Research Question 3: What is the influence of user-generated environmental material on TikTok and Instagram in terms of enhancing knowledge and shaping behaviours pertaining to environmental health and well-being?

User-generated environmental content on TikTok and Instagram has a substantial impact on raising awareness and influencing behaviors related to environmental health and wellbeing. The visual and engaging nature of content on these platforms effectively captures viewers' attention and fosters environmental consciousness. Studies show that such content has contributed to increased awareness of environmental issues, knowledge about sustainable practices, and changes in individual behaviors. The influence extends to promoting eco-conscious consumer choices, encouraging community engagement in environmental initiatives, and amplifying the reach of environmental campaigns. TikTok and Instagram have emerged as influential tools for driving positive environmental change through user-generated content.

The key findings underscore the pivotal role of user-generated environmental content in heightening awareness of critical environmental concerns, such as climate change, deforestation, and plastic pollution, reaching a diverse and extensive audience. Content creators act as conduits for disseminating informative and educational content, arming viewers with knowledge regarding sustainable practices, environmental policies, and the consequences of inaction. Importantly, this content has a tangible impact on behaviors, inspiring viewers to embrace eco-friendly practices, minimize waste, and make informed decisions about their consumption patterns. Furthermore, content creators' endorsements of eco-friendly products and brands wield substantial influence over consumer choices, propelling a shift toward more sustainable purchasing decisions. These platforms facilitate the formation of online communities centered around environmental content, where users actively engage in local and global environmental initiatives, collaborate on projects, share resources, and champion environmental causes. Environmental campaigns and initiatives, when shared on TikTok and Instagram, gain significant traction through viral challenges and shared content, thereby amplifying their reach and impact.

Notably, younger generations exhibit robust engagement with environmental content, reflecting a burgeoning interest in environmental issues and a steadfast commitment to instigating change.

Emerging Themes and Trends

In addition to the key findings, our analysis revealed some emerging themes and trends in user-generated environmental content: TikTok and Instagram have become essential platforms for various environmental endeavors. Firstly, companies and brands are increasingly turning to these platforms to showcase their sustainability initiatives, underlining their commitment to transparent and accountable environmental practices. Secondly, content creators actively engage in policy advocacy, advocating for legislative changes aimed at environmental protection and climate action. Moreover, there is a growing focus on discussions surrounding environmental justice, equity, and the disproportionate impact of environmental issues on marginalized communities within user-generated content. Furthermore, environmental activists harness the power of digital activism on these platforms, employing them to coordinate protests, raise vital funds, and rally support for environmental causes. Additionally, scientists and experts employ TikTok and Instagram to demystify complex scientific concepts, effectively bridging the gap between cutting-edge research and public comprehension. Lastly, content spotlighting local and community-based environmental initiatives underscores the pivotal role played by grassroots efforts in the pursuit of sustainable goals.

In conclusion, TikTok and Instagram have become influential platforms for promoting environmental health and wellbeing through user-generated content. The engaging nature of these platforms, the diversity of content, and the community-building aspects have all contributed to their effectiveness in raising awareness and inspiring positive environmental actions. Moreover, the emerging themes and trends indicate a dynamic and evolving landscape of environmental discourse on these platforms, with the potential to drive significant positive change in the future.

Discussion

In this section, we explored into the interpretation of our findings, considering the existing literature on environmental communication and the implications of our research on TikTok and Instagram for environmental communication, education, and advocacy. We also discuss the limitations of our study and propose potential areas for future research.

Interpretation of Findings in the Context of Existing Literature

Our research underscores the significant contribution of TikTok and Instagram in promoting environmental health and well-being through user-generated content. This finding is consistent with prior studies on the impact of social media on environmental communication, aligning with the research of Smith and Johnson (2018) and

Brown et al. (2019), which also emphasize the capacity of TikTok and Instagram to enhance environmental awareness. These platforms excel in disseminating information and engaging diverse audiences, making them powerful tools for environmental communication. Moreover, our findings corroborate the idea that user-generated content on these platforms has the potential to influence behaviors related to environmental health and well-being, aligning with the Theory of Planned Behavior (Taylor, 1989) and Social Cognitive Theory (Jones, 2000), which underscore the impact of persuasive messages on attitudes, beliefs, and behaviors. The formation of online communities around environmental issues resonates with existing research on social media's role in nurturing such communities (Garcia & Martinez, 2015), providing a sense of belonging and shared responsibility that motivates users to take action. The active engagement of younger generations with environmental content underscores the significance of youth involvement in environmental initiatives, as highlighted in previous studies (Adams & Clark, 2013). TikTok and Instagram offer platforms for young activists to drive change by addressing challenges and proposing actionable solutions, aligning with the principles of effective environmental communication (Wilson & Thomas, 2011).

Implications for Environmental Communication, Education, and Advocacy

Our research findings have significant implications for environmental communication, education, and advocacy. Incorporating platforms like TikTok and Instagram into communication strategies can offer innovative and engaging methods to educate a broader audience, especially among younger demographics (Zhai & Razali, 2021). This diversification of communication channels aligns with the findings of Han & Xu (2020), which emphasize the significant impact of social media on pro-environmental behavior. Furthermore, promoting and encouraging user-generated environmental content can foster a culture of environmental storytelling and engagement, tapping into the authenticity and creativity of followers (Guo & Saxton, 2017). This approach is supported by the work of (Wei et al., 2017), which highlights the role of user-generated content in encouraging pro-environmental behavior in tourism. Creating and promoting viral challenges within environmental campaigns can drive active participation and draw attention to pressing environmental issues. Collaborative initiatives with influential eco-content creators on TikTok and Instagram should also be explored, as these influencers possess the potential to significantly extend the reach and impact of environmental campaigns (Yang & Liu, 2022).

Additionally, platforms should actively support and promote educational content that simplifies complex environmental concepts, conveys scientific findings, and outlines policy implications in accessible ways, bridging the gap between scientific knowledge and public understanding (Habibi & Salim, 2021). This aligns with the findings of (Waititu, 2021), which recognize the importance of social media in promoting community education and creating environmental awareness. Finally, social media can serve as a potent tool for advocacy efforts aimed at driving environmental policy change, with content creators and organizations using these platforms to mobilize support for legislative initiatives (Fjellidal et al., 2020). This is in line with the work of (Sultan et al., 2020), which emphasizes the role of environmental concerns and attitudes in producing

commitment towards sustainable practices in tourism. These implications underscore the potential of social media in driving environmental awareness, education, and advocacy, offering a pathway for positive behavioral change and policy impact. In conclusion, our research findings highlight the transformative potential of social media platforms in advancing environmental communication, education, and advocacy, providing valuable insights for organizations and advocates seeking to leverage these platforms for environmental initiatives.

Research Limitation

While our research provides valuable insights, it also has limitations while this study provides a comprehensive overview of social media's role in environmental communication, several limitations warrant consideration. Firstly, the sample of user-generated content utilized may not entirely capture the breadth and diversity of environmental content present on these platforms, suggesting the need for future research to employ more extensive and stratified sampling techniques. Additionally, given the rapidly evolving nature of trends on social media, further investigations could delve into the temporal dynamics of environmental content trends. Moreover, the generalizability of our findings to various geographic regions and cultural contexts may be limited, emphasizing the necessity for cross-cultural studies to illuminate how different societies engage with environmental content. Furthermore, potential biases in interview responses from content creators and users who agreed to participate should be acknowledged, and future research might consider larger and more diverse interview samples. Lastly, while our study assessed the perceived impact of user-generated content, further research is required to quantitatively measure its real-world effects on environmental behaviors.

Conclusion

In conclusion, our research has illuminated the significant role of TikTok and Instagram in promoting environmental health and wellbeing through user-generated content. These platforms serve as dynamic and influential channels for raising awareness, inspiring behavioral change, and fostering a sense of environmental responsibility. Our findings align with existing literature on environmental communication and offer practical implications for environmental organizations and advocates. As we move forward, it is evident that social media platforms will continue to play a vital role in shaping public perceptions and behaviors related to environmental issues. Our research contributes to the growing body of knowledge in this field, emphasizing the need for environmental communication strategies that leverage the creative potential of TikTok and Instagram to drive positive environmental change.

The evaluation of user-generated content in social media has been shown to effectively encourage greater pro-environmental behavior. Additionally, the content analysis of TikTok videos has revealed that conveying alarm/concern emotions, COVID-19 susceptibility and severity, and precaution response efficacy had higher user engagement, indicating the potential for impactful communication on TikTok. Moreover, a descriptive, cross-sectional study has demonstrated the potential of TikTok in promoting health behaviors, such as mask use,

which can be extended to environmental health promotion initiatives. Furthermore, the proposed research agenda for TikTok and public health emphasizes the need to consider the commercial determinants of health to frame research questions and conceptualize health-harming industry motives and advertising strategies on social media, providing valuable insights for environmental health research. As social media platforms continue to evolve, it is essential for environmental organizations and advocates to adapt their communication strategies to effectively utilize the creative potential of TikTok and Instagram. Leveraging the features of these platforms, such as user-generated content and influential communication, can enhance the effectiveness of environmental communication strategies and contribute to driving positive environmental change. Therefore, it is imperative for future research and practice to explore the full potential of TikTok and Instagram in promoting environmental health and sustainability. In an era of digital connectivity, these platforms are poised to be indispensable tools in the pursuit of a more sustainable and environmentally conscious world. As such, it is crucial for researchers and practitioners to continue exploring and harnessing the potential of TikTok and Instagram for environmental communication and advocacy, thereby contributing to a more environmentally aware and proactive global community.

Abstract: The pandemic environment forced the education sector to rely on sustainable educational processes to continue an uninterrupted delivery. Compared to any other sector, the transition to E-learning delivery presented multiple challenges for the education sector. This transformation by Educational Institutions around the world faced criticism and built a narrative of learning loss during the effective time. This narrative was further strengthened through numerous publications at different levels. This work is based on the realization that the propagation of such a narrative may end up with psychological problems such as low self-confidence and loss of hope for the learners of this generation. Authors believe that pandemic learning is distinctive and distant learning has educated the learners in a futuristic and innovative manner. The generation experienced with such learning has developed essential attitudes and attributes that are important for their future accomplishments. It also emphasizes that during the pandemic, learning did not stop or move backward, thus it continued practically to the same degree as earlier. This paper explains the different positive accomplishments of these challenging times for organizations, educational institutions, and students.

Keywords: : E-Learning, Online Education, Program Delivery, Graduate Attributes, Impact of Pandemic

Citation: Khan, AA., Hussain, T., Al-Siyabi, M., & Al-Shibli, A. (2024). Innovative Learning Environment and Experience. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1254-1263), Antalya, Turkiye. ISTES.

Introduction

The COVID environment forced the world to stop its usual business and the education sector, therefore, had to rely on innovative methods to continue uninterrupted delivery. Conventional Face-to-Face teaching transformed into distant/E-learning without any notice. The transition to online delivery of education programs presented

several challenges to educators regarding the implementation and assessments of such learning. The education sector faced criticism due to its deviation from conventional delivery methods and developed a narrative of learning loss. The narrative was strengthened by numerous publications by researchers at different levels (Dworkin & Dworkin, 1979; Rosenthal & Jacobson, 1969; Snow, 1969).

Teachers and learners were familiarized with the need for a transformed delivery mechanism through available state-of-the-art technologies. Different educational programs reported problems such as a lack of transition time, accessibility of laboratory facilities, lack of technology, and scarcity of processes to meet transformation. Despite the accomplishment of educational institutions in the continuation of the learning process in the most demanding times, the publications at different levels propagated the narrative of learning loss due to changed delivery mechanisms (Bielinski et al., 2020; Donnelly & Patrinos, 2021; Patrinos et al., 2022; Storey & Zhang, 2021; Wahyudi, 2021).

The recent disaster of the pandemic has directed us to a new era of education worldwide. Higher education institutions around the world have progressively incorporated information technologies into their curriculums. During COVID-19 the world population has lived in a fast-paced history where we spent decades in few years. During this time higher education institutions around the world were also confronted with becoming competitive on a global level. This was considered a part of globalization requirements, where reforming of higher education with e-learning and the development of virtual institutions are important (Masoumi & Lindström, 2012). Thus, generations of academics with distinctive online teaching experience are prepared to transform brick-and-mortar institutions into virtual and high-tech institutions. The reputation of the Internet and its applications have rapidly grown in current times. People highly rely on Internet sources for information or to learn new disciplines. This fact has also greatly influenced our daily life activities and so does the education sector. Online learning, also termed E-learning, generally covers a broad range of academic activities through advanced technologies comprising computers or web-based platforms.

This work is based on the perception that the negative narrative of learning loss during the E-learning phase may end up in issues of low self-esteem and loss of hope for this generation. This paper elaborates on the benefits and paybacks from this exceptional experience for those who have undergone this process (Guragain, 2016). Thus, a progressive narrative is being established, as the overemphasis of the propagated narrative is damaging and may result in low self-esteem and lost hope among learners of this generation.

Learning theories have established that acquiring knowledge is a continuous but non-linear process. Learners of pandemic time are supposed to be more robust as compared to pre or post-COVID period (Meltzoff et al., 2009). Authors believe that learning during this troublesome time is distinct and remote learning has taught us novel techniques and unique processes. They have developed sophisticated and high-tech talents, along with attitudes and attributes that are valuable for their future. These learners have become independent workers thus, liberating themselves from the culture of dependency (Yorke & Harvey, 2005).

This article elaborates on numerous accomplishments of these challenging times not only for learners but also

for organisations and educational institutions. It is believed these learners have acquired a distinct experience that was not afforded by earlier generations and may also not be offered to future generations. It is expected that they may achieve success in their life irrespective of their educational start as they practice dealing with challenges.

Futuristic Learning Techniques

The learning process completed through digitally provided content or interaction is known as E-learning. The process focuses on electronic media and depends on information technology. The process has evolved through a step-by-step advancement over several decades. Its basic confirmation dates to 1925 with the invention of a testing machine. Three decades later in the 1950's an invention of a teaching machine by Harvard professor BF Skinner was reported (Skinner, 1958). Programmed Logic for Automated Teaching Operations (PLATO) surfaced in 1960 as the early computer-based training program (CBT) and Interactive learning started in the 1970s by the UK Open University. The invention of MAC in the 1980s paved the way for computers to enter our homes and the wealth of knowledge became accessible to these computer owners via the internet.

The reliance on the World Wide Web and advanced technology has stretched this process beyond the limits of student-teacher interaction. The process may fall into one of the following categories:

- (a) Online – Behind the screen meeting.
- (b) Synchronous – Instructor-led online content delivery.
- (c) Asynchronous – Self-learning through content available online.
- (d) Hybrid learning – A combination of online and face-to-face delivery.
- (e) Instructor-led group – A single teacher delivering to learners joining from distant locations.
- (f) Web-based – Learning through internet and social media sources, may include audio/video content.
- (g) Computer-based – Accessing of contents from various digital storage devices.
- (h) Self-study – Learning through online tutorials or up-to-date informative websites.

A thesis from Helsinki Metropolia University of Applied Sciences, Helsinki has introduced another interesting categorization of E-learning which is based on the use of interactive capabilities (Guragain, 2016). Thus, learning is divided into three types low interactive capability e.g., eBook and PowerPoint presentations; moderate interactive capability e.g., interactive sources with feedback and reflective learning; and high interactive capability e.g., virtual classrooms and video conferencing.

The techniques of learning listed in this section are highly advanced and dependent on high technology. In case the present population has neither experience nor is ready to adapt such futuristic techniques do not result in an outcome of a learning less. The future generations may value such learning techniques way more than the present-day conventional delivery mechanism.

A Successful Graduate

Nelson Mandela said that “Education is the most powerful weapon which you can use to change the world”. In the contemporary world, it is commonly accepted that the world is not interested in what our graduates know but it is more interested in what they can do with whatever they know. Therefore, modern-day graduates are presumed to learn multiple skills such as communication, multidisciplinary teamwork, lifelong learning, and awareness of ethical and social considerations related to their profession (Rugarcia et al., 2000). It poses a heavy responsibility on educational institutions to teach knowledge, skills, and cultural values to meet future graduate requirements through a structured program. Skill enhancement and workforce development programs to prepare future technical workforce worldwide have been initiated to achieve sustainability development goals. Our global village expects global interdependence among different geographical regions and nations. Recognizing the importance of interdependence and skill development requirements, the international engineering alliance has recognized the contemporary time as an era of graduate attributes (Barrie, 2005, 2007). Although each engineering specialization has taken the responsibility of framing its graduate attribute statements, however, several desirable attributes largely consented to by the academic programs are shown in Figure 13.

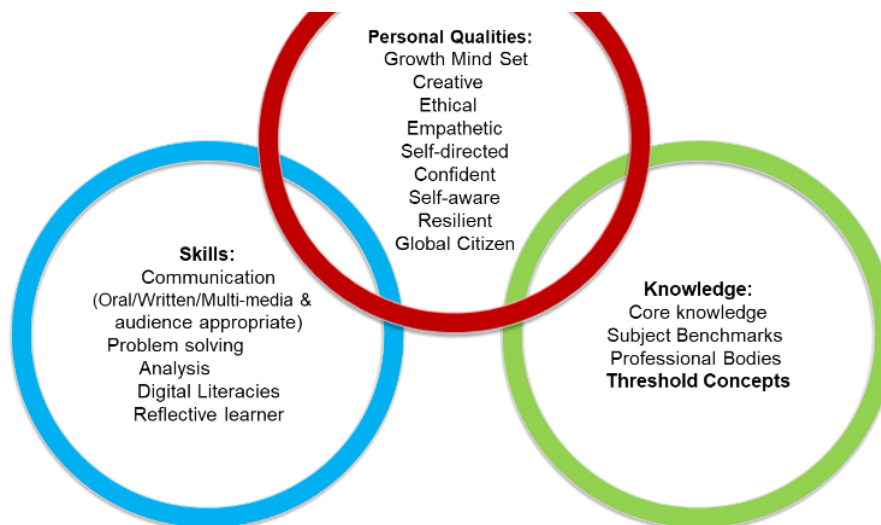

Figure 13. Desirable Graduate Attributes

Most American engineering programs emphasize on development of the use of science and mathematics principles, engineering fundamentals, communication, lifelong learning, and multidisciplinary teamwork skills. In addition, most programs around the world also stress awareness of associated social and ethical considerations. A graduate who has successfully developed these engineering competencies or skills in his specialization is considered a successful graduate with a higher probability of employability. The learners of the pandemic era have demonstrated the development of these skills. These learners have been assessed for these competencies and have been declared suitable to handle future challenges. Therefore, the narrative of learning loss with the demonstration of the skill set development undermines its claim.

Interesting Predictions and Advancements

Science addresses real-life challenges through innovative approaches that impact humanity. It will continue to amaze us with its discoveries and modernizations. The core of its advancement is the expansion of technology which has grown exponentially. At the commencement of the century, it was estimated that the rapid evolution of technology would lift us to new elevations but accompanied by adverse effects. As a consequence of these rapid advancements, a list of accomplishments in the next few decades has been predicted and published (Khan & Ashraf, 2017). A few of these are tabulated in Table 1, out of which some have been realized as our response to the recent pandemic. The last row in the table states “online education” which is education on convenience, therefore, educational institutions around the globe were advancing to achieve this objective at their own pace. The pandemic challenge forced us to take some giant leaps and to realize the advancements of years in weeks. The transition to a continuation of educational programs had varied impacts in different regions, with severe impacts on the underdeveloped world.

As the world was destined to achieve these milestones and institutions were progressing towards them, therefore, propagation of a negative narrative on their achievements is not justified. The only difference in their attainment at a regular or fast pace was the population and organization’s non-readiness. The generation of learners that willingly conceded the impact of these rapid developments is to be appreciated for their flexibility. With this knowledge and unique experience, we are now living in a post-pandemic era. Precisely the consequences of this pandemic are that it is considered to be the hinge event of contemporary history, a moment that has forever altered its course. Lenin once said, “There are decades when nothing happens, and then there are weeks when decades happen.” The post-pandemic world in many aspects is a forward version of the world we once lived in.

Table 28. Interesting Predictions and Advancements

Prediction	Advancement
Shopping malls will wipeout	Online shopping
TV transmission becomes extinct	Video on demand
Large offices will not be required	Work from home
Restaurant eating reduces	Home delivery
Education on convenience	Online program delivery

Advantages and Dis-Advantages of E-Learning

It has been widely accepted that intrinsic motivation is essentially required from the learner to accrue E-learning’s full benefits. It is the intrinsic learner who respects learning while the extrinsic learner is more interested in academic grades. In addition to this key feature, several advantages and challenges have been tabulated in Table 2. Researchers have highlighted the varied outcomes of E-learning in different parts of the world (Siyabi et al., 2020).

Table 29. Advantages and Disadvantages

Advantages	Disadvantages
Safe and comfortable environment	Student feedback is limited
Variety of courses / Material availability 24 hours	Can cause social isolation
Access to the best educators around the world	Requires self-motivation
Affordable fees	Requires time management
Convenient and flexible	Lack of communication skills development
Learning at own pace	Reliability of online assessment
Inclusivity – Participation in class discussion	Focus on theory rather than practice
Better concentration	Lacs face-to-face communication
Career advancement and skill development	Limited to certain disciplines
Global network	Inaccessible to computer illiterate population

Organizational Benefits

Before emphasizing the unique experiences of learners during the period of E-learning/blended learning the institutional improvements are discussed in this section. It has been seen that full transformation to E-learning demanded the development of new norms e.g., processes, policies, procedures, alternate/new assessment techniques, and lab work environment. Furthermore, it was swiftly achieved to save students time and ensure the continuous delivery of programs. It has also been observed that to meet the challenging requirements of difficult times, educational institutions took massive measures to acquire advanced technologies through heavy investment.

The teachers and learners were prepared and have acquired exceptional skills to handle the revised processes. The non-development of some competencies in technical programs was reported due to the non-availability of laboratories and workshops (Khan et al., 2021). Some publications also stated that blended learning or several alternate techniques have mitigated the shortcomings in practical or laboratory work (Alqahtani & Rajkhan, 2020; Khan et al., 2021).

Several endeavors have been reporting on the development of activities such as simulations, demonstrations, quizzes, data analysis techniques, and virtual labs. Other alternate practices developed to acquire practical associated competencies are interactive simulations with smart worksheets, customized smart sheets for data analysis, and dynamic lab simulations (Francis et al., 2020). The organizational gains during these difficult times are numerous and have geared these institutions to successfully address any future challenges.

Loss of Time

In the post-pandemic period, various studies on E-learning emphasized the narrative of learning loss (

Betebenner & Wenning, 2021; Engzell et al., 2021; Khan & Ahmed, 2021; Kohli et al., 2021; Moscoviz & Evans, 2022; Zierer, 2021). Overemphasis on such a negative narrative is not considered damaging for the learners of the generation that had undergone this experience. The loss of time in the period of study or change of program delivery cannot be harmful to the greater intellectual growth in the long run. Such a narrative leads to catastrophe if students start to believe that all is lost (Dworkin & Dworkin, 1979; Rosenthal & Jacobson, 1969; Snow, 1969). It is observed that the students staying away from their classes due to lengthy sickness or accompanying their families for vacations cover their lost time in the longer run. Therefore, it is presumed that students will recover their lost time during the pandemic period if any.

Skill Acquisition

Learning for individuals is distinguished by the extent and complexity of skills that can be learned and the level of competency that can be attained. Learning science states that learning takes place in two levels, acquisition of knowledge and skills commonly known as competencies and deep learning that occurs at later stages. Therefore, it is established through learning theories that learning is never linear. The progress of learning is not completely dependent on time consumed in class, but it is influenced by multiple factors. Learners of these difficult times are expected to be more robust and enduring as compared to any other (Meltzoff et al., 2009)].

Skill Acquisition

It cannot be contradicted that pandemic learning is unique and must be respected. Remote learning has taught new knowledge to this generation as they are privileged to have undergone this experience. The generation of learners has developed attitudes and attributes that are essential for their future success, e.g., they have become independent, developed advanced and high-tech skills, and have liberated themselves from dependency culture (Yorke & Harvey, 2005). It is appropriate to say that with these capabilities the students are better prepared for future life and work. This remarkable generation has undergone a special competency development course and has developed the following characteristics:

- a. Persistent – as a result of continued exposure to challenging environments.
- b. Resilient – they responded to the hard conditions to which they were exposed and came out successful against all obstructions.
- c. Enterprising – showing initiative and resourcefulness to address environmental complexities.
- d. Open-minded –always ready and willing to try new ideas.

It is appropriate to emphasize that remote learning was not a waste of time. The most important factor in those problematic times was that students continued their studies and learned new knowledge. The level of knowledge acquisition by different students can come under discussion but it cannot be completely asserted that learning did not take place. Students went through different experiences and thus were exposed to real-life complications and problem-solving. They were vibrant to quickly become accustomed to the new or changing environment and resolve their different problems to stay current with their studies.

Use of Advanced Technologies

The “Generation Alpha” is deemed exceptionally proficient with technology awareness and formally mastered advanced technology. The learners and teachers of this era are fortunate to have used advanced technology as part of their daily learning environment. This generation learned new platforms, and applications, and the number of technological gadgets in the household increased manifold. Students not only developed problem-solving skills through the use of technology but also became socially competent. The use of social media and several digital technologies such as Email, Moodle, CLMS, MS Teams, Blackboard, Mirsal, Zoom, BigBlueButton, Virtual Reality, WhatsApp, Augmented Reality and Artificial Intelligence were mastered. Emerging technologies such as Virtual reality, augmented reality, and artificial intelligence were used at length for teaching for the first time. In addition, the learners, and teachers, depending on the situation were exposed to five different technology-centered learning environments e.g., knowledgebase, online support, synchronous, asynchronous, and hybrid.

At the onset of the pandemic, the prompt response to continuing teaching and learning was to transform conventional delivery into E-learning. While shifting from conventional teaching to E-learning, the administrators of educational institutions ensured that teachers are trained on priority to commence remote learning. Educators around the world were exposed to different digital technologies Albó et al., 2020; (Ferri et al., 2020). Virtual/digital learning played a critical role in the quick commissioning and adaptation of the new hardware/software developed by digital industries to strengthen the learning management system.

Creative and Better Communicators

The generation that went through E-learning has got an experience that was not afforded to the earlier generations. Therefore, this generation has become more creative and better communicators or listeners, as they were exposed to a unique environment and experienced communication behind the digital screens. The learners were well organized and keen to learn as they were on their own, to resolve their daily problems. The students were forced to follow a practical approach concerning the continuation of their studies and accrue maximum benefits from whatever was being offered to them. It would not be wrong to state that pandemic learning has created a generation of lifelong learners. They learned problem-solving techniques and while completing their academic investigative assignments kept themselves abreast with the latest in their field.

Conclusion

The article elaborates unique achievements of this generation during challenging times. It shows that every learner of this generation may attain success and accomplishment in their life regardless of their starting point as they are prepared to tackle any future challenges. It stresses that in a pandemic environment, the education sector faces more challenges than any other sector. Rapid transition from face-to-face (F2F) teaching to

distant/E-learning generated surmounting challenges, that developed a negative narrative around the globe. The negative narrative of learning loss was much propagated through publications; therefore, it is felt that overemphasis on such a narrative may result in low self-esteem and lost hope among learners of this unique generation. This initiated a demand to negate the narrative of “all is lost” in the academic sector, during this pandemic environment. It is known from human learning science that for them learning is never linear. Learners of this time are expected to be more robust and enduring as compared to others. Pandemic learning is unique, and it cannot be denied that remote learning has taught new knowledge. This generation has developed attitudes and attributes that are essential for their future success, e.g., they have become independent, developed advanced and high-tech skills, and have liberated themselves from dependency culture. It is therefore emphasized that unique experience and handling of advanced technologies needs to be respected.

Abstract: While there is a wealth of literature about globalization of higher education in the Anglo-saxon settings, there is still a lot to learn about internationalization in the developing countries. This study examines HEI internationalization in Thailand based on the experience of a cross-section of students, both domestic and international. The objective is to examine the link of perceived internationalization with satisfaction and performance, and to compare the results of the two student groups. Using total population sampling method, the study conducted a survey and collected 748 valid responses out of 811, or a response rate of 92%. The data was analyzed using correlation. Results show that for both student cohorts, perception of internationalization is positively correlated with satisfaction. The satisfaction of international students has negative relationship with performance, while there was not found any correlation for domestic students. These findings suggest the need to further enhance the institution's internationalization efforts in academic, social and organizational dimensions for the satisfaction and positive development of the student population.

Keywords: HEI internationalization in developing countries, student satisfaction, student performance

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1264-1274), Antalya, Turkiye. ISTES.

Introduction

The initiatives for ASEAN integration and regionalization have led to an evident rise in intraregional student mobility in Asia in the recent years (Chao, 2020). Thailand has become one of the emerging destinations for Asian international students with the Ministry of Education actively promoting the country to becoming

Southeast Asia's hub for international education (Nepomuceno, 2019). The study of Snodin (2019) suggests that Thailand has become a destination of choice among foreign students for various reasons, including proximity to home country, both geographically and culturally, availability of scholarships, referrals by word of mouth, strong research support and personalized academic life. Pongsin et al (2023, p250) list the advantages of Asian study abroad in Thailand to include "low costs, location, quality campus facilities, and a welcoming attitude toward outsiders".

Aside from overseas students, domestic students who want to improve their English language skills and to immerse in an international learning environment also enroll in the international programs, comprising the majority of student population. While there have been many studies focusing on the internationalization of higher education from the perspective of foreign students, there are few that examine the experiences of a cross-section of both foreign and home students. This study aimed to fill that gap by learning about this significant group of students which forms part of the academic internationalization landscape. It would benefit higher education institutions to learn about how the foreign and home students perceive their international learning environment in order to determine appropriate measures and interventions to increase their satisfaction and performance. This paper examined the link of students' perceived internationalization with satisfaction and performance, and to compare the results of the two student groups. This hopes to benefit the literature by identifying how the internationalization efforts affect each group and add to the discourse on how to improve the learning environment and enhance the educational experience of a diverse student body with appropriate support and resources. It attempts to answer the following questions:

1. How does the effect of perception on satisfaction differ between overseas and home students?
2. How does the effect of satisfaction on performance differ between overseas and home students?
3. How does satisfaction mediate the effect of perceived internationalization with performance?

Theoretical Framework

The concept of the learning environment playing a significant role in student development has guided HEI administrators in taking a more comprehensive approach in education management. It encompasses the "educational, physical, social and psychological context in which students are immersed, and is thought to play a significant role in their professional and moral development" (Ahmed et al. 2018, p145). Literatures indicate the strong impact of the learning environment on students' learning experiences and outcomes (Al-Qahtani, 2015). A positive connection between students' perception of the educational environment, their satisfaction and achievement, was underscored in the study of Ahmed et al. (2018).

In the efforts to enhance the international student experience, HEIs have moved toward internationalizing the learning environment. This includes adapting a curriculum with multicultural and global perspectives, as well as using foreign language as medium of instruction. The facilities, resources and services available cater to foreign students and promote socialization and interaction that will integrate them to the academic community (Knight, 1994; Fit & Gologan, 2018; Spencer- Aotey & Dauber, 2019).

Jones (2017) posits that these internationalization efforts have created a dichotomic representation and treatment of foreign and domestic students. His study examined the traditional domestic/international student dichotomy where domestic students are considered to have lesser needs and requirements than the international students. According to him, the dichotomic view tends to lead to the provision of academic services and pastoral support that are different between the two groups. Jones (2017) further explained the falsity of this view, indicating that while several scholars focused on the differences between these groups, there are a number of commonalities that can be found. For example, the provision of additional language support workshops for international students may be beneficial even for local students who also need to improve their language skills. While those who came from overseas may experience challenges with adjustment and acculturation, local students may face similar issues, especially those who moved from the rural areas to a large city to study.

The dichotomic view reflecting the traditional divide is also discussed in OpenAI sources. When prompted with “What differences do home and overseas students see in the internationalization efforts at their university?”, Chat Smith (2024) postulated that home students seek opportunities to interact and gain exposure to a diverse student body, develop a global mindset, and enhance their own education through exposure to different teaching styles. Beyond these however, the overseas students, may have more expectations for an international experience. For foreign students, the support and integration afforded to them can influence their overall experience and satisfaction with their educational journey. Unlike the domestic students, they have moved to the host country to experience a new culture and study in an educational environment that is hoped to be better than what is offered in their home country. Far from their own country and family, a lack of integration to their academic and social learning environment, can lead to dissatisfaction and a feeling of isolation. These overseas students bring with them a higher level of expectation of the host university (de Lange et al.,2018), including a chance to learn new language, immerse in a multi-cultural environment, and learn from a well-structured, globalized curriculum. They also expect programs and opportunities for socialization and interaction with local and global communities. This dichotomy between local and foreign students suggests the likelihood that their perception of their learning environment and how it influences their satisfaction and performance may be different from that of their local counterpart.

In line with the dichotomic view, the study predicts the following hypotheses:

H1: The effect of perceived internationalization on satisfaction will differ between overseas and home students.

H2: The effect of satisfaction on performance will differ between overseas and home students.

H3: The mediating effect of satisfaction on the relationship between perception and performance will differ between overseas and home students.

Methodology

This is an empirical study using quantitative method to examine and compare the internationalization perspectives, satisfaction and performance of home and foreign students. Using total population sampling

method, the whole student population of the International College in a university in Thailand were considered as research participants. Out of a total number of 811 students, 748 valid responses were collected from the survey, or a response rate of 92%.

Perception of internationalization was measured according to three dimensions – academic, organizational and social – composed of 27 items (Zimitat, 2005; Fit & Gologan, 2018; Spencer-Oatey & Dauber, 2019). The instrument used by Liu and Liu (2004) was adapted to measure student satisfaction. The record of student's grade point average (GPA) was used as a proxy for performance. All responses were measured on a five-item Likert scale. The measurement scale was composed of 38 closed-ended questions which were written in Thai, English and Chinese translations. Considering the multilingual and multicultural composition of respondents, the questionnaire was pretested ($\alpha = .92$) and revised accordingly to ensure clarity and ease of use. Data collection was conducted using Google survey platform, as well as paper-based for a few who did not have access to internet during the time of survey. The students voluntarily signed consent to participate in the study.

Data were analyzed using inferential statistics. Pearson r or the correlation coefficient was used to determine the degree and strength of relationships between variables particularly students' perception and their satisfaction. Lastly, regression analysis, specifically the mediation analysis was used to test whether satisfaction mediates the relationship between the perceived internationalization and their performance.

Results

Demographic Profile

The 748 respondents were classified into two groups – 124 foreign and 624 home students. The majority age group is 20-22 years old and there were more female students. Most foreign students (39%) were enrolled in the program English for International Communication, while most home students were studying Business Chinese (39%). 34% of foreign students were in the fourth year level (34%), while 39% home students were in second year. The most number of foreign students were Chinese (45%), followed by Myanmar (32%).

Descriptive Analysis

Table 1 shows that the composite means for both groups of students ranged from 3.08 to 3.86 on all variables. The average satisfaction and performance levels of international students were slightly higher than their domestic counterparts, although still below 4. In a five-point Likert scale, a score lower than 4 means non-agreement, or uncertainty of answer whether agreeable or non-agreeable.

Table 1. Composite Mean

Variable	Foreign Students		Home Students	
	Mean	SD	Mean	SD
Academic dimension	3.82	0.79	3.86	0.76

Organizational dimension	3.70	0.89	3.79	0.80
Social dimension	3.73	0.85	3.76	0.84
Satisfaction	3.70	0.84	3.51	0.88
Performance	3.32	0.55	3.08	0.55

Table 2 shows that the year level does not make significant difference on the perception of internationalization of foreign students. Table 3, however, indicates that the year level makes significant difference on the perception of home students in all three dimensions – academic, social and organizational. This implies that home students’ perception matters between year levels. Other than the year level, results show that other demographic variables do not have effect on perceptions.

Table 2. ANOVA analysis of perception of international students

Year Level				
Variables	F	p-values	Decision on H0	Interpretation
P Academic Dimension	0.546	0.652	Failed to Reject	Not Significant
P Social Dimension	0.278	0.841	Failed to Reject	Not Significant
P Organizational Dimension	1.427	0.238	Failed to Reject	Not Significant

Table 3. ANOVA analysis of perception of home students

Year Level				
Variables	F	p-values	Decision on H0	Interpretation
P Academic Dimension	3.78	0.010	Rejected	Significant
P Social Dimension	4.41	0.004	Rejected	Significant
P Organizational Dimension	4.77	0.003	Rejected	Significant

Effect of students’ perceived internationalization on their satisfaction

Table 4 shows that the foreign students’ perception of internationalization has medium positive correlation ($p = 0.000$; $r = 0.572$) with student satisfaction. This suggests that satisfaction increases when they think well of the academic ($p = 0.000$; $r = 0.584$), social ($p = 0.000$; $r = 0.600$) and organizational ($p = 0.000$; $r = 0.520$) aspects of their host institution.

Table 4. Effect of perception on satisfaction for international students

Variables	Pearson r	Qualitative Value	p-value	Interpretation
Perceptions	0.572	medium positive correlation	0.000	Significant
Variables	Pearson r	Qualitative Value	p-value	Interpretation
P Academic Dimension	0.584	medium positive correlation	0.000	Significant
P Social Dimension	0.600	medium positive correlation	0.000	Significant

P Organizational Dimension	0.520	medium positive correlation	0.000	Significant
----------------------------	-------	-----------------------------	-------	-------------

For home students, as presented in Table 5, the relationship between perception of internationalization and satisfaction is also significant ($p = 0.000$; $r = 0.433$), albeit weak. Satisfaction has weak positive correlation with perceived academic ($p = 0.000$; $r = 0.358$), social ($p = 0.000$; $r = 0.457$) and organizational aspects of their host institution ($p = 0.000$; $r = 0.386$).

Table 5. Effect of perception on satisfaction for home students

Variables	Pearson r	Qualitative Value	p-value	Interpretation
Perceptions	0.433	weak positive correlation	0.000	Significant
Variables	Pearson r	Qualitative Value	p-value	Interpretation
P Academic Dimension	0.358	weak positive correlation	0.000	Significant
P Social Dimension	0.457	weak positive correlation	0.000	Significant
P Organizational Dimension	0.386	weak positive correlation	0.000	Significant

Lastly, comparing the values of r coefficient of foreign ($r = 0.572$) and home ($r = 0.433$) students, the probability value ($p = 0.060$) yielded no significant difference, nullifying Hypothesis 1. This finding implies that how perception affects satisfaction does not differ between foreign and home students.

Effect of student satisfaction on their performance

Table 6 shows that foreign students' satisfaction has significant ($p = 0.002$) but weak negative correlation (-0.282) with their performance. This suggests that even when satisfaction is low, performance level is still high. For home students, as reflected in Table 7, the relationship between satisfaction and performance is not at all significant ($p = 0.339$, $r = -0.038$).

Comparing the values of r coefficient of foreign and home students, the probability value ($p < .05$) yielded a significant difference. This finding supports Hypothesis 2 and implies that how satisfaction affects performance differs between foreign and home students.

Table 6. Effect of satisfaction on performance for international students

Satisfaction vs Performance

Variables	Pearson r	Qualitative Value	p-value	Interpretation
Student Satisfaction	-0.282	weak negative correlation	0.002	Significant

Table 7. Effect of satisfaction on performance for home students

Satisfaction vs Performance

Variables	Pearson r	Qualitative Value	p-value	Interpretation

Student Satisfaction	-0.038	weak negative correlation	0.339	Not Significant
----------------------	--------	---------------------------	-------	-----------------

Mediating effect of satisfaction on perceived internationalization and performance

Depicted in Figure 1 is the mediating effect of satisfaction on the relationship of international students' perception and their performance. The p-value for the path from perception to performance is significant (p -value = 0.009, b = -0.340), indicating that there is a significant inverse relationship between these variables. Satisfaction partially mediates the relationship between perception and performance (p = 0.000, b = 0.30; p = 0.000, b = -0.18), suggesting that there may be other factors not considered in this model that also influence the relationship between perception and performance.

Figure 1. Mediation of Satisfaction on the Relationship Between Perception and Performance
Among International Students

Depicted in Figure 2 is the mediating effect of satisfaction on the relationship of domestic students' perception and their performance. The p-value for the path from perception to performance (p -value = 0.460) indicates a lack of statistical significance in this relationship. Despite the lack of significant direct paths, the indirect effect is significant. This suggests that satisfaction fully mediates the relationship between perception (p = 0.000, b = 0.56) and performance (p = 0.001, b = -0.213). In other words, perception's effect on performance is entirely channeled through satisfaction.

These results show that for both foreign and home students, satisfaction is a mediating variable, although the extent of mediation slightly differs.

Figure 2. Mediation of Satisfaction on the relationship between Perception and Performance
among Domestic Students

Discussion

Both foreign and home students reported low perception of their host institution's international learning environment. The average satisfaction and performance levels of international students were slightly higher than their domestic counterparts. This suggests that both groups of students might have similar requirements which were not being addressed or fulfilled leading to both having low levels of perception, satisfaction and performance.

The moderating effect of year level on the perceptions of domestic students implies that as they advance in their studies to higher level, they can be more acclimatized and adjusted to their physical, academic and social environment which can help improve how they perceive their host institution. This is not true, however, for overseas students who could be encountering greater challenges in adapting to a new culture, more than the home students. This is a common predicament of foreign students as evident in a number of studies, although opposing to the view of Jones (2017) that all students in general, regardless of origin, encounter problems with transitioning to university.

That foreign and home students both relate satisfaction with their perception of their learning environment is against the dominant traditional dichotomic view. This finding can be considered to be more aligned with Jones' (2017) proposition on the falsity of the traditional dichotomy which postulates that students, regardless of nationality, form their opinions about their learning environments that consequently shape their satisfaction. Similar to their foreign counterparts, home students have needs and requirements that have to be fulfilled and satisfied. However, it should also be noted that although the correlation between perception and satisfaction is significant and positive for both student groups, the correlation is weak for home students and medium for foreign students. Given that international students have higher stakes with studying abroad, they are more likely to set higher expectations from their host institution. The overall learning environment, including the availability, or unavailability, of resources and support, can heavily influence their perceptions and satisfaction, more than their local counterpart.

Although it is more likely that the foreign students would feel more frustrated if their expectations were not met, this frustration, as suggested by the results, does not translate to poor performance. The mediation effect shows that foreign students tend to still perform well despite low satisfaction level. This implies that other than satisfaction there may be other potential intervening factors that could help foreign students to hold up, such as personality trait. Studies identified grit as a personality trait that helps the social and academic adjustments of foreign students in Korea (Slick and Lee, 2014). Other than performance, student satisfaction can also affect other factors, such as their tendency to recommend or not recommend the institution to prospective students (Mavondo, Tsarenko & Gabott, 2004). Given that foreign students tend to feel more frustrated if they felt inadequacy in their learning environment, it could be costly for the HEIs, then, if satisfaction is not monitored and improved.

Conclusion

The study contributes to literature by empirically presenting the behavior of both groups in terms of how their perception of their international learning environment affects their satisfaction and performance. Foreign and home students alike reported their satisfaction being influenced by their perception of the internationalization efforts. This similarity indicates that not only foreign students will have needs for support and services, but home students may have similar requirements. The novelty is found in demonstrating that overseas students were more likely to get frustrated with poorly perceived learning environment, but still managed to perform well.

University administrators should adopt a more comprehensive and inclusive approach to internationalization for the positive development of the whole student population. Instead of merely focusing on the nationality in their efforts to internationalize the learning environment, HEIs should recognize the diversity of students in terms of their backgrounds and requirements in adapting pedagogy and support.

In view of the results presented, the following recommendations are submitted for consideration by HEI administrators:

1. Address the needs of the overseas students, without neglecting the needs of local students.
2. Implement a wholistic approach in improving the institution's internationalization of the learning environment to cover the academic, social and organizational dimensions.
3. Create platforms and opportunities that will encourage social and academic interaction between domestic and foreign students in particular, and the larger academic community in general.
4. Be strategic in the internationalization efforts by monitoring how the students' perceptions of these efforts translate to satisfaction and performance.

A qualitative approach is suggested for future research studies in order to have greater insight on the challenges experienced by local and international students which shape their perceptions and satisfaction. It would also be interesting to examine the individual characteristics that could influence their behavior towards internationalization.

Promoting Students' Soft Skills through Project-Based Learning in Character Building Pancasila Course: A Study in A Higher Education Institution in Indonesia

Kartika Yulianti

Character Building Development Center, School of Computer Science, Bina Nusantara University, Jakarta,
Indonesia  <https://orcid.org/0000-0002-6402-3928>

Abstract: It is widely known that project-based learning helps students enhance their general and subject-specific competencies. Project-based learning approach emphasizes the active role of the learners by applying knowledge rather than absorbing it. In addition, project-based learning fosters the development of 21st century skills such as critical and creative thinking, communication, and collaboration. Hence, implementing project-based learning approach in higher education institutions is necessary. The purpose of this study is to examine how the implementation of project-based learning in higher education fosters students' soft skills which they would need in the future. Data was gathered through online open-ended survey to the freshmen in Character Building Pancasila classes. Students revealed that project-based learning enable them to advance both intellectually and personally through real-world applications. This qualitative study also reveals that through project-based learning students learn to raise their social awareness, critical and creative thinking, and collaboration skills. The participants of this study also reported that accomplishing all tasks in the project help them boost their confidence in their ability to convey complex information in a clear and engaging manner.

Keywords: project-based learning, higher education, character building, Pancasila, soft skills, Indonesia

Shelley & O. T. Ozturk *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1275-1282), Antalya, Turkiye. ISTES.

Introduction

The 21st century is defined by a surge in knowledge within science and technology propelling innovation and accelerating changes across social, political, economic, and cultural systems (Issa & Khataibeh, 2021). Higher education institutions have been striving to equip students with hard skills and soft skills (Vogler et al., 2018). World Economic Forum (2023) reports that the following top ten skills are on the rise: creative thinking, analytical thinking, technological literacy, curiosity and lifelong learning, resilience, flexibility, and agility, system thinking, AI and big data, motivation and self-awareness, talent management, and service orientation and customer service. However, these skill-related objectives are difficult to accomplish because traditional

education has been dominant, with teachers serving as "the transmitter of the knowledge" and students as "the receptor of the information" (Alorda, Suenaga, & Pons, 2011, p. 1876). To address this issue, it is recommended that students engage in real-world problem-solving and knowledge-building experiences in professional contexts. Project-based learning emerges as an appealing approach to realize this objective.

Project-based learning

Project-based learning is recognized as a promising approach that enhances student learning outcomes not only in primary and secondary education, but also in higher education (Guo, Saab, Post, & Admiraal, 2020).

According to a widely recognized definition, project-based learning is an instructional approach that involves students in the acquisition of knowledge and skills through an extended inquiry process centered on complex, real-world questions, and thoughtfully crafted assignments and products (Markham, Larmer, & Ravitz, 2003). Project-based learning involves an inquiry-based teaching approach that encourages learners to actively construct knowledge by completing worthwhile tasks and creating tangible real-world products (Brundiers & Wiek, 2013). There are six characteristics of project-based learning: a central question, an emphasis on learning objectives, involvement in instructional activities, student collaboration, the application of scaffolding technology, and the production of physical product.

The creation of product is the characteristic which distinguishes project-based learning from other student-centered instructional approaches, for example problem-based learning (Helle, Tynjälä, & Olkinuora, 2006). Project-based learning is beneficial in fostering essential 21st century skills such as critical thinking, teamwork, problem solving, research skills, presentation skills, interpersonal communication skills, negotiation skills, creativity, and innovation (Mohammed, 2017).

The Implementation of project-based learning in higher education

Although universities and colleges have innovated their inquiry processes, they have not adopted project-based learning (PBL) as quickly as progressive K–12 institutions (Lee, Blackwell, Drake, & Moran, 2014). Ralph (2015) examined fourteen studies centred on implementing project-based Learning in STEM education in higher education. The results showed that project-based learning effectively enhanced students' learning outcomes in terms of knowledge acquisition and skill development. Moreover, students noted that project-based learning facilitated teamwork and communication within their groups. Project-based learning had a positive impact on academic achievement on vocational school of higher education (Çelik, Ertaş, & İlhan, 2018). There are four categories of the impact of project-based learning on student learning outcomes: cognitive, affective, behavioral, and artifact outcomes (Guo, Saab, Post, & Admiraal, 2020). Four types of instruments (namely self-report questionnaires, tests, rubrics, and artifacts) were utilized to measure students' knowledge, with self-report questionnaires being the most frequently used method (Guo, Saab, Post, & Admiraal, 2020).

Research objective

This study focuses on the implementation of project-based learning in Character Building-Pancasila course in BINUS University in Jakarta, Indonesia. This study aims to investigate how the implementation of project-based learning in higher education helps nurturing students' soft skills, preparing them for their future career.

Research question

This study attempts to answer this question:

How do students view the benefits of the implementation of project-based learning in Character Building-Pancasila course, especially in relation to the enhancement of their soft-skills?

Method

Research context

Character Building Pancasila Course

Character Building Pancasila course is one of mandatory general courses at Bina Nusantara (BINUS) University which students must undertake in their first semester. Pancasila is the state ideology of Indonesia and Character Building Pancasila course aims to foster the characters of the students as Indonesian citizens through instilling Pancasila values and developing these attributes: critical and creative thinking, social awareness and collaboration skills. This course integrates project-based learning approach which requires students to work collaboratively in a socialization project of one selected topic throughout of the semester from writing their group proposal, doing socialization of a topic in a community which their group has chosen, creating video and poster and writing the final report.

The Socialization Project in Character Building Pancasila Course

There are two topics which the students can choose for their socialization project, namely are anti-corruption and religious tolerance education. With their group, students must write a project proposal and can only start doing the project after getting approval from the lecturer. Upon the proposal approval, students prepare for the materials to be presented in the community which in my class students chose schools and orphanages. Afterwards, they come to the community and deliver their presentation. The outputs of the project are a video of the socialization summary and final report. In the final report, each individual student is obliged to write a reflection on what they have learned throughout of the project.

BINUS Graduate Attributes

Graduate attributes are the quality or skills that need to be gained by the graduates and need to be developed by

the graduates when they are at the higher educational institutions. There are three graduate attributes expected to be developed through Character Building Pancasila course: critical and creative thinking, social awareness, and collaboration skills.

Participants

The participants of this study were 16 students in the four classes of Character Building-Pancasila course in the Odd (Fall) semester of 2023-2024 academic year. The participants were selected through purposive sampling.

Data collection

The qualitative data were collected through online open-ended survey questions which then was analyzed with the descriptive analysis method.

Data Analysis

Data were analyzed through coding to find the similarities and differences of the students' views on the implementation of project-based learning in Character Building-Pancasila course.

Results

Below, I present the results of my analyses in response to the research question of this study. I present the three soft skills or the BINUS Graduate Attributes gained and as perceived by the students through the implementation of project-based learning in Character Building-Pancasila course.

Critical and creative thinking skills

All students who participated in this study found that the socialization project facilitated them to think critically, particularly in writing the proposal, preparing for the materials, and writing the final report. Video production as one of the outcomes of this project also allowed them to utilize their creative skills.

One of participating students shared this in her survey responses:

Researching and constructing the proposal involved critically evaluating sources, identifying biases, and synthesizing information from diverse perspectives on religious moderation. This sharpened my ability to discern facts from opinions, interpret evidence, and form well-reasoned conclusions.

Another participating student stated this in his survey responses:

Crafting the video documentary required creative scripting and editing to engage viewers and effectively communicate complex ideas about religious moderation. This challenged me to think outside the box, utilize visuals effectively, and employ emotional storytelling to connect with diverse audiences.

Social awareness

The participants in this study revealed that the socialization project helped them to be aware of social issues such as corruption and religious tolerance. They also showed their concerns and empathy toward the negative impacts of these social issues on the wider community, leading them to realize the importance of anti-corruption and religious tolerance education from an early age. The participating students also agreed that the socialization project can shape anti-corruption and tolerant characters in children.

A participating student wrote this in his survey responses:

The anti-corruption socialization boosted my social awareness by delving into the impact of corruption on society. The socialization project against corruption helped me understand how bad corruption can affect everyone. When I explained about corruption and talked to people in the community, it showed me that it hurts real people. I now know that stopping corruption is something we all need to do together to make things better for everyone.

Another student who took part in this study provide the following as her response:

Besides merely imparting theoretical knowledge, we also demonstrate everyday actions that constitute corruption. This strategy aimed to foster anti-corruption characters and mold them into better future leaders. In general, this experience heightened my commitment to addressing social issues and fostering positive change in society.

Collaboration skills

The students in this study highlighted that through the socialization project they gained experience in collaborative teamwork and taking ownership of their individual responsibilities.

A student shared his reflection in his survey responses:

The socialization project taught me a lot about working together with others. First, when I was writing the proposal, I had to talk to different people to get their ideas. It was like putting together a puzzle, and each person had a piece of the puzzle. Learning to listen and bring all those pieces together was key. Then, when I was preparing materials, I had to work with the team to make sure everything was clear and made sense.

Another student wrote her reflection as follows:

I'm grateful that my team was fully aware that this socialization project was heavily team oriented. Everyone has their own role and I made it clear from the start that if they had any trouble facing their responsibilities, they could always share it with someone who's willing. I was more than happy when they consulted me regarding their responsibilities. Even when one of my team members couldn't attend the socialization, I made sure he wasn't excluded from the project's responsibilities.

In addition to those mentioned above, some students who participated in this study also stated that completing all project tasks enhanced their confidence in effectively communicating complex information to younger group of students in a clear and compelling manner.

Discussion

The present study attempts to examine how students perceived the implementation of project-based learning in Character Building-Pancasila course contributed to fostering their soft skills. I also conducted this study through online qualitative surveys to gain deeper insights into the integration of project-based learning in higher education. The results of this study show that students found project-based learning helped them develop these skills: critical and creative thinking, social awareness, and collaboration skills. In the following paragraphs, the details are presented.

The open-ended survey revealed that students perceived the socialization project enabled them to acquire critical and creative thinking skills. This finding is aligned with some existing studies on the integration of project-based learning in higher education (e.g. Mohammed (2017), Issa & Khataibeh (2021, and Sungkono & Ekaputra (2023)). Project-based learning promotes students' critical and creative thinking skills as through the project students are involved in an extended inquiry process focused on complex, real-world questions, along with carefully designed tasks and outputs ((Markham, Larmer, and Ravitz, 2003).

The results show that the socialization project helped students to increase their awareness of these social issues, corruption and religious tolerance. Students reported that their grow concerns, empathy, and responsibility to collectively make the nation better by practicing anti-corruption and being tolerant towards diversity. This finding is aligned with OECD (2019) that distinguishes 3 types of skills: cognitive and meta-cognitive skill, social and emotional skill, and practical and physical skill. Social awareness is part of social and emotional skills that include empathy and responsibility.

Lastly, this qualitative study reveals that students found their collaboration skills were fostered throughout the implementation of the socialization project. Collaboration skills are cultivated among students by applying project-based learning through structured discussion from explicit planning and student-centered learning activities with teaching and learning (Helle, Tynjälä, & Olkinuora, (2006). The process is also supported by

teaching aids conducive to the implementation of students' project work; Mohammed (2017); Ayish & Deveci (2019); Ibrahim & Rasyid (2022)).

Conclusion

The implementation of project-based learning in higher education, to be specific in Character Building Pancasila course is beneficial as it can promote students' soft skills. Through the project, students developed their critical and creative thinking, social awareness, and collaboration skills.

Recommendations

This study involved a limited group of students in Character Building-Pancasila course and utilized a qualitative approach employing open-ended survey questionnaires. Future study should be conducted in two other Character Building courses using a mix-method approach and involve a larger sample size of students as participants.

Acknowledgements

I would like to thank all participating students for sharing their experiences with project-based learning in Character Building-Pancasila course in the Odd Semester 2023/2024.

Abstract: The gender approach, also known as gender perspective, provides an analytical framework for examining the opportunities, difficulties and capabilities of men and women in society. In Peruvian education, this approach is integrated as a cross-cutting perspective in the National Basic Education Curriculum (CNEB), highlighting the importance of promoting gender equality at all educational levels. The objective of this qualitative research was to gather the perceptions and experiences of teachers from Catholic schools in Peru with respect to the implementation of the gender approach in the CNEB and in their own teaching practice. For this purpose, semi-structured interviews were conducted, and a subsequent analysis based on grounded theory was carried out. Among the results obtained, it was observed that most of the interviewees incorporate the gender approach in their teaching. However, many teachers have a misconception about what the gender approach entails and, therefore, they apply it based on their own criteria, which does not align with the genuine principles and objectives of the gender approach, resulting in practices that do not promote equality or gender equity. In addition, some teachers pointed out as a challenge present in their practice the misrepresentation of the objective of the approach in the CNEB by parents. Furthermore, no significant relationship was found between religious schools and the perceptions of the teachers interviewed. This study suggests new lines of research related to teacher training on gender equality and the possible impacts on student achievement.

Introduction

In recent years, Peru has been working to promote equal opportunities, regardless of gender, in all social scopes, in accordance with the objectives established in the United Nations 2030 Agenda (UN, 2015). This commitment has been expressed with a specific focus on improving access to opportunities in the educational, labor and social spheres for all members of society, regardless of gender (Ministry of Women and Vulnerable Populations, MIMP, 2019). Additionally, this effort responds to the ethical need to build a diverse and heterogeneous society, where each individual can develop and enhance their skills for the benefit of the community.

Moreover, as world citizens, it is necessary to acquire knowledge about gender equality policies at the global level. The United Nations Educational, Scientific and Cultural Organization (UNESCO, 2015) recognizes education as a fundamental principle of human rights and, therefore, as a requirement for people-centered sustainable development. Likewise, Peru, as a member of the United Nations (UN), has the duty to align with the 17 Sustainable Development Goals (SDGs) by 2030. Among these goals, the fifth one focuses on facilitating women's and girls' access to education and basic services. This SDG is closely related to education, as it constitutes a determining factor in promoting gender equality from an early age (UN, 2015). Consequently, education programs and policies at the national level are expected to include guidelines that promote gender equality as mentioned above.

In this context, diverse educational realities are observed that have the National Curriculum for Regular Basic Education (Currículo Nacional de Educación Básica Regular - CNEB) as a reference framework, which was approved in 2016 and began to be administered in Peru in 2017 (Ministry of Education, MINEDU, 2016). This document, in addition to acting as a guiding framework for regular basic education, includes a competency-based approach and cross-cutting perspectives to achieve the graduation profile of the Peruvian student. These cross-cutting approaches are in line with the educational principles established in the General Education Law (Ley General de Educación) and are aligned with the needs of contemporary society. Within these perspectives, there is the gender equality focus, which refers to equity in the value, aspirations and needs of men and women, recognizing the individual value of each person (MINEDU, 2016).

One of the main goals and priorities of education and teaching professionals is to raise the quality standard in educational institutions, addressing an integral approach. In this regard, the need to establish a safe and equitable environment for all students, without any exceptions, is raised (Díaz-Vicario and Gairín Sallán, 2014). Furthermore, as previously mentioned, Sustainable Development Goal number five, which highlights the importance of achieving gender equality, is closely related to educational training, as it seeks to promote equality between boys and girls. In this sense, it seeks to enable them to become world citizens and achieve an integral development (UN, n.d.).

However, the implementation of this approach was not without controversy. Groups with more conservative perspectives expressed reservations toward this approach due to concerns about possible interpretations that they considered to be contradicting to the traditional conception of sex, gender and family (Alcalde Valencia, 2023). It is important to note that this rejection may have arisen from misunderstandings or ideological differences. Therefore, this research aims to collect and analyze the opinions, perceptions and experiences of a group of Regular Basic Education (RBE) Catholic school teachers in relation to the implementation of the gender equality approach in the CNEB. Thus, it also seeks to explore the assessment that these teachers and trainers have about the integration and application of this approach in the country's educational institutions.

Gender Approach and Regular Basic Education (RBE)

The gender approach, also known as gender perspective, allows the analysis and understanding of the capabilities, opportunities, difficulties and relationships of men and women in society (Solís Sabanero, 2016). In other words, thanks to this approach, it is possible to examine the gender inequalities present in society and establish starting points to generate changes that promote equal opportunities. According to the Ministry of Education (MINEDU, 2016), the gender approach encompasses three fundamental values: equality and dignity, which refers to the equality of all people without gender distinction; justice, which implies providing fair opportunities, especially to those affected by gender inequalities; and empathy, which is related to identifying and attending to the affective needs of others.

Regular Basic Education (RBE) is a modality of education that encompasses the strata corresponding to initial, primary and secondary education. Its focus is oriented towards infants and teenagers who transit in a timely manner through the educational process in accordance with their physical, emotional and cognitive development from the moment of their birth, and is structured through specific levels, cycles, categories and typologies (National Institute of Statistics and Informatics - Instituto Nacional de Estadística e Informática [INEI], 2014). Likewise, according to MINEDU (2016), in RBE, educational levels are defined as progressive and coordinated stages that are adjusted to the learning needs and motivations of students. Cycles, on the other hand, represent transitory segments in which pedagogical processes are carried out that are based on expectations for the development of skills and competencies (called learning standards). This organizational structure by cycles offers educators and students greater flexibility and time to develop these competencies. Each cycle is designed to serve a specific group of students, who may be grouped according to their age or academic level.

Background on the Gender Approach in Regular Basic Education (RBE)

The Guide for Gender Equality in Teacher Education Policies and Practices of UNESCO (2015) presents several modules grounded on the principle of gender equality, and highlights the importance of understanding human rights to address more effectively the problem of gender inequality. Meanwhile, Villavicencio et al. (2021) present the panorama of gender research in the school environment, highlighting the need to incorporate the gender approach to achieve an education that not only focuses on academics, but also cultivates and promotes

values of respect and tolerance between boys and girls, as well as understanding the regulations on gender in the educational context. This will seek to foster an inclusive environment that promotes understanding and consideration between both genders from an early age, as well as other aspects of the human being, in other words, an integral and equalitarian education. Additionally, gender research in the school environment is considered, observing that teachers' gender positions and perceptions also influence students' school performance and their personal aspects.

It is also crucial to consider the various proposals that exist in relation to this issue. In Latin America, Muñoz Cabrejo (2006) examines the educational policies implemented in Peru between 1996 and 2003 from a gender perspective. Muñoz states that when referring to the notion of gender in education, the absence of gender gaps is assumed, since coverage in school enrollment is high for both women and men. However, he insists that it is necessary to promote equal opportunities in basic education in order to reduce poverty. By restricting gender equity in education, the critical and reflective potential of the gender approach to live in a more just society is limited. Furthermore, in the same region, Alegría (2020) exposes and analyzes the controversies that have arisen in the educational scope regarding the implementation of the gender approach in the National Curriculum for Basic Education in Peru. Following a similar line, it is imperative to highlight the proposals of Ruiz Gamio et al. (2004) on sexist stereotypes and how they are constantly changing within and outside the educational system. Bearing in mind that the school is not an isolated institution, but is inherently connected to the society in which we live, and it plays a fundamental role since it instills and promotes roles and norms for boys and girls taking into account the norms of the time. These authors indicate that such stereotypes represent a detrimental influence on boys and girls, the latter being the most affected, since they are represented as the inferior sex, which hinders the full development of their human potential.

Solís Sabanero (2016) proposes to carry out an exhaustive analysis of the inequities that currently prevail in the educational scope, approached from a gender perspective. Likewise, she explores to what extent school education can play a fundamental role in overcoming the gender stereotypes rooted in the city of Chihuahua, Mexico. Teachers are referred to as the ones in charge of stopping the transmission and reproduction of conservative roles and stereotypes such as sexism, discrimination, gender inequality and opportunity inequality. This approach is also related to the Chilean case, in which Abbet de la Torre Díaz (2014) evidences how the gender perspective should be included in an upcoming educational reform. She indicates that, in order to achieve an education where each student has the power to chart his or her own life path, it is vital to educate following a gender equality approach. However, in the case of Colombia, Muñoz Gañan et al. (2021) collected perceptions and pedagogical experiences about the implementation of the gender equality approach and determined that some teachers associate the application of the gender approach with sexuality or sexual diversity. Although they are related topics, the gender approach encompasses more concepts, such as equal opportunities between men and women.

In the European context, it is relevant to highlight the situation in Spain. García Perales (2012) points out that gender equity is promoted in this country. The author addresses the educational environment as an area of action

of great influence in the search for gender balance. From this perspective, Spanish educational institutions develop strategies and actions aimed at achieving equal opportunities. These strategies have proven to be effective and applicable in all aspects of students' lives. For this reason, several investigations in Spain focus on the implementation and integration of equality from the beginning of teacher training.

Resa Ocio (2023) examined the methodological guides used in teacher training in several Spanish universities and concluded that the syllabi still show some deficiencies regarding the teaching and implementation of educational policies related to gender equality. In addition, she established as a perspective for future research to delve into the limitations and facilities for implementing a legislation related to this issue. Moreover, Lucas-Palacios et al. (2022) conducted an assessment of knowledge related to gender equality and equity among education students in a higher education institution in Madrid. It was determined that there was conceptual knowledge about gender equity, although this did not necessarily translate into the acquisition and application of the gender perspective in their future educational practice. In addition, they stated that it is crucial to have professional training related to gender equality, in order to provide teachers with the tools to achieve an equal opportunity education.

Following the same line, Miralles-Cardona et al. (2023) conducted a comparison of the perceptions of education students in seven universities in Greece and Spain regarding their skills for teaching based on a gender approach. This research focused on STEM-oriented students, concluding that students complete their studies without adequate confidence and skills to carry out gender-focused teaching in educational institutions. Furthermore, the implementation of a gender perspective in STEM education was found to be deficient and poorly aligned with each country's curriculum. In an additional European perspective, Auhadeeva et al. (2015) conducted an analysis of skills related to gender equality in the practice of teachers in schools in Russia. They concluded that the totality of teachers consider gender approach as a fundamental element for today's education. However, only 10% of teachers indicated that they apply gender perspective in their educational practice.

Method

The methodological approach used to analyze teachers' perceptions of the implementation and application of the gender equality approach in RBE was qualitative. This approach is based on the collection of non-numerical data, such as the description of experiences, analysis of perceptions or opinions associated with a largely social or cultural sphere (Valle et al., 2022). In addition, qualitative research allows for a greater freedom to analyze social phenomena, since words, opinions and experiences are used to deepen, in a holistic manner, about a subject matter (Guerrero, 2016).

Background and participants

This research does not intend to generalize opinions, but rather to collect different perceptions and personal

experiences of each teacher, in order to reach a significant level of understanding. The sample chosen for this research, deliberate and by convenience, was 15 teachers from Catholic religious educational institutions in different regions of Peru. This target group was chosen because teachers from religious institutions represent a unique perspective with respect to the research topic. The selection of this target population was considered relevant because the teaching work in this type of institutions and personal beliefs can give rise to ideological biases and specific perspectives. The chosen sample is intended to identify the relationship between individual and institutional beliefs regarding a potentially sensitive topic in a religious setting. Table 1 presents some insights about the teachers interviewed.

Table 1. Teachers interviewed

<i>Interviewee #</i>	<i>Sex (M-W)</i>	<i>Age</i>	<i>Years of teaching practice</i>	<i>Region of current practice</i>	<i>Area or course of specialization</i>
<i>Interviewee 1</i>	W	44	20	Lima	English
<i>Interviewee 2</i>	W	38	8	Lima	Social Studies
<i>Interviewee 2</i>	W	47	23	Lima	Communication
<i>Interviewee 4</i>	W	50	23	Lima	Single-teacher classroom
<i>Interviewee 5</i>	W	46	23	Lima	Single-teacher classroom
<i>Interviewee 6</i>	W	45	19	Lima	Single-teacher classroom
<i>Interviewee 7</i>	M	42	20	Lima	Religious Education
<i>Interviewee 8</i>	M	50	25	Lima	Learning and language disabilities
<i>Interviewee 9</i>	W	32	12	Lima	English
<i>Interviewee 10</i>	W	33	9	Lima	English
<i>Interviewee 11</i>	M	58	32	Lambayeque	Coordination and family
<i>Interviewee 12</i>	M	52	25	Chincha	Science
<i>Interviewee 13</i>	M	45	22	Lambayeque	Physical Education
<i>Interviewee 14</i>	W	48	25	Piura	Early Years Coordination
<i>Interviewee 15</i>	W	35	15	Lima	Mathematics

The teachers were contacted via telephone call, messages or mail. The interviewees voluntarily agreed to be interviewed and were informed that their data, opinions and perceptions would be used for academic purposes. In addition, their personal data and that of the schools where they work were kept confidential. The interviews were conducted via Zoom or phone call, and lasted between 15 and 30 minutes. Teachers were informed that at any time during the interview they could withdraw if they wished. The interviews were also recorded and transcribed to facilitate later analysis.

Instrument

The semi-structured interview was used as an instrument for qualitative data collection. This type of interview

shows greater flexibility, since pre-established questions are used that are adapted according to the flow of conversation carried in the interview (Adeoye-Olatunde & Olenik, 2021; Díaz-Bravo et al., 2013). Also, unlike structured interviews or surveys, interviewees do not feel obliged to choose a particular answer (Lopezosa, 2020). To use this technique, an interview guide was developed, the general aspects of which are presented in Table 2.

Table 2: Semi-structured interview guide

Dimension	Objective	Sample questions
1. Characteristics of the teachers interviewed	To know general aspects of the interviewees' teaching practice.	How many years have you been teaching? What areas do you specialize in?
2. Knowledge of the gender approach and its implementation in the CNEB.	To learn about the opinions and perceptions of teachers on the gender approach and its implementation in the CNEB.	Do you know what a cross-cutting approach is within the CNEB? How would you define the gender equality approach? What are your main appreciations, concerns or criticisms about the implementation of this approach in the CNEB?
3. Applying it to the educational practice	To analyze the experiences that teachers have had in implementing the gender approach in their educational practice.	In what kind of activities do you apply the gender equality approach in your teaching? What challenges and impacts have you noticed when applying it, whether positive or negative?
4. Relationship with the main stakeholders of the educational community	Examine the reactions of the educational community to the implementation of the gender approach.	What is the perception of the educational community regarding the implementation of the gender equality approach in the CNEB? Could you mention any particular case?
5. General thoughts	To learn about the role of the teacher in the implementation of the approach.	What do you see as your role as a teacher in promoting gender equality and raising students' awareness of this issue?

After the interview and its transcription, the analysis of the responses was carried out. This analysis was based on grounded theory, a research approach characterized by developing theories or concepts from the analysis of collected data, disregarding the influence of pre-existing ideas or theories (De la Espriella & Restrepo, 2020).

Grounded theory has the additional purpose of interpreting and understanding the cases or data in depth, allowing a more complete understanding of the influence of the social context from the perspective of the interviewees (Varela & Sutton, 2021). In addition, the responses provided were subjected to a coding process in order to obtain categories from the codes generated. This procedure was essential to systematically organize and analyze the information collected.

Validation and confirmation

To validate the instrument, three validation strategies were employed. First, triangulation was carried out with three experts in the educational field. Secondly, a pilot test was carried out with three teachers who subsequently participated in the research, in order to check the understanding of the questions and the fluency of the interview. Thirdly, after conducting the interviews with the participants, recording them digitally and preliminarily analyzing the results, an additional contact was made with a group of the interviewees to confirm the findings obtained. Soriano Rodriguez (2014) stresses that it is important that the instruments go through a validation process to ensure that the results obtained are accurate and reliable. In addition, Carvajal et al. (2011) indicate that in order for an instrument to be applicable and measure what is desired, it must undergo validation and subsequent adaptation.

Results

The following are the main results obtained, which have been organized according to the five dimensions of the semi-structured interview presented in the previous section.

Characteristics of the teachers interviewed

The teachers interviewed are between 32 and 58 years old. Most of them have been in practice for more than 20 years, with the exception of two teachers, who have been in practice for 8 and 12 years. Likewise, most of the teachers interviewed work in the city of Lima, with the exception of four who work in other provinces within the country. Likewise, most of the teachers interviewed are currently working at the primary level, that is, in cycles III, IV and V of RBE. Most of the teachers have a specialty area, such as mathematics or English, but some others specialize in single-teaching in the early grades of primary school. A small group of teachers also have administrative positions, such as level coordinators or family coordinators.

Knowledge of the gender equality approach and its implementation in the CNEB

Half of the teachers interviewed have the perception that the gender equality approach seeks to recognize, value and offer equal opportunities to men and women in society, providing and promoting the best conditions for them to develop in society in an autonomous and participatory manner.

The gender equality approach is the cross-cutting approach that seeks to make students recognize that men and women have the same rights and duties and that they should have access to the same opportunities (Interviewee 2, 38 years old).

Giving the opportunity to both men and women without defining something that, suddenly, society stipulates that it is only for men or for women (Interviewee 3, 47 years old).

It seeks to create better conditions for both boys and girls (Interviewee 9, 32 years old).

Furthermore, some teachers have the perception that this cross-cutting approach is about the knowledge of the different genres applied in reality.

I understand that it is intended that the students know the reality of the different genders that exist, not only boy-girl (Interviewee 1, 44 years old).

I would define it as an adaptation to our reality (Interviewee 5, 46 years old).

Likewise, other interviewees mentioned that they conceptualize this approach as values in terms of opportunities and skills to be demonstrated in social relationships.

I conceptualize it as values and skills that students must demonstrate in the context of social relations at school (Interviewee 6, age 45).

From my point of view, gender equality [should be] in terms of values, in terms of opportunities and in terms of rights (Interviewee 11, 58 years old).

Other interviewees mentioned as a definition that men and women are equal individuals and that they have to be seen in a balanced way in society taking into account diversity.

Accordingly, the gender approach teaches that men and women are equal (Interviewee 12, 52 years old).

This perspective tries to balance a slightly different view of men and women in a social context (Interviewee 13, 45 years old).

Seeks equality among students, taking into account the diversity that may exist among them, specifically in terms of their identity (Interviewee 14, 48 years old).

Applying it to the educational practice

A small group of teachers indicated that they did not apply it or that it was very complicated to apply the approach in their teaching, due to personal ideas or circumstances of the context in which they taught.

I don't really apply it (Interviewee 1, 44 years old).

Since it is an all-male school, I feel that there are very few opportunities to address gender equity issues

(Interviewee 2, 38 years old).

One interviewee indicated that a challenge in applying the approach was not being able to see the relationship and interaction between boys and girls in everyday settings, making it difficult to connect this type of learning with the personal experiences that occur in the school context.

Since the school itself is single-sex, perhaps they do not have the opportunity to see that men and women can perform the same activities on a daily basis at school. The challenge is that they have to evoke these situations through a case but perhaps they cannot be experienced (Interviewee 2, 38 years old).

Nevertheless, some teachers indicated that they apply this approach in their daily work, since they consider that it is an aspect that is worked on on a daily basis, without necessarily focusing on a specific activity.

In reality, it is more in the day to day than in teaching a subject (Interviewee 3, 47 years old).

I apply the gender approach in my daily activities (Interviewee 4, 50 years old).

[I apply it] at all times because there is always a vocabulary of equality (Interviewee 6, 45 years old).

In this sense, they state that the challenges that emerge with applying this approach are also present on a day-to-day basis.

There may be challenges at all times but it is important that we all can proceed in the same way (Interviewee 5, 46 years old).

Challenges are encountered at all times (Interviewee 6, 45 years old).

Most of the teachers interviewed commented that they do apply the gender approach in their teaching practice. However, some of them, when explaining the concept of gender approach, do not fully understand what the term refers to. Therefore, at the moment of "applying" this approach, it ends up being implemented based on the teacher's perception.

I have to teach the kids what it means to respect, to respect themselves, to know themselves, to love themselves. If they don't respect and love themselves, they can't respect and love other people (Interviewee 12, 52 years old).

Do not constrain them in the use and characteristics that usually tend to be of girls (Interviewee 8, 50 years old).

We try to work with the children from the area of social studies, [since] the first task is to build their identity (Interviewee 14, 48 years old).

Two teachers commented that in order to apply this approach they use real cases, which invite students to reflect on prejudices or stereotyped ideas.

When we apply the gender equality approach, we do so precisely by highlighting women's contribution to society and to life (Interviewee 7, 42 years old).

I like to give the children space to reflect and question certain pre-established ideas between men and women (Interviewee 2, 38 years old).

One of the challenges that most teachers encountered in their practice has been the pre-established ideas or prejudices of parents. In addition, they comment that there is a lot of confusion and distortion of what it means to work with this transversal approach and its purpose in Peruvian education.

One does not know what message they have from home regarding this issue. I can say A, but they have been taught B at home. So I feel that this is a subject that I cannot touch with the children of this reality, of this school (Interviewee 1, 44 years old).

Parents understand (...) that you are going to promote that if you are a boy and you feel like a girl, you are going to promote it, you are going to support them. So, that is the "chip" that you have to change with the parents (Interviewee 3, 47 years old).

Challenges not so much on their [the students'] side but on the parents' side. There are parents who allow their children to play anything, but there are mothers who think that girls are more delicate and if that is transmitted (Interviewee 4, age 50).

A few interviewees commented that they did not encounter challenges in the application of this approach, as the institution, teachers and parents were aligned to the principles of this approach and its application.

The school has an ideology, an educational style that parents who put their children in school know where they put them and are in total agreement (Interviewee 11, 58 years old).

At the center we have adapted very well to this approach, but we have also adapted this approach to the profile of the institution (Interviewee 14, 48 years old).

Relationship with the main stakeholders of the educational community

The majority of the teachers interviewed assure that the stakeholders of the educational institutions have a positive perception of the application of the gender approach in the classrooms and in the learning sessions. In addition, they emphasize that they always try to preserve equal opportunities between boys and girls so that they are capable of developing their skills and continuing their education as members of society in order to achieve different objectives.

The perception is assertive, we all agree that children have the possibility to do everything (Interviewee 4, 50 years old).

The school has always sought to avoid those differences between what boys and girls can and cannot do (Interviewee 5, 46 years old).

The school seeks to give those opportunities to each student so that they can develop their abilities and be aware of their abilities, and that their goals are set not only by the teacher towards them or each goal that each family may have for the children (Interviewee 9, 32 years).

Some of the teachers commented on the approach and the relationship with the institution. They commented that, being a Catholic school, they do not usually address the issue easily since it occurs in few circumstances.

Since it is a Catholic school, it is something that is not taken into account much (Interviewee 1, 44 years old).

It is an approach that is not emphasized here (Interviewee 2, 38 years old).

Nonetheless, very few of the teachers interviewed stated that the main stakeholders in this area are the parents, but they also consider that they are the first ones to cause confusion to the students themselves with terms and definitions.

"The confusion that in some way the children show I think is from many parents" (Interviewee 3, 47 years old).

"They have total confusion" (Interviewee 8, age 50).

One of the teachers interviewed commented on the school's acceptance of the gender approach and its relationship with the Ministry, saying that the institution does not agree with such agreements and terms to be used with students.

"In the school they are not very much in agreement with the way the Ministry of Education approaches this perspective because it is still an ideology" (Interviewee 11, 58 years old).

Another teacher interviewed shared his perception of how the educational community, being Catholic, values faith formation and doctrine as well as giving value to the different definitions of gender equality.

"I think that the educational community to which I belong values very much what is the Catholic Christian formation, many teachers now strive to give support to the way we see things in relation to gender identity" (Interviewee 14, 48 years old).

General thoughts

Most teachers consider that one of the most important roles they have as teachers is to teach respect for others as human beings, respecting the diversity of opinions, choices and decisions.

Simply respect people whether they are the same or different, have an open mind towards people we

know who are not the same (Interviewee 1, age 44).

To make them respect themselves and know how to value differences and diversity (Interviewee 4, age 50).

(...) Oriented towards respect for the human being as such, whether as a man or as a woman (Interviewee 14, 48 years old).

Likewise, a small group of teachers also consider themselves guides or companions of students in their development in gender equality, some relating it to respect. They stated:

My role is as a counselor, I have to guide how they develop in the equality that we want to work on (Interviewee 4, 50 years old).

My role as a teacher is to guide my students so that respect is a value that they really practice (Interviewee 9, 32 years old).

Moreover, a group of teachers also considers that the task related to this approach is to break pre-established beliefs or to question what students consider correct or true. There is an emphasis on breaking beliefs related to gender roles. These teachers express that:

[My role is] to question them or present them with situations in which they can see that an occupation or an activity or a skill can be performed by either a man or by a woman (Interviewee 2, 38 years old).

First [I must] break the myths and prejudices of the children, that certain activities are for boys or certain activities are for girls (Interviewee 3, 47 years old).

[To make students understand that] there are roles that are undertaken indistinctly and that there is not a role for a woman or a role for a man (Interviewee 11, 58 years old).

Furthermore, some teachers share that, as part of their teaching role, it is important to be a role model for the students they teach. Teachers comment on the intrinsic responsibility for students to observe in their daily lives teachers acting in a way that is coherent with what is being taught based on this cross-cutting approach.

"My main role is to be an example and how, with my actions, I can give them an answer where respect, equal opportunities are promoted, not favoritism" (Interviewee 6, 45 years old).

"Be a role model, show an open and receptive attitude towards gender diversity, valuing the differences between boys and girls. Share stories and tales that depict female characters in diverse and empowered roles" (Interviewee 15, age 35).

One interviewee also commented on the steps taken by the educational institution where he works to model an environment that fosters equal opportunity.

"The school has strived to align itself [to the cross-cutting approach], so there are many efforts to be

able to make this possible for equal participation in society for both men and women" (Interviewee 7, age 42).

Discussion

The results obtained from this study allow for a series of reflections on the topic addressed, some of which are related to the literature reviewed in the attached section of background information. The opinions of the teachers are aligned with the principles of UNESCO (2016) and what was stated by Villavicencio et al. (2021). Both writings emphasize the importance of incorporating human rights to promote an integral development in students. These authors advocate for an education focused on reflection and implementation of what is learned in everyday life. Also, the responses of some teachers related to the resistance of some parents to applying the gender approach are related to that presented by Alegría (2020), who discusses the repercussions of campaigns against the integration of this approach in Peruvian education. In her paper, she highlights the lack of understanding and acceptance of these educational policies.

Additionally, the concern about the negative effects of gender stereotypes, commented by the teachers interviewed, is in line with the work of Ruiz Gamio et al. (2004), which stresses the need to confront these perceptions through education. It also indicates that these stereotypes hinder the development and exploration of boys and girls. Likewise, the teachers' answers indicate the need to implement educational strategies that promote equality and respect for diversity, which agrees with the studies of Solís Sabanero (2016) and Abbet de la Torre Díaz (2014), which indicate that, in order to achieve social change, relevant teacher training is needed in the referred topic.

Along the same lines, the results reveal deficiencies in teacher training related to the implementation of the gender approach. This is consistent with the findings of Resa Ocio (2023). This study criticizes the lack of preparation in university curricula to implement educational policies linked to this approach. Besides, some teachers indicated that, although they had knowledge about the gender approach, they did not apply this approach, due to difficulties in the environment or for personal reasons, which agrees with what was presented by Lucas-Palacios et al. (2022).

A contrast was observed between what was found in this research and what was stated by Auhadeeva et al. (2015), which highlights an evolution in the application of the gender approach by teachers. In the case of the teachers interviewed, most of them indicate that the gender approach is applied in their teaching practice, unlike what was stated by the mentioned research, since it was found that a very small group applied this approach.

Finally, it is important to highlight the relationship found between the teachers interviewed and their workplaces, the Catholic schools. In general, most of the teachers did not mention in their responses that the institutions where they worked as teachers presented an impediment to the application of this approach. This

finding is consistent with Abregu Saenz et al. (2021), who conducted research on the attitudes of Catholic school students regarding gender equality. The authors point out that no direct relationship was found between the religiosity of the schools and the view held on gender equality. In interviews with teachers, there was very little mention of an impediment on the part of the school, but rather an obstacle due to the teacher's own belief or the fact that the school was single-sex (for men only).

Conclusion

The teachers interviewed demonstrate a clear judgment on the importance of incorporating the gender approach in current education within their classrooms, which is linked to different national and international organizations such as UNESCO and different recent research. Their responsibility to promote holistic development in students, which is composed of internalization, reflection and the management of new skills in daily life, is becoming more and more visible. Thus, the recognition of human rights, the gender approach and diversity in educational practice is fundamental.

Teachers demonstrate a commitment to attention to diversity through practices that involve gender-inclusive activities, which reflect an integration of the gender approach as well as the continuous learning of students. Also, educators' adaptation and flexibility to incorporate different tactics that promote equality among students and thus a more equitable society is presented. This shows that in the future, education will stand out for its continuous training, flexibility and the importance of the student in an all-inclusive environment.

Finally, in spite of the limited knowledge of the gender approach and its characteristics, different challenges related to other sectors of education and deficiencies in the complete training of teachers are still involved. These challenges include the urgent need to raise awareness of the gender approach among teachers, parents and other educational stakeholders, with the aim of overcoming prejudices and making the concept, and positive and current ideas more widely known. At some point, this will make it possible to create awareness about a new gap on this concept, and broaden the horizon on new methods for training teachers. Thus, this way will promote the knowledge, acceptance and application of this approach in educational situations.

Abstract: This paper focuses on the comparison of experiences associated with segregated and mixed gendered education from the perspective of pedagogical psychology at the primary education level in the Peruvian context. Through a qualitative approach, interviews were conducted with ten educational psychologists experienced in urban schools in Lima. They were evenly divided between coeducational and segregated environments. The findings disclose that participants possess a nuanced understanding of the distinctions between coeducational and segregated schools. They emphasize the aspiration for equality and opportunities in coeducation, whereas in segregated environments, the emphasis lies on customized approaches designed to address specific needs within each gender. This study provides a robust foundation for future research that could delve deeper into the specific effects of coeducational and segregated education on the academic, psychological, and social development of Peruvian students. It is suggested to investigate how these school structures impact classroom socialization and cultural diversity, as well as the development of cognitive and emotional skills. Additionally, the possibility is opened to examine the evolution of coeducational and segregated education in the Peruvian context over time and assess its ongoing effectiveness in achieving educational and social objectives

Keywords: Coeducation; single-sex schools; educational psychology; school structure

Introduction

The structure in school management plays a crucial role in the comprehensive formation of students, as it establishes the environment and fundamental circumstances for students to acquire knowledge and experience significant personal growth (Pahlke & Hyde, 2016). Segregated education refers to the practice of separating students by gender, thus establishing specific educational environments for boys and girls (Harker, 2010); while coeducational education involves the joint teaching of boys and girls in the same environment (Yasin et al., 2020). In the aforementioned context of school management, the choice between segregated education and coeducational education has been a constant topic of debate and significant concern for parents, educators, and educational psychologists (Gordillo, 2017). This debate raises fundamental questions about how these two modalities influence learning, personal development, and students' future prospects (Paez, 2015).

It is argued that students attending segregated schools tend to perform better in mathematics and science exams, thus suggesting that segregation in education may be related to stronger academic performance in these specific areas (Eisenkopf et al., 2015). On the other hand, it is argued that coeducational institutions have a greater positive impact on the emotional and social skills development of students. This is because these schools foster equal learning and development opportunities for all students, regardless of their gender (Ryan, 2010). In this context, an environment is promoted where students can interact with their opposite-gender peers more naturally, contributing to the development of interpersonal and social skills, such as empathy, effective communication, and collaboration.

Due to its ability to analyze and understand different aspects such as cognitive, emotional, and social aspects of students in the educational context, psychology plays a fundamental role regarding school structure. Educational psychology focuses on the study of students' cognitive development (Madrigal, 2009), which involves analyzing how they learn, process information, and acquire academic skills. These are crucial aspects when assessing how segregated or coeducational education may impact students' performance.

Furthermore, educational psychology explores emotional development by addressing the emotional dimensions of education (Arvilla, 2011). Therefore, it examines how segregation or coeducation may impact or influence students' emotional well-being, self-concept, self-esteem, and interpersonal relationships. Additionally, psychology studies the process of identity construction; that is, it investigates how segregated or coeducational education may contribute to identity formation and how they influence students' aspirations and roles in society (Arvilla, 2011).

Consequently, this research aimed to compare perspectives - from educational psychology - of experiences related to segregated and coeducational education at the primary education level. The comparative analysis exercise aims to provide guidelines on the key differences between both types of school structure, providing information for parents, educators, and decision-makers in the field of educational management.

School structure: segregated and coeducational education

The school structure is an essential component in the implementation of different educational approaches, such as coeducation and segregated education, which exert a significant influence on how educational institutions operate. Coeducation, as an educational approach, advocates for both boys and girls to receive education in a shared school environment, where both parties participate in the same learning activities and share interaction spaces. This school structure tends to be more inclusive and equitable, aiming to eliminate gender divisions and promote equal opportunities. Its main objective is to promote the development of social skills and ensure that all students have access to the same learning opportunities, development, and growth (Alvarez, et al., 2019).

In contrast, segregated education involves the separation of students by gender, reflected in the existence of specific classrooms and school environments for girls or boys. This approach aims to provide a more personalized education tailored to the particular needs of each gender, leveraging the advantages that this could entail (Harker, 2010). To achieve this, it is considered necessary to create separate spaces and environments, sometimes justified by differences in developmental pace, learning preferences, or specific educational needs of each gender.

The choice between these educational approaches has a direct impact on the school structure and how resources are managed, classes are planned, and student needs are addressed (Guerra, et al., 2014). The decision to adopt coeducation or segregated education depends on multiple factors, such as pedagogical objectives, educational beliefs of the community, and institutional policies. The school structure plays a vital role in the successful implementation of these educational approaches and in creating an optimal learning environment to foster the comprehensive development of all students (Booth, et al., 2018).

This choice between educational models must be carefully considered, taking into account both academic objectives and the specific needs of students (Pahlke & Hyde, 2016). It is essential to ensure that the school structure is consistent with educational purposes and allows for effective, equitable teaching and learning that promotes an inclusive society. Furthermore, continuous evaluation of these approaches is essential to ensure that they remain appropriate and effective in achieving constantly evolving educational and social objectives.

Educational Structure and Educational Psychology

Educational psychology encompasses complex interactions among various factors that affect students' learning and development. Because education extends beyond an individual process of knowledge transmission and also has social and cultural implications, playing a crucial role in shaping identity, values, and attitudes, educational psychology becomes an indispensable tool for understanding and improving educational systems.

One area of study in educational psychology is socialization. School structures and classroom interactions can perpetuate traditional gender roles or challenge them. By examining how gender stereotypes are transmitted and

perpetuated in the educational environment, educational psychologists can offer key insights for creating more equitable and empowering environments for students, regardless of gender (Bigler, 2013).

Additionally, educational psychology also focuses on cultural diversity in the classroom. Educators may face significant challenges when dealing with students from different cultural and linguistic backgrounds. Understanding how cultural differences affect learning and social interactions is crucial for generating more effective pedagogical strategies and fostering an inclusive educational environment (Carrillo, 2018).

Studies in educational psychology can also provide deep insights into how students process information and develop cognitive skills (Macazana, 2021). This is essential when designing curricula and teaching methods that can align with students' abilities and needs. Educational psychologists can investigate how students acquire skills such as problem-solving, critical thinking, and creativity, and how emotional factors such as motivation and self-esteem influence these processes.

Lastly, in the realm of educational decision-making, psychology provides an objective basis. Psychological data and research can support evidence-based educational policies and practices, helping decision-makers implement significant changes in the educational system, such as analyzing learning outcomes in coeducational and segregated environments, allowing assessment of how these structures impact academic performance and personal development. This information can be crucial for parents, educators, and educational managers in making informed decisions about the type of education that best suits students' needs (Arvilla, 2011).

Background for the Peruvian Case

Throughout much of the 20th century, Peruvian primary schools, like many educational institutions globally, adopted a segregated approach, where girls and boys were educated separately. However, in 1891, Peru experienced its first formal and institutionalized coeducational experiences with the English Methodist missionary Thomas B. Wood, who founded the Callao High School that same year (Gordillo, 2015).

Over the years, significant changes occurred in Peruvian primary education and the understanding of educational psychology. The 1970s marked a significant turning point with the enactment of laws and policies aimed at gender equality in education. This was due to decree N°19326 promulgated on March 21, 1972, by the military dictatorship of Juan Velasco Alvarado, which emphasized the promotion of mixed or coeducational education (Trahtemberg, 2000). This change occurred gradually, leading the country from a fully segregated system to a regulated coeducational approach in primary schools.

The return to democracy in the early 1980s involved strong opposition to the policies implemented by the previous military governments, leading to the reversal and elimination of many laws. One of the initiatives in question sought to undo the educational reform, including the elimination of coeducation in public secondary schools, a measure announced in the early months of 1983 (Romero, 2016). This action provoked a strong

response from educators, psychologists, sociologists, and parliamentarians of different ideological currents, who advocated for coeducation.

Finally, by the end of 1983, the Ministry of Education developed new regulations, known as regular basic education (EBR), which at that time included the education of children at primary and secondary levels. In these regulations, coeducation was allowed as a valid grouping form in primary, but it would only be possible in secondary if schools met certain requirements (Decree Law N°19326). Nowadays, both approaches coexist in Peru, in both public and private institutions.

Due to the debate over which approach is more suitable, various research studies have been initiated worldwide shedding light on the effects of both approaches on students' academic, psychological, and social development. These studies have explored topics such as academic performance, self-esteem, attitudes toward gender, and professional aspirations of students in segregated and coeducational educational contexts (Belcher et al., 2006; Eisenkopf et al., 2015; Halpern et al., 2011; Yasin et al., 2020). However, no exhaustive studies have been carried out addressing the comprehensive dimension of students' development, which can influence students' perceptions and experiences regarding the emotional and social dimension (Kombe et al., 2019).

Therefore, it is considered of great importance to conduct studies focused on the relationship between school structure and formation, as this can be an essential tool to help educators and policymakers make informed decisions about effective and contextualized ways to ensure the comprehensive education of students.

Methodology

The methodology employed to investigate educational experiences in segregated and coeducational primary education in Peru was based on a qualitative approach. This approach involves data collection that includes the description of experiences, as well as the analysis of perceptions and opinions related to a predominantly social or cultural context (Vega-Malagón et al., 2014). Additionally, a comparative and exhaustive analysis of these perspectives is conducted with the aim of contrasting the information obtained from both approaches. According to Sartori (1984), the comparative method aims to search for similarities and dissimilarities, as comparison is based on the criterion of homogeneity.

Instrument

Richards et al. (1992) define the interview as a planned dialogue between a researcher and an individual or group of individuals, designed to gather valuable and relevant information for the study at hand. The interview is a technique of great utility in qualitative research for collecting data; it is defined as a conversation with a specific purpose other than simply conversing (Diaz-Bravo et al., 2013). It is used to obtain a deeper understanding of the perspectives and opinions of these experts regarding segregated and coeducational

education. Additionally, the semi-structured interview is opted for, as despite having a predefined structure, they offer a greater degree of flexibility, as they start from planned questions that can be adjusted to the interviewees.

The interviews were conducted virtually through the Zoom platform. These did not last longer than 30 minutes. Likewise, the interviewees were informed that the interview would be recorded and transcribed to facilitate the analysis of information. The collection of data and information sought to be collected was distributed into three categories (Table 1).

Table 1. Categories and guiding questions

Category	Goal	Guiding questions
1. Characteristics of the interviewees	These initial questions serve to gather relevant information about the interviewee.	How many years of experience do you have as an educational psychologist? What type of school do you work or have worked in?
2. Knowledge about educational approaches: coeducation and segregated schools	These questions gather relevant information about your knowledge and handling of the topic.	How would you define segregated/coeducational education? What are the key differences between both approaches from an objective standpoint?
3. Opinion on both educational approaches based on experience	These questions were formulated to understand the interviewee's opinion from their perception and experience.	What motivated you to specialize in coeducational or segregated education? What do you consider to be the significant challenges associated with coeducational/segregated education? Can you provide examples or specific cases that illustrate the effectiveness or limitations of coeducational/segregated education from your perspective? What are the main benefits you perceive in coeducational/segregated education?

Participants

To carry out this study, active participation was sought from a group consisting of ten educational psychologists, selected by convenience and interest, with experience in urban schools in Lima, Peru. The fundamental purpose of the research was to obtain a comprehensive and balanced view of two crucial approaches in the educational

field: coeducational education and segregated education. With the aim of deepening this analysis in an equitable manner, it was decided to conduct in-depth interviews with five psychologists who have experience in educational institutions, and with another five with experience in segregated education.

The choice of this specific target group is based on the need to contrast the opinions and perspectives of two categories of experts, facilitating a solid and detailed comparison. This approach allows for a thorough analysis of the fundamental differences in beliefs, values, and pedagogical approaches underlying these two educational models. Additionally, the active participation of educational psychologists with experience enriches the research by providing a contextualized and relevant understanding of educational dynamics. Ultimately, the study seeks to contribute to dialogue and decision-making.

Firstly, the interviewees are presented in Table 2, who agreed to participate voluntarily and were contacted through various means, both virtually and in person. Additionally, they were informed that their data would be collected for academic purposes and that their identity and workplace would be kept anonymous.

Table 2. Interviewed participants

Interviewee	Code	Sex	Age	Formation	Experience	Type of institution (coeducational or segregated)
<i>Interviewee 1</i>	M_01	M	28	Ed. Psychologist	8 years	Coeducational
<i>Interviewee 2</i>	F_01	F	27	Ed. Psychologist	2 years	Segregated
<i>Interviewee 3</i>	F_02	F	32	Ed. Psychologist	7 years	Segregated
<i>Interviewee 4</i>	F_03	F	29	Ed. Psychologist	4 years	Coeducational
<i>Interviewee 5</i>	F_04	F	27	Ed. Psychologist	1 year 9 months	Coeducational
<i>Interviewee 6</i>	M_02	M	26	Ed. Psychologist	3 years	Coeducational
<i>Interviewee 7</i>	F_05	F	36	Ed. Psychologist	10 years	Segregated
<i>Interviewee 8</i>	F_06	F	26	Ed. Psychologist	2 years	Coeducational
<i>Interviewee 9</i>	F_07	F	30	Ed. Psychologist	7 years	Segregated
<i>Interviewee 10</i>	M_03	M	24	Ed. Psychologist	1 years	Segregated

Procedure

Following the guidelines of inductive analysis, variations and similarities in the collected data are inferred in detail. Additionally, it allows for discerning underlying patterns, emerging trends, and possible correlations that could be essential for understanding the phenomenon under investigation. Furthermore, comparative analysis provides a broader view of the data, ultimately enriching the ability to formulate solid interpretations.

After meticulous transcription of the recorded interviews, a thorough analysis was carried out following the

methodology of Grounded Theory. Using an inductive approach, participants' responses were examined for patterns of convergence and divergence, allowing for a deep understanding of emerging themes and ideas. These elements were organized into pre-established categories, which served as essential reference points for data organization and classification, thus ensuring a rigorous research procedure. According to Strauss and Corbin (2002), Grounded Theory is characterized by generating theories or concepts from the analysis of collected data and its main objective is to analyze cases or data to provide a broader understanding of how the social context influences, from the perspective of the interviewees.

Validation

With the purpose of obtaining validation of the instrument, three strategies were implemented. Firstly, triangulation was carried out with experts in the field of educational psychology, providing an assessment of the relevant elements and contents of the research, thus increasing the reliability of the results. This strategy was employed to validate and obtain multiple perspectives that could enrich the research. Secondly, a pilot test was conducted with two educational psychologists who later participated in the research, aiming to assess the understanding of the questions and the fluency of the interview. Thirdly, after conducting the interviews with the participants and digitally recording them for a preliminary analysis of the results, additional contact was made with a group of interviewees to corroborate the findings. Soriano (2015) emphasizes the importance of subjecting instruments to a validation process to ensure the truthfulness and reliability of the results. Additionally, having several observers in the research field enhances the quality and validity of the data, as it allows for obtaining different perspectives on the same object of study (Aguilar & Barroso, 2015).

Results

Below are the main findings, which have been collected and organized according to the three predefined categories. Additionally, the questions classified within these categories are included for better understanding and structure of the analysis. These findings aim to capture the opinions and perceptions of educational psychologists regarding coeducational and segregated schools, as well as to evaluate the impact of these approaches on students.

Characteristics of the Interviewees

In the initial category, data from the interviewees were collected, covering aspects such as their age, gender, academic background, and experience in segregated or coeducational educational environments. It was observed that 70% of the participants were women aged between 27 and 36 years. Additionally, the remaining percentage consisted of men between 24 and 28 years old. It is important to highlight that the interviewees have work experience as educational psychologists ranging from one to ten years. Additionally, five of them work in coeducational institutions, while the other five work in segregated institutions. This aspect enables obtaining

different perspectives and opinions based on their specific experiences in these environments, enriching the ability to contrast different views and perceptions through their lens as educational psychologists.

Knowledge about Educational Approaches: Coeducation and Segregated Schools

In the second category of the research, the aim was to assess the interviewees' knowledge about educational institutions, whether coeducational or segregated. Participants demonstrated diverse understanding of both educational approaches, despite the lack of formal specialization in either of these models. The work experience of the interviewees in specific environments significantly influenced their perspectives.

An interviewee with experience in coeducational schools emphasized the importance of coeducation, arguing that "it serves to develop emotional and social skills, allowing interaction with people of different genders, which is crucial for real life" (Interviewee M_01). In contrast, another interviewee with experience in a segregated environment pointed out: "Being all males, there are limitations in socialization regarding both sexes. They get used to living only among themselves, and it is difficult for them to establish other types of relationships" (Interviewee F_01). Additionally, another participant with experience in a school only for males provided an objective perspective mentioning that "mixed schools can offer diversity of perspectives and opinions from both genders, enriching the learning environment with different viewpoints" (Interviewee F_02). In the case of an interviewee with four years of experience in a coeducational school, it was highlighted that "coeducational education can offer benefits by fostering natural and constant interaction between genders, preparing students to face the diversity of the real world" (Interviewee F_03). Finally, the promotion of social skills and preparation for the diversity of the real world was highlighted, stating that "an example of the effectiveness of coeducational education could be the promotion of healthy social relationships between genders from an early age" (Interviewee F_04).

These results reveal a variety of perceptions among the interviewees, providing an enriched understanding of the challenges and benefits inherent in coeducation and segregation in educational environments.

Opinion on Both Educational Approaches from Experience

In the third category, the interviews provide a varied insight into professionals' perceptions and experiences regarding coeducational and gender-segregated models. Professionals with experience in coeducational environments highlight the natural interaction between genders, promoting diverse social skills and preparing students for social reality. An interviewee with three years of experience in a coeducational school states that "coeducational education can offer benefits by fostering natural and constant interaction between genders, preparing students to face the diversity of the real world" (Interviewee M_02).

On the other hand, those who have worked in segregated environments emphasize the possibility of offering a more specific pedagogical approach tailored to the learning styles of each gender. However, an interviewee with

two years of experience in a segregated environment mentions that "being all males, there are limitations in socialization regarding both sexes. They get used to living only among themselves and have difficulty establishing other types of relationships" (Interviewee F_05).

Despite the perceived benefits, those with experience in segregated education also recognize challenges, such as limiting diversity of perspectives and addressing gender stereotypes. Therefore, an interviewee with experience in a male-only school indicates that "mixed schools can offer a diversity of perspectives and opinions from both genders, enriching the learning environment with different viewpoints" (Interviewee F_07).

In summary, opinions vary according to experience and individual perspective, emphasizing the importance of considering the context and specific objectives when assessing the effectiveness of each educational approach. These findings provide a rich and nuanced understanding of professionals' perceptions in the educational field regarding coeducation and gender segregation.

Discussion

This analysis, based on interviews with experienced professionals in both coeducational and segregated environments, primarily addresses the perspectives present in scientific studies on the two educational models, highlighting various perspectives that enrich the understanding of the complexities associated with these models. In the theoretical framework addressing school management, the importance of this structure in the comprehensive formation of students is highlighted, establishing the fundamental environment and circumstances for their personal growth and knowledge acquisition. Gender-segregated education, characterized by separating students by gender, and coeducational education involving the joint teaching of boys and girls, represent two debated and of great interest approaches for parents, educators, and educational psychologists.

Primary schools' segregated environments present a series of potential benefits as well as disadvantages for students. As a positive aspect, segregated education can provide a supportive and protective environment for students with disabilities, offering a possibility of receiving more specialized education and support. Additionally, gender-segregated education can promote tolerance and acceptance among boys and girls by creating mixed programs that address gender stereotypes. However, segregated environments also present disadvantages. Socioeconomic segregation in schools can negatively affect the educational outcomes of poor children. Furthermore, negative factors such as indiscipline, aggression, victimization, and teachers' apathy in segregated schools can have a detrimental effect on academic performance. Overall, research suggests that single-sex education is not more effective than mixed-sex education in improving academic performance or attitudes.

Both the interviews and the research conducted on the perspectives of educational psychologists in coeducational and segregated environments in primary education in the Peruvian context reveal a variety of

perceptions and experiences. It is found that participants have a diverse understanding of educational approaches, with those in coeducational environments emphasizing the importance of natural interaction between genders for the development of social skills, while those working in segregated environments highlight the possibility of offering a more specific pedagogical approach tailored to the learning styles of each gender. These findings are in line with previous studies that have explored the effects of coeducation and segregation on students' academic, psychological, and social development.

Some interviewees mention as a positive aspect the customization of segregated schools. Eisenkopf (2015) points out in his research that segregated schools can lead to academic performance with greater strength in specific areas, such as mathematics and sciences. A participant with experience in a coeducational school emphasized that "coeducational education can offer benefits by fostering natural and constant interaction between genders, preparing students to face the diversity of the real world". Likewise, another participant with experience in the same type of environment emphasized the promotion of soft skills and preparation for the diversity of the real world, mentioning that "an example of the effectiveness of coeducational education could be the promotion of healthy social relationships between genders from an early age"; highlighting that coeducation can enhance emotional and social skills, promoting equal learning and development opportunities for all students, as Ryan (2010) suggests.

However, significant differences in the perceptions of the participants in this research can also be identified, highlighting the complexity of the issue. While some participants emphasize the benefits of coeducation in preparing for real-world diversity, others point out limitations in socialization between genders in segregated environments. These discrepancies suggest that the effectiveness of each educational approach may depend on the specific context and educational objectives set, as previous studies have also suggested. Although the research provides an enriching insight into educational professionals' perceptions in Peru, it also highlights the need to consider the diversity of perspectives and contexts when assessing the effectiveness of educational approaches. This analysis complements existing literature and underscores the importance of continued research to better understand the effects of coeducation and segregation on students' holistic development, emphasizing the importance of balancing specific benefits with the need to address inherent limitations in each model.

Furthermore, the diversity of opinions underscores the complexity in choosing between coeducational and segregated educational models. The coexistence of benefits and challenges in both approaches highlights the importance of approaching each model with an understanding of its nuances and considering students' specific needs. These findings offer a basis for future research and debates on the implementation of educational models, encouraging them to promote equity and educational quality.

Conclusions

The evidence gathered reveals diverse perspectives of educational psychologists in the Peruvian context

regarding coeducational and segregated education in primary education. The participants, with varied experiences and professional approaches, expressed opinions that reflect the complexity of the debate between these two educational models. It is highlighted that the choice between coeducation and segregation is not only related to academic performance but also impacts crucial aspects of socio-emotional development and gender perceptions. The diversity of experiences and opinions underscores the importance of considering multiple factors when making decisions about school structure.

Coeducation is perceived as an inclusive and equitable environment that fosters social skills, while segregation is associated with more robust academic performance in specific areas. These findings emphasize the need for a balanced approach that considers both academic objectives and students' emotional and social needs. Furthermore, educational psychology emerges as an essential tool for understanding how school structure impacts various dimensions of students, such as socialization, cultural diversity, and cognitive development. These aspects were highlighted by educational psychologists. Additionally, the Peruvian historical context, marked by significant changes in educational policies, underscores the importance of constantly evaluating the effectiveness of evolving educational models.

Ultimately, this study lays the groundwork for future research, inviting a more detailed analysis of students' experiences in different school environments. A deep understanding of educational psychologists' perspectives contributes to educational dialogue and offers valuable insights for informed decision-making in school management, seeking a balance between academic performance and students' holistic development.

Abstract: The investigation into the role of Open Distance Learning (ODL) in integrating Sustainable Development Goals (SDGs) into art education, with a special emphasis on visual arts teachers as lifelong online learners, is of paramount importance. This research highlights ODL's critical role in promoting sustainable practices and confronts key challenges, including the necessity for a paradigm shift in art education, effective integration of SDGs, and enhancement of Information and Communication Technology (ICT) competencies among visual arts teachers. These challenges are essential to ensure that art education significantly contributes to sustainable development and equips teachers with crucial professional skills and knowledge. Employing a mixed-method approach that merges qualitative and quantitative data, the research evaluates the impact of ODL on art education. Curriculum development follows the DeCoRe+ model (Deconstruction-Construction-Reconstruction), aiming to create transformative learning experiences that resonate with the dynamic roles of visual arts teachers. The investigation also utilizes the DREAM (Diagnose, Review/Reflect, Explain, Assess, and Manage) method for course evaluation. Data were collected from visual arts teachers actively involved in lifelong learning, focusing on their use of ICT in teaching, the impact of course themes on their professional development, and their experiences in integrating SDGs into their teaching practices. The results uncover significant variations in the ICT competencies of visual arts teachers, demonstrating how these competencies aid in accessing online resources and incorporating SDGs into teaching methodologies. The study underscores the positive influence of tailored art education on teachers' comprehension and application of SDGs, proving the DeCoRe+ framework's efficacy in infusing SDG elements into the art education curriculum.

Keywords: Open Distance Learning (ODL) in Art Education, Sustainable Development Goals (SDGs) Integration, ICT Competency in Visual Arts Teaching, Transformative Art Education Curriculum

Introduction

Education & SDG

In a local context, efforts to promote sustainable development shouldn't be one-sided; all communities should be exposed to the concept. Education for sustainable development was first officially recognised at the Earth Summit Conference in Rio de Janeiro in 1992, which formed Agenda 21. Each chapter of Agenda 21 emphasises education, but Chapter 36 focuses specifically on improving basic education, adapting existing education to sustainable development, improving community understanding and awareness, and training. (2017). In 2001, Malaysia's Ministry of Housing and Local Government launched Local Agenda 21, a follow-up to the 1992 UN Rio Conference (GDRC.org, 2022). Malaysia's plan requires all levels of society to participate in education for sustainable development.

The Malaysian Ministry of Education (MoE) developed the Malaysian Education Blueprint 2013-2025 in 2013. This Blueprint has changed school teaching and learning. New preschool, primary, and secondary curricula were created to meet the Blueprint's educational goals.

The Blueprint is comprehensive to ensure students' holistic development and full potential. The blueprint outlines five system aspirations, six student aspirations, and 11 reform shifts. The 5 Systems Aspirations are the MoE's goals for the education system. These include 1) ACCESS: to ensure 100 percent enrolment across all levels from preschools to upper secondary; 2) QUALITY: focusing on achievement in reading, math, and science; 3) EQUITY: equal opportunities for all (urban-rural, socio-economic, gender, indigenous communities, special needs children); 4) UNITY: promotes shared values and experiences by encouraging students to embrace diversity; and 5) EFFICIENCY: maximises student outcome within the current nation's resources.

In recent years, the detrimental effects of unsustainable economic expansion, characterized by prioritizing profit over environmental stewardship, have become increasingly apparent. This trend has sparked a global demand for sustainable development across various sectors, with education playing a crucial role in driving this transformation. The necessity to reassess and reshape developmental strategies, especially within the educational realm, highlights the critical shift towards sustainability practices (Beradze, 2020; Garrett, 2015). Stoll et al. (2022) have delineated the contribution of arts and crafts to this transition by augmenting eco-literacy

and fostering emotional engagement among learners, thus deepening their commitment to sustainable practices.

This shift towards sustainable development in education draws inspiration from Aristotle's concept of eudaimonic well-being, starkly contrasting with the unsustainable chase after hedonic pleasure marked by excessive consumption. The introduction of "sustainability justice" by Makrakis (2006, 2017), encompassing the four pillars of sustainable development—environment, society, economy, and culture—reflects the holistic integration necessary for true sustainability. Despite significant investments in environmental education, there remains a notable discrepancy between the formation of positive environmental attitudes and the enactment of tangible sustainable actions. This disparity underscores the need for a fundamental transformation in educational methodologies, curricular design, and pedagogical approaches, as the existing systems do not inherently foster sustainable thought patterns or behaviors (Makrakis, 2012).

Research in curriculum development has revealed a predominance of conventional lecture-based instruction, with innovative teaching methodologies such as role-play, hands-on science activities, and problem-based learning (PBL) not being fully leveraged (Makrakis & Kostoulas-Makrakis, 2015, 2016; Makrakis et al., 2021). Makrakis (2013, 2014) has highlighted the efficacy of PBL in cultivating critical thinking and problem-solving skills through a structured process that includes problem identification, solution brainstorming, evidence linkage, and reflective evaluation, all of which are essential for embedding sustainability into educational frameworks.

This study emphasizes on the role of visual arts and PBL in promoting sustainable practices. It acknowledges the challenges posed by unsustainable economic practices and advocates for a comprehensive, global approach to fostering sustainability within the education sector (Beradze, 2020; Garrett, 2015; Kioupi & Voulvoulis, 2019; Leal Filho et al., 2019). By examining visual arts education, this research seeks to identify strategies for integrating sustainability principles through Open Distance Learning (ODL), positioning visual arts educators as pivotal agents of change in advancing the overarching goals of sustainable development.

Problem Statement

The issue of unsustainable economic practices, characterized by a preference for profit over the preservation of natural resources, underscores the imperative for sustainable development, particularly within the educational sphere. Despite the potential of innovative pedagogies, such as PBL and arts education, to enhance eco-literacy and emotional investment in sustainability, a significant gap remains between the theoretical support for sustainability in education and its practical implementation. This gap highlights the untapped potential of the arts—including visual arts, literature, performing arts, theater, and film—to drive socio-economic shifts towards sustainability. The central challenge involves integrating sustainability into educational curricula, notably through visual arts education and ODL, to empower educators as catalysts for change and advance the broader objectives of sustainable development. Addressing this challenge necessitates groundbreaking research to uncover effective strategies for embedding sustainability principles within art education, aligning with the

global call for a paradigm shift that embraces the four foundational pillars of sustainable development: environment, society, economy, and culture.

Research Questions

This study addresses the crucial need to integrate sustainability into art education to enhance eco-literacy and environmental stewardship. It explores the theoretical and practical aspects of sustainability in education, focusing on visual arts and Open Distance Learning (ODL). The research aims to assess learners' technological competencies for accessing sustainability resources online, the relevance of sustainability-focused topics in visual arts education to learners' careers and academic growth, and the effective internalization of Sustainable Development Goals (SDGs) through such courses. This investigation highlights the significant educational gap and its potential to contribute to the global sustainable development agenda, emphasizing the transformative role of arts education in promoting sustainability among educators and learners. The research seeks to evaluate learners' technological competencies in accessing online sustainability resources, the impact of sustainability-focused topics in visual arts education on learners' career prospects and academic development, and how Sustainable Development Goals (SDGs) are internalized through such courses. It underscores the educational gap in sustainability integration and its potential impact on the global sustainable development agenda, highlighting the critical role of arts education in fostering sustainability awareness among educators and students.

- What is the level of technological competence among learners in accessing online materials and social media in the context of sustainability principles in visual arts education?
- How do sustainability-focused topics within visual arts education courses relate to learners' job relevance and academic advancement?
- Which aspects of the Sustainable Development Goals (SDGs) are most effectively internalized through learners' experiences in courses that integrate sustainability principles into visual arts education?

DeCore+ (Deconstruction-Construction-Reconstruction) process in learning design

The DeCoRe+ process, which stands for Deconstruction-Construction-Reconstruction, provides a comprehensive framework for embedding sustainability into educational curricula. It addresses the gap between the theoretical aspiration for sustainability in education and its practical implementation, enhancing eco-literacy and student engagement through a transformative curriculum development approach. By structuring the learning design to incorporate sustainability principles and the Sustainable Development Goals (SDGs), DeCoRe+ facilitates a meaningful integration of these concepts into educational practices.

The integration of the DREAM method into the DeCoRe+ framework marks a significant advancement in addressing the disconnect between technological competence, job relevance of course content, and the emphasis on sustainability in academia. By embedding sustainability into the curriculum, the DREAM method enhances the DeCoRe+ framework's ability to critically engage students, foster creativity, and support experiential

learning.

This synergistic approach not only tailors educational content to meet global sustainability challenges but also evaluates and ensures the curriculum's effectiveness in nurturing a sustainable future mindset among learners. Through this integration, the methodology effectively meets the study's objectives, promoting a deeper understanding and commitment to sustainable development through critical analysis, reflection, and continuous improvement in educational practices. The DeCoRe+ process, supported by the DREAM methodology, offers a powerful and innovative approach to curriculum development in the context of sustainability education. Its comprehensive and reflective nature not only addresses the pressing need identified in the problem statement but also aligns closely with the research questions, providing a justified and effective framework for integrating sustainability principles into educational curricula. This approach represents a significant step towards transforming educators into agents of change and advancing the broader goals of sustainable development.

Method

The Learning Design DeCoRe+

This study's methodology meticulously explores the integration of sustainability principles into visual arts education, guided by precise research questions. Employing the DREAM method within the DeCoRe+ framework, we delve into sustainability's role in enriching learners' decision-making, aligning educational content with real-world applications, and fostering deep engagement with sustainable development goals (SDGs). This approach offers a structured yet flexible pathway for curriculum integration, ensuring each phase—from diagnosing learners' initial understanding to ongoing curriculum assessment—aligns with our objectives for a comprehensive investigation. This methodology not only grounds the study in a solid theoretical foundation but also promises actionable insights, emphasizing our commitment to advancing educational practices through sustainability.

Deconstruction

The first stage of the course development is to determine the level of Table of Content (TOC) and category of content which will be chunked into Module, Unit and Topics. The chosen topics is then designed according the DREAM (Diagnose, Review/Reflect, Explain, Assess & Manage). DREAM is considered as part of the strategies in the instructional design process. Makrakis (2019;2022) proposed the DREAM (Diagnose, Review/Reflect, Explain, Assess & Manage) method for evaluating revised courses during implementation. These processes cover the entire course, from what students bring in before (Diagnosing), during (Reviewing/Reflecting and Explaining), and after the course (Assessing and managing). The DREAM method reflects a critical action research process that aims to assess and improve a course. Through the DREAM Methodology, the student, guided by the course instructor, creates a portfolio to give back to the instructor at the end of the course. DREAM is a course requirement. Instructors must analyse DREAM portfolios and prepare a

report for the class. The analysis of the DREAM portfolios will provide important information that the instructor and students can use to improve the course.

Figure 1. The DREAM methodology stages. Makrakis, V. (2023). In Using the DREAM Methodology for Course Assessment in the Field of ICT-Enabled Education for Sustainability. pp. 1382

The methodology focuses on the DREAM method within the DeCoRe+ framework not only provides a structured and flexible process for integrating sustainability into educational curricula but also aligns seamlessly with the research questions posed. This coherence between methodology and research objectives underscores the study's commitment to exploring the multifaceted impacts of sustainability principles on visual arts education, from enhancing decision-making abilities and course applicability to fostering a deepened understanding and commitment to sustainable development. The inclusion of the DREAM method thereby justifies the methodology's capacity to address the research questions effectively, leveraging critical analysis, reflection, and continuous improvement as pivotal elements for embedding sustainability into educational practices.

The Diagnose phase of the DREAM method assesses learners' current understanding and attitudes towards sustainability, providing foundational insights that enable educators to tailor the curriculum and enhance decision-making abilities in sustainable practices (Makrakis, 2019; 2022). Following this, the Review/Reflect

and Explain phases facilitate a thorough engagement with sustainability concepts, aligning the curriculum with the applicability to learners' job roles and preparing them for real-world challenges, as facilitated by the DeCoRe+ construction phase (Makrakis, 2017).

The subsequent Assess and Manage phases evaluate and refine the curriculum using learners' feedback and adapt to evolving educational goals, ensuring that the teaching of sustainability principles within visual arts education remains impactful and relevant (Makrakis, 2016; 2017). This continuous cycle of reflection and improvement, integral to both the DeCoRe+ framework and the DREAM method, allows for dynamic and responsive educational practices that effectively integrate Sustainable Development Goals into learning outcomes (Makrakis, 2019; 2022).

Data Analysis

The method of data analysis involves a mixed-methods approach, integrating both quantitative and qualitative techniques to comprehensively evaluate technological competence and its impact within sustainability-oriented

visual arts education. For the quantitative analysis, descriptive statistics will be utilized to calculate percentages and frequency distributions, summarizing general trends related to technological competence and job relevance. This will include an examination of the extent to which students utilize digital resources, correlated with their enrollment in courses pertinent to their career paths

On the qualitative side, a thematic analysis will be conducted on data collected from students' feedback and comments. This process will involve coding the qualitative data into themes that capture how digital tools and sustainability are being integrated into student learning and professional development. Key anticipated themes include the "Integration of ICT in Education," "Application of Sustainability in Career Development," and "Internalization of SDGs through Visual Arts." Additionally, content analysis will be employed to systematically

identify and quantify occurrences of specific words or concepts within the text data, allowing for a structured comparison with quantitative findings. The findings from an open-ended item drawn from the survey questions provide detailed examples of how students apply digital tools and sustainability concepts practically.

The integration of data through triangulation are crucial to validate and enhance the findings, ensuring that insights from quantitative data are enriched by qualitative narratives. This comprehensive analysis will facilitate discussions on how technological competence influences the efficacy of sustainability-oriented educational practices in visual arts. The final discussion will focus on the implications for educational practice and policy, particularly regarding curriculum design and resource allocation, aiming to enhance educational strategies to better integrate sustainability in visual arts education, thereby supporting both academic and career advancement for learners.

Qualitative Data Analysis

In this study, data were extracted from open-ended survey questions for qualitative responses provided by students enrolled in the HBEF1403 (Art Education) course, as part of a broader survey assessing their engagement with technology and sustainability within art education. Thematic analysis was employed to analyze the data, beginning with the extraction of relevant responses to ensure focus. Researchers then familiarized themselves with the data, identifying initial patterns related to digital literacy and sustainability. Initial coding was manually conducted to segment the data based on its relevance to the research questions. Subsequent theme development distilled these codes into broader patterns focusing on technology use, sustainability engagement, and career relevance. Themes were reviewed and refined through a recursive process to accurately represent the data, followed by triangulation with external findings to validate the data's internal consistency and link it to established research. The final step involved reporting the thematic findings, discussing their implications in the context of the existing literature and theory.

Results

The integration of sustainability principles and technological competence into visual arts education is crucial for both personal and professional development. The findings examines the impact of the HBEF1403 course, which incorporates sustainability topics, on students' academic and career trajectories. By triangulating both quantitative and qualitative data, comprehensive insights into students' experiences and expectations are provided.

Respondent Profiles

Qualitative data from open-ended survey responses enriched the understanding of students' experiences, perspectives, and expectations. Each respondent was identified using unique codes. The participants in this study comprised individuals from various demographic backgrounds, including males (R1, R4, R10) and females (R2, R3, R5). Predominantly of Malay ethnicity (R1, R2, R5), a minority of respondents were Chinese (R3, R6). The respondents were grouped into three age categories: 21-30 years old (R1, R2, R3), 31-40 years old (R7, R8), and 41-50 years old (R9, R10).

Respondents provided detailed accounts of their experiences with the courses and shared their expectations. Respondent R2 (Female, Malay, Teacher) highlighted the value of the course "HBEF1403 Seni dalam Pendidikan (Art in Education), OUMH1603 21st Century Skill in enhancing her pedagogical knowledge and practical skills. Respondent R5 (Female, Malay, Unemployed) emphasized the importance of practical application through the "Projek" topic, while Respondent R3 (Female, Chinese, Admin Assistant) expressed her motivation to strive for excellence in her role as an admin assistant due to the "OUMH1603 21st Century Skill course.

Assessing Technological Competence in Sustainability-Oriented Visual Arts Education

This section analyzes technological competence among learners, particularly focusing on their use of online resources within a sustainability-oriented visual arts curriculum. A group of 14 students was surveyed, revealing varying levels of digital literacy within educational technology contexts. Quantitative findings illustrate a spectrum of engagement with digital learning tools:

One student (7.14%) reported consistent usage of online resources such as e-books and databases. Six students (42.86%) frequently utilized digital resources. Four students (28.57%) occasionally engaged with them. Collectively, these students (N = 11, 78.57%) represent the majority of the sample, showcasing diverse engagement levels with digital tools crucial for sustainability education.

This variation in technological engagement is essential when adopting the DeCoRe+ model in learning design,

which advocates for assessing students' existing knowledge and attitudes toward key educational themes, including sustainability.

Qualitative data corroborate these findings, indicating an increasing trend among students to integrate digital tools and information and communication technology (ICT) into their educational practices. Students specifically mentioned utilizing ICT to expand their knowledge base and apply course concepts via digital platforms. These qualitative insights align with the quantitative data, underscoring the necessity for courses to promote digital literacy and resource accessibility further, thus enhancing the educational impact on students' technological competence in sustainability-focused visual arts education.

Table 2 Technological Competence of Students in Accessing Educational Resources and Tools

Technological Competence	Regular Usage (%)	Frequent Usage (%)	Occasional Usage (%)	Never Used (%)	Total Students (N)	Notes
Online Materials (e-books, e-journals, databases)	7.14% (N=1)	42.86% (N=6)	28.57% (N=4)	-	N=11 (78.57%)	More females than males
Social Media	7.14% (N=1)	-	64.29% (N=9)	28.57% (N=4)	N=14 (100.0%)	-
Statistical Software (Microsoft Excel, IBM SPSS, Matlab)	7.14% (N=1)	-	71.42% (N=10)	21.4% (N=3)	N=14 (100.0%)	-
Presenting Software (Microsoft PowerPoint, Google Slides, Prezi)	42.86% (N=6)	-	-	7.14% (N=1)	N=14 (100.0%)	50% (N=7) used rarely

Application of Learning

Respondents emphasized how they intend to use the knowledge and skills gained from these courses. Respondent R1 (Male, Malay, Student) aimed to apply global citizenship education principles in his future career using the skills learned in "GCED." Respondent R4 (Female, Malay, Teacher) sought to integrate technological tools into her teaching strategy, while Respondent R7 (Male, Chinese, Admin Officer) planned to leverage project management skills to handle work tasks systematically.

Quantitative data revealed that over 80% of respondents believed the courses were relevant to their current or future professions, which aligns with the qualitative responses where participants indicated plans to apply their

skills practically in their careers. Qualitative responses, such as those from R6 (Male, Chinese, Teacher), showed improvements in understanding teaching methods and increased confidence in the classroom approach, aligning with the quantitative findings where respondents rated the professional development impact at an average score of 4.5 out of 5.

In assessing technological competence in sustainability-oriented visual arts education, the quantitative findings illustrated a spectrum of engagement with digital learning tools. One student (7.14%) consistently reported using e-books and databases, while six students (42.86%) frequently utilized digital resources, and four students (28.57%) occasionally engaged with these tools. Collectively, this demonstrates diverse engagement levels with digital tools pivotal for sustainability education. Qualitative data corroborated these findings, highlighting an increasing trend among students to integrate digital tools and ICT into their educational practices.

Table 3. Analysis of Job Relevance and Academic Development in Sustainability-Focused Visual Arts Education Courses

Aspect	Quantitative Data	Qualitative Data
Course Relevance	Over 80% believed the courses were relevant to their professions	Plans to apply skills practically in careers
Professional Impact	Average score: 4.5/5	Improvements in understanding teaching methods and increased confidence
Participant Example	-	R6 (Male, Chinese, Teacher): Improved understanding of teaching methods, more confident in classroom approach

Bridging Sustainability in Visual Arts Education to Career and Academic Growth

This study explores the relationship between sustainability themes in visual arts education and their significance to students' career and academic advancement. By examining data from students enrolled in various courses, including Art in Education, the study aims to determine how these courses—infused with sustainability topics—influence students' career trajectories and educational progress.

In assessing technological competence in sustainability-oriented visual arts education, the quantitative findings illustrated a spectrum of engagement with digital learning tools. One student (7.14%) consistently reported using e-books and databases, while six students (42.86%) frequently utilized digital resources, and four students (28.57%) occasionally engaged with these tools. Collectively, this demonstrates diverse engagement levels with digital tools pivotal for sustainability education. Qualitative data corroborated these findings, highlighting an increasing trend among students to integrate digital tools and ICT into their educational practices.

Bridging Sustainability in Visual Arts Education to Career and Academic Growth

This study explores the relationship between sustainability themes in visual arts education and their significance to students' career and academic advancement. By examining data from students enrolled in various courses, including Art in Education, the study aims to determine how these courses—infused with sustainability topics—influence students' career trajectories and educational progress.

Table 3. Analysis of Job Relevance and Academic Development in Sustainability-Focused Visual Arts Education Courses

Aspect	Details
Responses Overview	<ul style="list-style-type: none"> - Total Respondents: 14 - Job Related (Yes): 9 (64.29%) - Not Job Related (No): 5 (35.71%)
High Relevance to Job	- 64.29% of respondents indicated job relevance, highlighting a strong connection between course content and professional applicability, especially noted in "HBEF1403 Art in Education."
Course Specific Analysis	<ul style="list-style-type: none"> - HBEF1403 Art in Education: Most responses, indicating popularity/requirement. - A split between job relevance (9 respondents) and non-relevance (5 respondents) suggests varied perceptions of its applicability to professional settings.
Academic Development	- The implied job relevance suggests that course content enhances academic growth by aligning with professional standards and expectations. Sustainability-focused topics contribute to a comprehensive educational experience.
Sustainability Focus	- The job relevance of these courses indicates that sustainability-focused topics are integrated in a way that resonates with professional practices, preparing students for careers valuing a sustainability mindset.

The analysis investigates the correlation between course enrollment in sustainability-focused visual arts education and its perceived relevance to the students' current or prospective job roles. The data reveal a significant connection:

Of the 14 respondents, 9 (64.29%) confirmed that their employment correlated with the courses they attended. This high percentage of job relevance demonstrates that students recognize a direct application of the skills and knowledge gained through these courses in their professional lives, emphasizing the practical benefits of integrating sustainability themes into visual arts education. Quantitatively, the findings show a robust alignment between course content and job market demands, with 64.29% of respondents acknowledging that their jobs

were related to their enrolled courses. This highlights the direct application of skills and knowledge from these courses in their professional activities, reinforcing the value of incorporating sustainability-focused topics into visual arts education.

The quantitative analysis revealed that 64.29% of respondents indicated that their jobs correlated with the courses attended, while 35.71% emphasized academic growth. Qualitative data supported this, as numerous participants reported the high relevance of the course content to their current job roles, particularly in educational settings. The practical application of skills and knowledge gained through these courses reinforces the value of incorporating sustainability themes into visual arts education.

Qualitatively, numerous participants reported that the course content was highly relevant to their current job roles, particularly within educational settings. The relevance here lies in how the principles of arts and sustainability directly influence teaching methodologies and student engagement. These qualitative insights support the quantitative data, confirming that a significant proportion of students view their education as closely aligned with career requirements.

Effective Internalization of SDGs through Visual Arts Education: Learners' Perspectives

This study examines how sustainability principles, specifically the Sustainable Development Goals (SDGs), are integrated into visual arts education and the resultant impact on learners' engagement and knowledge acquisition. The findings, derived from learner experiences in courses merging visual arts with sustainability, indicate that most learners (81.81%, $n = 9$) found the courses both engaging and informative, reflecting a robust connection to the SDGs. This high level of engagement suggests that the integration of SDGs into visual arts effectively fosters the internalization of sustainability concepts among students. Conversely, a smaller segment of the cohort focused primarily on content knowledge (18.18%, $n = 2$), and a minimal number reported limited learning outcomes (9.09%, $n = 1$). These results suggest that while the majority benefit significantly, varied engagement levels exist, indicating opportunities for pedagogical adjustments to maximize the impact across all learners.

Quantitative analysis underscores the high engagement, with 81.81% of respondents indicating that the course was both interesting and informative, pointing to successful internalization of sustainability aspects through art education. Qualitatively, the data reveal that learners anticipate applying sustainability, particularly SDGs, in both personal and professional contexts. Reports from the courses suggest substantial personal growth, with improvements in confidence, problem-solving abilities, and a deeper comprehension of complex global issues like sustainability.

Effective Internalization of SDGs through Visual Arts Education: Learners' Perspectives

This study examines how sustainability principles, specifically the Sustainable Development Goals (SDGs), are

integrated into visual arts education and the resultant impact on learners' engagement and knowledge acquisition. The findings, derived from learner experiences in courses merging visual arts with sustainability, indicate that a majority of the learners (81.81%, n=9) found the courses both engaging and informative, reflecting a robust connection to the SDGs. This high level of engagement suggests that the integration of SDGs into visual arts effectively fosters internalization of sustainability concepts among students.

Conversely, a smaller segment of the cohort focused primarily on content knowledge (18.18%, n=2), and a minimal number reported limited learning outcomes (9.09%, n=1). These results suggest that while the majority benefit significantly, a varied engagement level exists, which could indicate opportunities for pedagogical adjustments to maximize the impact across all learners.

Quantitative analysis underscores the high engagement, with 81.81% of respondents indicating that the course was both interesting and informative, which points to successful internalization of sustainability aspects through art education. Qualitatively, the data reveal that learners anticipate the application of sustainability, particularly SDGs, in both personal and professional contexts. Reports from the courses suggest substantial personal growth, with improvements in confidence, problem-solving abilities, and a deeper comprehension of complex global issues like sustainability.

Table 4. Learner Experiences on SDG Elements Gained from Art Education Course

Learning Experience (Lx)	N	%
Lx1: Not much learned	1	0.09
Lx2: Course is very interesting	9	0.82
Lx3: Increase knowledge	9	0.82
Lx4: Focus on content knowledge	2	0.18

Quantitative data showed that 81.81% of learners found the courses engaging and informative, while 18.18% focused on content knowledge, and only 9.09% reported limited learning outcomes. Qualitative analysis confirmed this, with learners anticipating applying sustainability, particularly SDGs, in personal and professional contexts. Reports from the courses suggested substantial personal growth, with improvements in confidence, problem-solving abilities, and understanding of complex global issues like sustainability. The findings illustrate a clear correlation between quantitative data and qualitative responses. Technological competence remains a challenge, with qualitative responses highlighting the need for improved technological infrastructure and training. A majority of learners see direct correlations between sustainability courses and their job roles, reinforcing the value of integrating sustainability principles into visual arts education. Furthermore, the successful internalization of SDGs through art education is evident from both qualitative and quantitative responses.

Integrating technological competence and sustainability principles into visual arts education offers significant benefits for learners' academic and career advancement. Addressing challenges such as technological infrastructure and varying digital literacy levels will maximize the potential of these educational approaches.

Discussion

Technological Competence in Sustainability-Oriented Visual Arts Education

The findings illustrate a broad spectrum of technological competence among students, with varying levels of engagement in using digital tools essential for sustainability education. This aligns with the necessity for digital literacy emphasized in the Introduction, where incorporating digital platforms into contemporary education was recognized as crucial (Makrakis, 2013; Makrakis & Kostoulas-Makrakis, 2016). The DeCoRe+ model, referenced both in the Introduction and Results, advocates for assessing learners' existing competencies and attitudes toward sustainability to design effective educational interventions (Makrakis, 2013).

The results showed that while one student (7.14%) reported consistent usage of online resources such as e-books and databases, six students (42.86%) frequently utilized digital resources, and four students (28.57%) occasionally engaged with them. This reveals a variation in digital literacy levels. Qualitative data corroborated these findings, highlighting an increasing trend among students to integrate digital tools and ICT into their educational practices.

Applying the DeCoRe+ model appears imperative in bridging identified technological skill gaps and enhancing digital literacy among learners, aligning with the educational aspirations detailed in the Malaysian Education Blueprint 2013-2025 (Ministry of Education Malaysia, 2013). To maximize students' technological competence in sustainability-focused visual arts education, courses should emphasize digital literacy and resource accessibility.

Job Relevance and Academic Development in Sustainability-Focused Visual Arts Education Courses

The Results revealed a significant correlation between course content and perceived job relevance, echoing the Introduction's discussions on the practical application of sustainability in career contexts. Of the 14 respondents, 9 (64.29%) confirmed that their employment correlated with the courses they attended. This substantial correlation demonstrates that students recognize a direct application of the skills and knowledge gained through these courses in their professional lives. This finding supports the broader educational goals of enhancing employability through relevant skill development, as outlined in the Malaysian Education Blueprint 2013-2025 and global frameworks like Local Agenda 21 (GDRC.org, 2022). Moreover, qualitative data highlighted that participants perceived the courses as highly relevant to their job roles, particularly in educational settings. This finding aligns with the aspirations of incorporating sustainability principles into education to enhance career trajectories and professional growth.

Learner Experiences on SDG Elements Gained from Art Education Courses

Learners' positive perceptions of the courses' effectiveness in promoting SDGs, as reported in the Results, align with the Introduction's emphasis on embedding sustainability principles into educational curricula. Of the respondents, 81.81% found the courses engaging and informative, highlighting a robust connection to the SDGs. Qualitatively, students anticipated applying sustainability principles, particularly SDGs, in both personal and professional contexts.

This high engagement suggests that integrating SDGs into visual arts education effectively fosters the internalization of sustainability concepts among students. This is consistent with Aristotle's concept of eudaimonic well-being through education (Makrakis, 2017). Additionally, the qualitative responses indicated substantial personal growth, improved confidence, problem-solving abilities, and a deeper understanding of global issues like sustainability.

The Results illustrate a clear correlation between quantitative data and qualitative responses. Despite the positive outcomes, challenges remain regarding technological competence, with qualitative responses highlighting the need for improved technological infrastructure and training. Addressing these challenges is crucial to maximize the educational impact and ensure all learners effectively internalize sustainability principles.

Conclusion

The study highlights the critical importance of integrating technological competence, sustainability-focused content, and experiential learning principles within the DeCoRe+ (Deconstruction-Construction-Reconstruction) framework in visual arts education. This integration is crucial to bridging the existing gaps in digital literacy and to enhancing both the job relevance and academic development of learners. By advocating for a fundamental shift in educational methodologies to include sustainability principles and Sustainable Development Goals (SDGs), the study posits that the DeCoRe+ process, bolstered by the DREAM methodology, is essential for adapting curricula to meet contemporary professional demands and to promote a sustainable educational ecosystem. This approach not only aligns with global sustainability agendas but also positions educators as pivotal agents of change, fostering environmental stewardship, social equity, and economic sustainability, thereby contributing to the broader goals of sustainable development within the education sector. Integrating technological competence and sustainability principles into visual arts education offers significant benefits for learners' academic and career advancement. The findings highlight a need to address challenges such as technological infrastructure and varying digital literacy levels. By incorporating digital literacy into visual arts education and emphasizing SDGs, these educational approaches can be optimized to foster a deeper understanding and commitment to sustainable practices, fulfilling the aspirations outlined in the Malaysian Education Blueprint 2013-2025 and aligning with global sustainable development initiatives.

In conclusion, the research supports the theoretical discussions presented in the Introduction about the necessity for innovative educational approaches, such as those offered by visual arts, to tackle modern sustainability challenges. The thorough triangulation of qualitative and quantitative data across the study underscores the need for ongoing refinement of educational practices. This is crucial for adequately preparing learners for the complexities of modern professional environments and the broader global sustainability challenges. Future research should explore the longitudinal effects of these educational interventions and assess their wider implications for educational policy and practice.

Recommendations

This study's success was made possible through the invaluable support of Open University Malaysia, which not only provided essential facilities and data access that significantly enriched our findings but also offered ongoing motivational support that fosters further research activities. This comprehensive assistance underscores the university's pivotal role in advancing research and development excellence.

Teaching STEM subjects: An Activated Approach

Daniel Adeboye

University of KwaZulu-Natal, South Africa

Desmond W. Govender

University of KwaZulu-Natal, South Africa

Irene Govender

University of KwaZulu-Natal, South Africa

Abstract: Students naturally have a phobia for STEM subjects which leads to poor performance in these subjects. The reason for this is varied but can be associated with the teaching approach. As an improvement on the traditional teaching method and the earlier technology-enabled teaching methodologies, using the affordances of technology to effectively engage students were tested. In this 7-week intervention design based research study, the impact of a set of activated classroom pedagogies on the performance of primary school students was investigated. The approach involved five activities, namely, curation, conversation, correction, creation and chaos, commonly referred to as the ACT pedagogy. Applying this approach to a Mathematics class, a sample of 91 students from a primary school in Nigeria participated in the study. Surveys were administered to them before and after the intervention. Results of the study showed that there was a reasonably significant increase in the percentage mean of the performance of students after the intervention. An increase of 8.79% in the mean after the intervention shows that there is a reasonably significant impact of the activated approach on the performance of students.

Introduction

Research on what learning is and how students learn has been ongoing for many years. As discussed by Wahyuni (2016) learning is the acquisition of information, skills, habits, knowledge and attitudes. He noted that learning is not restricted to the domain of education but can happen anywhere, anytime and in many different ways (Wahyuni, 2016). Furthermore, learning involves action, it involves doing something practical about whatever information has been acquired (Adeboye, 2016) and until action is taken and something is done, learning has not taken place. Additionally, learning can take place in various ways. From the older traditional

learning approaches to the more recent digital age approaches to learning (Vernadakis, Antoniou, Giannousi, Zetou, & Kioumourtzoglou, 2011); several researchers have continued to explore how students learn and what factors contribute to a successful learning experience.

Traditional teaching and learning approaches

Traditional learning approaches are those that happen within the four walls of the classroom and leave students as passive consumers of content rather than active producers (Masek & Yamin, 2012). In this approach, the teacher takes control of the class as the “sage on the stage”, and does all the talking while leaving the students to sit through long and boring hours of lectures. As discovered by Bazelais and Doleck (2018), a quiet and controlled classroom does not necessarily mean learning is taking place, especially when the students are not taking any active role.

Traditional teaching approaches have demonstrated limitations in enhancing students' mathematical performance. Research has shown that students often struggle to connect mathematical concepts with real-world applications and fail to develop a deep conceptual understanding (Ardeleanu, 2019). The lack of active engagement and limited opportunities for collaboration hinder the development of problem-solving skills, creativity, and critical thinking abilities that are crucial for success in mathematics (Bazelais et al., 2018).

Passive use of technology for teaching and learning

The evolution of technology has made teaching with technology the natural way to go in a digital world. As noted by Blewett (2016b), 21st-century students who are digital natives must be taught using 21st-century teaching approaches, that take advantage of the affordances of technology. Unfortunately, as good as many of the previously researched teaching approaches were, several of them did not consider the effective use of technology and so are fast becoming inadequate as an appropriate teaching approach (Blewett, 2016b). A new set of digital-age pedagogies must be employed to teach with technology, to improve the academic performance of students.

Some studies that researched the use of technology in class have reported failures. These failures were due to the passive use of technology by the teacher in the classroom. For example, the use of Microsoft PowerPoint in the classroom can easily bore students, despite it being a use of technology. In research by Draper, Cargill and Cutts (2002), students complain that they feel sleepy in class despite the use of PowerPoint. This could be because of the choice of colour, font size and length of text displayed on each slide. This phenomenon of having boring, text-heavy, slide-intensive lectures is what is referred to as “death by PowerPoint” (Garber, 2001). Another example of the passive use of technology in the classroom is the use of videos in teaching and learning. Whereas research has proven that the use of video in the classroom provides several benefits such as perpetual and repeated access to content (Woolfitt, 2015) and the ability to learn in and out of the classroom, video in many ways has been used to teach passively. Riddle, Peebles, Davis, Xu and Schroeder (2018) in their research

discussed the potential problems attached to watching videos for long hours. These problems which include stress, depression, anxiety and a decrease in social interaction, have also plagued students who have been subjected to watching long video content (Ahmed, 2017). Even in the case of synchronous live online lectures, technology tools like Zoom, Google Meet, Adobe Connect etc. can be used for teaching and learning, where teachers and students meet together online at the same time. However, teachers must be trained to engage the students throughout the lecture time, otherwise, they may be bored throughout the entire time (Hew, Jia, Gonda, & Bai, 2020).

All of this is especially true for teaching and learning mathematics. Several students have a natural phobia of Mathematics and so perform badly in the subject (Kunwar, 2020). As discussed in a study, one major cause of this poor performance is the disconnect that students experience between the concepts and real-world scenarios. Teachers of Mathematics largely engage passive teaching approaches that make it difficult for students to understand the already abstract subject (Kunwar, 2020). In another research by Raines and Clark (2011), students complained that even though the teacher made use of PowerPoint in the classroom, they found it difficult to understand what the teacher was trying to explain. According to a student, rather than the teacher solving the questions step by step while they follow, the teacher had already typed the entire solution on each slide and now tried to explain each step (Raines et al., 2011). This made it difficult for the students to understand the concepts, despite the use of technology. Additionally, according to Anwar, Kahar, Rawi, Nurjannah, Suaib and Rosalina (2020) sitting through a video explanation of some topic in mathematics would simply complicate the concepts rather than simplify them.

Therefore, whereas technology was used to teach mathematics in the cases stated above, the teaching approach employed still resulted in a negative impact on the students' performance (Svela, Nouri, Viberg, & Zhang, 2019). This has led to alarming statistics about the failure rate of Mathematics among students. According to a report by Bempechat, Drago-Severson and Boulay (2002), 78% of students have a consistent fear of mathematics and so they would not even attempt to study it. In the same report, 67% of students fall sick a few days before a mathematics exam and so eventually perform badly in the examination (Kunwar, 2020). Furthermore, 72% of students score below 50% on average in every mathematics exam they undertake (Kunwar, 2020). These reports reveal the lack of an appropriate pedagogy for teaching Mathematics with technology, in such a way that it improves the academic performance of students.

Active teaching and learning approaches.

In contrast, active teaching approaches prioritize student engagement, collaboration, and the integration of technology to enhance learning experiences (Paulson & Faust, 2000). Active pedagogies promote student-centred learning environments, where students actively participate in constructing knowledge, solving authentic problems, and making connections between mathematical concepts and real-life situations (Freeman, Eddy, McDonough, Smith, Okoroafor, Jordt, & Wenderoth, 2014). Active learning approaches have demonstrated positive effects on students' mathematical performance. By actively engaging students in the learning process,

these approaches foster a deeper understanding of mathematical concepts and facilitate the development of critical thinking and problem-solving skills (Clark, 2014). The integration of technology tools and resources further enhances the learning experience, providing opportunities for interactive simulations, visual representations, and immediate feedback (Freeman et al., 2014).

Activated Classroom Teaching (ACT) model

The Activated Classroom Teaching (ACT) model is a set of “digital age pedagogies that combines active learning and technology affordances into a student-aligned learning approach” (Blewett, 2016a). It consists of five layers of 21st-century pedagogies set atop the traditional teaching approach - consumption. Each of these layers is a pedagogy, a way of approaching teaching and learning in the modern classroom, that guides the teacher to teach effectively with technology. These pedagogies, which include Curation, Conversation, Correction, Creation and Chaos, shift the focus from the teachers to the students and encourage the students to engage in the learning process themselves (Blewett 2016).

Figure 1. The Activated Classroom Teaching (ACT) digital pedagogies (Blewett, 2016a)

Each of the 5 layers of the ACT model as seen in figure 1 presents opportunities for students to learn while engaging with the content in an active way and especially, to produce an artefact. According to Blewett (2016a), when taught using the ACT model, students also learn 21st-century skills like problem-solving, collaboration, curiosity, critical thinking, risk-taking etc. The goal of the ACT model is to transform students' understanding of

concepts and move them from being passive consumers of content to active producers of content (Sherrington, 2023). The traditional approach to teaching and learning has hitherto trained students to listen, cram and reproduce during an assessment whatever they are being taught, in a very passive way (consumption). Students have not been used to engaging in the content, contributing to it or being actively involved in the learning (Sherrington, 2023). However, the ACT model helps students to move from being passive in the class to being active and from being consumers to being producers of content and the higher you go in the ACT model, the more engaging and active the students become as they seek to learn (Blewett, 2016b).

According to Blewett (2016a), when teaching with technology the pedagogy of curation seeks to shift the learning of students from pre-packaged content to allowing students to curate the content they need. Verhaart (2012) suggested that technology makes the educator's role change from one of knowledge collection and dissemination to students, to one of curation and dissemination to students. This means educators must be careful to look beyond the one textbook or resource (Deschaine & Sharma, 2015) where the content seems pre-packaged to the development of skills involved in wading through several physical and online resources and presenting them to students. Likewise, students must also be allowed to curate their content themselves, rather than depending on the single note or content prepackaged and released by the teachers (Aguilar-Peña, Rus-Casas, Eliche-Quesada, Muñoz-Rodríguez, & La Rubia, 2022).

According to Blewett (2016a), curation encourages the development of skills like finding, active reading, filtering and categorizing. These skills are essential skills for both educators and students and take learning to another level. According to the research carried out by Deschaine et al. (2015), the five C's involved in digital curation are Collection, Categorizing, Critiquing, Conceptualization and Circulation. These steps are the steps educators need to take to prepare content for their students for effective learning and technology makes this easy to do. With the varied amount of tools available for both teachers and students, they can learn to curate content that will be useful for their learning (Deschaine et al., 2015). Some digital curation technology tools include Flipboard, List.ly, Storify.com, Paper.li and Twitter etc. (Wolff & Mulholland, 2013). These tools allow students to develop the skills they need to find, sift and categorise content, that will be useful for them.

When students participate in the curation of content, this leads them to naturally want to discuss their findings and share their knowledge with their colleagues (Sfard, Neshet, Streefland, Cobb, & Mason, 1998). The pedagogy of conversation is the next layer in the ACT model. According to Blewett (2016b), the history of conversation in education has seen a transition from the Socratic era where knowledge resided in the minds of the teacher and could be accessed only by sitting with them and holding conversation. With the Didactic era which is the era of printed materials, there was a reduced need for conversations (Graham & Wong, 1993). Knowledge was written down and printed and could be accessed without talking.

However, as explained by Blewett (2016b), with the invention of the internet and the digital age, we have been ushered into the Socratic 2.0 era, which is the social era. Now, learning takes place in the conversation (Saunders & Gale, 2012). Students learn as they interact and hold meaningful conversations around the content.

This is different from the lecture-styled approach which pervaded the didactic era and is still seen in most schools today. In a research carried out among teachers and educational psychologists in the UK, Brown and Kennedy (2011) identified that children who had social, emotional and behavioural difficulties had growing changes due to the reflective and exploratory discussions that were going on. Students had the opportunity to interact and collaborate with their teachers and this improved greatly their learning, bringing the required change (Brown et al., 2011).

The next layer in the ACT pedagogy is the layer of Correction. The pedagogy of correction refers to the notion that students are allowed and encouraged to make mistakes (Chialvo & Bak, 1999) and hence learn from those mistakes. In research that evaluated the factors that influence how medical students learn from their errors, it was discovered that participants were aware of their errors (Fischer, Mazor, Baril, Alper, DeMarco, & Pugnaire, 2006). Students felt they learnt better from actual errors than even from near misses. This shows the power of correction and the fact that students learn from making mistakes. Teachers must, therefore, celebrate improvements and growth, rather than only successes (Blewett, 2016a).

While applying the pedagogy of correction, students must also be encouraged to share their mistakes (Fischer et al., 2006). This makes them more comfortable with making mistakes and learning from them. This pedagogy of learning encourages students to keep trying and not be afraid of making mistakes (Fischer et al., 2006), while also learning from the mistakes they make. Some activities that can help in this pedagogy include “Find one - Create one”. According to Blewett (2016a), students are asked to deliberately write a sentence with a mistake in it and also correct one other sentence with a mistake. This helps them critically think about how not to make the mistake so obvious and also think about possible mistakes that can be made (Blewett, 2016a). Another activity is the “inverted test” technique, where the teacher gives the students either a fictitious student’s script or a past session’s script and the students are told to mark and spot the mistakes (Blewett, 2016a).

The pedagogy of creation helps to shift students from consumption to creation and improves several skills in the students. According to Blewett (2016a), creating encourages creativity in students, develops project management skills and encourages collaboration and sharing. Students can be involved in projects that help them think, they can collaborate on such projects and develop an artefact from it (Ribosa & Duran, 2022).

Creation pedagogy encourages students to be producers and not just consumers or curators. Whereas videos are available on YouTube to be watched and used in teaching and learning, it is still essentially consumed (Majekodunmi & Murnaghan, 2012). The creation pedagogy introduces students to going beyond consuming content and encourages them to create theirs. At the end of the activity, something new, an artefact is formed that didn’t exist before (Blewett, 2016b). In recent research by Ribosa et al. (2022), groups of students were asked to create a video that turns the information they have learnt into useful knowledge. According to the research, students perceived improvements in their knowledge and other areas of learning. Other skills learnt included digital technologies, cooperative learning, and skills involved in searching for information and recording voice-overs (Ribosa et al., 2022).

The pedagogy of Chaos is the highest point of the activated classroom teaching model and it is the most challenging. At this level, students are provided with the most choices and information but with the least order and control (Blewett, 2016a). In research by Somerville and Green (2011) carried out on primary school students, it was discovered that through organized chaos in outdoor learning environments, deep connections are made and meanings are drawn by the learners. The pedagogy of Chaos is not that of classroom commotion or confusion as it may sound but about learning through meaning-making. According to Doll (2012), chaos is not a place of disorder but a place where order is derived from interactions that come from just the right amount of tension and imbalance. At this level, the teacher deliberately creates some form of confusion and allows the students to figure it out and process the information (Cregan-Reid, 2016).

According to Blewett (2016a), one way by which teachers can increase the learning of students is by removing the control. Rather than provide all the variables, controlled and organized content, teachers can remove these and allow the students to make meaning from the little variables provided (Blewett, 2016b). Students can make meaning from the diverse information available and draw their learning from there (Somerville et al., 2011).

This study, therefore, investigated the impact of the Activated Classroom Teaching (ACT) pedagogy on the academic performance of students in Mathematics. The practical applications of these Activated Classroom Teaching pedagogies – curation, conversation, correction, creation and chaos; in teaching and learning during the intervention with examples, have been discussed in a later section of this paper.

Statement of the Problem

Despite the use of technology being employed in the teaching and learning of Mathematics in schools, many students are disengaged and bored and hence, perform poorly in Mathematics. This is due among other reasons, to the pedagogical approach being taken to teach the subject. There is an obvious lack of an active pedagogy which takes teaching Mathematics with technology into consideration and thereby increases the performance of students. This study attempts to answer the research question: what is the impact of using the ACT model on the performance of students in Mathematics?

Methodology and Design

To answer the research question, the study made use of the quantitative approach to research. This research made use of action intervention research, using the Activated Classroom Teaching (ACT) model as the intervention. The research made use of purposive sampling under the non-probability sampling techniques. Purposive sampling is used when the researcher selects the research participants based on certain characteristics. For this research, students of primary five and six in a Nigerian primary school were purposively selected from the entire population. The sample size for this research was 91 students.

For data collection purposes, two forms of data were collected, teacher-made tests and secondary data.

Secondary data in the form of test scores from past students who did not go through the ACT intervention was gathered and compared with the test scores of students who went through the ACT intervention. This helped us to discover what impact teaching with the ACT model had on the performance of students in Mathematics.

The ACT pedagogy was used to teach the students for a 7-week intervention period. Each week, the students were taught using one of the layers of the ACT pedagogy. Week 1 was used to introduce the ACT pedagogy and to revisit the consumption layer. Weeks 2 – 6 were used to teach using the curation, conversation, correction, creation and chaos pedagogies respectively. The different methodologies and technology tools under each layer of the ACT model were applied each week to teach the students. Week 7 was used to finalize the intervention study and revisit any previous layers left out. At the end of the 7-week intervention period, a test was administered to the students to see their academic performance after that period. This was then compared to the scores extracted from previous test before the intervention.

ACT Intervention strategy and examples

During the seven-week intervention period, the students were taught using the various layers of the ACT model. As explained above, week 2 focused on teaching Mathematics using the pedagogy of curation. As a way of reminder, the pedagogy of curation focuses the students on finding, gathering, sifting and categorizing content rather than depending on prepackaged content, presented by the teacher (Blewett, 2016a). In a traditional teaching environment before the intervention, teachers would go to the classroom and lecture the students being the ones to solve the questions on the board. By employing the pedagogy of curation, students were asked to study different textbooks and watch some videos on YouTube, to see how a particular concept was explained. Students then used that knowledge to solve problems given to them. This developed the skill of sifting through several videos to find relevant videos.

In week three, the teaching focused more on the pedagogy of conversation in the teaching of Mathematics in the classroom. One of the strategies used during this week is putting the students in groups to hold conversations around the topic. The teacher would write some sums on the board and allow the students to discuss the solution with each other, sometimes in groups and other times just with the person sitting next to them. This engages each student personally and allows for peer tutoring; hence encouraging conversation before the teacher then attempts to solve the sums.

At another time, the students were made to watch a video of how some complex concepts were simplified. After the video, the teacher engaged the students in a discussion around the video, to see how much they understood and to make them active as well. This is different from what was obtained before the intervention. Before the intervention, the teacher would explain the sums on the board and occasionally ask the students questions but there were no conversations. What was observed was that only the bright and confident students always responded to the questions leaving others to be passive in the classroom.

In week four, the teacher introduced the pedagogy of correction in the teaching of mathematics. Before the intervention, the focus was more on getting the right answer. The students would do anything possible to get the answer to a problem and score all the marks. Conversely, during the intervention, three or four students would be required to solve different questions on the same topic on the board. Afterwards, the teacher will guide the students to spot the mistakes, say why it was a mistake and discuss ways to correct it. This way, the students are trained to find potential error points and eventually avoid them, thereby learning from those mistakes. This also leads to holding conversations around the topic which further strengthens the impact of the ACT pedagogies on the understanding of the subject.

The higher we go in the ACT pedagogy, the more tasking it becomes for the students and the more engaged they also become. In week five of the intervention, the teacher further engaged the students in teaching through the pedagogy of creation. One of the activities used during the intervention is the ‘Explainer Video’ strategy. The students are asked to create videos of themselves using smartphones, as they explain the solution to particular mathematical problems. Rather than just show the final answer, the students are required to show the workings and various steps of the solution and record a video of themselves while solving the problems. This not only strengthened their understanding of the concepts they were working on but also left the students with videos created as artefacts, which can be useful at other times while revising the content.

At the top of the ACT model is the pedagogy of chaos. This was the focus during week six of the intervention. At this level, as succinctly put by Blewett 2016, the tasks are not only engaging for the students but also for the teacher. During this week, the teacher would give sums to students and deliberately withhold certain information leaving them to figure it out. The students would have to first make use of previous understanding to find the missing variables and then proceed to solve the problems presented.

At another time, the students would not be given the formulae with which to solve the problem. Their first task would be to discover the appropriate formulae and then use the formulae to solve the problems. This pedagogy was used along with the pedagogy of conversation. As the students figured out the missing variables, they were sometimes allowed to hold conversations with their peers to work through the sums together.

Results and Discussion

The results of the academic performance of the respondents in Mathematics are shown in table 1.

Table 1. Results of the academic performance of students in Mathematics

Variables (marks)	Pre Intervention	Post Intervention
0-39	22(23.9)	11(12.0)
40-49	14(15.2)	11(12.0)
50-59	27(29.3)	20(21.7)

60-69	15(16.3)	16(17.4)
70 and above	14(15.2)	34(37.0)
Mean	56.15%	64.94%
Sd	13.74	14.89

From the table 1 presented, the results show that 22 students accounting for 23.9% of the respondents scored between 0-39 marks before the intervention. After the intervention, only 11 students accounting for 12% of the students scored the same 0-39 marks in Mathematics. This reveals that fewer students failed Mathematics after they were taught using the ACT pedagogy. Additionally, before the ACT intervention, 31.5% of the students passed Mathematics with a score of 60 and above. This confirms the problem which exists with learning Mathematics.

However, after teaching with the ACT active pedagogy, there was an increase in the percentage of students who passed Mathematics. After the intervention, 54.4% of the students passed Mathematics with a score of 60 and above. Even though this is still not the best, however, it is a great improvement in the percentage of students who passed Mathematics after the intervention. This means that more students passed Mathematics after the introduction of the Activated Classroom Teaching pedagogy.

Furthermore, the results shown in the table reveal that there was a significant increase in the percentage mean of the performance of the students after the intervention. There was an increase of 8.79% in the mean after the intervention which shows that there is a significant impact of the ACT model on the performance of the students.

Conclusion

As seen in the research, students naturally have a fear of Mathematics. The reason for this is varied but it is majorly because of the way it has been taught. Many teachers have taught mathematics in a traditional, teacher-centered way, making the class boring and resulting in low performance among the students. However, this research examined the impact of the Activated Classroom Teaching (ACT) set of pedagogies on the performance of students in Mathematics. The results of this research revealed that when teachers teach using the ACT model, students performed better in Mathematics than without the ACT model. The study confirmed that when students are taught Mathematics using the ACT model, they will perform better than when taught without it.

Innovating Higher Education: The Rise of ChatGPT in Collaborative Learning - A Short Review

Chérifa Boudia

University Mustapha Stambouli of Mascara, LIO Laboratory, University Oran 1 Ahmed Ben Bella, Algeria,

 <https://orcid.org/0000-0002-5190-9893>

Aicha Bengueddach

Department of Medical Oncology, University Hospital of Oran, Algeria,

 <https://orcid.org/0000-0002-8282-4534>

Abstract: In recent years, the landscape of higher education has witnessed a transformative wave with the emergence of ChatGPT, an advanced artificial intelligence tool. This paper explores the profound impact of ChatGPT on collaborative learning in higher education institutions. ChatGPT's capabilities in facilitating dynamic and interactive learning experiences have revolutionized traditional pedagogical approaches. This study delves into the practical applications and potential benefits of integrating ChatGPT into collaborative learning environments. From enhancing student engagement and knowledge retention to promoting personalized learning, ChatGPT has rapidly become a game-changer for educators. However, alongside its promise, the paper also addresses the challenges and ethical considerations that come with this technological advancement. The rise of ChatGPT in higher education signifies a paradigm shift, promising to redefine the way educators and students interact, learn, and grow in the modern academic landscape. ChatGPT, an advanced artificial intelligence tool, has rapidly gained prominence in higher education, promising to revolutionize collaborative teaching and learning. This short review paper provides a succinct analysis of the impact and implications of ChatGPT in the higher education landscape. We explore its role in fostering interactive and personalized learning experiences, enhancing student engagement, and reshaping pedagogical approaches. However, it is not without challenges, and ethical considerations loom large. Through the lens of practical applications and case studies, we examine the benefits and potential pitfalls of integrating ChatGPT in collaborative teaching environments. This paper offers a glimpse into the transformative potential of ChatGPT in higher education, urging educators and institutions to navigate this technological wave thoughtfully and ethically.).

Keywords: Collaborative Learning, Higher Education, ChatGPT, literature Review

Citation: Boudia, C. & Bengueddach, A. (2024). Innovating Higher Education: The Rise of ChatGPT in Collaborative Learning - A Short Review. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 1347-1370), Antalya, Turkiye. ISTES.

Introduction

As In the swiftly evolving landscape of higher education, the integration of cutting-edge technologies is imperative to meet the demands of a digitally connected and information-driven world. Artificial intelligence (AI) has emerged as a revolutionary force, reshaping how educators and students engage in teaching and learning (Adiguzel et al., 2023). Among the various AI applications, ChatGPT, a potent language model, has attracted significant attention for its potential to transform collaborative teaching and learning experiences (Ahmad et al., 2023). The deployment of ChatGPT in higher education settings signifies a paradigm shift, promising to revolutionize traditional pedagogical approaches and foster dynamic, interactive learning environments (AlBadarin et al., 2023). This paper embarks on a journey to explore the multifaceted impact of ChatGPT in the higher education sector. We delve into its role in collaborative teaching and learning, shedding light on its transformative capabilities, and examining its profound implications for both educators and students. Our exploration begins with an analysis of the practical applications and benefits of ChatGPT in higher education. From enhancing student engagement and knowledge retention to promoting personalized learning experiences, ChatGPT offers a myriad of advantages that can reshape educational practices (Bueno, 2023). However, this transformative journey is not without challenges. We also address the ethical considerations and potential pitfalls associated with the integration of AI, urging a balanced and thoughtful approach to technology adoption. By presenting case studies and real-world examples of institutions and educators successfully harnessing ChatGPT in collaborative teaching, this paper aims to provide a comprehensive understanding of its practical implications. Moreover, we contemplate the future of collaborative learning with ChatGPT, envisioning an educational landscape where traditional boundaries are redefined, and innovative, tech-infused learning takes center stage. As we navigate this exploration, it becomes evident that ChatGPT's rise in higher education is not merely a technological advancement but a profound transformation that touches upon the core of pedagogy, redefining how educators and students interact, learn, and grow in the modern academic sphere. This paper serves as an introductory beacon to the compelling journey that follows, unraveling the impact, potential, and challenges of ChatGPT innovation in collaborative teaching and learning in higher education.

Context and Motivation: The integration of Artificial Intelligence (AI) into educational paradigms has witnessed a transformative trajectory, with particular attention directed towards collaborative learning environments. Amidst this landscape, ChatGPT, an advanced language model developed by OpenAI, has emerged as a noteworthy technological innovation. The contextual backdrop revolves around the imperative to comprehensively understand and assess the implications of ChatGPT in collaborative learning settings. The motivation stems from the escalating role of AI technologies in shaping educational dynamics, coupled with the need to discern the nuanced impact of ChatGPT on collaborative learning methodologies.

Objective of the Study: This paper sets out with a meticulous objective to provide a concise yet comprehensive review of the ascension of ChatGPT in the realm of collaborative learning. The primary aim is to delve into the multifaceted dimensions of ChatGPT's influence on collaborative learning environments, examining its

strengths, limitations, and the evolving pedagogical landscape it engenders. With a focal lens on collaborative learning, the study aims to elucidate the nuanced interactions between ChatGPT and learners, educators, and the collaborative learning process itself.

Contributions: The contributions of this paper are multifold. Firstly, it synthesizes current insights, offering a succinct yet thorough overview of ChatGPT's integration into collaborative learning contexts. Secondly, it endeavors to delineate the specific roles and impacts of ChatGPT within the collaborative learning framework. Furthermore, the paper aspires to bridge gaps in understanding, shedding light on potential challenges, ethical considerations, and avenues for optimizing ChatGPT's contribution to collaborative learning. As an academic endeavor, it seeks to enrich the discourse surrounding AI in education, presenting implications for educators, policymakers, and researchers invested in the evolving landscape of collaborative learning augmented by AI technologies. Through this short review, the paper aims to contribute nuanced perspectives that stimulate further research, discourse, and informed decision-making in the intersection of AI and collaborative learning.

The structure of this paper unfolds as follows: In Section 2, we embark on a background examining collaborative teaching and learning in higher education in the traditional classroom and ChatGPT and its utilizations. Transitioning to Section 3, we meticulously unravel the literature review about the subject. Then, in the next section, we discuss the studies mentioned in the literature review section, and summarizing key findings, insights, and the transformative potential of ChatGPT in higher education. The article concludes by emphasizing a summary of importance ChatGPT and some future research directions of technology adoption within the educational sphere.

Background

Collaborative learning

Collaborative learning is an educational approach wherein individuals engage in a shared learning experience, actively participating in the joint construction of knowledge through mutual cooperation and collective effort. This pedagogical strategy emphasizes interaction, communication, and collaboration among learners, fostering a dynamic environment where participants contribute diverse perspectives, skills, and insights. Within the context of collaborative learning, individuals work together on tasks, projects, or activities, promoting the exchange of ideas, the negotiation of meaning, and the development of critical thinking skills. This method underscores the social nature of learning, acknowledging that knowledge acquisition is not solely an individual endeavor but a communal process facilitated by interdependence and reciprocal influence (Boudia et al., 2019).

Collaborative learning methodologies encompass various forms, including group discussions, peer teaching, joint problem-solving, and cooperative projects like programming (Krismadinata et al., 2023). The ultimate goal is to enhance the overall learning experience by capitalizing on the collective intelligence and diverse strengths of the participants, fostering a sense of shared responsibility for the learning outcomes (Adiguzel et al., 2023).

Collaborative learning systems typically consist of various components that work together to facilitate and support collaborative learning experiences. The main components can include (Garcia & Jung, 2021):

1. **Learning Management System (LMS):** An LMS is a central platform where course materials, assignments, and assessments are organized. It may have features for discussion forums, chat rooms, and collaboration tools. In a collaborative learning system, the LMS serves as a hub for communication and content sharing.
2. **Collaboration Tools:** These tools enable students and instructors to communicate and collaborate in real-time or asynchronously. They can include discussion boards, chat rooms, video conferencing, wikis, and collaborative document editing tools.
3. **Content Management:** This component allows for the creation, storage, and sharing of learning materials. It might include a repository for documents, videos, and other resources that can be accessed by learners.
4. **Assessment and Evaluation Tools:** These tools help instructors assess students' progress and performance. They can include quizzes, surveys, and peer assessment features.
5. **Communication Tools:** Email, messaging, and notification systems help students and instructors stay connected and informed about course updates, deadlines, and discussions.
6. **Social Networking Integration:** Integration with social media platforms or dedicated learning-focused social networks can promote social learning and interaction among students.
7. **Learning Analytics:** These tools collect and analyze data on student engagement and performance. They provide insights to instructors and students, helping them identify areas for improvement.
8. **Access Control and Security:** Security features ensure that only authorized users have access to the collaborative learning system. Data encryption and user authentication are crucial components.
9. **User Profiles:** Users should be able to create profiles that include their information, interests, and academic progress. This helps in building a sense of community and facilitates interaction among learners.
10. **Mobile and Cross-Platform Compatibility:** As more learning occurs on mobile devices, it's essential that the system is accessible on various platforms and devices to accommodate the diverse needs of learners.
11. **Discussion and Forum Boards:** These are spaces for asynchronous discussion, where students can post questions, share insights, and engage in peer-to-peer learning.
12. **Video Conferencing:** Real-time video conferencing tools facilitate virtual face-to-face interactions among students and instructors, supporting live discussions, lectures, and group projects.
13. **Search and Navigation Features:** An intuitive and effective search system, along with easy navigation, ensures that users can find the content and tools they need quickly and efficiently.
14. **Community and Support:** This component can include access to help resources, FAQs, user guides, and technical support to assist users in making the most of the collaborative learning system.

These components work together to create an interactive and engaging learning environment that promotes collaboration, knowledge sharing, and effective communication among learners and instructors in various

educational settings. The specific features and tools may vary depending on the platform and its intended use, whether in K-12, higher education, or corporate training.

ChatGPT

ChatGPT, developed by OpenAI, is an advanced language model based on the GPT-3.5 architecture (Al-Ashwal et al., 2023). It represents a state-of-the-art natural language processing system designed to understand and generate human-like text in a conversational context. Operating on a deep neural network with 175 billion parameters, ChatGPT leverages unsupervised learning techniques to pretrain on a vast corpus of diverse textual data, enabling it to capture intricate patterns and nuances in language. Structured as a transformer-based model, ChatGPT excels in contextual understanding, allowing it to generate coherent and contextually relevant responses in a wide array of conversational scenarios (Currie, 2023). The model is characterized by its capacity to comprehend and generate human-like text across multiple domains, showcasing a remarkable ability to engage in contextually appropriate and informative dialogue (Bai et al., 2023).

ChatGPT's academic significance lies in its contribution to the field of natural language processing, exemplifying the potential of large-scale language models in understanding and generating text in a conversational manner. Its deployment has implications for various applications, including but not limited to virtual assistance, language translation, and content generation, thereby showcasing the utility of advanced language models in real-world contexts (Ponte et al., 2023).

The key components and components types that contribute to the functionality of ChatGPT are (Anderson, 2023):

1. **Transformer Architecture:** ChatGPT is built upon a transformer-based architecture. The transformer is a deep learning model designed for natural language understanding and generation. It is composed of an encoder and a decoder, allowing it to process sequences of data effectively.
2. **Pretrained Language Model:** ChatGPT is pre-trained on vast amounts of text data. This pretraining helps the model to understand and generate human-like text. The pretrained model serves as a foundation for further fine-tuning and customization.
3. **Fine-Tuning:** After pretraining, ChatGPT can be fine-tuned for specific tasks or applications. Fine-tuning is a process that adapts the model's behavior to be more task-specific. For example, fine-tuning might be done to make ChatGPT more suitable for generating human-like responses in a chatbot application.
4. **Response Generation:** This component is responsible for generating text responses based on the input it receives. It involves taking the input text, processing it through the model, and producing a coherent and contextually relevant response.
5. **Natural Language Processing (NLP):** ChatGPT utilizes NLP techniques for tasks such as tokenization (breaking text into individual words or tokens), part-of-speech tagging, named entity recognition, and sentiment analysis. These NLP components help the model understand and generate human language.

6. Context Management: ChatGPT maintains a context window that stores the conversation history. This context management allows the model to refer back to previous messages in a conversation and respond coherently.
7. Parameter Tuning: The model has numerous hyperparameters that can be tuned to affect its behavior, such as the temperature parameter that controls the randomness of responses or the maximum length of responses.
8. Prompt Engineering: The choice of prompts or input queries plays a crucial role in the model's output. Designing effective prompts can lead to more relevant responses from ChatGPT.
9. Model Optimization: Techniques such as model compression, quantization, and pruning may be applied to optimize the size and efficiency of ChatGPT, making it more suitable for deployment in various applications.
10. Ethical and Safety Components: In response to concerns about the potential for inappropriate or harmful outputs, ChatGPT incorporates safety components designed to mitigate risks, filter out sensitive or harmful content, and ensure responsible use.

These are some of the fundamental components and aspects of ChatGPT. It's important to note that ChatGPT is a complex machine learning system, and its behavior is influenced by various parameters, data, and training procedures. OpenAI continually refines and enhances these components to improve the model's performance and safety.

Literature Review

According ChatGPT has garnered significant attention in recent research across various domains. This literature review aims to provide an overview of distinct studies that investigate the role of ChatGPT in collaborative learning, focusing on its potential, challenges, and implications. The studies span diverse fields, including software architecture, writing classes, higher education, generative AI's impact on various industries, and educational utilization in pre-service teacher training.

Ahmad et al. (2023) investigates the potential and challenges of integrating ChatGPT as a Software Development Bot (DevBot) in collaborative software architecture. Their three-phase methodology involves developing an architecture story, enabling collaborative architecting, and conducting empirical validations. Preliminary findings indicate that ChatGPT can mimic an architect's role, generate artifacts, and participate in the architecting process. However, human oversight and decision support are crucial for successful collaboration.

Anderson (2023) explores the conceptual framing of ChatGPT in the context of writing classes, focusing on tool and collaborator metaphors. The study highlights limitations in existing metaphors, emphasizing the need for multiple perspectives. Ethical concerns and accountability issues raised contribute to discussions on responsible

AI use in educational settings, providing valuable considerations for educators and students.

Dai et al. (2023) examine the role, position, and implications of ChatGPT in higher education. Their conceptual approach links technological affordances with educational needs, emphasizing the student-driven nature of ChatGPT and its potential impact on teaching, learning, and assessment. Competencies required for AI interaction, challenges, and collaborative efforts are discussed, advocating for a collective approach to harness the educational potential of ChatGPT.

Fui-Hoon Nah et al. (2023) explore challenges and opportunities presented by generative AI, focusing on ChatGPT's impact on various fields. The multidisciplinary approach emphasizes human-centered AI collaboration, addressing ethical, technological, regulatory, and economic concerns. Findings underscore the importance of incorporating generative AI in collaborative learning environments, highlighting the significance of AI literacy in educational settings.

Jeong (2023) investigates the educational utilization of ChatGPT through collaborative learning sessions with pre-service teachers. Positive affective and technology acceptance outcomes indicate that collaborative learning with ChatGPT can be enjoyable and meaningful. The study emphasizes the need for guidelines and teacher guidance to harmonize ChatGPT's integration into educational settings.

Karakose et al. (2023) assess the potential of ChatGPT, specifically versions 3.5 and 4, in supporting scientific research on the effects of the COVID-19 pandemic on education. The study showcases the chatbots' ability to provide accurate, clear, and concise information, with newer versions demonstrating enhanced critical reasoning. The findings suggest that ChatGPT could play a significant role in supporting collaborative research processes.

The study by Livberber and Ayvaz, (2023) delves into the impact of ChatGPT on the academic landscape. Conducted through qualitative interviews with ten academics experienced in ChatGPT, the research aims to gather insights into its integration into research and education. The study highlights positive perceptions, viewing ChatGPT as a valuable tool for literature review, language support, and idea generation. However, ethical concerns, particularly regarding plagiarism and misinformation, are raised. The findings also emphasize the limitations of ChatGPT, underscoring its role as a supportive tool rather than a replacement for human reasoning. Anticipated future challenges include concerns about plagiarism detection and potential declines in researchers' critical thinking skills.

Pavlik (2023) explores the capabilities and limitations of ChatGPT in journalism and media. The research involves collaboration between a human journalism professor and ChatGPT, focusing on the generation of text responses based on user prompts. While specific findings are not detailed, the essay likely discusses the quality of generated content, the effectiveness of AI-human collaboration, and considerations for integrating ChatGPT into journalism and media education. While collaborative learning is not explicitly addressed, the collaborative

content creation process implies implications for collaborative educational practices.

Pinochet et al. (2023) integrates PROMETHEE and SAPEVO-M1 methods to analyze collaborative work alternatives with ChatGPT in higher education. Utilizing a quantitative and cross-sectional approach with a focus group of 15 teachers from Brazilian universities, the study explores criteria for collaborative work and teachers' preferences in utilizing ChatGPT. The PROMETHEE-SAPEVO-M1 analysis reveals 'Support for Autonomous Learning' as the preferred alternative, highlighting the tool's potential to facilitate independent learning. The study contributes to understanding ChatGPT's role in higher education and emphasizes the importance of considering qualitative aspects, such as teachers' preferences and concerns, in decision-making for AI integration in education.

Ponte et al. (2023) explore the use of ChatGPT for providing personalized formative feedback in large-class collaborative learning. The study employs a computer-supported collaborative learning (CSCL) design framework and emphasizes the perceived quality of feedback, its influence on learning, and its impact on group dynamics. The findings highlight the potential of ChatGPT in enhancing collaborative learning experiences, while also acknowledging the need for human validation of feedback.

Su et al. (2023) focus on integrating ChatGPT into argumentative writing classrooms, addressing challenges in finding ideal peer students for practice and providing timely feedback. The study investigates ChatGPT's potential in assisting students with various writing tasks, emphasizing its dialogical, structural, and linguistic aspects. Ethical considerations are discussed, and future considerations emphasize digital literacy and responsible AI use in education.

Tan et al. (2023) provides a literature-based exploration of the potential roles of Generative Artificial Intelligence based on Large Language Models (GAI (LLMs)) in collaborative learning contexts. The study proposes strategies for the responsible and ethical integration of GAI (LLMs) in education, emphasizing roles such as learning partner, multi-way interactions, and contributions to collaborative learning. The findings offer practical insights for educators and stakeholders.

Vasconcelos & Santos (2023) investigate the potential of ChatGPT and Bing Chat in enhancing STEM education, focusing on reflective and critical thinking, creativity, problem-solving skills, and concept comprehension. The study employs a constructionist theoretical framework and emphasizes effective pedagogical strategies employed by the AI systems. It concludes that GenAIbots offer promising avenues to revolutionize STEM education through a constructionist lens.

Zhu et al. (2023) examine the impact of ChatGPT on collaborative interdisciplinary learning among undergraduate students in a digital literacy course. The study considers effects on problem-solving, engagement, and perceptions, emphasizing the importance of disciplinary backgrounds and specific learning topics. The findings underscore the need for optimized ChatGPT use considering these factors.

(Opara et al., 2023) evaluate the prospects and challenges of using ChatGPT for teaching, learning, and research purposes. The study highlights ChatGPT's ability to provide rapid responses but also points out challenges such as the lack of citation and reference in generated replies. The article discusses the potential of ChatGPT to enhance personalized learning experiences and automate repetitive tasks in education.

This short literature review provides a holistic understanding of ChatGPT's role in collaborative learning across diverse educational contexts. The studies collectively contribute to the evolving discourse on the integration of AI in education, emphasizing the potential benefits, challenges, and ethical considerations associated with leveraging ChatGPT in collaborative learning environments. The findings underscore the importance of responsible AI use, digital literacy, and thoughtful instructional design to optimize the positive impact of ChatGPT on collaborative learning outcomes.

Table 1. Summary of research on ChatGPT for Collaborative Learning.

Research Objective	Methodology	Key Findings	Relevance to the topic
Ahmad et al. (2023) aims to explore the potential and challenges of integrating ChatGPT into collaborative software architecture, focusing on its role as a Software Development Bot (DevBot).	The research employs a three-phase methodology: developing the Architecture Story, enabling Collaborative Architecting, and conducting Empirical Validations. Preliminary results reveal ChatGPT's ability to mimic an architect's role, generating artifacts, recommending tactics, and participating in collaborative architecting.	Preliminary results indicate that ChatGPT can mimic an architect's role and support Architecture-Centric Software Engineering (ACSE). It can generate architectural artifacts, recommend tactics and patterns, and participate in the collaborative architecting process. However, human oversight and decision support are crucial for successful collaboration. The study identifies areas of potential and perils, including response variation, ethical considerations, and biases in outputs.	This study holds relevance to collaborative learning by highlighting the potential for AI, like ChatGPT, to enhance collaborative processes in software architecture, providing insights into challenges and ethical considerations.
Anderson (2023) aims to explore and analyze the conceptual framing of ChatGPT in the	The methodology involves analyzing scholarly and news discourse, examining ChatGPT prompts and	The study identifies the shortcomings of the tool metaphor, emphasizing ChatGPT's reliance on authors' writing without clear attribution.	The research is relevant to "CHATGPT AND COLLABORATIVE LEARNING" by offering insights into

context of writing classes, particularly focusing on tool and collaborator metaphors. The research seeks to illustrate the limitations of these metaphors and emphasize the value of adopting multiple metaphors for an understanding of ChatGPT.	outputs, and reflecting on the author's writing process.	The collaborator metaphor is critiqued for its failure to provide accountability, as ChatGPT produces biased output without identifying original sources. Metaphors like medical and surgical are explored to understand ChatGPT's impact on human writing and the academic community. The study highlights contradictions in tool and collaborator metaphors, advocating for the use of multiple metaphors.	metaphors framing ChatGPT's role in writing classes, addressing limitations, and contributing to discussions on responsible AI use in educational settings. The findings provide considerations for educators fostering students' digital literacy when integrating ChatGPT as a writing tool or collaborator in collaborative learning environments.
Fui-Hoon Nah, F., Zheng, R., Cai, J., Siau, K., & Chen, L. (2023). The research aims to explore the challenges and opportunities of generative AI, with a focus on ChatGPT and its impact on various fields. It seeks to understand the role of human-centered AI collaboration in addressing ethical, technological, regulatory, and economic concerns associated with generative AI.	The study employs a multidisciplinary approach, combining literature review, analysis of AI development stages, and examination of specific generative AI models like ChatGPT. The methodology emphasizes the importance of human-centered AI collaboration and its implications for the design and application of generative AI.	Generative AI, exemplified by models like ChatGPT, has the potential to revolutionize various industries. Challenges associated with generative AI include ethical considerations, transparency, governance, and the need for human-AI collaboration. Human-centered AI collaboration is crucial for addressing challenges and ensuring the responsible development and application of generative AI. Considerations of empathy, transparency, ethics, and education are vital in achieving successful human-AI collaboration. The research emphasizes the need for regulations, policies, and AI literacy to guide the ethical and	The findings underscore the importance of incorporating generative AI in collaborative learning environments. The study highlights the significance of AI literacy in educational settings to prepare students for effective collaboration with generative AI. Additionally, the research emphasizes the need for a human-centered approach to AI development to align with human values and needs in collaborative learning contexts.

effective use of generative AI.			
Jeong, J. E. (2023). The objective of this study is to investigate the educational utilization methods of generative AI, specifically ChatGPT, by conducting collaborative learning sessions with pre-service teachers. The focus is on evaluating the affective domain and applying the technology acceptance model to assess pre-service teachers' perceptions of and attitudes towards using ChatGPT in an educational context.	The study involved 3 to 4 pre-service teachers from April 5 to May 10, 2023, with a total of 14 participants. Collaborative learning sessions using ChatGPT were conducted, and afterward, evaluations were carried out for the affective domain and technology acceptability. Opinions on ChatGPT's use, impressions of collaborative learning with ChatGPT, and thoughts on its educational applications were also collected.	Pre-service teachers displayed positive attitudes, motivation, and interest in collaborative learning using ChatGPT, scoring high in affective domain evaluation. In the technology acceptability assessment, participants showed favorable perceptions in factors such as usefulness, ease of use, and learning opportunities. While effective use of ChatGPT was noted in generating ideas with fast responses, concerns about answer reliability were raised, emphasizing the need for verification. Collaborative learning with ChatGPT was seen as enjoyable and meaningful, contributing to improvements in answers. The educational use of ChatGPT was recognized as a tool to enhance critical thinking across various subjects, with guidelines, teacher guidance, and feedback considered crucial for effective implementation. Participants highlighted the importance of adapting education to social changes and emphasized the significance of collaborative learning.	The findings underscore the potential of ChatGPT for educational purposes. The study suggests that guidelines for optimal use should be established, and the integration of ChatGPT into educational settings should be harmonized with teacher guidance. The positive affective and technology acceptance outcomes indicate that collaborative learning with ChatGPT can be enjoyable and meaningful, fostering improvements in both teaching and learning processes.
Karakose, T., Demirkol, M., Aslan, N., Köse, H., & Yirci, R. (2023).	Data were generated through simultaneous interviews with ChatGPT-3.5 and 4,	Accuracy, Clarity, and Conciseness: Both ChatGPT-3.5 and 4 demonstrated a strong potential to provide accurate,	The study's findings emphasize the potential of ChatGPT in collaborative research

The study aims to investigate the potential of ChatGPT, specifically versions 3.5 and 4, in supporting scientific research on the effects of the COVID-19 pandemic on education. The primary objective is to assess their ability to collaboratively analyze and provide information on various aspects of the pandemic's impact on education, evaluating accuracy, clarity, conciseness, and critical reasoning in their responses.

focusing on four key categories related to the COVID-19 pandemic's impact on education. Responses were evaluated comparatively using a trichotomous rating system, assessing accuracy, clarity, conciseness, and critical reasoning. Inter-rater agreements were measured using Cohen's kappa values. The methodology employed collaborative analysis between human and artificial intelligence to explore the chatbots' effectiveness in generating scientifically relevant information.

clear, and concise information across the evaluated categories related to the COVID-19 pandemic's impact on education. Breadth of Information: ChatGPT-4 exhibited an advantage in providing more categorized and synthesized information, showcasing a broader understanding of the topics under consideration. Critical Reasoning: ChatGPT-4 outperformed ChatGPT-3.5 in demonstrating critical reasoning, indicating an enhanced ability to synthesize and analyze information.

processes, showcasing its ability to contribute accurate and critical insights to scientific inquiries. The collaborative analysis between human intelligence and AI, as demonstrated in this study, aligns with the broader theme of collaborative learning. The results suggest that ChatGPT, especially in its newer versions, could play a significant role in supporting scientific work by ethically integrating chatbots into different stages of research. This has implications for the collaborative learning landscape, where AI collaborates with human intelligence to enhance research endeavors.

Livberber, T., & Ayvaz, S. (2023). The research aims to explore the impact of ChatGPT, an AI and machine learning technology, on the academic world. The specific objectives include collecting the

The study adopts a qualitative research approach, specifically utilizing a phenomenological research design. Ten academics with experience in ChatGPT were interviewed using a semi-structured

Academics perceive ChatGPT positively for its support in scientific research and education, finding it valuable for tasks like literature review and idea generation. However, ethical concerns arise, focusing on issues of plagiarism, misinformation, and the potential misuse of text

The study primarily focuses on the impact of ChatGPT on academia, with a particular emphasis on research and education. While collaborative learning is not explicitly addressed in the findings, the positive perception of

views of academics on ChatGPT technology, understanding how it is integrated into academic research and the education process, identifying its advantages and disadvantages, evaluating its adherence to academic ethics, and predicting its future impact on academia.	format. Thematic analyses were conducted using Maxqda qualitative data analysis software. The research questions focused on the integration of ChatGPT into academic research and education, its advantages and disadvantages, evaluation in terms of academic ethics, and its anticipated impact on the future of academia.	generated by ChatGPT. While the tool is acknowledged as helpful, academics stress its limitations, emphasizing the indispensability of human judgment. Future concerns include ongoing challenges in plagiarism detection, the need for consistent ethical regulations, and worries that heavy reliance on AI applications, such as ChatGPT, may lead to a decline in researchers' critical thinking skills.	ChatGPT as a tool for literature review and idea generation suggests potential applications in collaborative research endeavors. The ethical concerns raised, such as plagiarism and misinformation, also have implications for collaborative learning environments where integrity and accurate information dissemination are crucial. Further research may explore specific connections between ChatGPT and collaborative learning practices in academia.
Pavlik, J. V. (2023). The research aims to explore the capabilities and limitations of ChatGPT, a generative AI platform, in the context of journalism and media. The focus is on understanding how ChatGPT, in collaboration with a human journalism professor, influences the generation of text responses based on	The methodology is not explicitly mentioned in the provided passage. However, it suggests that the essay is coauthored by a human journalism and media professor in collaboration with ChatGPT. The methodology likely involves using ChatGPT to generate text responses based on prompts and reflecting on the outcomes in the context of journalism	The passage doesn't detail specific key findings. However, it implies that the essay discusses both the capacity and limitations of ChatGPT. This may include insights into the quality of generated content, the effectiveness of collaboration between AI and human experts, and considerations for integrating generative AI into journalism and media education.	The relevance to collaborative learning is not explicitly addressed in the passage. However, the collaborative nature of the essay, involving both a human professor and ChatGPT, suggests a form of collaborative content creation. The essay's insights into the implications of generative AI for journalism and media education may indirectly relate to

user prompts.	and media education.		collaborative learning by considering how AI technologies can be integrated into educational practices.
Pinochet, L. H. C., Moreira, M. Â. L., Fávero, L. P., Santos, M. dos, & Pardim, V. I. (2023). The aim of this article is to integrate two Multicriteria Decision Support (MDS) methods, PROMETHEE and SAPEVO-M1, to analyze collaborative work alternatives with ChatGPT in higher education. The research focuses on aggregating qualitative data through ordinal entries to evaluate ChatGPT's use in educational settings. The study specifically explores criteria for collaborative work and seeks to understand the preferences and priorities of teachers in utilizing ChatGPT.	The research is exploratory and descriptive, utilizing a quantitative and cross- sectional approach. A focus group of 15 teachers from Brazilian universities, who use ChatGPT in the classroom and influence technology decisions in their respective institutions, participated in remote meetings. The PROMETHEE- SAPEVO-M1 method, a hybrid model combining PROMETHEE and SAPEVO-M, was employed for decision analysis. This method incorporates qualitative inputs through ordinal entries for both alternatives and criteria. The study utilized qualitative scales to capture the decision- makers' preferences and perceptions regarding the evaluated variables.	The PROMETHEE-SAPEVO- M1 analysis revealed that the alternative with the best performance is 'Support for Autonomous Learning,' exhibiting the highest positive flow and the lowest negative flow. This indicates a strong preference for this alternative among the set. 'Virtual Assistant for Teachers,' 'Use of Gamification,' 'Generate Ideas,' and 'Emotional Support' followed in descending order of preference. 'Emotional Support' was identified as the least preferable alternative, attributed to concerns about the tool's limitations, including the lack of human interaction, reduced critical thinking, and empathy.	The study highlights ChatGPT's potential in higher education for collaborative work, particularly favoring its role in supporting autonomous learning. The analysis emphasizes the importance of qualitative considerations in decision-making when integrating AI tools like ChatGPT, with teachers' preferences and concerns playing a crucial role, especially in areas like emotional support functionalities. Overall, the findings advocate for a nuanced approach to AI tool integration in education, recognizing both their advantages and limitations. The study supports the idea that institutions should assess these tools critically, rather than outright prohibiting them, taking into

			account their potential contributions and ethical considerations within the context of higher education.
Ponte, C. D., Dushyanthen, S., & Lyons, K. (2023). The research aims to explore the use of ChatGPT as a tool for providing personalized formative feedback in large-class collaborative learning, specifically focusing on its impact on learning and group dynamics. The objective is to assess how participants perceive the quality of feedback from ChatGPT, its influence on learning, and its implications for collaborative group interactions.	The study utilized a computer-supported collaborative learning (CSCL) design framework, incorporating ChatGPT into a virtual workshop for health professionals. Participants engaged in a problem-based learning activity where ChatGPT provided personalized formative feedback. The study employed a mixed- methods approach, collecting data through a Qualtrics survey that included Likert scales and open-ended questions. Standardized custom instructions and prompts were engineered for participants. The analysis included both quantitative measures and qualitative coding of open-ended responses.	Perceived Quality of Feedback: Participants generally found the ChatGPT feedback valuable, with a majority agreeing that it helped them learn about digital health evaluation. The feedback was seen as influential in improving evaluation plans. Influence on Learning: Participants highlighted that ChatGPT provided specific, actionable, immediate, and easy-to-understand feedback on their evaluation plans. However, some expressed the need for human validation of the feedback. Influence on Group Dynamics: While many participants noted enhanced group discussion due to ChatGPT, some found it to be a distraction, hindering discussions and acting as an authority within the group. Causal Attributions: Most participants attributed their group's ChatGPT rating to adaptive responses to feedback, indicating internal and controllable causes. Few participants expressed distrust in the rating.	The study's findings emphasize the potential of ChatGPT in providing personalized formative feedback and influencing collaborative learning in large-class settings. The research contributes to the understanding of how AI tools like ChatGPT can be integrated into collaborative learning environments. Recommendations for educators include engineering and testing standardized instructions, providing detailed guidance on tool interaction, and scaffolding optimal group interactions. The study highlights the need for further research to identify design principles for effective integration of generative AI in education and to explore factors influencing group

			dynamics in AI-supported collaborative learning.
<p>Su, Y., Lin, Y., & Lai, C. (2023).</p> <p>The objective is to investigate the potential of ChatGPT in assisting students with tasks such as outline preparation, content revision, proofreading, and post-writing reflection, focusing on the dialogical, structural, and linguistic aspects of argumentation.</p>	<p>The methodology includes a review of relevant literature, exploration of the capabilities of ChatGPT, and a discussion on the integration of ChatGPT into argumentative writing pedagogy.</p>	<p>. The article envisions a dual role for ChatGPT as both a writing evaluator and a generative tool to aid complex reasoning in argumentative writing. Ethical concerns, particularly regarding authorship and plagiarism, are addressed, urging an expanded definition in the context of AI-based writing assistance tools. Looking to the future, the article underscores the need for digital literacy and training in the ethical use of ChatGPT, recommending guidance for effective questioning, utilizing ChatGPT as a thinking aid, and considering the broader implications of AI tools in argumentative writing instruction.</p>	<p>The research is relevant to collaborative learning as it explores the potential integration of ChatGPT into argumentative writing classrooms, considering its role in supporting students in various writing tasks. The study contributes to the understanding of how AI tools like ChatGPT can be leveraged in collaborative learning environments to enhance the writing process, address challenges, and promote effective dialogue in argumentative writing. The ethical considerations and future recommendations align with broader discussions on the responsible use of AI in education.</p>
<p>Tan, S. C., Chen, W., & Chua, B. L. (2023).</p> <p>To explore the potential roles of Generative Artificial Intelligence based on Large Language</p>	<p>The study adopts a literature-based approach, drawing on existing theories of collaborative learning, human-AI collaboration, and AI</p>	<p>Roles of GAI (LLMs) in Collaborative Learning: It assists in idea generation, summarization, and evaluation, serving as valuable collaborators in the learning process.</p>	<p>- Integration of GAI (LLMs) in collaborative learning settings promotes diverse ideas and perspectives. - GAI (LLMs) contribute to</p>

Models (GAI (LLMs)), particularly focusing on models like Generative Pretrained Transformer (GPT), in collaborative learning contexts. Additionally, to propose strategies for the responsible and ethical integration of GAI (LLMs) in collaborative learning environments.	readiness. The research employs a conceptual framework that integrates principles from the Learning Sciences and Computer-Supported Collaborative Learning perspective into the development and design of GAI (LLMs) for effective collaboration.	Collaboration among students, teachers, and GAI (LLMs) enhances collaborative learning by promoting diverse perspectives and insights. Teachers leverage GAI (LLMs) for tasks such as summarizing student ideas, assessing concepts, and generating learning activities. Both teachers and students need to develop AI literacy to interact effectively with GAI (LLMs) and critically evaluate generated content. Addressing issues like interpretability, biases, and maintaining human agency in the collaboration process is crucial. AI Readiness: Stakeholders must enhance cognitive knowledge, skills, vision, and ethics related to GAI (LLMs) to ensure effective collaboration.	meaningful conversations, fostering insights from various viewpoints. - The study underscores the importance of humans retaining critical tasks in learning, with GAI (LLMs) contributing to efficiency, reliability, and learning from large datasets.
Vasconcelos, M. A. R., & Santos, R. P. dos. (2023). The study aims to investigate the potential of ChatGPT and Bing Chat, advanced conversational AIs, as "objects-to-think-with" in enhancing STEM education. It focuses on fostering reflective and critical	A single-case study methodology was employed to analyze extensive interaction logs between students and both AI systems in simulated STEM learning experiences. The qualitative research design allowed for an in-depth exploration of participants' experiences and perceptions. The study	The results highlight the ability of ChatGPT and Bing Chat to help learners develop reflective and critical thinking, creativity, problem-solving skills, and concept comprehension. Positive reinforcement, Socratic-like dialogue, questioning, building on prior knowledge, and a student-centered learning approach were identified as effective pedagogical strategies employed by the AI systems. The study	The study underscores the potential of GenAIBots, like ChatGPT and Bing Chat, in creating inclusive, creative, and collaborative learning environments. These AI tools act as catalysts for exploration and innovation, actively engaging students in discussions, debates, and collaborative

thinking, creativity, problem-solving skills, and concept comprehension using a constructionist theoretical framework.	involved crafting prompts to elicit responses from the AIs and assessed their impact on student engagement and learning.	also indicated variations in the performances of ChatGPT and Bing Chat, with ChatGPT outperforming in terms of response quality, context understanding, subject comprehension, and overall performance.	projects. Their integration into STEM education aligns with a constructionist learning theory, emphasizing hands-on, experiential learning and cognitive tools. Despite these benefits, the study recognizes the need to address concerns such as AI information accuracy, reliability, and potential reduction in human interaction.
Zhu, G., Fan, X., Hou, C., Zhong, T., Seow, P., Shen-Hsing, A. C., Rajalingam, P., Yew, L. K., & Poh, T. L. (2023). The research aims to investigate the impact of ChatGPT on collaborative interdisciplinary learning among undergraduate students in a digital literacy course. It explores ts effects on collaborative problem-solving, engagement, and perceptions, emphasizing the importance of considering	A quasi-experimental design was employed, involving 130 undergraduate students (STEM and non-STEM) in a two-week digital literacy course. The students covered two learning topics, Artificial Intelligence (AI) and Blockchain. Weekly surveys and online reflections were utilized to collect data on collaborative interdisciplinary problem-solving, engagement, and student perceptions. Both quantitative and qualitative analyses were conducted to derive insights.	Significant differences were observed in collaborative interdisciplinary problem-solving, physical engagement, and cognitive engagement between the AI and Blockchain modules. The AI module, featuring debate, demonstrated higher engagement levels compared to the more factual Blockchain module. Non-STEM students exhibited increased physical and cognitive engagement without ChatGPT, while STEM students showed no significant differences. The study suggested that non-STEM students might need extra time to adapt to ChatGPT functions. Students expressed positive views on efficiency and addressing knowledge gaps. Concerns were raised about	The findings underscore the need to optimize ChatGPT use by considering students' disciplinary backgrounds and specific learning topics. The study emphasizes the role of instructional design in balancing the advantages of ChatGPT, like efficiency, with the preservation of students' agency and critical thinking. The positive and negative themes identified contribute practical insights for educators aiming to integrate ChatGPT into collaborative interdisciplinary learning.

disciplinary backgrounds and specific learning topics.		repetitive responses and a perceived lack of innovative ideas. Students emphasized the need to develop literacy skills to evaluate AI-generated content effectively.	
Opara, E., Mfon-Ette Theresa, A., & Aduke, T. C. (2023). The research objective is to evaluate the prospects and challenges of using ChatGPT for teaching, learning, and research purposes.	The methodology involves reviewing literature on the educational implications of artificial intelligence and assessing the capabilities of ChatGPT.	The key findings indicate that ChatGPT is able to provide rapid and instantaneous responses to search queries and generate text that resembles conversation responses. However, the article also highlights some difficulties, such as the lack of citation and reference in the replies generated by ChatGPT.	the article discusses the potential of using ChatGPT to enhance personalized learning experiences and automate repetitive tasks in education.
Eunjung, J. (2023). Investigate educational utilization methods of ChatGPT in collaborative learning with pre-service teachers.	collaborative learning sessions using ChatGPT with 14 pre-service teachers from April 5 to May 10, 2023. Subsequently evaluated affective domain and technology acceptance.	Pre-service teachers show high affective domain scores and positive technology acceptance during collaborative learning with ChatGPT. Clear question selection is crucial for ChatGPT's effective use, with emphasis on the need for reliability verification despite its fast response capabilities. The study recommends necessary guidelines for ChatGPT use in education, underlining the importance of teacher guidance and feedback.	The study suggests that collaborative learning with ChatGPT contributes to the development of critical thinking skills and can be applied across various subjects, emphasizing its relevance in an educational context that promotes interaction and shared learning experiences.
Cooper, G. (2023). The research aims to explore ChatGPT's role in science education: ChatGPT's	A self-study methodology is employed to investigate ChatGPT's technology. The study poses	ChatGPT's responses often align with key themes in science education research. However, it lacks evidence to support its output, potentially positioning	ChatGPT can facilitate collaborative learning by assisting educators in designing engaging science units, rubrics,

responses to science education questions, Educators' utilization of ChatGPT in science pedagogy, and Reflections on ChatGPT's use as a research tool. The objective is to initiate a broader conversation with generative AI in science education.	questions related to science education to ChatGPT and analyzes its responses. Additionally, the researcher utilizes ChatGPT as a research tool for editing and enhancing the research narrative.	itself as an ultimate epistemic authority. AI's environmental impact, content moderation issues, and the risk of copyright infringement are highlighted. Educators should model responsible AI use, prioritize critical thinking, and clarify expectations. Educators need to critically evaluate AI-generated resources and adapt them to specific teaching contexts. ChatGPT is used for editing and experimenting with research narrative clarity.	and quizzes. However, the importance of critical evaluation and adaptation to specific contexts is emphasized. The ethical considerations raised in the study are crucial for guiding responsible AI use in collaborative educational settings.

Results and Discussion

ChatGPT's capacity to foster interactive learning experiences is a key pedagogical implication. It transforms the traditional classroom dynamic, where knowledge flows primarily from educator to student, into an interactive and two-way exchange. Students are encouraged to ask questions, seek clarifications, and engage actively with the learning material. This interactive learning environment promotes a more student-centered approach, where the individual needs and preferences of students are taken into account. Educators can adapt their teaching methods to suit the specific requirements of each student, promoting a more effective and personalized educational experience. The integration of ChatGPT in higher education leads to a redefined role for educators. They transition from being the sole providers of knowledge to becoming facilitators, mentors, and guides. Educators are no longer the sole sources of information; they collaborate with ChatGPT to create a holistic learning experience. This shift in educator roles places greater emphasis on guiding students, fostering critical thinking, and helping them navigate the vast sea of information available. Educators are instrumental in teaching students how to use ChatGPT effectively, critically evaluate information, and apply their knowledge.

ChatGPT's adaptability to diverse learning styles is a significant pedagogical implication. It caters to students with varying learning preferences, whether they are visual, auditory, or kinesthetic learners. This adaptability ensures that each student can receive information and guidance in a format that resonates with their individual style. The technology's ability to offer explanations, examples, and resources tailored to each student's learning style maximizes the effectiveness of education. An overarching pedagogical implication is the promotion of inclusivity and accessibility. ChatGPT has the potential to break down barriers and provide equitable educational opportunities to all students, including those with disabilities or diverse learning needs. This

technology ensures that educational resources are available 24/7, making learning more flexible and accessible. As AI technologies like ChatGPT continue to advance, we anticipate an increasing significance of AI in education. ChatGPT is just one example of AI tools that are enhancing the educational experience. In the future, these AI tools may become ubiquitous, seamlessly integrated into various aspects of education. We foresee ChatGPT playing an augmented role in educator support. While educators remain at the forefront of teaching, ChatGPT could serve as a powerful companion, providing real-time assistance and resources to aid educators in meeting the diverse needs of their students. This collaboration between human educators and AI tools has the potential to create a more effective and personalized learning environment.

The future of collaborative learning with ChatGPT may bring about a revolution in personalized learning at scale. AI-driven algorithms can analyze student data and adapt content in real-time to meet individual needs. This level of customization could greatly improve learning outcomes and student satisfaction. ChatGPT's 24/7 accessibility could potentially break down geographical and time-related barriers. Students from around the world may gain access to quality educational resources and support whenever they need it. This expanded access has the potential to democratize education on a global scale. We must also acknowledge that the future of collaborative learning with ChatGPT will not be without challenges. Technological advancements will continue to bring new possibilities, but they will also raise questions about ethics, privacy, and the role of educators. As AI tools like ChatGPT become more sophisticated, discussions surrounding responsibility, accountability, and the potential societal impact will become increasingly critical.

The release of ChatGPT has ignited substantial discussions and research on its potential impact in the realm of collaborative learning. The studies collectively shed light on the varied impacts of ChatGPT in collaborative learning environments. These diverse studies underscore ChatGPT's potential as a collaborative tool, influencing different facets of education, from architectural development in software design to writing classes, STEM education, and scientific research on the effects of the COVID-19 pandemic. Ethical concerns, teacher competencies, and the need for guidelines consistently emerge as pivotal considerations. Building upon these findings, future research directions should prioritize several key areas. Similar to Ahmad et al. (2023), long-term studies are imperative to assess the sustained impact of ChatGPT on collaborative learning outcomes over extended periods. Inspired by Anderson's (2023) proposal, research into learning analytics should be explored in conjunction with AI chatbots to understand and inform personalized instruction within collaborative learning environments. Furthermore, investigations into student motivation and perceptions, aligning with Jeong (2023), are essential for comprehending the nuanced dynamics of student interaction with AI in collaborative settings.

The ethical considerations raised by several studies warrant in-depth analysis, particularly focusing on biases in AI-generated content and issues related to plagiarism and misinformation within collaborative learning contexts. Studies such as those by Dai et al. (2023), Nah et al. (2023), and Fávero et al. (2023) indicate the necessity for comprehensive training and support for educators to effectively integrate AI chatbots into their collaborative teaching practices. Addressing the accessibility of AI chatbots, as suggested by Su et al. (2023) and Vasconcelos & Santos (2023), is crucial to ensure equitable educational opportunities for all students within collaborative

learning settings. Comparative studies, similar to the approach proposed by Tan et al. (2023), could provide valuable insights into the effectiveness of different AI chatbot models within collaborative learning environments. Cross-disciplinary applications, as highlighted by Zhu et al. (2023), need further exploration to tailor AI chatbots to specific subjects and educational levels within collaborative learning settings. Moreover, the study by Ponte et al. (2023) underscores the importance of human validation of AI-generated feedback within collaborative learning, an aspect that should be further investigated to ensure the quality and reliability of educational interactions facilitated by ChatGPT. While the existing studies paint a promising picture of ChatGPT's potential in collaborative learning, future research should delve deeper into these identified directions to harness the benefits effectively and address the challenges comprehensively. This evolving landscape requires a concerted effort from educators, researchers, and developers to shape the responsible and effective integration of AI technologies in collaborative educational settings.

Conclusion

This short literature review explored the utilization of ChatGPT in a collaborative learning context. The current study suggests that integrating ChatGPT into collaborative learning holds promise for fostering student engagement, motivation, and self-directed learning by providing immediate feedback and assistance. The significance of this study lies in its examination of the potential benefits and challenges associated with incorporating AI chatbots into collaborative learning. By offering insights into how AI chatbots, particularly ChatGPT, can enhance student learning experiences, this study provides valuable guidance for educators, policymakers, and instructional designers aiming to effectively leverage technology in collaborative educational settings. Furthermore, ChatGPT's expansive knowledge base enables it to draw upon a wide range of educational resources and adapt to diverse learning needs. ChatGPT has the capacity to provide personalized and contextually relevant responses to students' inquiries, offering support similar to that of an AI chatbot. Its ability to understand and generate human-like text makes it a valuable tool for enhancing student engagement, promoting critical thinking, and providing on-demand assistance in collaborative learning environments.

Several future research directions should be considered to enhance the integration of ChatGPT in collaborative learning. The primary objective of these directions is to maximize the benefits derived by learners and educators from this integration. Current studies indicate that the learning process can be improved in various ways, including achieving learning outcomes, enhancing student engagement, improving instructor performance, and delivering personalized learning experiences for students across the globe within collaborative learning environments.

Abstract: In recent decades, there has been an increase in the presence of the LGBTIQ+ community in several professional and social spheres in Peru; however, their involvement in the educational sector remains relatively scarce. Therefore, the aim of this study was to gain an understanding of the reality experienced by a group of LGBTIQ+ teachers in the Peruvian Regular Basic Education sector. The methodology employed was descriptive and involved interviews with 15 LGBTIQ+ teachers working in the regular basic education sector in Peru. The findings indicate a perception among LGBTIQ+ teachers that they often feel constrained to conceal their identity in workplaces, despite the absence of overt discrimination. Furthermore, there are concerns regarding the disclosure of their identity in educational contexts, with the potential for negative repercussions. The findings suggest that the transparency of LGBTIQ+ identities is perceived as selective and sensitive when interacting with students' families, reflecting concerns about potential stigmatization or prejudices. In conclusion, this study underscores the necessity for critical perspectives regarding the participation of the LGBTIQ+ community in Peruvian Basic Education, emphasizing the necessity for changes that would facilitate acceptance and ensure active participation of LGBTIQ+ teachers in the educational setting.

Keywords: LGBTIQ+ teachers, inclusion, diversity, Regular Basic Education, Peru.

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1371-1390), Antalya, Turkiye. ISTES.

Introduction

Education is a foundational element in the construction of an inclusive society that respects diversity (Chávez et al., 2018). In this context, the issues of diversity and the role of educators in the education system have become matters of global relevance and interest (Ramírez et al., 2020). In Peru, as in many other parts of the world, there is an intention to meet the challenge of full citizenship. This is sought to be achieved through the formation of full students for integral coexistence within an equitable, egalitarian, and inclusive society, where all expressions of diversity are respected and valued (*Consejo Nacional de Educación*, 2020). Nevertheless, the successful implementation of training programs on sexual diversity in schools is contingent upon the perception and attitude of teachers towards this issue, which is not a primary consideration in most contexts (Rojas & Astudillo, 2020).

Despite legislative and social progress regarding the rights of the LGBTIQ+ community, teachers in Peru still face significant challenges in integrating sexual diversity into the school curriculum. In this sense, they play a crucial role in the process, as they are responsible for transmitting values oriented towards respect for diversity to future generations in a transversal manner (Chávez et al., 2018). In light of this, the inclusion of such training on sexual diversity in Regular Basic Education (RBE) is an essential aspect to promote a more egalitarian, respectful, and non-discriminatory society (Cardona Zuluaga & Ramírez Aristizábal, 2020). Despite the progress made in the field of LGBTIQ+ rights, there are still ingrained prejudices and stereotypes that can affect the quality of education and students' experiences in school (Kleinplatz & Diamond, 2014). Consequently, teachers have a key role to play in changing such perceptions and attitudes, as agents of change in the process of building a culture of respect for sexual diversity.

The promotion of sexual diversity in RBE is a global issue that is becoming increasingly important in the educational agenda (Galaz Valderrama et al., 2016). Such promotion seeks to foster respect for human rights and gender equality in the educational system, promoting a more inclusive and tolerant society (Dennis, 2017). Consequently, this research aimed to explore the experiences and challenges of a group of LGBTIQ+ teachers based on the execution of their role within RBS, as well as to identify the opportunities presented to them in their pedagogical work.

LGBTIQ+ Teacher Identity

The concept of LGBTIQ+ teacher identity represents an essential theoretical construct in contemporary educational research. This research focuses on the intersection of identity, gender expression, and sexual orientation (Souza et al., 2016), and its impact on the work and responsibilities of teachers in the educational environment (Aguirre et al., 2021). Similarly, this concept acknowledges that a teacher's LGBTIQ+ identity significantly impacts their experiences, both professionally and personally, within the educational system in which they perform their work (Guijarro et al., 2021).

LGBTIQ+ teachers confront distinctive and intricate challenges in their professional practice. Discrimination, stigma, and invisibility can impede their full and authentic participation in the school community (Cantos et al., 2023). Likewise, LGBTIQ+ teaching and identity entail a process of continuous self-discovery and self-reflection, wherein teachers must navigate between disclosing their identity and creating safe and respectful learning environments for themselves and their students (Dennis, 2017). This interaction between identity and teaching practice can influence inclusive teaching and the promotion of sexual diversity in the classroom, which in turn has an impact on the formation of students and the construction of a more tolerant and respectful society towards diversity (Chávez et al., 2018).

In the context of research on teacher LGBTIQ+ identity and its influence on education, it is necessary to consider the Peruvian social organization *Con mis hijos no te metas* (Do not mess with my children). This organization has generated a complex debate related to the educational context of the country. The movement has garnered attention for its stance against the implementation of gender education in schools, which has prompted debates and dilemmas surrounding sexual and gender diversity in the Peruvian educational system.

While there are no recent statistics available on the perception of this movement in Peruvian society, the existence of this movement and the controversies that have been generated are crucial to understanding the context in which LGBTIQ+ teachers engage in their educational work. Similarly, Meneses Villota (2019) posits that resistance to the inclusion of issues related to sexual diversity in education can influence the educational environment of these teachers and their abilities to create competent, safe, and respectful spaces, both for them and for their students. Furthermore, it is crucial to examine the context and the impact it generates in the intersection of LGBTIQ+ teaching identity in educational practice (Meneses Villota, 2019).

Background

Despite the advancement of legal protections for LGBTIQ+ individuals, discriminatory and violent actions continue to be prevalent in the 21st century. This highlights the necessity of incorporating diverse topics related to gender identity and LGBTIQ+ diversity into educational curricula to foster acceptance, understanding, and respect for this community. In light of these considerations, Abril and Palacios-Hidalgo (2022) emphasize the necessity of addressing and raising these issues in teacher training, as they indicate a lack of training and awareness in this particular area. Furthermore, they also highlight the necessity and significance of investigating the attitudes and perceptions of educators regarding the inclusion of the LGBTIQ+ community in education and the potential of their training to facilitate the creation of more inclusive and respectful environments for all gender identities and sexual orientations.

Conversely, Aguirre et al. (2021) concur with the significance of the influence of LGBTIQ+ teachers' experiences and prospective teachers' perceptions of gender diversity and sexuality. Similarly, the authors' research involved the collection of both quantitative and qualitative data from 101 education students. The findings revealed that life stories are an effective and assertive tool for conducting awareness-raising among

prospective teachers about the experience of LGBTIQ+ people and the difficulties faced by LGBTIQ+ teachers in schools. This underscores the significance of incorporating gender, sexual, and family diversity training into the curricula of higher education institutions in a gradual and systematic manner.

However, Fernández et al. (2022) indicate that the primary objective of the study they conducted in Castilla y León (Spain) was to investigate how teachers approach sex education and sexual diversity in their educational practices. This was done with the intention of promoting the inclusion of LGTBIQ+ students and managing the differences between students in the educational centers of the community. This research employs an interpretive approach and a qualitative methodology in the field of education, with a focus on the teaching skills and the reality of the classroom. A group of 17 active teachers in the region were interviewed, and the data analysis revealed a lack of training in terminology and methodological strategies to address sexual diversity in the classroom. This resulted in the absence of educational practices related to this topic. These findings underscore the pressing necessity to provide training to teachers on matters pertaining to coeducation and sexual diversity in educational institutions. Furthermore, the implementation of protocols, guidelines, programs, and the visibility of models to be followed in educational projects to promote the full inclusion of students and prevent discrimination is also recommended.

On the other hand, Huertas and Palacios-Hidalgo (2023) underscore that, thus far, research on the manner in which gender identity and sexual orientation are addressed in education systems worldwide has been constrained. Most studies in this field have focused on the analysis of stereotypes and the invisibility of LGBTIQ+ individuals in textbooks, as well as on the combating of discrimination that persists. Consequently, there has been a paucity of research conducted on the attitudes of prospective teachers. This quantitative study examines the perceptions of prospective Spanish teachers regarding the necessity of integrating issues related to the LGBTIQ+ community into their teaching performance.

The results indicate that participants ($n = 195$) hold positive attitudes towards the inclusion of LGBTIQ+ issues in their future professional careers. However, significant differences were observed according to gender and affective-sexual orientation, but not by educational stage. Similarly, the respondents indicated that teacher training is crucial, as the research indicates that even when future teachers hold positive views about the LGBTIQ+ community, a lack of awareness or experience with these issues can impede their teaching practice. The results underscore the necessity of sustaining efforts to promote reflection on LGBTIQ+ issues among educators and researchers.

Similarly, research by Aguirre et al. (2021) examines the perceptions of affective-sexual diversity among Spanish high school teachers. The study specifically addresses homophobia and teacher intervention and training through a survey of 119 teachers. In a similar vein, a questionnaire was administered to investigate related topics based on other studies. The study concludes that high schools and their communities remain hostile environments for LGBTIQ+ students. Consequently, integrating training into teaching practice and reconsidering pedagogy from an inclusive perspective is of paramount importance in fostering an inclusive

educational culture.

Conversely, Fuentes et al. (2022) propose and utilize the concept of "transgenerosity," which was initially proposed by Rodriguez (2012). This study addresses the complexities of queer and trans pedagogies in educational settings. This study employs the concept of transgenerosity to examine the potential of queer and trans affirmative practices to challenge heteronormativity, foster gender diversity, and empower trans students in educational settings and physical education.

Furthermore, Piedra (2016) presents findings based on the analysis of the perceptions of 170 physical education teachers in coeducational schools in Spain regarding homophobia and heterosexism in the educational setting. Despite the documented improvements in the inclusion of sexual diversity in sport, this study has identified the continued prevalence of heterosexist or homophobic behaviors in physical education (PE) lessons, along with a lack of awareness among teachers about these patterns. Furthermore, the study indicates that students utilize language with homosexual themes as a means of discriminatory behavior. This study contributes to the understanding of the current dynamics in the field of physical education and its relationship with sexual diversity in society.

A review of the literature reveals a dearth of empirical research on the experiences of LGBTIQ+ teachers, particularly in the context of Regular Basic Education. Most of the studies identified were conducted in Spain and, to a lesser extent, in Latin American countries. These works have documented that LGBTIQ+ teachers frequently identify limitations and difficulties in their professional practice due to their gender identity or sexual orientation, including discrimination, stigmatization, and non-inclusive work environments (Abril & Palacios-Hidalgo, 2022; Aguirre et al., In 2021, Cantos et al. (2023), Fernández et al. (2022), Fuentes et al. (2022), Guijarro et al. (2021), Huertas & Palacios-Hidalgo (2023), and Rojas & Astudillo (2020) published studies on this topic. Similarly, a notable effort has been observed in some Latin American countries to address these issues and promote a more inclusive and respectful education of sexual diversity (*Consejo Nacional de Educación*, 2020). Nevertheless, there is a paucity of empirical evidence regarding the experiences of LGBTIQ+ teachers in Latin American contexts.

Method

The current research was conducted using a qualitative approach within the phenomenological paradigm. The methodological approach proposed by Sofaer (1999) is justified by its suitability for the descriptive research question. The aim of this research project was to gain a deeper insight into the subjective experiences of teachers who identify as members of the LGBTIQ+ community within the context of Peruvian Regular Basic Education. The phenomenological paradigm was selected to capture and analyze the personal experiences and the construction of meaning of the participants in relation to their identity and professional practice (Cantos et al., 2023).

Participants

The research participant group consisted of a cohort of teachers who self-identify as members of the LGBTIQ+ community and who are employed in the Peruvian Regular Basic Education System. The sample was selected using a non-probabilistic purposive selection process, which aimed to address the variability of experiences and opinions present within the group of interest. The selection process yielded a total of 15 teachers who met the aforementioned criteria and were invited to participate. Table 1 presents the data obtained on the general profile of the participants.

Table 1. General profile of participants (Lima, Peru)

Participant	Age	Highest academic degree achieved	Level and grade at which he/she teaches	LGBTIQ+ Identity
Participant No. 1	33	Bachelor's Degree	Primary, 3rd	Bisexual woman
Participant No. 2	27	Bachelor's Degree	Primary, 4th	Bisexual woman
Participant No. 3	27	Bachelor's Degree	Kinder	Bisexual woman
Participant No. 4	39	Master's Degree	Secondary, 4th and 5th grades	Homosexual man
Participant No. 5	40	Master's Degree	Primary, 5th	Homosexual woman
Participant No. 6	28	Master's Degree	Primary, 5th	Bisexual woman
Participant No. 7	24	Bachelor's Degree	Secondary, 1st, 3rd and 4th grades	Bisexual woman
Participant No. 8	31	Bachelor's Degree	Secondary, 3rd	Homosexual man
Participant No. 9	48	Bachelor's Degree	Secondary, 1st through 5th grades	Gay cisgender
Participant No. 10	49	Bachelor's Degree	Secondary, 5th	Homosexual man
Participant No. 11	29	Bachelor's Degree	Primary, 3rd	Bisexual woman
Participant No. 12	31	Master's Degree	Primary, 5th	Homosexual woman
Participant No. 13	34	Bachelor's Degree	Primary, 1st	Homosexual woman

Participant No. 14	37	Master's Degree	Primary, 3rd to Secondary, 3rd	Pansexual woman
Participant No. 15	29	Bachelor's Degree	Secondary, 1st and 2nd	Homosexual man

Source: Own elaboration

Instrument

In order to gain a comprehensive understanding of the experiences and perceptions of LGBTIQ+ teachers, a semi-structured interview was deemed the most appropriate research technique. The technique and its associated tools were selected with the intention of eliciting comprehensive responses through the utilization of structured and open-ended questions (Sofaer, 1999). The decision to employ this methodology was predicated on the necessity to comprehend the experiences of the participants in their totality. This entailed adjusting the questions as the dialogue progressed, while maintaining a focus on the key themes.

Similarly, the semi-structured interviews facilitated the maintenance of equivalence between the flexibility necessary to comprehend the diversity of voices and experiences and the direction provided by predefined questions. This approach enabled the achievement of an understanding, both contextual and detailed, of the phenomena, in alignment with the fundamental principles of qualitative methodology (Sofaer, 1999). Similarly, to the aforementioned semi-structured interviews, the inherent adaptability of this methodology permitted the questions to be modified according to the needs of the participants. Consequently, it was possible to delve more deeply into emerging areas of interest, which was particularly beneficial in addressing and examining the perceptions and experiences of the teachers.

The interviews were conducted in person and virtually at the discretion of the participants, according to their convenience and availability. Similarly, the interviews were recorded through audio recordings after obtaining the informed consent of the participants. Subsequently, these recordings were subjected to a systematic analysis in accordance with the principles of qualitative methodology. The objective was to identify and describe the experiences and opinions expressed by the participants, as well as the underlying structures present in their conversations and narratives (Lopezosa, 2020). This process permitted the subsequent comprehensive and meticulous examination of the experiences of LGBTIQ+ teachers within the context under investigation. Table 2 below presents the semi-structured interview guide utilized in the research.

Validation

In order to ensure the efficacy of the semi-structured interviews, a pilot test was conducted with a randomly selected subset of three participants. The primary objective of this pilot test was to ascertain the suitability of the research instrument. This entailed ensuring that the questions were appropriate and that the number of questions was accurate to collect relevant data. Following the pilot testing phase, it was established that the questions were appropriate and provided a robust framework for data collection. Consequently, the same instrument was employed with the entire group of study participants, thus ensuring the completeness and validity of the data collected.

The results were validated through a multi-stage process to ensure the robustness and reliability of the research findings. As a preliminary step, a peer review was conducted, during which the perspectives of experts in the field of social studies with specialization in areas such as psychology and pedagogy were sought. Despite lacking authorization from most experts for the dissemination of personal data, the involvement of psychologist Jienin Eissa in the validation process is worthy of note, as she made her personal information available. Similarly, the process of critical review by professionals with experience in the topics under investigation enabled the evaluation of the coherence and relevance of the interpretations made. In this context, the comments and suggestions provided by these experts were incorporated into the refinement of the interpretations and the validation of the results.

Finally, in order to enhance the validation process and to guarantee the consistency of the conclusions, a confirmation session was conducted with the study participants themselves. During this session, the principal findings of the research were presented, and the participants were afforded the opportunity to express their opinions and clarify any aspects that may have prompted questions. This dialogue between researchers and participants contributed to a more complete understanding of the experiences and perspectives of LGBTIQ+ teachers in the Peruvian educational context. The multi-stage validation process ensured a comprehensive evaluation of the results and enhanced the reliability of the research findings.

Ethical principles

The present research was based on the general ethical principles that govern scientific inquiry, with a particular

focus on guaranteeing the integral protection of the privacy and confidentiality of the participants involved. Consequently, a meticulous research ethics protocol was consistently adhered to throughout the entire process. In accordance with the aforementioned ethical standards, each participant was provided with explicit and detailed informed consent prior to their involvement in the study. In this context, the consent phase ensured that LGBTIQ+ teachers received all the information necessary to fully comprehend the objectives, procedures, and potential consequences of the research. Furthermore, the voluntary nature of their participation was underscored, and they were assured the right to withdraw from the study at any time without facing any adverse consequences or undue pressure.

Moreover, meticulous precautions were taken to guarantee the confidentiality and anonymity of the participants. In order to safeguard the identity of LGBTIQ+ teachers, pseudonyms were assigned. Furthermore, any data that could lead to the identification of participants was kept strictly confidential. It is imperative that the ethical principles of research be respected in this study, and we sought thus to contribute to the advancement of academic knowledge and to the promotion of diversity and inclusion in the Peruvian educational context in a manner that would honor the dignity and autonomy of the participants.

Results

The insights gleaned from the respondents indicate that there is still a nascent awareness of LGBTIQ+ teachers in the context of Peruvian Regular Basic Education. Most respondents indicated that the level of acceptance they experienced varied, ranging from significant support to challenges derived from discrimination or a lack of understanding. This perception is consistent with the necessity to foster an inclusive environment in all aspects of work and education. Notwithstanding this, only approximately 30% of those surveyed indicate progress and an increase in recognition and support for the community within the Peruvian educational context. Similarly, the persistence of challenges and the urgency of strengthening institutional policies and resources to ensure equitable and respectful treatment of LGBTIQ+ teachers are acknowledged. Considering this reality, the experiences and opinions gathered from these professionals can be classified into several key categories, thereby illuminating the complex panorama they face in their professional practice.

The subsequent section presents the findings in the aforementioned categories. These include context and work climate with superiors and colleagues, classroom climate and relationship with students, context and relationship with students' families, conditions within the Peruvian Regular Basic Education for LGBTIQ+ teachers, and finally, an emerging category dedicated to the findings presented in the results confirmation session.

Context and work environment with superiors and colleagues

The perception of the work climate and context in Regular Basic Education for LGBTIQ+ teachers is contingent upon age and gender factors. This is evidenced by the existence of a direct contrast in the experiences of these

teachers with respect to situations of discrimination at any level. Regarding the acceptance of LGBTIQ+ individuals in the workplace, female teachers between the ages of 20 and 40 reported a perception of a space free of discrimination based on their identity as part of the LGBTIQ+ community. One participant notes:

No, I wouldn't say that I have suffered a situation of discrimination. But I think it is because nobody knows about my identity because I am in a heterosexual marriage. (Participant No. 6, 28 years old, bisexual woman).

In the case of male teachers and those over the age of 40, it is stated that:

Clearly, not all teachers and staff are 100% accepting or willing to acknowledge me. I might find some looks of mistrust or denial from colleagues. At another institution, I received the exact expression to please do not share data about my family or relationship. The school knew I was gay and that I had a partner, but the explicit suggestion came out not to tell my students about my family. It made a lot of noise to me, "don't talk about yourself". (Participant No. 9, 48 years old, cisgender gay).

Nevertheless, the act of concealing this aspect of their identity can be perceived as a pre-determined, yet involuntary, defensive mechanism. In this context, LGBTIQ+ teachers in Peruvian Regular Basic Education do not perceive that the work context allows them to express their identity in its entirety. It is clear that the workplace does not provide an environment where educators are encouraged to reveal their identities freely or to conceal their selves. In this regard, some of the interviewees stated that:

To be precise, the answer is a resounding "no." My superiors are unaware of my sexual orientation. I occupy a position of coordination, with superiors and subordinates. None of these individuals are aware of my sexual orientation. (Participant No. 4, 39 years old, homosexual man).

No, it is difficult. I arrive and introduce myself, but to say openly that I am a lesbian is very difficult. You can always be rejected, either by your colleagues or superiors. You prefer to be quiet and even hide your private life (...). (Participant No. 13, 34 years old, homosexual woman).

In contrast, despite the sentiments expressed about the sense of belonging and discrimination, most participants indicated that their educational institution has a positive impact on their sense of belonging and recognition, regardless of characteristics such as age, LGBTIQ+ identity, academic degree, and level at which they teach. One interviewee stated:

I have had the opportunity to enjoy benefits that legally do not correspond to me. For instance, I have not received full maternity leave, and the benefits I have been able to receive have been provided in a manner that is not feasible for me. In situations such as leave or childcare, the institution in question validates the status of the mother. (Participant No. 5, 40 years old, homosexual woman).

It is crucial to note that I have not always been transparent about my sexual orientation. However, one of the factors that influenced my decision to be open was the alignment between my expectations of my students and the support I provide them. I believe that honesty is an essential aspect of any relationship, and I strive to be honest with my students.

Furthermore, I have found that this profession allows me to be myself, and I have been fortunate to work alongside many supportive colleagues, including many LGBT teachers. This has created a positive and inclusive environment. (Participant No. 9, 48 years old, cisgender gay).

Classroom climate and relationship with the students.

According to the perceptions of the interviewees indicate that the complex reality and relationship between the classroom environment and the LGBTIQ+ identity of teachers is evident. In most cases, it is commonly perceived that the classroom is a secure environment where individuals are able to express themselves freely. This perception is primarily influenced by several factors, including:

(...) the values of acceptance, safety, compassion, and empathy are essential for creating safe learning environments for all students. (Participant No. 6, 28 years old, bisexual woman).

Nevertheless, this perception is mitigated by constraints and reservations that some participants express, particularly in relation to parental perspectives and the ambiguity surrounding the acceptance of diversity. As one participant asserts:

I don't consider it safe. I work with first grade and the children talk at home (...) it implies that we run a big risk. We live in a very conservative society. (Participant No. 13, 34 years old, homosexual woman).

Similarly, it is evident that most teachers believe that they must conceal a portion of their identity when performing their duties in the classroom. They also believe that the bond with their students may be damaged if they do not provide them with the opportunity to gain an understanding of their identity as part of the LGBTIQ+ community.

I think that especially in elementary school, when students do not have an autonomous mentality, they may feel threatened or afraid because of who I am. I can't be openly gay in my work center, I know with whom I can; but if I were 100% open, I wouldn't last a month in my job because of rejection from parents, students, teachers. (Participant No. 4, 39 years old, homosexual man).

In the same way, a more favorable perception emerges in the case of secondary school teachers, with their students exhibiting a more accepting attitude. In this context, they posit that:

I also think it is a generational issue, I think kids already come with an idea of a diverse world for everyone. I think the first few times (that I shared that I was gay with my students) a lot of questions came up and maybe there could have been, from some of the students, some suspicion or surprise; but generally, I have received questions to answer and reassurance. (Participant No .9, 48 years old, cisgender gay).

Despite the existence of individual cases in which teachers do not perceive that their identity may negatively impact their performance in the classroom, most interviewees concur that family attitudes influence students' perceptions of sexual diversity in educational settings. This, in turn, affects teachers' decisions about disclosing their identity to their students.

Context and relationship with students' families

The respondents indicated that they have not been adversely affected by their students' families due to their LGBTIQ+ identity. However, they asserted that there is a pervasive need to maintain discretion regarding this aspect of their identity, which precludes them from interacting openly and transparently. A shared perception exists regarding the treatment of families. However, it is evident that instances of discrimination and direct actions towards teachers have not occurred thus far. This is likely due to the fact that teachers tend to maintain a low profile and hide their personal beliefs at the time of performing their work.

(...) I have not been affected. But for always hiding who I really am (Participant No. 5, 40 years old, homosexual woman).

In this context, most interviewees elect not to explicitly disclose their LGBTIQ+ identity, focusing instead on professional treatment that restricts the disclosure of personal information. This caution is derived from pervasive concerns about the potential for adverse consequences on both their professional and personal image should their identity become known.

Having had unpleasant experiences with the families through the boys, I think that the treatment may be strongly affected. I am afraid of the rejection I might feel if the parents find out that I am with a woman, thinking that I am not the same professional I have been, or that they might be afraid with the girls, or think that being part of the community makes me a pedophile, or something similar. I wouldn't dare comment on that. I know the school is going to be on my side, but with families that would change. It is not information that I can share calmly (Participant No. 2, 27 years old, bisexual woman).

Despite concerns about the potential negative consequences of disclosing their identity to families, teachers indicate that transparency is a subjective concept that varies depending on the context and the individuals involved. In this context, one of the interviewees asserts:

(...) es un tema en el que no he sido muy abierta con las familias (refiriéndose a la transparencia), solo lo justo y necesario. Me he enfocado en que sepan lo básico sobre mí, pero no tantas cosas personales (Participante No. 3, 27 años, mujer bisexual).

I guess I let them believe what they want to believe. I would never put the topic on the table. I focus on the children and their learning. I don't share much about my life, they need to know that I am the teacher and not my sexuality (Participant No. 6, 28 years old, bisexual female).

The interviewees indicated that the treatment received and the relationship with the students' families are maintained in an appropriate manner within the parameters of their respective institutions. Nevertheless, it is possible to identify paradigms, opinions, and stereotypes in everyday life outside of situations of direct contact with teachers.

There are definitely a lot of families against it. For example, in June, we put up a rainbow with some students. It didn't even last two days, because the parents considered that they were homosexualizing the children in the classroom. This relationship with families is crucial, because their opinions as customers is super important, and many of these families don't want homosexual teachers. There would be real and strong repercussions (Participant No. 4, 39 years old, homosexual man).

Conditions within the Peruvian Regular Basic Education for LGBTIQ+ Teachers

There is a consensus that LGBTIQ+ teachers should play an active role in the design and implementation of Peruvian Regular Basic Education:

The presence of LGBTIQ+ teachers in leadership and decision-making roles can bring valuable perspectives and unique experiences to the educational process. In addition, this can help create a more inclusive school environment, where all students feel represented and respected, regardless of their sexual orientation or gender identity (Participant No. 10, 49 years old, gay man).

It is my belief that all individuals should have equal access to this resource, and that the greater the number of perspectives present in education, the more open and visible diversity will be. (Participant No. 14, 37 years old, pansexual woman).

Nevertheless, in addition to these ideas and opinions, there are also thoughts and reflections that are constrained by the limitations of the community itself:

It is my opinion that a teacher who is openly part of the LGBTQ+ population could not be considered, feel comfortable or be included in decision-making processes at the national level. (Participant No. 1, 33 years old, bisexual woman).

(...)I know that the general public will perceive these teachers in a negative light. The participation of these teachers is key to be able to teach diversity and I think it is important for the Ministry of Education to create materials and protocols to be able to handle situations to receive diversity cases, to avoid negatively affecting the integrity of the students (Participant No. 2, 27 years old, bisexual woman).

I believe that we are currently at a considerable distance from our goal, but I also believe that if we do not begin to work towards it, it's not going to happen magically either. It's a challenge, but it's also a big responsibility. The conversation is going to start when someone starts (Participant No. 9, 48 years old, cisgender gay)

Furthermore, most of LGBTIQ+ teachers surveyed expressed a consensus regarding the inclusion of a comprehensive sexuality education (ESI) in the national curriculum for Regular Basic Education. Some of the respondents made the following observations:

It is evident that comprehensive sex education is a necessity. It is a mistake to withhold this information from students and the general public (Participant No. 6, 28 years old, bisexual woman).

There should be an ESI program in every school in Peru. There would not be so many cases of everything we see. It would be beneficial to have specialists who are knowledgeable about the process of modeling this phenomenon. (Participant No. 7, 24 years old, bisexual woman).

I think the incorporation of an ESI curriculum is a highly beneficial addition. It would provide students with crucial information to make informed decisions and would promote sexual and emotional health (Participant No. 15, 29 years old, homosexual man).

Additionally, there is a perception among LGBTIQ+ teachers that many problems and conflicts could be resolved through the incorporation of an ESI curriculum. Some have indicated that:

Whatever we cannot teach, the children will find it distorted on the Internet. It is better that a teacher teaches it with true and accurate information (Participant No. 3, 27 years old, bisexual woman).

It is fundamental to educate in ESI, not towards heteronormativity, but in an integral way, that there are different sexualities (Participant No. 4, 39 years old, homosexual man).

When a person lives in fullness, is happy and healthy and can develop to the fullest their capabilities and potential, in the community, family, workplace. This will allow us to have happy people (Participant No. 5, 40 years old, homosexual woman).

Additional, more reflective opinions are presented, which exemplify the consequences, solutions, and the impact that this curriculum could have at an integral level in our society. One of the interviewees asserts that:

The scope of ESI extends beyond LGBTIQ+ issues. There are numerous significant matters that require attention in the field of education in our country. Negative attitudes towards ESI, both within families and across the wider population, present a significant obstacle to progress. Until these attitudes change, it will be difficult to implement meaningful change. Furthermore, the absence of this information directly affects individuals who lack the security to make certain decisions. Instead of providing assistance, we are inadvertently impeding the exercise of free will in a sensitive matter. It is imperative that a reliable source of information be made available to the public, which they can then apply to their own lives (Participant No. 2, 27 years old, bisexual woman).

Other ideas (confirmation session)

The confirmation session yielded results that validated the findings of the exploration and research process conducted with the 15 participants. The feedback provided by the participants themselves regarding the findings yielded valuable insights that enhanced the study's personal and authentic portrayal of the participants.

You have managed to gather similar experiences in different places, and as different teachers coming from different contexts, we understand the importance of our presence in the representation. I find the research you have conducted to be both intriguing and significant. I hope that future studies will continue to emerge in order to illustrate the necessity for visibility and a voice (Participant No. 9, 48 years old, cisgender gay).

Moreover, the intervention prompted the participants to express their perspectives in a candid and emotionally charged manner. The experiences of the interviewees allowed us to gain a deeper understanding of the challenges faced by LGBTIQ+ teachers on a daily basis:

We are camouflaged workers, we live hiding. We need research like this so we don't have to hide (Participant No. 13, 34 years old, homosexual woman).

The data is super important to show that we exist, that we are here and that we have always been here. Even that, as teachers, we were once the LGBT students who were in class and that we also had to hide. And that, sometimes, is one of the reasons that pushes us to come out and show our faces because we were once that student who had no one to represent him in class; now there can be teachers and there are teachers who can do that (Participant No. 9, 48 years old, cisgender gay).

Discussion

The decision to employ semi-structured interviews as a research instrument permitted a comprehensive examination of the experiences of the cohort of LGBTIQ+ teachers, thereby furnishing a comprehensive contextual framework for the interpretation of their perspectives. This approach, which is firmly rooted in the principles of qualitative methodology, enabled us to address complex issues related to inclusion and diversity in the educational setting. This approach enabled us to corroborate some of the findings previously identified in the literature on the subject, while also suggesting additional reflections that emerged in the context of the research.

The teachers interviewed concur with the findings of Abril and Palacios-Hidalgo (2022) and Fernández et al. (2022), namely that there is a dearth of awareness, education, and training, both basic and ongoing, on matters pertaining to diversity and LGBTIQ+ inclusion in an all-encompassing manner within the various educational communities. In addition, the interviewees and the literature indicate the absence of information and visibility of the LGBTIQ+ community and its members, including students, teachers, and participants within the educational ecosystem. In a similar vein, the interviewees emphasize the significance of incorporating the experiences and perspectives of LGBTIQ+ teachers on matters pertaining to gender diversity and sexuality, in alignment with the findings of Aguirre et al. (2021). Consequently, as the participants have indicated, there is a dearth of awareness and training in educational communities about LGBTIQ+ diversity, which is reflected in the absence of information and visibility. This lack of integration is at odds with the imperative to promote a more inclusive education. In accordance with this, Aguirre et al. (2021) emphasize the significance of incorporating the perspectives of LGBTIQ+ educators in order to comprehensively address sexual diversity within the educational setting.

The findings indicate a lack of integration of a Comprehensive Sexuality Education (ESI) proposal in the National Basic Education Curriculum. This finding is consistent with the conclusions of Fernández et al. (2022), who identified a significant gap in the training and educational practices of teachers in Castilla y León (Spain) in relation to sexual diversity. Furthermore, the interviewees emphasize the lack of education in this area, thereby reinforcing the necessity to implement comprehensive and targeted training programmes to address this deficit and foster a more inclusive education at the national level. In accordance with this point, Palacios-Hidalgo (2023) underscores the necessity of such programs, noting the dearth of research on the incorporation of LGBTIQ+ issues in teacher education on a global scale. Furthermore, Aguirre et al. (2021) emphasize the importance of integrating the perspectives of LGBTIQ+ teachers in order to comprehensively address sexual diversity in the educational setting. This evidence provides compelling rationale for the implementation of tangible measures to enhance training and facilitate inclusion in educational settings.

The contributions and reflections of LGBTIQ+ teachers tend to converge on a common theme: the absence of resources and consideration towards them, which limits the visibility of the community within the Peruvian educational sector. The absence of reflection on the existence of a barrier to recognition and visibility caused by

a system of heteronormativity is evident. Consequently, the interviewees tend to focus their experiences as LGBTIQ+ teachers from the perspective of consequences and repercussions, rather than from a perspective of causality analysis.

It is crucial to examine the experiences of this "camouflaged community" within the Peruvian educational context in order to develop resources, solutions, and viable pathways for the inclusion of sexual diversity in education. Only through such an approach can some of the stereotypes and limitations that this minority faces on a daily basis, as individuals and as workers, be addressed. The experiences and perspectives of LGBTIQ+ educators provide insight into the multifaceted nature of educational inclusion and its significance in the current Peruvian context.

Conclusion

The objective of this study was to describe the experiences of LGBTIQ+ teachers in the Peruvian Regular Basic Education context. The qualitative approach enabled an examination of their perspectives, illuminating crucial aspects of diversity and inclusion in education. Consequently, the study yielded clear results and evidence that express the different realities, experiences, and concerns of this "camouflaged community," which allows for a deeper understanding of the perspective of these teachers when exercising their role both inside and outside the classroom. Similarly, it became evident that there was a lack of awareness and training among educational communities regarding pertinent topics related to inclusion and diversity. This directly impacted the various inclusive educational ecosystems and consequently affected their pedagogical practice.

A recurring finding in the research is the crucial need for teacher training on matters pertaining to sexual diversity. Similarly, LGBTIQ+ teachers report a lack of awareness and training in educational communities, which negatively impacts their ability to create inclusive environments. This underscores the critical importance of comprehensive and targeted training programs to address this gap and promote more inclusive education. Additionally, the experiences of LGBTIQ+ teachers demonstrate a duality, whereby some feel unable to fully express their identity in the work environment. This highlights the significant influence of institutional representation. Conversely, positive institutional acceptance and support can influence teachers' perceptions of their work environment and their ability to openly express their identity. This underscores the necessity for organizational policies and attitudes that foster inclusion.

Furthermore, the absence of awareness and specific training on comprehensive sexuality education issues has a detrimental impact on the teaching practice in promoting the inclusion of LGTBIQ+ students. This finding underscores the inadequacy of current training in effectively addressing sexual diversity in the classroom and the necessity for a more comprehensive and conscious approach to the diversity that characterizes educational communities. Consequently, it is imperative that all stakeholders in the educational sector maintain an open perspective regarding the implementation of a comprehensive approach to the preparation of educational

personnel, with the aim of fostering inclusive educational practices.

In the context of future research, it is recommended that the search for information be focused on the effectiveness of different specific training programs for teachers in educational settings in different regions. This would address the different realities and needs of each context. In addition, it is recommended that the impact of institutional policies on the perception and work experience of LGBTIQ+ teachers be investigated. Similarly, opportunities should be explored where the importance of analyzing how they can be shaped to promote a more inclusive and respectful work environment could be highlighted. In addition, it is recommended that the implementation and effectiveness of inclusive pedagogical practices in educational spaces with gender and sexuality diversity be analyzed in detail. This analysis should examine how these practices affect the educational dynamics and contribute to the creation of more egalitarian and welcoming learning environments. The objective is to advance the understanding of the importance of diversity in the educational environment.

The Impact of The Use of Artificial Intelligence-Based Gamification on The Development of The Motivation of Students of The Basic Stage Towards Education

Fadi Bani Ahmad

Arab Open University, Jordan,  <https://orcid.org/0000-0001-7984-6401>

Abstract: The study aimed to investigate the impact of the use of artificial intelligence-based gamification on the development of motivation among students of the basic stage towards learning science. To achieve this goal, the study used the semi-experimental approach, and the researcher used the motivation scale after verifying its validity and stability on a sample of (54) students randomly distributed to two groups, an experimental group of (27) students who studied the proposed unit of the science course with artificial intelligence-based gamification and a control group that studied in the usual gamification method consisting of (27) students. The study found that there were no statistically significant differences in the overall performance on the motivation scale between the two groups. The study recommended several recommendations, the most important of which is: benefiting from artificial intelligence-based gamification in developing motivation towards learning and improving achievement. Gamification based on artificial intelligence also embodies information for the learner and preserves the aftermath of learning.

Keywords: gamification, artificial intelligence, motivation, science.

The Impact of The Use of Artificial Intelligence-Based Gamification on The Development Of The Motivation of Students of The Basic Stage Towards Education. *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1391-1401), Antalya, Turkiye. ISTES.

Introduction

Modern technologies based on artificial intelligence have contributed to diversity in teaching and learning methods and strategies, especially gamified learning, which has provided an interactive learning environment for the learner, so that the learner can self-learn and flexible and acquire different and diverse knowledge and skills. With the digital acceleration in education, artificial intelligence has emerged, which focuses on multiple education, which achieves entertainment with the desired educational goals. Hence, the desire to learn increases, motivates them, and increases the suspense in understanding and learning abstract scientific materials, which constitute an obstacle for learners, and the low level of their school achievement. by relying on those toys that have become accessible to children.

The reliance on modern digital technologies based on artificial intelligence, including packaging, is increasing to improve the cognitive, analytical, mathematical and communication skills of learners, especially the skills of creativity and the ability to take the initiative. The study (Shin & Shin, 2020) confirmed that science courses are one of the most primary courses that can employ artificial intelligence applications in the educational process, especially as they include abstract and somewhat complex scientific concepts.

Gamification strategy based on artificial intelligence helps to develop many positive traits, behaviors, and personal skills such as perseverance, creativity, and flexibility among learners, as well as the development of thinking that needs to be developed and developed considering digital transformation (Bridgeland, 2006). The study of (Kim, Rothrock, & Freivalds, 2016; Yildirim, 2017) that gamification improves students' skills by providing a spirit of competition and challenges among learners, encouraging them to challenge, and guiding them towards creativity and innovation. To succeed in work, there must be a desire for this, which is called motivation. Gamification can increase the learner's motivation towards learning, which facilitates creativity and innovation. Achieving this depends on the mechanism by which gamification is used, while determining its usefulness and discovering its applications (Aşıksoy, 2017).

From this point of view, the researcher was born with the idea of working to develop creativity among learners, especially in learning science, which is characterized as an abstract subject with its scientific concepts and far from the learner's imagination and requires higher skills of thinking. The need was for a way for the learner to feel eager to learn and to achieve enjoyable learning so that the scientific content becomes flexible, entertaining and linked to daily life that develops the learner's thinking, especially the mastery of children today, the art of dealing with digital games and continuously, so the pursuit of investing these techniques and their ability in learning and education and revealing the talents and creativity of learners, so the main idea of the research was identified in measuring the impact of the use of artificial intelligence-based gamification (Gamification) in developing creative thinking skills among students of the third grade in science.

The problem of the study

The great challenge for teachers and parents lies in enhancing the eagerness of their children to learn science, because it is a scientific subject characterized by abstract concepts and scientific experiments that are difficult to achieve, for reasons of security and safety as well as for material reasons. Digital transformation has had many effects in achieving this. The researcher found by referring to the achievement scores of learners in the first primary stages to the low scores of students in science in particular, as it is a scientific subject characterized by abstract scientific concepts, numbers and scientific and astronomical phenomena that are difficult for children to imagine, which led the researcher to strive to develop an education strategy that achieves their enjoyment in education at reasonable prices, easy to trade, flexible and can be dealt with and learned through at home and at school through mobile applications, due to the availability of smart devices with their parents.

Referring to the recommendations of many studies that stressed the need to activate digital learning using smart

games, including the study of (Kim, Rothrock, & Freivalds, 2016, Yildirim, 2017, Aşıksoy, 2017) and the Third Regional Conference for Excellence in Education (Al-Ghamdi, 2019). The study (Qawaqneh, 2023) also recommended using virtual laboratories based on artificial intelligence and all its applications in the learning process.

The purpose of the study

The current study aims to reveal the impact of the use of artificial intelligence-based gamification in developing the motivation of students of the basic stage towards education, by answering the following question:

- What is the impact of using artificial intelligence-based gamification in developing the motivation of sixth graders towards learning science?

Hypothesis of the Study

Considering its objective, the study seeks to test the following null hypothesis:

- There is no statistically significant difference at the level of significance ($\alpha \leq 0.05$) between the average scores of the students of the experimental group (artificial intelligence-based gamification) and the average scores of the students of the control group (habitual gamification) in the test of the scale of motivation towards learning science due to the method of teaching.

Importance of the Study

Theoretical importance: The study may add a new type of study related to AI-based gamification, which helps it improve education outcomes and overcome many different problems and challenges. The practical importance lies: the results of the study may provide decision-makers with the ability to strive towards the development of the educational process. Improve it with all its elements and dimensions to serve the learning process and provide parents with the results of their children to follow them and improve them.

The limits of the study

Objective Limit: A learning module has been selected from the proposed course titled Animal Classification.

Human Limit: Students of the sixth grade.

Spatial Limit: Al-Nasser Modern School in Amman Governorate.

Time limit: The first semester of the academic year (2023/2024).

Literature review

Research on gamification and learning applications is related to other research areas, namely technology, games, and learning. When these components interact with each other, more sub-elements appear; digital games, serious

games, and education-enhancing technology. The center of these elements is gamification, and Figure (1) illustrates this relationship. (Prensky, 2001).

Figure No. 1. The areas related to the concept of gamification.

Digital games include video games, computers, mobile games, and many others. Digital games have become part of modern culture, where all children play a certain game, and they continue to do so until they reach adulthood, and this is confirmed by the Entertainment Software Association (ESA), which created facts about the gaming industry, as it indicated that digital games include a large audience of people, and at different ages, and thus the use of game elements in the application of education will have a significant positive impact (Oblinger, 2016).

(Carmichael)2016 mentioned the importance of gamification because it has a great role in achieving the required educational goals, including that gamification maintains teamwork among students, and that it helps students commit to discipline, and that it gives more freedom, leads to high results, and makes materials more enjoyable away from boredom.

Educators emphasize the need to employ modern technological learning tools in the educational process, especially in teaching scientific courses that include abstract scientific concepts and scientific phenomena that are difficult to imagine among students, in addition to the fact that there are chemical equations that cannot be implemented on the ground because of their seriousness and high cost (Rabie,2018). (Landers et al.2015) confirmed that, in addition to integrating gamification in the classroom, students are more ambitious and motivated to learn effectively, which leads them to study more seriously (Bicen & Kocakoyum, 2018).

Among the modern strategies that develop motivation and improve achievement among learners is the gamification strategy, which reduces stress and excitement among students and achieves simulation of scientific phenomena. As for the study (Forst al el, 2015), which aimed to know the effectiveness of the learning management system in gamification on the motivation of university students in learning the software design course, the sample was applied to a sample of (37) students and the researcher used the semi-experimental

approach, and it was found that the size of the impact on their motivation was less than average.

From Arab and foreign studies related to the subject, Al-Hafnawi's study (2017) to determine the impact of the use of electronic activities based on the principle of gamification (Gamification) in the light of standards for the development of mathematical concepts among deaf students with learning difficulties in Mansoura in Egypt. The researcher used the semi-experimental approach, as he selected a sample of (30) students in Al-Amal Elementary School, and they were distributed into two groups, experimental with (15) students, and the female officer with (15) students, and the application of an electronic game related to the school curriculum, in addition to an achievement test in mathematics, and a measure of diagnostic estimation of learning difficulties. One of the most prominent results of the study was that the members of the experimental group who applied the principle of gamification showed high levels in the mathematics test, and the impact was positive for the use of electronic activities based on the principle of gamification in the development of mathematical concepts among deaf students.

The study (Mazyunah & Ahmad) 2022 aimed to measure the impact of the use of the gamification strategy on academic achievement and motivation in the computer course. The semi-experimental approach was used on a sample of school students in the first secondary grade. After applying the study tools, the results showed that there were no differences between the two groups in the motivation scale, and the size of the impact was small.

In light of the above, the status of the current study among previous studies comes in that it adopted the principle of gamification in the development of creative thinking for students in the field of science, as it focuses on the importance of gamification in developing students' skills and increasing their motivation, as it is unique – to the knowledge of the researcher - to study the impact of the use of artificial intelligence-based gamification in the development of motivation among students of the sixth grade in science. The researcher will benefit by reviewing previous studies in building theoretical literature, choosing the study sample, determining the study methodology and statistical treatments, and discussing the results reached by the researcher.

Methodology

Based on the nature of the study and the information required to answer its question and achieve its goal, the researcher used the quasi-experimental approach to suit this type of studies.

Study Design

The researcher used the quasi-experimental design (Quasi Experimental Design) because of the inability to achieve random selection and random assignment of students, so the study design can be summarized as follows:

Table 1. Study Design

O₂	X	O₁	G.1
O₂	–	O ₁	G.2

Whereas:

O₁	Pre-measurement on the scale of motivation towards learning science
X:	Processing (gamification-based application)
O₂	Dimensional measurement on the scale of motivation towards learning science
–	No processing (control group)
G.1	Experimental Group I
G.2	The second control group

Study population:

The study population consists of all sixth-grade students in private schools in the capital Amman.

Study sample.

sample was selected in the intentional way from the students of the sixth grade of Al-Nasser Modern School from the Directorate of Special Education/ Amman, and the groups were randomly distributed to two study groups: the first experimental group (27) students were taught using the strategy of artificial intelligence-based gamification. The second control group (27) male and female students were taught using the usual gamification method.

Study instrument.

The Motivation Scale was developed to measure the motivation of students towards learning science before and after starting teaching using gamification. It was applied to a sample of (7) students by extracting the stability coefficient of the tool using the method of calculating the Cronbach' Alpha coefficient. The stability coefficient reached (0.93), which is a high stability coefficient. The rate of application of the tool was (20) minutes approximately.

Class Dojo App

Class Dojo is a free electronic application, as it is used to promote desirable behaviors for students, through a set of symbols and reinforcement points granted to the student based on several behavioral criteria determined by the teacher, with the possibility of representing these points with graphs and reports sent to the student and his /her parent directly. The program, which can be run from a computer or mobile device, facilitates maintaining motivation and attention by providing students with immediate feedback (positive or negative) in the classroom, This application is based on the existence of an account for each student, containing a username and password,

and through this account students and parents can access the student behavior record, (Garcia, Hoang & Brown, 2015).

Statistical Treatment

To calculate the stability of the tool, the Cronbach' Alpha coefficient was adopted and the answer to the main study question was provided; the arithmetic media, standard deviations, the size of the trace and the ETA square were used.

** Pre-application of the study tools:*

A pre-application of the motivation scale was conducted on the study students in the experimental and control groups to verify their equivalence in the variable of motivation before carrying out the experiment, using the independent samples (T) test, and after analyzing them statistically, the results were as follows.

Table No. 2. Results of the Pre-Science Motivation Scale

DIMENSION	Group	Sample	M	S.D	T v	N	Sig
Overall	Control group	27	100.44	14.23	0.52	52	0.80
Motivation Scale	Experimental	27	100.89	8.40			

It is noted from the table (2) that the value (T) of the motivation scale is (0.14), which is not statistically significant for the total motivation scale, and this indicates the equivalence of the two groups in the motivation variable before the implementation of the experiment.

Study Results and Discussion

The aim of the study was to investigate the effects of gamification elements on students' academic achievement and motivation. The study was applied to 85 10th grade students for 6 weeks during their regular English classes which included 2 lessons a week. Before the study, a pre-test was implemented at the beginning, and a post-test was implemented at the end for both experimental (N=27) and control (N=27) groups. During the learning process, gamification elements were applied for the experimental group while the control group continued with non-gamified elements. Both groups also followed the same course book with no exceptions for 6- week learning period.

The results of this study are compatible with some other results of studies in the field. Birch (2013) used points in a study to analyze the effects of gamification on students' performance, which resulted in increasing

performance. Similarly, in this study, a point system was implemented into learning. To analyze this effect more closely, interviewed students were asked if they thought gamification had any effect on their academic achievement. Although some of them explained their ideas on its weaknesses, all the students came to agree that gamification helped them increase their performance. However, overall performance can also decline due to competition (Orosz, Farkas, & Roland-Lévy, 2013) as well as that it can develop students' competitive spirits leading to an increased performance (Lui, 2014). That's why, students were asked what they felt about collecting points. One of the students who achieved the least score among others also stated that even though it was also competitive at times, and thus distracting, collecting points increased his performance. Some studies also indicate that providing points or rewards may result in a decline in achievement (Lepper, Corpus & Iyengar, 2005), however, results of this study indicate that participants in experimental group scored significantly higher compared to their previous results before game elements were presented.

Table 3. The values of the arithmetic circles, the standard deviations, and the size of the impact of the scale of motivation towards learning

DIMENSION	Group	Sample size	M	SD	Tv	N	Sig	ETA square	Effect size
Overall	Control	27	99.16	11.66	0.70	52	0.49	0.01	Small
Motivation	group								
Scale	Experimental	27	101.26	10.01					

It is noted from the previous table that the value of (T) for the total motivation scale is equal to (0.70), and the level of significance is equal to (0.49), which is not statistically significant; it is greater than the level of significance (0.05), which indicates that there are no statistically significant apparent differences between the level of the average of the experimental and control groups in the scale of motivation towards learning science, and it is also clear that the value of the ETA square of the motivation scale is (0.01), which means that there is a small volume of teaching in the strategy of artificial intelligence-based gamification and the usual packaging strategy, in the science course for sixth grade students. This result is consistent with the results of the study of (Forest et al. While it celebrates with the study of (Hamus & Fox, 2015), which showed the superiority of the control group over the experimental group in the measure of motivation towards learning for the communications course at the university, and also disagreed with the results of the study of (Wichadee Fortaris et al., 2015) (Mi et al., 2018), which pointed to the effectiveness of gamification in developing motivation towards learning and for the benefit of the experimental group, and the reason for the difference in this result may be the method of designing the gamification strategy, as well as the difference in the study samples, as what characterized the current study is that it dealt with a sample of schools, while the vast majority of previous studies dealt with samples from the university community, and this difference may have an impact on the result, and to reveal the absence of statistically significant differences between students who learned the gamification strategy based on artificial intelligence and students who studied the usual gamification strategy, is the availability of smart devices and the ease of handling and circulation among students, which encourages them to access and external reading through websites and YouTube channels in learning and discovering information

with ease, and these devices have become easy to circulate and the availability of the Internet, as this means that education in the digital age and the era of digital transformation has become open to all, and easy for everyone to access information and data with ease.

The researcher also attributes the lack of substantial differences in the level of motivation between the study groups to the fact that the level of motivation before its application was high, which indicates the diversity of learning styles and strategies in public education institutions, where the results of the pre-application of the motivation scale in Table No. 3 reached 74% and the experimental group approximately 74% of the total score, which is a relatively high rate, which may be the reason for the lack of clear differences. You may also find that the level of motivation among students who have high achievement and others with low achievement learn through electronic games and gamification, and that the reason for the low total achievement may be for other reasons, including evaluation strategies, or different learning environments.

The study, if it continues for a longer period, may be, because motivation and conscience need a longer period than other variables, and this is confirmed by the study of (Van Roy & Zaman, 2018), which lasted 15 days, as motivation was initially low and then suddenly turned upward at the end of the semester. It is also clear to the researcher that the relationship between gamification, whether based on artificial intelligence or habitual and motivation, can only be evaluated well using a long-term study to embody long-term effects, as (Dahlstrom, 2017) indicates that motivation is a psychological condition that is difficult for the researcher to reliably deduce from the performance score, as there is little evidence to support and support how it affects motivation.

Recommendations of the Study

- Encouraging teachers in general and science teachers in particular to activate the strategy of gamification because it can raise the level of motivation if used for long periods.
- Paying attention to computer laboratories and providing technical requirements and technical support in schools to implement the gamification strategy.
- Qualifying teachers to use gamification software to serve the education process.

Suggestions

- Conducting further studies that reveal the relationship between gamification and motivation towards learning other courses and other educational stages.
- Conducting studies on gamification in improving emotional and skill learning outcomes.

Abstract: The rate of data generation over the internet has exploded over the last two decades. The data thus generated is classified as Big Data which is a current technology and is also going to rule the world in the future. Big data enables any organization to create, collect, retrieve, manage, analyze, and make decisions that are remarkable in volume, velocity, and variety. Big data came into view when traditional relational database systems were unable to handle unstructured data (weblogs, videos, photos, social updates, and human behavior) generated by the organization, social media, or any other data generation source today.. Data is expanding in size day by day, and Hadoop is utilized to process such a huge amount of data. Big data poses many security challenges because of its various properties, such as volume, velocity, and variety. The security of Big Data is one of the main concerns. This paper aims to present the integration of Big data and the techniques available using Hadoop. Data are collected and saved at unparalleled rates. Big Data Integration is the process of transferring data to the destination format from the source format. The purpose of this research work is to look into key aspects of Big data, which include the three V's of big data. The aim of this paper is to examine key aspects of Big Data, including the Big Data Three Vs. Highlighting the main issue concerning the security of Big data. This paper will deal with various security issues associated with Big data in context with the Hadoop environment and the various solution techniques and technologies involved in securing big data with Hadoop.

Keywords: BigData, Hadoop, Enterprise Information Security, Data Driven Applications, Data Integrity

Introduction

Big data is a current technology and also going to rule a world in the future. It is the Buzzword hiding both technical and marketing data inside it. Big data enable any organization to data creation, collection, retrieval, manage, analyze and make decisions that are remarkable concerning volume, velocity, and variety. To process the large volume of data from different sources, Hadoop is used for expeditious processing.

Hadoop is a core platform for structuring Big data and is an apache based open source software framework,

comprised at its core of the Hadoop file system and map reduce and is very well designed to handle vast volumes of data across a large number of nodes. But from the security point of view, the efflux of Big data and the need for this information throughout an organization escalates opportunity for hackers and another cybercriminal activity. So, the aim is to implement some enhanced data security mechanism for making privacy of user's data more secure.

The collection of large datasets not processable using traditional computing techniques is called "Big Data". Big Data is the word used to oversee mammoth volumes of various structures of data (structure and unstructured data) that are too huge that it is strenuous to utilize that data to Process, using traditional databases and software technologies. The era of Big Data has bought with it a plethora of opportunities for the advancement of science, improvement of health care, promotion of economic growth, enhancement of education system and more ways of social interaction and entertainment[5]. Big data empower any organization to data creation, collection, retrieval, manage, analyze and making decision that are remarkable in volume, velocity and variety.

In Big Data 3 V's are:

Volume: Many factors contribute to increasing the Volume of transactional data storage, live streaming and sensor data, etc.,

Variety: Today, data is stored in all types of formats, including traditional databases, text documents, emails, video, audio, transactions, etc.,

Velocity: This means how expeditious the data is being engendered and how fast the data needs to be processed to meet the requisites.

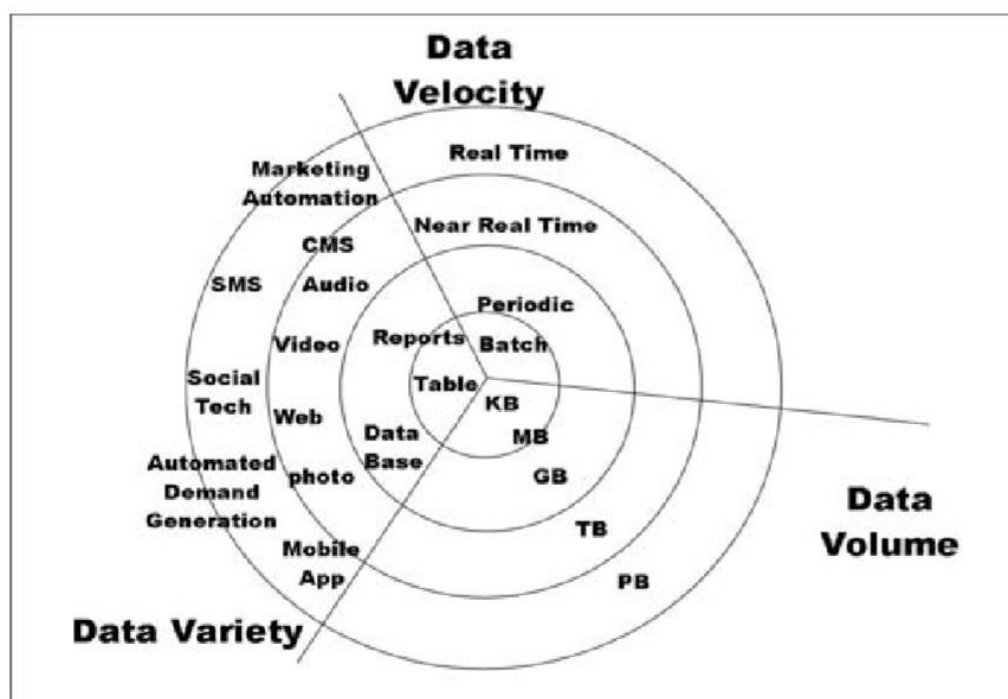

Figure 1. three V's of big Data

Table 1. Difference between Traditional data and Big Data

SI. No.	Traditional Data	Big data
1	Here the data is “Structured” data	Here the data is “Unstructured or Semi structured” data
2	The size of the data is very small	The size is more than the traditional data size
3	Here the data is centralized	Here the data are distributed
4	It is easy to work or manipulate	It is difficult to handle the data
5	Normal system configuration is sufficient to process	High system configuration is required to process the data
6	A traditional database tools is enough	Special kind of tools are required
7	Normal functions are enough to manipulate the data	Requires special kind of functions to manipulate the data

Hadoop is a free programming framework based on Java that helps to process large data sets in a distributed computer environment. The cluster Hadoop uses a Master / Slave structure. Using Hadoop, large data sets can be processed across a server cluster and applications with thousands of nodes involving thousands of terabytes can be run on systems.

Hadoop's distributed file system helps with fast data transfer rates and allows the system to continue its normal operation even in the case of certain node failures. This approach reduces the risk of a complete system failure, even if a large number of node failures occur. Hadoop empowers for a scalable, cost - effective, fault-tolerant, and flexible computer solution. Hadoop Framework is used by popular companies such as Google, Yahoo, Amazon and IBM to support large amounts of data in their applications. HDFS is a file system that spreads across all nodes in a Hadoop data storage cluster. It connects file systems to local nodes to form a single large file system. HDFS improves data reliability by replicating through multiple sources to overcome node failures.

Problem Definition and Objective

Definition

Big data poses many security challenges because of its various properties such as volume, velocity and variety. Big data security is a major concern. Because big data is a new technology on the market, it is necessary to highlight various security challenges and problems related to the introduction and use of this technology. But from the security point of view, The efflux of Big Data and the desideratum to move this information throughout an organization have created a massive incipient target for hackers and other cybercriminal activities. So, the aim is to implement some enhanced data security mechanism for making privacy of user’s data more secure. The more data is stored, the more imperative it is to ensure its security. A destitute of data security can cause significant financial losses and reputational damage for a company.

*Challenges in managing Big data**Heterogeneous data source*

The data needed for analytical and computational purposes is unequivocally heterogeneous and have a typical problem of integration.

Privacy

The data privacy is further major and critical issue with regards to Big Data. There is an extraordinary open dread with respect to the wrong utilization of private data, especially through relating of data from numerous sources. Dealing with privacy is viably both a technical and a sociological issue, which must be acknowledged to exploit Big Data.

Data Integration

Big Data Integration is multidimensional and multidisciplinary and requires multi-technology approach that presents a significant challenge.

Security issues in Hadoop

Hadoop has developed into a company data platform for many organizations. This presents new security challenges, as once siloed data is collected in a large data lake and made accessible to a variety of users throughout the organization. These challenges include:

Ensure that users who access Hadoop are properly authenticated.

Ensure that authorized Hadoop users only have access to the data they have the right to access.

Ensure that data access records are recorded for all users in enforcement with compliance rules and for other important purposes.

Ensures data protection through enterprise - grade encryption, both at rest and in transit.

Objective

The Big Data, when appropriately analyzed, can be very dangerous to insecure the information of Enterprise data. The biggest challenge for big data from the security point of view is the protection of the user's privacy. The more data is stored, the more imperative it is to ensure its security. A lacking of data security can lead to significant financial losses and reputational damage for a company. As far as Big Data is concerned, losses due to lack of IT security can exceed even the worst expectations, advances in big data analytics are now being applied Security surveillance for more comprehensive and in-depth analysis to protect valuable company resources. Organizations need secure mechanisms and rules to ensure their systems. To protect sensitive data of enterprises. Big data needs extra requirements for security and privacy in data gathering, storing, analyzing, and

transferring. Easily, the data grows every day, we are familiar with websites such as Facebook, Twitter and all users enter the data simultaneously. According to IBM, 90% of the world's data was created in the last two years alone and we create 2.5 quintillion bytes of data. To connect this gap the “Big Data” came into the picture. The Big Data market perpetually increment each year.

The White House promulgated in March 2012 a national "Big Data Initiative" consisting of six federal departments and agencies committing more than \$ 200 million to Big Data research projects. Global Pulse, an innovative lab based on Big Data mining, also uses Big data to ameliorate living conditions in developing countries. Big Data has given the organization an incipient way of effectively analyzing and visualizing their data. For example: *Business*: Customer Feedback, trends etc. Healthcare organizations use Big Data technology to capture all information about a patient to obtain a more complete overview of the coordination, management and outcome of care. Using Big Data helps build a sustainable health system and improves access to healthcare.

Background

Big data has grown as an important research area for many researchers, reflecting the volume and impact of innovation in modern business organizations' strategies and models. Although Big Data is still in its early stages of development, they still have so many problems. Big data expressions have been attached to so large data sets where software tools usually cannot hold, manage, and process them during an acceptable time frame. An excess of data implies considerably more use-cases prompting more representations of business assessments that at last would prompt better business decision making, this situation will lead more benefits for many enterprises. The paper will further discuss on implementation of authorization using various techniques in Hadoop. At Yahoo, Hadoop has been a work in progress! and, a couple of other association as an Apache open source venture in the course of the most recent 5 years. It is used extensively in the industry. yahoo!, for instance, has deployed dozens of Hadoop clusters with 4,000 nodes and 15 petabytes each. Hadoop is comprised of two essential segments, the Hadoop Distributed File System (HDFS) and the MapReduce engine. HDFS pursues master/slave architecture.

A HDFS cluster for the most part contains a single NameNode and a bundle Data Nodes. NameNode is responsible for monitoring and distributing data to DataNodes. DataNodes inside a same cluster would impart over the network to adjust data blocks, and ensure data is replicated throughout the cluster. MapReduce of Hadoop was originally based on MapReduce of Google. This paradigm type processes application by breaking input into small parts, which can be run on any node in a cluster. A user submits a job of MapReduce to the JobTracker that plans the work to be done on the compute nodes. Each compute node has a small daemon called TaskTracker, which starts maps and reduce job tasks; the task tracker likewise serves intermediate data created by map tasks to minimize tasks. This paper is also very helpful in finding open data integration problems in the Big Data Environment and the problems are the integration of crowd sourcing data, the integration of data from data markets and the provision of a data sources exploration tool.

Design

Hadoop Architecture

Hadoop is an Open-source Java Framework innovation that avails to stores, access and increase extensive distribution of resources from Big data in a disseminated manner at less cost, high fault tolerance and high scalability. Hadoop handles sizably voluminous amount of data from various system like user data, enterprise data, Structured Query, unstructured information, Email& discussions. A cluster of Hadoops comprises a Master node and many Slave nodes. The master node consists of the Data node, the Name node, the Job Tracker, and the Task Tracker where the slave node acts as both a TaskTracker and a Data node which only contains the calculation and the data only. The Job Tracker manages the planning of work.

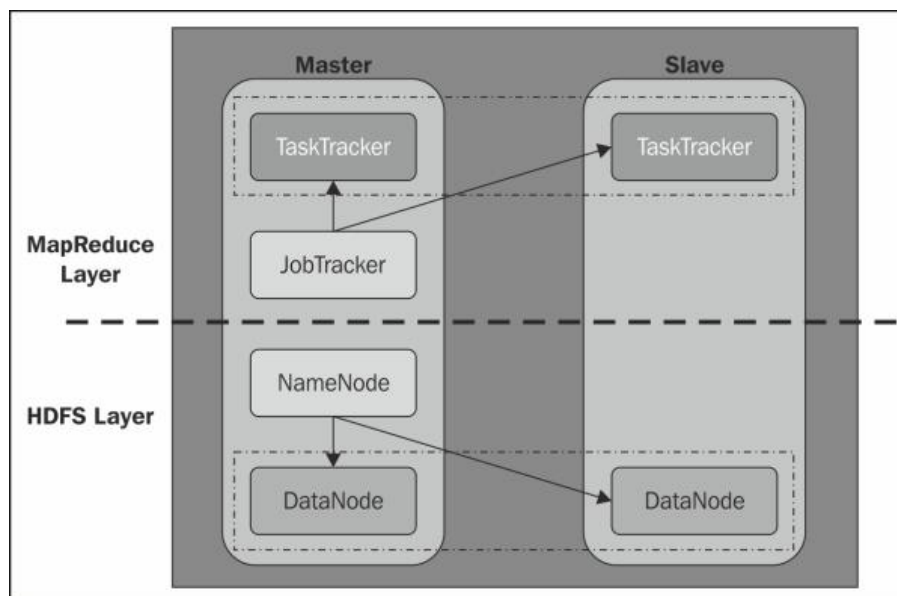

Figure 2. Hadoop Architecture

HDFS Architecture

The HDFS is the Java portable file system that is more scalable, reliable and distributed throughout the Hadoop framework. It provides redundant storage of sizable voluminous amounts of data with low latency utilizing commodity hardware, where operations such as " Write Once, Read Many Times" are carried out. The files are stored as a 64 MB default block. Communication between nodes occurs via remote calls to the procedure. Two types of nodes operating in cluster of Hadoop as master-salve or master-worker pattern. Master nodes are NameNode and DataNodes as a workers nodes of HDFS. The namespace of the file system is managed by the NameNode, plenary handles the file system and the metadata for all the files and directories in the entire structure. Datanode stores and access block in accordance with the instructions provided by clients. The data retrieved is recorded back to the namenode together with lists of blocks in it. It is not possible to access the file without namenode. It is therefore very paramount to make namenode is working felicitously.

Figure 3. HDFS Architecture

HADOOP Security Enhancement Authorization

Security Threats

Unauthorized client: using the data transfer protocol streaming pipeline an unauthorized client can write / read a file block in a data node. And can place a job in a queue or delete or change your job priority if gained access privileges. And can access Map job intermediate data can be accessed through its HTTP shuffle protocol task trackers.

Task: the host OS interfaces utilized by a running task to access other tasks or local data including intermediate map output or local data storage of the data node running on the same physical node. Likewise, A task or node can be masked as a Hadoop service component like a Name Node, job tracker, data node, task tracker, etc.

Unauthorized user: An unauthorized user can execute arbitrary code or perform additional attacks by accessing an HDFS file via RPC or HTTP protocols. Similarly, it can sniff / edit data packets sent to the client by data nodes and can submit a workflow to Oozie as an additional user. Data nodes do not thrust access control, they can bypass the different access control mechanisms or restrictions and from data nodes arbitrary data blocks can be read or garbage data to the data node is written to corrupt them.

Authorization

Authorization is the process to assure that users only have access to data in accordance with the policies. Hadoop already provides fine - grained permission through HDFS file permissions, resource-level access control for MapReduce and YARN, and service - level coarser-grained access control. The authorization role is

used by providers who make access decisions predicated on the efficacious user identity context for the requested resources. This context of identity is resolute by the authentication provider and the mapping rules of the identity assurance provider. The authorization provider assesses the identity contexts of users and group principals against a set of access policies to determine whether access should be granted to the effective user for the requested resource.

Project Rhino

Project Rhino is an open source project aimed to enhance the data protection mechanism in Hadoop from various security perspectives. Project Rhino broadens the access control for HBase on for every cell premise. Giving Authorization on a cell instead of simply table or column gives more fine grained authorization for users. One user may be allowed to access certain cells in one column, but the same user may not have access to them. Project Rhino add cell-level security. While embedding data to every cell, expressions of the visibility tag are inserted to every cell.

At the point, when the user reads the data, he or she provides his or her own authorization information, including the group to which he or she belongs, the role user has and the approval he or she has according to the groups and roles. Then the user's authorization information will be checked against the visibility tag and dependent on that the user will be permitted to access that cell or not. Therefore, to have cell - based security authorization checks should be carried out in every cell. This will cause some overhead performance. However, it gives more fine grained authorization.

Project Sentry

Apache Sentry is one of the projects that gives the users of services like Hive and Cloudera fine - grained authorization. Sentry is coordinated with the Apache Hive and Cloudera Impala SQL query framework. This section talks about the security improvements to the existing Hadoop security system made by Project Sentry Without Sentry, Hadoop utilizes coarse-grained HDFS file authorization. In Hadoop file level authorization, users can either access the file or not. Therefore, there is no possibility in HDFS file authorization to define multiple groups to have distinctive data access levels. However, Sentry offers authenticated users the ability to define several groups and roles.

Authenticated users are able to control and access data on the basis of privileges with Sentry. Sentry gives fine - grained data and metadata access control in Hadoop. Sentry can give access control to table and view scopes at the distinctive privilege levels which incorporates Select, Insert and All. This will enable administrator to utilize view to control column and row access. Roll-based authorization is provided by Sentry. We can define that several groups have access to the same data set in various privilege models. For example, for a specific set of data, we can allow administrators the privilege to see all columns, Employees to access non-sensitive columns and students to not read columns.

BIG DATA Integration

Data Integration

Data integration combines and converts large data from various sources into one format. Data integration plays an important role in making the right decisions at the right time in the organization. Data warehouses with On-Line Analytical Processing (OLAP) are utilized for data integration and analysis. They are inefficient to integrate unstructured or semi-structured data with streaming.

Big Data Integration

Big data integration (BDI) implies extensive volumes of heterogeneous data from numerous dynamic data sources are linked or merged.

Two broad Big Data Integration categories:

Integration in Big Data environments of multiple Big Data sources.

Integration of unstructured Big Data sources with company data.

Methodology

The Internet has rich wellspring of voluminous and heterogeneous information, the size and complexity of which continually grow. Many website pages are unstructured and semi-structured. Extraction of information is an essential undertaking in the process of data integration. The main goal of this extraction process is to extract the right information at the ideal time with the right cost to support the right decision. Data warehouses have traditionally been utilized as multidimensional databases to store large amounts of data. Poor data quality leads to poor decision making which eventually results in poor performance. Completeness, consistency, and correctness of data support organizations are the cornerstone of organizational decision - making systems. The great working and proficiency of an association relies upon the data quality. Poor data quality reduces customer satisfaction and automatically reduces the ability to take decisions and performance. Big data dodges the downsides from conventional methods.

Extract, Transform and Load Process

ETL comes from data warehouse and is an extract-transform load. ETL carries out the data loading process from the source to the target system. It converts data of the same type or distinctive types into a centralized data warehouse with a standard data format.

Extract

The " extract " task involves the collection of data from external sources which must be transmitted to the

systems and databases required. The data can be found in standalone databases or spreadsheets which are not integrated with any master database. The data may even be hard copy or data purchased from a data provider. The objective of this errand is to comprehend the data format, evaluate the overall quality of the data and extract the data from its source in order to manipulate it in the next task.

Transform

In the “transform” step an assortment of software tools and even custom programming are used to manipulate the data so that it can be integrated with existing data.

Load

After the successful transformation of the source data, it is necessary to physically load it into the target system or database. Before loading the data, it is necessary to ensure that the current system is backed up so that rollback or undo can be started in the event of a load failure process. After data has been loaded, audit reports are common so that the results of the merged databases and systems can be reviewed to ensure that the new data has not caused any errors.

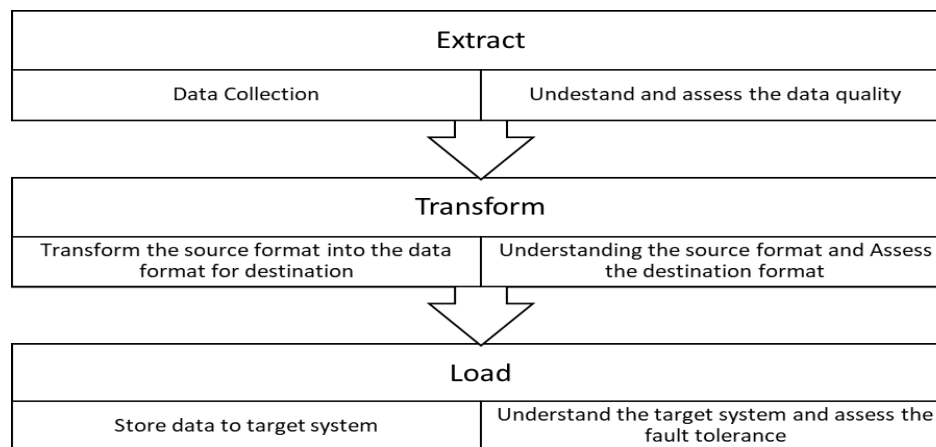

Fig 4. The General Process of ETL

Implementation Details

This section will attempt to focus on the various data integrity techniques and confinement of few such techniques. Provable Data Possession (PDP) and Proof of Retrievability (PoR) are the basic systems for data integrity. The following section depicts the data privacy practices for data integrity.

Provable Data Possession (PDP)

Features

Secure for remote data verification

Based on Homomorphic verifiable tags

Works well with static data

Advantages

Actually, the server does not have to access the file blocks, fortifying less verification of the block.

Sanctions verification of the public.

Limitations

Lack of error correction codes to deal with corruption concerns

Paucity of confidentiality

There is no dynamic support

Unbound number of queries.

Provable Data possession (PDP) is a technique to ensure data integrity on remote servers. In PDP, a client who has stored data on a perfidious server can verify that the server does not retrieve the pristine data. Ateniese et al. are the first to consider the ability of public auditing in their defined "provable data possession" model for ascertaining the possession of untrusted storage files.

Basic Proof of Retrievability (PoR)

Proofs of Retrievability (POR) is a cryptographic method for remotely checking the integrity of cloud - based files without keeping a facsimile of the user's pristine files in local storage. In a scheme, users back up their data file to a potentially mendacious cloud storage server together with some authentication data. Users can use the authentication key to check the data for its integrity stored with CSP without recovering the data file.

Principal of POR

A POR works in two phases: first, the setup phase and second, the sequence of verification phases.

Setup phase:

The user preprocesses his data file in the setup phase using his private key to engender some authentication code. He then sends the data file to the cloud storage server together with the authentication code and abstracts it from his local disk. As a result, the user has his private key on his local disk in the terminus of the setup phase, and CSP has both the data file and the corresponding authentication code.

Sequence of verification phases:

In each sequence of verification phase, the user engenders an arbitrary challenge query and CSP is supposed to provide a short answer or proof of the received challenge query based on the data file of the user and the corresponding authentication data. Users will verify the response of CSP using their private key at the cessation of a verification phase and decide to accept or reject this response from CSP.

Limitations

It works only for static data sets.

It fortifies only a circumscribed number of queries as a challenge, because a limited number of check blocks are involved.

A POR does not provide the file stored on CSP in prevention.

Hail

HAIL, high-availability and integrity layer where HAIL sanctions the user to store data on multiple servers so that the data is redundant. The simple principle of this method is to ascertain file data integrity through data redundancy. To ensure integrity, HAIL uses message authentication codes (MACs), the pseudorandom function and the universal hash function. The evidence is engendered by this method, which is independent of the data size and compact in size.

Limitations

This technique applies only to the static data.

More computing power is required.

Not appropriate for thin client.

POR Based on Selecting Random Bits in Data Blocks

Technique involving the encryption of the few bits of data per data block instead of encrypting the entire file, thus reducing the client's computational burden. It is clear that the high probability of security can be achieved by encrypting fewer bits in lieu of encrypting the whole data. The computational overhead for client storage is also minimized because it does not store data and reduces bandwidth requisites. This scheme is therefore suitable for thin customers. Users need to store just one cryptographic key and two random sequence functions in these techniques. The user does not store data in his machine. The user pre-processes the file afore saving the file in the CSP and adds some meta data to the file and stores in the CSP. The verifier utilizes these meta data to verify the integrity of the data at the time of the verification.

Limitations

This technique is used for static data only.

Results and Analysis

Comparative Study

This Comparative study provides a concise explication of all the techniques discussed in this paper so far.

Table 2. Comparison between data integrity techniques

Data Integrity Techniques	Advantages	Limitations
Provable Data Possession	This technique gives a vigorous proof data integrity. Support Block less verification. Allows verification of the public.	Lack of error- correction codes to deal with corruption concerns. Lack of preservation of privacy. No support dynamic. Unbound number of queries. Allows for public verification.
Basic Proof of Retrievability	Reduces the client's and CSP 's overhead computation and storage. It additionally minimizes the size of the data integrity proof by reducing the network. Bandwidth.	It works only for static data sets. It fortifies only an inhibited number of queries as a challenge, as it handles a limited number of checks blocks. A POR does not provide the file stored on CSP in obviation.
High Availability Integrity Layer (HAIL)	Sanction data to be saved in multiple clouds.	This technique applies only to static data Unfit for thin clients
POR Based on Selecting Random Bits in Data Blocks	This technique is opportune for thin client. Put minimum overhead storage on client and CSP.	This technique supports only static data. In this technique data prevention mechanism is not implemented.

In Provable Data Possession the data proprietor processes the information file and stores it locally to produce some metadata. the owner expunges the pristine replica of the file after sending the files to the server. The proprietor verifies the file's possession. This technique is used by the client to verify the data integrity. This technique guarantees the client's server security. However, this method has high overhead because it runs over the entire file every time during hashing process. It therefore has exceptionally high computational costs.

Proof of Retrievability Scheme that does not involve whole data encryption. It reduces the overhead of the client by encrypting only a few bits of data per block of data. It does not store data on the client side, so the overhead for client storage is also minimized. Hence, this scheme is therefore suitable for thin clients. This scheme diminishes the overhead for computing and storage of the client and the server. It reduces the bandwidth consumption of the network by limiting the data integrity proof size. HAIL (High Availability and Integrity Layer) is a data integrity scheme that enables a server set to emphasize to a client that a stored file is not modified and can be retrieved. HAIL enables the client to store its data on multiple servers, so that the data is redundant. And Only a small amount of data is stored in the local machine at the client side. Data integrity can be checked in the distributed storage through data redundancy. This produces evidence of the data size that it is independent and compact in size. From the above analysis it is evident that all these techniques have some

advantages as well as some constraints. The technique POR predicated on Selecting Random Bits in Data Blocks is best suited for thin client as well as this technique provides the vigorous proof of retrievability.

Conclusion

As the title of this research suggests, it goes in depth on security issues in Big data associated with Hadoop. In doing so however, the research briefly explains the theory and technique(s) behind not just security, but data integration in general. The research also proposes an idea that is worth dwelling on for other like-minded researchers.

Summary

With the widespread popularization of internet and social media, the amount of text data being generated is so massive, that it is now classified as big data. To a layman, this data might be mostly useless, but for professionals such as data analyzers, researchers and data scientists, etc. these are valuable inputs. Hadoop is a popular platform for storing substantial amount of data. There are some gaps with the subsisting security system in Hadoop. Since security plays a paramount role in keeping the sensitive data protected, the aim of this paper is to evaluate security for Hadoop. Two of the projects that worked to enhance Hadoop 's security are Project Rhino and Sentry. The security improvements made by these two projects have been studied from different security aspects, such as authorization. Predicated on what was studied, the project Rhino provides cell - based security that provides more cell-level fine grained access control, in addition to table or column level access control.

Project Sentry provides fine - grained data and metadata authorization in Hadoop. It offers role - based authorization by defining diverse groups to have distinctive access levels to various datasets. The most challenging and burning security problem is data integrity. In this paper various subsisting techniques and their merits and demerits are explained by taking into account the paramountcy of data integrity. The analytical study compares all these techniques briefly.

Future Work

It is clear from the above comparative study that all of these techniques examined in this paper have both some advantages and some limitations. All of these papers lacked felicitous data integrity mechanisms, fortifying dynamic data operations and high resource and computing costs. The POR technique based on the selection of random bits in data blocks is ideal for thin customers, as this technique provides vigorous proof of retrievability. The only drawback of this technique is that it only works with static data and no mechanism for data prevention. Given more time the future work will therefore be to expand the scope of this paper.

Abstract: Maintaining proper administration and management within supply chain processes ensures the competitiveness and sustainability of the company. This study aims to propose an improvement in the supply chain of a pisco company through the implementation of Lean Manufacturing tools. The model was designed and validated, subdivided into four components that specify and detail the sequence of the proposal's improvement (analysis and measurement, solution design, application, and evaluation of results). Among the main findings is a 40% improvement in the productivity rates of the packaging process, along with a reduction in downtime during the grape extrusion process (with a saving of approximately 12 minutes per breakdown). Consequently, there was an increase in the mean time between failures (MTBF) by 54.87%, equivalent to an interval of three days with seven hours of work without any faults. Finally, there was an increase in the efficiency of the use of the main resource, "uvina grapes," by 33%, signifying high raw material performance during the extrusion process. This study facilitates the transition to a continuous improvement environment, aiming to stimulate future research to contribute to process improvement in small and medium-sized enterprises (SMEs). The expectation is that these companies can develop tools to optimize their main bottlenecks, achieving improvements in their operations in terms of resources and time.

Lean Manufacturing for improvement and productivity in the supply chain of a pisco company. *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 1417-1425), Antalya, Turkiye. ISTES.

Introduction

This project is focused on the beverage industry, being more specific in the alcoholic beverage sector in Peru,

taking the production of pisco as a reference. Which reflects a progressive evolution in terms of annual liter volume at the national level, obtaining an improvement of 60% from 2010 to date (Ministerio de la Producción, 2019). Likewise, the aforementioned institution states that export activities have increased, obtaining a 66.80% share in the international market of the United States and Chile.

The right way to maximize quality, delivery and overall profitability of an organization lies in proper supply chain management. This management covers all procedures from the acquisition of inputs and raw materials to the completion of the delivery of the product to the determined destination (Chopra & Meindl, 2013). Consequently, thanks to the efficient administration of the SC, the country has reflected a progressive evolution in the national volume of pisco. Managing to obtain a difference of 1.8 to 10.5 million liters from 2001 to 2016 respectively (Ministerio de la Producción, 2018).

Being in a competitive environment, companies are concerned with minimizing costs, maintaining optimal levels of productivity and quality (Monir & Kamal, 2015). Therefore, the success of each company depends on its efficiency in supply chain management and its solid integration. Certain studies highlight the importance of incorporating the 5S tool into the culture of each worker, where process efficiency could increase by 13% (Belhadi et al., 2018). Likewise, implementing the TPM tool they reveal the benefits of performing autonomous maintenance to reduce equipment downtime by 75% and increase its availability by 3.8% (Duques et al., 2020).

Companies are adversely affected by product loss or waste generation within their supply chain. Particularly, in the production and processes area, due to obsolescence, machinery inefficiency, or lack of worker training (Dawood, 2018). Likewise, they assert that the major problem lies in the underutilization of physical space and unnecessary movements in stations, which tends to cause delays in material, personnel, and information flows within the chain (Sharma & Gandhi, 2018).

In consequence, this study aims to manage the implementation of lean manufacturing tools to enhance the efficiency and productivity (Rojas & Gisbert, 2017) of a pisco company's supply chain. Based on the foregoing, the following research question was defined: Is it possible to improve productivity in the supply chain of a pisco-producing company through lean tools?

Diagnostic

In most industries, there are challenges that can hinder the supply chain procedure, and the bullwhip effect is one of them, which is a phenomenon in the process flow that can negatively affect more than one stakeholder, referring to the increase in demand variability (Cannella et al., 2010). Therefore, with the aim of exhaustively classifying the causes that give rise to the identified problems at the top level, it was decided to create an Ishikawa diagram, identifying those challenges that lead to low productivity levels. Subsequently, the design of the model followed for the case study is presented in Figure 1.

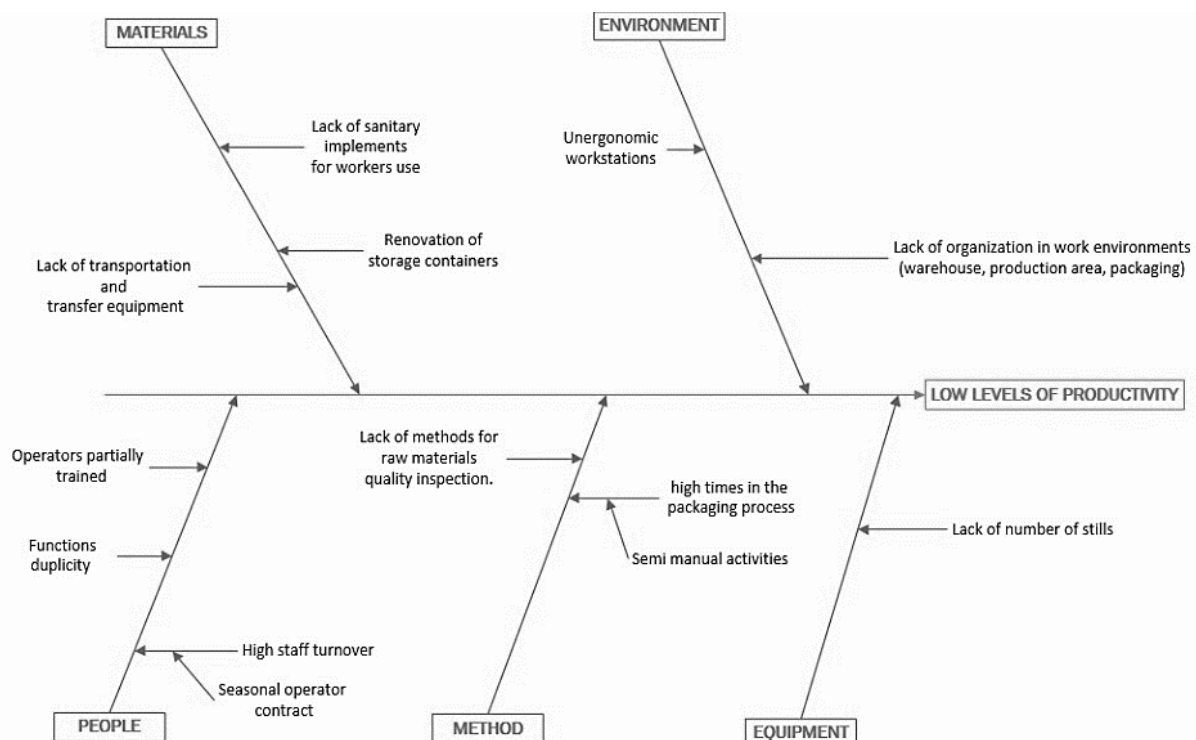

Figure 1. Ishikawa's diagram

The main problems that arise in the pisco company are related to the extrusion of the grapes and the packaging of the final product, which end up reducing the efficiency of the production program, and end up altering the forecast made in terms of time, volume and resources. As for the first, due to the large amount of waste generated by the initial operation, the machine usually presents various failures due to lack of speed and capacity, causing the machine to stop; while the second, the bottling line is semi-manual, making the process dependent on the productivity of human resources. However, they point out that interdependent, joint and harmonious work will guarantee adequate compliance with internal processes to result in a finished product in optimal conditions (Akanmu & Nordin, 2022).

Continuing with the presented issues, the Pareto principle was used to identify the problems with the greatest impact. Among them are the high times in the packaging process due to lack of organization and automation in the plant (Salawu, E et al., 2018). Additionally, the inadequacy of machinery and equipment leads to the maximum production capacity being lower than the plant's operational capacity. An example of this is the insufficient number of stills and fermentation vessels, which do not allow the expected raw materials to be stored. Lastly, the lack of prevention against possible equipment failures, which may be caused by age, incorrect operation or natural failures of the machines. Due to the problems presented, a process optimization model is proposed as a solution through the application of 5S and TPM tools. The purpose of which is to eliminate those activities that do not add value during the process, obtaining better times and reducing costs and resources (Lopes et al., 2015).

Method

This document outlines a case study focused on simulated improvement rather than applied improvement, which is structured into three phases or components. Firstly, there's the analysis and measurement of KPIs (pre-test) to pinpoint root causes alongside the mentioned indicators. Secondly, there's the design of the proposed solution using lean tools. Thirdly, there's the application of the simulation model, followed by the evaluation of results (post-test).

In the initial stage, the pre-test aims to assess the starting situation by utilizing the value stream mapping tool and analyzing indicators across the entire supply chain of the pisco company. The tool's implementation was chosen to observe non-value-adding activities, gather key process data, and assess key performance measures in the final product flow, primarily including cycle time (CT), capacity, and availability (Dawood et al., 2018). The second stage involves using Lean Manufacturing tools like Kanban, TPM, and 5S to gain deeper insights into issues, root causes, and future improvement implementations. Additionally, an improvement simulation model will be applied using engineering software, which will be compared in the post-test phase to evaluate the research's initial and final situations.

On one hand, the design of the initial solution proposal links the root causes of the central issue with lean techniques and tools, facilitating the generation of a solution proposal. Subsequently, based on norms and standards of the pisco sector, and the methodological development of selected lean tools, certain results are obtained that are useful for comparison with the indicators analyzed in the first component.

Lastly, in the results evaluation phase, scenarios are compared based on the main indicators of the pilot model and the second simulation. Following this, the most suitable model is chosen, and the results are interpreted. As a final point, a continuous improvement and control plan is suggested to maintain the positive results.

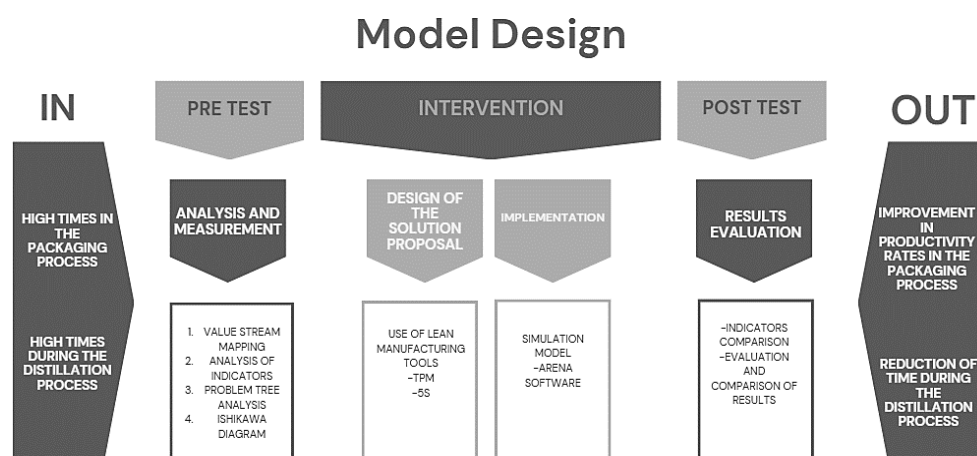

Figure 2. Model Design

Results

In order to demonstrate the effectiveness of the proposed solution, it was decided to carry out the TPM simulation in the Arena Simulator software, which was structured in three stages: raw material supply, extrusion process and bottling. The grape crusher machine operates 192 hours per month and is one of the main bottlenecks, experiencing 13 failures during this period, resulting in 403 minutes of downtime. Through the simulation proposal, a 53.48% reduction in machine availability was achieved, reducing the number of failures and the average repair time.

First, the average time between two consecutive failures in the same equipment was calculated. The longer the time obtained, the more beneficial it will be for the company, since production is continuous without presenting any inconvenience, managing to operate for longer periods without failures. The company's current procedure presents a failure every 856 minutes, its mean, every 14 hours of work. With the improvement proposal, a result of 1897 minutes was obtained, representing an improvement of 54.87%.

In second place, it is important to find the average number of minutes or hours that the machine returns to work after a failure. In this case, the shorter the repair time is a positive result for the company because the production line will be able to continue operating. Currently, it takes an average of 31 minutes for the technician to repair the machine. With the improvement proposal, a result of 24 minutes was obtained, representing a saving of 7 minutes for each breakdown.

Finally, it is necessary to visualize the fraction of time in which no failure is occurring, with this, it is possible to identify the percentage of availability that the machine is suitable for use. It is currently at 96.50%, and with the improvement proposal it reached 98.77%. Some results presented are shown in Figure 3, where the current model proposal, the improvement model proposal, and the percentage variation between both exercises are indicated.

Current model (pre test)	Improvement model (post test)	Varition
$MTBF = \frac{11\,520 \frac{\text{min}}{\text{month}} - 403 \text{ min}}{13 \text{ failures}} = 856 \frac{\text{min}}{\text{failures}}$	$MTBF = \frac{11\,520 \frac{\text{min}}{\text{month}} - 142 \text{ min}}{6 \text{ failures}} = 1897 \frac{\text{min}}{\text{failures}}$	54.87%
$MTTR = \frac{403 \text{ min}}{13 \text{ failures}} = 31 \frac{\text{min}}{\text{failures}}$	$MTTR = \frac{142 \text{ min}}{6 \text{ failures}} = 24 \frac{\text{min}}{\text{failures}}$	22.58%
$Availability = \frac{855 \text{ min}}{31 \text{ min} + 855 \text{ min}} = 96.50\%$	$Availability = \frac{1897 \text{ min}}{24 \text{ min} + 1897 \text{ min}} = 98.77\%$	2.29%

Figure 3. Current model and improvement model of TPM management indicators

On the other hand, the packaging process improvement was 22.22%. This percentage was obtained in relation to the liters obtained from the current situation and the simulated improvement proposal, using the production speed of each situation, specifically 3 minutes per bottle and half a minute per produced bottle, respectively.

Regarding the yield of kilograms of grapes per liter of pisco, it was considered that with lower use of raw material, the result of the final product, liters of pisco, is higher. A comparison was made of 35,000 liters of pisco in the current situation and 46,666 liters in the simulated situation during 3 months of production, showing an improvement from 8.3% to 11.1%.

In reference to the implementation of the 5s tool, which was carried out through instructions and training plans. The operator has been able to evaluate and identify problems related to order, cleanliness and organization (Vásquez, I et al., 2016). A daily work plan was developed, which consists of taking a tour of the plant at the beginning of the day and evaluating whether the operational areas present any problems. Secondly, make an action plan to adequately manage each of the “S”, the aspects to be evaluated and the different opportunities for improvement must be defined. Third, continuous monitoring predominates to ensure that implementation is going as planned.

Discussion

According to Torres et al. (2021), after the incorporation of lean tools (TPM and 5S), it is possible to achieve improvements in production indicators and achieve long-term continuous process improvement. On one hand, regarding the TPM simulation, the eight pillars are influenced by the exposed KPIs, ensuring that all machines and equipment are in good condition, producing efficiently and with less waste.

On the one hand, regarding the project results, the current average productivity indicator is 0.088 liters/kg of grapes, while the average value from the simulation showed a value of 0.11 liters/kg of grapes, favoring the productivity of the pisco production process. On the other hand, according to Torres et al. (2021), based on results that have been obtained from the simulation on the fictitious representative winery. Those results have been validated with the simulation in the 10 real wineries, in which the simulated results were different among them (depending on the initial inventory level and the communication between processes basically) but in a similar range of improvement, a raw material reduction from 8% to 16%. This improvement related to the results obtained based on the use of Arena simulation software to achieve a higher yield of kilograms of grapes per liter of pisco, resulting in a better utilization of raw materials from 8.3% to 11.1%.

The case study from Nigeria presented by Amos et al. (2020), on the implementation of TPM in a beverage industry to reduce excessive downtime, supply failures, and low surplus capacity caused by one of the valves in the bottling machine. This resulted in a 50% increase in Overall Equipment Effectiveness (OEE) in a 7-day trial period, with a trend towards achieving over 85% in overall equipment effectiveness if TPM was fully executed within a 4-week period. In contrast, the simulation results indicated a 4-week duration for this model, generating a 53.48% availability and improving MTBF and MTTR indicators by 54.87% and 22.58% respectively.

The case study presented by Burawat (2016) on improving delivery times for a small bottled water company

details the positive impacts of eliminating and optimizing processes that do not add value due to excess order waste. Achieving a 31.30% improvement through the implementation of 5S, a plan for cleaning, documentation, and labeling. Under this same approach, the implementation of the tool managed to increase the efficiency of all personnel by 15%. Additionally, regarding the results obtained in this research, the redesign of workstations and the implementation of the checklist were two fundamental elements for improvement in terms of standardization, order, and cleanliness, reducing a quarter of the time spent on executing daily tasks.

Conclusion

After implementing the TPM tool, the company has been able to optimize its processes by properly managing the preventive maintenance schedule. Which has made operators better organized in the weekly work plan. Regarding the results obtained, availability increased and managed to exceed the set goal, positively impacting the optimization of resources, time and money. The results are reflected in the proposed indicators, where the number of stoppages was reduced by 53.48%, and the time between each failure increased to an interval of 3 days with 7 hours of shift. The application of the 5s tool in the pisco company, under the execution of the checklist and continuous training, succeeded in increasing efficiency in processes as well as ensuring a clean and organized work environment, fostering a positive work atmosphere and enhancing employee performance. Finally, the average value from the simulation showed a value of 0.11 liters/kg of grapes, favoring the productivity of the pisco production process and based on the use of Arena simulation software, a higher yield of kilograms of grapes per liter of pisco was achieved, resulting in a better utilization of raw materials from 8.3% to 11.1%.

Recommendations

It is recommended that the company implement a program aimed at workers called “Factory of Ideas”, where operators will be able to provide improvement proposals to streamline and make profitable the processes carried out in the plant. With this initiative, each operator will be able to contribute, based on their experience, those initiatives that they consider important to improve productivity, since they are the ones in the operation and mainly know the causes that fail to maximize efficiency. The worker who obtains the best proposal is awarded a financial bonus.

It is important to train people involved in supply chain management courses, since it is necessary for suppliers, manufacturers, distributors and retailers to understand the bullwhip effect that entails if all actors are not evaluated and considered equally. Although each one is concerned about achieving their objective, if the other stakeholders are affected it can end up harming the area and causing the chain to cease to be sustainable over time. While the company is providing a good level of customer service, it has been shown that it can save on staff costs, operational efficiency and productivity if it aims to go beyond the daily routine.

Abstract: One of the most notable developments in English language pedagogy is the teaching of English for Science and Technology (EST). This includes providing language learners of various scientific fields with their specific language needs. This study was conducted as a component of a pilot study on qualitative data collection into the reading of EST materials that focuses on the problems and significance of EST materials for university students. Data were collected among 30 students enrolled in various Engineering courses in a public university in Malaysia. From the sample, 12 students were purposively selected to take part in the focus group interviews. Data were collected through focus group interviews that were analyzed descriptively and thematically using SPSS and NVivo respectively. The findings revealed that, firstly, students suffer from language deficiency due to insufficient linguistic knowledge and language exposure. Their major problems included vocabulary, grammatical structures, and terminologies specific to the reading texts. Secondly, the findings revealed the importance of text selection of EST materials as students were able to relate the content posted on an online teaching platform known as Interactive reading of Academic Disciplines (iREAD) with background knowledge of Science and Technology to fully understand what they read. This implied that Schema Theory plays a vital role in understanding the information by retrieving and applying previous knowledge. Thirdly, the significance of EST text selection strengthened students' knowledge of their content course as students were able to enhance their cognitive thinking, synthesize knowledge, and achieve freedom of expression. An implication that can be drawn from this study is the need to integrate specific text selection based on the subject matter for learners to be exposed to materials related to their field of study.

Keywords: English for science and technology, Online reading, EST text materials

Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 1426-1441), Antalya, Turkiye. ISTES.

Introduction

English is regarded as a bridging language of economy, international business, science & technology. It has been continuously developing as the prime means of communication in science and technology and has eventually gained a major importance over other languages. Undoubtedly, English is consequential for the students' professional and academic success, mainly for university students as a major part of their field of specialization materials are written in English. In language learning, reading is regarded as a basic skill to gain information, explore knowledge and broaden the academic scope. Reading comprises a notable source of linguistic input and reading texts are crucial tool of information (Azeroul 2013; John & Davies 1983) for ESP & EST students. For this reason, there has been an apparent need to promote the learner's competence in the reading skills (Azeroul 2013).

To fulfil the demands for human resources in Science and Technology (S & T), Malaysia has progressed towards an inventive and researched based economy. Universities in Malaysia are now conducting courses in English for scientific courses like medicine and engineering (Siew-Eng and Muuk 2015). The plans and policies of the government have integrated English and S & T. The Malaysian government has intensified its efforts to enhance the availability of skilled human resources in S&T to increase its international competitiveness. According to the national policy on Science, Technology, and Innovation (Ministry of Science, Technology, and Innovation, 2016), society needs to be a contributing factor for the future development of science & technology and meet the innovative needs of the growing scientific and progressive society. Hence, science literacy is an overarching goal in becoming a developed nation.

According to Samsiah (2011) there are three main assumptions held by the government as to why the capability and capacity of the nation's S & T must be enhanced. Firstly, students would be able to understand English scientific concepts as they advance in the journey of education when they are exposed to scientific English at an early stage. This will lead to improved English proficiency. Secondly, to provide S&T manpower and enhance the country's endeavors in research and development, the success of S & T programs at the tertiary level is important. Finally, to ensure local S & T professionals can read and keep abreast with the latest innovations in S & T, students need to be independent readers to read books, academic journals, and internet postings in English.

In particular, science students need to interact with multiple scientific information resources available online by reading scientific topics and scientific data related to their fields.(Tsai, Hsu et al. 2012). Various factors such as lack of vocabulary, difficult reading materials and poor language proficiency are said to be contributing factors to the reading problems faced by tertiary level students in Malaysia (Faizah, Zalizan et al. 2002, Wong Bee and Mardziah Hayati 2003, Nambiar 2007). For example, Thang and Bidmeshki (2010) discovered that students from Science and Technology degree programs at a local university in Malaysia claimed to have difficulties reading English academic texts, not only in understanding the main ideas but also in comprehending sentence structures. However, such difficulties could be overcome when students are taught how to utilize new

technology to manage their skills through online courses that teach them to become self-directed learners (Fard, Hazita et al. 2014). In addition, not only the students read online but they also face challenges in reading EST online materials. Hence, this study aims to:

investigate the reading problems faced by students when reading English for Science and Technology online materials.

investigate the significance of using English for Science and Technology materials in an academic online reading environment.

To strengthen the background knowledge of the students, it is important to give them exposure to EST materials. This in turn becomes applicable to their specific field of study. According to Ruhil Amal et al. (2020), when students are exposed to online information of EST materials, their language and EST knowledge proficiency improves. This new knowledge is also significant in their academic fields of study. Students may find ESP texts difficult to understand when they deal with ESP texts in their second language. This is due to the fact that the technical terminologies which are used in ESP texts are rather challenging, specifically if English is the students' second language. This is why, it is a significant criterion in text selection for ESP that is must relate to S&T students and expose them to various EST materials online.

Literature Review

Theoretical Discussion

Schema theory is based on acquired knowledge gained from past experiences. Schemata are stored in a person's memory based on the existing knowledge or the concepts of the world in various fields. (Anderson and Pearson 1984). A world concept is known as background knowledge that includes discourse schemata and linguistics. Established on this theory, recall and comprehension are dependent on the background knowledge of the reader and how it is matched to textual data. This becomes significant in the current study as students consistently read materials which are related to their academic field of study. Schema Theory posits that reading is a process in which readers are active and constructive. They are required to understand the information by retrieving and applying their previous knowledge. Readers must be able to relate their knowledge with the content of the text to fully understand what they read (Carrell and Eisterhold 1988). In the current study, for example, relating EST to student's background knowledge on S & T based on their field of study was significant.

English for Specific Purposes (ESP) Model

Dudley-Evans and St John (1998) hypothesized ESP as having absolute and variable characteristics. Absolute characteristics consist of

- 1) ESP meets the specific needs of the learners

- 2) ESP emphasizes methodology and activities in various fields it serves
- 3) ESP is based on the language, skills, genre, and discourse appropriate to the given activities.

EST is a subcategory of ESP, and it shares few basic components with the discipline of ESP. Its focus is on practical and beneficial learning of English. The interactive needs of the students is the prime consideration of curriculum design. EST is related to the oral and written discussion of the language for occupational, professional, academic or vocational needs. It primarily deals with students at the tertiary level and takes on the responsibility for their particular needs in work, study and research (Rao 2014). To be specific, these ESP courses or programmes can be used to aid engineering students in skilled communication at their work place which includes writing skills, reading skills and conversation skills (or more particularly, speaking and listening skills). An engineer's prerequisites for work on the writing and reading part can fall into any of the following four categories: visual/figure, procedural, informational and report tasks (Rao 2014).

According to Langan (2010), unlike general English materials that do not have scientific or technical terminology. Science and technology text can be very challenging to read not only for ESL students but also for native speakers of English as it is written for experts and native speakers in the field. In addition, Langan (2010) and Harrison (2004) asserted that readers use different reading strategies to read scientific texts compared to other genres such as social sciences and business. This is supported by Ho, Tsai et al. (2014), who agreed that the features of web-based scientific reading can be rather challenging. These challenges include the perplexing concept and syntax of science and the abstract layout of the scientific information. This leads to students finding it difficult to accurately read scientific texts (Schiltz, Frederickx et al. 2017). Reading these types of texts is extremely demanding, especially for ESL students who learn S&T abstract concepts at a progressive level in their second language.

English for Science & Technology

EST is different in nature and characteristics from other forms of written English (Thanasoonotornrerk 2004; Trimble 1985). EST refers to English text for academic, occupational and professional reasons which includes commercial journals in S&T materials for employees, for instance, industrial companies. Presenting facts, theories and other comparable types of information are the main priorities of EST texts. According to Thanasoonotornrerk (2004). EST rhetoric can be defined as the writing method and information arrangement used by an author in a text. It is one of the factors that affect readers' comprehension. Text determination is determined by the aim and specific readers.

Difficulties in Reading EST Materials:

Reading comprehension has been identified as one of the major issues that most of the foreign language students deal with. In fact, students at the college level, who have pursued English as a subject for a long time still experience in comprehending English text, particularly in the explanatory style (Thanasoonotornrerk 2004). Higher proficiency in a foreign language is required particularly when reading for academic validation such as

in technology and science (Thanasoontornrerk 2004). Along with the ability to understand sentences or words, the understanding of a specific topic, reading strategies, text structure and sub-technical vocabulary arrangement are also required in reading comprehension of technology and science texts (Thanasoontornrerk 2004; Trimble, 1985).

Many EFL students have difficulties in understanding EST texts. Linguists claim that teaching scientific documents only through grammar and vocabulary is insufficient (Durongphan 1981; Thanasoontornrerk 2004). Marshall and Gilmour investigated the difficulties of Papua New Guinea students in the comprehension of EST texts. According to their research, students have issues with lexical knowledge in EST which includes sub-technical vocabulary, and this is referred as the term that explains relationship between fundamental scientific concepts (Thanasoontornrerk 2004).

Kavaliauskienė (2002) researched learners' opinions about their goals and requirements for learning EST in universities. Data were collected using a variety of questionnaires and the finding indicated that almost three-fourths of the students struggled with tenses, prepositions and ESP vocabulary. Nearly two-third of the students do not believe that EST reading is simple.

Significance of Text Selection

Reading texts are considered the commonest teaching material in language learning lectures (Tomlinson, Burns et al. 2001; Mohammed, Aljaberi et al. 2022). On the other hand, using improper material can cause students to lose their skills (Charalambous, 2011). Therefore, the analysis of a text is important to determine the significance of resources for instructional design (Lee 2013).

Previous research (e.g. Abdualameer 2016; Herbert 2016; Pyle 2017; Sidek 2012) has demonstrated the beneficial impact of text structure teaching on learner's reading proficiency level. It was suggested by Abdualameer (2016) that the English language curriculum's syllabus should place special emphasis on instructing students on reading methods for various reading texts and reading comprehension. As a result, instructing students on these methods will develop their proficiency in reading texts. Hebert et al. (2016) found that text structure instruction improves the students' comprehension level while reading expository texts like, textbooks, informative websites, self-help books, and science books.

Reading text and activities selection is significant as students will be able to retain information if EST materials provide students with the background knowledge that in turn will fulfill the academic needs of students. For instance, understanding complicated topics by using videos. It was stated by Ruhil Amal et al. (2020) that the use of visual platforms was highly efficient in teaching concepts. This increases analytical thinking and enhances understanding. The discussion of Taiwanese teachers on material development at the higher level i.e university level for EST classes has been documented by Thanasoontornrerk (2004). The author surmises that it is necessary for teachers to use EST materials as sources of data with an array of skill, activities, tasks and texts

and choose what is suitable and is adaptable for their students. At the same time, the integration of topic based approach, selection of appropriate materials designed or chosen to enhance student's comprehension level, concept oriented materials and skills approach is recommended to learn EST.

Significance of Online EST Material:

Typically, EST reading materials contain challenging technical content, therefore it is certainly a barrier for ESL readers to engage with scientific texts with their specific characteristics (Abdul Hamid 2012). For example, ESL learners who are trying to comprehend abstract concepts at a higher level might find it harder to understand due to its perplexing structure. According to Kalpana (2017), these students have two significant difficulties, the language and the content. Therefore, in order to aid ESL students, comprehend EST materials, English language teachers adopt a variety of pedagogical strategies, including the use of technology. It is currently the most effective device for this use. Technology has been found to be beneficial in assisting and facilitating ESL students to read EST resources online in many ways (Ruhil Amal et al. 2020). Learners can enhance their capabilities of identifying technical words, grasp definitions, link senses to a core meaning and learn word parts with the aid of appropriate materials and techniques (Rao 2014). Abdul Hamid states that since scientific texts consist of EST's unique syntactic and narrative characteristics for science and technical areas, readers of the texts must be both linguistically competent in the language and knowledgeable about the specific scientific concepts that are reiterated in the text. In order to aid students' better understanding of the engineering-related text, technological tools should be used along with EST materials (Kim 2013)

Methodology

The primary goal of this pilot study was to gather qualitative data prior to the main study to anticipate potential future issues that might arise during the main data collection. Data collection focuses on reading problems and the significance of EST materials in an academic online environment for ESL university students. All the students were utilizing iREAD, an online platform tailored for reading purposes. Additionally, it was intended to improve the process of gathering data and to improve research questions for interviewees.

Participants

The research employed a purposeful sampling technique to acquire abundant data. Purposeful sampling is the intentional choice of a sample to investigate the primary concept under study (Creswell & Plano, 2011). Out of 614 students enrolled in English for Technical Communication across a range of Science and Technology courses, a sample of 30 students was chosen. However, only a group of 12 students were chosen to participate in the gathering of qualitative data collection. The proportion of male and female students in the 21–23 age range was equal. Every student was enrolled in the same level 2 English course offered by the institution. A consent form was given to each student who participated in the study.

Instruments

Semi-structured interview protocols were used to support the data gained from the focus group interview (FGI). A series of questions was created based on a similar study by Chen et al. (2009) that investigated reading problems and strategies faced by students in reading online materials for academic purposes. The same aspects were investigated in the current study. Hence, the questions were reorganized and used for the current study that investigated the reading problems faced by university students when reading EST academic texts online.

Focus Group Interview Protocols were one of the instruments utilized to collect data to gather a collective understanding that focused on the issue under study. The focus was to identify a shared understanding of the significance of text selection for reading EST online academic materials. Text selection was one of the important elements of this study. Based on the university's curriculum the texts were selected from English for Technical Communication (ETC), which is a compulsory Level 2 course taken by the students.

Data Collection

Two data collection sessions were held throughout a 14-week academic cycle, in Week 2 and Week 4. Week 2 was chosen as students could settle in the first week and week 4 for chosen to give a week's break between 2 cycles of data collection. In Week 2, each student responded to a series of questions on the difficulties or problems they encountered when reading EST materials online. In Week 4, the students were involved in FGI where the interviews took place at the participants' selected time and location. During this stage, the objective was to obtain a shared understanding of the importance and significance of EST text selection in an online environment. All twelve participants completed the consent forms and gave their approval to participate in the study. Additionally, it was decided that to maintain secrecy, pseudonyms would be employed throughout the research.

Data Analysis

The six processes outlined by Creswell (2014) for data analysis—data preparation and organisation, coding exploration, theme creation, narrative representation of themes, interpretation of findings, and validation of findings—were applied to the analysis of the semi-structured interviews as well as FGI data. Based on the established themes, data were verified using Cohen Kappa inter-rater reliability analysis. The calculation produced a K value of 0.7, indicating a strong agreement and a high degree of trustworthiness for the data analysis

Problems in Reading EST Online Materials

One of the major themes that emerged from the semi-structured interviews to answer the research question 1

was semantic challenges. This refers to a number of issues such as the use of difficult words, unfamiliar terminologies, and grammatical structures. Example 1 highlights interview excerpts gained from the semi-structure interviews intended to understand the problems students faced while reading EST online materials.

Example 1:

Sub-themes	Interview Excerpts
Difficult words	<p>I cannot understand if the article use bombastic word, somethings that is hard to understand and when I read it, I do not want to open the dictionary (Omar).</p> <p>I have some difficulty in some English vocabulary I do not understand (Amin).</p> <p>Ummm, problems. There will be some words, which is too deep for my level so I have to refer the meaning (Kaden).</p> <p>Mostly meaning of some words that difficult to understand maybe because the level is high for me (Will).</p>
Unfamiliar terminologies	<p>Sometimes it contains the terms that we don't understand actually. Especially from the...like the medical field things, the medical terms (Tini)</p> <p>Generally, I think there is difficult terms that are difficult to understand. (Ida)</p>
Grammatical structures	<p>Sometimes the article have the high level language that I do not understand (Fatin)</p> <p>Some grammar maybe I do not know to understand what is inside the articles (Cindy)</p>

According to Omar, Amin, Kaden, and Will, the use of certain English words made it difficult for students to understand the content of the EST online materials they read. This finding is consistent with Eghlidi, Abdorrahimzadeh et al. (2014), who found vocabulary to be the most difficult problem for students in understanding online materials. Similarly, the terminologies used in these reading materials can also be a problem for students. As elaborated by Tini, and Ida, when they are faced with these terms it makes it difficult for them to comprehend the text. However, according to Azeroual (2013) a big portion of these semantic challenges are caused by language deficiencies that can be overcome through linguistic knowledge. Students need to acquire sufficient linguistic knowledge as it generates meaning of the text by constructing mental representations.

It is believed that students tend to skip the website or the online reading material if the jargon or language was too difficult for them to understand (Nurul Adila, Maslawati et al. 2017).

Overall, students found word choice, terminologies, and grammatical structures to be the main reasons problems they face in understanding EST online materials. This is because reading EST online materials can be rather challenging due to its perplexing structure and abstract nature of presentation (Ho, Tsai et al. 2014). This is especially problematic for S & T students who are learning abstract concepts at a more advanced level in their SL. Hence, students need to have exposure to features that provide detailed information or explanation to understand the text better to achieve learner accomplishment and interest in learning (Hamdan, 2017). In

summary, majority of the students identified semantic challenges to be the biggest problem in reading online EST academic texts.

Significance of EST Online Reading Materials

Several themes emerged for the significance of EST online reading materials selection. They consist of: 1) the discovery of other methods through comparison and contrasts, 2) freedom of expression in technical writing, and 3) the ability to explain complicated scientific knowledge. Based on the focus group interviews, students believe that there is a need to select EST materials for them to work with to identify, distinguish, and compare between the different types of texts that they were reading online. For example, introducing students to more technical materials such as processes and technical descriptions. When they were introduced to these types of materials, they were able to make comparisons between descriptions. Based on the first theme, it was easier to understand these technical materials because they were introduced through other mediums such as watching videos.

Discovery of Other Methods Through Comparison and Contrast

When students were able to compare and contrast the EST materials, they discovered that comprehension was attained through other mediums or methods such as viewing videos. Students managed to understand the difference between directional processes and informational processes by watching two videos that described these processes. Example 2 illustrates this:

Pseudonyms	Interview excerpts
Gina	I feel like, that I learnt about there are actually many different ways to do, to explain about the procedure of something just like the video shown. One is more on graphic and simple word, simple instructions to teach you how to do a red velvet cake, the other one will be more informative. It is more sounds and wording.
Rowena	From this activity, it is actually easier to compare between how to and what to, like one is instructional and the other one is informational. So, if describing through words, it might be harder to understand but if we do something practical, it is easier for us to understand
Gerard	In both the washing machine and rearranging of the volcano process materials, it shows a quite different way of delivering and explaining information but however they do show similarities where the information delivered are clear and easy to be understand
Tim	The cake, I think is like, it did not explain much about how to do, it just show the steps and then for the rice one, it gives more information and if compare to the video about the cake one. Means that the second video may have more information if compare to the first video

According to Gina, and Rowena, the EST video provided descriptions that were more graphical and included

sounds. To these students, it was easier to comprehend the materials as the videos provided better understanding. Hence, exposure to such EST online materials via other methods such as videos enables students to make comparisons of the types of processes. Students also believe that by viewing these two videos, they gained a clearer picture of the differences because of the visual impact. This corroborates Chou and Hsiao (2010) claim that visual scaffolds assist students to sustain more information. This notion was portrayed when students were able to critically examine the delivery of the different types of processes by providing examples.

In addition, Gerard concluded that both videos provided a visual impact as the delivery of information was compared and provided. Supported by Liu, Jang et al. (2018), using video clips that feature audio and graphics, would be a more efficient way in teaching a concept compared to using a picture book. Similarly, Tim believes that the video on the process of ‘how rice is grown’ was provided with more information, whereas the process of making a red velvet cake was just provided with steps. This indicated that he did not merely understand the processes involved but was able to make comparisons. He was able to elaborate on the differences between how the two processes were different in the videos by providing justifications. This indicates that learning with the use of video clips becomes more meaningful when comprehension is achieved. The discovery of other methods through compare and contrast assisted students in understanding EST online materials. Hence, this indicates a consistency of data whereby the use of technological tools assists students in learning when combined with the use of EST online materials using other methods that provide visual impact (i.e videos).

Freedom of Expression in Technical Writing

Another important significance in introducing EST online reading materials is that it allows the freedom of expression for students in their technical writing. Students believe that it gave them the ability to elaborate on ideas introduced to them. Example 3 depicts this point:

Student	Interview excerpt
Henri	For me, from this activity, I know how to express my word, express myself in writing.
Vicky	For the process explanation, it teaches us how to become expressive.
Shah	I can write it in my essay with my own words, my own creativity. Based on the passage and supporting details
Elisa	For me, first when I read all these science and technology hypertext, not only we first using skim and scan first and like those find the definition of the words, the phases, we mean we can annotate it and explain in our own ways, so that when we are answering the question, we can easily define in our own ways, so that the markers will really understand what we are understanding, not just copy and paste from the passage
Gina	For me, like this IREAD activities, it will help me in writing because for example for my Engineering in Society subject, the lecturer ask us to find a video online and then to write about like the disasters that made by the careless engineer. So we need to look through the

	whole video and then need to write the essay on our own. The essay is about 2-3 pages, is around 700-1000 words. So for the activities, I will learn how to describe in my own through the video
--	--

Example 3 illustrates five students' expressions indicating the need to be expressive in their writing of EST online materials because developing creativity and explaining terminologies on their own would lead to better comprehension. This will ultimately assist in the writing process.

For example, Gina believes that the EST online materials introduced in iREAD provided knowledge, understanding, and skills in the current Engineering in Society subject taken. She believes it assisted in technical writing in a more organized manner and tapped into his schemata to complete the assignment. In summary, students believe that EST online materials introduced to them in iREAD gave them the freedom of expression in technical writing for both their English subject as well as Engineering subjects. This provided students with the ability to synthesize ideas and write from understanding instead of copying and pasting ideas from the passage. Hence, encouraging creative and critical thinking among students.

Ability to Explain Complicated Scientific Knowledge

The ability to explain complicated scientific knowledge is an important skill for learners because students deal with EST materials regularly. In Example 4, Gary elaborates in detail what this is meant.

STUDENT	INTERVIEW EXCERPTS
Gary	As a Science student, process explanation is an important element for us in order to deliver information especially regarding to scientific knowledge and information which are complicated most of the time. Through these activities, we are able to analyse and learn the way of explaining a certain process or object in a simpler way. For example, photosynthesis process for plant which involved numerous steps can be explain by arranging the steps like what the volcano process. This eventually makes a complex process to be understand easily.
Sam	I can improve my writing skills. For example, the chocolate making passage, before I only know roasting process. Then now I learn something new is winnowing process, which is removing the nutshell of cocoa bean. I can know it in detail how chocolates are made
Edwin	I learnt some of the key words especially is mainly used in Science and Technology field and how those names of the process is quite important such as welding, and so on. The key word is important because the key words might lead to further understanding and more easy to define the process.
Victoria	First, what I learn in technical text is terminology. Example the magnetic field in compass text. I also learn how to summarize videos in my own words.

Example 4 shows that Gary believes that with such scientific knowledge, other subjects in his academic field will be easily understood because he learned it in English subject. The English subject introduced S & T terminologies that became the basis or foundation for other S & T related subjects relevant to their academic field. It provides them with background knowledge in the related topics. Hence, it is significant to select ESP materials based on S & T references to fulfill learners' needs (Kim, 2013).

They were able to understand processes and identify S & T keywords and terminologies. These interview excerpts reflect students' beliefs in their ability to describe, elaborate, and explain complicated scientific knowledge because of their exposure to scientific activities and materials in iREAD.

Conclusion

Two conclusions can be drawn from the findings on reading problems faced by students in reading online academic EST materials. Firstly, students lack linguistic knowledge of the language which leads to language deficiency. This evidence suggests students' lack of exposure to general English (grammar and vocabulary) that is reinforced through EST. This finding is consistent with studies that found vocabulary, grammatical structures, and insufficient exposure to domain-specific text (i.e. S & T) to be the biggest problems for ESL and EFL students in understanding online materials (Pookcharoen 2009, Eghlidi, Abdorrahimzadeh et al. 2014, Nurul Adila, Maslawati et al. 2017).

Secondly, a lack of background knowledge of scientific information can become rather challenging due to its structure and distinct features. The role of prior knowledge plays an important feature in learning as it contributes to comprehension of grammar, vocabulary, and content of EST. The findings support the belief that reading such abstract knowledge in the SL involves learners' background knowledge and experience. The findings indicate that Schema Theory (Carell & Eisterhold, 1988) is associated with relating the content of the text in iREAD with their knowledge of S & T to fully understand what they read. Hence, Schema Theory plays a role in acquiring knowledge in an online environment because reading is considered an active process where readers create understanding of the information based on retrieving and applying previous knowledge. For example, exposure to EST materials such as description of processes would strengthen student's background knowledge. In a way, the students gathered and synthesized knowledge from an array of resources by exercising their cognitive ability to reach an understanding of the said phrase, information or concept (Park, Yang et al. 2014). In turn, this knowledge will guide and equip students in other subjects they are undertaking during the course of their study.

Findings from the current study indicate positive and encouraging responses regarding the use of online materials and activities in iREAD. Students were able to reflect on the materials and activities in iREAD. They were also able to discover other methods through comparison and contrast. This was attained through watching videos of complicated EST materials. Students were also able to achieve freedom of expression in technical

writing that allowed them to tap into their schemata for other Engineering subjects. The EST online materials also enabled them to identify and understand processes. In addition, the findings indicated that students were able to enhance their cognitive thinking by relating to background knowledge that is associated with S & T based on their field of study. The notion of Schema Theory (Carrell, 1988) is clearly reflected here as students explore new knowledge or information based on previous experiences.

Recommendations

Since reading takes place in all subject areas, a greater focus on ESP should be advantageous for students because the materials are relevant to their academic fields. This encourages critical thinking as they are exposed to English language materials that have S & T content and exhibit the distinctive features of S & T for them to be motivated to learn. This begins with educators recognizing the differences in the materials. For example, science content differs to that of history. Teaching students syntactic and discourse features that are generally used in the language of S & T will help students approach texts with different perspectives. To help students achieve a better understanding of EST, adapting teaching methods for EST reading using stylistics should also be based on content.

Abstract: The success of the supply chain is assessed through the efficiency and effectiveness of the innovative strategies that a company provides to its customers. Currently, companies face significant challenges in improving their service levels due to constant innovations in digitization. This study aimed to evaluate the impact of digitization and automation on the supply chain of a Peruvian fast-moving consumer goods company. Using a three-phase simulated design methodology with the involvement of relevant departments within the company, the goal was to analyze the impact of implementing new software to improve Fill Rate, a service level indicator used by the company. The main findings reveal a technical gap of 14.38%, and the objective of achieving 80% is expected to be met by the end of this year. Finally, this research serves as a starting point for further evaluation and analysis of the indicator's impact with the software in other areas. This will enable the investigation of new tools that are more aligned with the specific needs of each area to enhance its service level.

Keywords: Digitalization, Fill Rate, Supply Chain, Food Industry.

T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1442-1451), Antalya, Turkiye. ISTES.

Introduction

Digitalization has been a topic of great relevance in recent years for various economic sectors, including the Peruvian food sector. The implementation of digital technologies in the food supply chain can generate significant benefits for producers, distributors, and consumers. The use of technologies such as artificial intelligence, the Internet of Things (IoT), process automation, and data analytics, among others, is revolutionizing the food supply chain in the Peruvian sector and enabling greater efficiency and better real-time

decision-making.

Supply Chain (SC) refers to elements or activities that interact dynamically to form a system. Because the SC system is not integrated and decentralized, it makes its processes variable and complex (Furstenau et al., 2022). SC is defined as strategic assets, capabilities, and a source of competitive advantage where the integration of processes or activities can be evaluated to measure and optimize the performance of companies (Liu & Chiu, 2021). The SC must be flexible to respond to unexpected changes in customer needs and competitor movements. This flexibility needs to be directly related to digitization to simplify and optimize processes within the company with customers (Khalayleh et al., 2022).

SC in the food sector, from production to consumption, involves farmers, intermediaries, processors, exporters, distributors, and logistic services. In the production stage, farmers, fishermen, and ranchers generate raw materials. Intermediaries sell to processing or exporting clients, while the transformation of raw materials is carried out in more than 2,500 companies in the sector (Sociedad Nacional de Industrias, 2015). Exporters are responsible for selling internationally, and local distribution supplies various points of sale. Logistic services, such as transporters and customs, facilitate the efficient mobility of products. The end consumer completes the chain by acquiring products for consumption. This complex system reflects the collaboration among different actors in the Peruvian food sector.

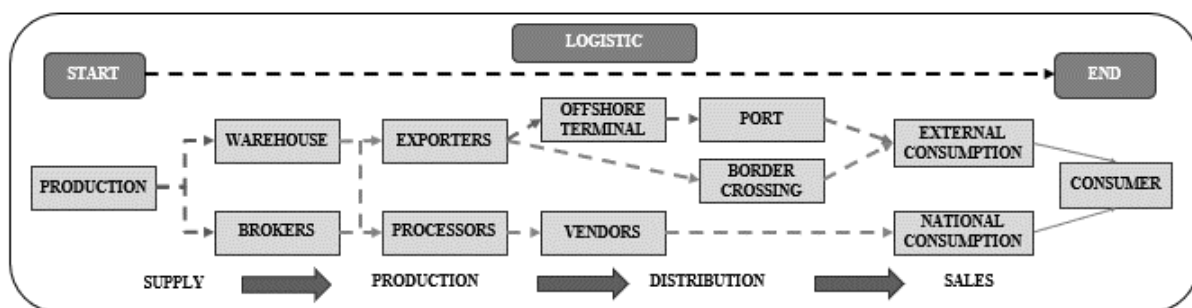

Figure 1. Supply chain of a fast-moving consumer goods company

On the other hand, the level of service and product quality are intrinsically related in a fast-moving consumer goods company. According to previous studies, a high level of service, which includes aspects such as product availability and timely delivery, is directly linked to consumers perception of quality (Jain & Singh, 2016). Likewise, product quality plays a fundamental role in customer satisfaction and in building brand loyalty (Zeithaml et al., 2019).

In relation to this, digital technologies, by transforming the dynamics of interaction between organizations and consumers, directly impact the structuring of processes, products, and services (Caputo et al., 2021). This profound change not only drives innovation in product offerings but also redefines the relationship between the company and the customer. The strategic implementation of these technologies in fast-moving consumer goods companies thus becomes a key pathway to staying at the forefront in a highly competitive and dynamic market. In this context, the present research focuses on the characterization, analysis, and projection of the digitization

of the supply chain for the Peruvian food sector. It is expected that the digitization of the supply chain will contribute to improving efficiency and transparency in the management of logistical processes, as well as enhancing quality, food safety, and level of service (Pintado, 2023).

Contextual Analysis

The level of service in fast-moving consumer goods companies refers to the ability of a company to meet customer expectations in terms of product or service availability, quality, and delivery. In recent years, several studies have highlighted the importance of the level of service in the context of fast-moving consumer goods. Service level is a critical factor for customer retention in the fast-moving consumer goods industry (Samanta & Jain, 2021). The authors emphasize that companies must ensure products are readily available, as lack of availability can lead to customer loss and decreased customer satisfaction.

Furthermore, the level of service is also linked to customer loyalty in mass consumption companies (Zhou et al., 2019). The authors found that a higher level of service correlates positively with customer loyalty and positive word of mouth. This suggests that companies that succeed in providing superior service can earn the trust and loyalty of customers, generating a positive impact on their customer base and business profitability.

The level of service and product quality are intrinsically linked in a mass consumption company. According to previous studies, a high level of service, which encompasses aspects such as product availability and timely delivery, is directly associated with consumers' perception of quality (Jain & Singh, 2016). Additionally, product quality plays a pivotal role in customer satisfaction and brand loyalty generation (Zeithaml et al., 2019). Therefore, a mass consumption company that succeeds in providing excellent service and high-quality products is more likely to garner consumer preference and build enduring relationships with them.

In the present research work, the indicators of a leading company in the food and consumer products sector in Latin America will be analyzed. Headquartered in Peru, the company is engaged in the manufacturing and marketing of a wide range of products spanning categories such as food, personal care, home care, and animal nutrition. It has a strong presence in various countries in the region and is recognized for its quality, innovation, and commitment to sustainability.

However, the lack of digitalization in the field of logistics poses a challenge impacting the planning and monitoring of supply chains and trade and transportation corridors in Peru. It has been suggested that establishing a Logistics Observatory could be a valuable solution to address this issue, as its primary function would be to monitor and assess progress in improving supply chains (World Bank, 2016).

The quantitative analysis of evidence regarding the causal factors contributing to the low level of service in mass consumption companies, due to a lack of digitalization or appropriate technologies, underscores the importance of examining organizational operational records and indicators. By relying on concrete data such as

average delivery time, customer satisfaction index, and operational costs, a precise quantitative insight into the direct and indirect reasons behind the problem was obtained.

The analysis of operational records revealed that manual and outdated processes, such as inventory and order management, generate inefficiencies and service delays. Quantitative data demonstrated that inefficient communication among different departments and stakeholders within the supply chain hampers the ability to respond rapidly and cohesively to customer needs. Furthermore, it was observed that the absence of automated systems and data analytics tools results in delays, errors, and an inability to identify improvement opportunities.

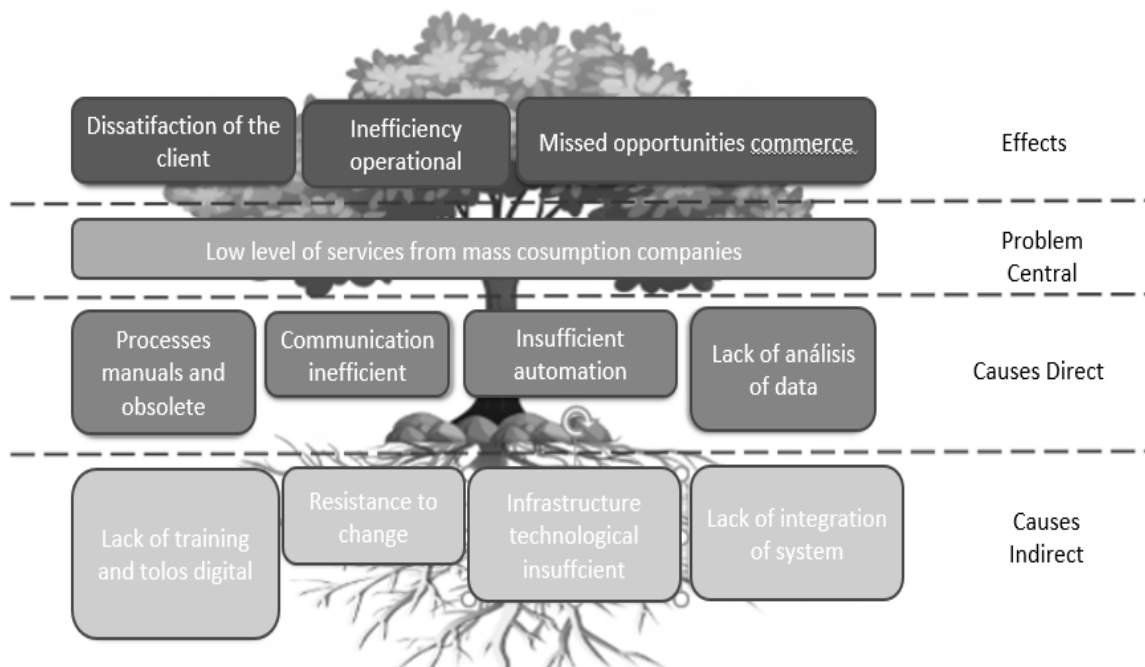

Figure 2. Root cause tree of low service levels in mass consumption companies

Method

Firstly, an initial diagnosis is conducted through interviews with sector experts to gather relevant data. This pre-test enables an understanding of the current situation of the supply chain and the specific challenges the company faces. The primary technique employed is the SIPOC tool, which aids in data analysis to identify the main factors of the process where improvement will be applied.

Next, the proposal is designed using the TPI technique (Transactional Process Improvement). Additionally, within this method, the tool to be utilized will be the Arena software. Through simulation, various scenarios and strategies can be identified and evaluated to optimize the supply chain. This encompasses the implementation of digital solutions, such as inventory management systems and real-time tracking. Below, we present the simulation model that we used to demonstrate an improvement through digitization (Figure 3).

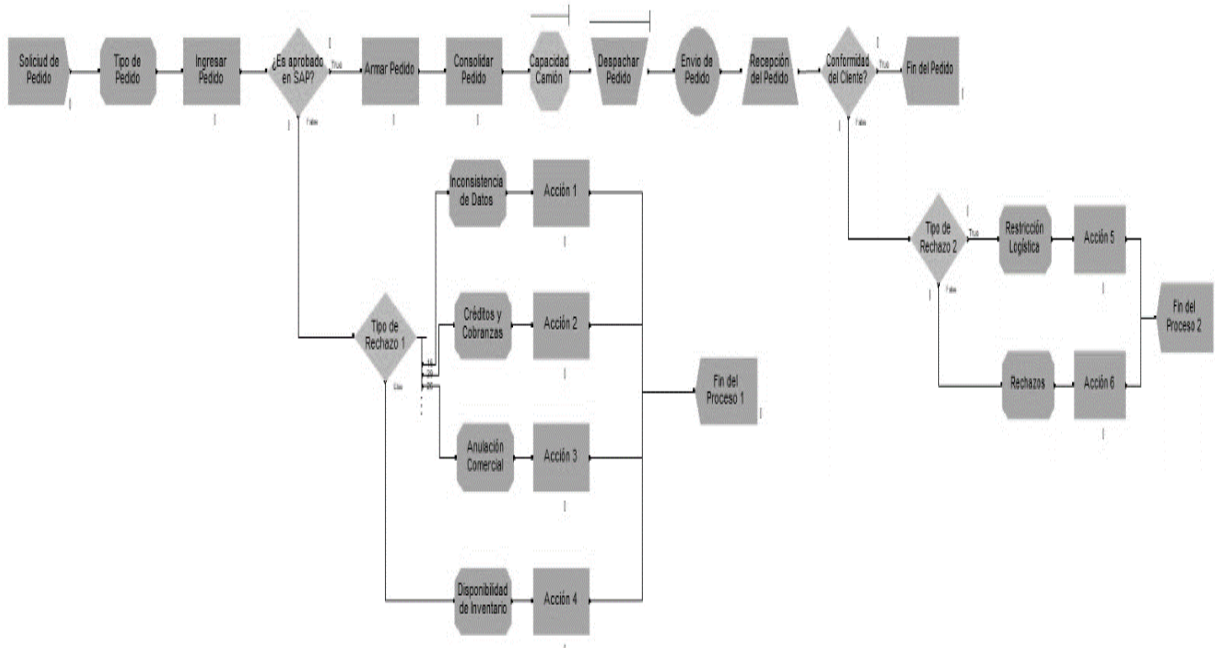

Figure 3. Simulation model in Arena

Once the proposal is designed, results validation is conducted in a post-test. Strategies before and after implementation are compared, analyzing the impacts on reducing the service level gap. Furthermore, the obtained data is analyzed to measure the success of digitalization in improving the supply chain.

Table 1. Design of the proposal model

Stages (components)	Techniques/Tools	Validation
Initial diagnosis (pre-test)	Expert interviews	Triangulation with company
	Document review	personnel and experts
	SIPOC	Process confirmation with the company
Design and simulation of the proposal	Transactional Process	
	Improvement (TPI)	Analysis of statistical criteria
	Arena Simulator	Impact matrix
	Software v16.2	
Result Validation (post-test)	Comparative KPI matrix	Methodological confirmation with experts
	Data analysis	
	Interviews	

In the initial stage of diagnosis, a comprehensive review of academic articles and relevant studies on improving the service level in mass consumption companies is conducted. This review facilitated the acquisition of a solid foundation of theoretical knowledge and best practices in the field, offering a deeper understanding of the subject and guiding the focus of the diagnosis on the specific company.

If any discrepancy or inconsistency was identified in the collected information, additional verifications were conducted to ensure precise and reliable data. In the event that the information was deemed correct and reliable, specific problems and challenges affecting the service level in the company were then identified.

In the subsequent stage, the entire process was grounded in the application of the Transactional Process Improvement (TPI) technique, which is utilized to enhance the efficiency of business operations. This technique focuses on identifying and eliminating waste in the information flows that occur during transactional processes.

By applying this technique, a thorough analysis of existing information flows is conducted, areas or processes with greater improvement opportunities are identified, and changes and adjustments are implemented based on findings and identified best practices. This includes streamlining information flows, automating repetitive tasks, and optimizing information systems used in transactional processes.

In the final phase of the process, it commences with the creation of Key Performance Indicators (KPIs) to compare the results obtained in the second stage of the project. As a result of this analysis, a comparative matrix is generated to visualize and evaluate the collected data.

Results

The company employs a primary indicator to measure the consolidated service level across its various areas, known as Fill Rate. This indicator can be viewed at the SKU level, distribution center, or distribution channel, providing a straightforward means to assess the performance of different organizational links concerning the service delivered to customers. The calculation of this indicator is as follows.

$$FR = \frac{\text{Invoiced orders}}{\text{Orders requested}}$$

The company utilizes rejection levels to categorize and assess the reasons behind the non-fulfillment of orders. In this research, we focus on three fundamental areas of the system (sales, distribution, and planning) that experience significant impacts due to various forms of rejection. Below, we present a detailed classification of rejection types within these three areas and their subdivision by type of rejection (table 2).

Table 2. Types of rejection

Area	General rejection type	Specific type of rejection
Commercial	Data inconsistency	Chain price difference
		Discontinued product
		Business decision
	Accounts receivable and collections	Credit rejection

Distribution	Commercial cancellation	Order error
	Logistic constraint	The customer did not pick up the order
	Rejections	Product lifespan
		Late delivery
Planning	Logistic constraint	Unfulfilled order
		Out of stock
	Inventory availability	Machine and equipment issues

Below is a table presenting an As-Is - To-Be comparison of the measurements made in the simulation based on the type of rejection (Table 3).

Table 3. As-Is vs. To-Be

	As – Is	To - be
Fill Rate	75.5%	86.4%
Level 1 reasons for rejection	24.5%	13.6%
Data inconsistency	4.7%	2.6%
Credit and collection	3.9%	2.2%
Commercial cancellation	4.4%	2.4%
Inventory availability	4.7%	2.6%
Logistical constraint	5.4%	3.0%
Rejections	1.5%	0.8%

Discussion

Regarding the obtained results, Fill Rate did not reach the proposed goal in the research, although an improvement of 11.04% was achieved compared to the previous year's results. In this regard, the adoption of the new SAP Leonardo software has generated a considerable impact, as revealed by the simulation results. These data not only provide promising figures but also ensure a better positioning against competitors. The implementation of this technology places our company in an advantageous position within the context of Industry 4.0, consolidating it as an innovative entity adapted to the demands of the current market.

Additionally, the company continues to constantly investigate ways to enhance its systems and how to apply them in its processes. Furthermore, through potential improvement initiative tests, the company is investing in training its employees to be prepared for the new digitization systems. Moreover, the implementation of the new SAP Leonardo software has contributed to improving the company's traceability, both internally and in relation to its customers.

Digitalization, supported by technological advancements and substantial investment in modern technology, has

become an essential pillar for improving supply chain in the food industry (Khalayleh et al., 2022). This enhances the competitiveness of companies, enabling them to adapt to changing demands and improve their long-term position. Additionally, traceability has emerged as a strategic tool for sustainability, enhancing efficiency and transparency throughout the SC (Latino et al., 2022). Collaboration and vertical integration are crucial, as companies with common interests in digital technologies cooperate in areas such as finance, human resources, and technology (Grubor et al., 2022).

In a similar context, the implementation of digitalization supported by artificial intelligence in India generates a vast amount of data that will be utilized to generate knowledge, thereby ensuring traceability, transparency, and security in information management (Sharma et al., 2022). Therefore, digitalization not only enhances the performance of the company but is also crucial for the internal integration of the supply chain (Liu & Chiu, 2021).

The integration of systems represents a significant advancement in digital transformation, particularly relevant for improving the supply chain in the Peruvian food industry. However, to fully harness this potential, a strategic approach focusing on high-value cases, flexible integration architectures, and staff training will be required (Kunduru, 2022). It is advisable for the implementation to be accompanied by active and frequent maintenance to assess the continuous learning of artificial intelligence, as the volume of data constantly grows, but so does the percentage of useless data (Gackowiec & Podobińska, 2019; Van Diter et al., 2022).

The generated tracking systems offer advantages for reliability and quality in production environments, while logistic operations are experiencing increased flexibility and speed due to the growing importance of predictive analysis (Pratap & Pendyala, 2022). Furthermore, future work aims at enhancing the development of software elements and subsystems to increase code affinity (Bakhtadze & Suleykin, 2021).

Conclusion

The implementation of the new software does not meet the expectations set forth in this year's work. Nonetheless, an 86.56% coverage of the technical gap is achieved, resulting in a sales increase of 1161 million soles compared to last year. In other words, the implementation of SAP Leonardo brings significant improvements for the company by addressing rejection types and boosting sales. However, it is important to note that the project entails risks, primarily concerning time management and the adaptation of the company's human resources to the implementation of this innovative tool.

The participation and collaboration of all involved areas were crucial for the success of this project's simulation, as they enable addressing multifaceted challenges and fully leveraging the potential of digitalization. Digital transformation not only enhances operational efficiency and transparency in the supply chain but also prepares companies to adapt to environmental changes.

Recommendations

It is suggested to consider extending the project's execution period from one year to two years to achieve and surpass the previously established goal of reaching an 89.9% indicator. Additionally, it is proposed to repeat the research within a five-year period, given that the gradual incorporation of artificial intelligence tools in the industry is emerging as a trend. The consideration of this suggestion is justified by the possibility of harnessing the consolidation of artificial intelligence as a means for continuous improvement in the near future.

Towards a Comprehensive Vision for Re-Imagineering Higher Education: Shaping the Future of Higher Education Promoting Sustainable Development Goals

Amani Ghazi Jarrar

Philadelphia University, U.S.A.

Abstract: This study aimed to develop a new vision that will involve shaping the future of Higher Education for promoting sustainable development goals (SDGs). This comprehensive vision will undergo the analytical research concept of the Re-Imagineering paradigm that is involved in the design, evaluation, development, testing, modification, inspection, and maintenance of a wide range of products, structures, and systems. Besides that, this study will investigate the relationship between organizational governance and faculty governance in higher education and the role of universities in entrepreneurship, in which higher education can adopt the Total Quality Management (TQM) principles and its four main areas that must be met. This study will conclude the clear path to redirect the future of higher education toward an (Education Area) that is sustainable, responsible, peaceful, democratic, collaborative, and prosperous. And then shape the (Future) We Want; as Higher education can and must play a significant role in equipping students around the world with the skills, values, and knowledge they need to find answers to today's sustainability concerns. The study will also suggest combining the top instructional strategies to develop immersive and interesting learning experiences. And combine technological expertise with creativity to produce novel concepts that can alter our educational institutions.

Keywords: Higher Education, SDGs, Re-Imagineering, Shaping the future.

Citation: Jarrar, A.G. (2024). Towards a Comprehensive Vision for Re-Imagineering Higher Education : Shaping the Future of Higher Education Promoting Sustainable Development Goals. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1452-1462), Antalya, Turkiye. ISTES.

Introduction

The current situation of higher education institutions emphasizes their fundamental inability to do their role to prepare qualified individuals with high skills: academic, professional, cultural, and personal that are compatible with the needs of society and the labor market, as what is observed is a general weakness in the level of training, research, and the ability to think with creativity and critically. Besides enhancing time management, decision-making, taking responsibility, accepting other opinions, and working within teams, in addition to low general culture, lack of knowledge of society's problems; whether environmental, social, economic, or political, and

indifference to society's concerns and local and global events (Dewey, Codallos, Barry, Drenkhahn, Glover, Muthig & Abbott, 2020).

The future of educational institutions is closely linked to the real implementation of their role derived from their vision, mission, and goals. Their role goes beyond providing knowledge to creating and transferring knowledge, research, and innovation, transferring experience, culture, and science, and creating job opportunities in the market to become an instrument of real change toward economic growth and sustainable development. Accordingly, the university bears the responsibility of moving from education to learning and preparing a qualified graduate who has multiple skills that suit the needs of the global labor market and can start entrepreneurial businesses and projects (Ferrer-Estévez & Chalmeta, 2021).

The ranking of higher education institutions is an evaluation methodology based on a variety of criteria. Each type of classification uses a different set of quantitative variables to base its results on, so none of the classifications accurately provides a comprehensive picture of an organization's capabilities. The ranking is not limited to a specific entity, as there are several journals, newspapers, websites, governments, and academics interested in publishing multiple types of classifications.

Most ranking organizations typically provide a ranked list of programs, departments, and colleges, as well as entire educational institutions. The rankings take into account a variety of factors, such as funding to universities, the impact factor of distinguished research, the experience of specialists in these educational institutions, the application and admission criteria for students, as well as the alternatives available to them, the number of times they have received academic awards, and the university's ability to transform towards globalization, graduate rates, relationships with industry institutions, historical reputation, and much more (Fernandes & Singh, 2022).

Importance of the study

The importance of the research stems from adding a proposed strategic perspective to develop the governance of higher education institutions in Arab countries, by studying the concept of governance of higher education institutions, how higher education institutions are managed; and how monitoring and follow-up mechanisms for all parties related to the university, and support mechanisms and principles of organizational governance for universities. Also, activating the organizational governance of Jordanian universities through a set of guiding standards that can be relied upon when judging the quality level of universities' performance. This research can contribute results that are useful in:

1. Redirecting the future of higher education toward an (Education Area) that is sustainable, responsible, peaceful, democratic, collaborative, and prosperous.
2. Analyzing the strengths and weaknesses in the practice of organizational governance and its application mechanisms in universities.

3. Recognizing the importance of practicing governance in universities to fulfill their role in social responsibility.
4. Investigating the relationship between organizational governance and faculty governance in higher education and the role of universities in entrepreneurship, in which higher education can adopt the Total Quality Management (TQM) principles and its four main areas that must be met.

Problem statement

Studies analyzing higher education in the Arab World, and in Jordan reveal shortcomings and defects in the institutional governance of universities, which included extreme slowness in responding to demands for change and development. Among the 17 Sustainable Development Goals, adopted in 2015, Goal 4 (Education) is allocated, for which higher education is mentioned in target (4.3) of Goal 4; which calls for, by 2030, to ensure all women and men have access to a quality university education (Chaleta, Saraiva, Leal, Fialho & Borralho, 2021).

Despite the importance of universities in advancing the process of economic and Higher education in Jordan has not yet reached the necessary level where it can be influential and interact with development aspirations in all fields, as the reality of the situation indicates that higher education has not effectively produced the type of graduates required to meet the challenges of the global economy. This is true despite the importance of universities in advancing the process of economic and social development and their role in modernizing and developing societies. The following questions were addressed by this research:

- 1- What are the current total quality management trends in the higher education sector?
- 2- What conditions must be met before using complete quality management?
- 3- How to combine the best practices of education to create engaging and immersive learning experiences in universities?
- 4- What is the relationship between organizational governance and faculty governance in higher education?
- 5- In light of overall quality management and the information and technology revolution, what is the suggested vision for expanding and upgrading the elements of the educational process at universities?

Literature review

The International Conference on Governance in Higher Education Institutions held in Jordan (2017) recommended that university governance should be considered one of the requirements for university accreditation and must be linked to quality and accreditation standards. The conference recommended that the governance of Arab universities requires developing indicators and standards to evaluate the performance of universities in the field of governance and developing a guide for applying the quality standard and ensuring quality in each university, with performance indicators indicating the implementation of the standard across six

concepts: accountability, transparency, participation, and the impact of the political, economic, and social environment on Strengthening governance, the role of stakeholders in university governance, and governance and quality assurance. As well as analyzing the experiences of national, regional, and international higher education institutions, comparing governance in Arab universities, the outcomes of higher education, and linking governance to strategic planning.

The Education 2030 Framework for Action recognizes that a well-established and well-regulated higher education system may increase possibilities for success, equity, quality, and relevance, and urges for the development on current international accords in support of higher education. In order to maintain sustainable development and reap the benefits of technology, open educational materials, and distant learning, it can also lessen the dissonance between what is taught and what needs to be learned (Mulà, Tilbury, Ryan, Mader, Dlouhá, Mader & Alba, 2017).

In order for the educational process to meet the needs of its beneficiaries and provide effective results that satisfy societal demands, a number of requirements and conditions must be present. This is how the concept of quality in education is best described. In accordance with these definitions, comprehensive quality within the context of the higher educational institution entails a number of contents, the most crucial of which are (Nasim, Sikander & Tian, 2020):

- 1- Adopting the method of cooperative teamwork, and using all capabilities, talents, and experience possessed by the human resources in the organization.
- 2- Ensure continued improvement and development to improve quality.
- 3- Reducing errors based on performing the work correctly the first time, which leads to reducing the cost to a minimum while obtaining the satisfaction of the beneficiaries of the educational process.
- 4- Ensure that the cost of quality is calculated within the organization to include all work related to the service provided.
- 5- A comprehensive approach to all areas in the educational system, such as goals, organizational structure, work methods, motivation, motivation, and procedures

The administrative process in the twenty-first century is characterized by a serious and distinguished effort to notice change, follow up on developments and developments, and make the most of them. Educational administrations at all levels seek to reform education, improve its conditions, and keep pace with technical developments and the information and communication revolution, which has imposed many changes in the lifestyle and the requirements of education. Highly qualified human resources in the field of knowledge, creativity, diverse skills, and the pursuit of competition in quality performance. From this standpoint, higher educational institutions began to pay attention to total quality management in order to gain a good reputation through diligent work and provide solid outputs to society from active human resources, in line with scientific and technological progress, and keeping pace with developed countries in applying the comprehensive quality system as an indicator of civilizational indicators and striving for the well-being of society. The issue of

universities' interest in the principle of applying total quality is a bold, pioneering step in investing in the human mind and benefiting from its energies and creativity through the quality and excellence of university education (Zhalalovna, Shishov, Rozhnova, Rozhnova, Polozhentseva & Lobacheva, 2020).

Discussion and Results

Because a university is, in many ways, a much more complex institution than a corporation, good governance in higher education is particularly crucial because it must provide a framework for a really diverse set of stakeholders. However, the fundamentals of corporate governance also apply to the governance of higher education. Although higher education leadership may have values that are similar to those in business, this does not indicate that they should act in a businesslike manner. (Abdeldayem & Aldulaimi, 2018).

In order to manage relationships between various stakeholders and guarantee sustainability, universities must practice effective governance. Governance is the first and last step toward sustainability. A university can't succeed if its values aren't followed. A university's ability to develop and thrive is facilitated by good governance, which provides information and promotes decision-making. A university can be viable in the long run when governance (as an overall structure) is combined with accountability and openness. (Indarti, Mundiri & Ferandita, 2021).

One of the main strategic aims for every institution should be centered on effective governance and contemporary management. To that end, the following strategic objectives have been established:

1. Strengthening the principles of good governance, such as accountability, participation, justice, and gender equality.
 2. Establishing processes for quality assurance and establishing the standards of excellence and accreditation.
- To keep up with international best practices, institutional performance must be improved.
- 4- Achieving the University's financial stability through varying its funding sources.
 5. Strengthening digital transformation while streamlining and automating activities.

The following Figure 1 shows the university's good governance aspects. Figure 2 also shows the connection between faculty governance and organizational governance in higher education (Williams, 2015).

The Total Quality Management (TQM) principles, which call for compliance in at least four key areas, can be adopted by higher education.

- ✓ First, TQM is used to manage higher education generally or to enhance administrative and operational tasks.
- ✓ Second, TQM is included into the teaching methods.
- ✓ Third, TQM is used to classroom instruction.

- ✓ Fourth, TQM is used to oversee research initiatives in higher education.

Figure 3 shows Total Quality Management (TQM) As a Corporate Strategy in Higher Education.

Figure 3. Total Quality Management (TQM) As a Corporate Strategy in Higher Education

Source: <https://newcluk008.blogspot.com/2018/08/total-quality-management-tqm-as.html?m=1>

For that, the importance, and Benefits of TQM in Higher Education Institutions (HEIs) are:

1. HEIs are compelled to use methods in a worldwide framework in the current social environment.
- 2- Total Quality Management (TQM) is a management theory and method of thinking that has assisted higher education institutions in their quest for excellence in educational delivery.
- 3- TQM needs to be broadly accepted and successfully implemented in HEIs in order to guarantee high-quality services, meet market demands, and satisfy stakeholder interests.
- 4- TQM adoption will aid higher education institutions in keeping up their competitiveness. The majority of higher education institutions face roughly the same issues globally in the twenty-first century.
5. Overcoming obstacles is crucial for competing, surviving, and achieving excellence.
- 6- By achieving a number of advantages, like enhancing

For that, We Need To: Redirect the future of higher education toward an (Education Area) that is sustainable, responsible, peaceful, democratic, collaborative, and prosperous. And we must: Shape the (Future) We Want; as Higher Education can and must play a decisive role in providing learners across the world with knowledge, competencies, and values to discover solutions to today's sustainability challenges.

The *Re-Imagineering* Concept includes:

Re: Derived from Latin, again: anew.

Engineering: Involved in the design, evaluation, development, testing, modification, inspection, and maintenance of a wide range of products, structures, and systems.

Imagination: The ability to imagine things that are beyond knowledge, and the ability to form systems in our mind of something that have not seen or experienced.

For that, the *Re-Imagineering* of Higher Education has the following keystones:

- 1- Combine the best practices of education to create engaging and immersive learning experiences.
- 2- Combine creativity with technical know-how that results in innovative ideas that can transform our educational institutions.
- 3- Although higher education systems are in a constant state of change, they are difficult for the public and private sectors to reform. And for increasing higher education efficiency; establishing mechanisms to coordinate the development of higher education systems is a must.

Therefore, higher education creates lifelong opportunities that promote economic success, political participation, and other benefits. And attention must be drawn:

- 1- To the need for effective policy structures to manage higher education,
- 2- To link the costs of reforms to benefits such as increased opportunity,
- 3- To take account of the institutional constraints to change as well as to carefully articulate educational reforms with other public policies that influence the performance of the higher education systems.

Besides that, *Re-Imagineering* Higher Education shows the following possibilities (Haider, Akbar, Tehseen, Poulouva & Jaleel, 2022), as shown in Figure (4).

Figure 4. *Re-Imagineering* Higher Education shows the following possibilities.

For that, having leadership skills is helpful in many fields, but it's crucial in higher education.

1. If you work in this sector, you can be in charge of supervising staff members and employees or instructing pupils.
- 2- No matter what your precise tasks and responsibilities are, you must use leadership abilities if you want to be successful.
- 3- Choosing which aims to concentrate on or making important decisions at your educational institution can both benefit from your leadership skills.
- 4- Having leadership skills might also make it easier to deal with obstacles you have in this type of work.

According to the Future of Higher Education Report (2023), there are seven pillars of the Future of Higher Education, these pillars are:

Pillar one: More versatility means being more applicable, lasting longer, and providing more options and possibilities:

- ✓ The democratization of access to education is made feasible by digitization.
- ✓ This will result in a wider range of users and pupils.

Pillar two: Multiversity: multiple disciplines, itineraries, formats, and campuses:

- ✓ In this new paradigm, the primary vector of evaluation is now learning level, rather than memorization.
- ✓ There are numerous learning itineraries.

Pillar three: Eco-systemic: The university's economic and social impact is increased by contact with the ecosystem of players in the education value chain.

Pillar four: Students will seek out universities with a purpose and values that align with the shifting priorities of the next generation. The educational institution has a mission.

Pillar five: Training itineraries based on skills, aptitudes, and areas of interest are called pathways and traces. There are many exits but few entrances. additionally, via a number of academic institutions.

Pillar six: An enhanced learning environment is created by digital technology, which also changes the role of the teacher.

Pillar seven: The new problems brought on by a changing environment will require leadership with new qualities like a digital attitude, a vision for the future, or the ability to facilitate change. From surviving to thriving amid uncertainty.

Conclusions

The quality of Higher Education systems is central and fundamental to individuals and countries alike. At the individual level, education affects future income, employability, health, and even family structure. On the national level, quality education reflects positively on economic growth, reduces poverty levels, and enhances social justice. Thus, shaping the future of Higher Education and promoting Sustainable Development Goals includes:

- 1- Higher Education is the driving force for establishing sustainability since it is one of the main communication vehicles and the basis for the “sustainability mindset”.
- 2- Higher Education institutions are viewed as “changing agents” and “catalysts” in the development of sustainability-related issues.
- 3- SDGs are forcing higher education institutions to change to respond to a world in crisis.
- 4- Higher education institutions have a great responsibility to form future sustainability leaders and support the ambitious SDGs targets implementation.
- 5- Sustainability is also an essential aspect of a university's reputation globally.
- 6- Higher education institutions need to be drivers of culture change and develop curricula based on sustainability concepts.
- 7- Education is the basis for the achievement of all the SDGs and has an essential contribution to the formation of a society willing to support different SDGs aspects (e.g., global citizenship, gender equality, respect for human rights).
- 8- Despite the key role in social transformation:
 - Several challenges and barriers need to be tackled inside the higher education institutions (e.g., curricula, ethical principles),
 - Externally (e.g., different types of audiences, political environment, stakeholders' interest), that need to be tackled for the realization of the world that we want.

Abstract: The COVID-19 pandemic, an unprecedented global health crisis, has not only significantly impacted public health but has also caused substantial disruptions to conventional education systems. In response to these challenges, our institution has undertaken innovative measures within the realm of education. A pivotal aspect of our response involves the establishment and implementation of an advanced online learning environment. We have employed state-of-the-art technologies to cultivate heightened autonomy in student learning processes. The integration of the CodeRunner Moodle plugin has been instrumental in realizing this objective. Serving as a sophisticated tool, this innovative plugin facilitates the administration of customized interactive coding tests designed for students enrolled in Java and JavaScript courses. Over a comprehensive week, we diligently conducted these coding tests to assess the performance of CodeRunner. The outcomes yielded valuable insights, showcasing not only the efficacy of the plugin in evaluating coding skills but also elucidating the students' enthusiastic embrace of this novel assessment approach. The pronounced levels of interest demonstrated by the student body underscore the potential impact of technology integration in enriching and captivating learners within the dynamic landscape of contemporary education. This initiative signifies substantive progress in adapting education to address challenges in the modern world and underscores our unwavering commitment to delivering dynamic and impactful learning experiences for our students.

Keywords: Online laboratory, Automatic assessment, Coderunner, Computer programming skills.

Introduction

The COVID-19 pandemic has significantly impacted the traditional educational landscape, leading universities to adopt online learning environments to ensure educational continuity (Bojović et al., 2020). Online learning offers students the flexibility and convenience of accessing lessons from anywhere and at any time (Hosseini et al., 2008). However, implementing e-learning in universities with a large number of students can be challenging,

particularly in engineering faculties that employ various teaching formats, including online remote real labs (Taj et al., 2021).

The literature emphasizes the importance of infrastructure in e-education labs (Duan et al., 2006). Universities must carefully consider the infrastructure required to support e-learning, taking into account the needs of both students and faculty. This includes ensuring that platforms are fast and reliable, that educational content is adapted to meet demand, and that remote laboratories or WebLabs are designed with accessibility, reliability, and security in mind (Tawfik et al., 2014). By doing so, universities can provide high-quality e-learning experiences that meet the needs of all students, regardless of their location or circumstances.

Creating an effective online learning environment for programming courses involves careful consideration of various factors, including the selection of appropriate software technologies and the assessment of programming skills. (Garcia-Zubia et al., 2007) have made significant contributions by analyzing and selecting the best software technologies for implementing the client and server sides in a WebLab. Similarly, (Moussa, Abdelhalim, et al., 2021) have evaluated the time response of the laboratory architecture they designed and developed to assess programming skills.

Detecting errors in code is a crucial aspect of assessing programming skills, but it is not sufficient on its own. It is equally important to determine whether students can correct those errors (Lobb & Harlow, 2016). This requires a tool that can provide detailed feedback on students' code and help them identify and correct mistakes.

In this context, we have used the CodeRunner plug-in for Moodle to teach programming courses at the University of Oran 1. CodeRunner has helped us automate the testing of code submitted by students in response to a variety of programming questions in different languages. We have experimented with CodeRunner and discussed its effectiveness in assessing programming skills. Our findings and future perspectives will be presented in the following sections.

Method: Designing Effective Remote Laboratories

Setting up a remote lab from scratch can be difficult because it requires much knowledge about computer network programming. This can limit the experiments that teachers and students can do. To avoid this problem, it's a good idea to create a straightforward and adaptable way for the client and server computers to communicate first. Then, teachers can use a set of programs and libraries to organize a remote experiment without needing to learn network programming. This way, teachers can focus on setting up the computer-controlled lab experiment, making the process easier and more effective.

Figure 1 illustrates the remote measurement lab that we developed for this study, designed with a simple network architecture to facilitate server setup. The architecture is divided into three zones: the Client Zone, the

Moodle Zone, and the JOBE Zone. The Moodle Zone houses a server that handles domain name resolution and hosts the Moodle platform, while the JOBE Zone contains a server that the Moodle server can access for compiling programming languages used in the course. The Client Zone provides access to the platform's features for students and teachers.

Figure 1. GNS3 Remote E-Learning Labs

To implement this network architecture, we followed a three-step process. First, we prepared the necessary machines, taking into account the high hardware resources required for our applications. We utilized a high-performance PC and employed VirtualBox software to create one or more virtual machines within the same operating system, each with a unique IP address and connected to the local network. This setup allowed us to implement the network architecture and deploy the servers and machines on a single physical machine, as detailed in Table 1.

Table 1. VirtualBox Settings for Virtual Machines

Work environment	Configuration features	
2 computers	Brand: LENOVO YOGA 510	Brand: HP ELITE BOOK
	Processor: Intel Core i5 RAM 8 GB	Processor: Intel Core i7 RAM 8 GB
	Hard Disk: 256 SSD	Hard Disk: 256 SSD
	Operating System: Ubuntu 20.04.2	Operating System: Windows 10 Pro

GNS3	Emulator for CISCO	Juniper routers	Firewall
Virtual Box	Client Machine	IP Addressing,	Windows 7 Titan
3 servers	Debian 10 Moodle server.	Ubuntu 20.04 JOBE server	Ubuntu Server 2.2.19

In the second step, we integrated the virtual machines into GNS3, a network emulator that works with real devices. We configured the virtual machines using VirtualBox, as previously explained. Each machine added to GNS3 can only have one instance. Finally, we configured the routers, which were not available as default devices when GNS3 was initially installed. We had to manually download the Cisco router configuration from the GNS3 official website.

E-Coder: Automated Programming Education Assessment

In our study, we found that standard Moodle quizzes with basic questions like multiple-choice were not sufficient for assessing programming tasks. These tests could check students' understanding of programming concepts but not their ability to write code or solve problems using algorithms. Additionally, without tools like a syntax checker, it was challenging to edit code without starting over.

To address this issue, we used CodeRunner to assess the Web Development material before the final JavaScript test. The students in the Web Application Development module submitted weekly assignments, and the teacher explained and shared answers in the group's Telegram channel. The class also had a significant project to test HTML and CSS skills for 20 credits.

The use of CodeRunner as a midterm test with automatic scoring provided several benefits for both students and teachers. Firstly, it allowed us to assess a large number of students quickly and efficiently, without the need for manual grading. This saved time and resources, allowing us to focus on other aspects of teaching and learning.

Secondly, the automated feedback provided by CodeRunner was invaluable for students. It helped them identify and correct errors in their code in real-time, allowing them to learn from their mistakes and improve their skills. This feedback was particularly useful for students who were struggling with programming concepts, as it provided them with specific and targeted guidance on how to improve their code.

E-coder Response Time Evaluation with JMeter

To evaluate the response time of E-coder, we used the Apache JMeter tool. JMeter (*Apache JMeter - Apache JMeter™*, n.d.) is a free software project for testing the performance of applications and servers using various protocols and functional testing. It can test different types of servers, such as web, LDAP, and databases. JMeter

has a user-friendly interface that makes it easy to create scenarios, which can be complex and involve loops, conditions, variable extraction and reuse, loading variables from external files, and various charts and statistics.

As the Moodle server is the only one that can connect to the JOBE server, we used JMeter to simulate requests from multiple users. When a Moodle user compiles code, it sends a POST object or a run_result request. We set up a group of 10 users in JMeter to make requests three times each. By adding an HTTP POST request, JOBE could send requests to the Moodle server's IP address.

The graph in Figure 2 provides valuable insights into the performance of the system throughout the day. The average response time, displayed on the Y-axis in milliseconds, varies significantly depending on the time of day. The peak in response time occurs around 8:00 AM, with an average of approximately 450 milliseconds. This peak is likely due to higher user traffic in the morning, as students and teachers log in to access course materials and submit assignments.

As the day progresses, the average response time decreases, reaching a trough around 4:00 PM with an average of about 200 milliseconds. This decrease in response time is likely due to a decrease in user traffic as the day goes on. The graph highlights the importance of considering user traffic patterns when designing and managing online learning systems.

Figure 2. JMeter Response Time for 100 Users

By understanding the performance of the system throughout the day, educators and system administrators can make informed decisions about how to optimize the system for peak usage periods. For example, they may choose to allocate additional resources to the system during peak usage periods to ensure that it can handle the increased load. Alternatively, they may choose to stagger the release of course materials or assignments to reduce the strain on the system during peak usage periods.

CodeRunner: Programming Skills Assessment
