Editors: Mack Shelley & Omer Tayfur Ozturk

Articles: 1-174

Conference: International Conference on Research in Education and Science (ICRES)

Dates: April 27-30, 2024

Location: Antalya, Turkiye

Publication Date: December 01, 2024

Conference Chair(s):

Dr. Mack Shelley, Iowa State University, United States

Dr. Wilfried Admiraal, Leiden University, the Netherlands

Dr. I-Tsun Chiang, National Taiwan Normal University, Taiwan

Dr. Wenxia Wu, George Washington University, United States

© 2024 Published by the International Society for Technology, Education, and Science (ISTES)

The proceedings is licensed under a Creative Commons Attribution-NonCommercialShareAlike 4.0 International License, permitting all non-commercial use, distribution, and reproduction in any medium, provided the original work is properly cited.

Authors alone are responsible for the contents of their papers. The Publisher, the ISTES, shall not be liable for any loss, actions, claims, proceedings, demand, or costs or damages whatsoever or howsoever caused arising directly or indirectly in connection with or arising out of the use of the research material. All authors are requested to disclose any actual or potential conflict of interest including any financial, personal or other relationships with other people or organizations regarding the submitted work.

The submissions are subject to a double-blind peer review process by at least two reviewers with expertise in the relevant subject area. the review policy is available at the conference web page: www.icres.net

CONFERENCE PRESIDENTS

Dr. Mack SHELLEY - Iowa State University, United States
Dr. Wilfried ADMIRAAL - Leiden University, the Netherlands
Dr. I-Tsun CHIANG - National Taiwan Normal University, Taiwan
Dr. Wenxia WU - George Washington University, United States

SCIENTIFIC BOARD

Allan TARP - MATHeCADEMY, Denmark
Altay FIRAT - European University of Lefke, Cyprus
Andrea DEBELJUH - University Juraj Dobrila of Pula, Croatia
Ali Korkut ULUDAG - Ataturk University, Turkey
Brahim FERDI - Bechar University, Algeria
Branislav POPOVIĆ - University of Kragujevac, Serbia
Chalavadi SULOCHANA - Gulbarga University, India
Dariga NURKESHEVA - Nazarbayev University, Kazakhstan
Elizabeth ADAMSON - Edinburgh Napier University, United Kingdom
Farhad BALASH - Kharazmi University, Iran
Farouq ALMEQDADI - Emirates College for Advanced Education (ECAE), U.A.E.
Gordana SAVIC - University of Belgrade, Serbia
Haydar YUKSEK - Kafkas University, Turkey
Henry David KATNIYON - Federal College of Education, Pankshin, Plateau state, Nigeria
Hsin-Chih WU - National Taiwan Normal University, Taiwan
Jessie BUSTILLOS - London Metropolitan University, United Kingdom
Mesut AYDIN - Inonu University, Turkey
Milica PAVKOV HRVOJEVIĆ - University of Novi Sad, Serbia
Mohammad SARWAR - Scialert, Dubai, United Arab Emirates
Morteza BARIN - Farhangiyan University of Iran, Iran
Muteb ALQAHTANI - Rutgers University, United States
Nurten SARGIN - Necmettin Erbakan University, Turkey
Ognyan B. MANOLOV - European Polytechnic University, Bulgaria
Sanaa AL-DELAIFY - Mosul University, Iraq
Shynar BAIMAGANBETOVA - Nazarbayev University, Kazakhstan
Summer MOUALLEM - University of Central Lancashire, United Kingdom
Tamer USTUNER - Kahramanmaraş Sutcu Imam University, Turkey
Tri Marhaeni PUDJI ASTUTI - Semarang State University, Indonesia
Yi-Teng HSU - National Taiwan Normal University, Taiwan

ORGANIZING COMMITTEE

Aliya MUSTAFINA - Nazarbayev University, Kazakhstan
Ann D. THOMPSON - Iowa State University, United States
Halil SNOPE - South East European University, Macedonia
Hakan AKCAY - Yildiz Technical University, Turkey
Jacqueline T. MCDONNOUGH - Virginia Commonwealth University, United States
Mariusz JAWORSKI - Medical University of Warsaw, Poland

Mary M. CAPRARO - Texas A&M University, United States
Muhammad ZAYYAD - Al-Qasemi Academic College of Education, Israel
Murat BEYTUR - Kafkas University, Turkey
Mustafa PEHLIVAN - Necmettin Erbakan University, Turkey
Natela DOGHONADZE - International Black Sea University, Georgia
Natalija ACESKA - Ministry of Education and Science, Macedonia
Ossi AUTIO - University of Helsinki, Finland
O. Tayfur OZTURK - Necmettin Erbakan University, Turkey
Silvia MORARU - National High School Bucharest, Romania
Silviya KOSTOVA - The D.A. Tsenov Academy of Economics, Bulgaria

Table of Contents

'Problem Case Historiography': Alternative Learning Strategy to Instill Students' Historical Thinking Skills in Merdeka Curriculum.....	177
The Influence of Learning Student Teams Achievement Division (STAD) on Students' Mathematical Learning Motivation	188
Using Artificial Intelligence (AI) for Academic Writing: How Not to Cross the Line	197
The Language Between the Geological Structure and The Chemical Significance: An Interlinguistic Approach	208
Knowledge And Attitude Regarding School-Based Sexual Health Education Programs Among High School Students in Bulgaria: A Cross-Sectional Study	223
Factors Affecting the Stress Levels on Online Learning during COVID-19 Situation: A Case Study of Thai Undergraduate Students.....	232
Phronesis 2.0 For the VUCA World.....	248
Inspiring Minds: Childhood Teachers Using Gamification to Motivate Children's Learning English as a Second Language (ESL).....	260
Less Is More: The Role of Lexical Complexity in The EFL Lexicon on TOEFL Reading Comprehension Outcomes.....	278
STEM and Non-STEM Learners: Responses to Writing in a Second Language.....	294
Statistical Investigation on the Impact of COVID-19 Towards Engineering Consultants in Malaysia.....	305
Success Through Error: Using Error Analysis of ChatGPT Output in English as a Foreign Language Learner Writing Instruction	320
Performance of Spatial Interpolation Methods for Monthly Rainfall: A Case Study in Peninsular Malaysia....	333
The Role of Civic Education in State Development: A Philosophical Approach.....	342
Development of Skills for Pharmacy Students in Evaluating Randomized Controlled Trials Using CASP Checklist.....	349
Teaching With Purpose: Indonesian Educators' Response to The Challenges of Society 5.0	360
Futures Literacy: The Need for and Contents of a Course	373
Examining Primary Teachers' Concerns, Self-Efficacy, Attitudes, Intentions, and Challenges of Implementing Inclusive Pedagogy in English Literacy Classrooms for Bilingual Dyslexic Students in the UAE.....	393
Primary Teachers' Inclusive Pedagogy Experiences in Literacy Support for Students with Dyslexia in a Bilingual School	428
Evaluating Mobile Apps Features for Learning English Speaking Skills.....	487

Research on the Parameters Influencing the Flow Rate and Power of a Rotating Volumetric Pump.....	507
Unlocking the Power of Perception: Exploring the Influence of Perceived Value on Mobile Payment Adoption in Saudi Arabia	519
Road To Renaissance: An Empirical Assessment of Saudi Tourism's Future with Vision 2030	536
The Impact of Falsely Detecting AI-Generated Text on Academic Assessment.....	573
Examining the Transdisciplinarity and Complementarity of a Double Degree Program in Chemistry and Computer Engineering.....	587
The Unknown Indigenous Tribe in Calamba City, Laguna, Philippines	600
Exploring the Relationship of Safety Mindset and Knowledge, Attitude, and Practice (KAP) on Safety in Chemistry Laboratories	613
Gender-Affirming Care in Nursing Education: Students' Perceptions, Knowledge, and Attitudes	626
English for the Workplace: Experiences and the Way Forward	638
The Significance Contribution of Lecturer Competence in Delivering Project Base Learning on The Student Religious Moderation through Religion Education	651
The Power of Festivals: Five Festivals in CALABARZON, Philippines that Helped Shape Their Host Communities.....	663
Herbularyo (Folk Healer): An Herbal Medicine Card Game	686
Reconceptualizing Multitasking in Synchronous Online Learning through the Lens of Merleau-Ponty's Embodiment Theory	700
Enhancing Road Design Education: A Comprehensive Analysis of Micro-Field Trips from the Perspective of Students	723
Project-Based Learning: The Influence of Engagement on Teamwork.....	736
The Positive Effect of "Sabilulungan" Culture on Civics Group Discussion Supported by Video-Based Learning	747
EFL Students' Acceptance of Using Learning Management System for Online Testing.....	758
Enhancing EFL Learners' Listening Skills Through the Flipped Classroom Approach	772
Students' Achievements and Teachers' Perception: Exploring the Effectiveness of Kahoot for Vocabulary Learning in Vietnamese Classrooms	787
English Language Students' Perception of Using Grammarly in Academic Writing Subject.....	799
Students' Perception of Using Wordwall Application to Enhance Vocabulary Memorization.....	810
Prefixes of Present Tense Between Arabic & Amharic Languages: A Descriptive Analytical Comparative Study	821
EFL Students' Perceptions on the Use of Liveworksheets in Self-study.....	838

The Degree to Which Students at Shoubak University College Practice the Elements of Digital Citizenship Related to Education.....	863
Impacts of Humor as a Communication Strategy for Teachers in the EFL Classrooms.....	871
EFL Students' Perceptions of Using a Social Constructivist Approach-Based Platform: A Case Study	882
Factors Affecting Undergraduate Student Well-Being in Learning English Online.....	896
Teachers' Psychological Resources - Coping Mechanisms in the Prevention of Burnout	917
The Use of The GoIro Semantic Mapping Method Enhances Composition Writing Skills Among Secondary School Elementary Japanese Language Students	937

Abstract: Self-esteem is one of the factors that influence children's social-emotional development. The level of self-esteem was determined by the surrounding environment which includes the family, school and community environment. At this time there is still limited research that examines student self-esteem at the elementary school level based on geographical factors. The purpose of this research is to find out whether there are differences in the self-esteem of students who live in rural area and students who live in urban. The approach used in this study was a quantitative approach to comparative research. The population of this study were elementary school students who lived in rural area with 50 students as respondents and students who lived in urban with 50 students as respondents. The sampling technique used was purposive sampling. The data collection technique used in this study was the Rosenberg Self-Esteem Scale, observation and interviews. While the data analysis technique used was descriptive statistics and independent sample t test. The results of the study showed that there were significant differences in self-esteem between students who live in rural and students who live in urban. In addition, the self-esteem of students who live in villages is lower than the self-esteem of students who live in cities.

Keywords: Self-esteem, Geographical analysis, Elementary school students

Introduction

Social and emotional development in children is essential in shaping the child's personality and patterns of interaction with the surrounding environment. Each child can experience different emotional and social

development. Factors such as the family environment, social interactions, and personal experiences can influence a child's social and emotional development. Socio-emotional competence refers to an individual's ability to acquire and effectively apply knowledge, attitudes, and skills to understand and manage emotions, set and achieve positive goals, express empathy for the feelings of others, build and maintain positive relationships with peers, and make responsible decision (Wang et al., 2019). Lack of socio-emotional competence is the root cause of various psychological and behavioral problems, which seriously hinder students' academic progress and growth of body and mind (Rautakoski et al., 2021). Therefore, social-emotional competence can be an important factor affecting social adaptability (Liu et al., 2023). One aspect that is closely related to individual social and emotional development is self-esteem. Self-esteem refers to an individual's evaluation or emotional response to their physical characteristics, personality, social identity, and behavior (Liu et al., 2023).

Self-esteem is an individual's assessment and perception of his own worth (Donnellan et al.; MacDonald & Leary, cited in Orth et al., 2018). It includes generally held and internalized attitudes about oneself, including individual beliefs, feelings, and evaluations of their abilities, physical appearance, self-worth, and potential. Self-efficacy, empathy and emotional intelligence have a significant positive relationship with self-esteem (Fuentes et al., 2019). Self-esteem can affect how a person views and relates to himself, others, and the world around him. High self-esteem leads to an increase in one's social relations, social relations and self-esteem have a reciprocal relationship in all stages of life which reflects positive feedback (Harris & Orth, 2020). High self-esteem is closely related to good health, success in academics, and coping with stress (Sowislo & Orth; Di Guinta et al.; cited in Pinquart & Gerke, 2019).

The importance of self-esteem lies in positive personal feelings and self-esteem (García et al., 2019). Individuals with healthy self-esteem tend to have stronger beliefs in overcoming challenges and facing failure. They tend to feel valuable, competent, and valuable as individuals. High self-esteem can also affect other aspects of a person's life, including mental health, physical health, interpersonal relationships, and academic or professional achievement (Orth & Robins, 2022). Self-esteem is very important for understanding one's well-being and success (Monteiro et al., 2022). Individuals with a high level of self-esteem can be identified through the following characteristics: having self-respect, considering themselves a valuable person, appreciate his abilities, but still admit his mistakes. Meanwhile, individuals with low self-esteem are known through the following characteristics: these individuals lack self-esteem, think that they are worthless, and have weak abilities (Altmann & Roth, 2018).

Self-esteem focuses on two main functions, especially its relation to positive psychology, self-control or regulation, and positive emotions. One of the first important functions is self-protection, which is related to the maintenance of identity. This is related to protection from stress in everyday life, help in dealing with disappointment, and bounce back from failure. The next function relates to increasing or developing self-capacity. This is related to the role of self-esteem to help move beyond the comfort zone, the courage to take risks to cross the limits of ability, see new opportunities, explore new dimensions of life, career, and interpersonal dimensions (Mruk, 2018).

Self-esteem is defined as a positive or negative attitude towards oneself (Rosenberg cited in Pinquart & Gerke, 2019). In addition to positive attitudes, negative attitudes also affect individual self-esteem. Self-esteem can be influenced by factors such as life experiences, environmental influences, social interactions, and the judgments and criticisms of others. Traumatic experiences or repeated demeaning experiences can damage a person's self-esteem and lead to the development of low self-esteem. In addition, there are other factors that influence self-esteem. Academic difficulties experienced in everyday life have an impact on self-esteem, the decrease in self-esteem becomes greater when facing difficulties (Gá et al., (2022). People who have high self-esteem are more resistant to environmental influences that are inconsistent with their own observations, and they are able to solve problems in an easier way than people who have low self-esteem (Cesar et al., 2021).

Self-esteem can be developed and enhanced through steps such as recognizing and changing negative thought patterns, honing skills and talents, setting realistic goals, dealing with fear, and honing social skills. Achievement, social support, and positive recognition can also contribute to increased self-esteem. It is important to remember that self-esteem is not about feeling better than others or being perfect. This relates to self-acceptance with all the strengths and weaknesses possessed, and the recognition that all individuals have value and dignity as human beings.

Self-esteem is very important for individual mental development. As in the previous explanation, self-esteem influences an individual's perspective on himself and the surrounding environment so that self-esteem becomes one of the determining factors for success in an individual's life. High self-esteem correlates with a better ability to handle stress and problems. Conversely, low self-esteem will have difficulty solving problems. Self-esteem affects the way a person makes decisions. This affects someone in living their life, they will be more confident, optimistic, and easy to actualize themselves in achieving their goals. Adolescents with low self-esteem have poorer mental and physical health, poorer economic prospects, and higher rates of criminal behavior during adulthood (Park, 2018). Self-esteem issues can contribute to behaviors such as problems with alcoholism, drug addiction, and engaging in sexual problems, as well as other harmful behaviors (Baumeister & Campbell cited in Park, 2018).

There are several factors affecting self-esteem, including environment, gender, socioeconomic, social relationships, and age (Orth et al., 2018). The surrounding environment has a more dominant influence on self-esteem. This includes the family, school and community environment. As stated Łukasiewicz & Sokulska (2018) factors influencing self-esteem are the support from the people around them, including the parenting style (Peng et al., 2021) and peers. Parents are one of the most significant influences on self-esteem and the main source of positive and negative experiences in a child's life (Park, 2018). Thus, the environment has an impact on individual self-esteem. As stated by Orth et al., (2018) that both genes and environment have an effect on self-esteem, but environmental factors have a greater influence than genes.

Several studies have stated that environmental factors have a significant impact on a person's self-esteem. This environmental factor is related to the geographical conditions of an area such as remote areas and urban areas.

This geographical condition allows for different circumstances in socioeconomic, cultures, and social relations. All of these aspects play a role in determining the condition of self-esteem. As an example, students who live in urban environments have more benefit by having teachers providing emotional and academic support. Relationship between student and teacher in urban environments can help determine the future success of students living and studying in urban (Akin & Radford, 2018). Meanwhile, rural areas tend to experience limitations in accessing public facilities such as education and health. Different things are shown in the aspect of social relations of children who are in the village. Friendships of children in rural areas are relatively compact and relationships between peers are closer than children in urban areas. This shows that children in urban areas tend to behave individually (Rui, 2019). The livelihood aspect also determines the social economic situation. The majority of rural areas have livelihoods related to agriculture. According to research conducted by Ma (2021), working as a farmer experiences difficulties in terms of socio-economic conditions, children's education, and welfare.

Paselloreng Village is one of the villages in Gilireng District, Wajo Regency, South Sulawesi Province. The village is a transmigration destination village determined by the Government of the Republic of Indonesia. Most of the people living in Paselloreng Village have livelihoods related to agriculture and animal husbandry. The education level of the people in the village is still in the low category. Based on this, it is necessary to know the state of self-esteem of students who live in Paselloreng Village to obtain an overview of the state of self-esteem based on the geographical location of an area.

Method

This research uses a quantitative approach with a comparative research type. This study aims to determine differences in student self-esteem based on the geographic conditions where they live. This study will compare the self-esteem of students who are in rural areas and urban areas. Respondents in this study were elementary school students who lived and studied in coastal areas with a total of 50 students. As a comparison, the researcher also took respondents with the same level and lived in urban areas with a total of 50 students. The subjects in this study were elementary school students in grades 5 and 6.

The sampling technique used is purposive sampling taking into account several reasons such as the same level of education, the average age in the group, and the proportion of male and female students. Data collection techniques used in this study are Rosenberg Self-Esteem Scale, observation and interview. Rosenberg Self-Esteem Scale is a standard source that is widely known and used to measure self-esteem. This scale consists of 10 items which are divided into 5 positive statements and 5 negative statements. Rosenberg Self-Esteem Scale rated on a Likert scale. Respondents can check one of the four choices with the answers: Strongly Disagree, Disagree, Agree, and Strongly Agree. This scale has been scored within a range of a minimum score of 10 and a maximum score of 40 (Sinclair et al. cited in Garcia et al., 2019).

The data analysis technique used is descriptive statistics and independent sample t test. Descriptive statistics are used to describe the average self-esteem between students who live in rural areas and students who live in urban areas. Meanwhile, independent sample t test used to determine whether there is a significant difference between the self-esteem of students who live in rural and urban students.

Results

This study aims to find out two things. First, a description of student self-esteem in villages and cities. Second, differences in self-esteem of students who are in the village and in the city. The following is a descriptive analysis of the self-esteem data of students living in villages and cities.

Table 1. Descriptive Statistics of the Students' Self-Esteem

	Mean	Median	Mode	Std. Deviation	Min	Max	Sum
Self-Esteem of Rural Student	22,82	22,50	21	3,180	18	30	1141
Self-Esteem of Urban Student	32,34	32,00	35	4,138	21	39	1617

Based on table 1 above, it is known that the average (mean) self-esteem of students living in rural areas is 22,82 in the moderate category, the standard deviation is 3,180, the highest value is 30 and the lowest value is 18. Meanwhile, the average value (mean) self-esteem of students who live in urban areas is 32,34 in the high category, a standard deviation of 4,138, the highest score is 39 and the lowest score is 21. The mean difference (mean) between the self-esteem of students who live in villages and in the city of 9,52.

Self-Esteem Description of Students Living in Rural Area

Table 2. Self-Esteem of Rural Student

Category	Score Range	The Number of Student	Percentage (%)
$30 \leq X$	High	2	4,0%
$20 \leq X < 30$	Moderate	40	80,0%
$X < 20$	Low	8	16,0%

Based on table 2, it is known that there are 2 students who have a high category with a percentage of 4,0%. While the number of students who have a moderate category is 40 students with a percentage of 80,0%. The number of students who have low self-esteem is 8 students with a percentage of 16,0%.

Self-Esteem Description of Students Living in Urban Area

Based on table 3, it is known that there are 37 students who have a high self-esteem with a percentage of 74,0%.

While the number of students who have a moderate self-esteem category is 13 students with a percentage of 26,0%. There are no students who are in the low self-esteem category.

Table 3. Self-Esteem of Urban Student

Category	Score Range	Number of Students	Percentage (%)
$30 \leq X$	High	37	74,0%
$20 \leq X < 30$	Moderate	13	26,0%
$X < 20$	Low	0	0%

Normality Test

The normality test was carried out to find out whether the data is normally distributed. The normality test is one of the assumption tests to determine the type of hypothesis test that will be used, whether the test is parametric or nonparametric. Data conditions are said to be normally distributed when Asymp. Sig. (2-tailed) greater than 0,05. The following are the results of the self-esteem normality test for rural students and urban students.

Table 4. Normality Test of Students' Self-Esteem

Data	Asymp. Sig. (2-tailed)	Explanation
Self-Esteem of Rural Student	0,087	$0,087 > 0,05 = \text{normal}$
Self-Esteem of Urban Student	0,200	$0,200 > 0,05 = \text{normal}$

Table 4 shows that student self-esteem in villages and cities is normally distributed. This can be seen from the results of the Asymp value. Sig. (2-tailed) self-esteem of students in villages and cities is more than 0,05. Asymp value. Sig. (2-tailed) student self-esteem in the village is 0.087 while the Asymp. Sig. (2-tailed) self-esteem of students in the city is 0.200. Thus, it can be concluded that student self-esteem data in villages and cities is normally distributed so that parametric tests can be carried out for hypothesis testing.

Homogeneity Test

Homogeneity test was carried out to find out whether the data from the two samples is homogeneous. The data is said to be homogeneous if the significance value is greater than 0,05. The following is the data on the results of the student self-esteem homogeneity test in villages and cities.

Table 5. Results of homogeneity test

Data	Sig.	Explanation
Self-Esteem between Rural and Urban Students	0,054	$0,054 > 0,05 = \text{homogeneous}$

Table 5 shows that the homogeneity test results between students' self-esteem in villages and cities are

homogeneous. This can be seen from the value of Sig. self-esteem between students in the village and in the city of 0.054 more than 0.05. Thus, the self-assessment data between students in the village and in the city is homogeneous so that a hypothesis test can be carried out using a parametric test.

Hypothesis Test Results

The results of the hypothesis test are determined by the results of the assumption test, based on the results of the normality test it is known that the self-esteem data of students in villages and cities is normally distributed, while based on the results of the homogeneity test it is known that the self-esteem data of students from rural and urban groups is homogeneous. Thus, it is determined that the hypothesis test used is the independent sample t-test.

Independent Sample t-Test

Independent Sample t-Test aims to test two sample groups that have no relationship. The data tested using this analysis is the self-esteem of students in villages and cities. This analysis was conducted to find out whether there are differences between students' self-esteem in villages and students' self-esteem in cities. The data is significantly different if the Sig. (2-tailed) more than 0,05. The following are the results of testing the differences in student self-esteem in villages and cities.

Table 6. The Result of Independent Sample t-Test

Data	Sig. (2-tailed)	Explanation
Self-Esteem of Rural and Urban Students	0,000	0,000 < 0,05 = significant

Based on table 6, it is known that the Sig. (2-tailed) the self-esteem of students in villages and students in cities is 0,000, less than 0,05. The research hypothesis is formulated as follows.

H_0 : There are significant differences in self-esteem between rural and urban students

H_1 : There is no significant difference in self-esteem between rural and urban students

Based on the results of the independent sample t-test, it is known that H_0 accepted and H_1 rejected. Thus, it can be concluded that there are significant differences in self-esteem between students in villages and students in cities. Furthermore, based on the results of descriptive statistics, it is known that the self-esteem of students in villages is lower than that of students in cities.

Discussion

At the present time, there are not many research results that examine self-esteem comparisons in terms of geographical factors. Most of the current research focuses on adolescent self-esteem, so it is rare to find the results of research studies for elementary school students. This study aims to determine self-esteem between

students who live and attend school in villages and cities. Self-esteem can be interpreted as the way a person views his abilities. The level of a person's self-esteem is different and influenced by various factors, both factors that come from within a person (internal factors) and factors that come from outside (external factors).

Based on research data collected using the Rosenberg Self-Esteem Scale, it is known that there are significant differences in self-esteem between rural students and urban students. The results of the analysis show that the self-esteem of students in villages is lower than that of students in cities. These results are in line with research conducted by Tauro et al., (2018) which shows there is a significant difference between the self-esteem of urban adolescents and rural adolescents. In addition, adolescents living in urban areas have higher self-esteem than adolescents living in rural areas. The difference in self-esteem of students who live in villages and cities is influenced by various factors including geographical factors. As stated by Ma (2021) that there are differences in aspects of mental resilience, self-esteem, emotional and imitative behavior based on geographical conditions. Geographical factors include the environment where the child lives including the family, school and community environment. The surrounding environment has an impact on the growth and development of both physical and psychological children.

Geographical factors are closely related to ecological aspects. According to Bronfenbrenner cited in Buser et al., (2020), in ecological systems theory, an individual is believed to be part of an integrated functional system which includes various psychological processes such as cognitive, affective, emotional, motivational and social interacting with one another. The ecological aspect consists of five systems, including the microsystem, mesosystem, exosystem, macrosystem, and chronosystem. Ecological theory stems from an understanding of the relationship between environmental conditions and human behavior (Stokols cited in Buser et al., 2020). Ecological theory comes from various types of scientific disciplines, including the health sciences which are heavily influenced by community and developmental psychology (Eriksson et al., 2018).

The ecological system is a wide broad scope related to the development of individual psychology. In ecological studies, the environment is the core connected to many aspects of life, the environment can have a positive or negative impact on individuals. One of them is the impact on self-esteem as a result of interaction with the environment. The low self-esteem of students who live in villages can be caused by limitations in accessing public facilities, such as the low quality of education, caused by limited facilities and infrastructure. Rural areas tend to experience infrastructure gaps in the field of communication media, especially in the provision of internet facilities. This gap is motivated by socio-economic factors and geographical factors (Hampton & Shin, 2023).

On the other hand, urban areas are associated as areas that have adequate supporting facilities. In general, the urban situation is synonymous with economic growth, good quality education, wider employment opportunities, higher incomes and access to quality health services. (Dorélien & Xu, 2022). The learning environment, self-esteem, and resilience are drivers of student success in urban areas (Fallon cited in Akin & Radford, 2018). However, in terms of teaching aspects, villages and cities are relatively similar, because the applied curriculum

has the same standard in each region. The teaching process carried out by rural teachers and urban teachers has similarities, especially in the material structure that serves as reinforcement in pedagogical practice (Martin & Mills, 2022).

The family environment plays a key role in the process of social and emotional development of children, especially in the aspect of self-esteem. The home environment is the main factor influencing the development of children's self-esteem at an early age to adulthood with long-term effects (Orth, 2018). The quality of the home environment includes quality of parenting, cognitive stimulation, and physical home environment, quality of parental relationships, presence of fathers, maternal depression, and family poverty status. (Orth, 2018). Parenting styles, especially parenting styles applying warm family treatment and associated with the internalization of social values, produces high self-esteem (Martinez et al., 2020). Wrong parenting patterns will result in aggressive child behavior patterns (Perez-Gramaje et al., 2020). High educational stress, physical and emotional violence originating from the family environment are the main factors affecting low self-esteem (Nguyen et al., 2019). Positive relationships between parents and children can increase children's self-esteem and these two aspects affect emotional and behavioral problems in children (Shi et al., 2022). Parental support, especially mothers, has a positive relationship with self-esteem and can reduce the likelihood of being involved in deviant behavior (Liu et al., 2018).

The relationship existing between children and peers, especially in the school environment, also influences the child's self-esteem. The school environment includes teacher and peer relationships in which it becomes a determining factor in the development of children's self-esteem (Chen & Ma, 2023). The impact of this relationship can be either a positive impact or a negative impact. The negative impact will affect the low self-esteem of students. Children who have low self-esteem will more easily become victims of their peers. This happens because when they communicate both verbally and non-verbally, they are unable to defend themselves or fail to defend themselves when they become victims so that the incident is likely to recur (Geel et al., 2018). Intervention from the family and school environment needs to be done to increase self-esteem as an effort to prevent risky behavior (Banstola et al., 2020). Time spent with family and peers has a positive relationship to self-esteem, more time spent with family and peers is followed by an increase in self-esteem (Hampton & Shin, 2023). The community environment also influences the state of children's self-esteem, including patterns of community behavior playing a role in the state of children's self-esteem. An unsafe environment will have an impact on feelings of anxiety and worry which have an impact on low self-esteem.

As previously explained, geographical aspects affect student self-esteem. The impact arising from this influence can be either a positive influence or a negative influence which will determine the level of student self-esteem. The existence of social support from the environment has a positive effect on self-esteem. Students who receive high social support tend to have high self-esteem, self-esteem also has a positive relationship with academic achievement (Li et al., 2018). Along with increasing social support, there is an increase in self-esteem (Wang et al., 2019). On the other hand, low social support has an effect on low student self-esteem. Social feedback is the most relevant aspect in forming self-esteem. This is influenced by social support or exclusion based on ties that

are established from a closer or wider social environment. The existence of the behavior of comparing oneself with others can increase or reduce one's self-esteem (Schmuck et al., 2019). Low self-esteem is an important factor that can increase susceptibility to depressive symptoms (Masselink et al., 2018). Self-esteem has a correlation with anxiety, depression, and academic stress which significantly affect the quality of life of students and their relationship with the emergence of suicidal ideation (Nguyen et al., 2019).

The state of self-esteem possessed by students will determine their social-emotional development in the future, the state of self-esteem influences many things. One of the conditions of self-esteem affects academic achievement which will ultimately determine one's quality of life. Self-esteem serves as a shield against mental health threats such as fear and loneliness so that it can overcome anxiety and depressive symptoms (Rossi et al., 2020). The social environment is one of the factors that influence self-esteem, in the social environment there are social values such as a culture of popularity (Purnama et al., 2021). For this reason, aspects of self-esteem need to get serious attention in the process of students' social-emotional development. Efforts need to be made to address this issue, one of which is through strengthening the role of the family, school and community. Social support is an effort to increase student self-esteem. The social context that is around significantly influences the student's condition (Bronfenbrenner cited in Li et al., 2018). The living environment needs to provide attention, show concern and help for students who experience difficulties. In addition, it is necessary to provide a place for students to develop potential that is oriented towards increasing self-esteem. Things that can be done by doing physical activity. As stated by Dale et al., (2019) that increasing physical activity affects the increase in self-esteem. This research is limited to testing whether there are significant differences in self-esteem between rural students and urban students, especially students at the elementary school level. Due to the limited research that examines the influence of geography on student self-esteem, it is necessary to conduct similar research to increase data related to comparisons of self-esteem in villages and students in cities.

Conclusion

Self-esteem is an attribute attached to an individual, self-esteem is seen as the way a human being sees his self-image. Self-esteem can be influenced by various factors. This study aims to examine the self-esteem of elementary school students in terms of geographical factors which include the condition of an area such as rural and urban areas. Based on the results of this study, it was concluded that there are differences in self-esteem between students who live in villages and students who live in cities. Furthermore, this study shows that the self-esteem of students who live in villages is lower than the self-esteem of students who live in cities.

Recommendations

As a recommendation, future research can examine more deeply related to the dominant factors that influence the low self-esteem of students who live in villages. Schools have a vital task in creating conditions that can increase students' self-esteem. Schools are expected to realize this through the role of teachers in schools.

Teachers in rural areas are expected to be able to create a positive learning environment for students by providing assignments and challenges according to students' abilities. It is important for teachers to reward and recognize student achievement. In addition, teachers need to provide emotional support to students, especially when students experience failure. Meanwhile, teachers in cities can support students in participating in extracurricular activities that suit their talents and interests, teachers must encourage interaction and cooperation within the school environment, teachers must also encourage respect for diversity and build an inclusive culture in the classroom.

Abstract: There is an essential concept in Taoist wisdom called Wu Wei. The term is Lao Zi's advice aimed at understanding the limits of human behavior as a leader to face various possibilities. This leadership concept has similarities and differences with Platonic teachings called Philosophers King, which has often become an ideal standard for leadership in the Western world. This research is intended to bring these two concepts of Eastern and Western leadership as materials for developing character-building education. This study uses the literacy comparison method to synthesize the two concepts above. The results of this study show that both the leadership teachings of Wu Wei-Lao Zi and the Platonic philosopher King favor the leader's intelligence to control himself to be able to control the conditions and others. Several differences between the two concepts can be considered to develop character education in Indonesia.

Keywords: Leadership education, Wu Wei, Philosopher King , Daoism, Platonism

Introduction

Character education has become one of the objectives of education, especially in Indonesia. One of the goals of education is to shape people into responsible figures and understand morality in society. This further affects the development of the concept of leadership because, in that concept, there are goals that are the same as those aimed at by the object of character education. In Eastern philosophy, there is a teaching that is now being recognized as one of the beliefs by the Indonesian state, namely Taoism. Taoism has a philosophical foundation known worldwide as Daodejing (Michael, 2022), believed to be taught by a classical Chinese philosopher

named Lao Zi. In Daodejing, Lao Zi teaches a concept that is often repeated, namely the concept of Wu Wei. This concept is intended to teach humans to behave like water. The moral purpose of Wu Wei is that humans can explore themselves to master situations in everyday life. The self in Taoist philosophy is never separated from other people (Lai, 2007), so when a person can recognize himself, he will be able to recognize the condition of others.

Meanwhile, in classical Western philosophy, it is recorded that a famous philosopher, namely Plato, taught various subjects ranging from morality and politics to education. Plato is known as one of the developers of philosophy in Greece and the Western world because the concepts he taught influenced the development of philosophy and the development of world politics in general. As a philosopher and educator of wisdom, Plato proposed that a leader or King must be a philosopher as well. This concept is then commonly known as the King of Philosophers or Philosopher King. The development of the concept of the philosopher king later became the inspiration for the development of political science to see the virtues that must exist in a leader.

Due to its outstanding contribution to the world of education, morality, and especially the concept of leadership, this study seeks to find the harmony and differences between the two concepts. Both Wu Wei and King Philosophers can be considered in determining the direction of character education and leadership in Indonesia and the world. The purpose of this study is to find a synthesis of two leadership concepts with different worlds of discourse, namely in the eastern (China) and western (Greek) parts of the world.

Method

The research method used in this thesis was a qualitative methodology, which was chosen to do the literature comparison on two objects (Wu Wei and Philosopher King) in the main discussion. This research is one of the results of a pre-research interview in which several respondents stated that Chinese philosophy should be proposed as material for character development education. This research is from April to June 2022 with several steps, namely discourse collection, literature collection, literature comparison, and analysis.

Findings

Wu Wei Leadership

Taoism is one of the oldest philosophical structures in the Eastern world. Taoism, developed in China, is believed to have been taught by Lao Zi around 500 BC. The book that Lao Zi and his disciples passed down is called the Daodejing or Tao Te Ching. The mention of teachings in the book is now called Taoism. The year 500 BC was when ancient China was still experiencing wars between nations. Each region has a head of state or King who seeks to defend his territory or seeks to expand his power. In this context, many intellectual figures teach philosophy, ethics, politics, literature, and even strategies for acting as a consequence of a life always haunted by war. These philosophers include Kong Qiu (commonly called Confucius), Han Fei, Li Zi, Mo Zi,

and Xun Kuang.

Among these names, the figure of Lao Zi is one of the most trusted in his teachings. He not only compiled his teachings based on revelation but also based on conversations with his students and on his experiences and observations of the context that included his people. In one part of Lao Zi's teachings, there is a dualism called the universal rule or law of nature, commonly known as Yin and Yang. These two concepts are the initial foundation that a philosophy student must understand. For Lao Zi, human actions must have two different but complementary sides. This foundation will also help students understand the concept of Wu Wei ethics.

Wu Wei's ethical concept cannot simply be called the primary Lao Zi teaching because there are many other principles that humans need to know to build a decent life. However, this concept is often referred to by Lao Zi because it is an essential principle for maintaining human survival. The following is Lao Zi's opinion that shows the importance of Wu Wei's teachings in Taoism:

"The Dao... is at once the beginning of all things and the way all things pursue their path. When individual things possess this Dao, it becomes its character or virtue (de). The ideal life for the individual, the ideal order for society, and the ideal type of government are all based on and guided by it. As a way of life, it denotes simplicity, spontaneity, composure, weakness, and most importantly, non-action (Wu Wei)." (Wang, 2012).

Philosophers and sinologists further developed this Wu Wei concept as the basis of leadership science because it contains practical attitudes that a leader can carry out. Xiang'er, a Daodejing catechist, has also identified the nature of an enlightened person in the Dao as a king figure (Michael, 2018). In other words, a supreme person (King) is a trait that Taoism aims to achieve. Wu Wei's translation can mean silence, controlling behavior, or controlling events. In addition, Wu Wei can also be interpreted as following the flow of life or acting like water (Y.-T. Lee et al., 2008). Another alternative to understanding Wu Wei is to understand it by not putting in much effort, not forcing one's will, not making any artificial effort, or being spontaneous and unintentional.

This very varied translation of Wu Wei gave rise to various interpretations. From an opposing point of view, Wu Wei teaches a person to be passive, lazy, do nothing, or surrender without trying. However, this interpretation is disputed by some philosophers and students of Taoism, giving examples such as Zhuangzi. Zhuangzi illustrates the importance of Wu Wei by describing the importance of Lao Zi's teachings to be silent and to know oneself or to be non-coercive (Small, 2019). Thus, Zhuangzi stated, "Flying with wings is easy. However, flying without wings is difficult. Being smart in science is easy. Being smart without knowledge is difficult." In this statement, Zhuangzi describes that the most significant human challenge is not to know many things in the world but to know himself or what is called Ziran (Wu & Kang, 2019). Since ancient times, many people have been brilliant but cannot control themselves or others. This is not the ideal attitude in Taoism. To understand how Wu Wei works, there is one of Lao Zi's teachings which reads:

"Not leaving the house already knows the world's problems. Not peeking from the window already understands

the laws of nature. The further he goes out in search of knowledge, the less he gets. So, Sheng Ren (a philosopher with a Dao spirit) did not go far to understand the world. It does not need to be obvious what the problem is. Not being forced to work.”(Wang, 2012) This statement of Lao Zi is an apt description of self-control and Wu Wei. Wu can also be interpreted as (non-), and Wei is an active behavior (or action). So literally, Wu Wei is non-action, which does not mean doing anything but doing based on Dao principles, which is doing the right thing at the right place and time. In Lao Zi's teachings, one does not need to put much effort into acquiring knowledge because one should be recognized. In addition, the effort made to know oneself is less than the effort that must be made to know the whole world. This is because, back in the teachings of the natural laws of Taoism, it is already established in Yin Yang.

Based on the context of the phenomena that existed in Lao Zi's lifetime, it takes a philosophical building to organize one's life. This makes the teachings of Lao Zi, including Wu Wei, can be interpreted according to the problems humans face. Wu Wei is one of Lao Zi's teachings that can be applied in character development education because this principle teaches one's ideals or standards of behavior to achieve ideal self-conditions or to live well as a leader. Several translations of Wu Wei are associated with human education to be wise.

The *first* is that Wu Wei was later developed into one of the foundations of leadership science, also often referred to as the science of imitating water or Water Leadership. In addition to his description of the metaphor of life like water, Lao Zi also tries to explain that a person who has self-control can allow himself to become one with nature and thus follow the prevailing natural conditions. A person who is wise and can know himself will be at one with nature and thus not manage nature (Nelson, 2009), exploit nature, or go against the laws of nature as proposed by Chen and Holt that actions that have intentions are very contrary to the universal will of nature. Where it causes destruction and destruction to the human world itself (Chen & Holt, 2002). In short, the nature of Wu Wei in this art of imitating water is to allow oneself (passive motion) to be in harmony with nature.

Second, Wu Wei can also be interpreted as abolition or self-emptying. This means that a person needs to try actively cleaning himself from the additional attributes attached. In other words, Wu Wei also emphasized the importance of letting go of oneself, or what in the modern world is known as selfishness. Signs of merit, rank, or fame are impurities that can make the 'water' in the soul impure. Through Wu Wei philosophy, Lao Zi taught a person how to discover his essence, which is that part of the Dao or that which is unspeakable, untouchable, and unrecognizable by simple human reason. Laozi, through Wu Wei, also does not want us to try too hard to recognize nature through all the knowledge that exists in the world because humans already have their small world, namely themselves. Thus, Lao Zi stated:

“The more you learn, the more knowledge you gain. The more we learn the Dao philosophy, the more we lose and the less we get less and less. So, it comes to the realm of 'Wu Wei' behavior. When it reaches the behavior of 'Wu Wei,' nothing cannot be done. Managing a country should not be associated with personal interests. If he has a personal interest, he is no longer fit to be a leader.” (Wang, 2012)

In the leadership of Wu Wei, a leader cannot have personal intentions or wills. Personal will, in this context, is a desire that is contrary to a person's role, name, or responsibility. As an individual who is expected to lead himself or others, a leader must understand Wu Wei's behavior in the sense of throwing away all intentions driven by his passion or lust. By marginalizing the name, a leader will not be bound by personal desires and create a transformative leadership process (Zhang & Tan, 2021).

Wu Wei, in a straightforward interpretation, does bring the conclusion that everything should be handled, not trying too hard, and even leading to an attitude of surrender. However, more than that, Wu Wei is an attitude to silence, silence, or calm all desires because the primary goal of Wu Wei is to increase human potential through the elimination of the control of Desire. With the removal of this control of Desire, humans can be at one with nature, where, in one case, a leader can listen to the voices of those who put their trust in him. Thus, the practice of a leader, according to Lao Zi's teachings, is to "minimize individual will and the practice of 'forgetting' one's tendencies and intentions brings perfection to one's capacities" (Wang, 2012).

The principle of Wu Wei aims to educate people to be calm and calm individuals through the path of self-control. Therefore, according to Lao Zi, someone, especially a compulsive leader, will leave his foundation (Yao & Chen, 2017). This has implications for the concept of leadership and character, where someone who does the Wu Wei principle can become a responsible leader, prioritizing the interests of others, not expecting rewards, and understanding ethical boundaries according to universal knowledge of natural laws.

The Leadership of the King of Philosophers

Slightly different from the background experienced by Lao Zi when teaching Wu Wei self-regulation, Plato teaches the concept of the philosopher king to his students in the context of a sovereign state. The polis where Plato taught was in Athens, where wars could still be suppressed through political means. As the primary goal of Plato's education, he hoped that all his students could obtain self-fulfillment or maximize their abilities with another big goal is to build a good society. In the context of Plato, it is necessary to understand a slight difference from the current context where, at that time, Plato agreed to an oligarchic form of government. An oligarchy that is meant today is when there is a group of educated people willing to manage the running of a country.

Meanwhile, Plato disagreed with democracy because, for Plato, not all people can be responsible. After all, not all people are educated people, let alone a philosopher. However, because the ultimate goal of Plato's teachings is to create suitable conditions through thinkers, it is necessary to reconsider the identification of a good leader for Plato.

According to Plato, a good leader is a philosopher with other abilities than a king, and this concept is commonly referred to as a philosopher king. The philosopher king presupposes a person who studies wisdom, logic, ethics, metaphysics, and even rhetoric so that he has the maximum rational capacity. If someone already has this

ability, he can learn about politics, nature, and the state's workings. Thus, a philosopher king has a remarkable ability to control society and organize society and its devices. Plato is known to have high hopes for the intellectuals of his time. Thus, he revealed:

"There will be no end to the problems of the state ... mankind itself until philosophers become kings of the world ... and political and philosophical power thus fall into the same hands." (Plato, 2007). Nevertheless, there is a critique of this concept that not all philosophy students, even Plato's most prominent student, Aristotle, had the Desire to rule as a philosopher king. In addition, the leadership of an aristocratic state has many shortcomings because of the emergence of confusion in determining the leader (Kuljanin, 2019). In addition, not all philosophy students have a grand vision of a nation, even if they wish to participate in building a nation. Despite the criticism of the philosopher king in Plato's thinking, this concept is still suitable for developing organizational leadership traits (Zyglidopoulos, 2021). Therefore, we need to re-analyze the character of a leader, according to Plato, which is adequate for the development of character education.

The *first* characteristic that can be found is that the leader, according to Plato, must be able to solve problems. This problem can be overcome through reason and little physical strength. As an additional note, Plato also emphasizes the importance of physical health for his students even though the appeal could be more dominant in his teachings, emphasizing the world of ideas. While the *second* characteristic is the ability to control oneself. In this case, a philosopher king needs to do several things to practice self-control. Although Plato did not advocate scourge or self-denial as was done by the ascetic philosophers at that time, he still suggested the control of lust and Desire. Self-control can then be done by doing *sophrosune*, or a person's ability to be self-critical. By understanding his shortcomings, a leader can embody the nature of not being arrogant and trusting others. In the dialogue *Socrates and Critias* written by Plato, it is stated that this activity (*sophrosune*) (Wibowo, 2015) is the next step in knowing oneself apart from because a philosopher king can collect discourses that he must know. However, he also needs to map out what he needs to know. What discourse or knowledge he does not know.

The *third* characteristic is to understand reality, which can only be studied by the philosopher Soren. For example, to make sure someone is a friend or foe, several things must be considered both through ethical and political standards. Someone who is not trained to question things as philosophers always do will make mistakes as a leader because they only pay attention to a reality based on its advantages or disadvantages. For example, a philosopher who deserves to be a leader is someone who can question the value of beauty (Wogu et al., 2017). This affects the standard of human values and good values possessed by the philosopher king.

In addition, this trait also leads a person to be able to distinguish between good and bad things where law, diplomacy, education, and even trade require it. A prince (descendant of King) alone may not know it. Only philosophers can solve this problem. In short, according to Plato, the leader requires mastery of discourse on the things that are his responsibility (Bauman, 2018).

The *fourth* trait is to recognize and control others. Of course, this control cannot be applied by relying on

violence. Mastery over others can be achieved by understanding and willing to hear the opinions of others. Since a leader favors the opinions of many, he must also master the main idea or purpose of the opinions of others. Furthermore, a leader needs to filter ideas from the people around him, especially for ideas that have the potential to be implemented (Sarigiannidis, 2021). In other words, a leader needs to understand and master the discourse that exists in society. It is the ideas that exist in a society that become the reference for a philosopher king to lead.

The *fifth* characteristic is controlling the state without monopoly or using force. Plato is a philosopher who is most against violence. It is primarily self-directed, and the consequence of that concept is the opposition of violence to others. A philosopher king, even with vast power or a large military fleet, cannot arbitrarily do anything to injure people. This is stated in the term *heauton biazesthai* (Pacewicz, 2006) or 'using cavalry force.' For Plato, a leader will find the ideal way to solve problems. Therefore, a leader is required to master much knowledge. The function of knowledge here is to find the best possible. If a leader does not have sufficient discourse, he will not know the problem, cannot find a way out, and usually, the last way to deal with problems is to make their own decisions (monopoly) or use violence.

Combines The Concepts

The similarity of the two concepts above is that both Plato and Lao Zi propose the nature of a wise leader. Lao Zi emphasizes leaders who nurture, protect, care for, and soothe. In other terms, leaders in Lao Zi's philosophy are maternal leaders (Flavel & Hall, 2020). Meanwhile, Plato's leadership is more Platonic because a good philosopher king, according to Plato, emphasizes the importance of mastering discourse and understanding other people so that they can make wise decisions.

In other words, leadership, according to Lao Zi, is passive, while leadership, according to Plato, is more active. By combining the two concepts above, an analysis emerges where there is a weakness in the interpretation of Wu Wei and Lao Zi's teachings, namely, when the question arises, where can one know the universal laws of nature without seeking or studying knowledge about them? However, character learning and science education, whether social, metaphysical, religious, or scientific, takes much time.

On the other hand, Plato's concept of the philosopher king also has shortcomings where a philosopher king is considered more necessary to recognize various sciences so that there is no definite explanation or clear principle about how much a leader needs to know himself, compared to his portion to recognize situations and people who put their trust in one, or, in other words, the leader needs to accept differences of opinion with a pluralistic attitude (Catana, 2020). This is a shortcoming of the concept of the philosopher king proposed by Plato. However, through this concept, we know that a leader needs extensive knowledge and the ability to manage the knowledge he has so that it can be applied when he is dealing with other people. Self-knowledge is also essential in Plato's teachings, but further interpretation and research are needed to understand the practical steps in living the concept.

Conclusion

Through this research, several conclusions emerge, including that the leadership philosophy that appears in the concept of the philosopher king by Plato and Wu Wei by Lao Zi have in common, including the superiority of self-control. This becomes an excellent objective to be included in the output of character education. By controlling oneself, one can control his role in the world until the next he can rule the world. Furthermore, self-control can only be achieved by educating oneself through the learning process, for example, regarding social conditions, natural science, and spirituality. The only difference between the concepts of Wu Wei and the King of Philosophers is that each has a different emphasis. Through the concept of the philosopher king, Plato favors the wealth of knowledge even though self-control is considered necessary, while in the concept of Wu Wei, self-control is the main one, and science can be put aside.

Someone who wants to be a leader still needs to learn many things, at least to be open-minded to new things. This inclusiveness goal then leads our research to a synthesis between the principles of Wu Wei and the King of Philosophers in which someone who wants to be educated or learn to become a leader with good character must strive to realize good things actively through the learning process, but on other occasions can also consider other things. Humans cannot change natural nature, so they must respect and follow it. Wu Wei is taught with the aim that one can lead by silence or control a situation by negating or not doing something. At the same time, the concept of the philosopher king teaches that a leader can know and take action actively. These two different characters can be referencing material for teaching character development, especially as a suggestion for how to shape oneself to be a good leader in Western and Eastern traditions.

Abstract: Hemorrhoids is one of the most common pathologies of anorectal region. At least 4.4% of the population suffer from this disease. According to statistics, every tenth patient with hemorrhoids needs surgical treatment. Therefore a great number of patients undergo hemorrhoidectomy every year. That is why, there is a need to have methods for preventing complications of this surgical intervention. Identify and apply methods of prevention from the most significant complications of hemorrhoidectomy. We performed analysis of scientific articles. There were investigated management of complications after a hemorrhoidectomy and prevention of such complications. Based on the literature, we improved treatment strategy and implemented it. Nowadays, there are a number of clinical studies that have shown the effectiveness of venotonics in the non-surgical treatment of mild hemorrhoids. Moreover, these drugs are prescribed to patients who have undergone hemorrhoidectomy. Venotonics reduce intensity of exudation in the area of inflammation by means of increasing venous tone. As a result, patient's pain is relieved in the postoperative period. In addition, venotonics can be used to prevent other postoperative complications, including bleeding. For instance, some clinical studies showed a reduction in the risk of bleeding in patients after surgery in comparison with the control group. According to the performed meta-analysis, topical application of glycerin trinitrate showed effectiveness in reducing post-operative pain. Application of glycerin to the mucous of the anal canal was associated with less intensity of pain for 2 weeks after hemorrhoidectomy. The effectiveness of ointments with local anesthetics has been studied for a long time. This drugs demonstrated significant analgesic effect in the postoperative period. Patients who were applied a combined ointment with lidocaine and prilocaine after hemorrhoidectomy noted significant reduction in pain. Improved treatment strategy showed significant efficiency. In particular, we managed to relief postoperative pain without using narcotics, to prevent occurrence of bleeding in postoperative period and to avoid appearance of anal stenosis.

Introduction

Hemorrhoids are one of the most common proctological diseases in the world. Its prevalence reaches up to 35-40% of the total population, with a higher incidence among middle-aged people with a high socioeconomic status. It is estimated that about 50% of the general population experience symptomatic hemorrhoids at some point in their lives. In addition, pregnant women are prone to a high risk of developing hemorrhoids. The prevalence of hemorrhoids in pregnant women ranges from 20% to 30%, and up to 80% of pregnant women suffer from hemorrhoids in the third trimester.

Other subjects with an increased risk of developing hemorrhoids are the elderly and people with a high body mass index.

The severity of hemorrhoids is divided into four stages. Medical treatment and lifestyle changes are suitable for stage I-II hemorrhoids, which make up the vast majority (> 90%) of all reported cases, while later stages III-IV of the disease require surgical treatment, which can have a number of complications.

The main manifestations of chronic hemorrhoids are:

- rectal bleeding (usually fresh blood);
- protrusion of formations;
- discomfort, possible moderate pain;
- mucous secretions from the rectum;
- possible secondary anemia.

During the examination of a patient with hemorrhoids, enlarged and pathologically changed external and internal hemorrhoidal nodes can be detected, while manifestations of external changes in the hemorrhoidal plexus indicate, as a rule, acute hemorrhoids (acute thrombosis of pinched hemorrhoidal nodes), which often manifests as painful bluish formations from the outside of the anus, they occur spontaneously, perhaps after unusually strong exertion or the consumption of alcohol or spicy food.

The skin covering the outer part of the anus is usually firmly attached to the underlying tissues, and if thrombosis develops in this tightly held area, the pressure in these tissues increases rapidly, often causing considerable pain. The pain is usually constant and can be very severe.

Sometimes the increased pressure in the thrombosed external hemorrhoidal node leads to the destruction of the covering skin, and the coagulated blood begins to flow out.

Patients may also complain of periodic swelling, pressure, and discomfort associated with external hemorrhoids that are not thrombosed and suggestive of chronic external hemorrhoids with the location of enlarged and

pathologically altered nodules on the virtual "clock face" at 5, 7, and at 11 "hours".

The presence of pathologically changed and enlarged internal hemorrhoidal nodes can be established during the examination of the patient.

Painless rectal bleeding or anal tissue prolapse is often associated with symptomatic internal hemorrhoids.

An external prolapsed hemorrhoid is a protruding hemorrhoidal tissue that can often be felt on the outside of the anus during defecation or hygiene procedures after it. This tissue often turns inward spontaneously or may be pushed back inward by the patient. Symptoms, as a rule, slowly progress over a long time and are often periodic, associated with psycho-emotional and physical stress, alcohol, so-called "spicy food".

Bleeding caused by internal hemorrhoids is usually bright red and may stop quickly after a bowel movement. Not all patients with symptomatic internal hemorrhoids will have significant bleeding. Instead, prolapse (falling out of nodes) may be the main or only symptom. The shedding of the tissue can cause significant irritation and itching around the anus.

Patients may also complain of discharge of mucus, difficulty with the act of defecation, or the feeling that feces are "stuck" in the anus.

The severity of hemorrhoids has four stages, which correspond to the first 4 points of the classification, and are manifested by one or another state of prolapse and maneuverability of internal hemorrhoidal nodes:

- discomfort, slight pain, discharge of pink blood during defecation without loss of knots;
- discomfort, slight pain, release of pink blood during defecation with the loss of knots during defecation, after which the knots are independently inserted into the anal canal;
- discomfort, slight pain, discharge of pink blood during defecation with loss of knots during defecation and any other physical activity, after which the knots do not move into the anal canal on their own, they must be moved by the patient's hands;
- discomfort, slight pain, discharge of pink blood during defecation with internal hemorrhoidal nodes constantly sticking out, the nodes are not inserted into the anal canal by themselves, when the nodes are inserted into the anal canal by the patient's hands, they fall out again.

This state of affairs requires a solution to the issue of effective treatment of patients with chronic and acute hemorrhoids.

In particular, dietary and lifestyle changes that require strict adherence by the patient are usually considered the

first step in any conservative hemorrhoid treatment. Medical treatment is mainly based on the use of topical preparations containing anti-inflammatory components, including steroids, anesthetics and / or antiseptics. However, in most cases, randomized trials have not been conducted to evaluate the effectiveness and safety of various substances, which in some cases - for example, steroids - are associated with the potential onset of undesirable manifestations. (*Mamchur, V., Sulyma, V., 2021*).

Hemorrhoids mainly affect people of working age, the exacerbation of the disease usually recurs from 2 to 6 times a year, and the periods of temporary incapacity reach up to 1 month, which causes large economic losses. Currently, 3 main methods of hemorrhoid treatment are used: conservative, minimally invasive and radical surgical. The used traditional methods of treatment do not always lead to the desired results and, despite the availability of many methods of treatment of hemorrhoids, the problem does not lose its relevance.

Existing methods of surgical treatment are still accompanied by a considerable number of postoperative complications, such as bleeding, severe pain syndrome, dysuric phenomena, local swelling and inflammation, which leads to additional suffering for the patient, increases the cost of treatment and prolongs the period of temporary disability.

According to statistics, every tenth patient with hemorrhoids needs surgical treatment. Therefore a great number of patients undergo hemorrhoidectomy every year. That is why, there is a need to have methods for preventing complications of this surgical intervention.

Surgical hemorrhoidectomy is necessary for the large third- and fourth-degree hemorrhoids when medical management has failed, when there is a large bulging external component, or when incarcerated internal hemorrhoids need immediate medical treatment. This activity reviews the evaluation and treatment of hemorrhoidal disease and highlights the role of the interprofessional team in evaluating and treating this condition. (*Cristea, C., Lewis, C.R., 2022*).

However hemorrhoidectomy of the Milligan and Morgan variety (open hemorrhoidectomy) remain the gold standard. Identify and apply methods of prevention from the most significant complications of hemorrhoidectomy. Surgical treatment of patients with chronic hemorrhoids of coagulation of biological tissues is most often used.

Method

We performed analysis of scientific articles. There were investigated management of complications after a hemorrhoidectomy and prevention of such complications. Based on the literature, we improved treatment strategy and implemented it.

Nowadays, there are a number of clinical studies that have shown the effectiveness of venotonics in the non-surgical treatment of mild hemorrhoids. Moreover, these drugs are prescribed to patients who have undergone hemorrhoidectomy. Venotonics reduce intensity of exudation in the area of inflammation by means of increasing venous tone. As a result, patient's pain is relieved in the postoperative period. In addition, venotonics can be used to prevent other postoperative complications, including bleeding. For instance, some clinical studies showed a reduction in the risk of bleeding in patients after surgery in comparison with the control group. (Sheikh, P., et al., 2020).

A modified electro-surgical device, the LigaSure, has become available for the last decade as a 'vessel-sealing system'. This system delivers electro-diathermy energy across its jaws much like a bipolar diathermy device with minimal lateral spread of current or heat.

We used the LigaSure device for hemorrhoidectomy in grade III and IV hemorrhoids and compared our results with conventional hemorrhoidectomy of the Milligan and Morgan variety.

Hemorrhoidectomy is associated with significant pain-related complications such as urinary retention and constipation. Additionally meticulous hemostasis needs to be ensured to avoid postoperative hemorrhage. Occasionally the operative field can become quite bloody, prolonging the surgery. We found that LigaSure hemorrhoidectomy was a major improvement over the conventional technique in all these parameters. Technically the LigaSure method is much more simpler and can be safely and effectively carried out by relatively inexperienced surgeons. (Khanna R., et al., 2010).

According to the performed meta-analysis, topical application of glycerin trinitrate showed effectiveness in reducing post-operative pain. Application of glycerin to the mucous of the anal canal was associated with less intensity of pain for 2 weeks after hemorrhoidectomy. (Ratnasingham, K., et al., 2010)

The effectiveness of ointments with local anesthetics has been studied for a long time. This drug demonstrated significant analgesic effect in the postoperative period. Patients who were applied a combined ointment with lidocaine and prilocaine after hemorrhoidectomy noted significant reduction in pain. (Rahimi, M., et al., 2012) Several meta-analyses have shown efficiency in postoperative pain relief with oral metronidazole. (Lyons, NJR., et al., 2017).

The drug inhibits activity of anaerobic flora in the rectum. Thus, the intensity of the inflammatory reaction decreases, which leads to pain reduction. (Xia, W., et al., 2018).

Treatment of hemorrhoids is a problem of modern surgery. In the structure of proctological diseases, hemorrhoids occupy almost 40%. Up to 30% of patients need surgical treatment.

Existing methods of surgical treatment are still accompanied by a considerable number of postoperative

complications, such as bleeding, severe pain syndrome, dysuric phenomena, local swelling and inflammation, which leads to additional suffering for the patient, increases the cost of treatment and prolongs the period of temporary disability.

Hemorrhoidectomy methods are accompanied by quite a large number of postoperative complications, such as pain syndrome, urination disorders, bleeding, local edema, narrowing of the anus, which leads to additional patient suffering and increases the cost of treatment.

The use of the LigaSure (Covidien) and EK-3000M (SVARMED) electrocautery generators for the removal of hemorrhoids and cauterization of blood vessels in hemorrhoidectomy can also be complicated by stricture of the anus. We studied the dependence of the development of anal strictures on the method of anesthesia during surgery.

The use of generators for electrocoagulation of vessels, which "boil" them, makes it possible to perform seamless hemorrhoidectomy. This necessitates the development of hemorrhoidectomy methods using the latest technologies.

Performing electrosurgical hemorrhoidectomy using the modern LigaSure technique, due to the small spread of the damage zone and the absence of sutures in the anal region, leads to a decrease in pain syndrome, absence of bleeding and swelling of tissues, acceleration of wound healing, shortening of treatment periods and temporary disability.

The described technique is safer, faster and significantly reduces the number of postoperative complications compared to the standard method of excision of hemorrhoidal nodes.

The technology of performing advanced hemorrhoidectomy according to Milligan-Morgan: the patient is in the position for perineal lithotomy on the back with legs bent at the hip and knee joints, placed on stands.

After treatment of the operative field, divulsion of the anal sphincter is carried out with a rectal mirror, revision of the anal canal. With a window clamp, the internal node is pulled up by the top and the bent electrode of the LigaSure apparatus is placed on its stretched base, which includes the vascular leg. Conduct electroligation of the base of the node at an intensity of 2 or 3 LEDs, after which the internal hemorrhoidal node is removed above the clamp without stitching the vascular pedicle.

The external hemorrhoidal node is grasped, after the node is pulled, electroligation of its base is performed, the node is removed above the clamp. The other 2 internal and 2 external hemorrhoidal nodes are sequentially removed in the same way.

Equipment: The LigaSure electrothermal system, designed for sealing vessels up to 7 mm in diameter, provides controlled energy delivery to tissues and effective compression. The basis of the mechanism of action on tissues

is the melting of collagen and elastin. The strength of the "welded zone", consisting of partially denatured protein, is comparable to the strength of stitched fabric.

Results

Throughout 2020-2021, we analyzed the results of treatment of 612 patients who underwent hemorrhoidectomy using the LigaSure. By analyzing these data, we identified the most common complications of this surgical intervention.

For symptomatic grade III and IV hemorrhoids, some form of hemorrhoidectomy remains the accepted modality of treatment.

The traditional methods like the Milligan—Morgan method have been in practice for more than half a century for want of a better alternative. Recent years have seen the introduction of newer techniques with relative merits and demerits.

The most significant recent introduction has been the circular stapling device for prolapsed hemorrhoids. This has been criticized for not treating the external component of hemorrhoids and the skin tags. Additionally the stapler cartridges are expensive and beyond the reach of most patients.

Trials have also emphasized the significantly shorter convalescence period, patients resumed daily activity after a week. Comparison of LigaSure with other methods for hemorrhoidectomy has found that the operative time and postoperative pain were lesser with LigaSure.

In particular, bleeding in the early postoperative period directly from the wound was detected in 16 patients (2.61%). In 13 patients (2.12%), bleeding was observed for 2-3 days after the operation. It was accompanied with bright *red blood* mixed with feces. During revision of the wound in such patients, bleeding from the wound was not detected. Subsequently, these patients underwent an endoscopic examination, but the location of bleeding was not identified.

Apparently, bleeding was associated with stressful factors. On the 8-9th day after discharge, bleeding was observed in 18 patients (2.94%), that was accompanied with bright red blood mixed with feces. It was also associated with a stressful factor and uncontrolled taking of NSAIDs.

No statistically significant differences were observed in postoperative bleeding, urinary retention, difficult defecating, anal fissure, anal stenosis, incontinence, postoperative pain, return to normal activities, and hospital stay.

Our analysis shows that LigaSure is an effective instrument for hemorrhoidectomy, which results in shorter

operation time and lower recurrence rate.

Patients treated with LigaSure had a significantly shorter operative time and hospital stay. The blood loss during operation was less in LigaSure group. No statistically significant differences were noted in postoperative bleeding, difficult defecating, anal fissure, anal stenosis, and incontinence.

Based on our study and analysis of literature, we have improved treatment strategy.

The treatment included:

1. The day before surgery, patients were administered proton pump inhibitors at a dose of 40 mg per day. They continued taking for 21 days after the surgery;
 2. Patients had their last meal 3-4 hours before surgery;
 3. Mechanical bowel preparation was performed on the day of surgery by using a combination of sodium dihydrogen phosphate and disodium phosphate (Enema-Sella);
 4. Previously, the day before the operation and immediately before the operation, the patients took anxiolytics, in particular, the benzodiazepines;
 5. Patients were administered venotonics 2 days before surgery and 4 weeks after. These medications contains diosmin and hesperidin (Ginkor Fort , Phlebodia, Venosmil);
 6. In the postoperative period, an ointment with a local anesthetic, glycerin and a topical glucocorticosteroid was applied. It was made by the pharmacy, according to our prescription;
 7. After surgery, patients had been taking orally metronidazole 500 mg 3 times a day for 7 days;
 8. Patients took nonsteroidal anti-inflammatory drugs with severe pain.
- Opioid analgesics were not used;
9. In order to prevent scarring and narrowing of the anus in the postoperative period, we performed anal dilation on the 14th and 28th days after discharge.

Performing electrosurgical hemorrhoidectomy using the modern LigaSure technique, due to the small spread of the damage zone and the absence of sutures in the anal region, leads to a decrease in pain syndrome, absence of bleeding and swelling of tissues, acceleration of wound healing, shortening of treatment periods and temporary disability.

Discussion

The described treatment strategy was used during 2022 for the management of 312 patients. In the study group, 235 patients (75%) underwent hemorrhoidectomy, and 77 (25%) underwent hemorrhoidectomy with excision of rectal fissures using the LigaSure.

Analyzing the results, a decreasing in the frequency of postoperative complications was identified in the study group in comparison with the control group. In particular, 3 patients (0.96%) had postoperative bleeding, but they were successfully treated conservatively. Stressful bleeding was observed in 1 patient (0.32%), who abused NSAIDs. In 2 patients (0.64%) during examination on the 14th day after discharge, a tendency to narrowing of the anal canal was revealed. Diprosan was injected into the scar tissue of these patients and followed by finger dilation on 28 day after operation.

Such combined therapy combines a rapid local anesthetic effect with effectiveness in accelerating local healing and restoration of local vessels to a normal state. This dual mechanism of action allows you to control both subjective (pain and discomfort) and objective (prolapse and bleeding) symptoms of hemorrhoids, reducing inflammation and improving vascular tone.

It made possible preventing scar stenosis of the anal canal by conservative methods. Administration of ointment with a local anesthetic, glycerin and topical corticosteroid and NSAIDs leads to optimal patients pain relief without usage of opiates.

Conclusion

LigaSure hemorrhoidectomy is a sutureless, closed hemorrhoidectomy technique dependent on a modified electro-surgical unit to achieve tissue and vessel sealing. It is safe and effective, has less blood loss, postoperative pain and complications compared to conventional hemorrhoidectomy. Technically it is much simpler because suturing is not required and hemostasis is easy to achieve.

Improved treatment strategy showed significant efficiency. In particular, we managed to relieve postoperative pain without using narcotics, to prevent occurrence of bleeding in postoperative period and to avoid appearance of anal stenosis.

Recommendations

We recommend using the proposed technologies in the practices of surgeons-proctologists for medicaments treatment or surgical operations of patients with chronic hemorrhoids.

Abstract: Choosing an unsuitable method of delivering material is one of the factors that gives students difficulties in applying concepts in solving mathematical problems. Strong mathematical concepts will help students develop their mathematical thinking skills, including geometric thinking skill. The use of ethnomathematics combined with worked example strategies will make learning more meaningful, and concepts will be stored in long term memory during the learning process. The aim of this study is to figure out the influence of the ethnomathematics approach using a worked example strategy on the geometric thinking skills of seventh grade students. This research falls under the type of quantitative research using a quasi-experimental approach. The study was conducted in an experimental class that received mathematics instruction using an ethnomathematics approach and a worked example strategy and a control class that received mathematics instruction using a direct learning model. According to the findings of the study, the ethnomathematics approach using the worked example strategy had a positive impact on the geometric thinking skills of seventh grade students. However, there is no significant difference in the geometric thinking skills of seventh grade students between the direct learning model and the ethnomathematics approach using worked example strategy.

Citation: Risywandha, I. & Dhoruri, A. (2024). The Influence of Ethnomathematics with Worked Example Strategy on Students' Geometric Thinking Skill: Quasi Experiment. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 34-45), Antalya, Turkiye. ISTES.

Introduction

Learning mathematics is closely associated with many cultures in Indonesia. Be it cultural ceremonies, pieces of art, or regional customs. This culture can be used to support the success of mathematics learning on certain resources. Ethnomatematics is the study of the relationship between mathematics and culture. According to (Murtafiah et al., 2022), learning activities that involve collaborating math issues with culture are projected to be a new alternative in problem solving in both the classroom setting and in everyday life.

Geometry is one of the mathematical materials that can be used to teach ethnomathematics. According to the findings of a study conducted by (Fauzi & Arisetyawan, 2020), students still struggled with employing concepts and principles, as well as addressing verbal problems when answering geometry questions. These obstacles that students face are undoubtedly influenced by a variety of circumstances, both internal and external.

One of the external variables contributing to students difficulties in addressing verbal problems is a lack of learning habituation. Giving problems with a close context to students' life when learning geometry, either as a model method or as material for practicing questions, can encourage greater geometric thinking skills. According to (Fitriza et al., 2022), using an ethnomathematics approach for geometry learning can help students strengthen their geometric reasoning abilities. Furthermore, if students learn using the proper method, their geometric thinking skills are likely to improve.

Ethnomathematics

According to (Mania & Alam, 2021; Rosa et al., 2016), ethnomathematics seeks to connect mathematical ideas and methods entrenched in local activities (emic) with academic conceptual frameworks (ethics). Emic analysis extends this approach, but studying cultures according to established ethical processes inhibits the identification of cultural variation (Haskell et al., 1992). Thus, the emic method focuses on the meaning of objects in individual lives, such as mathematical artifacts, while also utilizing value theory to describe how people organize knowledge in their own surroundings.

This is consistent with what (Meaney et al., 2008) state about "certain cultural practices, such as those that are ethno-mathematically embedded in cultural language." Members of various cultural groups have evolved logical processes connected to quantification, measuring, and modeling, in addition to language, to understand and explain their social, cultural, and historical environment. In this study, ethnomathematics is a science that may merge mathematics and culture through integrating local cultural phenomena into mathematics learning. More specifically, this study focuses on square and rectangular materials.

Worked Example Strategy

The worked example strategy is a cognitive load theory-based method. The presentation of material through worked examples allows students to employ their cognitive resources more effectively in knowing, remembering, and understanding the structure of issues and their solutions as demonstrated in the examples (Cooper, 1990). A worked example is a teaching method that gives a problem statement together with a comprehensive step-by-step solution from beginning to end.

According to (Sweller, 2011), the stages of learning worked example strategy through introduction phases followed by a phase acquisition. 1) Level of identification (introductory) is the first stage of learning in which students acquire prerequisite material that must be mastered before moving on to new material. 2) The

acquisition stage (acquisition) is the central stage of learning using the worked example strategy. This level will make use of the prerequisite material from the previous stage. Students are given examples to study, and after studying each example, problems are supplied for students to complete. Students will gain an understanding of the plan or steps that can be employed to address the problem as a result of the numerous examples provided.

According to several experts and research findings, the benefits of learning using worked examples are as follows: 1) provide opportunities for students to focus on the challenges supplied and the processes that have been provided; 2) Students are able to solve the problem; 3) Allow students to practice activating knowledge gained by addressing similar problems so that it may be applied to different problems.

Geometric Thinking

Geometric thinking refers to a student's capacity to use geometric concepts in mathematics studies and other areas of life. Geometric thinking is concerned with how people reason utilizing geometric shape and spatial relationship features (Ling et al., 2021; Lumbré et al., 2023; Massarwe, 2023; Pavloviová et al., 2022; Yitmen & Almusaed, 2022). Geometric thinking, as defined by (Aditya & Musa, 2016), is the ability of students to observe objects, build definitions based on the inherent characteristics of objects, recognize the relationship between one object and another object, and apply it in solving geometric problems.

The notion of geometric thinking development was inspired by study undertaken by a husband and wife team, Pierre van Hiele and Dina van Hiele-Geldof (two Dutch educators). Van Hiele's geometrical thinking theory has five levels, according to (van de Walle et al., 2020). Each level outlines how we think, what sorts of geometrical ideas we think about (referred to as objects of thought), and what students can achieve (referred to as products of thinking).

Level 0: Visualization

Students progress from thinking about shapes and what they "look like" to creating classes or groups of shapes that appear to be "like." At this level, students will sort and categorize forms depending on their appearance. "I put these shapes together because they are all pointy." As a result, at this level, the dominant appearance/form can dominate students reasoning about shape qualities. For example, students at level 0 who see a square with sides that are neither horizontal nor vertical may mistake it for a diamond.

Level 1: Investigation

Students shift their focus from classes of shapes to individual shapes by focusing on shape attributes. Analysis students evaluate all shapes in a collection of several shapes rather than just one shape. Instead of discussing this specific rectangle, they might discuss the properties of all rectangles. Students can think about what makes a rectangle a rectangle by focusing in form class (it has four sides, two pairs of parallel sides, opposing sides the

same length, four right angles, and so on).

Level 2: informal deduction

Students progress from considering shape properties to investigating the connections between geometric object properties. Level 2 students, such as level 1, are able to think about the properties that exist in a collection of forms and build relationships between these properties across forms. Students, for example, can deduce that "if a shape with four right angles is called a rectangle, and a square also has four right angles, then a square is also called a rectangle." After students have mastered "if-then" reasoning, they can classify forms just by being provided the bare minimum of attributes.

Level 3: deduction

Students progress from analyzing the relationships between geometric object attributes to building deductive axiomatic systems for geometry. Students at this level are typically in high school and are able to make abstract claims regarding geometric properties and draw logical implications. At this level, students analyze informal arguments based on entire system structures with axioms, definitions, theorems, implications, and postulates that are beginning to evolve and can be utilized to establish geometric truths.

Level 4: rigor

Students progress from analyzing deductive axiomatic systems for geometry to comparing and contrasting various geometry axiomatic systems. The axiomatic system is the focus of attention at this greatest level. So contrast and compare the axioms of various geometries. This is the level of college where students major in mathematics and study geometry as a field of mathematics.

Method

This study is a category of quantitative research using a quasi-experimental approach. This study uses two classes: the experimental class, which learns through ethnomathematics utilizing the Worked Example technique, and the control class, which learns through the direct learning model. In this study, all seventh-graders at MTs Mu'allimaat Muhammadiyah Yogyakarta were separated into six classes of 210. This study's sample included 30 students taken from six different classes. Researchers employed simple random sampling as a sampling technique. The researcher uses this strategy to pick participants for the sample so that each individual has the same chance of being chosen from the population (Creswell, 2015).

The geometric thinking skill is a skill to be measured in this study. The instrument employed is a posttest multiple choice style of questions. This study adopted a geometric thinking test instrument developed by

(Usiskin, 1982).

Results

Description of geometric thinking skills in the experimental class

The data to be discussed are the results of the experimental class geometric thinking skills pretest and posttest. The results of the experimental class's pretest and posttest geometric reasoning skills are provided in the table below.

Table 1. Experiment Class Statistical Description

	Statistical Description	
	Experiment Class Pretest	Experiment Class Posttest
The number of students	15	15
Minimum Score	27	33
Maximum Score	67	73
Average	44,40	53,60
Standar Deviation	12,357	12,911

Based on the image above, a pretest score on the geometric thinking skill can be generated, specifically a minimum score of 27, a maximum score of 67, an average score of 44.40, and a standard deviation of 12.357. In terms of posttest findings, the minimum is 33, the highest is 73, the average is 53.60, and the standard deviation is 12.911.

Description of the geometric thinking ability of the control class

Accurate data pretest and posttest control class geometric thinking skill is described. The pretest and posttest geometric thinking skills of the control class are provided in the table below.

Table 2. Description of Control Class Statistics

	Statistical Description	
	Control Class Pretest	Control Class Posttest
The number of students	15	15
Minimum Score	20	33
Maximum Score	60	73
Average	37,8667	51,0667
Standar Deviation	13,42634	11,75018

Based on the table above (see Table 2), a pretest score on the capacity to geometric thinking skill can be

obtained, with a minimum score of 20, a maximum score of 60, an average score of 37.8667, and a standard deviation of 13.42634. The posttest results show a minimum score of 33, a maximum score of 73, an average score of 51.0667, and a standard deviation of 11.75018.

Test the Average Difference

After the normality and homogeneity tests of variance have been fulfilled, the average similarity test will be performed in the experimental and control classes prior to the treatment. Independent Sample T Test with a significance level of 0.05 is used for testing. The following is the formulation of the average difference hypothesis test.

$H_0: \mu_E = \mu_K$, There is no significant difference in pretest geometric thinking skills between students who learn using an ethnomathematics approach with a worked example strategy and those who learn using direct learning models.

$H_1: \mu_E \neq \mu_K$, There is a significant difference in pretest geometric thinking skills between students who learn using an ethnomathematics approach with a worked example strategy and those who learn using direct learning models.

Table 3. Average Difference Test Result

Average Difference Test Result	
Pretest score	0,176

The table above (see Table 3) shows that the signature (2 tailed) is $0,176 > 0,05$, which is then H_0 approved. Thus, there is no average difference in pre-test geometric thinking skills between students who learned using an ethnomathematics approach with a worked example technique and students who learned using direct learning models.

Paired Sample T Test

Hypothesis testing begins with a pretest and posttest score difference test utilizing test statistics, Paired Sample T Test. The purpose of this test was to determine whether the direct learning model and the ethnomathematics approach with worked examples have a positive impact on students' geometric thinking skills.

Influence of ethnomathematics approach with worked example strategy

Hypothesis formulation:

H_0 : An ethnomathematics approach with worked example strategy has no influence on students geometric thinking skill.

H_1 : An ethnomathematics approach with a worked example strategy has an influence on students' geometric thinking skill.

Table 4. Paired Sample T Test Worked Example Strategy Result

Paired Sample T Test	
Pretest and Posttest	0,0000

The value of Sig. (2 tailed) was $0,000 < 0,05$ then H_0 rejected based on the table above (see Table 2). This suggests that an ethnomathematics approach with worked examples may assist students improve their geometric thinking skills.

The influence of the direct learning model

Hypothesis formulation:

H_0 : Direct learning model has no influence on students geometric thinking skill.

H_1 : Direct learning model has influence on students geometric thinking skill.

Table 5. Paired Sample T Test Direct Learning Model Result

Paired Sample T Test	
Pretest and Posttest	0,003

Based on the table above (see Table 3), the value of Sig. (2 tailed) is $0,003 < 0,05$ then H_0 rejected. This gives the meaning that the direct learning model has an influence on students' geometric thinking skill.

Independent Sample T Test

The purpose of this test is to determine which effect differences are better between learning using an ethnomathematics approach and learning with the direct learning model. This test involves comparing the data from the two models. The formulation of the hypothesis is as follows:

H_0 : There is no difference between the experimental and control classes in terms of posttest score-pretest score.

H_1 : There is a difference between the experimental and control classes in terms of posttest score-pretest score.

Table 6. Hasil Uji Independent Sample T Test

Independent Sample T Test	
Pretest and Posttest	0,279

Based on the table above (see Table 4), the sig was $0,279 > 0,05$ then H_0 accepted. This means that

learning with direct learning models or ethnomathematics approaches with worked example strategy had no significant impact on students' geometric thinking skill. Because the data show that the ethnomathematics approach to worked example method has no significant effect, there is no need to perform effect size estimations.

Discussion

Based on earlier studies, it was discovered that the two treatments had an influence on students' geometric thinking skills. To determine whether model has the greatest influence on students' geometric thinking skills, a pretest-posttest test for differences in data differences is performed in both treatments, in this case using the Independent Sample T Test. Based on the significance value derived by the Independent Sample T Test, it can be stated that learning through direct learning models or ethnomathematics approaches with worked examples strategy had no significant difference in influence on students' geometric thinking skill.

However, both of these treatments, both in the control class that received learning through direct learning models and in the experimental group that received learning through an ethnomathematics approach using a worked example strategy, reveal that both had an influence. This is demonstrated by the Paired Sample T Test, which shows an increase in pretest and posttest scores. This is also demonstrated by a rise in the two classes' average. It has an average pretest score of 37.8667 and an average control score of 51.0667 in the control class. As a result, the average value of 13.2 rises in the control group. The same thing happened in the experimental class as well. The experimental class likewise had an increase in pretest score, which was initially as high as 44.40 and increased to 53.60 posttest. It can be seen that the average value of pretest to posttest increased 9.2 score in the experimental class.

The findings formed by students in the experimental class appear better and more complete when seen through the results of the students' conclusions on square or rectangular shapes. Meanwhile, the control class is more straightforward and provides short responses. Here are a few examples of student work.

However, there is no significant difference in effect when the Independent Sample T Test is used to determine whether difference in effect is better between learning that occurs in the control and experimental classes. This is because the core concepts of the learning stages in the direct learning model and the worked example method are comparable. Both stress the ease with which students absorb the topic. The scientific approach consists of five stages, each of which focuses on students and is capable of improving students' critical and creative thinking.

Where the two thinking abilities are associated indirectly or where there is a need to improve geometric thinking skills. When the average difference between pretest and posttest was calculated for both classes, the control

class had a larger average rise. In other words, classes with scientific learning have a greater influence on enhancing geometric thinking skill than classes with an direct learning model.

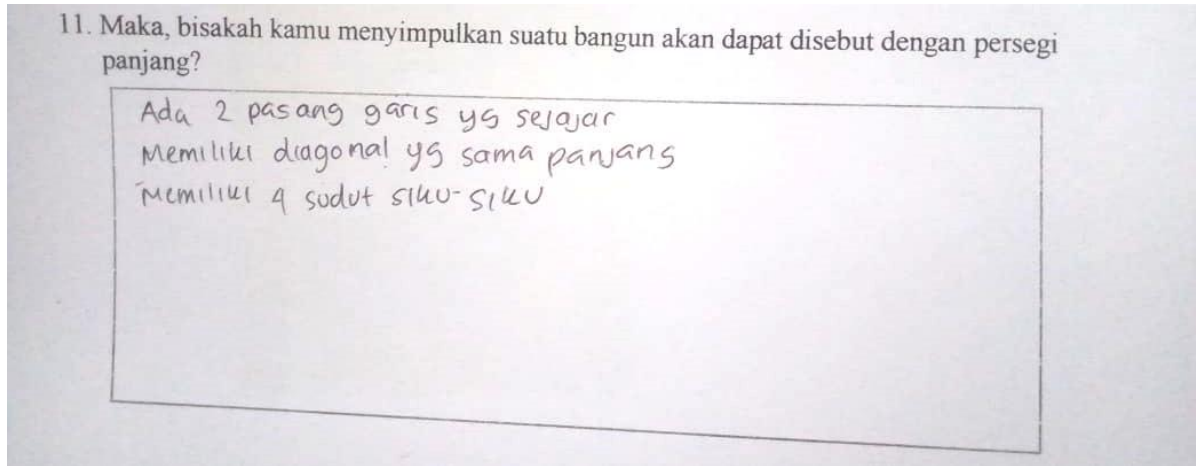

Figure 1. The results of the control class students' work

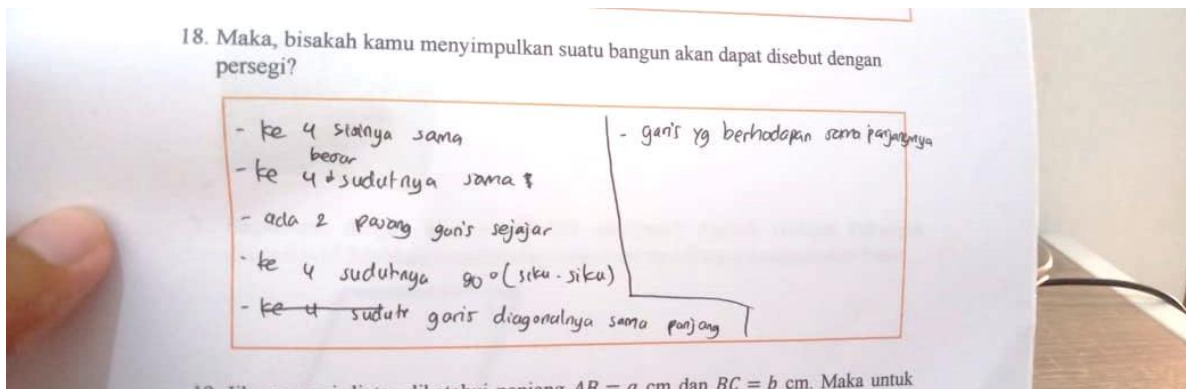

Figure 2. Results of experimental class students' work

The cultural context used during learning had a minor influence on the experimental class, namely the context contained in the student worksheet, which was Javanese culture, such as the Surakarta palace construction, diamond treats, and so on. Meanwhile, the majority of the students in the experimental class came from outside of Java and felt unfamiliar in these settings. This decreases students motivation in the learning process. As a result, there is a slight rise as compared to the control class.

However, as measured by increasing the level of geometric thinking, the experimental class outperforms the control class. According to the value attachment pretest and posttest results, four students in the experimental class reached to level 1 from level 0. And there were two students who advanced from level 1 to level 2. In the control class, the increase was four students who were previously at level 0 who were becoming at level 1. And there was one student who advanced from level 2 after previously being at level 0. However, there was 1 student who experienced a decrease, that is, who was originally at level 1 to level 0.

Conclusion

Based on the findings of the data analysis and discussion, it is possible to infer that 1) direct learning models and ethnomathematics approaches with worked examples strategy have an impact on the geometric thinking skills of seventh grade students. 2) There is no significant difference in the geometric thinking skills of seventh-grade students between the direct learning model and the ethnomathematics approach with worked example strategy.

Recommendation

For Teachers

Teachers can use the working example strategy to assist students develop their geometric thinking skills. This strategy aims at reducing students' cognitive load, but students' active participation should not be overlooked. So, if you want to use this strategy, it is preferable if you can employ student worksheet, which can pique the curiosity of students.

For School

It is hoped that the worked example strategy, combined with the Indonesian cultural perspective, might be extended to other areas than mathematics.

For Other Researchers

If other researchers want to perform ethnomathematics research, they must consider the cultural background that will be presented. The greater context is most effective if it is close to students.

Abstract: Students need critical thinking skills to develop their ideas in mathematics learning situations at school, and they can apply mathematical concepts in solving contextual problems. Junior high school students have unique characteristics and are highly curious about new knowledge. Therefore, it is crucial to apply the learning models that support the development of critical thinking skills. Problem-based learning is a student-centered learning model that familiarizes students with finding solutions to a problem. This study aims to see how applying the Problem-Based Learning model affects students' critical thinking skills. This type of research is a quasi-experimental conducted at one of the junior high schools in Yogyakarta in odd semesters of the 2022/2023 academic year using 2 subjects: a control class and an experimental class. The pretest and post-test were analyzed using the SPSS-assisted. The result shows that the N-gain score of students in the experimental class is 0,703 which is categorized as the high level, and the N-gain score of students in the control class is 0,417 which is in the medium level. This means that the Problem-Based Learning (PBL) model influences students' critical thinking skills more effectively than the conventional learning method.

Keywords: Critical Thinking, Problem-Based Learning, Quasi-Experiment

Introduction

Educational problems are endless issues to be discussed on various occasions. According to Law Number 20 of 2003, chapter II Article 3 “education has the function of educating the life of the nation by developing capabilities and forming dignified national character and civilization, to develop the potential of students”. The potential in question is faith and piety to God Almighty, having noble character, being healthy, knowledgeable, capable, creative, independent, and being a democratic and responsible citizen. However, achieving this goal is

very complex and not easy to achieve. There needs to be an effort to improve the various components involved in education.

Broadly speaking, the problems of education in Indonesia are divided into two, namely macro problems and micro problems. Macro problems are problems in education as a system and its relation to other broader systems. Meanwhile, micro problems include problems in the education component itself (Adrianto, 2019). According to (Kurniawati & Auliah, 2022), micro problems in education include inadequate facilities and infrastructure, monotonous learning methods and models, and low student achievement. The problem of curriculum complexity which is increasingly confusing, education is not evenly distributed, and problems with the quality and misplacement of teaching staff are part of the micro problems in national education.

Technical issues in the educational component such as the use of methods, models, approaches, and strategies are some of the most influential things because they involve students directly. This is in line with the opinion of (Gomes et al., 2023), who voiced the importance of considering the characteristics, behavior, and psychological conditions of students in determining the teaching style of an educator. There are many learning models and approaches currently developing, but their effectiveness is of course influenced by students, educators, and subjects in the learning itself. In other words, a learning model may be effective for certain class groups but not necessarily as effective for other classes. Even different subjects may affect the effectiveness of a learning model.

One of the most widely applied learning models today, especially in mathematics learning, is the problem-based learning model, better known as Problem Based-Learning (PBL). PBL is a model that focuses the learning process on students who are stimulated by clinical, social, and scientific problems and focuses on solving them (Barrows, 1986; Davis & Harden, 1999). The selection of the learning model greatly determines the achievement of the objectives of the learning itself.

Problem-Based Learning is a model that refers to the four pillars of universal education, namely learning to understand (learning to know), learning to do, learning to be oneself (learning to be), and learning to work together or live in togetherness. According to Isrok'atun & Rosmala (2018) Learning to understand is when students learn a lesson concept not using memorization techniques, but understanding the contents of the concept instead. In understanding this concept, students learn by directly carrying out learning activities in the classroom so that they can develop an attitude of cooperation and understanding together. According to Sukirwan et al., (2018), PBL is a teaching model characterized by real problems as contexts for students to learn critical thinking and problem-solving skills and acquire knowledge.

Isrok'atun & Rosmala (2018) in problem-based learning, "students are given the opportunities to solve the problem in a collaborative setting, create mental models for learning, and form self-directed learning habits through practice and reflection". In this case, students are seen to be active in learning activities by practicing collaboratively in solving the problems they face. Learning like this can accustom students to learning

independently and not relying on the teacher's explanation. Students have their way of solving problems. This is because students have initial knowledge that they get from their daily environment regarding the problems presented, not least regarding mathematical problems. Through the initial knowledge that students have, it can make it easier for them to solve mathematical problems. Problem-based learning has several stages, starting with a problem and ending with a solution to the problem. The stages of problem-based learning according to Suradika et al., (2023) are as follows.

Table 1. Problem-based learning syntax

Phases	Teachers Activities	Students Activities
Phase 1 Student orientation on the problem	<ul style="list-style-type: none"> explain the learning objectives, explain the logistics needed Motivate students to be actively involved in solving selected problems 	Students record and prepare the needs needed in the learning process and are in predetermined groups.
Phase 2 Organizing students	Help students define and organize learning tasks related to these problems.	Students limit the problems to be studied.
Phase 3 Guide individual or group investigations	Encourage students to collect appropriate information, carry out experiments to get explanations and problem-solving	Students find out, investigate, and ask questions to get answers to the problems they face.
Phase 4 Develop and present the work	Assist students in planning and preparing appropriate work such as reports, models, and sharing assignments with friends	Students compile reports in groups present them in front of the class and discuss them in class.
Phase 5 Analyze and evaluate the problem-solving process	Evaluate learning outcomes about the material that has been studied or ask the group to present the work	Evaluate learning outcomes about the material that has been studied or ask the group to present the work.

Learning objectives as stated in Law Number 20 of 2003 cover many things, including skills, in terms of learning mathematics, of course, what is meant is mathematical skills. Mathematical skills include 1) conceptual understanding; 2) procedural fluency; 3) strategic competence; 4) adaptive reasoning; and 5) productive disposition (Kilpatrick & Swafford, 2001). To achieve these mathematical skills, there are process standards that must be met such as problem-solving abilities, mathematical communication, mathematical connections, critical thinking skills, and so on.

Critical thinking ability is a series of thinking processes consisting of interpretation, analysis, evaluation, and inference, as well as exposure to concepts, evidence, methodology, criteria, and contextual considerations which then become the basis for decision-making or concluding (Facione, 1991). According to (Setiana & Purwoko, 2020), a person's critical thinking ability is greatly influenced by his learning style because each learning style has different characteristics so it also influences the way of thinking. On this occasion, the author wants to see the effect of the learning model on students' critical thinking skills. Critical thinking is needed by everyone to address problems in the unavoidable reality of life. By thinking critically, a person can organize, adjust, change, or improve his thoughts, so that he can make decisions to act more appropriately.

Mathematical critical thinking ability is a mathematical ability and disposition to include prior knowledge, mathematical reasoning, and cognitive strategies to generalize, prove, or evaluate unfamiliar mathematical situations reflectively. According to Glazer, an unfamiliar situation is a situation where individuals cannot directly understand mathematical concepts or know how to determine solutions to problems. Meanwhile, reflective thinking involves communicating solutions with full consideration, making meaning of answers or arguments that make sense, determining alternatives to explain concepts or solve problems, and or generating extensions for further studies.

Mathematical critical thinking is an intellectual ability possessed by a person to understand mathematical problems. They can analyze these problems and decide on appropriate solutions to these problems (Oktaviani et al., 2018). In line with that, mathematical critical thinking can also be defined as the ability to think logically and reflectively which focuses on how to make decisions that can be trusted (Isrok'atun & Rosmala, 2018; Oktaviani et al., 2018). Therefore, someone who can think critically and mathematically has the intellectual ability to think logically and reflectively in understanding mathematical problems, analyzing problems, and deciding on the right solutions.

According to Kowiyah in studying mathematics, you will learn how to formulate problems, plan solutions, study steps for completion, and make assumptions if the data presented is incomplete, so a skill called critical thinking is needed. This thinking activity is in line with the steps of Problem-Based Learning which can stimulate students' critical thinking skills. The indicators of critical thinking skills in the Problem-Based Learning model are as follows.

Table 2. Critical thinking ability indicator in PBL

Problem-Based Learning Model	Critical Thinking Ability Indicator
1. Orientation of students to problems	<ul style="list-style-type: none"> • elementary clarification (give a simple explanation)
2. Organizing students to study	<ul style="list-style-type: none"> • Basic Support (building skills) • Inference (conclude)
3. Guiding individual and group	<ul style="list-style-type: none"> • Basic Support (building skills)

investigations

4. Develop and present the work
 - inference (conclude)
 - Advance clarification (providing a further explanation)
5. Analyze and evaluate the problem-solving process
 - inference (conclude)
 - Strategy and tactics (set strategy and tactics)

Method

This research is a type of quasi-experimental research that was conducted to test the hypothesis about whether there is an effect of an action. This research was conducted to determine students' critical thinking skills between the experimental class that applied the Problem-Based Learning (PBL) learning model and the control class that applied conventional learning methods.

The population of this study was all classes at one of the schools in Yogyakarta consisting of 3 classes, where each class consisted of 32 students. The sample for this study was class VIII B and class VIII C, respectively, the experimental class and the control class. The independent and dependent variables in this study are the Problem-Based Learning model and without the Problem-Based Learning model and students' critical thinking skills. The research design is in Table 3.

Table 3. Research design

Class		Learning Method	
Experimental	Pretest	Problem-Based Learning	Post-test
Control		Conventional Learning	

This study uses quantitative analysis, which is an analytical technique in which the process is carried out by calculating the results of critical thinking skills tests given to students. The instrument used in this research is a test that measures students' critical thinking abilities in the form of an essay test, which has been adapted to indicators of critical thinking abilities. The test consists of four math questions related to circles. The pre-test and post-test questions are different but have the same level of difficulty to avoid bias in research. Both the pretest and posttest have gone through a validation process by experts and have been tested with the results that the instruments are valid and reliable. The analysis was carried out by comparing the test results of the experimental class and the control class.

Before the statistical test is carried out, a prerequisite test is first carried out, namely the normality test and homogeneity test. The normality test is carried out on a series of data to find out whether the data population is

normally distributed or not, if the data is known to be normally distributed then parametric statistics will be tested whereas if the data is not normally distributed then non-parametric statistical tests will be carried out. Testing the normality of the data in this study used SPSS software with the *Shapiro-Wilk* test. Homogeneity testing aims to find out whether the object under study has the same variant. The homogeneity test used in this study uses the SPSS software with the Levene test.

The hypothesis test was carried out after the prerequisite test to see the comparison of the average variable of the two samples. Hypothesis testing was carried out on pretest and posttest data. The hypothesis test on the pretest is to see whether students from both classes have the same level of initial critical thinking skills using the Compared Means Independent Sample T Test. The hypothesis test on the post-test data is used to see whether there is an effect of the Problem-Based Learning model and conventional learning method on students' critical thinking skills or not, which was tested using the Paired Sample T Test. In the next stage, the hypothesis was tested with the N-Gain Test which aims to see which model is the most influential on students' critical thinking skills. The criteria for the N-Gain Score test are shown in Table 4.

Table 4. N-Gain score criteria

N-Gain Score	Category
$g > 0,7$	High
$0,3 \leq g \leq 0,7$	Medium
$g < 0,3$	Low

Results

The first thing that needs to be conveyed in the results of this research is a report on learning implementation. The research took place over eight meetings, the first meeting was the pre-test while the last meeting was the post-test. The second to seventh meetings were a learning process using the PBL model for the experimental class and conventional learning for the control class. The learning process using the PBL model was carried out well with an implementation percentage of 85% following the PBL phases listed in Table 1. Meanwhile, the conventional learning given in the control class was teacher-centered. In this process, the teacher explains the material and the students listen, then the students are allowed to ask and answer the teacher's questions regarding the learning material. This learning was carried out well with an implementation percentage reaching 90%.

The second thing is data description, to show the initial abilities and learning outcomes of the two classes descriptively. The result of descriptive statistics is shown in Table 5.

Table 5. Descriptive statistic result

Descriptive Analysis	PBL Model	Conventional Method
----------------------	-----------	---------------------

	Pretest	Post-test	Pretest	Post-test
Number of samples	36	36	36	36
Average	61	87	64	79
Median	67	85	66	73
Maximum score	73	95	75	88
Minimum score	51	72	51	68
Standard deviation	5,79	6,48	5,28	6,73

Table 5 above shows that the initial abilities of students from both classes tend to be the same, but the learning outcomes after treatment are quite different, which indicates the influence of the learning model applied in both classes. Then to see this influence in more detail, we carry out inferential analysis, but first it must be ensured that the data is normally distributed and homogeneous. The results of the normality test and homogeneity test are presented in Tables 6 and 7 below.

Table 6. Normality test results

	Experimental Class		Control Class	
	Pretest	Post-test	Pretest	Post-test
<i>p-value</i>	0,43	0,47	0,27	0,31

Based on Table 6, it can be seen that the normality test of the pretest and post-test from both classes obtained more p-value of 0,05. Thus, it can be interpreted that data are normally distributed and it can be used for the next stage.

Table 7. Homogeneity test results

	Experimental Class		Control Class	
	Pretest	Post-test	Pretest	Post-test
<i>p-value</i>	0,89	0,77	0,73	0,81

Table 7 shows that the statistical p-value of the data is higher than 0,05. So it can be concluded that the variance of students from the experimental class and the control class are the same. Thus, the data has met the prerequisite tests so that analysis can be continued at the next stage. The next step is to look at the average initial critical thinking ability of students in the two classes. If there is no difference in the average initial ability then the t-test can be continued.

Statistical hypothesis testing is as follows:

$H_0: \mu_1 = \mu_2$: There is no significant difference in the average critical thinking ability between students in the experimental class and the control class

$H_1: \mu_1 \neq \mu_2$: There is a significant difference in the average critical thinking ability between students in the experimental class and the sample class

The test criterion is that H_0 is accepted if sig. $\alpha > 0,05$. Test results can be seen in Table 7.

Table 8. Average initial ability test result

Compared Means Independent Sample	
T Test	
sig.	0,913

Table 8 shows that H_0 is approved due to the signature (two-tailed) value being greater than 0,05 which means there is no significant difference in critical thinking ability between the students of the two classes. Furthermore, to find out the treatment applied in each class, whether the Problem-Based Learning learning model and conventional learning method have an effect or not on students' critical thinking skills, a hypothesis test is carried out. Hypothesis testing was carried out on pretest and post-test data using the Paired Sample T Test. The hypothesis formulation is written below.

H_0 : The Problem-Based Learning model does not affect students' critical thinking abilities

H_1 : The Problem-Based Learning model affects students' critical thinking abilities

The same hypothesis formulation also applies to the conventional learning method. The criterion of the test, H_0 is rejected if the sig. (two-tailed) $< 0,05$. The results of the Paired Sample T Test are shown in Table 9.

Table 9. PBL model and conventional learning method affect the test result

Paired Sample T Test	
Class	sig.
PBL model	0,000
Conventional learning method	0,002

The table above shows that both the PBL model and conventional learning method may affect students' critical thinking ability. This is indicated by the sig value both classes are smaller than 0,05, which means that H_0 is rejected. Next, to see which effect is greater between the two learning methods, an N-gain test is carried out. The result is summarized in Table 10.

Table 10. N-Gain score results

Class	N-Gain Score	Category
Experimental Class (PBL Model)	0,703	High
Control Class (Conventional Learning)	0,417	Medium

Based on the results, there is a difference in scores between both classes. The N-Gain score of the class applying the Problem-Based Learning model shown in the table above (see Table 10) reaches 0,703 and is in the high category. This shows that the application of PBL in circle material has a big influence on helping students improve their critical thinking skills. While the conventional learning method shows an N-gain score of 0.417 which is in the medium category. This means that the conventional learning method also influences students' critical thinking abilities in learning mathematics, especially circle material, but the influence is not significant.

Overall, the Project-Based Learning model applied in the experimental class and the conventional learning method applied in the control class in learning about circles were proven to influence increasing students' critical thinking abilities. However, when compared to the Project-Based Learning model provides a more effective influence so the application of this model is highly recommended in the learning process.

Discussion

The results of this study indicate that there is a positive relationship between the application of the problem-based learning model and students' critical thinking skills which are very important abilities for students, especially in learning mathematics. However, this research is still limited to a small population and only considers learning in circle material, research with other materials and linking it to certain approaches might strengthen references in improving students' critical thinking skills. In general, problem-based learning can improve students' thinking skills because this learning model is more real and acceptable to students, rather than providing theory which tends to be abstract and less acceptable to students. Other learning models may have a positive influence on students' critical thinking skills in different ways.

Conclusion

To conclude, the mathematical critical thinking ability of students who take part in Problem-Based Learning (PBL) is higher than that of students who take conventional learning. This shows that the Problem-Based model influences students' mathematical critical thinking skills.

Acknowledgments

By participating in the 2024 Education, Social Sciences, and Humanities Research Conference, the authors would like to take this opportunity to thank the LPDP scholarship, the Indonesia Endowment Fund for Education, which has facilitated and provided financial support.

Abstract: During the past two decades, technology-mediated task-based language teaching (TMTBLT) has received great attention among scholars and practitioners in the EFL context. However, exploring the perceptions of teachers and students enacting TMTBLT in EFL teaching from the dimensions of various tasks and English skills remains under-explored. To fill this gap, this study aims to capture EFL teachers and students enacting TMTBLT in teaching reading, which focuses on challenges and strategy In the Indonesian context. Thirty-three EFL teachers and students were recruited as participants in this study. The data were derived from questionnaires and followed by semi-structured interviews with EFL teachers and students from Indonesian universities. The study revealed that technical issues, digital literacy challenges, language barriers, and limited access to technology are among the primary obstacles encountered in integrating technology into TBLT practices. These challenges underscore the multifaceted nature of technology integration in language teaching contexts and highlight the need for comprehensive strategies to address them effectively. This study implied that the policymakers should prioritize ongoing training and professional development initiatives to enhance teachers' and students' digital literacy skills and proficiency in integrating technology into TBLT practices.

Keywords: EFL teachers and students, technology-mediated task-based language teaching (TMTBLT), survey.

Citation: Nurhadi, K, Widiati, U., Suryati, N., & Muniroh, S. (2024). EFL Teachers and Students Enacting

Technology-mediated task-based language teaching (TMTBLT) in Indonesia Context: Challenges and Strategy. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 56-76), Antalya, Türkiye. ISTES.

Introduction

During the past three decades, task-based language teaching (TBLT) has garnered considerable attention from scholars in the realms of second language acquisition (SLA) and language instruction (Duong & Le Truong, 2022; Meniado, 2023; Robinson, 2011; Thi et al., 2022). Positioned as an extension of communicative language teaching ((Kumaravadivelu, 2006), TBLT represents a shift in the prevailing perspectives on language pedagogy, moving away from a focus solely on 'knowledge of language' towards a more practical and experiential emphasis on 'achieving communicative purposes' (Scarino, 2009, p. 45). TBLT views tasks as the central organizing element, or, as Bygate (2016, p. 386) describes them, a point of reference for both instruction and curriculum design.

Advocates of TBLT argue that learners of a target language (TL) develop their written and spoken language skills through participation in a sequence of meaning-oriented and context-driven communicative tasks (Bygate, 2016; Doughty & Long, 2003; Ziegler, 2016). Conversely, TBLT has sparked controversy due to its departure from conventional language teaching methodologies of the twentieth century, such as grammar, translation, and audio-lingualism. Ellis (2009) suggests that the core disparity between TBLT and these traditional synthetic approaches lies in TBLT's fundamental principle that 'language learning progresses more effectively when teaching aims to establish environments that nurture learners' innate language learning abilities' (p. 222). Notably, research over recent decades highlights the significant traction of TBLT in the Asia-Pacific region, including areas like Hong Kong, mainland China, Japan, South Korea, Indonesia, and Thailand, where English is taught as a second (ESL) or foreign language (EFL) (Butler, 2011; Carless, 2009; 2012; Yanto et al., 2022).

Similar to TBLT, computer-assisted language learning (CALL) has experienced remarkable growth as a discipline, with an expanding body of research predominantly centered on second/foreign language (S/FL) education, documenting the utilization of various technological resources (such as word processors, presentation software, computer-mediated communication platforms, Web 2.0 tools, blogs, wikis, social networking platforms, interactive whiteboards, and more recently, digital games and augmented/virtual reality) by language instructors (Baralt & Gómez, 2017; Duman et al., 2015; Ziegler, 2016; Widiastuti. et al., 2022).

Despite the multitude of technologies integrated into language learning environments and their recognized developmental and sociocultural advantages, there is a call for exploring the integration of technology and task-based learning in EFL learning and crafting more pedagogically impactful computer-based learning activities (Ziegler, 2016, p. 137). Against this backdrop, this study aims to capture EFL students' and teachers' challenges and strategies for enacting technology-mediated task-based language teaching (TMTBLT) in EFL teaching

situated in the Indonesian landscape (González-Lloret & Ortega, 2014). Ziegler's (2016). Drawing on the background of this study, we propose three research questions to be investigated:

1. What are the challenges faced by EFL students in Indonesia when teaching and enacting technology-mediated task-based language teaching?
2. How do EFL students and teachers offer strategies to cope with the challenges?
3. What is the future trend of technology-mediated task-based language teaching in the Indonesian context?

Technology mediated task-based language teaching: From theory to practice

The integration of technology into pedagogical tasks is attractive to numerous researchers and practitioners of TBLT as a potential remedy for the challenges above (Thomas, 2013; Thomas & Reinders et al., 2010). Firstly, studies have shown that through the use of synchronous and asynchronous computer-mediated communication (CMC), learners generate a greater amount of the target language (TL) due to reduced anxiety and heightened motivation. For instance, Levy and Stockwell (2006) have demonstrated how technology-mediated tasks expand language learning opportunities outside the classroom, fostering genuine interaction.

Additionally, besides facilitating TL usage, technology usage has been linked to increased engagement and second language (L2) interaction. Yamada (2009) notes that both the quantity of learner-produced utterances and the use of target expressions rose during online chats, while Tavakoli et al. (2019) illustrate how incorporating real-world texts into classroom tasks enhanced motivation in L2 reading. Moreover, Oskoz and Elola (2014) exhibited the impact of utilizing Web 2.0 tools on L2 writing. Reinders, Lakarnchua, and Pegrum (2015) also found heightened levels of engagement when learners were tasked with creating an augmented reality campus tour, which led to enhanced interest and involvement due to the tangible outcome of the project.

In addition, by liberating learners from the spatial confines of the classroom, technology-mediated TBLT practices (such as asynchronous CMC like forums, email, and blogs) afford learners more time to process their language output before sharing it, thereby encouraging the production of more grammatically accurate and intricate language (Reinders et al., 2015). The extended processing time allows learners to review and correct their language output autonomously, enhancing their awareness of various linguistic features in online communicative contexts, as observed in digital games (Reinders & Wattana, 2015). Previous studies have shown the complexity of integrating technology and TBLT.

In recent years, a plethora of studies in TMTBLT have been undertaken from a wide range of perspectives (Andrew-Todd, 2023; González-Lloret, 2022; Huang, 2022). Aubrey and Philpott (2023) report the use of face-to-face synchronous video-based computer-mediated communication modes in second-language engagement tasks. The study found that face-to-face (FTF) communication mode facilitated higher levels of engagement compared to synchronous video-based computer-mediated communication (SvCMC) mode in second language

tasks. FTF interactions resulted in significantly more turns, negotiated content, affiliative backchannels, and higher enjoyment levels. Learners perceived FTF mode as more advantageous due to factors like a supportive classroom atmosphere and ease of verbal interaction.

In contrast, SvCMC mode was hindered by the lack of non-verbal cues, difficulties with stimuli integration, and logistical concerns. Overall, the research suggests that communication mode plays a significant role in shaping learner engagement experiences during language tasks. Another relevant study by Fang (2021) investigates the effects of mobile-supported task-based language teaching (TBLT) on EFL students' linguistic achievement and conversational interaction. This study concluded that mobile-supported TBLT can lead to significant improvements in vocabulary learning and conversation comprehension in EFL classrooms.

While traditional TBLT may result in higher task completion rates, the mobile-supported approach showed better learning outcomes. The scaffolds provided by the mobile application facilitated student engagement and strategic language use during tasks, highlighting the potential of mobile technology in overcoming challenges in large EFL classrooms. In a similar vein, Aorny et al. (2022) investigated TMTBLT in the Bangladesh context from a student and teacher perspective. Drawing on the findings, this study highlights the complex interplay between technology, tasks, student engagement, and teacher proficiency in the context of language education, providing valuable insights for improving language teaching practices in private university settings in Bangladesh. The study suggested the importance of strong internet connections, skilled and trained language teachers, more practice opportunities, careful authority, a friendly environment, and adequate technological support in language classrooms to enhance the effectiveness of TBLT in private universities in Bangladesh.

Despite the previous studies providing insights into the enactment of technology and tasks, EFL students' and teachers' challenges and strategies in TMTBLT still need to be explored. Given the relative paucity of research on exploring challenges and strategies in TMTBLT, this study is aimed to capture EFL students' and teachers' challenges with limited access to technology, digital literacy, technical issues and language barrier perspective.

Method

Anchored in qualitative research with the survey design, this study captures the challenges and strategies of EFL students and teachers for enacting TMTBLT in EFL teaching situated in the Indonesian context. Thirty-two participants were recruited voluntarily. The participants are undergraduate students, graduate students, doctoral students, English teachers and faculty members from a wide range of institutions in Indonesia. The participant's demography can be seen in the figures.

The data were derived from the questionnaires and followed by semi-structured interviews. In this study, we delivered ten questionnaires to all the participants. The participants filled out the questionnaire through a Google form that we sent via WhatsApp privately. Following the ethical protocols, before the participants fill out the

questionnaire, we explain the research purposes and the benefits for their future academic careers. We are also convinced that their data would be kept confidential only for research purposes, and their anonymity would be protected.

Figure 1. Participantss gender

Figure 2. Participantss ages

Figure 3. Participants' positions

Table 1 Questionnaire for participants

No	Questions
1	How often do you use technology in your EFL learning activities?
2	What types of technology tools do you frequently use in EFL learning tasks?
3	In your opinion, what are the main challenges faced by EFL students and teachers in enacting technology into task-based language teaching in the Indonesian context?
4	What strategies do you think can help to overcome the challenges associated with integrating technology into task-based language teaching in Indonesia?
5	What should the Indonesian government do to cope the challenges of integrating technology in EFL learning?
6	What are the technology tools that you frequently use for listening and speaking? Please mention.
7	Do you have any challenges apply technology tools in EFL listening and speaking? If yes, please mention
8	What are the technology tools that you frequently use for reading and writing? Please mention
9	Do you have any challenges apply technology tools in EFL reading and writing? If yes, please mention
10	In your opinion, what is the future of technology-mediated task-based language teaching in EFL Indonesian context? Please describe.

The analysis of the data involved two approaches: Likert-type analysis and examination of open-ended responses. Likert-type items, presented as a checklist with options like "rarely," "occasionally," "often," and "very often," aimed to gauge the extent to which participants experience enacting technology and TBLT in EFL learning. Meanwhile, open-ended items were designed to capture the range of challenges and strategies in TMTBLT.

Results

Drawing on participants' answer, we focus on capturing participants regarding the frequency of using technology in EFL learning, types of technological tools, challenges and strategies and the future of technology in EFL learning.

EFL students and teachers' frequency using technology in learning

This section presents how the participants voiced the frequency of technology in EFL learning. The results of participants frequency using technology in EFL learning can be shown in table 2

Table 2. Frequency of using technology in EFL learning

Frequency	N	Percentage (%)
Rarely	4	12.1
Occasionally	6	18.2
Often	11	33.3
Very Often	13	36.4

Table 2 offers a comprehensive overview of the frequency of technology utilization in English as a Foreign Language (EFL) learning among the participants, providing valuable insights into the adoption and integration of technology within this educational context.

Firstly, it's notable that a significant portion of participants, comprising 36.4%, reported very frequent use of technology in their EFL learning endeavors. This suggests a high level of comfort and familiarity with technology among this subgroup, indicating a strong adoption of technological tools as integral components of their language learning experiences. Very frequent use implies that these participants rely heavily on technology to support various aspects of their language learning process, such as accessing online resources, interactive exercises, language apps, and communication platforms.

Furthermore, 33.3% of participants reported frequent use of technology in EFL learning. Although slightly lower than the "very frequent use" category, this still indicates a substantial reliance on technology within language learning contexts. Frequent technology use suggests that these participants actively incorporate technological tools into their learning routines, albeit not to the same extent as those who reported very frequent use. Nevertheless, this group likely engages with technology regularly to access supplemental materials, practice language skills, and communicate with peers and instructors.

In contrast, 18.2% of participants reported occasional use of technology, indicating a more sporadic integration of technological tools into their EFL learning activities. Occasional users may utilize technology selectively or in specific instances where it complements their learning objectives but may only partially rely on it as a primary resource.

Technology plays a significant role in EFL learning among the surveyed participants. The majority of individuals demonstrate a high level of engagement with technology, suggesting a widespread adoption of digital tools and resources in the EFL learning environment. This adoption of technology reflects the increasing recognition of its potential benefits in enhancing language learning outcomes, such as providing access to authentic language materials, facilitating interactive learning experiences, and promoting autonomous learning. Moreover, understanding the frequency of technology use in EFL learning can inform educators, curriculum developers, and policymakers about the evolving needs and preferences of language learners, thereby guiding the design and implementation of effective technology-enhanced language learning strategies and interventions.

Types of technology tools use in EFL learning tasks

Figure 1. technology tools use in EFL learning tasks

Figure 1 shows the types of technology tools used by participants in EFL learning tasks. Among the total participants (33), 78.1% prefer Google Classroom and Zoom as their favorite technology tools, 62.5 % use Google Meet, followed by Canvas 28.1 %, Kahoot 25 % and only 15. % use Padlets, while 46.9 % prefer other technology tools. Understanding the types of technology tools enables us to explore the various technology tools for EFL learning.

Overall, the data highlights the prevalence of various technology tools in EFL learning, with a notable emphasis on platforms facilitating communication, collaboration, content delivery, and interactive learning experiences. By understanding the types of technology tools preferred by participants, educators and stakeholders can make informed decisions regarding the selection, integration, and utilization of digital resources to support effective and engaging EFL instruction. Additionally, exploring emerging technologies and innovative tools can further enrich the EFL learning experience, catering to the evolving needs and preferences of learners in an increasingly digitalized educational landscape.

The main challenges of EFL students and teachers enacting technology into task-based language teaching

Navigating the intersection of technology integration and task-based language teaching poses significant challenges for both EFL students and teachers alike. Table 3 provide the data of a wide range of main challenges faced by the participants.

Table 3 highlights the primary challenges associated with integrating technology into task-based language teaching (TBLT) and draws attention to the multifaceted nature of these challenges. With 51.5% of participants citing technical issues as the main challenge, it's evident that infrastructure-related problems such as slow internet connectivity, power outages, and malfunctioning devices significantly hinder the effective

implementation of technology in TBLT. These issues disrupt the flow of instruction, impede access to digital resources, and undermine the reliability of online learning platforms.

Table 3. The main challenges of technology and task-based language teaching

Challenges	N	Percentage (%)
Limited access to technology	2	6.1
Technical issues (e.g. slow internet connectivity, power outages, mal functioning devices)	17	51.5
Digital literacy (e.g. navigating learning platforms, using software applications, or troubleshooting technical issues)	11	33.3
Language barrier (e.g. English proficiency)	3	9.1

Approximately 33.3% of participants reported facing digital literacy challenges, indicating that many learners and educators struggle with using technology effectively for educational purposes. This lack of digital proficiency can manifest in difficulties navigating online platforms, utilizing digital tools, and critically evaluating digital content, ultimately hampering the integration of technology into language teaching practices. While a smaller percentage (9.1%) of participants identified language barriers as a challenge, it's crucial to acknowledge that language proficiency issues can still pose significant obstacles, particularly in language learning contexts. For EFL students, navigating digital resources and engaging in online communication activities may be daunting, especially if they lack confidence or proficiency in the target language.

Interestingly, only 6.1% of participants reported limited access to technology as the main challenge. While this may seem relatively low compared to other challenges, it still underscores the importance of ensuring equitable access to technology for all learners. Disparities in access to devices, internet connectivity, and digital resources can exacerbate existing inequalities in education and limit opportunities for marginalized learners.

The data highlights the diverse array of challenges that educators face when integrating technology into TBLT. Addressing these challenges requires a comprehensive approach that encompasses technical support, digital literacy training, language support, and efforts to bridge the digital divide. By recognizing and addressing these challenges, educators can harness the potential of technology to enhance language learning outcomes and promote inclusivity in language teaching contexts.

In conclusion, the data underscores the importance of understanding and mitigating the multifaceted challenges associated with technology-mediated TBLT. By prioritizing efforts to address technical issues, promote digital literacy, overcome language barriers, and ensure equitable access to technology, educators can create more effective and inclusive learning environments that leverage the power of technology to support language acquisition and proficiency development.

The strategies offered by EFL students and teachers to cope the challenges technology and TBLT

Exploring the complex landscape of integrating technology into task-based language teaching (TBLT), EFL students and teachers alike have devised innovative strategies to effectively cope with the challenges posed by this dynamic educational approach.

Table 4. strategies given by participants to cope the challenges

Strategies	N	Percentage (%)
Teacher training, professional development and collaborative learning platforms	17	51.5
For both students and teachers		
Providing quality of internet connection and technology resources	11	33.3
Designing flexible tasks and media	3	9.2
Conducting need analysis on technology tools and tasks	2	6.1

The data presented in Table 4 provides valuable insights into the strategies proposed by participants to address the challenges encountered when integrating technology into task-based language teaching (TBLT) within an English as a Foreign Language (EFL) context.

Firstly, it is evident that a significant portion of participants, accounting for 51.5%, emphasized the importance of teacher training, professional development, and collaborative learning platforms as essential strategies. This highlights the recognition among participants of the crucial role that educator preparation and ongoing support play in effectively utilizing technology in language teaching. By investing in training and fostering collaboration among teachers, institutions can empower educators to leverage technology more effectively to enhance language learning outcomes.

Furthermore, 33.3% of participants highlighted the need for providing reliable internet connections and adequate technology resources. This underscores the fundamental infrastructure requirements necessary for successful technology integration in educational settings. Ensuring consistent access to high-speed internet and sufficient technological tools is essential for minimizing disruptions and maximizing the potential benefits of technology-enhanced language learning experiences.

Moreover, 9.2% of participants advocated for the design of flexible tasks and the use of multimedia resources. This suggests an acknowledgment of the importance of adapting instructional materials and activities to accommodate diverse learner needs and preferences. Incorporating multimedia elements into tasks can enhance engagement and cater to different learning styles, thereby promoting more effective language acquisition.

Interestingly, only 6.1% of participants suggested conducting needs analysis specifically focused on technology tools and tasks. While this strategy received less emphasis compared to others, it underscores the importance of

systematically assessing the technological requirements and preferences of both students and teachers. Conducting needs analysis can inform decision-making processes regarding the selection and implementation of appropriate technological solutions tailored to the unique needs and contexts of EFL learners.

In conclusion, the data from Table 4 highlights a range of strategies proposed by participants to address the challenges associated with integrating technology into TBLT in an EFL context. By prioritizing teacher training and professional development, ensuring access to necessary technological resources, designing flexible tasks, and conducting needs analysis, institutions can enhance their capacity to effectively leverage technology to support language learning and teaching initiatives.

Technology tools to teach listening and speaking

Table 5. technology tools to teach listening and speaking

Strategies	N	Percentage (%)
Zoom, google meet, google classroom and local LMS	17	51.5
YouTube, podcast, duolingo	11	33.3
Ted talks, spotify	3	9.2
Digital storytelling, Elsa talk, BBC	2	6.1

The data shows (51.5%) the majority of participants in the sample utilize popular online platforms such as Zoom, Google Meet, and Google Classroom for their listening and speaking activities. These platforms offer features such as video conferencing, chat functions, and document sharing, which can facilitate real-time communication, collaborative learning, and access to multimedia resources. Their widespread use may be attributed to their user-friendly interfaces, availability across devices, and integration with other educational tools and materials.

YouTube, Podcasts, Duolingo (33.3%): A significant proportion of participants rely on multimedia platforms like YouTube and podcasting platforms, as well as language learning apps like Duolingo, for listening and speaking practice. These tools offer a diverse range of audiovisual content, including instructional videos, podcasts, language learning podcasts, and interactive exercises, which can enhance listening comprehension, pronunciation, and oral communication skills. The popularity of these tools may stem from their accessibility, flexibility, and the abundance of free educational content available.

Ted Talks, Spotify (9.2%): A smaller percentage of participants utilize platforms such as Ted Talks and Spotify for listening and speaking activities. Ted Talks provide engaging and informative speeches on various topics, while Spotify offers access to a wide range of audio content, including podcasts, music, and language learning materials. Although less commonly used compared to other platforms, these tools can still serve as valuable resources for language learners seeking authentic listening materials and opportunities for language practice.

Digital storytelling, Elsa Talks, BBC (6.1%): A minority of participants incorporate specific tools like digital

storytelling platforms, Elsa Talks (a pronunciation app), and BBC resources into their listening and speaking activities. These tools offer interactive storytelling experiences, pronunciation practice, and access to authentic audiovisual content from reputable sources like the BBC. While less prevalent among the sample, these tools may cater to specific learning preferences or objectives, such as improving pronunciation accuracy or cultural understanding.

It's evident that participants utilize a variety of technology tools to support their listening and speaking activities in EFL learning. The prevalence of platforms like Zoom, Google Meet, and Google Classroom underscores the importance of real-time communication and collaborative learning experiences in language acquisition. Meanwhile, the diverse range of multimedia platforms, language learning apps, and specialized resources reflects the evolving landscape of digital tools available to language learners, offering flexibility and customization in language learning approaches. Understanding the types of technology tools used in listening and speaking activities can inform educators and learners alike in selecting appropriate resources and strategies to enhance language proficiency effectively.

Technology tools to teach reading and writing

Table 5. technology tools to teach reading and writing

Strategies	N	Percentage (%)
Padlets, canva, kahoot	3	9.3
Google docs, quizizz, web blogs,	17	51.5
Facebook, Instagram, whatsapp	11	33.2
Chat GPT, Quillbot, grammarly	2	6.1

Table 6 provides insights into the technology tools utilized by participants specifically for reading and writing activities in English as a Foreign Language (EFL) learning. Understanding the distribution of technology tools in this context can offer valuable insights into the preferences and practices of language learners when engaging in these language skills.

The majority of participants (51.5 %) in the sample rely on widely accessible platforms such as Google Docs, Quizizz, and weblogs for their reading and writing activities. Google Docs offers collaborative document editing and sharing capabilities, while Quizizz provides interactive quizzes and assessments. Weblogs, or blogs, offer a platform for individuals to publish written content online. These tools facilitate writing practice, reading comprehension, and feedback exchange among peers, contributing to the development of language skills in a digital environment.

A significant proportion of participants (33.2%) utilize social media platforms like Facebook, Instagram, and WhatsApp for reading and writing activities. While primarily designed for social interaction, these platforms also serve as channels for accessing written content, engaging with texts, and communicating with others in

written form. Language learners may leverage these platforms to read articles, posts, and messages in English, as well as to practice writing through status updates, comments, and direct messaging.

A smaller percentage of participants (9.3 %) incorporate specific tools like Padlet, Canva, and Kahoot into their reading and writing activities. Padlet allows users to create digital bulletin boards for sharing and organizing information, while Canva offers graphic design tools for creating visual content. Kahoot provides interactive quiz-based learning activities. These tools offer opportunities for creative expression, visual literacy development, and interactive learning experiences, complementing traditional reading and writing practices with multimedia elements.

A minority of participants (6.1 %) utilize AI-powered writing tools like ChatGPT, Quillbot, and Grammarly for their reading and writing activities. These tools offer features such as text generation, paraphrasing, and grammar checking, aiming to enhance writing fluency, accuracy, and efficiency. While less commonly used compared to other platforms, these tools can support language learners in generating written content, improving language proficiency, and self-editing their work.

It's evident that participants employ a variety of technology tools to support their reading and writing activities in EFL learning. The prevalence of platforms like Google Docs, Quizizz, and social media platforms underscores the importance of digital collaboration, interactive learning, and authentic text engagement in language acquisition. Meanwhile, the diversity of tools ranging from blogging platforms to AI writing assistants reflects the evolving landscape of digital resources available to language learners, offering flexibility and innovation in language learning approaches. Understanding the types of technology tools used in reading and writing activities can inform educators and learners in selecting appropriate resources and strategies to enhance language proficiency effectively in these areas.

The future of technology-mediated task-based language teaching in EFL learning

Drawing on the interview, the participants express their idea for the future of TMTBLT in EFL context. As one of the participants note:

In my view, the future of technology-mediated task-based English teaching in the context of English as a foreign language in Indonesia is very bright and full of potential. The reason underlying this view is because, the very rapid development of technology in Indonesia will make it easier to integrate technology in English language learning. Smartphones and the internet are increasingly affordable and can be a gateway to learning digital English. (p.5, interview)

The participant acknowledges the rapid advancement of technology in Indonesia. This suggests that the infrastructure and technological ecosystem in the country are evolving rapidly, providing a solid foundation for the integration of technology into various sectors, including education. In addition, the accessibility of

technology, particularly smartphones and the internet, is highlighted. The affordability of smartphones and the widespread availability of internet connectivity indicate that a larger segment of the population can potentially access digital English learning resources. This increased accessibility lowers barriers to entry for learners who may not have had access to traditional language learning resources before.

Therefore, the participant emphasizes the potential for integrating technology into English language learning. With the proliferation of smartphones and internet connectivity, digital platforms and resources can serve as effective tools for language instruction. This integration can enhance the learning experience by providing interactive and engaging learning materials, opportunities for real-world language use, and access to a wide range of authentic language content.

Another important point, the participant also argues that task-based language teaching within the context of technology suggests that technology-mediated TBLT approaches hold promise for English language education in Indonesia. Task-based approaches focus on meaningful language use and communication, aligning well with the interactive and communicative affordances of digital platforms.

In summary, the participant suggests that the future of technology-mediated task-based English teaching in Indonesia's EFL context is indeed promising. The rapid development of technology, coupled with increased accessibility, creates an environment conducive to leveraging technology for English language learning. By harnessing the potential of digital resources and integrating them into task-based language teaching approaches, educators can enhance the effectiveness and accessibility of English language education in Indonesia.

Another participant said:

I think using technology is inevitable for teaching and learning activities since it can provide teachers with more teaching resources and media. It will be great if there are strategies that teachers can use to make all students be engaged in performing learning activities while using technology as their learning media. It will also be great if more teaching resources suitable for all levels of proficiency are available for free. (p.10, interview)

The participant underscores the inevitability of technology in education. She suggests a recognition of the pervasive influence of technology in modern society and its integration into educational practices. The acknowledgment of technology's inevitability implies an acceptance of its role as a fundamental component of contemporary teaching and learning environments. In addition, the participant emphasizes the potential of technology to provide teachers with a wealth of teaching resources and media. This includes digital tools, multimedia content, and interactive platforms that can enrich instructional materials and facilitate diverse learning experiences. By leveraging technology, educators can access a wide range of resources to enhance their teaching methods and cater to different learning styles and preferences.

The participant expresses the desire for strategies that can effectively engage all students in learning activities while utilizing technology as a learning medium. This highlights the importance of ensuring that technology integration goes beyond mere access to devices and resources. Effective pedagogical strategies are needed to actively involve students in the learning process, leveraging the interactive and collaborative features of technology to promote engagement and participation.

Another important thing, the data is also highlighting the importance of having a diverse range of teaching resources suitable for learners at all proficiency levels. Furthermore, the desire for these resources to be available for free underscores the importance of accessibility and equity in education. Access to free teaching resources can democratize education, ensuring that learners from diverse backgrounds have equal opportunities for learning and advancement.

Overall, the participant emphasizes the need for effective strategies to engage students in learning activities while leveraging technology, as well as the importance of ensuring the availability of diverse and accessible teaching resources. By addressing these concerns, educators can harness the full potential of technology to enhance teaching and learning experiences and promote inclusive education for all learners.

While other participant notes:

The future of technology-mediated task-based language teaching in the EFL Indonesian context likely involves increasingly personalized and adaptive learning experiences, supported by AI-driven platforms and mobile technologies, to enhance accessibility and engagement across diverse learner populations. (p.25, interview)

The data shows a shift towards more personalized and adaptive learning experiences facilitated by technology. This indicates a departure from traditional one-size-fits-all approaches towards more tailored learning experiences that cater to individual learner needs, preferences, and proficiency levels. Technology, particularly AI-driven platforms, can analyze learner data and provide customized learning pathways, activities, and feedback, thereby optimizing learning outcomes. In contrast with, the mention of AI-driven platforms and mobile technologies signifies the increasing role of artificial intelligence and mobile devices in language education. AI-powered systems can offer intelligent tutoring, language assessment, and automated feedback, enhancing the efficiency and effectiveness of language learning. Mobile technologies, such as smartphones and tablets, provide learners with flexible access to learning materials, fostering flexibility and convenience in language learning endeavors. However, AI-powered system should not prevent students critical thinking skills. In this context, the teachers are urged to remind their students in balancing the use of AI and technology in EFL learning.

The data is also indicating the integration of technology into TBLT aims to enhance accessibility and engagement across diverse learner populations. Technology can bridge geographical barriers, making language

learning more accessible to learners in remote or underserved areas. Furthermore, interactive and multimedia-rich digital resources can stimulate learner engagement, motivation, and participation, thereby fostering a more dynamic and immersive learning environment. The participant underscores the importance of considering diverse learner populations within the EFL context in Indonesia. Technology-mediated TBLT approaches should be inclusive and adaptable to accommodate learners with varying linguistic backgrounds, learning styles, and educational needs. By leveraging technology to provide personalized and adaptive learning experiences, educators can better address the diverse needs of learners and promote equitable access to quality language education.

In summary, the data suggests a future for technology-mediated TBLT in the EFL Indonesian context characterized by personalized, adaptive, and technologically-enhanced learning experiences. By harnessing the potential of AI-driven platforms and mobile technologies, educators can foster accessibility, engagement, and inclusivity in language education, ultimately empowering learners to achieve their language learning goals more effectively.

Discussion

This study investigates three important issues, including the challenges of EFL students and teachers enacting TMTBLT in EFL learning, the strategies to cope with the challenges and the future trends of TMTBLT in Indonesia. Table 3 indicates the challenges such as technical issues (e.g., slow internet connectivity, power outages, malfunctioning devices), digital literacy (e.g., navigating learning platforms, using software applications, or troubleshooting technical issues), language barrier (e.g., English proficiency) and limited access to technology. The data shows a wide range of challenges that both students and teachers face when incorporating technology into TBLT. To minimize these hurdles effectively, a holistic approach is necessary, involving technical assistance, training in digital literacy, language support, and initiatives to bridge the digital gap. By acknowledging and tackling these challenges, educators can maximize technology's potential to improve language learning results and foster inclusivity in teaching settings.

In summary, the data emphasizes the significance of recognizing and mitigating the diverse challenges linked with technology-driven TBLT. Through prioritizing efforts to tackle technical issues, enhance digital skills, overcome language barriers, and ensure fair access to technology, educators can establish more efficient and inclusive learning environments that capitalize on technology's capabilities to facilitate language acquisition and proficiency growth. The findings correspond with the previous study that enacting TBLT has numerous challenges in many Asian countries, especially in Indonesia (Adams & Newton, 2009; Aorny et al., 2022; Butarbutar, 2021; Littlewood, 2007; Putri, 2023).

Secondly, to cope with the challenges, participants offer strategies, including teacher training. Professional development and collaborative learning for both students and teachers, providing quality internet connection and

technology resources, designing flexible tasks and conducting need analysis. Participants advocate for prioritizing teacher training and professional development initiatives. By equipping educators with the necessary skills and knowledge to effectively utilize technology in TBLT, institutions can enhance teacher confidence, competence, and proficiency in integrating digital tools and resources into their teaching practices.

Another key strategy proposed is ensuring access to essential technological resources. This involves providing educators and learners with adequate hardware, software, internet connectivity, and digital learning materials required to facilitate technology-mediated language teaching and learning activities effectively. Another point is that participants emphasize the importance of designing flexible tasks that accommodate diverse learner needs, preferences, and proficiency levels. By creating adaptable and customizable tasks, educators can cater to individual learning styles, abilities, and interests, thereby fostering engagement, motivation, and active participation in language learning activities. Furthermore, conducting needs analysis emerges as a crucial strategy for institutions seeking to enhance their capacity to leverage technology in TBLT. By systematically assessing the specific needs, preferences, and challenges of learners and educators, institutions can tailor technology integration initiatives to address identified gaps and ensure alignment with institutional goals and learner outcomes.

Overall, the strategies proposed by participants underscore the importance of proactive and comprehensive approaches to technology integration in TBLT within EFL contexts. By prioritizing teacher training, ensuring access to technological resources, designing flexible tasks, and conducting needs analysis, institutions can strengthen their capacity to harness technology effectively to support language learning and teaching initiatives, ultimately enhancing the quality and effectiveness of language education programs.

Lastly, the participants also mention the future issue of TMTBLT in Indonesia. The data indicates a shift towards personalized and adaptive learning experiences, implying that educational technologies will be tailored to meet the individual needs, preferences, and learning styles of each student. This approach recognizes that learners have diverse backgrounds, abilities, and interests and aims to provide tailored instruction and support to optimize learning outcomes. The participants also emphasized that AI-driven platforms and mobile technologies will play a significant role in supporting personalized and adaptive learning experiences. These technologies can analyze learner data, track progress, and deliver targeted feedback and recommendations. Additionally, mobile technologies provide learners with on-the-go access to learning materials, enabling anytime, anywhere learning opportunities.

In this context, by leveraging personalized and adaptive learning experiences supported by AI-driven platforms and mobile technologies, the future of technology-mediated TBLT in the EFL Indonesian context aims to enhance accessibility and engagement across diverse learner populations. These advancements can help address barriers to learning, such as limited access to resources and varying levels of language proficiency, while also fostering greater student engagement and motivation.

Overall, the data suggests that the future of technology-mediated TBLT in the EFL Indonesian context will be characterized by a shift towards more personalized, adaptive, and technologically-driven learning experiences. By embracing these advancements, educators can enhance accessibility, engagement, and effectiveness in language teaching and learning, ultimately empowering learners to achieve their language learning goals more effectively.

Conclusion

In conclusion, this research sheds light on the challenges faced by EFL teachers and students in Indonesia when enacting technology-mediated task-based language teaching (TMTBLT). Through the analysis of participant responses, it becomes evident that technical issues, digital literacy challenges, language barriers, and limited access to technology are among the primary obstacles encountered in integrating technology into TBLT practices. These challenges underscore the multifaceted nature of technology integration in language teaching contexts and highlight the need for comprehensive strategies to address them effectively.

Furthermore, the research identifies various strategies proposed by participants to cope with these challenges, including prioritizing teacher training and professional development, ensuring access to necessary technological resources, designing flexible tasks, and conducting needs analysis. These strategies provide valuable insights into the proactive measures that institutions and educators can undertake to enhance their capacity to leverage technology effectively in language teaching and learning. Even though this research has provided insightful findings to address the challenges and strategies enacting TMTBLT in the EFL context, it has a limitation in the limited participants and data collection. Therefore, further research should be undertaken to explore the challenges and strategies of TMTBLT in a broader context and with participants in order to get comprehensive data.

Recommendations

Drawing on the findings of this research, several recommendations can be made to support EFL teachers and students in enacting technology-mediated task-based language teaching in the Indonesian context. Policymakers and institutions are recommended to prioritize ongoing training and professional development initiatives to enhance teachers' digital literacy skills and proficiency in integrating technology into TBLT practices. In addition, efforts should be made to provide adequate access to essential technological resources, including hardware, software, and internet connectivity, to facilitate effective technology integration in language classrooms. Pedagogically, EFL teachers must design tasks that are flexible and adaptable to accommodate diverse learner needs, preferences, and proficiency levels, thereby fostering engagement and participation in language learning activities. Another crucial point is conducting regular needs analysis to identify the specific challenges, preferences, and learning goals of both teachers and students, informing the development of tailored technology integration initiatives. Practically, students and teachers can collaborate through online or offline

platforms in order to get effective teaching-learning using TMTBLT.

Acknowledgements

The authors thank to Centre Funding for Higher Education (BPPT) and Indonesia Endowment Fund for Education (LPDP) from the Ministry of Finance Republic Indonesia for granting the scholarship and supporting this research. We also thanks to all the participants involved this study.

Abstract: Augmented Reality has a positive impact in the world of education. Systematic review studies and article reviews have provided evidence of this positive impact. Augmented reality is an effective medium for learning, especially during a pandemic. The keyword used to find the articles on the Scopus database was “augmented AND reality AND in AND science AND education,” which discovered 1153 publications, then screening found 68 articles that met the criteria for analysis were obtained by following the Preferred Reporting Items for Systematic Review procedure. The bibliometric finding in this study is the increasing trend of augmented reality research. Research trends consist of distribution year, research type, keywords, author nationality, and international collaboration. The findings reveal that there has been an increase in research from 2018-2023 on the theme of augmented reality. The research employed several methods, i.e., qualitative, quantitative, mixed-methods, and survey. The author publishes the theme of augmented reality from 28 countries, especially the Malaysia, China, romanisa, Spain, Turkey. Furthermore, it was found that the number of collaborating publications (universities or countries) was higher than those not collaborating. The AR trend in education has benefits for students and teachers. The conclusions from the analysis of the article show that the theme of augmented reality is becoming a trend in education.

Keywords: Student, literature review, education, augmented reality

Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 77-93), Antalya, Turkiye. ISTES.

Introduction

Technology is increasingly into every aspect of life, education is also undergoing a significant transformation. One of the technological innovations that has changed the way we learn and teach is Augmented Reality (AR). AR combines the real world with interactive digital elements, creating immersive and engaging learning experiences. In an educational context, AR has opened the door to more immersive, visual and practical learning, helping students to understand complex concepts in ways that were previously difficult to access (K. Lee, 2012).

In recent years, there has been a significant increase in the use of Augmented Reality (AR) technology in education (Garzón, 2021; Jayamaha, 2024; Johnson & Westbrook, 2021). AR has changed the way we view learning and is having a powerful impact on the way students learn and teachers teach. With the increasing sophistication of technological devices and the development of digital content, AR has become an increasingly popular and enthusiastic tool in various educational settings (H. Lee & Cho, 2020).

This increase is not surprising considering the huge potential that AR has to offer. With the ability to blend the physical world with interactive digital elements, AR creates evocative and memorable learning experiences. Currently, students can explore abstract concepts in an attractive visual form, as well as face real-world situations that are enriched with additional information from the digital world.

In this article, we will investigate how the increased use of AR has affected education. We will explore the reasons behind its increased popularity, as well as the impact it has seen in terms of quality of learning, student engagement and teaching effectiveness. Some examples of successful AR use cases will provide insight into the different ways in which this technology has been integrated in a variety of educational contexts, from elementary to tertiary levels. By looking at this trend, it is clear that AR has taken a significant role in changing the learning paradigm. This is an exciting time in which technology has not only been used as an auxiliary tool, but has become an integral part of the educational experience. With the continuous development of technology and emerging innovations, AR has great potential to bring education into a new era full of possibilities and opportunities.

Method

The acquired information was synchronized into Mendeley's Reference Manager as *CSV and *RIS files. The data were visualized using the software VOSviewer to make them more clear and communicative. The researchers uncovered 1153 articles using the keywords. Inclusion and exclusion models were utilized as preferred reporting items for systematic reviews and meta-analysis (PRISMA) (Gallagher et al., 2016). The researchers' order of inclusion and exclusion is shown in Figure 1.

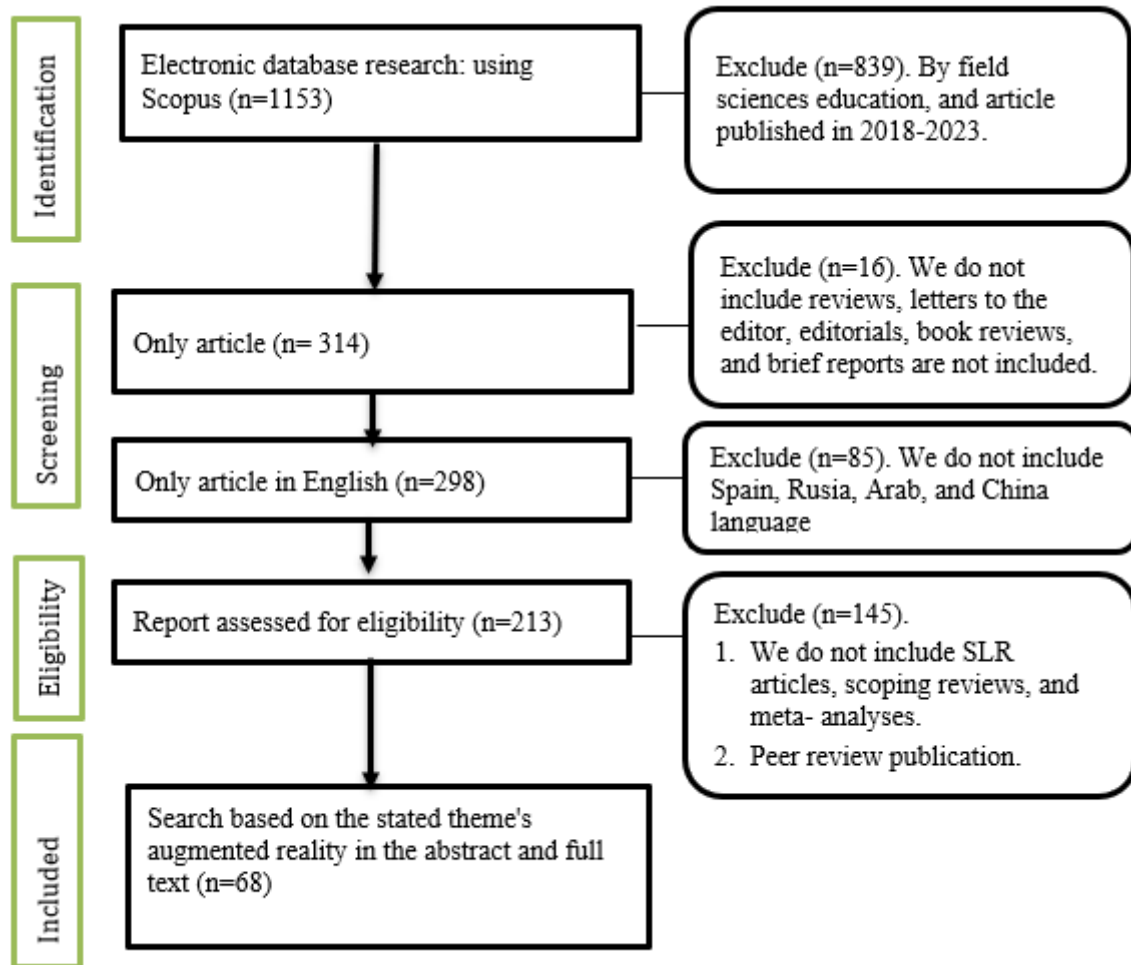

Figure 1. Method for SLR

Results

Distribution Year

Based on Figure 2, it can be seen that the highest number of publications was in 2022, $n=23$ articles at which time the COVID-19 pandemic was ending. In 2023 only 7 articles were found, but we did not include them considering that 2023 will continue to experience developments in article publication. Figure 2 shows the number of articles published annually from 2018 to 2023.

Research Type/Method

The trend of types of research related to augmented reality in education themes is presented in Figure 3. Augmented reality in education research is more dominantly carried out using a quantitative approach (32 articles). Qualitative research is also relatively large in number, reaching 20 articles. This shows that the issue of AR in education (science education) can be approached through both quantitative and qualitative means.

Figure 2. Distribution of Year

Figure 3. Research Type

Keyword

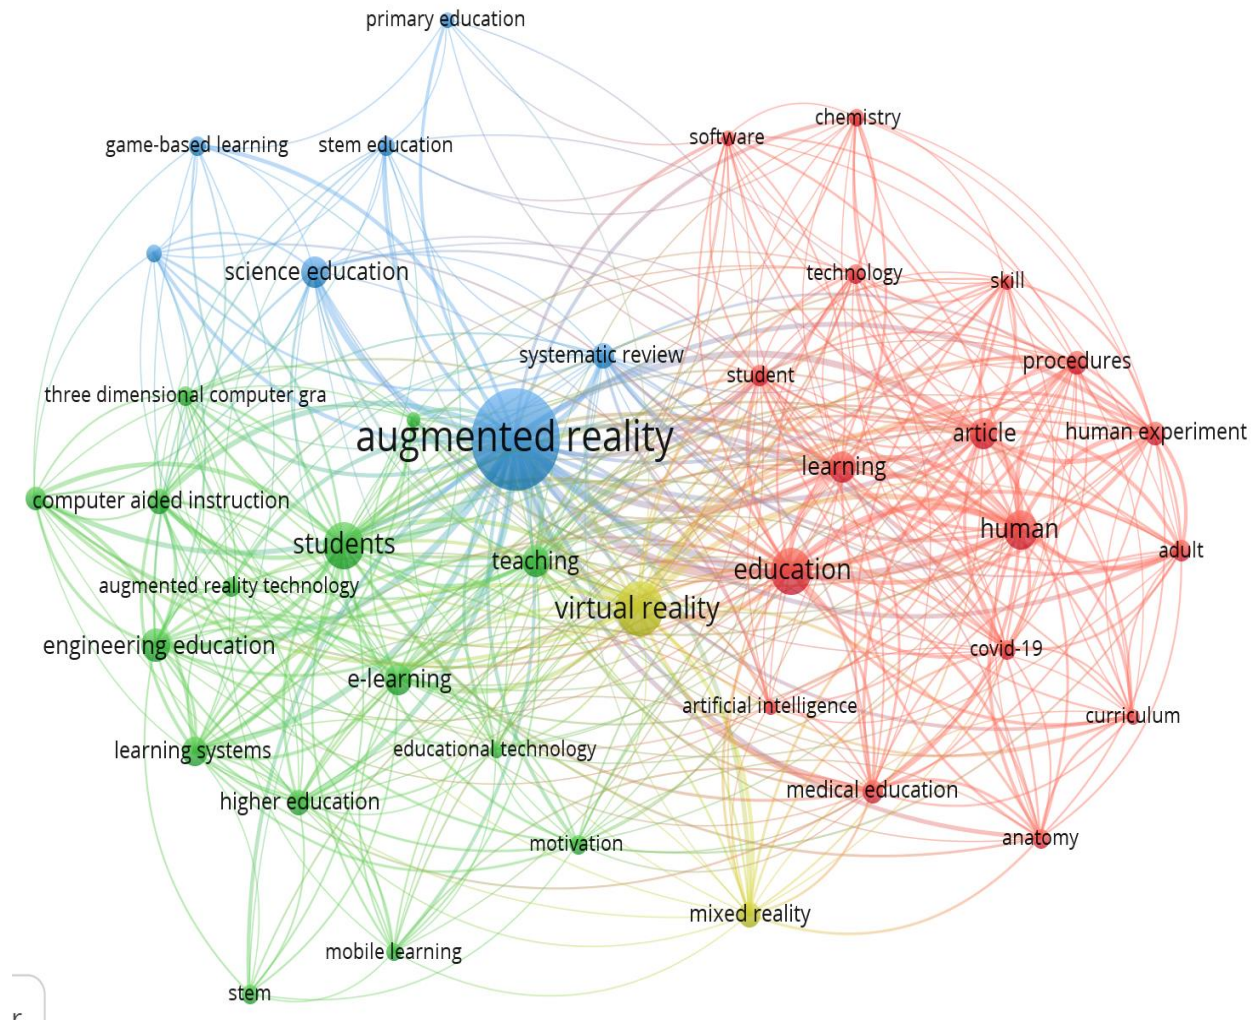

Figure 4. Keyword of vosViewer

Based on Figure 4, the different colours (yellow, purple, red, green, blue) indicate the relationship clusters between different topics. It can be seen that there is a main keyword that appears, namely augmented reality. The strength of the topic area or keyword pairs was indicated by the thickness of the connecting line.

Author Nationallity

The trend of author's nationality of research related to "AR in science education" themes are presented in Table 1. Based on Table 2, it can be seen that there are 28 nations of origin for the author. The nine countries with the most AR in science education themes are Malaysia (6 articles), China (5 articles), Romania (5 articles), Spain (5 articles), Turkey (5 articles), next are Germany, Taiwan, Australia, Austria, and UK. Based on continents, Europe contributes the most authors who publish about AR in education.

Table 1. Author's nationality and continental

No	Nations	Continent	Amount
1	Malaysia	Asia	6
2	China	Asia	5
3	Romania	Europe	5
4	Spain	Europe	5
5	Turkey	Europe	5
6	Germany	Europe	4
7	Taiwan	Asia	4
8	Australia	Australia	3
9	Austria	Europe	3
10	UK	Europe	3
11	USA	America	3
12	Egypt	Africa	2
13	Finland	Europe	2
14	Greece	Europe	2
15	India	Asia	2
16	Indonesia	Asia	2
17	Brazil	America	1
18	Canada	America	1
19	Chile	America	1
20	Cyprus	Europe	1
21	Iran	Asia	1
22	Kazakhstan	Asia	1
23	Korea	Asia	1
24	Kuwait	Asia	1
25	New Zealand	Oceania	1
26	Russia	Europe	1
27	Saudi Arabia	Asia	1
28	Serbia	Europe	1

International Collaboration

Based on Figure 5 it can be stated that there are more articles published with collaboration status in one country (69%), then international collaboration (21%). It can be said that most of the articles were written and published in a collaboration system both country and internationally.

Figure 5. International Collaboration

Contribution AR in Education

Table 2. Contribution AR in Education

Contribution	Description	Contribution of Articles
For teacher	Design AR educational concepts that support learning, help to solve the problem, innovation teaching using AR make a meaningfull learning, AR is greater media for teaching, experimentation with AR promoted a slight increase in student motivation	(Schaffernak et al., 2020), (Bedewy et al., 2022), (Kee & Zhang, 2022), (Buchner & Hofmann, 2022), (Sural, 2018), (Marín-Díaz, 2023), (Asino et al., 2022), (Nechita & Rezeanu, 2019), (Castaño-Calle et al., 2022), (Gómez-García et al., 2021).
For studets	AR can help their connecting people more easy and interest, increase self-efficacy, interesting and easy to use, increase self assessment, ease of use, usefulness, and attitude toward using, understand lessons better	(Fleischer et al., 2023), (Elford et al., 2022), (Lampropoulos et al., 2022), (Çetin & Türkan, 2022), (Yang & Wang, 2023), (Hashim et al., 2022), (Minty et al., 2022), (Sinfield, 2018), (Su Cai, 2019), (Karagozlu, 2021), (Tuli et al., 2022), (Schoeb et al., 2020), (Sofianidis, 2022), (Abd Majid, 2019), (Lo et al., 2021),

through the AR

Discussion

There was an increase in publications from 2018 to 2023, an increase in publications starting from 2018 to 2022. There was an increase in articles in 2022, considering that in that year learning during the pandemic was carried out online (Cortés-Álvarez et al., 2022). The world of education has made enormous changes in learning, from in-class learning to online learning. Teachers and students adapted quickly to do online learning. However, there are many difficulties faced by students and teachers at the beginning of online learning (Kamal & Illiyan, 2021), starting from students feeling bored so they have no motivation to learn (Chowkase et al., 2022; Kaya & Akgül, 2022), until the teacher is not ready in technical terms. In 2021, publications related to the AR in education theme will increase in their use in online learning (Mystakidis et al., 2022; Ropawandi et al., 2022; Weng et al., 2019), so that in 2022 there will be an increase in publications on the AR in education theme experienced an increase with reports that AR learning can increase knowledge (Oberdörfer et al., 2021b; Poğan et al., 2023b), motivation (Carbonell-Carrera & Saorin, 2018; Jalaluddin et al., 2020b), attitude toward science (Karagozlu, 2018).

Based on the keyword we analyzed using VOSviewer described AR as the biggest node. That means AR field research is becoming popular. The unique thing we found suggests AR research is often related to the field of education. One article revealed that AR is a transformative technology that significantly alters the location and timing of education (Lee, 2012). In addition to AR education, there is also a line that connects to mobile phones and mobile applications. Results show that in the world of AR education, a lot is made in the form of mobile applications. Modern mobile devices today already have sensors and extensive computing capabilities to leverage augmented reality technology (Mota et al., 2018). Nowadays, smartphones are an integral part of everybody's life (Rashid et al., 2020). Therefore, smartphones are extensively employed for the implementation of augmented reality in education.

Article authors come from 28 different nations, with the majority being from America and Europe, followed by Asia. Interest in AR in America is high, according to arriscomposite.com the use of AR in America is used in many fields and even more people (71%) believe AR will also become part of everyday life over the next few years. It is estimated that in 2025 America will use AR in everyday life (Jovan, 2022). Based on the European commission (2020) announced the AR/VR industry coalition aims to inform policy makers, encourage investment, identify the main challenges and opportunities of the VR/AR sector in Europe. AR in Europe is a project program by Erasmus+ which aims to market virtual classrooms for innovation and add value to education. The use of AR/VR can help students in learning in an interesting experience. Adding AR/VR to learning can improve and broaden the way students learn and develop.

AR in Europe is becoming a trend in learning (Luna et al., 2019), so this has caused publications in the field of AR in education to be number one compared to publications from other countries. The most publication after USA, America followed by Asia in Malaysia. Malaysia is a developing country trying to compete in the eyes of the world. Various achievements were recorded from aspects of sports, education, economics, politics, social and so on (Syafiq Yusof et al., 2022). The government in Malaysia is making new investments in the information and communication industry to use ICT (Kamarulzaman Ab Aziz, 2012). Support from the government is a factor in the development of ICT in Malaysia, so it is only natural that the theme AR in science education in Malaysia is the third most published after the USA and Europe.

Publications written by authors around the world indicate that the theme of AR in science education is an important thing to study. AR is a technology that has been widely used in education because it has good benefits (Mystakidis et al., 2022; Sofianidis, 2022b). Three-dimensional virtual objects from the virtual world are incorporated into the actual world using augmented reality (AR). The use of augmented reality (AR) in educational systems is a creative and effective teaching tool that enhances the effectiveness of the teaching and learning process. Most publications related to AR in science in education are written in collaboration (collaboration in country and international collaboration). Collaborative writing demonstrates the strengthening of global scientific networks (Fernandes et al., 2020b).

Good publication writing is written in collaboration (Frassl et al., 2018). Collaborative publication writing has

benefits, including increasing visibility, sharing project costs, easy access to expensive physical resources, gaining wider influence by sharing data, and increasing creativity by exchanging ideas (K. R. W. Matthews et al., 2020). From the results of the literature review there were only six single authors, while 43 other articles were written in collaboration. Some collaborations were found between researchers from Sweden, US, Morocco besides that there were collaborations with authors from Colombia, Spain, USA. In order to solve the complex research subjects and challenges that call for the integration of information from multiple disciplines, scientific collaboration in research and publication is crucial (Eberle et al., 2021). Collaborative imperatives have strengthened in many research fields over the last few decades, reflecting the higher impact of collaborative research, the need to share research resources, and new technological opportunities (Doreian & Kronegger, 2017).

We divide AR's contribution to education into two, namely contributions to teachers and students. Contributions for teachers reveal that AR in learning is one of the contemporary media in providing good understanding for students. AR's contribution to students has proven many improvements from various sides. AR in education provides many benefits that must be utilized as a medium for learning.

Conclusion

The trend of publications with the theme of augmented reality has shown an increase. The results of the analysis show that augmented reality in education has a positive impact on learning. In addition, the writing of reports related to augmented reality is generally proven to be written in collaboration. Collaboration is very important to share knowledge and opinions related to this theme.

The trend of publications with the theme of AR has increased. We can provide recommendations to be able to analyze how the learning situation uses augmented reality, in order to inspire learning using augmented reality from various levels of educations.

Acknowledgements

The author thanks to the Centre for Education Funding Services (PUSLAPDIK), Centre Funding for Higher Education (BPPT), Ministry of Education Culture, Research and Technology (KEMENDIKBUDRISTEK), Indonesia Endowment Fund for Education (LPDP) from the ministry of finance Republic Indonesia for granting the scholarship and supporting this research.

Perceptions of Campus Climate and Academic Engagement Among International Students in the USA

Ohaud Al Muoaeweed

Prince Mohammad University, Saudi Arabia

Abstract: This study examined learning engagement among a sample ($n = 2,478$) of international students who studied at institutions of higher education in the US. Using survey data collected by the National Center for Education Statistics (2020), I ran six regression analyses to study relationships among responding international students' reported ages, genders, races, degree aspirations, fields of study, residences, and their learning engagement. I found that international students who reported strong degree aspirations were more likely to display higher levels of learning engagement; furthermore, residence on campus was found to relate to learning engagement. I conclude that U.S. institutions of higher education had facilitated integration of international students with varied demographic characteristics. My findings addressed an evident research gap and showed that the critical race theory might be not applicable to an analysis of international students' learning engagement at U.S. institutions of higher education. My recommendations are for development of effective strategies to increase international students' learning engagement.

Introduction

The presence of international students on campuses of many institutions of higher education (IHEs) in the United States has encouraged researchers to investigate the integration of these students into the institutions' academic and social lives. Researchers agree that international students add diversity to IHEs and their communities, thus enriching their experiences (Spencer-Oatey & Dauber, 2019). There is also a consensus in the academic literature that in a multicultural society, the treatment of people in institutional settings is the product of deeply rooted social perceptions that determine how people view themselves and those around them across the globe (Bleich, MacWilliams, & Schmidt, 2015). For international students, the institutional dimensions of race play a critical role in the social-psychological dimensions of how these individuals view themselves and how they act. The majority of U.S. institutions of higher education admit international students, including both foreign students and resident aliens, from 42 countries, including India, Japan, China, Saudi Arabia, and many others (Perry, 2016). In this situation, it is becoming increasingly topical to explore the experiences of these learners and their integration into IHEs.

To build relationships and a sense of belonging, colleges are tasked with the creation of a positive academic and

social engagement for their students. However, the concept of “belonging” might be controversial in case of international students due to the fact that they arrive from a foreign country and, thus, are naturally inclined towards experiencing problems with developing their sense of belonging in the USA. It is the responsibility of an institution to create an inclusive climate to help international students adjust socially (Cabrera, 2017). A social adjustment for international students involves the building of friendships with US students and fostering academic success through inclusive classroom contexts (Gummadam, Pittman, & Ioffe, 2016). While these practices have long been in place, they have failed to capture what is exactly meant when discussing “belonging” for international students. There is a popular opinion that international students might not feel as a part of an institution even if they find friends among classmates and participate in inclusive educational experiences (Perry, 2016). In this situation, the establishment and maintenance of an inclusive climate on the campus might be considered as a strong driver of facilitating the integration of international students into the educational environment.

The promotion of social connections strongly affects educational engagement. Prior research found that feeling socially connected to peers at college is positively correlated with students’ feelings of belonging at institutions of higher education (Batterton & Horner, 2016, p. 472). Likewise, students’ perceptions of a campus climate that is supportive of diversity have been linked to higher performance (Gummadam et al., 2016; Ma & Guo, 2023; Walter et al., 2021). Previous studies on a relationship between campus climates and belonging typically focus on one ethnic group rather than comparing associations for different types of students within the same college environment. Cabrera (2017) reported that there was no consensus in the literature regarding the potential of demographic factors, such as ethnicity and family income, to moderate the association between predictor variables and the sense of belonging (p. 89). At the same time, there is still a premise to believe that some of these factors, primarily race, can strongly affect the integration of students into the campuses’ environment and, as a result, affect their academic engagement in a learning institution (Gummadam et al., 2016, p. 292). The maintenance of a diverse campus climate enhances academic engagement of international students as noted by researchers (Batterton & Horner, 2016) who study student engagement.

Purpose

The purpose of this study was to explore international students’ reported learning engagement in U.S. IHEs. I had the following research objectives:

- To evaluate international students’ feeling of belonging in US IHEs;
- To analyze the influence of international students’ ages on their learning engagement in US IHEs;
- To explore the impact of international students’ genders on their learning engagement in US IHEs;
- To investigate the effect of international students’ races on their learning engagement in US IHEs;
- To analyze the impact of international students’ degree aspirations on their learning engagement in US IHEs;
- To explore the impact of international students’ fields of study on their learning engagement in US

IHEs.

- To determine whether international students' residences affect their learning engagement in US IHEs.

Research Question

This study was guided by the following research question: does learning engagement of international students in U.S. IHEs depend on their reports of demographic characteristics, degree aspirations, fields of study, and residence on campus?

Theoretical Framework

In this study, I was based on two valid theoretical frameworks: first, Tinto's (1993) concept of student engagement in higher education and, second, critical race theory (Batterton & Horner, 2016). The model designed by Tinto (1993) highlights students' needs to make connections both inside and outside classrooms to increase their retention. This theory explains that pre-entry factors, such as family background, skills, and prior schooling, may strongly affect students' intentions, objectives, commitments, and goals (Ashwin & McVitty, 2015). Students' experiences at IHEs encompass a variety of formal and informal academic and social experiences. In turn, they determine students' level of integration into the institution and affect their interaction with other students.

This model includes two forms of integration. First, the theory offered by Tinto (1993) underlines social integration, which explains students' daily interactions with other students inside and outside classrooms. Social integration can be informal and occur through conversations with peers. Alternatively, students may also engage in formal interactions, such as those that occur in student organizations. The model also includes academic integration that refers to students' interaction with academic staff during office hours or in the classroom (Batterton & Horner, 2016, p. 480). According to Tinto (1993), students must have some degree of social integration, academic integration, and persistence (p. 46). These three aspects help them integrate into the institution, which then strengthens their goals and objectives, and a commitment to the institution. Tinto (1993) claimed that the model is interactive and longitudinal because it interacts with other concepts and models over a given range of time. Students, according to this model, ought to have a community within the campus and help all its members integrate into an institution and to facilitate their sense of belonging (Howard & Navarro, 2016). The maintenance of an inclusive climate within such community is supposed to ensure an increase in retention rates across students from all the demographic groups.

Tinto's model might help explain the sense of belonging on campus and investigate its connection with social integration into an institution. This study departs from Tinto's (1993) theory with its focus on students' perspectives of social and learning integration. Some students might break off the ties with external communities and only consider relationships with other students rather than community and family

relationships. The lack of social inclusion or association is likely to lead to low dedication, engagement, satisfaction, and accomplishments. Furthermore, the scholarly literature illustrates that this factor might result in depression and elevated stress levels (Bond, Buntins, Bedenlier, Zawacki-Richter, & Kerres, 2020). This emphasis illustrates that belonging is a fundamental need among students that acts as a crucial requirement and a reason for acting (Bleich et al., 2015, p. 90). A failure to satisfy this need might lead to devastating implications.

Tinto's (1993) model is relevant to the study as it describes student engagements through academic, institution, and peer dimensions. The attachment of students to the academic life translates into institutional engagement; in turn, institutional engagement depends on students-faculty relationships (Ashwin & McVitty, 2015, p. 350). The model holds that both formal and informal relationships are affected by institutional rules and guidelines to enhance positive engagement. Moreover, it also draws an avenue for investigating the impact of students' interactions on campus on their engagement.

Critical race theory (CRT) is the second model used in this study. For the past two decades, many scholars have studied CRT. According to Batterton and Horner (2016), it has "theorized, examined, and challenged how race and racism shape schooling structures, practices and discourses" (p. 479). In the past, educators used to be interested primarily in critical race research and sought to describe negative experiences of students of color in educational settings (Taylor, Gillborn, & Ladson-Billings, 2015). However, some versions of CRT shift to the areas of pedagogy, epistemology, and policy (American Educational Research Association, 2006). CRT challenges the perception of White persons' experience in a society as a yardstick to which the experiences of all the demographic groups should be measured. It seeks to examine distinctive experiences of students of color instead of exploring them through the prism of White persons' perceptions. The CRT framework was used in this study to enrich an understanding of barriers encountered by international students and ensure the comprehension of international students' academic engagement.

Significance of the Study

The engagement of international students and their sense of belonging are important drivers of their academic achievements as well as many other important outcomes. IHEs must ensure adequate integration of international students into their environments because campus climate affects both quality of education and popularity among both students. Existing literature does not offer sufficient evidence of relationships among students' characteristics and perceptions of their engagement, and it remains unknown whether U.S. IHEs have been successful in establishing and maintaining inclusive campuses and communities that would promote international students' sense of belonging. This study was valuable both from theoretical and practical perspectives because in addition to closing an evident research gap, I sought to provide empirical data learning engagement among international students in U.S. IHEs.

Summary

A high number of international students in U.S. IHEs call for increasing amounts of attention to their integration into the learning environment. My study sought to explore the learning engagement of international students by examining such variables as age, gender, race, degree aspirations, and fields of study. The theoretical frameworks of this study were Tinto's (1993) model of retention and critical race theory as stated by the American Educational Research Association (2006). My findings provide insights into ways to foster international students' learning engagement.

Literature review

The purpose of this study was to investigate the learning engagement of international students. This literature review comprises two sections, as follows: experiences of international students in U.S. IHEs, and the concept of learning engagement.

International Students in the USA

In rural and urban centers, millions of international students are transforming American learning institutions into world-class universities. With over a million international students making their way to class in America every day, their American college experience needs to create room for diverse backgrounds and ethnicities (Cole & Zhou, 2014). The prospect of studying at U.S. universities is now open for representatives of many nationalities (Glass, Wongtrirat, Buus, & Aw, 2015). This process leads to increased diversity in homogenous campuses where international students have to overcome barriers to their full integration into the learning environment (Lambert et al., 2013). Although the influx of international students promotes intercultural learning in the United States, challenges faced by international students indicate that the development of intercultural learning in the country is still insufficient (Barnett III, 2016). Research on international student engagement and culturally diverse campus environments has been of importance not only to U.S. campuses but also to a broad range of local and international stakeholders.

Experiences of international students on campuses have attracted the attention of many scholars. Ashwin and McVitty (2015) recommended implementing strategies to enhance the experiences of international students in colleges through the creation of inclusive and connected campus environments where international students are empowered to excel in all types of education institutions (p. 349). Glass et al. (2015) advocated for the adoption of a comprehensive approach to the creation of an inclusive campus climate through culturally sensitive strategies that recognize the needs of international students as they struggle to integrate into the American culture (p. 578). Likewise, Bleich et al. (2015) indicated that international students require extra care before they can adapt to U.S. IHEs' rules, programs, and practices because they are completely removed from their culturally diverse backgrounds (p. 85). Batterton and Horner (2016) concluded that international students have been forced to deal with barriers to integration, and most of them are forced to struggle with feelings of powerlessness and isolation (p. 482). All these studies illustrate that international students experience substantial

challenges that inhibit their integration into the learning environment and complicate their academic engagement.

Student Engagement

One study defined student engagement as involvement in curricular and extracurricular activities in learning institutions (Korobova & Starobin, 2015, p. 78). These activities determine how well a student performs in the classroom and integrates with an IHE. The learning experiences of students in an educational institution are more successful if they are involved in academically beneficial activities. Korobova and Starobin (2015) stated that definitions of student engagement vary greatly. Bleich et al. (2015) noted that engagement is a valid indicator of excellence in a learning institution that deviates from traditional measurable characteristics (p. 90). Cole and Zhou (2014) emphasized that the concept of student engagement applies to educational outcome indicators that extend beyond the classroom (p. 114). All these arguments illustrate the importance of student engagement in educational settings.

The available evidence provides a reason to believe that engagement indicators may be even more important for international students. A study by Nguyen, Nguyen, and Teranishi (2018) found that international students' engagement could predict whether they graduate (p. 385). Zhao, Kuh, and Carini (2005) found that researching engagement among international students is critical in understanding the experiences of international students who are a significant source of diversity in American college campuses. They found that students arriving in the country reported disorientation associated with stress, anxiety, and a feeling of loss (p. 230). Batterton and Horner (2016) explained that international students often fail to integrate fully into the American community (p. 467). Korobova and Starobin (2015) said that in attempts to satisfy their need to belong, they create support structures involving students from their home country or other nations when studying in the United States (p. 84). Gummadam et al. (2016) found that social structures that cultivate and sustain relationships between international students and their American counterparts could ease adjustments and improve learning outcomes (p. 302). Such options are preferable over support structures created by international students because it facilitates students' engagement and integration into the learning environment.

The absence of consistent student engagement strategies might lead to disturbing consequences. Barnett III (2016) reported that international students complaining about the lack of engagement reportedly felt lonely and isolated (p. 89). In another study, Griffin, Cunningham, Mwangi, and Chrystal (2016) found that feelings of isolation halts learning processes because students experience withdrawal from participating in learning processes and other activities (p. 34). Nguyen et al. (2018) suggested that lack of student engagement led international students to rarely interact with peers (p. 487). Museus, Yi, and Saelua (2017) said that the establishment of specific support structures and the conduct of targeted interventions could address this problem and, as a result, improve the extent of international students' engagement in educational practices and enhance the learning process (p. 187). An increase in student engagement among international students, therefore, is highly desirable for any IHE.

The task of ensuring high student engagement rates is challenging due to the existence of many intermediary variables, such as early academic readiness, academic achievements, family income, and other demographic factors. If particular students have low marks in mathematics and reading, their chances of completing a secondary school degree are relatively low; however, according to the results of one recent study, students' grades also strongly affect their engagement (Bond et al., 2020). In addition to students' grades, their learning habits and other characteristics of their behavior have been found to affect their achievements at IHEs (Hughes, 2010). Such intermediary variables influence the ability of IHEs' interventions not only to ensure that students complete their degree programs but also to increase their academic engagement.

The website of the National Survey of Student Engagement (NSSE) provides recent data on student engagement in U.S. IHEs. It investigated international students' experiences in different dimensions (Bleich et al., 2015, p. 91). Its data ranged from students' willingness to engage with in-class and out-of-class activities to their take on reading and writing, which all mirror their perceptions of their learning environments (Strayhorn, Bie, Dorime-Williams, & Williams, 2016, p. 72). Ashwin and McVitty (2015) found that, with a culture already in place, college engagement activities fostered the creation of a climate capable of handling diverse international populations (p. 347). Glass et al. (2015) found that student engagement enhanced tolerance for international students and created welcoming environments (p. 489). Through engagement programs, campuses can help international students living alone to attain a semblance of some sort and face the challenges in a supportive social structure.

Counseling has been found to be an effective mechanism to increase student engagement. Koborova (2015) found that counseling could enhance international students' engagement in IHEs. Similarly, Nguyen et al. (2018) determined that the provision of advice on how to navigate life in a new country, which could occur in the form of counseling, might ease the adjustment and adaptation of international students to their new environments (p. 383). Eventually, the implementation of counseling sessions can improve international students' engagement and, as a result, enhance their learning outcomes (Museus et al., 2017, p. 213). Thus, counseling could be considered as a part of support structures to promote the sense of belonging among international students.

Engagement of international students has been found to change over time. Zhao et al. (2005) found that groups of international students indicated varying degrees of engagement from time of enrolment to the end of studies (p. 214). Ashwin and McVitty (2015) found that, without appropriate measures to enhance student-faculty interaction, students in the first semester spent more time on electronic gadgets than they did on interacting with their counterparts (p. 346). Museus et al. (2017) reported that over time, international students channeled their energies toward interaction with other students or productive academic areas that improved their academic outcomes and facilitated personal development (p. 183). To improve the outcome process, research advocates for fostering productive relationships between academic departments and international students and the close monitoring of individual international students using counselors and advisors who share a background with international students.

The promotion of cultural awareness is also an important requirement in this sphere. Comprehensive teaching techniques that accommodate the need of each nationality could be an effective instrument of achieving this goal (Batterton & Horner, 2016, p. 477). Cultural sensitivity provided by such techniques at the institutional level could promote student engagement among international students (Strayhorn et al., 2016, p. 50). To help international students integrate, IHEs should introduce practical approaches towards cultivating awareness and sensitivity and help faculty understand specific needs of international students (Bleich et al., 2015, p. 92). Although it is hardly possible to address the needs of every nationality, sensitivity and cultural awareness increase stakeholders' awareness of diverse cultures represented in learning institutions and inform the development of culturally sensitive approaches towards facilitating the integration of international students into the learning environment.

Summary

This review of studies on international students attending colleges and universities in the USA showed the importance of student engagement in extracurricular activities and development of inclusive diverse communities of support. Studies reviewed showed that counseling and advising services were effective in developing cultural awareness and learning engagement.

Method

This study sought to explore the concept of learning engagement among international students of U.S. institutions of higher education. Specifically, the study tried to answer the research question: does learning engagement of international students in U.S. IHEs depend on their reports of demographic characteristics, degree aspirations, fields of study, and residence on campus.

The focus of the study was placed on examining the students' feeling of belonging and its drivers. I was interested in investigating the impact of students' perceptions of campus climate and their demographic characteristics on their engagement. It was decided on the chose the research philosophy of critical realism for this study. This research philosophy allows analyzing research objects through the examination of humans' experiences, sensations, and perceptions (Saunders, Lewis, & Thornhill, 2012). This paradigm was selected because unlike positivism, pragmatism, and interpretivism, the philosophy of critical realism could be suitable for scrutinizing international students' perceptions of their engagement in the learning environment.

My study has an explanatory research design. I sought to measure a causal relationship between different variables and relied on both deductive and inductive research approaches. I used the former in applying results of the literature review to discuss empirical data and used the latter to analyze data collected from the United States Department of Education's National Center for Education Statistics (NCES).

I analyzed NCES (2020) data to draw conclusions regarding the learning engagement of international students in U.S. IHEs. I conducted all data collection and data within the cross-sectional time horizon. This study used a quantitative method to explore the concept of international students' engagement by determining whether engagement was affected by specific parameters. Quantitative methods measured the impact of those parameters on learning engagement.

Hypothesis

Hypotheses form a crucial steppingstone toward a yet-to-be-proven phenomenon. Castillo (2013) notes that a hypothesis is a prediction of what is likely to be observed. However, it is more than a product of pure guesswork since it has to be based on background research. My study aims to investigate the learning engagement of international students by examining multiple variables, including age, gender, race, degree aspirations, and fields of study. Given that preliminary studies show that a lack of learning engagement can have negative implications for foreign students (Barnett III, 2016; Griffin et al., 2016; Nguyen et al., 2018), I hypothesize that there is a robust correlation between students' learning engagement and such variables as their ages, genders, residences, racial identities, bachelor's-degree aspirations, and fields of study.

Data Source

The dataset (NCES, 2020) included data on all responding students. I was interested exclusively in exploring the experiences of international students, the filter "foreign or international students" was chosen to select the population ($N = 2,478$). I have used a purposive sample (Etikan, Musa, & Alkassim, 2016). Table 1 shows the strata of the sample in this study.

Table 3. Sample

Variable	Parameter	<i>n</i>	%
Engagement	Feel as a part of an IHE	2,193	89%
	Do not feel as a part of an IHE	285	12%
Gender	male	1,063	43%
	female	1,415	57%
Race	White	1,393	56%
	non-White	1,085	44%
Major field of study	STEM*	1,797	73%
	Social or behavioral sciences	681	28%

	19-21	823	33%
	22+	426	17%
Degree Intention	Bachelor's degree intention***	1,925	78%

Variable	Parameter	<i>n</i>	%
Residence	No Bachelor's degree intention***	553	22%
	On campus	751	30%
	Off campus	1,727	70%

* Math, computer, sciences, engineering, technologies

**as of 12/31/2011

*** within five years of 2012.

The study's sample consisted of 67% of the population. The official website of NCES indicates that the sample includes 2,478 students. Apparently, NCES used a purposive sampling method to include students from a list of selected education institutions. The stratified sample does not represent the population across all the parameters.

The percentage of foreign and international students with low levels of learning engagement is 12% of the stratified sample, while such levels are displayed by only 10% of the sample. At the same time, respondents' age and gender characteristics as well as their major fields of study and degree aspirations display similar patterns both for the stratified sample and for the population. Moreover, the percentage of the population and the stratified sample who live on campus constitutes 31% and 30% respectively.

Data Collection

I used data from international students pertaining to their learning engagement, age, gender, race, degree aspirations, fields of study, and residence—I chose to use an existing dataset that was available on the NCES website as its *Beginning Postsecondary Students Longitudinal Study*. The dataset (NCES ,2020) included information about beginning students at the end of their first years and three and six years after starting tertiary education. The use of robust methodologies in NCES's surveys provides a premise to believe that the data collected by the organization display high reliability and validity. I retrieved data on responses by international students who identified their races, ages, genders, fields of study, learning engagement, degree aspirations, and residences.

Data Analysis

Reported learning engagement that was tabulated by NCES as responding students' feeling of belonging, was utilized as the dependent variable; the other six parameters were independent variables. I sought to determine whether independent variables could predict the variation in learning engagement among international students. I decided to use a linear regression analysis to estimate relationships among variables (Lavrakas, 2008); furthermore, the use of a linear regression is available on the website of NCES. I ran seven linear regressions to compute *P*-values for each regression; a *P*-value below the confidence level of 0.05 would indicate the existence of a statistically significant relationship between variables.

Summary

This study used an explanatory research design, a cross-sectional time-horizon, and a combination of deductive and inductive approaches in its empirical part. I formed a hypothesis and collected quantitative data from *Beginning Postsecondary Students Longitudinal Study*, a large-scale dataset (NCES, 2020). After retrieving data on seven variables that pertain to my research question, I ran six regression analyses to examine relationships among six independent variables with a dependent variable of learning engagement as reported by self-identified international students.

Results

My main goal was to explore international students' reported learning engagement in U.S. IHEs. I sought to evaluate international students' feeling of belonging in U.S. IHEs and analyze the dependence of learning engagement on reported ages, genders, races, degree aspirations, fields of study, and residence. Learning engagement is critical for all students in IHEs, and especially for international students in the U.S. Inclusive diverse communities could embrace, welcome, and support international students, but they face many obstacles.

In particular, my literature review showed that international students sometimes find difficulty engaging with members of their cohort which in turn affected their learning engagement. I analyzed datasets from the National Center for Educational Statistics (2020). I used PowerStats tools that were integrated into their website. It allowed me to manually choose variables from datasets and combining them into categories that could be later utilized in regression analysis. It also has an option of inserting specific filters so that all the variables would be retrieved exclusively for international students.

I retrieved data on the following seven variables:

- Student engagement;
- Gender, race;
- Major fields of study;
- Age;
- Bachelor's degree aspirations; and
- Residence.

Learning engagement served as the dependent variable, while the other six parameters were used as independent variables. The fact that the data were collected by NCES made it impossible for me to analyze its normality through the measures of skewness and kurtosis. NCES does not allow users to download students' responses; therefore, it is impossible to access raw data. Users are only permitted to download the results of regression analyses, correlation matrixes, or other operations conducted in PowerStats. I ran six regression analyses to measure relationships among one dependent and six independent variables, as follows.

Race

Considering that the literature review showed that racism remains a common problem in many U.S. universities, colleges, and campuses (Gummadam et al., 2016; Batterton & Horner, 2016), I analyzed whether identified races of students could predict their feelings of belonging.

Table 2 shows that students representing a majority of respondents' reported racial identifications were unlikely to display any patterns of learning engagement that could be explained by their racial identification.

Table 4. Regression Results for Race on Learning Engagement

	<i>b</i>	<i>SE</i>	<i>t</i>	<i>p</i>	Lower 95%	Upper 95%
White	0.88	0.04	23.45	0	0.81	0.96
Non-White	-0.02	0.05	-0.30	0.76	-0.12	0.09

The reported races did not predict participants' learning engagement. The probability (76%) was significantly higher than the confidence level, indicating the absence of a statistically significant relationship between these variables.

Gender

My analyses also did not confirm the existence of a statistically significant relationship between reporting students' gender and reported learning engagement.

Table 5. Regression Results for Gender on Learning Engagement

	<i>b</i>	<i>SE</i>	<i>t</i>	<i>p</i>	Lower 95%	Upper 95%
Male	0.88	0.05	16.08	0	0.77	0.97
Female	-0.01	0.09	-0.13	0.90	-0.18	0.16

The probable relation ($p = 0.9$) was substantially higher than the confidence level. The variable of gender, therefore, did not predict learning engagement

Fields of Study

A major field of study with a focus on STEM fields was another independent variable chosen for this analysis. I found that reported choices of a field of study did not have a statistically significant effect on responding students' reported learning engagement. I found that the variation in learning engagement was not be predicted by responding students' reported fields of study (Table 4). There was no statistically significant relationship between the variables ($p = 0.58$).

Table 6. Regression Results for Fields of Study on Learning Engagement

	<i>b</i>	<i>SE</i>	<i>t</i>	<i>p</i>	Lower 95%	Upper 95%
STEM*	0.90	0.05	19.20	0.00	0.81	0.10
Social sciences	-0.06	0.11	-0.56	0.58	-0.29	0.16

Age

Responding international students' ages also did not relate to their reported learning engagement.

Table 7. Regression Results for Age on Learning Engagement

	<i>b</i>	<i>SE</i>	<i>t</i>	<i>p</i>	Lower 95%	Upper 95%
Intercept	0.74	0.63	1.16	0.25	-0.51	1.99
Ages*	0.01	0.03	0.21	0.84	-0.06	0.07

* as of 12/31/2011

Probability ($p = 0.84$) was significantly higher than the confidence level.

Degree Aspirations

In accordance with my initial expectations, responding students' reported degree aspirations was a strong predictor of their sense of belonging. The results of the regression analysis supported my expectation (Table 6).

Table 8. Regression Results for Degree Aspirations on Learning Engagement

	<i>b</i>	<i>SE</i>	<i>t</i>	<i>p</i>	Lower 95%	Upper 95%
No intention	0.94	0.04	0	0	0.86	1.02
Yes intentions*	-0.12	0.06	-2.07	0.04	-0.24	-0.01

* within five years of 2012

I found that responding students' reported degree aspirations (i.e., their intention of completing a bachelor's degree or not) had a strong relationship with their reported learning engagement, ($p = 0.04$).

Residence

I analyzed the variable of learning engagement in relation to the reported residences of responding students (Table 7).

Table 9. Regression Results for Residences on Learning Engagement

	<i>b</i>	<i>SE</i>	<i>t</i>	<i>p</i>	Lower 95%	Upper 95%
On campus	0.95	0.01	160.1	0	0.94	0.97

www.icres.net		April 27-30, 2024		Antalya, Turkiye		www.istes.org
Off campus	-0.05	0.01	-3.89	0	-0.07	-0.02

I found a p -value of zero that indicated a strong relationship among variables.

Summary

I ran six regression analyses to investigate the dependence of responding students' reported learning engagement on such independent variables as their ages, genders, residences, racial identities, Bachelor's-degree aspirations, and fields of study. A majority of regression analyses showed the absence of statistically significant relationships among variables, but I found that data from responding students with high degree aspirations was related to higher learning engagement. Moreover, I found that reported residences of responding students was a predictor of their reported learning engagement, as respondents who reported living on campus showed significantly higher learning engagement rates than those who reported living off campus. A detailed discussion of these findings is provided in the next chapter of the dissertation.

Summary

The purpose of this study was to investigate international students' learning engagement at U.S. IHEs. A high number of international students in U.S. IHEs require stakeholders to explore the perceptions of these individuals in order to facilitate their integration into learning environments and maximize the value that they could gain from educational services. This study used secondary data collected and published by NCES (2020). Using regression analyses, I examined the dependence of responding students' reported learning engagement on such variables as age, gender, field of study, residence, racial identity, and degree aspirations. I found no statistically significant relationships with responding students' reported learning engagement among their reported racial identities, genders, fields of study, and ages. I found that responding students' reported degree aspirations were significantly related to their reported learning engagement. Furthermore, I found a strong relationship between responding students' residence and learning engagement. In particular, I found that data from responding students who reportedly lived on campus showed high learning engagement than data from those living off campus.

Discussion

This study contradicts the academic literature in reporting no statistically significant relationship between students' demographic characteristics and their reported learning engagement. Ultimately, race and racism continue to elicit contentious debates in the realm of education, and other institutions in the society. For instance, the critical race theory indicates that racism significantly affects social constructions (Batterton & Horner, 2016) and calls for studies that would narrate distinctive stories of students of color (Taylor et al., 2015). I found no confirmation of this effect.

In my study, responding students' reported races as well as ages and genders had no effects on their reported learning engagement. One possible explanation of this regularity is the presence of some compounding variables, such as responding students' reported living on campus; however, further research is needed to confirm or reject this explanation. Despite efforts by theoretical frameworks, such as the CRT to steer away from exploring the issue of race through the prism of White persons' perspectives, it can be argued most of the existing statistical data remains deeply rooted in this approach. For example, the calculation of the race variable in this context was based on responses from participants who identified as non-White. This approach creates a glaring omission because it negates the experiences of White international students. Notably, IHEs also enroll white students from other countries. Therefore, their perspectives on the rate of student engagement may be remarkably different from other racial groups such as Arab, Asian, or African.

My study's results are consistent with Tinto's (1993) model in highlighting the importance of peer dimensions for student engagements. Responding students' reported residences on campus was a variable related to their reported feelings of belonging implies that interaction with other students on campus might boost learning engagement. More studies are needed to unravel relationships among these variables.

Conclusions

I conclude that the findings of this study were valuable because they extend the existing literature while also challenging the findings of some studies. The fact that reported racial identifications of responding students did not relate with their reported learning engagement contradicts the results of some other studies (Gummadam et al., 2016; Batterton & Horner, 2016). Such a finding could be connected with a plethora of possible explanations, such as the traditional diversity of U.S. IHEs hosting international students or the continuous progress in their development of inclusive environments. In this study, my findings that respondents' reported racial identities were covariant with their learning engagement lead me to suggest that IHEs are progressing toward eradication of racism.

Many studies on discrimination on IHE campuses and effects of students' negative perceptions of their learning engagement focus on racial and cultural considerations rather than gender ones (Bleich et al., 2015; Gummadam et al., 2016; Batterton & Horner, 2016). My findings in this study are consistent with studies stating that gender does not predict an individual's learning engagement in an IHE. I also expected that respondents' reported fields of study and age would not be covariant with learning engagement. A person's decision to pursue a certain field of study was not indicative of character, temperament, and behavior; and did not predict learning engagement. Likewise, variations in respondents' reported ages also did not predict their reported learning engagement. Although a student who is older than traditional ones might experience problems with integrating into the learning community, slight age differences were not found to affect respondents' reported learning engagement.

My finding that respondents' reported degree aspirations predicted their learning engagement seems natural because such aspirations strongly affect students' behavior and their interactions with faculty and other students. Unfortunately, even though degree aspirations are crucial for boosting learning engagement, most IHEs do not have an established framework to play an impactful role in this aspect. This situation has prompted researchers to recommend that institutions and departments assume a more proactive role in student engagement. For instance, Wang and Brckalorenz (2017) suggested that faculty support for international students should be regarded as an essential parameter in promotion. Thus, it can be concluded that IHEs lack a coordinated approach to foster international students' sense of belonging.

I conclude that my most important finding was a statistically significant relationship between respondents' reporting living on campus and high learning engagement. Apparently, students who live on campus are exposed to the continuous impact of other members of the learning community that facilitates their integration into the learning environment. From this perspective, the study illustrates that efforts of U.S. educational institutions to create an inclusive environment in campuses have achieved significant progress (Gummadam et al., 2016; Cabrera, 2017). In light of the current study's findings, ethnicity and race of students do not predict students' feeling of belonging. Thus, it is plausible that living on campus plays a significant role in fostering student integration. On the other hand, there is overwhelming evidence that proves an intricate relationship between racial identity and the sense of belonging of international students (Aggarwal & Çiftçi, 2020; Singh, 2018). Besides, Mitchell et al. (2017) urge that more focus should be dedicated to race and racism as international students join US postsecondary education institutions. This recommendation comes at the backdrop of the researchers' acknowledgement that there is a paucity of studies focusing on the salience of racism among students who transition to the U.S. (Mitchell et al., 2017). Consequently, while the current study demonstrates a lack of prediction between race and sense of belonging, further research would be required to verify this finding.

Recommendations

I recommend that living on an IHE's campus could be an effective way for an international student to develop learning engagement and a feeling of belonging. IHEs should take measures to facilitate the integration of international students into campuses by refraining from considering the racial and ethnic factors as relevant criteria for planning students' accommodations. Living on campus seems more beneficial for learning engagement than living off campus. Although IHEs have achieved significant progress in ensuring inclusiveness of their learning environments, I recommend that administrators and instructors eradicate any signs of racism and other kinds of discrimination, by celebrating diversity among students and staff. I agree with Cabrera (2017) in recognizing the difficulty of clearly understanding predictors of belonging, and recommend that more research is needed to address this gap in the literature. Scholars should consider temperament, culture, personal preferences, and marital status, among variables that might be relevant to learning engagement. I also recommend scientists to explore a relationship between students' reported on campus residence and their

reported learning engagement in more detail to identify specific variables related to campus that positively affect the feeling of belonging.

Limitations

This study did not have substantial limitations because the robust methodology of NCES surveys ensured high validity and reliability. Because these data were from only U.S. IHEs, my findings might be limited for discussing other countries. While the researcher strived to ensure statistical integrity of all the calculations, the fact that racial identity was only classified as non-White could also limit the applicability of the findings on describing student engagement for White international students.

Summary

This study investigated learning engagement of international students at U.S. IHEs. I found that learning engagement was positively associated with living on campus. Variables of gender, racial identity, fields of study, and age were not covariant. I recommend that all IHEs continue investing in development of inclusive learning environments for all students, especially international students, to leverage their on-campus experiences to develop feelings of belonging.

Abstract: Situated within the context of EFL learning, which aims to foster the development of Intercultural Communicative Competence (ICC) among language learners, this research constitutes a segment of a doctoral dissertation exploring the advantages of utilizing the Autobiography of Intercultural Encounters through the Visual Media (AIEVM) to assess the ICC progress of student teachers studying Intercultural Communication at a private university in West Java, Indonesia. The data was the particular encounter that the learners had experienced with individuals from different cultures through the visual image. Within our study, the AIEVM was then employed within the framework of the SFL appraisal to evaluate intercultural attitudes. Drawing upon a comprehensive review of current literature and research, we believe that AIEVM can be employed as a pedagogical tool to assess language learners' ICC for various reasons. Firstly, AIEVM offers a systematic reflection or self-evaluation of intercultural encounters, which is the foundation for ICC growth. Secondly, the questions provided in AIEVM are derived from scientific research, fostering intercultural awareness among learners. Thirdly, AIEVM is accompanied by guidance for facilitators to aid in analyzing intercultural encounters. Lastly, while this article primarily focuses on attitudes, other aspects of ICC can also be addressed, thereby highlighting potential avenues for further research.

Keywords: Autobiography of Intercultural Encounters through Visual Media (AIEVM), Intercultural Communicative Competence (ICC), Intercultural Communication.

Introduction

For the last ten years, there has been much interest in investigating students' intercultural communicative competence (ICC) as a means to support language learners as a part of global citizenship (Byram, 2020; Eren, 2021; Hajisoteriou & Angelides, 2020; Jaidev, 2014; Kiss & Weninger, 2017; Lourenço, 2018; Mahaputri et al., 2024; Porto, 2019; Simpson & Dervin, 2019). In the educational context, it is widely believed that intercultural competence enables language learners to have a critical awareness of global citizenship to mediate, relate, and interpret various cultural backgrounds from both the school and society (Byram, 2008). In this regard, in Indonesia's context of the school curriculum, mastering intercultural competence has recently been mentioned as one of the mandatory aspects of English language learning outcomes to prepare students with the ability to communicate interculturally in the multicultural context and Global era.

In today's multicultural society and Global era, where intercultural encounters are frequent, the notion of ICC has long been discussed in various contexts related to the development (Cancino, 2023; Deardorff, 2019; Susilo et al., 2023; Zhang, 2020), theories (Byram et al., 2013; Coulby, 2006; Moeller & Osborn, 2014; Tiurikova, 2021), definition (Byram et al., 1995; Schifffrin et al., 2001), and models of intercultural competence (Khan et al., 2023). In the context of language teaching and intercultural education, scholars defined ICC as effectively managing interactions between people with varying emotional, cognitive, and behavioral perspectives, who are affiliated with different cultural groups or characteristics, constituting an intercultural process. Therefore, it is important to understand how individuals are influenced by their cultural affiliations to manage these interactions appropriately. A distinguished scholar in intercultural education whose model is arguably considered the most influential, Byram (2009) argued that ICC relates to the ability to interact with people from another country and culture in a foreign language.

Previous studies have promoted various instruments to measure ICC development which covers cognitive, affective, and behavioral aspects of language learners. Arasaratnam (2006) developed and tested a new instrument encompassing these elements of ICC among participants from diverse cultural backgrounds and validated the tool using factor, regression, and correlational analyses. In addition, Byram (2020) argued that assessing ICC the specific and general aspects of culture, including knowledge, skills, and attitude, to effectively and appropriately communicate with people from different cultural backgrounds. Regardless of the idea that ICC is a life-long process in which no end-point to mastering this competence (Deardorff, 2006), the Education Department of the Council of Europe has launched the autobiography of intercultural encounters, which is claimed to help in assessing and enhancing intercultural competence. It can facilitate structured and critical reflection on encounters with people from different cultural backgrounds (Lindner & Méndez García, 2014). Objectively, an Autobiography of intercultural encounters is an educational tool that encourages reflection on intercultural encounters that can help the user develop values, attitudes, skills, knowledge, and critical understanding that constitute intercultural competence (Barrett & Byram, 2022; Soong et al., 2015).

The fact that globalization and internalization are brought massively through the internet connection, hence, intercultural encounters become part of the learners' everyday lives either on a face-to-face basis or often mediated through the internet, and social media, sometimes in visual form and sometimes as text. Liddicoat and Scarino, (2013) mentioned that intercultural encounters can be experienced directly or indirectly. This study focuses on the implementation of indirect intercultural encounters, particularly through the Visual Image. Autobiography of Intercultural Encounters through Visual Media (henceforth AIEVM) has been piloted in language teaching practice in many countries (Barret & Byram, 2022). This provides opportunities for people from different cultures to connect, share experiences, and learn from each other by observing the visual image. One of the key benefits of AIEVM is the opportunity it provides for individuals to learn about different cultures and perspectives (Lindner & Méndez, 2014).

People can better understand different cultural practices, beliefs, and values by observing the cultural elements that can reflect their identity and culture. This can help to break down stereotypes and prejudices and promote greater tolerance and respect for diversity. As the internet provides people with access to global spaces, language learners can interact with others from different cultures and access various cultural content in the visual image. This exposure to diverse content has the potential to shape their attitudes and beliefs (Barrett & Byram, 2022). Despite many advantages of experiencing intercultural encounters through the visual media from the Internet, few studies reported in what ways the use of AIEVM can effectively help instructors assess learners' ICC development. To fill this gap, this research discusses the affordances of using AIEVM in the EFL context informed by the principle of Systemic functional linguistics (SFL) namely appraisal framework (Martin & White, 2005) in assessing intercultural attitude as one aspect of ICC.

The Autobiography of Intercultural Encounters through the Visual Media (AIEVM)

AIEVM is one of the learning outcome products of an intercultural communication course using the SFL Genre-based approach. AIEVM has been designed to help learners analyze a specific image that they have encountered in the media (e.g. on television, in a book, or on the internet) that shows someone (or several people) from another culture (Barrett & Byram, 2022). In this study, the learners created AIEVM at the end of the learning process of the intercultural communication course as their ICC self-assessment. Intercultural scholars in Europe claim that the AIEVM is one instrument for promoting and enhancing intercultural competence. Besides, it can facilitate structured and critical reflection on encounters with people from different cultural backgrounds. Objectively, AIEVM is an educational tool that encourages reflection on intercultural encounters that can help the user develop values, attitudes, skills, knowledge, and critical understanding that constitute intercultural competence (Barrett & Byram, 2022).

By creating AIEVM, the learners were encouraged to analyze a specific intercultural encounter they have experienced in the teaching-learning cycle of GBA by reflecting critically on their responses and attitudes to experiences of other cultures. The study by Sandell and Bersh (2022) revealed that autobiography can capture

hidden or invisible voices. In line with this, Fairclough (2013) also acknowledged that autobiography's significance can make people increasingly reflective about their social life. Since culture is constructed from visible and invisible forms such as the way of life, belief, way of thinking, etc. (Kramsch & Hua, n.d.), thus, AIEVM is considered appropriate to mediate and assess ICC development. The learners created their AIEVM by answering the guided questions about various aspects of intercultural encounters during the learning program using SFL GBA mediated by the visual image they chose themselves. However, to understand AIEVM better, the concept of intercultural encounters must be highlighted first. According to Barrett and Byram (2022), an intercultural encounter is:

“An encounter with another person (or group of people) who is perceived to have different cultural affiliations from oneself. Such encounters may take place either face-to-face or virtually through, for example, social or communications media. They may involve people from different countries, people from different regional, linguistic, ethnic, or religious backgrounds, or people who differ from each other because of their lifestyle, gender, social class, sexual orientation, age or generation, level of religious observance, etc. An interpersonal encounter becomes an intercultural encounter when cultural differences are an individual's orientation and perceived and made salient by the situation or attitudes”. (p. 7)

Respecting this, AIEVM in this present research is used to assess language learners' ICC by helping them to analyze and reflect on their participation in intercultural encounters, and to foster relevant knowledge, skills, and attitudes in the process. In doing so, the learners gained not only the inclusion of reflection on personal development through an intercultural experience but also know the values, beliefs, and behaviors of all involved as the crucial element of the AIEVM. In addition, this concept aligns with the principle of SFL genre-based that was used as a teaching approach. This approach views teaching language as assistance to help learners understand the world better by understanding the text and context (Emilia, 2014). In this sense, the learners were assisted in critically analyzing online encounters that present a person or people in a specific image, such as in a newspaper, magazine, television program, or film that they chose as the most interesting one.

Meanwhile, situated under the teaching framework of SFL Genre-based pedagogy, (Halliday & Hasan, 1989) claim that the term text refers to any instance of language, in any medium, that makes sense to someone who knows the language. With this in mind, texts-mediated intercultural encounters in this research are the visual image that the learners easily find in their daily lives as the medium of authentic intercultural encounters. In this regard, the present study focuses on interpersonal metafunctions according to the SFL theory depicted in the visual image as the data. It was then analyzed through the appraisal system to reveal the learner's ICC. Focusing on the participants' attitudinal lexis in the level of discourse semantics that deals with Byram's model of ICC (1997; 2020), identified appraisals will be synthesized to interpret the overall interpersonal stance of the learners' ICC. Accordingly, how the language choices contribute to their positioning in their AIEVM can be identified.

Assessing ICC in the EFL Context

Reviewing intercultural communication in the EFL context, previous studies have mentioned that the goal of teaching foreign languages has evolved over the years to develop ICC (Butarbutar et al., 2024; Byram, 2008; Cancino, 2023; Khan et al., 2023; María & Vallejo, 2018; Misdi & Mahaputri, 2022). Furthermore, the rapid development of technology to enhance language learning makes communicative language teaching focus on sociolinguistic appropriateness (Mahaputri et al., 2024) and politeness etiquette (Mahaputri et al., 2021) in teaching communication in this globalization era. This perspective is one of the reasons why the use of AIEVM has the potential to assist in assessing the aspect of ICC. This was because the visual media was inherent to the living experiences of individuals in a society and culture (Kiss & Weninger, 2017). In this sense, language learners understand that language and context are intertwined. In turn, scholars in the field of intercultural communication (e.g. Byram, 2020; Fantini & Tirmizi, 2006; Liddicoat & Scarino, 2013; Liu, 2016) have contended that intercultural competence is essential in constructing this new goal.

There are many kinds of instruments to use in assessment for ICC, such as portfolios, journaling, and learning diaries (Deardorff, 2004, 2006, 2009; Lazarević, 2018; Owczarek, 2017). Assessment can also be conducted by teachers, learners, and their peers. In this research, assessing ICC means that EFL learners must know how to react and respond to intercultural encounters appropriately to avoid misunderstanding, prejudice, stereotyping, etc. (Azarnoosh et al., 2018; Byram, 2020; Deardorff, 2006; Fantini & Tirmizi, 2006; Gu, 2016; Owczarek, 2017). With this in mind, teaching intercultural communication is challenging because of linguistic and sociolinguistic barriers and the consequence of intergroup perception and interaction (Byram, 2020; Liddicoat & Scarino, 2013; Liu, 2016; Risager, 2011). For this reason, as mentioned in the research background, teaching ICC in the EFL context needs to investigate the potential of AIEVM as a teaching instrument to help instructors assess ICC development. While ICC is seen as a skill to mediate intercultural communication among users and English learners in different social and cultural settings (Baker, 2015; Byram, 2020; Mahaputri et al., 2024), assessing learners' ICC can be attempted through reflection and experience toward intercultural encounters. Regarding this, AIEVM contained guided questions that can help the learners to critically reflect on their experiences of intercultural encounters.

Method

This classroom-based study was conducted by one of the authors who acted as the teacher-researcher of an intercultural communication course at the English education program at a private university in West Java, Indonesia. A key objective of the study was to promote students' intercultural awareness regarding their interest in new experiences, and other people's ideas, cultures, and nations. The learners in the course were encouraged to observe and compare cultures, as well as explore social interactions based on intercultural pedagogical task principles informed by visual media. Using Byram's Byram (2020) ICC perspective, the tasks were designed to engage learners in genuine and natural social interactions that reflected the communicative event (Newton et al.,

2015). Specifically, learners needed to elaborate on the experience of their intercultural encounter, followed by reflections on them, written on AIEVM.

Participants

The participants of this study were 15 student teachers from a total population of about 75 students in the English language department of a private university in Cirebon. The participants were ensured that they were voluntarily registered to participate in the study upon the researcher's giving information on the nature of the study, their expected contribution, and filing the form of consent. As Rose (2020) suggested, in terms of ethical procedure, to create responsive communication with the participants, all the participants were gathered in a WhatsApp group that the authors administered. Regarding the sampling technique, the participants were selected using convenience samplings as the principle considered to get the participants, such as eagerness to volunteer, time, and accessibility to choose the population (Dörnyei, 2007). The participants' recruitment process was on an ethical protocol basis regarding their autonomy to participate in this study. All participants were between the ages of 21 and 22, consisting of 11 female and 4 male student teachers.

Data collection and analysis

The AIEVM is essentially a series of questions about a memorable intercultural experience that has been particularly important. The questions will reflect on the learners' best experience(s) in intercultural encounters through a visual media regarding their response, their perception towards people they encounter, and a reflection of their assumption and feelings now and then to finally help draw the findings of intercultural learning mediated by SFL GBA. At the beginning of writing AIEVM, the learners must complete the "Who I am" task, asking them to reflect on how they define their identity. The intention behind this initial use of the "Who I am" task is to encourage users to focus their gaze on themselves and their cultural positioning as a preliminary to completing the AIEVM. However, the learners would be given time to return to it and possibly revise their original "Who I am" text after they have responded to the questions to complete their AIEVM.

As seen in Table 1, this kind of data collection objectively will lead learners to evaluate an encounter with someone from a different social group critically as part of an intercultural experience (Barrett et al., 2013). In doing so, the learners' works of making AIEVM provided reliable evidence of their ICC development. To implement this guidance of AIEVM, the lecturer, who acts as the facilitator and researcher, has learned comprehensively the notes given by the authors and publisher for the facilitator.

In analyzing the data, the appraisal system was deployed to assess the learners' ICC as reflected in their AIEVM, which realized the interpersonal resource in the level of discourse semantics rather than the level of lexicogrammar. Martin and White (2005) argued that a text is prosodically organized, which means that the meaning of the schematic structure from an interpersonal perspective, or interpersonal structure, spreads over the constituent structure with repetition. Furthermore, anchoring to the metafunction (ideational, interpersonal,

and textual) in SFL proposed by (Halliday & Hasan, 1989), the appraisal system used as an integrative framework focuses on addressing the interpersonal components of the genre produced (AIEVM). In this study, the appraisal system depicted how the participants negotiate cultural information in the visual media (function/interpersonally oriented features) through the AIEVM.

Table 10. AIEVM aspects for intercultural learning (taken from Lindner & Méndez, 2014. p. 235)

- [1] The parts where you write about yourself, then you answer the questions – and then you are asked to think about yourself again – in connection with the raised questions/thoughts. And questions where you are asked to think about your reaction – why did you react in that way, what influenced you, etc. This triggers critical thinking, which is very important nowadays, since we are constantly confronted with influential and manipulative images. (S.R.1)
- [2] *Same and Different* [...] made me think of all the things I might have in common with the woman on my picture. It is important for the students to learn that they have something in common with people they don't know (living standard, character traits, clothing, hobby...). (S.R.8)
- [3] *Same and different*. It makes the user compare the image to his/her own community and put things into perspective.
Thinking back and looking forward. It summarises many of the questions spread over previous parts. (S.R.3)
- [4] *The feelings of other people* and *Your feelings*. You can find out more about yourself and you become aware of what makes you to be the human you are and in which way your cultural and ethnic background influences your way of thinking and your subconscious mind. (S.R.5)
- [5] *The feelings of other people*. I tried to stay away from my mind and my views and attempt to be as open-minded as possible. It is a great effort to make, but very worthy and tolerant. (S.R.2)
- [6] The part where you have to image being the person on the photo is very useful for intercultural reflection since you have to empathize with the person on the photo. (S.R.8)
- [7] I became aware of why I am the way I am, because through working with the *AIEVM*, one had to automatically reflect about this and so one can reach a state of understanding in how far the cultural background influences one's way of thinking and acting. (S.R.5)
- [8] The *AIEVM* not only made me think about the image, but also about myself and my relation to the culture I was raised in. Thinking about a striking image is something that probably everybody does. However, the difference between doing it on your own and going through the *AIEVM* is the extent to which you do it. Being confronted with all those questions makes you connect your direct impressions with issues seemingly far away from the image. (T.D.9)
- [9] If you know how to define yourself, you are able to define other people. A definition always needs another which is different to one self. I also think that the *AIEVM* contains the self-reflective part due to that reason, because it is much easier to define others if you have a clear definition of yourself. Some might think that I'm referring to the process of Othering, but in my opinion, having self-awareness that helps to define other cultures can also have a positive connotation. You should appreciate otherness and differences like flavours in meal :) (T.D.7)
- [10] Through empathizing myself with the people in the image, I got a better understanding of their situation. (S.R.9)
- [11] The *AIEVM* and other methods that promote intercultural relations might be the perfect 'weapon' to break up with racist perceptions that just harm our society. (S.R.2)

According to Martin and White (2005), the appraisal framework proposes three general systems of meanings. 1) **Attitude**, which includes feelings, assessments of people's attitudes, behaviors, and actions as well as an understanding of events; 2) **Engagement**, which enables the presentation of propositions that are more or less debatable; and 3) **Graduation**, which provides for adjusting the force or focus of an expression. However, this study focuses on how attitudinal meanings function to negotiate the participants' ICC from the perspective of the interpersonally oriented features of writing AIEVM from the appraisal perspective. Martin and White (2005)

referred to the three subsystems of attitude as AFFECT, JUDGEMENT, and APPRECIATION. This is a comprehensive system that deals with human emotions, perceptions, cognitions (**affect**), aesthetic evaluation of things or entities appreciation), and moral or legal judgment (**judgment**) of individuals and their behaviors or characters. There are further divisions among the three attitude systems. The four affect components are unhappiness, dissatisfaction, insecurity, and disinclination. While reaction, composition, and valuation are other subcategories of **appreciation**. Five sub-values make up judgment: capacity, tenacity, normality, veracity, and propriety. All attitude-related items connote positive (+) or negative (-) values. The following is a data analysis example for learner's AIEVM (see Figure 3) using an appraisal system focused on participants' attitudinal evaluation.

Indians Culture: Weaving as Women's Empowerment

I'm Fatmah, I live in Cirebon as a college student at Swadaya Gunung Djati University. I'm currently majoring in English education. I still live with my parents, meanwhile my older sister who already got married, lives with her husband. So, yes, I live like the only daughter in this family since my sister moved with her husband. Economically, I'm Indonesian middle-class where in my environment most women are working as a maid, seller, farmer, tailor, etc. I rarely find people with higher profession or job, even the highest position is being a teacher. Somehow, I think I am affected by this environment. Back then, I thought that a job or a profession that led to success is to become a doctor, teacher, office worker, etc.

Recently, I have found an image in an article in google arts and culture, the image represents Indians women as hardworking women who empower themselves through weaving. When I saw this image and the title of the article, I felt curious because I have seen more than one post about "weaving" at the theme of India in google arts and culture, so I wondered why "weaving" is somehow a hot issue for Indian's women. Besides that, as the same gender as women, I felt motivated from the image of being a hard worker woman. Basically, it is an image of a 2-woman worker who works in Nong luth Weaving Cooperation. In Indonesia, Weaving is also a culture or tradition in Indonesia inherited from our ancestors. In my own place there are also weaving production houses, but they are not as well-known or skilled as there are in several regions in Indonesia, such as Bali, Lombok, Watubalpi and Sumba. From the image above, the workers wear a shirt, Indians scarf, and some jewellery, so I assumed that the workers belong to the lower or middle class from what they wear. From that I thought that weaving is a majority job for middle-class Indians women. It is the same for Indonesians but there are some women who wear traditional clothes while weaving.

There are some things that I noticed from the image that have similarities and differences with me as Indonesian. Indian women have the same skin and hair colour as me and also the people of the image looked like they have the same level of society, namely middle class. Meanwhile the most significant difference is the way they dressed and their community. From the way they dressed, the thing that made it different is they used a scarf and they used something like a wrapper that was identical with Indians style. Meanwhile, in my daily life sometimes I just wear a shirt with long pants or a skirt with also a hijab because I'm Muslims. Another difference is from the community we belong to. The people in the image belong to factory employees, while I belong to English major students.

This image showed some stereotypes. As I have mentioned before, Indians still live an old-fashioned life and I think this image shows this stereotype through the way the people in the image are dressed. It also shows the gender stereotype where weaving can only be done by women, it can't be done by men. The people of the image presented in a positive way because they show the workers while working which can represent their hard work. On the other hand, it also presents the people in a negative way where the photo gives the picture that these people live in a low or middle economic class.

If I was them, I would feel honoured to be an inspiration for other people, especially women. Because, maybe in this rough world, there are a lot of women who still feel insecure with themselves and haven't found a way to empower themselves. I also think the people in the image felt proud or pleased with the way they captured the image. But, on the other side I think they would like to be shown as a more successful person with a higher position and better job, for example a boss or office worker. Someday, if I can meet them, I would like to show my appreciation for them.

After I saw and observed the image, something changed in my mind. Empowering women can be done in any way, if there is no forum, then we should start creating a forum for ourselves and all women in the world to empower their ability. I believe that every person has a different thought, so there can be some people who agree with me but some also can disagree with me. After this, I would like to search more about this and Indians culture to gain more knowledge and prevent stereotypes that I already have about Indians.

Figure 3. An example of learners' AIEVM

From the example of the data AIEVM, the appraisal system was then deployed to assess the learners' ICC which realized the interpersonal resource in the level of discourse semantics rather than the level of lexicogrammar. Focusing on the attitudinal competence of ICC, thus the coding system was made based on lexes that referred to affect, judgment, and appreciation (see Table 2).

Table 11 Appraisal analysis

Appraiser	Appraising Items	Affect	Judgment	Appreciation	Appraised
Fatmah	Indonesian middle-class		cap (+)		Economically, I am
	rarely find		prop (-)		people with higher profession
	even the highest		prop (-)		position

affected	sec (-)			this environment
led to success		Prop (+)		a job or a profession
hardworking women			val (+)	the image
felt curious	des (+)			the image and the title
wondered why	des (+)			weaving
a hot issue		norm (+)		weaving
felt motivated	des (+)			from the image
inherited		norm (+)		weaving in Indonesia
not as well-known or skilled as		cap (-)		weaving in my own place
assumed	sat (-)			the image
the lower or middle-class		cap (-)		the workers
thought that..			reac (+)	weaving
noticed			reac (+)	the image
similarities and differences			val (+)	the image
the same			comp (+)	Indian woman
the same		cap (+)		level of society
the most significant difference			comp (+)	the way they dressed and their community
identical		norm (+)		the way they dressed
showed some stereotypes			val (-)	this image
an old-fashioned life		cap (-)		Indians
Shows the stereotypes			val (-)	this image
can only be done		cap (-)		weaving
in a positive way			val (+)	The people on the image
On the other hand	sat (-)			the image
a negative way			val (-)	the picture
a low or middle economic class		cap (-)		these people
I would feel honored	hap (+)			to be an inspiration for other people
rough			reac (-)	world
feel insecure	sec (-)			rough world
haven't found		cap (-)		a way to empower
felt proud	sat (+)			the people in the image
pleased	hap (+)			the way they capture the image
But, on the other side			reac (-)	the image
a more successful person with a higher position			val (+)	the image
better job			val (+)	the image
show my appreciation	des (+)			for them (people in the image)
changed in my mind	sec (+)			after I saw and observed the image
in any way		cap (+)		Empowering women
should start creating a forum			reac (+)	if there is no forum
to empower	sec (+)			all women in the world
has different thought		norm (+)		every person
After this, I would like to	des (+)			about this (image)
search for more				
to gain more knowledge	sat (+)			about this (image)

	prevent stereotypes	sec (+)		about this (image)
Key:				
+	Positive attitude		prop	judgment: propriety

des	affect: desire		comp	appreciation: composition
hap	affect: un/happiness		val	appreciation: valuation
sec	affect: in/security			
sat	affect: dis/satisfaction			
	normjudgment: normality			
cap	judgment: capacity			
ten	judgment: tenacity			
ver	judgment: veracity			

In more detail, the data from the table reveal that about 38% of the coded language in the AIEVM reflects an **appreciation for cultural differences**. This indicates that the learner frequently highlighted the positive aspects of cultural diversity, such as celebrating unique traditions, customs, and perspectives from different cultures. Approximately 34% of the coded language involves **judgment of cultural differences**. While this reveals some level of the learners' critical evaluation. It is essential to note that judgment here encompasses mostly positive assessments. It included reflections on the impact of cultural differences on their experiences and opinions about societal attitudes toward cultural diversity. Meanwhile, the least represented category is affect, which comprises around 28% of the coded language. In this sense, affect refers to **emotional responses** or attitudes towards cultural differences. While affect may not be as prominent in the AIEVM as appreciation or judgment, it still significantly shapes the learners' perceptions and interactions with cultural diversity.

Findings

While ICC development is an ongoing and lifelong process, drawing from the critical review of the literature, the authors believe that the AIEVM-informed SFL appraisal framework can effectively be employed as a pedagogical tool to assess language learners' ICC development for the following reasons.

A systematic reflection or self-evaluation of intercultural encounters in AIEVM

A systematic reflection or self-evaluation (table 3) of intercultural encounters in an AIEVM is crucial. In this regard, the learners chose one of the meaningful intercultural encounters through the visual media which showed someone from a different cultural background to reflect on. In this way, the assessment was focused on the personal level that led to the interpersonal meaning to reveal intercultural attitudes. Supporting this, Lindner and Méndez (2014) argued that when someone focuses on the personal level of interaction, they are more likely to see the other person as a complex individual with a unique cultural background. This can help prevent making generalizations or assumptions that can lead to harmful stereotypes. Barrett and Byram (2022) point out that reflecting on how the new knowledge relates to our self-understanding and values is important to analyzing intercultural encounters and exchanges. This reflective process is an essential part of the analysis.

By using AIEVM, the learners can reflect on their experiences and examine how they have grown and changed their perspective about a culture they did not know before as illustrated in these points:

Extract 1

*I noticed from the image that there are **similarities and differences** between me as an Indonesian and the people in the image.*

Extract 2

*I **assumed** that the workers belonged to the lower or middle class because of what they wore. **From that image**, I thought weaving was a standard job for middle-class Indian women. It is the same for Indonesians, but some women wear traditional clothes while weaving.*

Table 12. AIEVM orders and theoretical indicators (ICC) (adapted from Barrett & Byram (2022))

AIEVM orders	Theoretical Indicators (ICC)
1. The online encounter	Analytical and critical thinking skills; knowledge and critical understanding of the self; Openness
2. The other person or people	Skills of listening and observing; knowledge and critical understanding of the world (culture and cultures); respect
3. Your thoughts, feelings and actions	Knowledge and critical understanding of the self; respect; civic-mindedness
4. The thoughts and feelings of the other people involved	Empathy; tolerance of ambiguity
5. Same and different	Analytical and critical thinking skills; empathy; tolerance of ambiguity; knowledge and critical understanding of the world (culture and cultures); knowledge and critical understanding of the self
6. Thinking about communication	Knowledge and critical understanding of language and communication; skills of listening and observation; knowledge and critical understanding of the world (media); empathy; linguistic, communicative and plurilingual skills
7. Thinking further about the content that was posted	Knowledge and critical understanding of the world (media); knowledge and critical understanding of language standing and communication.
8. Thinking further about the person who posted the online content and the people who saw it	Empathy; knowledge and critical understanding of language and communication; knowledge and critical understanding of the world (media, culture and cultures)
9. Finding out more	Autonomous learning skills
10. Thinking back and looking forward	valuing human dignity and human rights; valuing cultural diversity; analytical and critical thinking skills Empathy; tolerance of ambiguity Civic-mindedness Flexibility and adaptability Civic-mindedness

These extracts show that the learner obtained cultural self-awareness. She argued that individuals need to have a deep understanding of their own cultural identity. This includes language, customs, traditions, and social norms that shape their worldview. Recognizing one's cultural biases and assumptions is essential for effective intercultural communication (Özdemir, 2017; Wang, 2018). Previously, she assumed that the workers in the picture were from the lower or middle class. Lately, she promoted intercultural awareness and acknowledged that waving was a standard job of middle-Indian women. Furthermore, her critical understanding is shown by

comparing the similarities and differences between her culture (Indonesia) and others. Hence, the systematic reflection represented in AIEVM orderly becomes a powerful tool for the learners' self-assessment of ICC.

This table shows a systematic reflection or self-evaluation of AIEVM is presented orderly to help learners develop a deeper understanding of themselves, others, and the intercultural encounters they have experienced. By reflecting and analyzing their behavior toward intercultural encounters, they at the same time can assess their competencies. This way can develop more respectful, accepting, and effective strategies for ICC development. (Barrett & Byram, (2022) claimed that the reflective process is to relate new understanding to one's values and beliefs that can help to clarify the concepts of "tolerance", "respect", and "intercultural dialogue". Ultimately, this can lead to greater intercultural awareness.

The critical questions in AIEVM

What sort of image have you chosen? For example, is it a photograph or poster, or in a music video, a television programme or a film that you have watched, or is it in a history, geography, religious studies or language textbook that you use at school?
The image that I choose is a picture from an article in google arts and culture.

Why have you chosen this image?
Is it because ... (please tick one or more of the following reasons, or add your own reason if it is different from the ones listed below):

- it made me think about something I had not thought about before?
- it was the first time I had seen this kind of image?
- it was the most recent image of this kind that I have seen?

I choose this image because I recently saw this kind of topic for several time while I'm exploring in Google Arts and Culture.

2. The contents of the image
Who is shown in the image and what are they doing?
The image shows two women workers in Nong luth Weaving Cooperation who's weaving.

What was the first thing you noticed about them?
The first thing I noticed from the image is their appearance. From their appearance, from what they wear, I assumed that both of those workers are belong to a lower or middle class.

Are they male/female, older/younger than you or do they belong to a different country, language group, religion or region from yourself? Is there any other thing which you think is important about them?
The people in the image are a two Indian female and I think they're older than me. Indian usually speak using Indian language or Indian English, from what I know, Indian religion is buddha so I think they have a different religion with me.

3. Your feelings
How did you feel when you first saw the image?
The first time I saw the picture, I feel interested and curious.

What do you think caused these feelings?
I felt curious because as I said before, I have saw more than one post about "weaving" at the theme of India in google arts and culture, so I wondered why "weaving" are somehow being a hot issue for Indian's women. Besides that, as the same gender, as women, I felt their spirit and motivated from the image.

If you were the person in this image, would you like people to feel this way about you? Please give your reasons.
Yes, I would feel honorable to be an inspiration for other people, especially women. Because, maybe

4. The feelings of other people
Do you think the person/people shown in the image would be pleased with this image of themselves? Please give your reasons.
Maybe yes, maybe no. It depends on the person. Because every person has a different concern about people's opinion.

Do you think they would have preferred to be shown differently? Please explain your answer.
Maybe yes. I think they would like to be shown as a more successful person with a higher position and better job, for example a boss or office worker.

How do you think other people from the same group or culture as them would feel about the image?
I think they would feel proud that their culture is being known by people all around the world

5. Thinking about communication
In the image, do the person/people shown use language or gestures to communicate with people in the image or viewers? If so, what language or gestures do they use?
I think they don't use any language or gestures to communicate because they focused to do their job.

If you were to actually meet the person/people shown in the image, what would you do or say?
First, I would like to ask them why they choose to work there and how they learn about the skill? I would like also to say that they are an amazing woman, they don't need to feel insecure about their job and their life.

Do you have any knowledge of their language and/or culture which could help you to understand and communicate with them? If so, what sort of things do you know?
I only know that they can use English but it is a little bit different because they use Indian English. And the thing that I like from there is their a different level of society.

6. Same and different
Thinking about the person/people in the image and yourself, what do you think are the main similarities between them and yourself?
Maybe our level of society and our skin color

What do you think are the main differences between them and yourself?
The way they dressed and community

Are they like anyone that you know in your own life? If so, in what ways do they resemble them (for example, in the way they look, the way they behave, the way they think)?
I don't think so

When looking at an image, people often compare things in other groups or cultures with similar things in their own groups or cultures. Did you do this?
I do, berdasarkan foto, di beberapa daerah di Indonesia juga banyak Perempuan Perempuan hebat yang bekerja sebagai penenun.

Now you have answered the questions in this section, you could go back to the answers which you gave in the "Who I am" section of this AIEVM and see if you want to make any changes.

7. Thinking further about the image
Is there anything about the person/people shown in the image that is exaggerated or emphasized? If so, what?
No

Figure 4. Example of critical questions

The AIEVM essentially contained a series of critical questions about a visual image (Barret & Byram (2022). Through the critical questions, the learners are helped to reflect on their experiences and gain insights into their

own cultural biases. These critical questions guided them to write about their experiences in which they can analyze their reactions and emotions, identify areas of improvement, and develop strategies for future intercultural interactions. Furthermore, the questions given promote the learners' competence in analyzing online exchanges and engaging with people from different cultural backgrounds. However, when reflecting on intercultural encounters, it is important to consider the context in which the encounter occurred. The context can include factors such as the location, the purpose of the encounter, and the cultural background of the individuals involved. Understanding the context can help individuals identify the underlying factors that may have influenced their reactions and behavior during the encounter.

Through the critical questions, the learners self-evaluated by analyzing intercultural encounters they have experienced scientifically. Barrett & Byram (2022) argued that "the order of these questions gives structure to the process of analysis, taking the user from description to interpretation and then to the evaluation of the encounter". This is also an essential element of reflecting on intercultural encounters. In the first section of the AIETI, the learners are asked to describe themselves. In describing themselves, they need to think about things that are especially important to them in how they think about themselves and how they like others to see them. They may also wish to include how they perceive themselves on the internet. The questions lead them to examine their own cultural biases and preconceptions to understand how they may have influenced their behavior during the encounter. By identifying these biases, the learners can work to overcome them and develop a more open and accepting attitude toward other cultures.

The facilitators' guidance

In the language learning process, the intercultural facilitator will assist the language learners in understanding the relationship between language and the broader context of culture while intercultural communications happen. In doing so, the learners' understanding of the language system developed within the context of a particular culture (including beliefs, values, behaviors, way of life, etc.,) enables them to meet that culture's context. In addition, teaching ICC needs to involve the dialogue that allows the negotiation of their language(s) and culture(s) about the additional language and culture. In response to this, AIEVM can raise awareness among users about the potential benefits and risks associated with intercultural communication on the Internet. Regarding this, the facilitators can assist learners by restating or rewording questions more simply or, interpreting the meaning of the questions, and providing explanations to help learners better understand the questions. Furthermore, the facilitators can modify the questions under a certain topic to better suit the age group, the previous experience of users, or the specific type of online content that is being discussed (Barret & Byram, 2022).

It can help instructors assess the learners' beliefs, values, and attitudes toward other cultures and gain a deeper understanding of oneself concerning the world. Regarding this, according to Barret & Byram (2022), AIEVM can be applied in varied teaching scenarios such as at different points during a student project group; in the course of a project developed by high school students; enhancing an online intercultural citizenship project;

Built into the explorations of the members of a high school literature circle; as an addition to a language portfolio; expanding the horizons of teacher education and In support of education professionals participating in an online community of practice.

Discussion

Reviewing Byram (2020) suggests that instructors in the EFL classroom can facilitate the learners to gain ICC in three ways. 1) Providing the space for systematic and structured presentations of knowledge in the extension of the better traditions of language teaching. 2) Allowing for the acquisition of the skills needed for ICC under the guidance of a language educator. And 3) Offering space for reflection and guided discussion of the skills, knowledge, and experience collected beyond the classroom. Thus, AIEVM is one teaching instrument for promoting and fostering intercultural competence (Barret & Byram, 2022).

AIEVM helps learners reflect on their interactions with people from diverse cultural backgrounds in three main ways. First, systematic reflection or self-evaluation of intercultural encounters. In this regard, AIEVM allows individuals to depict their intercultural encounters in a tangible and often emotionally resonant way. Through photographs, drawings, or other visual mediums, individuals can capture moments, emotions, and nuances that might be difficult to express solely through words. This visual representation can then catalyze systematic reflection and self-evaluation. Through the analysis of appraisal (Martin & White, 2005) it was found that by looking at the images, learners can revisit their experiences, analyze their reactions, and consider the impact of cultural differences on their thoughts, feelings, and actions. This process helps to deepen their understanding of themselves and their intercultural interactions. a structured and analytical manner. Second, critical questions play a crucial role in guiding the analysis of autobiographical visual imagery of intercultural encounters. Third, the facilitator's guidance. It plays a key role in supporting learners as they navigate the process of using autobiographical visual imagery to explore intercultural encounters.

Conclusion

In conclusion, the use of AIEVM offers a rich and multifaceted approach to exploring intercultural encounters. Through systematic reflection and self-evaluation, the learners can delve into the complexities of their interactions with people from different cultural backgrounds. Critical questions serve as a guide, prompting deeper analysis and insight into the cultural dynamics at play. The teacher as facilitator plays a vital role in supporting and guiding learners through this process, providing frameworks, feedback, and a supportive environment for exploration. By using AIEVM as a medium for introspection and dialogue, learners can enhance their ICC, gaining a deeper understanding of themselves and others in an increasingly diverse world. Barret & Byram (2022) claim that the main concept conveyed in AIEVM is that an educational resource that promotes contemplation on cross-cultural experiences can assist the user in cultivating intercultural competence by developing values, attitudes, skills, knowledge, and critical understanding. However, it is important to be

mindful of the potential challenges and to approach indirect intercultural encounters with an open mind and a willingness to learn. Therefore, further investigations are suggested to provide more empirical evidence for the effectiveness of using AIEVM.

Abstract: In work analyzed clinical manifestations and treatment program in patients with Crohn`s disease (CD - regional enteritis as part of inflammatory gastrointestinal tract) and Bechterew`s disease (BD - ankylosing spondylitis, AS) in practice of surgeon-proctologist and rheumatologist. Crohn's disease, also known as Crohn syndrome and regional enteritis, is a type of inflammatory bowel disease that may affect any part of the gastrointestinal tract from mouth to anus, causing a wide variety of symptoms. Ankylosing spondylitis (AS, from Greek ankylos, fused; spondylos, vertebrae; -itis, inflammation), previously known as Bechterew's disease (or syndrome) and Marie-Strümpell disease, is a chronic inflammatory disease of the axial skeleton with variable involvement of peripheral joints and nonarticular structures. An analysis of the examination and treatment of patients of these groups by the specified doctors and implementation of the results in the practical activities of the medical community and in the process of training new personnel was carried out. Received results underscore the increased objectivity in the control of knowledge on the part of teachers' interest and increasing of students and of medical interns' interest to master a subject, that allowed to prepare a general practitioner in surgery and surgeons, and integrate in the future in practical public health in worldwide. Training of general practitioners is a major task of medical higher educational institution, and therefore the proper teaching of surgery in a whole range of other disciplines will create conditions for quality medical practice doctor in the future, and should meet the requirements of the integration process of the educational systems of other countries. The main goal of any innovation – improving the quality in any sphere of life. A comparison in this work of these results application new pedagogical methods on ESTC in Medicine.

Keywords: Crohn`s disease, Bechterew`s disease, examination, treatment

Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 131-141), Antalya, Turkiye. ISTES.

Introduction

Regional or granulomatous ileitis is a chronic bowel disease (Crohn's disease) that covers all the layers of the intestinal wall (transmural lesions), and sometimes spreads to the mesentery, regional lymph nodes affecting both the small and large intestines, but most often localized in the terminal section of a thin guts (regional, terminal ileitis). These diseases can be accompanied by damage to the peripheral joints, spine, or joints and spine (Ankylosing spondylitis or Bechterew`s disease). The clinical manifestations of the joint syndrome in both processes are the same. (Braun J, Sieper J., 2007).

The pathogenesis of the intestinal process and joint damage has not been fully established, but it is believed that many mechanisms participate in it, and in particular, toxic, immune, autoimmune. In the blood of patients, antibodies to the cells of the intestinal mucosa, lymphocytotoxin antibodies, circulating immune complexes, in which, possibly, antigenic components of intestinal microbes, etc., are also present.

In Crohn's disease, articular manifestations usually occur in childhood and adolescence. The development of peripheral arthritis in these diseases is usually not associated with the carriage of the histocompatibility antigen B27. Ankylosing spondylitis is more common in men than in women (3: 1). This disease usually develops in people who have HLA B27. Articular changes with regional ileitis occur more often in patients with other extraintestinal manifestations of the processes - with ulcers of the oral mucosa, exacerbate erythema nodosum, gangrenous pyoderma.

So too can the onset of symptoms. Although symptoms usually start to appear in late adolescence or early adulthood (ages 17 to 45), symptoms can occur in children or much later in life. The most common early symptoms of AS are frequent pain and stiffness in the lower back and buttocks, which comes on gradually over the course of a few weeks or months. At first, discomfort may only be felt on one side, or alternate sides. The pain is usually dull and diffuse, rather than localized. This pain and stiffness is usually worse in the mornings and during the night, but may be improved by a warm shower or light exercise.

Also, in the early stages of AS, there may be mild fever, loss of appetite, and general discomfort. It is important to note that back pain from AS is inflammatory in nature and not mechanical. The pain typically becomes persistent (chronic) and is felt on both sides, usually lasting for at least three months. Over the course of months

or years, the stiffness and pain can spread up the spine and into the neck. Pain and tenderness spreading to the ribs, shoulder blades, hips, thighs, and heels is possible as well.

Note that AS can present differently at onset in some people. This tends to be the case in women more than men. Quoting Dr. Elaine Adams, "Women often present in a little more atypical fashion so it's even harder to make the diagnosis in women." For example, we have heard anecdotally from some women with AS that their symptoms started in the neck rather than in the lower back.

Varying levels of fatigue may also result from the inflammation caused by AS. The body must expend energy to deal with the inflammation, thus causing fatigue. Also, mild to moderate anemia, which may also result from the inflammation, can contribute to an overall feeling of tiredness.

Chronic inflammatory arthritis, a hallmark of several inflammatory rheumatic diseases, and inflammatory bowel disease are both life-long conditions, with substantial morbidity and even mortality. These diseases are highly prevalent—for example, chronic arthritis has a frequency of approximately 2%–3% within a given population. Interestingly, the co-existence of gut and joint inflammation was found to be prominent in spondyloarthritis, a family of interrelated rheumatologic diseases. Number of typical clinical and genetic characteristics, including peripheral arthritis (particularly of lower limb joints) as well as inflammation of the axial skeleton (e.g., spine). Moreover, different forms of may also affect other organs, such as the skin (psoriasis) or the eye (anterioruveitis), demonstrating the systemic nature of these diseases. (*Jacques P, Elewaut D., 2008*).

Various subtypes have been described based upon clinical features, but any two may share important characteristics. The prototypical disorder of the family is ankylosing spondylitis (AS), which is characterized by prominent inflammation of the axial skeleton (spine, sacroiliac joints), although other joints may also be affected. Other diseases include infection-triggered reactive arthritis, some forms of juvenile idiopathic arthritis, arthritis in association with inflammatory bowel diseases (IBD), and some forms of psoriatic arthritis.

Method

The pathogenesis of the intestinal process and joint damage has not been fully established, but it is believed that many mechanisms participate in it, and in particular, toxic, immune, autoimmune. In the blood of patients, antibodies to the cells of the intestinal mucosa, lymphocytotoxin antibodies, circulate immune complexes, in which, possibly, antigenic components of intestinal microbes, etc., are also present.

A recent study found a strong association between increased levels of an inflammatory marker in the gut and the subsequent development of Crohn's disease in those with existing ankylosing spondylitis.

Patients participating in the study were asked to provide stool and blood samples, as well as to complete a questionnaire at the beginning of the study, (to establish their baseline scores) and once again five years later at the follow up visit. Of the patients with ankylosing spondylitis initially enrolled in the study, 80% completed the study by returning for the follow up examination.

Researchers found that an elevated level of gut inflammation at the start of the study – as evidenced by increased levels of a protein called calprotectin in the stool – was a strong predictor of the development of Crohn's disease within five years.

The striking relationship between Crohn's disease and AS has been recognized for many years: up to 10% of Crohn's Disease patients develop AS, and, vice versa, Crohn's disease commonly develops in patients primarily diagnosed with AS. As both have an important underlying genetic heritability, it has been suggested that the two diseases could have an overlapping set of predisposing genes. Strong evidence for this idea has been derived from the Icelandic genealogy database: it was shown that AS and Crohn's disease have a strong elevated cross-risk ratio in first- and second-degree relatives.

However, the precise nature of the predisposing genes remained unknown for some time. Nowadays, in the absence of a positive response in the treatment of refractory forms of Crohn's disease (CD) with articular manifestations with 5-aminosalicylic acid (5-ASA) drugs and steroids, reserve drugs are prescribed - immunosuppressants, which in some cases do not solve the problem. The development of refractoriness to treatment is observed in an average of 35-40% of patients and leads to severe complications, surgical interventions and disability of young people of working age. "Biological" drugs continue to be used in the complex treatment of this category of patients. Infliximab remains quite effective and safe in refractory clinical inflammatory bowel diseases.

In 2020-2023, a preliminary study of the complex use of 5-aminosalicylic acid (5-ASA), corticosteroids, immunosuppressants and biological therapy (infliximab) for the treatment of patients with inflammatory bowel diseases with joint manifestations was continued: 31 patients with CD with the cooperation of gastroenterologists, proctologists and rheumatologists.

Crohn's disease (CD) (regional enteritis, granulomatous ileitis) is an inflammatory disease involving all layers of the intestinal wall in the process; characterized by intermittent (segmental) nature of the lesion of various sections of the gastrointestinal tract. It is characterized by diarrhea mixed with mucus and blood, abdominal pain (often in the right iliac region), weight loss, and fever.

Extraintestinal manifestations of CD are noted to 25% of cases, including Bechterew's disease. This causes a systemic immuno-inflammatory process with damage to the vessels, the synovial membrane of the joints and the ligamentous apparatus of the spine. Peripheral arthritis in patients with CD develops more often with widespread colon damage. As a rule, its manifestation falls on the first year from the onset of bowel disease. In

70% of cases, arthritis develops with an exacerbation of intestinal pathology, but sometimes its symptoms may precede the symptoms of the underlying disease, especially in patients with Crohn's disease. In joint damage is observed in 10% of patients with CD. In 75% of cases, joint damage occurs in the form of peripheral arthritis, in 25% of spondylitis and sacroileitis.

The describes the medical history of a concomitant manifestation of classical Bechterew's disease (positive HLA B 27), which preceded the detection of Crohn's disease of the stomach, terminal ileum, and rectum by 10 years. Scientists discuss the relationship between the two diseases, in particular, in view of the probable definite extraintestinal manifestation of Crohn's disease. The simultaneous presence of two diseases causes difficulties in assessing humoral activity. 5-aminosalicylic acid is the drug of choice for ankylosing spondylitis with overt or silent bowel inflammation. Early detection of these two diseases is important for therapy and prognosis. (Mielants H, et al., 1995).

Bechterew's disease (BD) and Crohn's disease (CD), especially when associated with spondylitis are interrelated conditions included within the categories of spondyloarthropathic disease entities. They share some common clinical, genetic, and microbiological findings. An extensive amount of studies which have been carried out by various independent groups throughout the world have shown that *Klebsiella pneumoniae* microorganisms could be suggested as the most likely etiopathogenetic triggers for BD and CD based on the molecular mimicry mechanism and the existence of the evidence for immunological, microbiological, and molecular link between *Klebsiella* and self antigens. (Thjodleifsson B, Geirsson AJ, Bjornsson S, Bjarnason I., 2007).

It is proposed that the use of low starch diet in conjunction with the currently used treatment might help in the eradication of *Klebsiella* microbes from the bowel and could result in the stoppage and alleviation of the disease process in patients with BD and/or CD.

Crohn's disease is an immune-mediated gastrointestinal inflammatory disease, which could arise from an interplay between genetic and environmental factors. *Klebsiella* microbes were suggested to have a vital role in the initiation and perpetuation of the disease through the mechanism of molecular mimicry. This proposition is based on the results of various studies where significantly elevated levels of antibodies against the whole bacteria or preparations from *Klebsiella* microbes and antibodies to collagen types I, III, IV, and V were detected in patients with CD and patients with BD. Molecular similarities were found between *Klebsiella* nitrogenase and HLA-B27 genetic markers and between *Klebsiella* pullulanase and collagen fibers types I, III, and IV. (Danoy P, et al., 2010).

Furthermore, significantly positive correlations and cross-reactivity binding activities were observed between anti-*Klebsiella* and anticollagen antibodies among patients with CD and BD. Early treatment of CD patients with anti-*Klebsiella* measures is proposed, which may involve the use of antibiotics and low starch diet together with other traditionally used immunomodulatory, immunosuppressive, or biologic agents.

Before to 10% of cases of Bechterew's disease (BD) are associated with inflammatory bowel disease (IBD), either Crohn's disease (CD). A much larger percentage of BD patients have subclinical gut inflammation manifested either by endoscopic findings or by histology. The association with HLA-B27 is less strong in IBD-associated BD than in idiopathic AS, and there is evidence for an association between gut inflammation in BD with the Crohn's-disease-related CARD15 mutations. Despite the different genetics, the immunopathology suggests common inflammatory pathways in gut and joint inflammation in AS, and in gut inflammation in BD and CD. (*Barrett JC, et al., 2008*).

Although this observation is of interest to unravel the pathophysiology of the disease, systematic screening of BD patients by ileocolonoscopy is not indicated in the absence of gut symptomatology as only a small proportion of BD patients with subclinical gut inflammation will develop overt CD over time. Treatment of AS associated with IBD with non-steroidal anti-inflammatory drugs (NSAIDs) is problematic because of concerns of potential re-activation of IBD by NSAIDs. Major advances have been made in recent years with the establishment of anti-tumour necrosis factor (TNF) therapy in AS, the other spondyloarthritides and IBD. Anti-TNF agents are of particular relevance to BD patients with concomitant CD who are at risk of exacerbation of the underlying bowel disease when treated with NSAIDs. (*Burton PR, et al., 2007*).

In CD, infliximab, unlike etanercept, is effective in treating clinical symptoms, inducing and maintaining remission, and mucosal healing. Adalimumab appears to be effective in treating both BD and CD; however, official approval is pending. Currently, infliximab is the drug of choice for the treatment of patients with active BD associated with CD.

In the case of extraintestinal manifestations of Crohn's disease, active disease, if present, should be treated to induce remission, which can have a positive effect on the course of most accompanying extraintestinal manifestations. However, for some extraintestinal manifestations, special treatment should be instituted. This latter part of the management of the disease will be discussed in this chapter, particularly for pyoderma gangrenosum, uveitis, spondylarthropathy (axial arthropathy), and primary sclerosing cholangitis, which have also been described in quiescent Crohn's disease. In the past, several new drugs have been developed to treat extraintestinal manifestations of Crohn's disease, and only the role of infliximab has increased in extraintestinal manifestations associated with Crohn's disease. Drugs specifically targeted for this treatment, derived from several randomized controlled trials or case series, are sulfasalazine, 5-ASA, corticosteroids, azathioprine or 6-mercaptopurine, methotrexate, infliximab, adalimumab, etanercept, and cyclosporine or tacrolimus.

Collaboration between proctologic surgeons, gastroenterologists, and rheumatologists is recommended for the appropriate management of patients with Crohn's disease (CD) and associated Bechterew's disease (BD). We aimed to establish the appropriateness of rapid referral to a specialist. A systematic review of the literature was conducted to describe the prevalence of concomitant CD-BD and diagnostic accuracy. A consensus was then reached between expert surgeons, gastroenterologists, and rheumatologists to confirm the appropriateness of

each patient referral to a specialist. A review of the literature confirmed a high prevalence of concomitant CD-BD.

Consensus among proctologists, gastroenterologists, and rheumatologists was used to confirm the appropriateness of each recommendation. The main criteria for referral of patients with BD to a proctologist or gastroenterologist were: rectal bleeding, chronic abdominal pain, perianal fistula or abscess, chronic diarrhea, and nocturnal symptoms. The main criteria for referring patients with Crohn's disease to a rheumatologist included: chronic low back pain, dactylitis, enthesitis, and peripheral joint pain/swelling. Several primary and secondary warning signs for the diagnosis of concomitant CD-BD have been identified. The use of these recommendations in routine clinical practice can avoid diagnostic delays and reduce clinic overload.

Results

We analyzed the cooperation of proctological surgeons and rheumatologists in the examination and treatment of patients with Crohn's disease and Bechterew's disease on based Regional Proctological Center (Dnipro), Dnipro City Hospital and Department Surgery #1 of Dnipro State Medical University.

In each case of extraintestinal manifestations of Crohn's disease, active disease, if present, should be treated to induce remission, which may positively influence the course of most concomitant extraintestinal manifestations. For some extraintestinal manifestations, however, a specific treatment should be introduced. This latter part of disease management will be discussed in this chapter, in particular for pyoderma gangrenosum, uveitis, spondylarthropathy - axial arthropathy - and primary sclerosing cholangitis, which have also been described in quiescent Crohn's disease. (*Sulima, O., & Sulyma, V., 2020*).

Few new drugs for the treatment of extraintestinal manifestations of Crohn's disease have been developed in the past and only the role of infliximab has increased in Crohn's disease-related extraintestinal manifestations. Drugs specifically aimed at this treatment, stemming from a few randomized controlled studies or case series, are sulfasalazine, 5-ASA, corticosteroids, azathioprine or 6-mercaptopurine, methotrexate, infliximab, adalimumab, etanercept and cyclosporine or tacrolimus. Unfortunately, because of the paucity of data in this field, the best evidence presented and discussed in this article for the treatment of these extraintestinal manifestations is extrapolated from patients that for the most part did not suffer from Crohn's disease.

You might already see a rheumatologist for BD. A proctologist (gastroenterologist) diagnoses and treats Crohn's disease.

If you do have to take one of these medicines, your doctor will prescribe it with a proton pump inhibitor like omeprazole that prevents and treats gastric ulcers.

One TNF inhibitor, etanercept (Enbrel), works for BD but not for Crohn's disease. In fact, it might cause more IBD flares, or even trigger IBD in people who didn't have it before.

Corticosteroids, or steroids, act on your immune system to bring down inflammation. Examples of these medicines are:

- Budesonide
- Hydrocortisone
- Methylprednisolone
- Prednisone

Doctors may prescribe steroids for some cases of moderate to severe Crohn's disease. But over time, they can have serious side effects. Steroid injections or pills are a treatment for arthritis in your arms, legs, fingers, or toes. These injections aren't as helpful for arthritis in the spine.

Researchers are looking at other biologic drugs that might treat both Bechterew's disease and Crohn's disease.

Discussion

Treatment Crohn's disease:

Mild to moderately severe:

This category includes cases that can be observed on an outpatient basis, with the ability to eat normally, without signs of intoxication, abdominal pain, space-occupying formations, or obstruction. 5-ASA (mesalamine) is usually used as first-line therapy. Pentaza® is the drug of choice for lesions of the small intestine, and Asacol® if for lesions of the distal ileum and colon. However, the benefit of any 5-ASA drug in small bowel Crohn's disease is negligible, and many experts oppose its use in small bowel Crohn's disease.

Some experts view antibiotics as first-line treatment; they can also be used as reserve drugs in the absence of response to treatment with 5-ASA within 4 weeks; the choice of drugs is empirical. When using any antibiotic, the duration of treatment is 8–16 weeks.

If the response is good, maintenance therapy is prescribed.

Moderately severe to severe:

In the absence of fistulas and abscesses, but in the presence of severe pain, tenderness on palpation, fever, vomiting, as well as in the absence of response to treatment in a mild form of exacerbation, the administration of corticosteroids orally or parenterally helps to quickly relieve symptoms. Oral prednisolone usually gives a faster and more reliable effect than oral budesonide, but budesonide has less pronounced side effects and is considered in many treatment centers, especially European ones, as the drug of choice among corticosteroids.

If there is no rapid response to corticosteroids or if the dose of these drugs cannot be reduced within several weeks, these drugs should be discontinued and other therapy should be prescribed.

An antimetabolite (azathioprine, 6-mercaptopurine, or methotrexate), a tumor necrosis factor (TNF) inhibitor (infliximab, adalimumab, or certolizumab pegol), or a combination of both, may be used as second-line therapy after corticosteroids and even as first-line therapy as more preferable to corticosteroids. Prescribing these drugs based on measurements of drug and antibody levels resulted in clinical success in most cases. When these lines of treatment fail in patients for whom surgery is not possible or appropriate, newer biologics may be used, including anti-integrins (eg, vedolizumab) or anti-IL-12/23 (eg, ustekinumab). . In addition, other biological agents are rapidly emerging.

If obstruction develops, treatment is first carried out by aspiration through a nasogastric tube and intravenous administration of solutions. Intestinal obstruction in uncomplicated Crohn's disease should resolve within a few days, and therefore does not require specific anti-inflammatory therapy or parenteral nutrition; however, the absence of a rapid response is an indication of urgent surgical intervention and indicates complications or another etiology of the disease.

Fulminant course or formation of abscesses:

If there are signs of intoxication, high fever, ongoing vomiting, the phenomenon of rebound pain, or a painful palpable formation, hospitalization and intravenous administration of solutions and antibiotics are indicated. Abscesses must be drained via percutaneous or surgical access. Intravenous corticosteroids or biologic agents are given only when infection has been ruled out or effectively controlled. If there is no response to corticosteroids and antibiotics within 5-7 days, surgery is usually indicated.

Treatment of Bechterew's disease:

It is not possible to completely cure the disease, but with the help of conservative therapy you can: reduce inflammation; relieve pain syndrome.

The basis for the treatment of ankylosing spondylitis in women and men is the following: non-steroidal anti-inflammatory drugs (NSAIDs); glucocorticoids (they, like NSAIDs, also have an anti-inflammatory effect); immunosuppressants; drugs that are considered biological modifiers (correctors) of the immune response.

The use of non-drug treatment methods also gives good results: eliminating loads on the cervical, thoracic and lumbar spine; physiotherapy - it is used only during remission; Spa treatment.

In sanatoriums for patients with ankylosing spondylitis, mud therapy and balneotherapy are successfully

practiced; breathing exercises-in order to counteract the occurrence of chest immobility physiotherapy.

The patient should sleep on a hard bed. To prevent cervical lordosis from developing, the pillow or cushion that is placed under the neck should be removed.

Conclusion

Crohn's disease and Bechterew's disease are unusual pathological conditions in medicine, which require a compatible cooperative approach to the examination and treatment of patients of these groups by proctologists, gastroenterologists and rheumatologists.

We recommend using the proposed technologies in the practices of surgeons-proctologists and rheumatologists for investigation and medicaments treatment or surgical operations of patients with Crohn's disease and Bechterew's disease.

Abstract: Social anxiety is common in adolescents and often persists into adulthood. Many previous studies have addressed this issue and its interventions in a general psychological context, but not much has focused on the educational sphere. This study aims to explore counsellor strategies for overcoming social anxiety in adolescents and to analyze whether digital self-help bibliotherapy can be an appropriate strategy for overcoming social anxiety in adolescents. The online survey method was conducted on school counsellors (N= 215). The results showed that school counsellors found many students experienced social anxiety, mostly caused by bullying behaviour, socioeconomic conditions, and difficulties in adapting. Counselling strategies to overcome social anxiety include relaxation, humour, self-talk, bibliocounseling and psychoeducation. Further discussions were held regarding the possibility of using self-help digital bibliocounseling. This research has implications for developing effective interventions to help adolescents with social anxiety. The results of this study can be used

to increase understanding of the counsellor's role in providing psychological assistance through digital technology.

Keywords: bibliotherapy, social anxiety, cognitive behavior therapy, self-help, adolescence.

Introduction

Social anxiety is the most common form of anxiety disorder experienced by adolescents (Krygsman & Vaillancourt, 2022), studies show that at the age of 17, the ability to cope with stress is at its lowest (Sagalakova et al., 2016), this relates to events that have been experienced in the past and present. Social anxiety is fear and worries about negative judgment from others (Fredrick & Luebbe, 2022) and this has an impact on avoiding oneself from social contexts and impression-management (Evans et al., 2021), it can also hinder normative development and adversely affect brain function (Smith et al., 2020). Social anxiety is related to shyness and judgment bias (Weeks et al., 2016), loneliness, and depressive symptoms which are internalization problems that are interrelated and often occur together in adolescence (Danneel et al., 2020), so as a preventive measure for something prone to psychological impacts on adolescents, a more in-depth study is needed.

Some of the causes of social anxiety disorder include parenting style, parental discipline, social competence, and self-esteem (Gómez-Ortiz et al., 2016). Individual development in the past has had an impact on adolescent social anxiety at this time, interactive effects of infant temperament and parenting in early childhood particularly in the first 36 months influencing the developmental trajectory of social anxiety in children aged 9-15 years (Lorenzo et al., 2022). Furthermore, social anxiety disorder especially at the age of 15 years is also predicted by maternal inhibition and anxiety (Rapee, 2014). Social withdrawal also occurs when kindergarten age and environmental risk factors coexist such as parental monitoring and peer relationships may predict social anxiety in adolescence. (Buss et al., 2021). So, several factors in the past can predict social anxiety in adolescence.

Social anxiety is closely related to the dimensions of negative self-image and loneliness over time (Maes et al., 2019). Negative self-images such as emotional tone, social attitudes, educational and vocational goals, external mastery, family relationships, and psychological health (Di Blasi et al., 2015). In addition, the role of social media use in adolescents which causes comparisons of adolescent appearances to other people generally influences adolescent social anxiety (Rapee et al., 2022). The use of social media also has an impact on increasing depression and anxiety in both boys and girls (Mundy et al., 2021). Several things related to the role of general interpersonal stressors, peer victimization, and family emotional abuse can also predict adolescent

social anxiety, and adolescents who have more rapid depressogenic reactions are at greater risk of developing social anxiety disorder later in life. (Hamilton et al., 2016). Thus, internal and external dimensions can affect the symptoms of adolescent social anxiety.

One of the effects of social anxiety is suicide. The highest suicidal ideation was observed among adolescents who consistently experienced two or three symptoms simultaneously, such as loneliness and depression as well as anxiety (Liang et al., 2022). Furthermore, psychological insecurity shows a high level of psychological vulnerability in adolescents with a high possibility of impulsive reactions in the form of negative attitudes, self-aggression, and suicidal behavior (Sagalakova et al., 2016). Symptoms of social anxiety can also have an impact on feelings of loneliness and depression that appear in adolescence (Danneel et al., 2019). To reduce the negative impact, an appropriate intervention strategy is needed.

Coping strategies designed to overcome social anxiety. Self-compassion is related to coping strategies in stressful situations which contribute to reducing social anxiety, whereas coping with avoidance can reduce self-compassionate attitudes which can increase social anxiety symptoms (Ştefan, 2019). Social support is also needed regarding mental health problems during the transition from adolescence to adulthood (Scardera et al., 2020), social support will be able to prevent and help individuals with mental health disorders including social anxiety. School counselors are of the helpers who can provide preventive and curative efforts related to social anxiety experienced by students. In providing counseling services, counselors can use approaches and strategies that are appropriate to student problems.

The results of an initial study related to school counselor strategies for overcoming social anxiety are as follows, most school counselors have done cybercounseling, school counselors have used bibliocounseling techniques to deal with anxiety problems and this has been done offline and online using digital media.

The results of research studies on efforts to overcome social anxiety were carried out using the cognitive behavior therapy approach (CBT). Several studies have examined the effectiveness of CBT in overcoming social anxiety. Through randomized controlled trials, Group CBT can overcome the social anxiety of adolescents aged 12-17 years (Lassen et al., 2019). Furthermore, the use of brief cognitive behavior group therapy (bCBGT) and psychoeducational-supportive therapy (PST) in an experimental study showed that the bCBGT group conducted for 6 sessions can overcome social anxiety disorder among medical students. Cognitive models in CBT that are carried out using bibliotherapy guided by a therapist can also reduce avoidance behavior and social anxiety disorder (Santoft et al., 2019). In addition to social anxiety, online CBT-based skills courses can also address anxiety and depression disorders (Williams et al., 2022). Similar research regarding the use of internet-based cognitive behavioral therapy (iCBT) can also overcome social anxiety disorder (Stefanopoulou et al., 2019). Thus, both traditional and online CBT approaches that emphasize cognitive and behavioral aspects can be used as a treatment for anxiety and depression.

More specifically, we want to analyze one of the strategies in CBT that can be used by school counselors in providing counseling interventions. We also try to analyze the self-help digital bibliotherapy model to overcome adolescent social anxiety. Some of the research results related to this matter include randomized trial research on the use of self-help acceptance and commitment therapy (ACT) and traditional cognitive behavior therapy (tCBT) books that can overcome social anxiety in college students (Krafft et al., 2020). Furthermore, studies on Unguided self-help using bibliotherapy can also overcome social anxiety, general anxiety, depression and improve quality of life (Furmark et al., 2009).

Cognitive and affective bibliotherapy can also be used to treat general anxiety in children (Betzael & Shechtman, 2010). In addition to overcoming anxiety, digital bibliotherapy can be used to overcome suicidal ideation and increase optimism in life (Franz et al., 2022). Studies on self-help digital bibliotherapy models have not been carried out much and can be a discourse for further model development, but interventions using bibliotherapy are noted to be used to treat various psychological problems including anxiety, depression, and suicidal ideation.

From the explanation of the study above, it can be concluded that social anxiety often occurs in adolescence and may start from childhood which continues into adulthood. An approach that can be used by counselors to overcome social anxiety is cognitive behavior therapy (CBT) with bibliotherapy techniques that emphasize cognitive aspects. Therefore, we tried to examine the possibility of a self-help digital bibliotherapy model as a form of school counselor treatment strategy in dealing with adolescent social anxiety.

The impacts that can arise from this treatment include high satisfaction, motivation, effectiveness, and efficiency. Nevertheless, many e-learning systems do not achieve the desired goals due to non-compliance and lacking knowledge related to the technique and method for online information system development (Clegg et al., 2003). So, this can be our consideration in designing an online self-help-based treatment.

According to Haron et al. (2019), the importance of digitalizing learning content and assessment is crucial. Consolidating e-learning into traditional teaching is a troublesome duty with many complexities and challenges (Octaberlina & Muslimin, 2020). Assessing e-learning is important (Al-Shagran, 2017). Further, according to (Basilaia & Kvavadze, 2020), it also suggested that online learning quality should be investigated in future studies. Therefore, before conducting an assessment, a need analysis of the indicators of the required assessment instrument should be performed first to get a relevant result (Novaliendy et al., 2015).

This study aimed to analyze the needs for online learning programs comprising the assessment instrument indicators, such as the dimension consisting of Stakeholders, Organization, Technology, Environment, pedagogical and curricular, and the e-learning system quality. The significance of this study was to analyze the required indicators for online learning to know the weaknesses and the strength levels of each required indicator and the accuracy of instruments for conducting online learning assessments later (Novaliendry et al., 2020).

Method

We conducted a descriptive survey design among school counselors (N=215) in East Java using cluster random sampling. Data was collected in February-May 2023. The criterion for education level is Senior High School with students aged between 15-18 years. This report focuses on the efforts of school counselors to deal with social anxiety and examines self-help digital bibliotherapy as an appropriate form of treatment for social anxiety.

The survey for this study was structured to determine counselor strategies for overcoming social anxiety in adolescents. Data were collected online using Google Forms, which is a secured web-based survey. The survey link was distributed to school counselors through social media tools (e.g., Facebook, WhatsApp, and Instagram). In addition, to increase survey participation by asking respondents to forward the survey link to their colleagues in the current area. In the questionnaire, we explain the purpose of the study, and participation is voluntary, there is no risk in filling out the survey. We asked the participants to include their contact information (i.e., name, workplace, phone number and email address). The confidentiality of their information was assured. The survey started with an online consent form followed by survey questions.

Descriptive statistics were used to analyze the data, and the mean \pm standard deviation of the continuous variables was utilized to illustrate the results. The statistical software SPSS (IBM corporation) was used for all statistical analyses. Data on the possibility of future treatment using self-help digital bibliotherapy will be discussed.

Results and Discussion

Participant

The characteristics of participants in this sample consisted of 215 high school counselors in East Java, with participants including 115 female counselors and 100 male counselors, the majority of whom were undergraduates in the field of guidance and counseling. Table 1 shows the characteristics of participants.

Table 1. characteristic of participant

Counselor Strategies in Dealing with Social Anxiety

The survey results show that school counselors (>90%) have found students experiencing anxiety, both general anxiety and social anxiety. Social anxiety causes overcome in diagram 1.1.

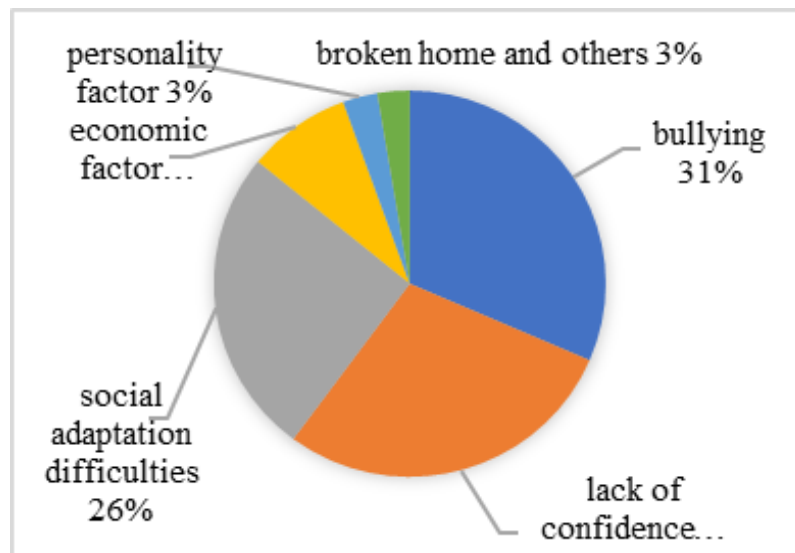

Diagram 1.1 causes of adolescent social anxiety

The causes of social anxiety experienced by adolescents include bullying (29,7%), lack of confidence (27%), difficulty adapting (24,3%), family economic conditions (8,1%), student personality (2,7), broken home and a combination of other causes (2,7%). Study results show that bullying can increase stress and anxiety that interfere with their ability to function (Albdour et al., 2017). Aspects that involve peers have a significant influence on reducing adolescent social anxiety, such as peer relations and positive self-confidence will make adolescents tend to be more satisfied with school and this can reduce social anxiety (Flick et al., 2022). In addition, self-confidence can also be increased by cognitive restructuring techniques and effective self-instruction in the CBT approach (Chandra et al., 2019).

The counselor's strategy in dealing with adolescent social anxiety is using counseling (62,2%), guidance (27%), and dan combination (2,7%). The guidance strategy that is usually carried out is group guidance (63,9%),

classical (52,8%), role playing (19,4%), using media (16,7%), and others (2,8%).

Diagram 1.2 guidance strategies

Diagram 1.3 counselor's strategies

The counseling approach taken to overcome adolescent social anxiety uses rational emotive behavior therapy/REBT (34,3%), person-centered therapy / PCT (25,7%), solution-focused brief therapy / SFBT (17,1%), cognitive behavior therapy / CBT (14,3%), psychoanalysis and eclectic (2,9%). The approaches used to overcome social anxiety are supported by the results of previous studies, namely REBT which can significantly reduce adolescent social anxiety. (Iyeke & Lawrence, 2022). Furthermore, digital storytelling in REBT can be used in online psychology services to reduce social anxiety and increase academic and social integration of adolescents (Pordelan et al., 2022).

Apart from REBT, a similar approach, namely CBT, is also effective in dealing with adolescent social anxiety

(Santoft et al., 2019), Likewise, brief cognitive behavior group therapy (bCBGT) is also effective for dealing with social anxiety (Samantaray et al., 2021). The person centered approach to addressing adolescent social anxiety is not widely practiced, but one study stated that PCT can contribute to client change but not substantially (Stephen et al., 2011). From several previous studies, the most widely used approach to overcome social anxiety is REBT and CBT.

Counseling techniques that are often used by school counselors in overcoming social anxiety include relaxation techniques (55,6%), self-talk (41,7%), humor (30,6%), psychoeducation dan role playing (16,7%), bibliocounseling and cinematherapy (11,1%), systematic desensitization (8,3%), eclectic (2,8%). The results of studies that support the findings include the development of relaxation techniques such as Computerized interpretation bias modification (IBM) programs with progressive muscle relaxation (PMR) which are useful for overcoming social anxiety. (Cogle et al., 2020).

Furthermore, self-talk techniques that reinforce themselves are negatively related to their anxiety (Shi et al., 2015), so positive self talk will contribute to reducing anxiety.. Humor coping can directly improve the Internal Health Locus of Control (HLoC) and indirectly reduce social dysfunction (anxiety & depression)(Sumantri et al., 2021). Eclectic interventions such as cognitive restructuring, role playing approaches and cognitive coping skills can be useful for increasing self-assertiveness and reducing social anxiety in students (Tavangar & Yazdkhasti, 2013). Furthermore, for bibliotherapy techniques will be discussed further in the following discussion.

Self-help Digital Bibliotherapy in Dealing with Social Anxiety in Adolescence

Based on the basic concepts explained above, social anxiety is fear and worry related to the social context. Past and present experiences influence the way individuals think about social situations that make them anxious. So a strategy is needed that is by the cognitive domain as a modality in overcoming social anxiety. Bibliotherapy is a technique that focuses on changing individual cognitive aspects through reading materials both offline and online and is suitable for overcoming social anxiety (Corey, 2015).

The survey results show that school counselors have used bibliotherapy to treat social anxiety (57,9%), and bibliotherapy has been done online (52,6%) dan offline (47,4%). Furthermore, school counselors have never developed media for bibliotherapy (73,7%). Thus bibliotherapy can be used as an alternative in overcoming adolescent social anxiety for school counselors.

Several studies related to the use of bibliotherapy in overcoming psychological problems including anxiety, among others, bibliotherapy is effective in reducing depression and anxiety in adolescents (Yuan et al., 2018). The use of affective and cognitive bibliotherapy can also reduce social anxiety in children (Betzael & Shechtman, 2010), including the child's anxiety and fear at night (Lewis et al., 2015). Furthermore, the combination of three strategies namely internet treatment (CBT), guided internet treatment (U-ICBT) and as

unguided bibliotherapy can significantly reduce social anxiety (Hedman et al., 2016). The book project can be used as a bibliotherapy tool for children with social anxiety (Sundman, 2020), and the combination of app use and bibliotherapy showed reductions in social fear after 6 weeks and social anxiety after 12 weeks (Carlbring et al., 2017), another development is that the use of podcasts serves as an evolution of the traditional practice of bibliotherapy and provides guidelines for selecting and effectively integrating podcasts into clinical practice (Casares & Binkley, 2021). Thus the bibliotherapy technique allows it to be used as a treatment in overcoming adolescent social anxiety.

In this study, bibliotherapy was assessed using a digital self-help model. Some research supports the use of this model in overcoming social anxiety disorder, including, Treatment through smartphone applications as an addition to internet-based unguided self-help is effective in overcoming social anxiety disorder (Boettcher et al., 2018). The ACT and CBT-based online Bibliotherapy self-help book model is effective for students with depression (Davis, 2021). The self-instruction module is effective for reducing the level of social anxiety in adolescents (Khandagale & Dumbray, 2017). Effective use of a mindfulness-based self-help approach and acceptance for social anxiety.

Significant changes were also observed in self-compassion, mindfulness, acceptance, and depression (Kocovski et al., 2019). Doing What Matters in Times of Stress (DWM) is a five-module transdiagnostic guide self-help (GSH) intervention developed by the World Health Organization. Guided self-help bibliotherapy is a transdiagnostic intervention that is freely available and appears to be efficacious for internalizing symptoms of disorders (Lorenzo-Luaces et al., n.d.). From the results of the research above, the use of bibliotherapy techniques on digital platforms and designed in the form of unguided self-help can be used as a guidance or counseling tool in overcoming social anxiety disorders in adolescents.

The limitation of this research is that the context of social anxiety in adolescents has not yet reached children and adults. This research also limits the discussion regarding predictions of future treatment which focuses on self-help digital bibliotherapy. Suggestions for future researchers are to develop a self-help digital bibliotherapy model and conduct related experiments.

Conclusion

Social anxiety experienced by adolescents is a maladaptive belief such as a pervasive condition characterized by irrational thoughts and constant fear or worry about social performance, as well as the potential for social avoidance. The counselor's strategy is to provide counseling services with various techniques such as relaxation techniques, self-talk, humor, psychoeducation dan role-playing, bibliocounseling and cinematherapy, systematic desensitization, and eclectic. This study also examines the possibility of a self-help digital bibliotherapy model as a form of school counselor treatment strategy for overcoming adolescent social anxiety

Recommendations

This study discusses the appropriate strategy to overcome social anxiety. Services provided by school counselors use a counseling approach, one of which is the cognitive behavior therapy (CBT) approach. This research is a foothold in the development of a CBT counseling model using self-help digital bilbiotherapy which will be developed in future research.

Acknowledgements

We are grateful for the contributions of the Lembaga Pengelola Dana Pendidikan (LPDP), Universitas Negeri Malang and school counselors in East Java for their participation and support in this work.

Abstract: In today's society, more people are conscious of and concerned with their physical appearance and body image. As a result, many people prefer to undergo body and cosmetic enhancements to match the desired standards and to address psychological and societal demands. Employability and career advancement are two of the reasons why a person wants to undergo body and cosmetic enhancement. The research aims to determine the relationship between body and cosmetic enhancements, employability, and career development through quantitative methods. The study focused on young adults ages 18 and above who underwent body and cosmetic enhancements, such as makeup, surgical and non-surgical enhancements, and other aesthetic practices, in the capital region of the Philippines. The data was treated using statistical tools such as Statistical Package for the Social Sciences (SPSS) and Structural Equation Modeling (SEM). The study's findings showed that confidence

and informed cosmetic choices significantly impact transformative insights, work experience, the creation of an impressive portfolio, appearance and professional opportunities, and self-presentation. A person's educational attainment significantly affects work preparedness, passion, diverse work experiences, good recommendations from management, work ethics, the acquisition of new skills, a solid personal brand, and positive feedback. The person's neat appearance greatly influences holistic approaches to career success and media beauty standards, physical appearance, length of service, societal pressure, media portrayal, peer opinions, and tight connection. The study also revealed that accepting the natural body greatly affects a person's perspective on career advancement.

Keywords: Body Enhancement, Career Development, Cosmetic Enhancement, Employability, Structural Equation Modeling

ISTES.

Introduction

People today are becoming more aware of and concerned about their physical appearance and body image. Different cosmetics and body clinics have emerged, and the rise of their popularity appears to be emphasized and glamorized by the public. According to Sharp (2018), individuals may be mocked, discriminated against, and stigmatized when they do not satisfy societal norms for physical attractiveness. They may have heightened sensitivity to rejection based on physical appearance. As a result, many people prefer to undergo body and cosmetic enhancements to match desired standards or to address psychological and social demands.

Body enhancement is defined as the natural, artificial, or technological modification of humans to improve physical or mental capacities (Issah, 2022). Individuals have the empowering option to enhance or reconstruct their bodies as they see fit. Cosmetic procedures are a choice made by those seeking to improve their self-confidence by addressing concerns about the size, shape, color, or texture of specific body features (Sutter Health, 2018).

Various reasons influence a person's desire to undergo body and cosmetic enhancement to improve their appearance, one of which is employability. According to Pan (2021), a person's appearance may have a halo effect in the workplace, particularly in recruiting and employee potential appraisal. Also, most businesses would prefer to recruit individuals with a more appealing appearance. However, according to Antonellis (2019), people who have body modifications and enhancements have both negative and positive attitudes, and visible body alteration is a substantial barrier to employment.

Furthermore, in some cases, body and cosmetic enhancements were used for career advancement. Soergel (2021) claims that people deemed more attractive experience more positive reinforcement as they age, which may affect their confidence as adults. Career advancement may be impacted by confidence. In China, according to Wu, Mulken, and Alleva (2022), a more attractive appearance is associated with a higher work performance rating and better promotion prospects. As a result, women may seek to alter their appearance through cosmetic surgery to advance in their careers.

The main objective of this study is to investigate and understand the multifaceted relationship between body and cosmetic enhancements, employability, and career development among individuals in various industries and demographic groups. Specifically, the study aims to determine the impact of body and cosmetic enhancement on an individual's employment and career development, to learn about the predictors of employability and career advancement for people who undergo body and cosmetic enhancement and to assess the relationship of body and cosmetic enhancement to an individual's employment and career development, to develop a Structural Equation Model (SEM) that explains the models and has a good model fit.

Body and Cosmetic Enhancement

According to the ISAPS 2021 Global Survey on Aesthetic/Cosmetic Treatments, plastic surgery treatments have increased significantly worldwide by 19.3%. 17.5 million non-surgical operations and over 12.8 million surgical ones were carried out. The surgical technique that has seen the highest increase is liposuction, which has overtaken procedures including breast augmentation, eyelid surgery, rhinoplasty, and abdominoplasty to become the most popular. Botulinum toxin, hyaluronic acid, hair removal, skin tightening, and fat reduction were the most popular non-surgical therapies. Women still prefer breast augmentation, although the number of breast lifts and implant removals has considerably increased. The number of facial and head procedures increased by 14.8%, with eyelid surgery being the most popular, particularly among men. The fastest-growing procedures were thigh lifts, buttock lifts, and augmentation, which have significantly increased since 2017.

Self-esteem can be briefly defined as a personality trait linked to one's emotional and mental well-being. It is also viewed as a multifaceted model encompassing global self-worth, physical self-esteem, physical condition, sports competence, physical strength, and attractiveness. The assessment of self-worth is categorized as either high (indicating positive self-esteem) or low (reflecting negative self-esteem). This distinction becomes especially critical during adolescence when physical appearance is essential, leading to increased peer scrutiny and ranking.

Consequently, an individual's acceptance in social circles is closely tied to their physical appearance. Experiencing rejection in these social contexts can give rise to doubts about one's appearance and self, detrimental to body perception and self-esteem. Thus, during adolescence, body perception and self-esteem evolve as psychological factors significantly influenced by social dynamics (Khalaf et al., 2021).

According to Amanda Sharp (2018), a person's self-esteem and confidence may increase depending on how satisfied they feel about themselves following a cosmetic operation. Preoccupation with physical appearance may occasionally get to the point where it starts interfering with a person's ability to function in social settings, work, and other areas of life. When one has this amount of anxiety, and there is no or very little perceived problem with their looks, it may be a sign of body dysmorphic disorder (BDD; Castle et al., 2004). As a result, people who seek cosmetic modifications may experience internal and external mental suffering as well as functional damage.

Employability

According to Ali and Jalal (2018), higher education assists students in developing employability skills, which implies that they can find and stay a job, contribute improvements to the working environment, and improve their proficiency for development. Higher education is altering its goals to better prepare students for careers, chances, progressive employment, training for the working world, and a greater understanding of their capacities. Students benefit from higher education to improve employability skills now, which implies allowing students to find and hold a job, allowing them to bring about changes in the working world, and similar competencies for development.

People with noticeable bodily alterations have both negative and positive opinions, according to Antonellis (2019), and they represent a considerable impediment to work. However, in some cases where visible body modification is permitted, the type of employment, industry impact, and competency of the applicant with visible body modification were also considered decisive factors. The study has also shown that altering one's physical appearance may negatively impact one's employment prospects. These findings emphasize the importance of carefully considering the ramifications of wearing a visible body modification for both the individual and the organization.

The effect of one's appearance on their employment has recently come under more attention. Many people are using cosmetic operations and grooming techniques to improve their physical appearance as the popularity of beauty enhancements grows. The importance of personal branding and how one displays oneself in specific circumstances was underlined in Natasha Edge's 2019 article. She emphasized that these factors are crucial for fostering the appropriate mindset and increasing self-confidence, but they are also crucial for directing one's professional life in the right direction (Edge, 2019). A person's physical appearance can have a substantial impact on their ability to find employment, advance in their careers, and eventually raise their long-term earning potential.

It might be difficult to accept this truth, especially when taking into account the abilities and accomplishments one has amassed within their organization. It can be depressing to consider that, despite unshakable dedication

and determined efforts, one's physical appearance might be the only thing keeping them from reaching their goals. While it can be tempting to think that talent, perseverance, and knowledge are the only elements that determine work success, it's important to consider whether other factors, like one's appearance, also have a significant impact on one's chances for career progression.

Career Development

In recent times, physical appearance has become a topic of significant debate, exerting influence across various aspects of individuals' lives. Research has demonstrated the existence of the attractiveness-induced halo effect, particularly within the workplace context. This effect is particularly evident in recruitment decisions and assessments of employee potential. A considerable number of businesses tend to favor the recruitment of individuals who possess a more aesthetically pleasing appearance, as they are often perceived as more competent by employers. Employers favor candidates who have facial attractiveness. Those with lovely and handsome faces are more likely to earn a raise not only when job hunting but also at work (Pan, 2021).

In terms of career development, physical attractiveness has developed into a valuable asset in the Chinese work market due to its productive qualities and marketing appeal (Wu et al. 2022). Many Chinese businesses, including government organizations, now require applicants seeking jobs to be attractive. Additionally, in China, having a more attractive appearance is associated with better performance reviews and more opportunities for job progression. Women may therefore think about cosmetic surgery as a way to improve their looks and possibly secure a more lucrative job path.

Method

Data Collection

According to Swaraj (2022), exploratory research can help us comprehend subjects or fields about which we know little or nothing, but it cannot answer research questions or offer definitive answers. This frequently happens when measuring a phenomenon is challenging. The study was exploratory research that used in-depth research into the relationship between body and cosmetic enhancements, employability, and career development. The research methodology employs quantitative techniques by gathering data through surveys. It is a research technique used to investigate how or why something occurs when there is little understanding of the issue.

Quantitative approaches entail the examination of numerical variables and data that may be measured and statistically examined. According to Mills (2021), a quantitative survey design is often used in large-scale research and depends heavily on closed questions to collect information that can be analyzed rapidly, such as multiple-choice or dichotomous response replies. The data collected in a quantitative survey is numerical and is typically analyzed using statistics.

Table 1. Demographics

<i>Variable</i>	<i>Category</i>	<i>No.</i>	<i>Response Information N=222</i>
Age	18-25	44	19.8%
	26-30	58	26.1%
	31-35	67	30.2%
	36 above	53	23.9%
Gender	Male	81	36.5%
	Female	119	53.6%
	Prefer not to say	22	9.9%
Civil Status	Single	135	60.8%
	Married	55	24.8%
	Widowed	18	8.1%
	Separated	14	6.3%
Location	Quezon City	52	23.4%
	Makati City	35	15.8%
	Marikina City	31	14%
	Pasig City	25	11.3%
	Taguig City	24	10.8%
	Mandaluyong City	13	5.9%
	Others	42	18.8%
Profession	Manager/Supervisor	30	13.5%
	Entrepreneur	29	13.1%
	Model	23	10.4%
	Flight Attendant	21	9.5%
	Engineer	19	8.6%
	Receptionist	17	7.7%
	Others	83	37.2%
Industry	Fashion	34	15.3%
	Hotel and Restaurant	33	14.9%
	Retail	26	11.7%
	Commercial Aviation	23	10.4%
	Academe	21	9.5%
	BPO Industry	19	8.6%
	Others	66	29.6%
Educational Attainment	College Graduate	135	60.8%
	Undergraduate	52	23.4%
	Master's Degree Holder	23	10.4%
	Doctoral Degree Holder	7	3.2%

Income	Senior High School Graduate	3	1.4%
	High School Graduate	2	0.9%
	40.001 above	88	39.6%
	30,001-40,000	70	31.5%
	20,001-30,000	33	14.9%
	10,000 below	21	9.5%
Amount spend for enhancement	10,001-20,000	10	4.5%
	10,000 below	123	55.4%
	10,001-20,000	58	26.1%
	40.001 above	21	9.5%
	20,001-30,000	13	5.9%
	30,001-40,000	7	3.2%

The demographic profile of the study includes two hundred twenty-two people from the National Capital Region. It demonstrates a diverse representation across multiple categories. The respondents were employed individuals residing in the National Capital Region, 36.5% were male, 53.6% were female, and 9.9% preferred not to say, who had undergone a major or minor degree of body and cosmetic enhancement surgery. The age distribution shows that the participants were at least 18-25 years old (19.8%), 26-30 with 26.1%, 31-35 with 30.2%, and 36 above with 23.9%. The participants' civil status was 60.8% single, 24.8% married, 8.1% widowed, and 6.3% separated. In terms of profession, 13.5% were managers/supervisors, 13.1% were entrepreneurs, 10.4% were models, 9.5% were flight attendants, 8.6% were engineers, 7.7% were receptionists, and 37.2% did something else. Those respondents work in a variety of industries, including fashion (15.3%), hotel and restaurant (14.9%), retail (11.7%), commercial aviation (10.4%), academia (9.5%), BPO (8.6%), construction (5.9%), and others (23.7%).

In terms of educational attainment, the majority of respondents (60.8%) were college graduates, followed by undergraduates (23.4%), master's degree holders (10.4%), doctoral degree holders (3.2%), senior high school graduates (1.4%), and high school graduates (0.9%). Furthermore, the monthly income distribution shows that 39.6% of participants have 40,001 or more income, 31.5% have 30,001 to 40,000 income, 14.9% have 20,001 to 30,000 earnings, 9.5% have less than \$10,000 income, and 4.5% have 10,001 to 20,000 income. Finally, the money spent by participants on enhancements reflects a diverse final background. The majority of participants spent \$10,000 or less (55.4%), followed by 10,001-20,000 (26.1%), more than 40,001 (9.5%), 20,001-30,000 (5.9%), and 30,001-40,000 (3.2%).

Data Analysis

Kaiser-Meyer-Olkin Test

Kaiser-Meyer-Olkin (KMO) Sample Measurement Adequacy. The KMO test is a measure designed to determine the acceptability of data for factor analysis. In other words, it determines whether the sample size is adequate.

The test determines sampling sufficiency for each variable in the model as well as the overall model. KMO values range from zero to one. KMO values of 0.8 to 1.0 imply that sampling is appropriate (Shrestha, 2021).

Furthermore, this study used an online sample size calculator to determine the number of respondents needed to represent the population. The parameters used to calculate the number of respondents needed are a 90% confidence interval and a 10% margin of error.

Exploratory Factor Analysis

Exploratory factor analysis (EFA) is a type of multivariate statistical method that seeks to identify the smallest number of hypothetical constructs (also known as factors, dimensions, latent variables, synthetic variables, or internal attributes) that can adequately explain the covariation observed among a set of measured variables. The goal is to identify the common factors that explain the order and structure of measured variables. In the social and behavioral sciences, factors are assumed to be unobservable characteristics of people, which are manifested in differences in their scores on the measured variables (Watkins, 2018).

Measures

Body and cosmetic enhancements include a wide range of items and treatments that can be used to enhance and improve one's appearance and self-esteem, either surgically or non-surgical operations. According to Davis and Arnocky (2019), the current review defines appearance enhancement as a self-promotion approach used to increase reproductive success by making oneself more attractive to mates than rivals, hence boosting one's mate value. The various ways in which humans enhance their appearance are explained, as are the different tactics used by men and women to enhance their looks, which correspond to opposite-sex partner preferences in a heterosexual environment.

Based on the study of Ganesan (2018), employability is improved by a good academic record plus skills and attributes that enable you to adapt and manage the constantly changing work environment. Employability skills are transferable abilities that an individual must possess to be considered "employable." Employers frequently describe a set of abilities that they expect from an employee, in addition to solid technical understanding and subject knowledge. Teamwork, problem-solving, self-management, business knowledge, literacy and numeracy related to the role, ICT expertise, good interpersonal and communication skills, the ability to use one's initiative while still following directions, and leadership qualities were required.

According to Whitfield (2022), career development is the evolution of short-term measures taken toward long-term professional goals. It entails developing role-specific skill sets, which can include taking night classes, networking, seeking a mentor, and taking on new duties in your existing employment. Determine a career objective, then sketch out the experience, competencies, and contacts you'll need to get there.

Data Gathering

The research focuses on investigating the relationship between body and cosmetic enhancements, employability, and career development. It involves a sample of 222 individuals from the National Capital Region, Philippines, who have undergone body and cosmetic enhancement operations, with participants being both male and female and at least 18 years old. Body and cosmetic enhancements are defined as procedures aimed at improving appearance and self-esteem, encompassing both surgical and non-surgical operations. The study emphasizes the importance of appearance enhancement as a means of increasing reproductive success and mate value, drawing from previous research by Davis and Arnocky (2019).

Employability is described as the combination of a good academic record, adaptable skills, and attributes necessary to navigate the changing work environment, as per Ganesan (2018). Employability skills encompass a range of abilities sought by employers, including teamwork, problem-solving, communication, and leadership. Career development involves actions taken to progress toward long-term professional goals, such as acquiring role-specific skills, networking, and seeking mentorship, as outlined by Whitfield (2022).

Data gathering utilized quantitative methods. Quantitative methods involved Likert survey questions to assess attitudes and perceptions. Data analysis employed statistical tools such as the Statistical Package for Social Sciences and the Structural Equation Model to evaluate the relationship between body and cosmetic enhancement, employability, and career development. Overall, the study aims to provide insights into how body and cosmetic enhancements impact employability and career development, utilizing quantitative approaches to gather and analyze data from the respondents.

Factor Analysis

Multiple phases were involved in processing the data. Metrics such as the KMO and total variance explained are used to identify whether there is enough variation in the data to explain hidden constructs. Reliability testing using Cronbach's alpha was also conducted to determine if the metrics in each construct measure the construct adequately. Moreover, correlation analysis is employed to determine if certain demographic variables are related to the identified factors. Lastly, statistical modeling was utilized to identify the relationship between the variables simultaneously. In statistical modeling, the model created must conform to model fit indices.

Table 2. Factor Analysis Results

Corresponding Measures	Code	Factor Loadings
Demonstrate a passion and enthusiasm for one's work has a favorable effect on professional advancement	CD7	0.732
I believe that gaining diverse work experiences across different industries positively impacts career development	CD5	0.722

Getting good recommendations and support from the management boosts your likelihood of getting promoted.	CD6	0.722
I believe having a strong work ethic contributes to my career advancement	CD9	0.721
I believe acquiring new skills and staying updated with trends is relevant for career development.	CD2	0.697
I believe maintaining a strong professional reputation and personal brand is essential for career development.	CD4	0.696
I believe the level of education and continuous learning opportunities have an impact on career development	CD1	0.664
Positive feedback from previous employers enhances employability prospects	E10	0.579
I believe that dressing professionally and maintaining a neat appearance positively impacts employability	E9	0.577
I believe that people should accept their natural body rather than trying to enhance their appearance in any way	BCE12	0.696
I believe that having a tight connection to the executive level can lead to employment advancement	CD10	0.676
Peer opinions influenced my decision to get a cosmetic enhancement	BCE6	0.658
I believe my perception of beauty is influenced by media portrayal of enhanced bodies	BCE4	0.635
I think that considering a body or cosmetic enhancement as motivated by societal pressure	BCE2	0.624
I believe the length of service in an organization significantly impacts career development	CD3	0.617
Physical appearance has a big impact on job advancement	CD8	0.545
I feel the media creates an unrealistic beauty standard, which leads to a desire for body or cosmetic enhancement	BCE7	0.514
I believe my overall happiness has increased since having a body or cosmetic enhancement	BCE3	0.812
I do not doubt that having a body or cosmetic enhancement has improved my self-esteem	BCE8	0.776
I feel more confident in myself now that I've had a body or cosmetic enhancement	BCE1	0.742
I think that before making a choice, people should be informed about the advantages and disadvantages of cosmetic enhancements	BCE9	0.621

I believe higher education qualifications enhance job prospects	E4	0.687
I believe effective self-presentation significantly impacts employability	E6	0.645
I think a person's capacity to get work in various professions can be impacted by their physical appearance	E2	0.607
A well-written and tailored resume significantly improves employability	E1	0.571
Having appropriate work experience boosts employability	E5	0.542

The rotated component matrix is in its treated version. Several items were eliminated from the data after it was treated. This is because the items did not experience any factor loadings, i.e., their loading value was less than the fixed value of 0.50 used to calculate the factor loading. Cross-loading, where some items experienced loading factors on two different columns, is another reason. Additionally, the calculated KMO score of 0.947 is higher than the minimum cut-off of 0.8, indicating that the data set is a sufficient sample. Furthermore, the total variance explained has four components, and the data imply that the overall variance is 64%, meaning that 36% of the study remains unexplained and 72% of the research is explained by the findings.

Reliability Testing

Table 3. Reliability Testing

Factors	No. of items	Cronbach's Alpha	Cut-off	Remarks
Trans Insight	9	0.930	≥ 0.7	Acceptable
Work Preparedness	8	0.869	≥ 0.7	Acceptable
Perspective	4	0.861	≥ 0.7	Acceptable
Holistic Approach	5	0.820	≥ 0.7	Acceptable

The factor analysis is displayed in the table above. Cronbach's Alpha is used in reliability testing to gauge how strongly the items within the component factors are associated with one another. Cronbach's alpha is a measure of internal consistency, or how closely linked a group of things is as a whole. It is regarded as a metric of scale reliability. Cronbach's alpha is frequently used to assess the reliability of internal consistency. A reliability coefficient of 0.70 or above is regarded as "acceptable" in most research scenarios (Sileyew, 2019). With scores of 0.930, 0.869, 0.861, and 0.820, respectively, the component factors Transformative Insight (C1), Work Preparedness (C2), Perspective on Career Advancement (C3), and Holistic Approach to Career Success (C4) over the normal cut-off of 0.7 received acceptable remarks.

There is a positive weak relationship between age and transformative insights. This can mean that transformative insights predict the age of an individual by 4%. The mean score obtained in the survey results about age is 2.60. This means that the respondents who are ages 31 to 35 and 36 and above have better transformative insights.

Industry & Transformative Insight- .214

There is a positive weak relationship between money spent on body enhancement and transformative insights. This can mean that the transformative insight predicts the industry by 5%. The mean score obtained in the survey about the industry is 5.85. This means that participants in the business process outsourcing, entertainment, fashion, beauty, and medical industries have a more transformative perspective.

Money Spend On Body Enhancement & Work Preparedness - .258

There is a positive weak relationship between money spent on body enhancement and work preparedness. This can mean that work preparedness predicts the money spent on body enhancements by 7%. The mean score obtained in the survey about how much money they spend on body enhancement is 1.83. This means that participants who spend at least 20,000 are better prepared for work.

Money Spend To Body Enhancement & Transformative Insight - .323

There is a positive weak relationship between money spent on body enhancement and transformative insights. This can mean that the transformative insight predicts the money spent by an individual /on body enhancements by 10%. The mean score obtained in the survey results about money spent on body enhancement is 1.83. This means that the respondents spending 20,000 and above on body and cosmetics enhancements have better transformative insights.

Money Spend To Body Enhancement & Perspective on Career Advancement- .242

There is a positive weak relationship between money spent on body enhancement and perspective on career advancement. This can mean that the perspective of someone on advancement predicts the money spent on body enhancements by 6%. The mean score obtained in the survey results about money spent on body cosmetics is 1.83. This means that the respondents spending 20,000 and above on body and cosmetics enhancements have a better perspective toward advancement.

Money Spend To Body Enhancement & Holistic Approaches to Career Success- .219

There is a positive weak relationship between money spent on body enhancement and Holistic Approaches to Career Success. This can mean that the holistic approach to career success predicts the money spent on body enhancements by 5%. The mean score obtained in the survey results about money spent on body cosmetics is

1.83. This means that the participants spending 20,000 and above on body and cosmetics enhancements have a better understanding of the holistic approaches to career success.

Income & Transformative Insights- .292

There is a positive weak relationship between money spent on body enhancement and transformative insights. This can mean that the transformative insight predicts the income by 9%. The mean score obtained in the survey results about income is 3.87. This means that participants with an income of 40,000 or higher have more transformative insights.

Factor	A	B	C	D	E	F	G	H	I	J	K	L	M

** . Correlation is significant at the 0.01 level (2-tailed).

* . Correlation is significant at the 0.05 level (2-tailed).

* Note: A = Age; B = Gender; C = Civil Status; D = Location; E = Profession; F = Industry; G = Educational Attainment; H = Income; I = Money Spent to Body Enhancement; J = Work Preparedness; K = Transformative Insights; L = Perspective to Career Advancement; M = Holistic Approach to Career Success

Statistical Modeling

The researchers employed statistical modeling, specifically structural equation modeling (SEM), to assess constructs that cannot be directly measured by instruments but can be inferred from other measurable constructs. In structural equation modeling (SEM), the relationship between variables generates a structural model. This structural model can be explained using structural equations, for example, in regression analysis. This structural equation describes the relationship between the latent (exogenous) independent variable and the latent (endogenous) dependent variable. Researchers using structural equation models must know whether or not the model constructed using empirical data has a unique value to estimate it. If the model lacks a unique value, it is unable to be identified. A model's cause is classified as unidentified because the information provided in empirical data is insufficient to yield a unique answer when computing model estimation parameters (Hidayat and Wulandari, 2022).

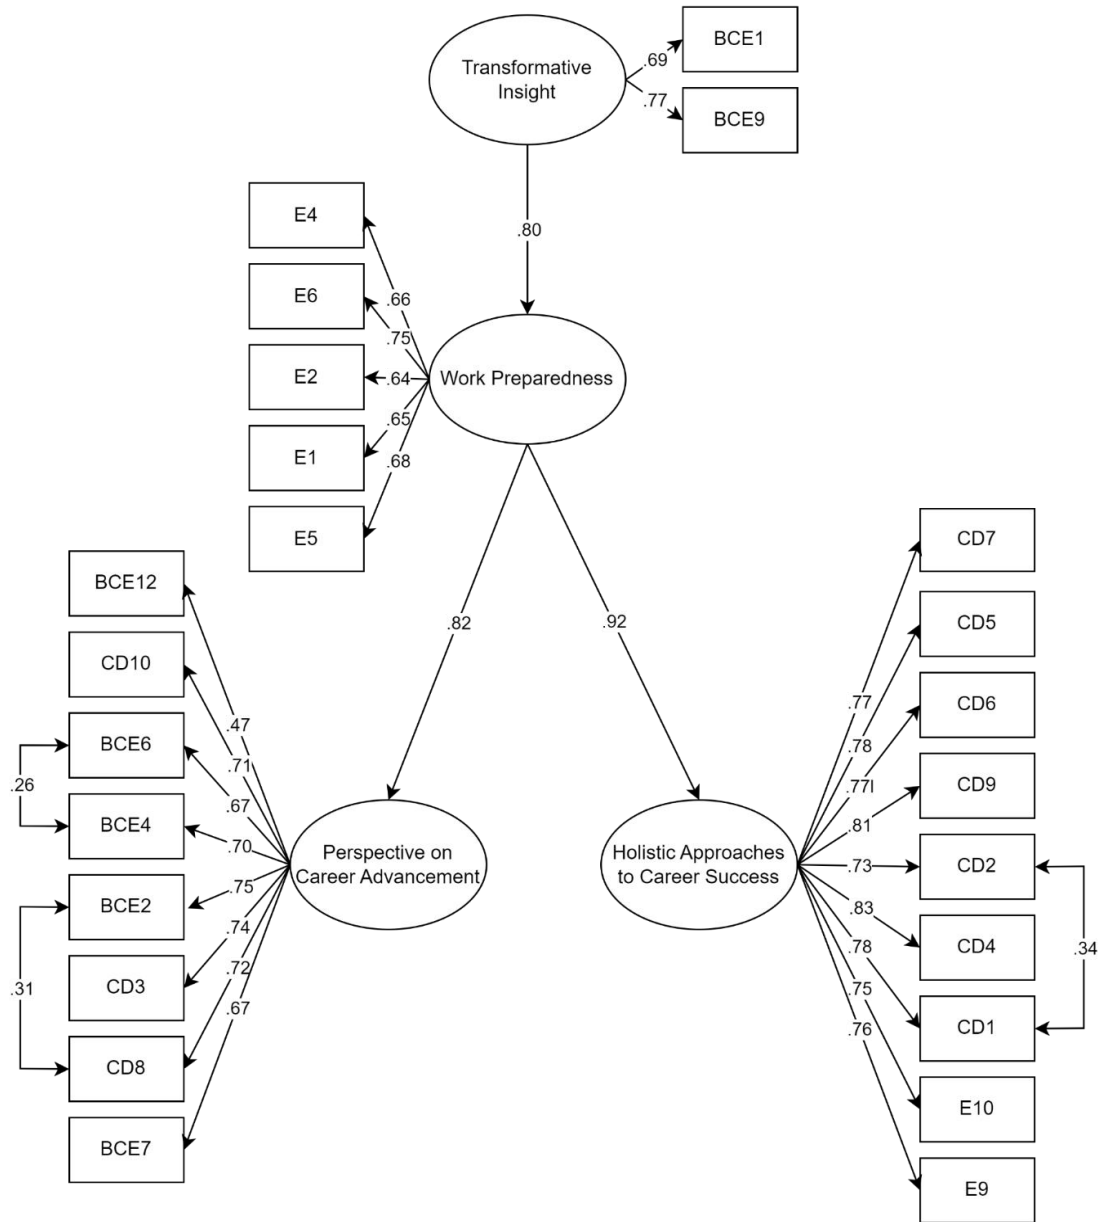

Figure 1. Structural Equation Modeling (SEM)

Figure 1 depicts the Structural Equation Modeling of the study. Understanding transformative insight within organizational transformations involves conducting a thorough evaluation of change readiness, which encompasses the preparedness of leaders, employees, and the transformation program itself. As stated by Jahn et al. (2021), this concept is closely intertwined with work preparedness, as it requires assessing whether leaders possess the requisite skills and experience to navigate change, gauging employees' readiness to embrace new approaches, and ensuring that the transformation program is adequately supported with resources and systems. Through a systematic assessment of change readiness, organizations can pinpoint areas of full, partial, or lacking preparedness, empowering leaders to implement targeted measures to bolster work preparedness and enhance the likelihood of success. This approach transcends mere anecdotal observations and intuitive judgments,

instead relying on data-driven insights to inform strategic decision-making and foster effective change management strategies.

Transformative insight plays a crucial role in effective career management by empowering individuals to navigate transitions, seize opportunities, and develop resilience when confronted with challenges. In contrast, mentorship acts as a catalyst for fostering and applying transformative insight. It offers mentees the necessary guidance, support, and resources to navigate their career paths with clarity, confidence, and purpose. By harmonizing transformative insight and mentorship, individuals can unleash their complete potential and attain lasting success in their chosen professional domains. (Speaker Agency, 2024)

The model highlights the importance of taking into account various aspects of an individual's life, including skills, interests, values, and environmental factors, when making career decisions. This approach aligns with the concept of work preparedness, which goes beyond technical competence to encompass a thorough understanding of one's personal attributes and circumstances in relation to career goals (DreamGravity, 2023). The holistic view of career success emphasizes the need for balance and integration across different areas of life, recognizing that career satisfaction is intertwined with overall well-being. Promoting self-awareness, exploration, and informed decision-making assists individuals in aligning their career choices with their personal goals and values, ultimately fostering sustained fulfillment and achievement in the professional realm. Thus, the holistic approach contributes to career success by advocating for a comprehensive evaluation of individuals' abilities, interests, and aspirations in guiding their career paths.

Career readiness involves acquiring essential skills, knowledge, and confidence for transitioning from education to employment and pursuing fulfilling careers. As suggested by Heine (2023), this aligns with the idea of work preparedness, emphasizing the need for both technical and soft skills for workplace success. Additionally, career readiness empowers individuals to actively pursue growth opportunities, enhancing their employability and career advancement prospects. Scholars emphasize the significance of career readiness in bridging the education-to-employment gap and fostering long-term career success. Overall, career readiness plays a pivotal role in individuals' professional development and success.

Capabilities are referred to as "work readiness," which includes a variety of attitudes, actions, and abilities that equip people to carry out their professional roles in the workplace. Because of this, work-ready ECPMs have the qualities (behaviors, beliefs, and abilities) needed to successfully contribute to the completion of projects in project-based organizations (Borg et al., 2023).

Table 5. Model Fit Indices

Model Fit	Value	Cut-Off	References	Remarks
Chi-square/df	2.1	<5	and Hocevar (1985)	Acceptable
IFI	.91	≥0.90	(Na et al., 2022; Ibrahim et	Acceptable

				al., 2021; Lee et al., 2023)	
TLI	.90	≥ 0.90		(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable
CFI	.91	≥ 0.90		(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable
RMSEA	.07	< 0.10		(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable

* Note: IFI = Incremental Fit Index; TLI = Tucker Lewis Index; CFI = Comparative Fit Index; RMSEA = Root Mean Square Error of Approximation; df = degree of freedom

The table shows the model fit indices of the modified model. Results show that all model fit indices are satisfied. According to Stone (2021), model fit indices give researchers useful information to evaluate how well their structural equation models fit the data.

Results

The results revealed 24 observed variables. The resulting variables were: confidence, informed cosmetic choices, work experience, resume optimization, appearance and professional opportunities, self presentation, education, passion, diverse work experiences, good recommendation from the management, work ethics, new skills, strong personal brand, educational attainment, positive feedback, neat appearance, media beauty standards, physical appearance, length of service, societal pressure, media portrayal, peer opinions, tight connection, and accepting natural body. Initially, there were 30 variables with various literatures, but factor analysis indicates that there are only 24 variables based on the measures developed. Furthermore, the resulting KMO score computed is 0.947, which exceeds the minimum cut-off of 0.7, indicating that the data set is adequate. This indicates that the sample size is adequate for factor extraction. Furthermore, the results show that the total variance is 64%, implying that the research explains 64% of the study and leaves 36% undiscovered.

The Structural Equation Model shows the final model results which revealed two factors that can be used to measure transformative insights. The variables included confidence ($\beta = 0.69$) and informed cosmetic choices ($\beta = 0.77$). This means that both external factors have a positive impact on transformative insights. Furthermore, other external variables of transformative insights, such as overall happiness and self-esteem, were removed from the statistical model because the estimates show low beta values, which cause model issues. The results of the data analysis showed that the five exogenous variables such as education, ($\beta = 0.66$), self presentation ($\beta = 0.75$), appearance and professional opportunities ($\beta = 0.64$), resume optimization ($\beta = 0.65$), work experience ($\beta = 0.68$) positively impact the factors related to work preparedness. Moreover the data analysis results demonstrated that the nine exogenous variables, including work ethics ($\beta = 0.81$), diverse work experience ($\beta = 0.78$), passion ($\beta = 0.77$), good management recommendations ($\beta = 0.77$), educational attainment ($\beta = 0.78$), positive feedback ($\beta = 0.75$), and neat appearance ($\beta = 0.77$), had a positive impact on the factors related to

holistic approaches to career success. The results of the data analysis showed that the eight exogenous variables such as accepting natural body, ($\beta = 0.47$), tight connection ($\beta = 0.71$), peer opinions ($\beta = 0.67$), media portrayal ($\beta = 0.70$), societal pressure ($\beta = 0.75$), length of service ($\beta = 0.74$), physical appearance ($\beta = 0.72$), media beauty standards ($\beta = 0.77$) has positively impact the factors related to perspective on career advancement.

In reliability testing, Cronbach's Alpha is used to determine the degree of association between the items in the component factors. The internal consistency of a group of items, or how closely related they are as a whole, is measured by Cronbach's alpha. It is recognized as a scale reliability metric. A common tool for evaluating the dependability of internal consistency is Cronbach's alpha. Therefore the values received acceptable remarks, showing a strong correlation between the items in each factor.

The Model Fit Indices yielded outstanding results. The chi-square/df result is 2.1, which is less than the acceptable threshold of 5. The model's IFI is 0.91, with an acceptable value of 0.90 or greater. The model has a TLI of 0.90 and a cut-off value greater than 0.90. The RMR score is 0.05, which is less than the acceptable threshold of 0.1. The CFI score is 0.91, with an acceptable value greater than or equal to 0.90. The model's NFI score is 0.90, which is an acceptable value equal to or greater than 0.90. Finally, the RMSEA score is 0.07, which is less than 0.1, making it acceptable. The results of the model fit indices were all within the cut-off limit.

In conclusion, the study emphasizes the importance of rigorous data treatment and statistical analysis in understanding the complex relationships between body enhancements, demographics, and career perspectives, urging further research in this area. Based on the findings and conclusions, this study made a number of recommendations. The study's findings revealed an association between body and cosmetic enhancements, employability, and career development.

Discussion

The findings of this study shed light on the complexities of data treatment, factor analysis, and the relationship between various demographic variables and constructs related to body enhancements and career perspectives. The utilization of statistical modeling, such as structural equation modeling (SEM), facilitated the examination of constructs that are not directly measurable, thereby enhancing the depth of analysis. Upon examination of the rotated component matrix, it was observed that several items were eliminated from the dataset due to their failure to meet the predetermined factor loading threshold of 0.50. This rigorous selection process ensured the integrity of the data and the accuracy of subsequent analyses. Additionally, the occurrence of cross-loading, where items exhibited loading factors on multiple columns, underscored the need for meticulous scrutiny in construct measurement.

The high Kaiser-Meyer-Olkin (KMO) score of 0.947 surpassed the recommended minimum threshold of 0.8, affirming the adequacy of the sample for factor analysis. Furthermore, the substantial proportion of total

variance explained (64%) by the identified components signifies the robustness of the findings. However, the remaining unexplained variance (36%) highlights the presence of other factors influencing the phenomena under investigation, suggesting avenues for future research exploration. Reliability testing using Cronbach's alpha demonstrated satisfactory internal consistency among the component factors, with scores exceeding the conventional threshold of 0.70. This indicates that the items within each factor are strongly associated with one another, enhancing the credibility of the measurement instrument. The correlation analyses revealed weak but significant relationships between demographic variables and constructs related to transformative insights, work preparedness, career advancement perspectives, and holistic approaches to career success. Notably, variables such as age, industry, income, and money spent on body enhancements exhibited modest predictive power about these constructs, offering valuable insights into the nuanced interplay between individual characteristics and career-related perceptions.

In evaluating the structural equation model, all model fit indices met the criteria for satisfactory fit, as outlined by Stone (2021). These indices provide researchers with valuable information regarding the appropriateness of the proposed model for explaining the observed data, thereby enhancing the validity and reliability of the study findings. Overall, the findings underscore the importance of robust data treatment procedures, rigorous statistical analyses, and careful interpretation of results in advancing our understanding of the complex interrelationships between body enhancements, demographic variables, and career perspectives. Future research endeavors should aim to further elucidate these relationships and explore additional factors that may influence individual perceptions and behaviors in the context of career development and personal enhancement strategies.

Conclusion

In conclusion, the findings of this study unveil the profound impact of confidence and informed cosmetic choices on various facets of professional development. Specifically, transformative insights, work experience, portfolio creation, appearance, and self-presentation were found to be significantly influenced by these factors. Moreover, the educational attainment of individuals emerged as a crucial determinant of work preparedness, passion, diverse work experiences, recommendations from management, work ethics, skill acquisition, personal branding, and feedback. Additionally, the influence of one's neat appearance on holistic approaches to career success and media beauty standards, alongside societal pressures, peer opinions, and connections, underscores the intricate interplay between personal attributes and career trajectories.

Furthermore, this study's rigorous analytical approach, employing structural equation modeling and factor analysis, elucidated the complex relationships between demographic variables, body enhancements, and career perspectives. Notably, the meticulous data treatment procedures, evidenced by the rigorous selection process and reliability testing, ensured the integrity and accuracy of the findings. The robust statistical analyses revealed significant correlations between demographic variables and constructs related to career advancement, emphasizing the importance of individual characteristics in shaping professional outcomes.

The satisfactory fit indices of the structural equation model further attest to the validity and reliability of the study findings. Collectively, these insights underscore the necessity of comprehensive data treatment procedures and rigorous statistical analyses in advancing our understanding of the multifaceted dynamics influencing career trajectories and personal enhancement strategies. Looking ahead, future research endeavors should continue to explore additional factors that may impact individual perceptions and behaviors in the context of career development, thereby contributing to a more nuanced understanding of professional success and personal enhancement strategies in contemporary society.

Recommendations

The study suggests several recommendations for individuals to understand the benefits and drawbacks of cosmetic procedures. It suggests disseminating information about cosmetic procedures, fostering self-esteem and body positivity, and collaborating with influencers and media outlets. Media literacy programs can help individuals critically assess and interpret beauty standards. Employers should provide resources for career development, emphasizing a well-rounded skill set, continuous learning, and professional networking. Career counseling services and mentorship programs can help individuals develop technical and soft skills for success in the job market. Future research should explore the relationship between body enhancements and employment, focusing on initial employment, job retention, and opportunities for advancement. Furthermore, the sample size may be augmented based on the required model's complexity, the number of observed variables, and the intended amount of statistical power. It can strengthen the validity and reliability of their factor analysis and model fit assessments. Ethical and legal considerations should also be considered. The study's findings should be carefully considered to ensure the validity and reliability of factor analysis and model fit assessments.

Abstract: Merdeka Curriculum, the latest curriculum implemented in Indonesia by the Ministry of Education and Culture since 2021, faces obstacles in its implementation, including in history subject. A key obstacle history teachers encounter is the lack of alternative learning strategies designed to develop students' historical thinking skills. This study addresses this gap by formulating and examining a new strategy specifically designed to instill students' historical thinking skills named Problem Case Historiography, tailored to build critical historical reasoning abilities. This learning strategy integrates Problem Based Learning, Case Study, and Historiography concepts. This study aims to obtain new perspectives related to the implementation of Problem Case Historiography in historical learning within Merdeka Curriculum. This research was conducted in six senior high schools in Malang which have implemented the Curriculum. Data collection involved observing lessons and conducting interviews with teachers and students. The observational findings revealed increased student enthusiasm and participation during Problem Case Historiography. The results of the interviews also showed that they were pleased with the learning strategy applied, due to its clearly described procedures which could train them how to think like historian, so that their historical thinking skills could be stimulated.

Keywords: Merdeka Curriculum, Problem Case Historiography, Historical Thinking Skill, Learning Strategy

Citation: Astutik, W.T., Widiadi, A.N., Agung, D.A.G., & Wijaya, D.N. (2024). 'Problem Case Historiography': Alternative Learning Strategy to Instill Students' Historical Thinking Skills in Merdeka Curriculum. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 177-187), Antalya, Turkiye. ISTES.

Introduction

The Merdeka Curriculum is a new curriculum implemented by the Ministry of Education and Culture, which is starting from 2021. Initially, the Merdeka Curriculum was only implemented in Sekolah Penggerak. Sekolah Penggerak are pilot schools for the application of the Merdeka Curriculum in Indonesia. In the 2021/2022 school year, the Merdeka Curriculum will be implemented in nearly 2,500 schools participating in the Program Sekolah Penggerak (PSP) and 901 SMK Pusat Keunggulan (SMK PK) as part of learning with a new paradigm. This curriculum will be implemented from TK-B, SD & SDLB Grades I and IV, SMP & SMPLB Grade VII, SMA & SMALB and SMK Grade X (Kemendikbudristek, 2022a, 2022b)

The Merdeka Curriculum will replace the implementation of the previous curriculum, the 2013 curriculum. The 2013 Curriculum has been implemented in Indonesia for more than a decade. Apart from the various advantages of the 2013 Curriculum, it requires several improvements related to the various challenges that have emerged today, especially the COVID-19 pandemic since the beginning of 2020 (Widiadi et al., 2022).

The Merdeka Curriculum and the 2013 Curriculum have many differences, starting from the curriculum structure to the content of each subject. For history subjects, the difference between the Merdeka Curriculum and the 2013 Curriculum is starting from the curriculum structure, where in the Merdeka Curriculum, the specialisation subject of history is abolished, to the changes in the content of the material taught. In the Merdeka Curriculum, the skills to be achieved in History subjects include process skills and conceptual skills. The scope of skills strands in history subjects, including; historical conceptual skills, historical thinking skills, historical awareness, historical research, historical practice skills (Kemendikbudristek, 2022a).

Based on the explanation above, one of the skill strands in history subjects is students' historical thinking skills. Students' Historical Thinking Skills is one of the new skill strands emphasised in the Merdeka Curriculum. In previous curricula, students' historical thinking skills were not explicitly emphasised within the scope of the history learning objectives. As something that is newly implemented, there are still many obstacles that arise in terms of what methods can be used by teachers to achieve the goal of developing students' historical thinking skills. For this reason, the researcher tried to formulate a learning strategy that can train students' historical thinking skills.

Based on the literature review conducted by the author, there are not many alternative learning strategies that can be used by teachers to achieve students' historical thinking skills. This study offers an alternative learning strategy that is specifically designed to train students' historical thinking skills. The learning strategy is called Problem Case Historiography, where this learning strategy is a combination of three existing theories, namely 'Problem Based Learning', 'Case Study' and 'Historiography'.

This research was conducted in six public senior high schools in Malang Regency. The selection of the research

sites is based on the decree of the Head of Curriculum Standards and Educational Assessment Agency, Ministry of Education, Culture, Research and Technology No. 044/H/KR/2022 concerning educational units implementing the implementation of Merdeka Curriculum in 2022/2023, which identified six schools out of thirteen public schools in Malang Regency to implement Merdeka Curriculum in 2022/2023 (Kementerian Pendidikan Kebudayaan Riset dan Teknologi, 2022). The reason for selecting research sites in public senior high schools in Malang Regency because these schools have been implementing the Merdeka Curriculum since 2022/2023 school year. Public senior high schools in Malang Regency can also be said to be equal in terms of student input and school facilities, so there is no gap between one school and another. This is an important consideration for the selection of research sites. The purpose of this research is to gain new knowledge in the field related to the use of the learning strategy Problem Case Historiography.

Method

This study used a descriptive qualitative approach, by utilize observation and interview data collection techniques. Observations are conducted by making observations while learning is taking place, while interviews are conducted after learning is completed by interviewing several randomly selected students. The subjects of this research are Grade X students from six public senior high schools in Malang Regency that have implemented the Merdeka Curriculum since 2022. From each school, one class was randomly selected to carry out learning with learning steps according to the learning strategy Problem Case Historiography. The data from observations and interviews were then analysed to obtain findings related to the implementation of the Problem Case Historiography learning strategy as an effort to instill students' historical thinking skill in the Merdeka Curriculum.

This study become the first step taken by the researcher, the results of this study will provide information related to the advantages, disadvantages and difficulties in using the Problem Case Historiography learning strategy. The results of this study can be used to formulate further studies, both by the researchers themselves and other researchers, with the aim of reference, improvement and development of this strategy.

Discussion

1. Concept of historical thinking

History is not just a series of events in the past, it is complex because it involves people, space and time. More than this, historical events can be understood as a complex concept that requires skills to understand. Teachers need to be selective in their choice of teaching methods and do their best to ensure that the learning that takes place achieves the learning objectives that have been set. According to some experts, teachers can use two approaches to classroom pedagogy, namely fact-based approaches or historical understanding/thinking (Jones, 2003; Parker, 2004; Stearns et al., 2000; Taylor, 2006; in Zajda & Whitehouse, 2009). The fact-based approach is more conservative in that students are only required to master historical facts, whereas historical

understanding/thinking focuses more on students' critical thinking about historical events and the complexities within them (Zajda & Whitehouse, 2009). To deal with the world's increasingly complex problems, teachers need to equip students with historical thinking skills so that they can think critically and be wise in the face of information disclosure and the rapid development of science and technology.

According to Widiadi, historical thinking skills are skills that are not automatically possessed by anyone, neither by students nor by historians (Widiadi et al., 2022). Historical thinking skills are the ability for learners to distinguish between past, present and future time, to see and evaluate evidence, to compare and analyse historical stories, illustrations and records from the past, to interpret historical records and to construct a historical story based on their understanding (Isjoni, 2007).

In line with historical thinking, learning approaches with the concept of andragogy or adult learning can also be an effort to improve learners' verification skills. Learners can use their experience as a resource for further learning. In addition, andragogical learning focuses on problem solving and learners are expected to take responsibility by finding solutions to existing problems. By thinking historically and based on the concept of adult learning through learning, it is hoped that students can solve problems in their daily lives, including being more selective in accepting information in circulation (Nurjanah, 2020).

According to Zed, historical thinking means a typical way of thinking in the discipline of history. History is an expression of scientific thinking. Scientific thinking is a systematic way of thinking, a way of thinking that is organised and integrated. In other words, scientific thinking is theoretical-systematic thinking or conceptual thinking (Zed, 2018). The standards of historical thinking consist of four (4), namely: 1) Awareness of time (sense of time / cronological thinking); 2) Awareness of the nature of continuum; 3) Ability (capacity) to capture and explain important changes that imply the existence of historical coverage (historical copherhension); 4) Ability to reconstruct historical events (Zed, 1999).

The application of diverse and appropriate approaches, strategies, methods and models in learning by prioritising students' active activities in the whole learning process will provide opportunities for students to develop all their potential in learning (Hudaidah, 2014). Based on the above explanation, historical thinking skills are not something that can occur naturally, there is a need for teachers' efforts to train students to have historical thinking skills. In addition, historical thinking skills have been mandated in the achievement of skills in the Merdeka Curriculum, so teachers need to pay more attention to the learning that will be provided so that students can achieve historical thinking skills.

Problem Case Historiography

The concept of Problem Case Historiography

In this section, the author attempts to offer alternative learning strategies formulated with the aim of training students in historical thinking skills. As discussed earlier, the purpose of implementing this learning strategy is

to train students' thinking skills in the Merdeka Curriculum. The concept of problem-case historiography learning strategy was formulated from a combination of three pre-existing concepts, namely problem-based learning strategy, case study research method and historiography. In addition to these three concepts, this study was also inspired by Sam Wineburg's concept of 'Reading Like Historian'. Wineburg (Wineburg et al., 2012) recognises that today's students are overwhelmed by mountains of information and need new ways to make sense of it. The massive development of technology can bring both convenience and difficulty. Furthermore, with easy access to information, new skills are needed to select and verify information. Teachers therefore need to develop learning in this direction.

The term Problem Based Learning was first introduced in 1960 by Don Woods in his research with chemistry students at McMaster University in Canada (Mayasari et al., 2016). In the 1970s, several universities also used this method, such as Newcastle in Australia, Maastricht and New Mexico. Since then, Problem Based Learning has been used in various fields such as health, social work, engineering, architecture, business, law, economics, management, mathematics, education and agriculture (Schwartz, 2013). To date, Problem Based Learning continues to be used and developed, including in the world of education. Problem Based Learning has several characteristics, such as: learning begins with the provision of 'problems', usually 'problems' have real world context, learners actively formulate problems and identify their knowledge gaps, study and search for their own materials related to 'problems', and report the solutions they find. The teacher acts more as a facilitator, designing a problem scenario (Amir, 2009).

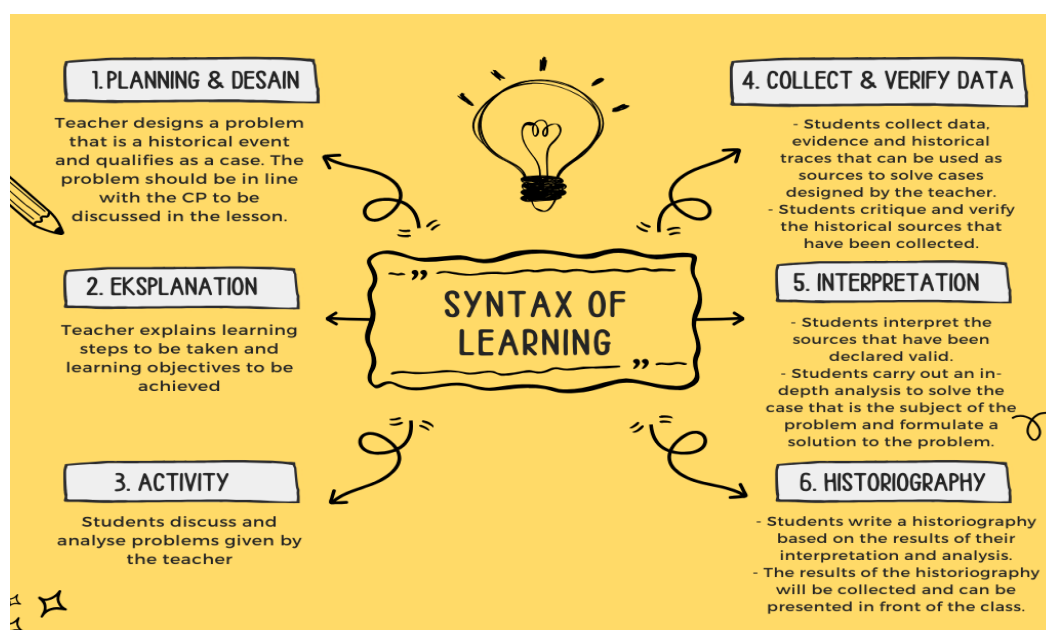

Case study is one of the social science research methods. In general, case study is a strategy that is more appropriate when the subject of research is related to how or why (Yin, 2014). Case study researchers provide an in-depth understanding of a case or cases (Creswell & Poth, 2016). Furthermore, (Kusmarni, 2012), argues that a case study is research in which researchers explore a particular phenomenon (case) in a time and activity (programme, event, process, institution or social group) and collect detailed and in-depth information using various data collection procedures over a period of time. Historiography is a research method in the study of history. As a science, history needs research methods. Bernheim defines historical method as "research techniques consisting of four stages, namely 1. Heuristics (searching and finding historical sources). 2. Criticism (judging whether a source is authentic or not and how credible the source is). 3. Synthesis (synthesis of facts obtained through source criticism or called source analysis). 4. Presentation (writing up the results) (Aron & Bernheim, 1978). Gottschalk (Gottschalk & Notosusanto, 1975: 27-28), defines the historical method as "four main activities consisting of 1. Collecting objects from the period, both printed, written and oral materials that may be relevant. 2. Eliminating materials or parts of materials that are not authentic. 3. deriving reliable evidence from the authentic materials. 4. organising the reliable evidence into a meaningful story or presentation (Dedi & Syair, 2014). According to Kuntowijoyo, there are 5 research steps in historiography, namely: 1. selecting the topic; 2. collecting sources; 3. examining historical criticism; 4. interpreting; 5. writing history (Kuntowijoyo, 2003).

From the theories mentioned above, the author tries to combine the three concepts to produce a new learning

strategy formulated with the aim of training historical thinking skills in students. The author believes that the Problem Based Learning method is still very relevant to be used in learning history, but it is still not strong enough to sharpen historical thinking skills, for this reason the combination with the Case Study research method, which explores a case/problem, is expected to train students to think more deeply about the problems designed by the teacher, so that students' historical thinking skills can be trained. The results of learning can be assessed from the products produced in the learning that has been done, for this reason the author adds the method of historical writing (historiography) in the combination of new learning strategies found. By including elements of historiography, it is hoped that students will be able to write a series of historical events with precise and in-depth narratives according to the problems designed. In this way, students will acquire products and skills after they have implemented their learning using this strategy.

Syntax of the Problem Case Historiography

In this section, the author will explain the alternative syntax of the Problem Case Historiography with the aim of instil students' historical thinking skills. The learning steps are as follows: First, before learning, the teacher designs a problem that is a historical event and qualifies to be a case. Second, the students (individually or in groups) analyse the problems assigned by the teacher; Third, the students collect data, evidence and historical traces that can be used as sources to solve the cases designed by the teacher; Fourth, the students criticise and verify the collected historical sources; fifthly, students interpret the sources that have been declared valid; sixthly, students carry out an in-depth analysis to solve the case that becomes the subject of the problem and formulate a solution to the problem; seventhly, students write the results of the interpretation and analysis in a historiography; finally, the results of the historiography are collected and can be presented to the class (Astutik et al., 2024). The flow of the understanding of the steps of the learning process can be seen in the illustration:

Source: Syntax of Problem Case Historiography learning strategi (Astutik et al., 2024)

The learning syntax above includes the syntax of the three concepts discussed earlier, namely problem-based learning, case study and historiography. The purpose of this syntax design is to train students to think like historians, where the next phase can teach historical thinking skills. This goal can be achieved by following each phase, starting with the presentation of a problem, then asking students to find information and evidence, then verifying the information/evidence, and then after obtaining valid data, students can write the results of the investigation of the given case in a historical writing, which we know as historiography.

Research Findings

This research was conducted by asking the teacher to help implement the learning according to the syntax previously formulated by the researcher, and then observing during the learning process. After the lesson, interviews were conducted with two to three randomly selected students. The observation guide includes questions about the learning process, the students' responses when carrying out a series of tasks in accordance with the syntax of the Problem Case Historiography learning strategy, and the students' activity and enthusiasm as reflected during the learning process. The interview guide contains questions about the students' opinions about the learning process that was carried out, the obstacles that were encountered, as well as the advantages and disadvantages of the learning strategy that was just implemented compared to the learning strategy that is usually carried out by history teachers in the classroom.

The results of the research are presented as follows; based on the analysis of the results of the observation sheets of six classes in six schools of the research subjects, it can be concluded that the students are active and enthusiastic in the learning process. The observation results from the six schools are on average the same because the schools have the same student background, the same student input and the same adequate school facilities. This liveliness and enthusiasm were reflected in the students' activity in finding historical sources related to the historical cases used as assignments.

Students also actively communicate with other students to exchange ideas and opinions and to discuss the historical sources they have found. In the early stages of learning, students were confused and needed explanation and guidance from the teacher regarding the given task. During the verification process, students had problems, active students asked the teacher to carry out the verification process, while less active students tended to wait for instructions from the teacher or wait for questions from friends.

From the interview the following results can be obtained; almost 2/3 of the respondents, namely the students who were randomly selected after the learning process, admitted that they were interested and enthusiastic about the learning that I had just implemented. They felt that the learning was interesting and exciting because it was different from the learning usually done by the teacher. The learning steps were clearly explained, so all they had to do was follow the direction of the learning syntax. However, they also felt that at the beginning they were confused about the tasks and what they had to do, so the teacher had to provide an apperception of the material

and tasks given. Most of them admitted that they got a lot of sources from the internet, but they still need help to check the data they get. They are still unfamiliar with the term historiography or historical writing, so they need to learn more to understand the concept.

The results of the interview provided information about the advantages and disadvantages of the learning process that had just been implemented. The advantage of this learning strategy is that it encourages students to be active and enthusiastic learners. Students have to find sources related to the given case, then verify and write the story. This strategy encourages students to actively question and discuss both with the teacher and with other students. Another advantage is that because the learning flow is prepared, the students' thinking process is more structured, although the students feel that the role of the teacher is still very necessary to accompany each learning process. The demands of the task of making history or writing history can stimulate students to try to write, although students still find it difficult to write history because almost all students have just received this concept.

The shortcoming perceived by the students in relation to the learning process is time management. The students felt that the time given to carry out the series of learning processes was very insufficient. This is because the series of learning processes are only carried out in one session, so students feel that there is not enough time to do the task properly, as a result they are rushed in finding sources and verifying them, even when writing their historiography. This information is an important note for the researchers to make improvements and develop this learning strategy in the future.

Nowadays, many teachers use constructivist methods in teaching under the pretext of student-centred learning, so the teacher's role in learning is not so important. Although learning is student-centred, the teacher's role in learning is still absolutely necessary. This is in order to avoid misunderstandings and misconceptions on the part of the students. The results of the observations and interviews show the importance of the teacher's role in explaining learning materials and tasks. Students who were initially confused by the tasks given were able to complete them well after the teacher gave explanations and instructions. Although the learning syntax is clearly written and structured, the role of the teacher in the classroom is still very important in order to accommodate the learning process well.

The students still find it difficult to think like historians, as the concept is new to them in high school. In fact, they are still unfamiliar with the term historiography or historical writing.

Developing historical thinking in students, especially in Grade X, is a major task for history teachers and stakeholders, especially for schools implementing the Merdeka Curriculum. This is because the previous curriculum did not emphasise this aspect. Students are used to being exposed to the material only in junior high school, so there is a stigma that history is only about past events. But more than that, history has theories, concepts and values that we need to live in this modern era, especially when the freedom of access to information and the development of science and technology are becoming increasingly rapid, as they are today.

Efforts to instil historical thinking processes must continue, to encourage students to think critically and historically as they face the era of globalisation. This learning strategy is a starting point for researchers or teachers to develop learning that can train students' historical thinking skills. Apart from the students' historical thinking ability being a skill that is emphasised in the Merdeka Curriculum, it is also because this ability is needed by students in facing the rapid development of science and technology and information disclosure. This skill is important so that students can think critically and not easily believe news or information without checking the source first. So that students can get used to thinking critically and historically to avoid false news that can break the unity and integrity of the nation or have other negative effects.

Conclusion

The curriculum is constantly evolving from time to time in accordance with the development and demands of the times, so teachers must constantly update themselves with new methods so that the learning done in the classroom can meet the mandate of the curriculum.

Historical thinking skills, which are the competency strands of the history subjects in the Merdeka Curriculum, are absolutely necessary to meet the challenges of the times. Historical Thinking Skills can train students to think critically, this ability is absolutely necessary for the younger generation to face global threats both from within the country and abroad.

This study aims to provide new insights into the implementation of the Problem Case Historiography learning strategy. The results of the field research provide information that students are active and enthusiastic in carrying out the learning process. Students are active in the process of source finding, verification and historiography of cases used as assignments. Students feel that teachers need to provide awareness, explanation and support in learning activities. The shortcomings felt by the students are related to the time given. They feel that the time given is not enough to carry out a series of learning processes because they have to find sources, carry out verification and write historiography.

This study becomes the first step for researchers to improve and develop this learning strategy. The results of this study can be a reference material or a study for researchers or other researchers to make improvements or developments related to the problem case historiography learning strategy

Acknowledgments

Praise be to Allah for all the goodness bestowed upon the author. The authors would like to express their gratitude for the provision of scholarships for financial support. Abstract: The application of learning models is one of the things that must be considered in the learning process in the classroom. This study aims to determine the effect of the cooperative learning model type STAD (Student Teams Achievement Division) on motivation to learn Mathematics in class VIII students of SMP 2 Mlati Yogyakarta. The research design used was pre-experimental (non-design) with quasi-experimental research methods. The sample of this research consisted of 26 students, namely class VIII A as the experimental class. The data analysis technique used is descriptive analysis and inferential analysis with the *Paired Sample t-test*. The results showed that there was a significant effect of the STAD (Student Teams Achievement Division) cooperative learning model on student motivation. This can be seen from the results of the *t-test*, namely the value ($p\text{-value} = 0.000 < \text{level of significance} = 0.05$). In addition, it is also indicated by the change in the percentage of the pre-test value, which is 62.8571 which is included in the sufficient category, and the percentage value of the post-test which changed to 75.04 which is included in the strong category. This shows that the cooperative learning model type STAD affects motivation to learn mathematics.

Keywords: cooperative learning, STAD, learning motivation

Introduction

The era of Society 5.0 demands that various key skills must be mastered to face the increasingly competitive demands of life and the world of work. There are four pillars of relevant 21st-century skills, namely learning to know, learning to do, learning to be, and learning to live together. Internationally, the quality of education in Indonesia is in position 110 out of 187 countries in the Human Development Index (HDI) with a figure of 0.684. Based on this figure, Indonesia is still lagging behind two neighboring ASEAN countries, namely Malaysia at number 62 and Singapore at number 11 (*Web Bapenas SDGs*, n.d.). This shows that the education system in

Indonesia needs to be improved in terms of the learning process, facilities, teaching staff, and even the assessment system applied. The results of the program for International Student Assessment (PISA) in 2018 showed that in the reading ability category, Indonesia was ranked 74th out of 79 countries, in addition to math and science skills, Indonesia was ranked 73rd and 71st out of 79 countries (OECD, 2019). Indonesia's ranking in the PISA assessment has not changed since Indonesia began participating in this assessment, namely from 2000 to 2018. This indicates that there are still many factors that cause Indonesia's math skills to remain low.

Mathematics is one of the subjects that has a perspective that math is difficult and a scary specter. This continues to develop in society and certainly affects the thinking or responses of students regarding mathematics itself. One of the causes of the low mathematics learning outcomes of students is that many students think that mathematics is difficult to learn and the characteristics of abstract mathematics, namely students think that mathematics is a frightening specter (Bilah et al., 2017). The assumption related to mathematics is difficult and tends to be avoided by students is wrong to cause students to feel anxious or afraid of mathematics itself. Some of the consequences that can be caused in addition to those described above are the learning process in the classroom becomes less fun and is often considered boring because of pre-existing perceptions. Many factors cause this to happen including factors within students (internal) and factors from outside students (external). In general, two factors can affect the success of learners, namely internal factors and external factors. Internal factors are factors that come from the learners themselves while external factors come from outside (Kapitan & Aseng, 2023). Internal factors include the interests, talents, and motivation of learners while external factors include the condition of the school environment, infrastructure, the learning model applied, and the media used in the learning process. The learning model is one of the things that affects many things including learning outcomes, achievement, talent, interest, and even motivation to learn mathematics. In addition, the right and fun learning model will also bring good results in the math learning process.

The use or application of the right learning model will certainly also affect the willingness of students to learn or in this case, the motivation to learn mathematics. Learning models that do not focus too much on the teacher as the center of learning and involve students' activeness in the classroom can help students understand the mathematics material being taught. One of the learning models that involves students' activeness is cooperative learning. This is in line with research conducted by (Eka Pratiwi & Sukanti, 2018) which found that there was a significant difference in student learning outcomes after applying a cooperative learning model of around 37.80%. The learning model that will be used in this study is the STAD (Student Teams-Achievement Division) type cooperative learning model. According to (Darmuki et al., 2017) STAD is a learning model that involves academic information uses verbal or text presentations, divides students heterogeneously into 4-5 people, and uses quiz procedures. In schools, many factors trigger the emergence of less pleasant learning and this can result in learning motivation in students.

From the results of observations at Muhamdiyah 2 Mlati Junior High School, it appears that students show different learning motivations, some are high, medium, and low. This can be proven through observations made by the author through interviews with mathematics teachers. Some of them are the existence of several other

activities carried out by students, namely during class time, students are often rowdy, talking to their classmates, doing other things when the teacher teaches and even students sometimes cheat when given assignments. Based on the problems presented above, the researcher is interested in further research related to the effect of the STAD (Student Teams Achievement Division) type cooperative learning model on motivation to learn mathematics in Muhamadiyah 2 Mlati Yogyakarta Junior High School students.

Method

This research is quasi-experimental. The experimental research method is one part of the quantitative research method. According (Arikunto, 2019) research methods are the main methods used by researchers to achieve goals and find answers to the problems posed. The design used in this research is pre-experiment (non-designs), because there are still external variables that influence the formation of the dependent variable, while the form of the design is "pre-test and post-test one group design". In this study, the experimental method was used to determine the effect of applying the STAD (Student Team Achievement Division) learning model in Mathematics subjects and the design used in the pre-test and post-test treatment

Table 1. Research Design

Group	Pre-test	Treatment	Post-test
Experiment	O_1	X	O_2

Description:

E : Experimental group

O_2 : Posttest in the form of a questionnaire

O_1 : Pretest in the form of a questionnaire

X : STAD model treatment

This research was conducted in class VII of Muhamadiyah 2 Mlati Junior High School Yogyakarta in the 2022/2023 academic year. The time of this research will be carried out in March 2023. The population used is all students of class VII A SMP Muhamadiyah 2 Mlati Yogyakarta with a total of 26 people a total of 16 female students and a total of 10 male students. Sample determination was carried out using cluster random sampling, which is a sampling technique based on certain groups rather than individuals. Through this technique, it can be determined which class will be the sample, where the class is designated as the experimental class, namely class VII A which will be taught with the STAD-type cooperative learning model.

The technique used in the data collection process is a questionnaire. The questionnaire was conducted at the time before the treatment was given called (the pretest) and at the time after the students finished being treated or called (the posttest). The questionnaire used is to carve out students' math learning motivation.

The variables contained in this study are independent variables and dependent variables. The independent variable in this study is the STAD (Student Team Achievement Division) type cooperative learning model,

which is seen to have an effect or not on the dependent variable, namely the students' mathematics learning motivation. The following is a reference table for the criteria for determining the level of mathematics learning motivation used in this study.

Table 2. Percentage Criteria for Learning Motivation

Percentage	Criteria
25% - 40%	Very Weak
40% - 55%	Weak
55% - 70%	Fair
70% - 85%	Fairly Strong
85% - 100%	Strong

Source : (Marlis, 2015)

The math learning motivation questionnaire used and given to students has previously been validated. The data collection techniques or methods of this study are questionnaires and documentation. Documentation to complement existing data. Therefore, some are very important at the time of data collection, namely, researchers collect such as photos and questionnaire results from students. Furthermore, a questionnaire is a data collection technique that is done by giving a set of questions or written statements to respondents to answer (Sugiharto et al., 2018). This instrument is distributed before and after the implementation of the learning process ends and the data obtained were analyzed through three stages, namely the data description stage, the analysis requirement test stage, and the hypothesis testing stage.

Results

The pretest and posttest data can be presented in the following table:

Table 3. Descriptive Data Analysis Results

Descriptive Data Analysis	Pre-test	Post-test
Highest Score	98	112
Lowest Score	60	78
Number of Samples (n)	26	26
Average (X)	79,8846	90,8846
Percentage	62,8571	75,04
Description Motivation	Fair	Strong

Based on the table above, it can be seen that numerically the average motivation to learn the mathematics of students before being given treatment is 79.8846 with a percentage of 62.8571 which can be categorized as sufficient motivation to learn the mathematics of students, and if seen in the posttest table or after being given

treatment using the STAD (Student Team Achievement Division) type cooperative learning model, the average is 90.8846 and the percentage is 75.04 with the predetermined category of strong or high mathematics learning motivation. By only looking numerically, it cannot prove that there is an effect of the STAD (Student Team Achievement Division) type cooperative learning model on students' mathematics learning motivation, therefore an inferential analysis is carried out so that the results obtained are truly accurate.

Analysis Prerequisite Test

Normality test

The normality test aims to determine whether the data from each variable has a normal distribution or not. Based on the normality calculation test using the Shapiro-Wilk test with the provisions if $p > 0.05$ which means that the data is normally distributed but otherwise if $p < 0.05$, the data is not normally distributed.

Table 4. Normality Test of Mathematics Learning Motivation of Students

Data		Sig.	Ditribution
Mathematics Learning Motivation	Pre-test	0,269	Normal
	Post-test		Normal
		0,185	

Based on the table above, shows that the mathematics learning motivation of students in class VII A before being given treatment shows a value of 0.269 which indicates that the pretest is normal, as well as the post-test learning motivation questionnaire value shows a significance value of 0.185 so that the data is normally distributed.

Homogeneity Test

The homogeneity test is intended to show that two or more groups of sample data come from populations that have the same variance. Homogeneity is met if the sig value is 0.05, then the variance of each sample is the same (homogeneous). Conversely, if the significance obtained < 0.05 , then the variance of each sample is not the same (not homogeneous). With the help of SPSS statistical data processing computer software. Obtained homogeneous test results are shown in the following table:

Table 5. Homogeneity Test Results Variance

Leveme Statistic	df1	df2	Sig.
.900	1	50	.347

Based on the results of the homogeneity of variance test output using the Levene test, the table above shows that the results of the population variance homogeneity test obtained a value of $p = 0.347$ where $p > \alpha$, $\alpha = 0.05$ can be stated that the population variance is the same (homogeneous).

Hypothesis test

To see whether or not the effect of the learning model is significant on students' motivation to learn mathematics, hypothesis testing can be done. Hypothesis testing is carried out to answer research questions that were previously still estimates or conjectures. Hypothesis testing in this study was carried out using the paired sample t-test. The paired sample t-test test is used to determine whether the independent variable has a significant effect on the dependent variable. The calculation of the paired sample t-test test in this study used the help of the SPSS program. The results of the paired sample t-test are:

Table 5. Hypothesis Test Results

		t	Df	
Pair 1	<i>Pretest-Post test</i>	-4.452	25	.000

Based on the results of the paired sample t-test above, it is known that the sig value. (2- tailed) of 0.000. By the decision-making rules in the paired sample T-test test the sig value. (2-tailed) <0.05 or $0.000 < 0.05$, it can be concluded that the hypothesis is rejected and is accepted because there is a significant difference between pre-test and post-test learning motivation. So, it can be concluded that there is an effect of using the STAD type cooperative learning model on the motivation to learn mathematics in class VII A students at Muhamadiyah 2 Mlati Junior High School, Sleman Yogyakarta.

Discussion

Based on the results of data analysis obtained by pre-experimental methods with the one-group pretest posttest design, it can be seen that there are changes in students' motivation to learn mathematics between the Pre-test and Post-test in the class given the treatment. The Learning Process after being given treatment, namely using the STAD type cooperative learning model, in this case, the researcher took class VII A as the experimental class. This class has a total of 26 students consisting of 10 boys and 16 girls. As explained by (Kagan, 2009) cooperative learning is learning in the form of sharing information and experiences, responding to each other, and communicating with each other. In addition, according to (Maulana & Akbar, 2017) through group learning, students can train and get used to helping each other and sharing responsibilities, students also learn and practice interaction or socialization among their groupmates, various experiences and knowledge, learn to do and say, foster competition, and realize the strengths and weaknesses of each. At the first meeting, a pretest was conducted by giving a questionnaire of motivation to learn mathematics, then the next meeting began learning with the STAD-type cooperative learning model for circle material. Students were asked to discuss the circle material in this case through student worksheets, discussing by interacting with each other in groups by determining heterogeneous groups.

The determination of the group is also supported by the opinion conveyed (Le et al., 2018) that collaborative skills are also a person's ability to engage in activities related to others, appreciate relationships, and work in groups to achieve the desired goals together. His research (Wulandari, 2022) revealed that the STAD-type cooperative learning model is how students work in groups so that students can foster the willingness to work together, think critically, be motivated, and be responsible for the group. Based on the explanation above, the STAD model is more concerned with the participation or activeness of students in the mathematics learning process, in this case, when discussing and presenting the assigned tasks.

Giving a questionnaire of students' motivation to learn mathematics for the post-test was carried out at the last meeting, after being given a final questionnaire related to motivation to learn mathematics, the data was analyzed by the method used. Based on the results of data analysis regarding the comparison of statistical values, it shows that the number of samples is 26 people, the pretest questionnaire score for the lowest score is 60 the highest score is 90 and the post-test score for the lowest score is 78 and the highest score is 112. In addition, the average pretest score was 79.8846 the average post-test score was 90.8846 and the percentage based on the assessment of the mathematics learning motivation questionnaire at the time of the pre-test was 62.8571% while in the post-test questionnaire results, namely after being given treatment using the STAD (Student Teams Achievement Division) type cooperative learning model of 75.04%. This shows that there is a significant difference between the initial learning motivation and after treatment.

Based on the results of the hypothesis test calculation using the paired sample t-test, it is also known that the sig. (2- tailed) of 0.000. By the decision-making rules in the paired sample t-test test the sig. (2-tailed) < 0.05 or $0.000 < 0.05$, this shows that there is an influence in the use of the STAD (Student Team Achievement Division) type cooperative learning model on math learning motivation, (Ngalimun, 2018) which can increase the ability of students to use the information and the ability to learn abstract to be real (real). The calculation of the hypothesis test above also shows that the STAD-type cooperative learning model contributes to or positively influences math learning motivation by 75.04%. While the rest is influenced by other factors not discussed in this study.

Conclusion

Based on the results of research and discussion, it is concluded that the cooperative learning model type STAD (Student Team Achievement Division) has a positive and significant effect on the motivation to learn mathematics circle material in class VIII A students at SMP Muhammadiyah 2 Mlati, Yogyakarta City. This can be seen from the results of the t-test, namely the value ($p\text{-value} = 0.000 < \text{level of significance} = 0.05$). This shows that there is a positive influence on the use of the STAD (Student Team Achievement Division) type cooperative learning model on math learning motivation. In addition, the average value of the pretest was 79.8846 the average post-test was 90.8846 and the percentage based on the assessment of the mathematics learning motivation questionnaire at the time of the pre-test was 62.8571% while in the post-test questionnaire

results, namely after being given treatment using the STAD (Student Teams Achievement Division) type cooperative learning model of 75.04%. This shows that there is a significant difference between the initial learning motivation and after being given treatment and it can be concluded that the STAD-type cooperative learning model has an effect on students' mathematics learning motivation, but based on these figures, the rest is influenced by other factors not discussed in this study.

Recommendations

In the STAD-type cooperative learning model in mathematics lessons, it is expected that students can develop ideas, ideas, creativity, and cooperation between peers in the classroom, to increase motivation to learn mathematics and other things such as learning outcomes and mathematics learning achievement. For educators, the STAD (Student Team Achievement Division) type cooperative learning model can be used as an alternative to learning mathematics. Motivation to learn mathematics is also not only influenced by one factor but by many factors, therefore for future researchers it is recommended that they examine other factors besides the STAD learning model.

Using Artificial Intelligence (AI) for Academic Writing: How Not to Cross the Line

Afifah

Yogyakarta State University, Indonesia,  <https://orcid.org/0009-0001-2891-5865>

Abstract: The emergence of AI-driven writing tools has assisted students in writing academic papers. Although the positive benefits of these tools have been acknowledged, concerns regarding ethics emerge. This research is a qualitative study aiming to explore university students' perspectives on the use of AI tools for academic writing. This study sought to answer the following research questions: What are the reasons for using AI tools in academic writing?; What are some ethical concerns related to using AI in academic writing? In what instances is AI reliable to use for academic writing? This study involved ten university students, and each participant was interviewed. The data obtained were analyzed using thematic analysis. The results revealed that the main reasons for using AI tools were to speed up the writing process, overcome writer's block, and enhance writing quality. Some ethical concerns about using these AI tools covered issues related to plagiarism, information accuracy, maintaining originality, and balancing AI's role in writing. The participants found these AI tools reliable for generating ideas, outlining, editing, and proofreading. However, writers should navigate reputable journals for accurate information, as these tools mostly do not have access to credible resources. This study concluded that despite the assistance of AI tools, writers should maintain control, uphold ethical standards and ensure the credibility of the information they incorporate in their scholarly work.

Keywords: academic writing, ethics, artificial intelligence, AI-driven writing tools

Introduction

Academic writing is an essential component of higher education. It serves as the primary mode through which students demonstrate their understanding of complex concepts and theories. Further, students explore knowledge in their discipline and learn to meet the standard of being a scholar through academic writing practices (Yuvayapan and Bilginer, 2020). When engaging in academic writing, students are expected to exercise their critical thinking and learn to articulate ideas with strong argumentation. Unfortunately, the journey towards composing academic work often proves to be a daunting challenge for students.

Gupta et al. (2022) investigated several areas of difficulty in academic writing. The result of their study elucidated four common challenges: the writing process, idea and content development, use of grammar,

vocabulary, and writing organization. Students express that the most difficult one is the writing process itself. Writing academic papers is more than just putting ideas into words. It involves a complex process: sorting and analyzing large volumes of text to synthesize new ideas. Students are expected to write something new from what has been known in the literature. Every piece of written information should also be based on facts; students cannot state their opinion without strong evidence.

Writing a paper is even more challenging when students must write in a foreign language. This is due to the fact that many English as a Foreign Language (EFL) students do not have sufficient proficiency in writing. Students may experience cognitive stress as they need to translate ideas from their native language to a foreign language (Gayed et al., 2022). Then, they should ensure their sentences are mistake-free and coherent and use linguistic conventions. Consequently, the language barrier adds to students' difficulties when composing an academic paper.

As technology advances, many AI tools emerge and provide assistance to ease the writing process. AI tools like ChatGPT and Grammarly have been significantly enhancing writing quality due to their ability to check grammar and generate text and feedback (Khalifa and Albadowy, 2024). Other AI writing tools like Connected Paper and Semantic Scholar help students find related references on the topic effortlessly. The use of AI for academic writing is also associated with better efficiency, consistency, writing style, and language level/word choice (Bahammam et al., 2023). In addition, a prior study by Song and Song (2023) has also shown that when used in instruction, AI enhanced students' proficiency in writing organization, coherence, vocabulary and grammar.

Although AI offers promising benefits, this technology also has downsides that may threaten the academic world. AI use for writing might lead to overreliance and loss of creativity (Bahammam et al., 2023). Students might degrade their cognitive ability as they become lazier in using their own critical thinking and analysis skills while writing. In addition, AI use in academic writing is also linked to issues like poor research paper quality, plagiarism, and other ethical issues (AlZaabi et al., 2023). However, AI tools for writing are growing in number, and it is more likely that people will continue to utilize them. It then becomes necessary to look at how students engage with these tools and investigate whether they are truly helpful in academic writing practices.

Therefore, three research questions framed this study:

- (1). What are the reasons for using AI tools for academic writing?
- (2). What are some ethical concerns related to using AI for academic writing?
- (3.) In what instances is AI reliable for academic writing?

Method

This study employed a descriptive qualitative research design. It aims to describe a phenomenon and its

characteristics from the viewpoints of those who experience it (Nassaji, 2015; Vaismoradi et al., 2013). The participants of this research were 10 EFL graduate students from Indonesia who were familiar with AI writing tools. The data was obtained through a semi-structured interview, a data collection method that includes predetermined closed and open-ended questions and is also accompanied by several follow-up questions (Adam, 2015). The interview was done with each participant for around 30 minutes per session. The interview was recorded and transcribed using an online transcription tool. The transcript was further analyzed with thematic analysis, which included several steps: 1. familiarizing with the data, 2. Generating initial codes, 3. Searching for themes, 4. Reviewing themes, 5. Defining themes, and 6. Writing up (Braun and Clarke, 2006).

Results

The findings of this study are presented according to the three research questions.

RQ1: What are the reasons for using AI tools for academic writing?

Regarding the reasons for using AI writing tools, there were three themes generated: 1. To speed up the writing process, 2. To overcome writer's block, and 3. To enhance writing quality.

1. Speed up the writing process.

Students expressed that they mainly use AI to shorten the time needed to write. They stated that AI can help them finish the overloaded tasks that must be turned in around the same due date.

"I use AI tools because it helps me when I have many assignments to submit at the same time" S3.

Another student said AI cut her time to decide and have a clear outline of what to write and what to put on the paper.

"The reason why I am using AI is because I need to have a faster way to reach a fixed concept before writing my articles." S9

2. Overcome writer's block

Participants highlighted that they use AI when they experience writer's block, the feeling of not knowing what to write or how to continue writing.

"I mostly use AI when I don't know what I will write in my paper." S2

"I usually use them when I feel struggled" S4

These excerpts suggest that AI can help them overcome the common obstacles encountered while writing academic papers.

3. Enhance writing quality

As the participants are EFL students, they also experience some language barriers. Therefore, another thing that motivates them to use AI writing tools is to improve their writing quality.

"I use AI only as tools to enhance my writing" S4.

"To help me make a good writing. It can help me to paraphrase sentences and make it more academic writing." S2

Student 2 conveyed that she utilized AI to make her work sound 'more academic'. EFL students may have limited knowledge of more advanced words commonly used for academic writing. Therefore, AI can help them choose better wording that is appropriate for their paper.

In addition to better wording, another student mentioned that AI tools can also improve writing organization and grammar.

"ChatGPT helps me in improving the quality of my paper, for example, my paper can be more organized, the grammar is getting better" S7.

Student 5 also acknowledges that AI improves the quality of his writing but in other aspects rather than content quality.

"it is improving in relation to the quality of my writing. But it is not really helpful in relation to improving my content writing." S5

RQ 2: What are some ethical concerns related to using AI for academic writing?

Four themes were identified based on the data obtained regarding the ethical concerns of using AI for writing academic works.

1. Plagiarism

Students worry that content generated by AI may contain plagiarism. It might be because AI cannot provide a link to the source of the information.

"The challenge is that the content produced by the AI is not original, so it can cause plagiarism" S8.

In addition, students are also afraid that the content will be detected as plagiarism when checked in the plagiarism checker.

"sometimes I am worried about the detection of plagiarism." S3

2. Information Accuracy

Participant highlighted that when asked several questions/prompts, AI may not fully understand the context. As a result, the content generated might not be as they expected.

"I have some concerns, especially related to its ability in understanding the context. I need to reread the suggestion made by the AI and evaluate whether the information has been as what I am looking for." S1

3. Maintaining originality

Participant articulated a common concern regarding using AI tools in academic writing, expressing apprehension about the authenticity of their writing when utilizing such technologies.

"The original writing is my dilemmas when I use this AI. Because I feel like it's not my pure writing." S10

However, students are also aware of taking ownership of the paper by expressing their original thinking, putting their voices on it, and demonstrating critical thinking while using AI for writing.

"By putting my own thoughts." S5

"at the writing process, the author has a responsibility to keep their authentic voice." S2

"Well, I have to use my critical thinking when writing with AI." S9

Students believe that by doing these things, they could maintain the originality of their writing.

4. Balancing AI's role in writing

I can automatize many tasks and generate text in a very short time. It must be tempting for students to rely solely on the text produced by AI, as acknowledged by student 9.

"It is challenging to make sure that the AI does not dominate the result of our writing." S9

Nevertheless, students pointed out to keep in mind that this technology is here only to help, not to replace their overall effort.

"it's important to remember that they are meant to assist, not replace my own writing." S4

"By using AI as a tool not as a writer. Utilize them to enhance your content, provide suggestions, and streamline the writing process, but always maintain ownership of the content." S1

Based on the above excerpt, the student also emphasizes using AI for things other than writing the main content or ideas of the paper.

RQ3: In what instances is AI reliable for academic writing?

This section categorized the data into two themes: reliable and not reliable. The first theme generates four subthemes, while the second has two.

1. Reliable

a. Generating ideas

Most participants expressed that AI assisted them from the very beginning of the writing process in finding ideas on what to write.

"AI have been helpful in generating ideas and expanding my thinking process" S4.

"AI tools help me in generating the idea of my writing" S3.

Further, student 3 explained that AI can be a brainstorming platform, giving her initial knowledge on the topic to write.

"I usually use AI to look for some references and wider view about a problem or topic to work on." S6

b. Outlining

Once participants know the topic to work on, AI can be used to write a comprehensive outline so that they will have clear goals on what to write in detail.

"AI tools help me in creating structured outlines by suggesting me the main sections, subsections, and key points to include in each part of the paper. also it helps me to organize my thoughts and ensures a logical flow of information in my paper." S10

As student 10 stated, AI can build a very structured outline. Thus, it also helps her to organize her ideas so the paper will have a logical flow.

c. Editing and proofreading

Participants also use AI to find and correct sentence errors, particularly grammatical errors.

"My writing is simple sentence, and the AI helps me to find advance vocabulary. For grammatical also, it helps me to correct my error sentence." S9

"I use AI to grammar check my writing" S7.

"I use AI as grammar checker to cut the time" S5.

2. Not Reliable

a. Critical Analysis

Student 10 was reluctant to use AI for tasks requiring critical thinking and analytical reasoning. It suggested that AI is limited in replicating the complex cognitive processes involved in such tasks.

"I don't use AI in content creation especially for critical analysis and original thinking." S10

b. Finding Credible resources

A participant stated that using AI is fine for getting the general background of the topic. However, students need to manually search for accurate information from credible resources.

"I use AI when I need big pictures in relation to imagining what to write, but to expand my writing, I will go to credible references." S3

Student 10 also raised concerns about the validity of information in the AI-generated content.

"AI may provide good answers to our prompts. However, it cannot link to the original sources. I am afraid the text is not valid", S10.

Therefore, it is highly recommended that students go to credible search engines or digital libraries to find references.

Discussion

This study revealed that the main reason students go to AI when writing academic papers is to cut the writing time. Participants acknowledged that writing takes a lot of time, and AI helps speed it up. For instance, students need prior knowledge on the topic they plan to write. Previously, students should go to search engines and read many articles to gain an understanding of the topic. AI can provide and highlight essential information so students can easily grasp the background knowledge. Then another common challenge students face is finding ideas on what to write and what to include in their papers. This technology can tell and suggest writing outlines with each detail, even at the subtopic level. It is safe to say that AI saves time, particularly in the pre-writing process, which often becomes the longest part of writing.

Another important point is that AI is very good for brainstorming. Whenever students feel stuck or struggle to continue writing, they can always ask anything to AI. From trivial matters to questions related to the problem, they are facing. This way, AI is a go-to assistant ready to overcome students' writer's blocks. Participants also mentioned that AI has helped improve their writing quality, as it can be used as a grammar checker, paraphraser, and writing evaluation tool. It is beneficial for writers who are not native users of the language as they should no longer worry about sentence mistakes. Participants in this study mentioned these three points as the reasons for using AI for academic writing. Concurrently, they acknowledged that AI is beneficial, which also aligns with previous studies: cutting the time needed to write (Mondal and Mondal, 2023), solving writer's block (Washington, 2023), and improving writing quality (Marzuki et al., 2023).

Several concerns related to AI use emerged from the participants. Firstly, they mentioned about the plagiarism. Students think that AI, particularly generative AI like ChatGPT, does not produce original content as it only generates text without mentioning citations or providing resources. Even when ChatGPT generates text with citations, most of the citations included are inaccurate (Kacena et al., 2024). It is indeed a threat as the AI may fail to cite properly. This finding supports a previous study by Francke and Alexander (2019) that found that AI can proliferate plagiarism in higher education.

Nevertheless, there have been several generative AIs, like perplexity and Jenni AI, which have the ability to provide citations to the content generated. These tools might produce better and more accurate information compared to ChatGPT as they put citations that refer to the original source. In addition, students also expressed that they are worried if their paper is detected using AI with AI detectors. However, such detectors might be beneficial as a counterbalance to the generative AI use. Students may become more aware of using AI responsibly as they do not want their work identified as having a higher percentage of text generated by AI.

Another issue is related to the accuracy of information from the generated text. When given instructions or prompts, AI sometimes does not fully understand the context and produces content which is not as expected. As

largely known, generative AI is pre-trained with large amounts of information freely accessible on the internet, and the content generated will be based only on the pre-trained data. According to Salvagno et al. (2023), ensuring the generated text contains accurate and up-to-date information is difficult. There can also be risks of biases, societal stereotypes, and discrimination in the content produced. Again, AI might be good for brainstorming and understanding general knowledge on a certain topic. However, writers are suggested to go to credible sources for more accurate information.

Students also expressed concerns about balancing the role of AI and their efforts in composing academic work. However, as the participants are graduate students, they have the responsibility to take ownership of the writing. They acknowledge that AI is very helpful, but it is here only to assist. However, for undergraduate students still honing their academic skills, the potential pitfalls of overreliance on AI loom larger. To address this, institutions should have better regulations to ensure these AI tools will not overpower students.

AI tools are varied and can be used for many stages of writing. This study found that AI is particularly helpful for idea generation, outlining, editing, and proofreading. The findings are the same as previous work by Khalifa and Albadawy (2024), suggesting that AI is a multipurpose tool for writing. Unfortunately, AI tools like ChatGPT are unable to do tasks requiring critical analysis and reasoning. It is also unreliable for literature search as it often generates inaccurate information (Francke and Alexander, 2019). Users can opt for AI tools that include citations with direct links to the resources so they can see the sources. Some AI-powered websites, like Connected Paper and Semantic Scholar, are also specifically for literature searches. Users should use such tools or manually find references in credible academic databases.

Conclusion

This study delves into the motivations driving students' adoption of AI tools for academic writing. Participants emphasized how AI can quickly complete tasks like giving background information on certain topics and writing and structuring outlines, reducing the time needed for writing a paper. Furthermore, AI shows promise as a trustworthy tool for overcoming writer's block and improving writing quality, which is especially helpful for students learning to write academic work. It can be used for ideation, outlining, and editing processes. However, its limitations become apparent when doing tasks that require critical analysis or involve robust literature review. There also come worries about possible plagiarism issues arising from generative AI and the dependability and accuracy of AI-generated content. These results highlight the necessity of a balanced integration of AI, encouraging students to be responsible for maintaining academic integrity while utilizing AI as a helpful tool.

Recommendations

This study only involved a small sample size and was conducted on EFL students. Consequently, the findings of

this study might not apply to other contexts in general. Further studies may include more participants from diverse backgrounds so that the findings can represent many disciplines.

Abstract: As scientific advancements continue, researchers increasingly confirm the interconnectedness of various scientific disciplines. This has led to the development of interdisciplinary studies within the realm of science and knowledge. Among the diverse subjects explored by researchers, language stands out prominently. It has been thoroughly examined from multiple perspectives including historical, social, philosophical, linguistic, cognitive, psychological, cultural, and civilizational angles. These studies concluded with results of high scientific value, which led to the development of linguistic research on the one hand, and methods of scientific and systematic thinking on the other hand. In this paper, the researchers believe that the subject of language has a close relationship with important vital fields like geology and chemistry due to the epistemological rapprochement that exists between the two fields in addition to linguistic thinking, where the subject is addressed - with a descriptive and analytical approach - in three points: **1st**. Language is viewed from a panoramic point of view, and its position in human life is different from the classical approach that stands at its known functions. **2nd**. approaching the concept of language from the perspective of geology, by projecting several geological concepts on language levels. **3rd**. approaching language from the perspective of chemistry, through a comparison between chemical elements and the interactions that occur between them, and between phonetic, morphological, and semantic elements and their effects during the verbal process.

Keywords: Language, structure, geology, chemistry, semantics, interaction

Introduction

The most important feature that distinguishes this era is scientifically dealing with various issues through choosing the methodology rigorously, objectivity in description, comparison, and discussion, precision in controlling terminology and striving through the study of human, social, and natural phenomena to find solutions to problems resulting from observation and contemplation. One of those prominent issues is language, as it is one of the phenomena that linguists have sought to apply such rigor, objective, and accurate methodology. The obvious evidence for that is the emergence of several linguistic schools since the descriptive structural school, which was pioneered by de Saussure in the late 19th century and the beginning of the 20th century, along with the theories and schools that followed. Some of them aimed to focus on the functions performed by the phonological elements within speech chains which is the phonological or functional school, and some scholars considered - in the study of language - the systems it contains, through a proposal that relies on abstraction and logical methods of reasoning, description, and conclusion. Some linguists viewed language as behavior, governed by the equation: “stimulus and response”, while some of those schools dealt with the transformations that enter into the processes of synthesis of linguistic elements. Among the linguistic trends were what was considered the innate predisposition that the speaker possesses, and the mental processes that occur according to the speaker’s competence and linguistic ability to act in language in its various contexts and syntactic structures, which is reflected in its effective performance to achieve its rhetorical and communicative purposes.

If each of these schools had founders, pioneers, followers, foundations, goals, and special linguistic concepts, then two basic things should be noted:

- 1) Every school was established on the relics of the previous school through the criticism it presented, that the study of linguistic phenomena did not meet scientific requirements which satisfied the cognitive insight that the language student expects.
- 2) The intellect of each school was keeping pace with the prevailing intellect in some areas of the human sciences such as structural, functional, and behavioral theory which appeared simultaneously with those that appeared in psychology and sociology, which indicates the cognitive communication between these sciences and others. This paved the way for later steps to study each science separately and reconnecting bridges between sciences, thus appeared the concept of inter-sciences in which the efforts of its scientists combine to study a multi-faceted subject with complementarity and openness.

Research Problem

The examples we have given on the interconnection that exists between the human sciences based on the study of the subject of language opens the door wide for us to consider linking language to fields that seem at first glance unrelated in their subject matter, concepts, methods, and goals (other than the humanities). We have shown that this is possible by describing language as a subject to be studied in linguistics, sociology,

psychology, philosophy, and other fields, but here we mean the relationship of the subject of language to natural sciences, specifically geology and chemistry which is what this research aims to confirm by trying to answer the following basic research question:

- If structure and significance are among the most prominent linguistic issues addressed by modern linguistics in its branches (most notably structural linguistics, descriptive linguistics, and significance); can they be related to the fields of geology and chemistry respectively?

This fundamental question is divided into two sub-questions:

- 1 - How can the concept of “structure” and its related linguistic elements be linked to geological concepts?
- 2 - What are the aspects of the relationship between language and chemistry, specifically at the semantic level?

These questions will be answered according to the following plan:

Outline

Preface: Sciences and Interpersonal Spirituality

Topic 1: Language and its Role in Human Life.

Topic 2: The Geological Structure of Language.

Topic 3: Language and the Chemistry of Significance

Problem of the Research:

The significance of the study is related to the fact that it deals with two of the most prominent topics in the field of linguistics: “structure” and “significance”, and links them to two scientific fields: “geology” and “chemistry”. Thus, it reflects the vision of cognitive integration that exists between the various sciences and knowledge to establish cognitive bridges between their systems functionally and epistemologically and fill the existing gap and the isolationist position witnessed in linguistic studies. Accordingly, the research process becomes three-dimensional, as in Figure (1).

Figure 1. The relationship of significance and structure to geology and chemistry

Research Objective

- Considering the terms “structure” and “significance” as two of the topics addressed by linguists, on which theories were based and linguistic schools were laid which contributed to the development of linguistic research.
- Expanding the scope of language in its structural and significance dimensions to present them on an inter-level, highlighting its template for integration with various natural and cosmic sciences and making them available to researchers in natural and cosmic scientific fields.
- Highlighting the importance of the cognitive openness of humanities to the sciences - in general - and linguistic thinking - in particular - in linking the prevailing concepts in language studies to all fields concerned with studying issues of nature and the universe.
- Highlighting the relationship between the concept of structure and significance and the field of geology and chemistry

Study Approach and Tools

The nature of the subject requires reliance on the descriptive and analytical approach in order to trace the elements relevant to the study of language from an interdisciplinary perspective and their presence in the fields of geology and chemistry by monitoring and describing existing relationships and demonstrating their importance in linguistic and scientific studies in general.

Literature Review

What is common in studies that link linguistic approaches to the fields of geology and chemistry are those related to the fields of terminology or lexicography, which study the use of language in the two fields by addressing their terms within the framework of terminological and lexical systems, analyzing their conceptual elements, tracking them ontologically, comparing their units and the educational methods for teaching each field; to conclude results that are an addition to the field of science itself, at the linguistic (terminological and lexical) and educational levels, at the level of theory and application together.

1st - Studies related to the field of terminology and lexicography:

1) Related to chemistry:

A - Language and the teaching and learning of chemistry, by: Silvija Markic & Peter E. Childs, 2016.

B - Symbolic language in Chemistry- A new look at an old problem, by: J. D. Bradley¹ and E. Steenberg, 2008.

C - Learning at the Symbolic Level, by: Keith S. Taber, 2009.

It is noted that these studies address the issue by linking linguistics to chemistry, in terms of:

1.1 Terms and nomenclature:

Both sciences use specific terms to describe their phenomena and concepts. In chemistry terms are used to describe chemical elements, compounds, and chemical reactions. Likewise, language uses terms to describe sounds, linguistic structures, and other linguistic phenomena.

1.2 Using symbols:

Chemistry uses symbols and formulas to represent elements, compounds, and reactions. In contrast, language uses symbols such as letters of the phonetic alphabet and other linguistic symbols to represent sounds, linguistic structures, and linguistic phenomena.

1.3 Chemical linguistic analysis and studies:

Studies have examined the relationship between language and chemistry where it is assumed that there is an effect of chemistry on language and human communication. For example, some researchers study the impact of chemicals in food on language and social interactions.

1.4 Common scientific applications:

There are areas in common between language and chemistry, such as medical language which uses chemical terms to describe diseases, treatments and biochemistry which studies chemical processes in biology.

2) Related to geology:

A - English language and usage in geology: a personal compilation, by: Dorothy Helen Rayner, 1982.

B - Language and Earth: Elective affinities between the emerging sciences of linguistics and geology, by: Bernd Naumann Frans Plank, Gottfried Hofbauer, 1992.

C - Employment of Manifest Intertextuality in Geology and Applied Linguistics (Ph. D. Theses): A Social Constructionist Perspective, Nauman Al Amin Ali El Sayed, 2014.

D - Frequency of Linguistico-communicative Features in Scientific Language of Geology, Nosrat Hejazi, Masoumeh Shiri, 2021.

The above studies link language to the field of geology with regard to the terminological aspect and this is represented in:

2.1 Using language to name geological terms:

Language is used to name geological terms such as mountains, rivers, valleys, lakes and other natural places. These names are also used in describing the geological history and geological nature of those areas. Language is

also used in describing natural calamities such as: volcanoes, earthquakes, and others. These terms are also used to explain geological concepts such as: rock formation, paleontology, marine geology formation, etc.

2.2 Geology enriches the language:

Geological phenomena can affect the development of language. For example, natural disasters such as volcanoes and earthquakes may enrich the language with new terms that express those phenomena.

2.3 Documentation:

Geologists also use language as a tool to document new discoveries, results and concepts in the field whether through scientific publications, articles or academic books.

2.4 Comparison between applied linguistics and geology:

As stated in Nauman Al-Sayed's study, which showed that the abundance of intertextual links in applied linguistics and their scarcity in geology is due to the interdisciplinary nature of applied linguistics; the scattered threads must be woven together into a cohesive fabric to build a common spirit between the writer and the reader. In contrast, the objective, linear and cumulative nature of geology largely omits such a need, as a great deal of procedural experience is assumed. Also, while geology has relied on human citations - abandoned phenomena - and non-integral salient citations, applied linguistics has tended to highlight human efficiency through integral citations.

In addition, nomenclature in citation structures in geology is intended to identify the report-based nature of the field while in applied linguistics there has been an emphasis on textual structures and verbal processes. (Nauman, 2014)

2nd - Studies related to linking the field of language to its elements and levels:

A - The Geology of Language, by: John Edmund Barss, 1920:

This is obvious in his statement:

"And even if you accuse me of shifting from geology to the navigation of rivers I shall not complain, if only my inconsistency may help to convince you that out of the forbidding rock of an unknown language there may gush living waters, if we are truly athirst for knowledge" (Barss, 1920).

B - Linguistic groups: Geological connections, by: Sanjay Sonawani, 2017:

In which he concluded that:

"The regional Geological factors play a major role in the development of the languages, cultures and general psychological patterns of the people living within the boundaries of specific geological formations."

C - Linguistics as Chemistry: The Substance theory of semantic primes, by: Arnold M. Zwicky, (467-485).

He explained the role of living in specific geological formations in developing the development of languages, cultures, and general psychological patterns, as in his saying:

“The regional Geological factors play a major role in the development of the languages, cultures, and general psychological patterns of the people living within the boundaries of specific geological formations” (Sonawani, 2017).

Comments on previous studies and the distinction of the current research:

It seems that most studies have attempted to compare the field of language/linguistics with the fields of geology or chemistry by searching for the common point at the terminological level, which relates primarily to the development of terminology and the comparison between terminological systems which is an issue that can be addressed in all fields, given that terminologies are the key to science (El Massadi, 1989).

Regarding the study of (J.E. Barss), it has a philosophical and literary tendency, while the study of (Sanjay Sonawani), which linked the development of languages and cultures to the geological aspect, is closer to linguistic sociology and cultural sociology.

What this study aims to address is completely or initially different from what the aforementioned studies actually addressed; as the current research considers language in its structure from the perspective of geologists' view of the earth with its layers and divisions, as Claude Lévi-Strauss alluded to in his philosophical theses (researchers will refer to it later), and its significance is considered as the chemists' view of the reaction that occurs between particles of matter.

Preface: Sciences and the inter-spirit

It has become clear to us from the above that the human sciences represent a mosaic of knowledge and theories, which address topics that concern humans in various fields that solve their psychological and social problems, study their cultural and communication issues and discuss their literary and philosophical perceptions among others. One of the most prominent topics that have an impact on these fields is the issue of “language,” which is considered one of the most complex and important issues in human life.

Despite the different angles of view on this subject, and the diversity of approaches to studying it, modern scientific research has recorded an unparalleled accumulation of knowledge that has revealed the most subtle elements contained in language as a psychological, social, and cultural phenomenon which has its effects on the natural and material aspects. It also monitors all cognitive processes during the processes of linguistic communication and the pragmatic issues that it faces which constitutes a system of interconnected and

interrelated concepts in its essence, so this was one of the aspects of interconnection that exists within the fields of the human sciences, which we call Interdisciplinary fields.

The reality is that interdisciplinary fields are those bridges connecting one field to another, linking the unlinkable. So, we are talking about a connection between sciences that appear at first glance to be separate in their relationship, but the structural spirit that exists between them makes those sciences - with their multiplicity of topics - appear as one science, because ultimately, they fulfill the needs of humanity in every time and place without exception.

Perhaps this is why history records the interest of a number of scholars in previous eras and even currently, in more than one field, as is the case with Ibn Sina who was interested in medicine with all its branches and also in astronomy, psychology, philosophy, ethics, mathematics, astronomy, poetry, music, and so on. While Al-Biruni was interested in astronomy, geography, arithmetic, history, philosophy, culture, pharmacy, and others. In our time, we find Noam Chomsky's interests - for example - related to linguistics, grammar, psychology, philosophy, epistemology, and politics.

In addition to the terminological overlap between the concepts of these sciences, we often find the same terms (nomenclature) in more than one science, even though we differentiate between their concepts with definitions that include different characteristics, and sometimes this takes on a formal character.

The benefit of this epistemological openness in diverse sciences lies in raising the level of cognitive awareness in understanding natural, human, and cosmic phenomena, and transferring thought from one cognitive system to another in a way that confirms these systems an integrated structure reflecting human thought that has mastered the link between them.

We are then faced with a descriptive concept - which we borrow from linguistics - the systems of those sciences that come together within a cognitive entity. We can call it the "cognitive structure" which differs from the cognitive structures inherent in the human mind. Each knowledge of that cognitive entity can represent a cognitive element that falls within a harmonious structural context which is similar to the elements that make up the structure of a language.

Based on this, the distinction that most researchers make between sciences and disciplines is purely methodological, with organizational, functional, educational, and pedagogical motivations, and cannot, under any circumstances, be an intentional epistemic rupture.

1st requirement: Language and its role in human life:

The role of language is what linguists and communication scholars intended when they addressed the topic of language functions. They initially stated that the basic and pivotal function of language is the communicative

function. Then those functions branched out and Jakobson mentioned the six famous functions which Louis Hébert summarizes in the following table:

Table 1. “Factors of communication and functions of language”

Function	Source Factor	Target Factor	Target factor and function no.
Referential	Message	Context	1
Emotive	Message	Addressee	2
Conative	Message	Addressee	3
Phatic	Message	Contact	4
Metalingual	Message	Code	5
Poetic	Message	Message	6

(Hébert, 2011)

As mentioned, Michael Halliday defined these functions as follows:

1 - Instrumental Function: It means using language to obtain material things, such as food and drink, and is summarized by the phrase: (I want).

2 - Regulatory Function: Language is used to issue orders to others and direct their behavior and is summarized by the phrase: “Do as I tell you”.

3 - Interpersonal Function: Using language to exchange feelings and ideas between an individual and others, summarized by the phrase: “Me and you”.

4 - Personal Function: The use of language to express one's feelings and thoughts, and Halliday summarizes it in the phrase "I come here".

5 - Heuristic Function: Using language to inquire about the causes of phenomena, and the desire to learn from them, and summarizing them in the phrase: “Tell me why”.

6 - Imaginative Function: Using language to express imaginations and perceptions of his own creativity, even if they do not match reality, and summarizing them in the phrase: “Let us pretend”.

7- Representational function: Using language to represent ideas and information and communicate them to others, summarizing them in the phrase: “I have got something to tell you”.

8 - Language manipulation function (Play function): It means playing with the language and building words from it, even if they are meaningless, and trying to exploit all the capabilities of the language system, summing it up in the phrase: (Billy Pilly) (Al-Munizel, 2020)

9 - Ritual function: Using language to define the group's personality, express behaviors within it, and summarize them in the phrase “How do you do?”.

These functions, no matter how numerous and different they are, indicate the urgent need for language in all human life. Indeed it can be said that the field of research into the functionality of language can be expanded depending on the diversity of linguistic research and the development of human thought. Accordingly, the function that emerges from this study is the collaborative function and we summarize it similar to what Halliday

did in the phrase: “Let us think and research,” as it represents a comprehensive tool for thinking and research in all areas of knowledge that concern humans. It is a tool for linguistic thinking and research in the natural sciences.

2nd requirement: the geological structure of language

Structure is: “those concepts and procedural tools that are used to know the characteristics and laws of the typical structure underlying natural phenomena” (Hobbs B.E, 1), and this indicates that its concept can be applied to the field of linguistic study and other scientific fields, and based on this Structuralism appeared in several scientific branches, including:

- Anthropological structuralism
- Social structuralism
- Structural functionalism
- Psychological Structuralism
- Philosophical structuralism
- Formative structuralism
- Structural geology

It is concerned with studying the elements that make up phenomena without considering factors external to them.

I - Structure according to linguists:

When defining the term "structure", linguists believe that: "Structures are determined by a set of relationships between elements".

They also believe that structure is an image and form that can be applied to any substance or phenomenon. Abdelrahman Al-Hajj Saleh explains all of this further by saying: “The search for the structure of a thing is the search for the elements from which it is composed and the standards upon which these elements are composed”. (Haj Saleh)

Accordingly, we can consider all the elements that constitute the language, which fall within the relationships between them, as structural elements, and the types of linguistic structures can be limited to:

- Phonetic structure
- Phonetic structure
- Phonetic structure
- Syntaxial structure
- Lexical structure
- Semantical structure

II - The Structure in geology

Structural geology means: “The study of the three-dimensional distribution of rock units in relation to their rupture histories”.

“Structure” is defined by geologists as: “rock is the spatial and geometric configuration of all the elements that make it up.”

They have types of it, including:

- Initial structure
- Shape structure
- Penetrating structure

Through the comparison between structure in the linguistic and geological fields, we can arrive to the following assumptions.

1) The geological structure also focuses on knowing the types of rocks, their distribution, the minerals that make them up and their locations. It includes igneous rocks that contain most of the mineral wealth and salts, while the sandy, calcareous, and chalky rocks of the Second Period contain petroleum ore, and the Upper Cretaceous and Paleocene rocks contain phosphate ore. Studying the types of rocks helps to know the types of soil and the extent of their fertility so does the linguistic structure, as it is based on knowledge of the phonetic system, lexical units, the nature of morphological forms, what the structures contain with their various basic components (attribution) and their complements, and the method of distributing linguistic signs in speech chains. And the metalinguistic elements related to these chains (context, body language, etc.).

2) Just as the phonetic structure in the language the geological structure also has syllables, which is called the “geological syllable”.

3) If structure in language is studied within a science in which topics intersect, such as morphology, rhetoric, and literature then structure in geology intersects with topics in topography, geophysics, and geochemistry.

4) This link between structure among linguists and geologists is confirmed by what was mentioned by (Al-Yousef, 2017), who explains the foundations of the cultural and intellectual repertoire on which Claude Lévi-Strauss relied in his deductions as a structural philosopher and anthropologist, and these three foundations are

A - Psychology.

B - Marxism.

C - Geology, which branches out from and is closely related to phonetics and language.

This connection between these three foundations led Lévi-Strauss to define structuralism as: “a scientific attempt to carry out geological excavations deep into the depths of the cultural soil, instead of being limited to

[illegible]

219

3) The chemistry of language imposes the presence of basic elements upon which the structure is based (such as nouns, verbs, and adjectives) and it differs from one language to another according to the characteristics of each language and its structural system, which is a natural principle that guarantees the survival and permanence of the structures, and corresponding to this in chemical equations, the reaction requires pressure, heat, and auxiliary agents such as water (H_2O).

4) Achieving the functions of language requires full discretion of all its levels and mechanisms. This practice mainly emerges from the standard perceptions of language associated with the collective linguistic community (linguistics) to the use of various strategies during the process of communication (speech). This is similar to what happens in chemical reactions of breaking the chemical bonds between molecules of the reacting substances; to produce new bonds between molecules of the substances resulting from the reaction, leading to the formation of new different substances, in their chemical and physical properties together. (Fullick, 2001).

5) The concept of transformation according to the transformational generative school in the study of language is applying a specific set of transformation rules such as deletion, addition, substitution, and changing position, to a limited number of basic correct sentences (core or predicate sentences) to yield an infinite number of correct sentences, such as negation, interrogative, passive, or restrictive sentences..." (Harris, 1964), which is similar to the concept that chemistry aims to study in materials by studying the material and the changes that occur in it, specifically by examining its properties, structure, composition, behavior, and reactions.

Conclusion

1 - The interdisciplinary field that exists between the sciences dealing with language goes beyond the humanities, which represent the cognitive environment for the subject, due to the various dimensions that language refers to: social, cultural, psychological, philosophical, and others, to other sciences that seem to be completely different.

2 - The relationship between language and the field of geology and chemistry goes beyond the terminological aspect, or shallow comparisons close to literary approaches, to a convergence in goals, cognitive tools, and epistemological contexts.

3- The structure of language with its system, levels, and phonological, individual, and syntactic elements resembles the geological system with its levels contained within the earth, its elements, and the shifts, deviations, and phonological and semantic developments that occur in language reflecting the approaches and transformations that occur in geological elements.

4 - Linguistic significance is a pivotal issue in the field of language functions, and it is a complex world made up of phonemes, which are formed into syllables, lexical units, and syntax similar to chemical components, in their phonetic, syntactic, and semantic interaction.

5 - The transformative and interactive processes that occur within the structure of language and the fields of geology and chemistry can be generalized to all sciences that deal with various natural and human phenomena. This indicates that all phenomena proceed in a coherent manner and according to harmonious laws. Therefore, it is possible for each field to benefit from the results of other fields, away from the cognitive disintegration that occurs for methodological or perhaps ideological reasons.

Abstract: Introduction: Sexual health education provides young people with accurate, age-appropriate information about sexuality and their sexual and reproductive health, which is very important for their overall health. The aim of this study is to determine the knowledge and attitude school-based towards sexual health education among high school students in Bulgaria. Material and methods: A cross-sectional study design was used to determine the knowledge and attitude towards reproductive and sexual health education among high school students. A total of 315 adolescents in the age group of 15-19 years were surveyed using a self-report questionnaire. Girls being predominant - 56.2% (n=177). Data was analyzed using descriptive statistic and non-parametric tests. Results: A significant part of the respondents did not attend a health lecture in the current year (40.0%; n= 126), and most often received health information from books, brochures, magazines (31.4%; n=99), followed by friends and relatives (24.8%; n= 78). Most of the respondents have good knowledge about preventing unwanted pregnancy (82.9%; n= 261) and sexually transmitted diseases (85.7%; n= 270), with girls being better informed about both the questions (P=0.019; P=0.000). 36.2% (n=114) of the respondents have ever had sex. The mean age at first sexual initiation was 15.56±1.761 years. Conclusion: High school students have a good knowledge of sexuality and sexual and reproductive health, but they receive this information mostly outside of school. There is a need for teachers to be engaged in effective teaching of sexual health education to high school students in order to improve the quality of their knowledge and attitudes towards sex.

Introduction

Sexual health education programs are essential in providing young people with accurate, age-appropriate information about sexuality and their sexual and reproductive health. This education is crucial for their overall well-being and development. It encompasses a range of topics relevant to their age group, including understanding their bodies, healthy relationships, consent, contraception, sexually transmitted infections, and the emotional aspects of sexuality (World Health Organization, 2010).

In today's interconnected world, where young people have access to vast amounts of information through various media channels, providing accurate and comprehensive sexual health education is more important than ever (Olamijuwon et al., 2021). School-based sexual health education programs equip students with the knowledge and skills they need to make informed decisions about their sexual health, navigate relationships, and understand the importance of respect and consent (International Planned Parenthood Federation, 2016; Maqbool & Jan, 2019).

However, sexual health education for students can be a sensitive and challenging topic for educators, parents, and policymakers alike (Naz, 2014; Sharan et al., 2020). There may be concerns about age-appropriateness, cultural sensitivities, and differing moral or religious beliefs. Despite these challenges, evidence suggests that well-designed school-based sexual health education programs can have significant benefits, including reducing the risk of sexually transmitted infections and unintended pregnancies, promoting healthy relationships, and empowering students to advocate for their own sexual health (Women & UNICEF, 2018).

The aim of this study is to assess the knowledge and attitude regarding school-based sexual health education programs among high school students in Bulgaria.

Method

Study Design

The study design is cross-sectional, based on an online survey conducted among 315 adolescents aged 15-19 in the Haskovo region, Bulgaria. A convenient sampling technique was used to collect the data from the students. A link was sent to them via their e-mails. The number returned and validly completed questionnaires was 315.

Questionnaire

A self-administered questionnaire was used to determine the knowledge and attitude towards school-based reproductive and sexual health education programs among high school students. The questionnaire included a

total of 6 closed questions regarding knowledge and attitudes towards school-based sexual health education programs, as well as 1 open-ended question related to the age at which they began engaging in sexual activity. The survey also included questions related to demographic characteristics such as gender and age.

Data Collection

The study was conducted from October 2023 to November 2023 using the Google Forms application for response collection. A total of 315 adolescents aged 15-19 participated in the survey, with 56.2% (n=177) being female. The average age of the surveyed individuals was 17.41 ± 0.871 years.

Data Analysis

Descriptive statistics were used to analyze the data. Non-parametric tests were employed to test hypotheses. Central tendencies, such as the mean (M) and standard deviation (SD), were used to illustrate the dataset's distribution. Additionally, a significance level of $P < 0.05$ was established to evaluate the importance of the null hypothesis, ensuring a strong and reliable analytical method. Data processing was performed using SPSS 23 and MS Excel 2016 software.

Results

The results found that a significant part of students was sexually active - 36.2% (n=114) (see Figure 1). The average age at first sexual initiation was 15.56 ± 1.761 years, with girls starting earlier than boys ($P=0.003$).

Figure 1. Are you sexually active?

Most of the respondents reported good knowledge about preventing unwanted pregnancy (82.9%; n= 261) and sexually transmitted diseases (85.7%; n= 270), with girls being better informed about both the questions (P=0.019; P=0.000) (see Figure 2 and 3).

Figure 2. Do you know how to protect yourself from unwanted pregnancy?

Figure 3. Do you know how to protect yourself from sexually transmitted diseases?

A significant part of the respondents did not attend lectures at school on health topics during the current year (40.0%; n= 126), as well as lectures on sexually transmitted diseases (39.0%; n= 123) (see Figure 4 and 5). Boys attended significantly fewer and less frequent school talks on both topics (P=0.011; P=0.015).

Figure 4. How many talks on health topics have you listened to this school year?

Figure 5. How many talks about sexually transmitted diseases have you listened to in school this school year?

The students reported that they most frequently received health information from books, brochures, and magazines (31.4%; n=99), followed by friends and relatives (24.8%; n=78) (see Figure 6).

Statistically significant differences were found in the responses of the students, with girls preferring to receive information on the topic from books, brochures, magazines, as well as health lectures at school. Meanwhile,

boys prefer to receive information from friends, relatives, and parents ($P=0.000$). In both genders, a low percentage seeks information from their GP - 8.7% of boys and 11.9% of girls.

Figure 6. Where do you usually get information about methods of preventing sexually transmitted diseases?

Discussion

The study has tried to assess the knowledge and attitude regarding school-based sexual health education programs among high school students in Bulgaria. The results indicate that high school students generally declare a good knowledge of sexuality and sexual and reproductive health.

Similar to our results, other studies have also shown that young women generally demonstrate greater awareness of sexuality issues (Moreira et al., 2023; Ronda, 2015; Nery et al., 2015; Ramiro et al., 2011). This observation may be related to several factors, such as increased curiosity and interest among adolescent females in topics related to sexuality. In addition, societal norms often assign women a greater role in managing their sexual and reproductive health, prompting them to actively seek knowledge and participate in conversations about these topics (Moreira et al., 2023, Ronda, 2015; Nery et al., 2015).

Despite the declared good knowledge of topics related to sexual health, the high school students in our study indicated that they receive this information mostly outside of school. In contrast, studies conducted in India found that a majority of adolescents prefer to receive sex education from doctors or teachers (Kumar et al., 2017). The preference for teachers as a source of sex education has been observed in various other studies

conducted in different regions and cultural contexts (Jaideep, 2012; Wong et al., 2006; Zhang et al., 2007; Dorle et al. 2010).

In our study, teenagers might feel uneasy discussing their sexual health matters with medical professionals and teachers due to concerns regarding privacy, stigma, and the fear of potential judgment. This unease often originates from apprehensions about being perceived as sexually active or engaging in behaviors deemed socially unacceptable. As a result, many adolescents turn to their peer networks and conversations with friends of similar age as their primary sources of information and support regarding sexuality (Ronda, 2015).

Addressing these barriers is crucial to ensuring adolescents' access to accurate information, confidential healthcare services, and appropriate guidance. Healthcare providers and educators must establish a safe and non-judgmental environment, fostering open and honest communication with adolescents. By actively listening to their concerns, providing comprehensive and accurate information, and respecting their autonomy, healthcare professionals and teachers can help alleviate the fears and discomfort hindering adolescents from seeking the information they require (Ramiro et al., 2011). Additionally, efforts should be made to raise adolescents' awareness of the confidential nature of healthcare and educational services and their rights to seek and receive non-judgmental information. Educating adolescents about their rights, confidentiality laws, and the supportive role of these professionals in safeguarding their sexual health will empower them to seek health information without fear or hesitation (Hellström et al., 2021).

In our study, we found that adolescents heavily rely on seeking health information from peers and friends. Some research suggests that peer support and peer-led interventions can significantly impact adolescents' behavior in seeking information. Encouraging open and nonjudgmental discussions among peers offers a valuable platform for adolescents to exchange experiences, seek advice, and learn from one another. Initiatives led by peers, such as peer education programs, have effectively promoted positive outcomes in sexual health by addressing adolescents' unique needs and preferences, while also fostering trust and relatability (UNESCO, Joint United Nations Programme on HIV/AIDS, 2018).

On the other hand, with the rapid evolution of technology, shifting societal norms, and emerging sexual health concerns, it becomes imperative to provide adolescents with accurate and timely information through comprehensive sex education programs. These programs should cover essential topics such as consent, healthy relationships, sexual diversity, and digital safety, all of which hold increasing relevance in today's digital age (Hellström et al., 2021; Association of Women's Health, 2010). Moreover, promoting comprehensive sex education that goes beyond basic knowledge is critical. This involves discussions on communication skills, setting sexual boundaries, decision-making, and fostering positive sexual health behaviors. By imparting a holistic understanding of sexuality and equipping adolescents with practical skills, sex education programs can empower them to make informed choices and cultivate healthy relationships (Kotiuga et al., 2022).

Teachers, mass media, and friends play important roles in imparting information regarding sexual matters.

However, it is necessary for teachers to engage more effectively in teaching sexual health education to high school students to improve the quality of their knowledge and attitudes toward sex.

Conclusion

The study reveals significant insights into sexual health education and knowledge among high school students. Notably, a considerable portion of students are sexually active, with girls initiating sexual activity at a younger age than boys. Despite this, most students demonstrate a good understanding of preventing unwanted pregnancies and sexually transmitted diseases, with girls generally more informed than boys. However, it's concerning that many students did not attend school lectures on health topics, including sexual health, indicating a potential gap in formal education. Boys attended fewer talks on these subjects compared to girls. Moreover, while students receive health information from various sources, girls tend to prefer formal sources like books and school lectures, while boys rely more on informal sources like friends and family. These findings underscore the need for enhanced engagement of teachers in providing effective sexual health education to high school students, aiming to supplement their existing knowledge and address any misconceptions or gaps.

Abstract: The COVID-19 pandemic situation spreading around the world had brought dynamic changes in every field of life since 2019, especially in the learning processes. The processes of learning were done by using online platform. In a sudden shift in the learning processes, students were forced to adapt. Consequently, the processes of online learning affected students' stress. The purpose of this study was to investigate the factors affecting the stress levels on online learning of undergraduate students in Thailand. The participants of the study were 356 students from the Faculty of Science, Kasetsart University. The results from the multiple linear regression analysis showed that there were 7 factors affecting the stress levels; 1) improper time management, 2) lack of online learning supported devices, 3) the effects of covid-19 to the family, 4) online testing rules, 5) online learning rules, 6) expenses related to online learning and 7) internet problems. The remarkably high factor effected on the stress level on online learning was students' improper time management.

Keywords COVID-19, Online learning, Regression analysis, Stressor

Introduction

The COVID-19 pandemic brought about a seismic shift in education, with traditional classrooms giving way to virtual learning environments. While online learning has provided a lifeline for continuing education during these challenging times, it has also introduced a new set of stressors for students, educators, and parents. In

2021, the COVID-19 pandemic, with the implement of lockdown measures, forcing a rapid shift to online learning in Thailand. The COVID-19 pandemic brought both challenges and opportunities to the education system. Although there were issues related to infrastructure and access to online learning, efforts had been made to address these issues and ensure that students could continue their education through online learning. The experience of online learning which was likely to have a lasting impact on the way education was delivered and may lead to the integration of more technology in future educational practices.

One of the most immediate stressors in the transition to online learning was the need for reliable technology and the internet access. Many students and teachers faced issues with the internet connection, device compatibility, and software glitches. These technological challenges could disrupt lessons, assignments, and examinations which cause frustration and anxiety to both educators and students. Online learning could be a solitary experience, leading to feelings of isolation and loneliness. Students missed social interactions and support networks provided by in-person classes. The absence of face-to-face communication with peers and teachers could exacerbate stress, impacting mental health (Rizvi & Nabi, 2021). Traditional classrooms provided structure and routine, which, due to the COVID-19 pandemic, they had been disrupted by the sudden shift to online learning. Students had to adapt to a new learning environment, often without proper training or guidance. This transition, along with the need for increased self-discipline, posed significant challenges and stressors. Online learning requires prolonged screen time, which leads to digital eye strain, headaches, and fatigue (Bahkir & Grandee, 2020). The extended exposure to screens can also affect sleep patterns, exacerbating stress and impacting overall health. Assessment methods changed during online learning, with a shift towards more online exams and assignments. This change brought about concerns related to cheating and academic integrity, adding to the stress of students and educators alike (Janke et al., 2021). The fear of not performing as well as in traditional exams can lead to heightened anxiety.

For many students, online learning occurred within their homes, blurring the lines between school and personal life. This could challenge them to create a healthy work-life balance, leading to stress and burnout. Parents also faced stress as they had to juggle their own responsibilities by supporting their children's education. Online learning could make it difficult for students to stay motivated and engaged. The absence of physical presence and the distractions at home could lead to decrease in motivation to attend classes and to complete assignments. This lack of engagement could contribute to feelings of stress and academic underperformance. Not all students had equal access to the resources necessary for successful online learning. Socioeconomic disparities and disparities in access to technology and a quiet study environment became pronounced issues. Students who lacked these resources faced additional stressors in keeping up with their peers. The uncertainty brought by the pandemic, including concerns about health, the economy, and the future of education, added a layer of stress to an already challenging situation. Students worried about their academic progress and future prospects, while educators grappled with the uncertainty of their profession.

When the COVID-19 pandemic hit Thailand, schools and universities were forced to close to prevent the spread of the virus. To ensure continuity in education, institutions quickly shifted to online learning platforms. This

transition took place at all levels, from primary schools to higher education institutions. Such a quick and sudden shift in the educational system might cause intense stress on students. Therefore, the objective of this study was to explore the factors that contributed to stress levels of students in online learning during the COVID-19 pandemic.

Literature Review

In 2020, Moawad conducted a study analyzing academic stressors among students at the College of Education, King Saud University, during the COVID-19 pandemic. The research highlighted that the closure of schools and universities in Saudi Arabia, coupled with the sudden shift to virtual learning, led to heightened stress levels among students. Uncertainty regarding exams and assessments due to these changes emerged as a significant stressor, reflecting the challenges faced by students in adapting to the new online framework. In a separate study in Ghana, Agormedah et al. (2020) explored students' response to online learning in higher education. Despite a generally positive attitude towards online learning platforms such as UCC Moodle, Alison, and Google Classroom, students expressed concerns about the lack of formal orientation, consistent internet access, and financial preparedness, highlighting the need for better support structures for online education.

In Jordan, Elsalem et al. (2020) evaluated the experience of remote E-exams among Medical Sciences students. The study revealed that 32% of students reported increased stress with remote exams, with factors such as exam duration, navigation methods, technical problems, and concerns about teaching methods contributing to their anxiety. Additionally, remote exams negatively impacted students' lifestyle habits, including diet, sleep, physical activity, and smoking habits. Research from Romanian universities, conducted by Coman et al. (2020) indicated that students faced technical challenges and a lack of preparedness from higher education institutions for online learning. Technical issues took precedence, followed by teachers' inadequate technical skills and difficulties in adapting teaching styles to the online environment. Surprisingly, students rated the lack of interaction with teachers as a lesser concern.

In 2021, Sukdee et al. studied the stress factors in online learning at the Faculty of Education, Thailand National Sport University Chonburi Campus. Their research identified key variables, including perceived usefulness of stress management, risk of stress, university policies promoting stress management, and social support, which significantly contributed to students' stress levels. These factors collectively accounted for 70.50% of the stress experienced by students. In Lahore, Pakistan, Hassan et al. (2021) investigated the relationship between online learning, time management, and self-anxiety among university students. Their findings highlighted a positive correlation between online learning, time management behavior, and self-rating anxiety, emphasizing the importance of effective time management in reducing students' anxiety levels. Baticulon et al. (2021) discussed common barriers to online learning, including difficulties adjusting learning styles, household responsibilities, and communication issues. Despite spending more time at home, students struggled to concentrate due to family conflicts and distractions. A mixed-methods approach employed by Barrot et al. (2021) revealed that the quality

of the learning environment at home significantly impacted students, with the pandemic exacerbating challenges related to learning experience and mental health. Students employed various strategies, including resource management, technical skill enhancement, and help-seeking behaviors, to cope with the challenges of online learning. Finally, Shafiq et al. (2021) explored the factors contributing to mental stress among students from public and private universities. Financial crises, uncertainties in online classes, and high tuition fees were key stressors for students, with private university students experiencing higher levels of stress compared to their counterparts in public universities.

In Nairobi, the capital of Kenya, Oketch-Oboto, J. W. B. (2021) investigated challenges faced by Psychology students in online learning, including an uncondusive learning environment, internet connectivity problems, inadequate training, unreliable electricity supply, and lack of necessary equipment. Coping strategies involved social media consultation, accessing learning materials, utilizing local internet cafes, and seeking technical help from university staff. Additionally, Bringula et al. (2021) explored the relationship between individual factors and students' mathematics self-concept during online learning. Students faced challenges in technology, personal life, domestic issues, assessments, pedagogy, consultations, and test anxiety, indicating the multifaceted nature of obstacles in online mathematics education during the COVID-19 pandemic.

Method

Populations and Samples

A total of 365 participants were selected for this study from a pool of 3,044 students in the Faculty of Science at Kasetsart University. The Taro Yamane approach was used in a process selection.

Research Instruments

The research employed two main instruments: questionnaires and a stress test from the Department of Mental Health. These instruments were categorized into three parts:

Part 1: Personal Information

This section gathered personal information of the participants, including gender (X_1), college year (X_2), department (X_3), GPA (X_4), and location during online learning (X_5).

Part 2: 20-Question Stress Test

Participants responded individually to the stress test questions, addressing their experiences and emotions over the past 6 months of online learning. The test, provided by the Department of Mental Health, the Suanprung Stress Test-20 (SPST-20) featured a self-assessment scale ranging from 1 to 5 corresponding to no stress to

severe stress. It has 20 items each on stress, anxiety, and depression. Each item has to be rated by a five-point rating scale. The rating scale is as follows: 1 (did not apply me at all), 2 (applied to me to some degree, or some of the time) , 3 (applied to me moderately), 4 (applied to me to a considerable degree, or a good part of time) and 5 (applied to me very much, or most of the time).

Scoring for stress is based on a scale comprising 20 items, categorized into four types: normal-mild, moderate, severe, and extremely severe. The breakdown is as follows:

- Normal-Mild Stress (0-23 points): At this level, stress is minimal and transient. It's typical of everyday life and can be managed effectively. This degree of stress can even be beneficial, serving as motivation for success.
- Moderate Stress (24-41 points): Moderate stress arises from various challenges or threats in daily life, leading to feelings of anxiety or apprehension. However, it remains within manageable bounds and doesn't significantly impair functioning. Activities such as exercise, leisure pursuits, or seeking support from trusted individuals can alleviate this type of stress.
- Severe Stress (42-61 points): High levels of stress characterize this stage, often stemming from overwhelming concerns or unresolved conflicts. Coping becomes more challenging, impacting daily life and potentially contributing to physical ailments like high blood pressure or stomach ulcers. Effective stress management strategies such as breathing exercises, seeking support, and problem-solving are recommended. Consulting with counselors may also be beneficial if self-relief methods prove insufficient.
- Extremely Severe Stress (62 points or more): At this level, stress reaches a critical point, persisting over time or arising from significant life crisis like serious illness or profound loss. Both physical and mental health may suffer, leading to impaired decision-making and emotional instability. Without intervention, these effects can cascade, affecting not only the individual but also their close relationships. Urgent intervention from counselors or support services is essential to address the root causes and mitigate the negative impact of such severe stress.

Part 3: Contributing Factors Questionnaire

This part focused on factors influencing stress levels among Faculty of Science students at Kasetsart University. There were 12 variables; surrounding environments such as weather and noise (X_6), effects of covid-19 to the family (X_7), difficulty of subjects (X_8), task quantity and time (X_9), lecturer-student miscommunication (X_{10}), internet problems (X_{11}), improper time management (X_{12}), reduced support from lecturers and peers (X_{13}), online learning rules (X_{14}), online testing rules (X_{15}), expenses related to online learning (X_{16}), and lack of online learning supported devices (X_{17}).

Data Collection and Processing

Once the data was gathered, the collected questionnaire data underwent scrutiny, encryption, and organization

for subsequent statistical analysis.

Descriptive Statistics (Part 1):

Personal factors of respondents were analyzed using frequency and percentage distributions.

Spearman's Rank Correlation Coefficient (Part 2):

The Spearman's rank correlation coefficient was used to investigate the relationship between two variables, personal factors and contributing factors-as independent variables, and the stress levels of students as the dependent variable

Multiple Linear Regression Analysis (Part 3):

The study employed multiple linear regression analysis with a stepwise regression procedure to identify and analyze factors influencing stress levels in online learning among students at the Faculty of Science, Kasetsart University, during the COVID-19 pandemic.

Multiple linear regression, also referred to simply as multiple regression, is a statistical method that utilizes multiple explanatory variables to forecast the outcome of a response variable. The primary objective of multiple linear regression is to construct a model that captures the linear relationship between the independent variables and the dependent variable. In essence, it investigates how several independent variables are interconnected with a single dependent variable. Once the predictive power of each independent variable regarding the dependent variable is established, this collective information can be employed to generate a precise prediction of the impact these variables have on the outcome. The model formulates a linear relationship represented by a straight line that best fits all the individual data points (Yale University, 2020).

Stepwise regression, a widely adopted approach, integrates elements of both forward and backward selection techniques. It is essentially an adaptation of forward selection, wherein, after each step involving the addition of a variable, all candidate variables in the model undergo scrutiny to assess if their significance falls below a specified tolerance level. If a variable is found to be nonsignificant, it is excluded from the model. Stepwise regression necessitates two significance levels: one for adding variables and another for removing them. The threshold probability for adding variables should be lower than the probability for removing variables to prevent the procedure from entering an infinite loop. In the context of modeling predictive equation for stress level, multiple linear regression will be employed. The multiple linear regression model, involving the dependent variable Y and p independent variables denoted as X_1, X_2, \dots, X_p , can be expressed as $Y_i = \beta_0 + \beta_1 X_{i1} + \beta_2 X_{i2} + \dots + \beta_p X_{ip} + \varepsilon_i$; where β_0 represents the intercept, $\beta_1, \beta_2, \dots, \beta_p$ are the partial regression slope coefficients, and ε_i is the residual term associated with the i th observation. The regression model provides the expected value of Y given the fixed values of X_1, X_2, \dots, X_p plus the error component.

Fundamental assumptions of regression analysis include the absence of serial correlation and homoscedasticity. The no multicollinearity assumption implies that the regression function should encompass only variables that are not linear combinations of others in the model. Coefficients such as R^2 and adjusted R^2 serve as general fit indices, with R^2 approaching 1 for a well-fitted model and close to 0 for a poor fit. The adjusted R^2 is recommended for conclusive analysis due to its sensitivity to the number of predictors and its ability to decrease or even become negative. The adjusted R^2 increases as long as the t -value of a newly added variable's coefficient surpasses 1 in absolute value, with the t -value computed under the hypothesis that the true coefficient value is zero.

The subsequent phase in evaluating the model involves the t -test, where each regression coefficient is individually tested. The null hypothesis ($H_0: \beta_1 = \beta_2 = \dots = \beta_p = 0$) posits a joint or simultaneous equality of all coefficients to zero. Overall significance can be examined through the analysis of variance technique, with the rejection of H_0 indicating a linear relationship between Y and the independent variables. The variance inflation factor (VIF) serves as a gauge of multicollinearity among independent variables in a multiple regression model. A high VIF suggests substantial collinearity with other variables. Generally, a VIF exceeding 5 raises concerns about high correlation (Hair et al., 1995).

Teaching and Learning Arrangements at Kasetsart University amidst COVID-19 in 2021

Kasetsart University underwent adaptations in its teaching and learning methodologies throughout the year 2021 in response to the challenges posed by the COVID-19 pandemic. These adaptations were structured into three primary formats: (Kasetsart University Announcement, 2020)

Online Learning:

Kasetsart University prioritized the organization of teaching and learning activities through online platforms, utilizing various tools such as KU e-Learning, Zoom, Google Meet, Microsoft Teams, and Webex. Educators were afforded the flexibility to employ diverse teaching techniques, including live online lectures (Live Streaming), pre-recorded lectures, and the facilitation of online group activities. Students were provided access to study materials, course content, and assignments via the online platform.

Blended Learning:

Blended learning approach integrated both online and face-to-face learning modalities. Instructors conducted certain sessions online, typically focusing on theoretical concepts, while arranging for in-person activities, such as practical exercises, within classroom settings. The blended format aimed to enable students to independently grasp theoretical concepts while reinforcing practical skills through hands-on classroom experiences.

On-Site Learning:

Kasetsart University implemented on-site instruction for select subjects necessitating specialized skills, such as laboratory practices. Class sizes were limited, and stringent measures were enforced to mitigate the risk of disease transmission, including mask-wearing, social distancing, and frequent hand hygiene practices. These adapted arrangements ensured continuity in education while prioritizing the safety and well-being of both students and staff amidst the ongoing pandemic challenges.

Results

Descriptive statistics

According to Table 1, the data revealed that the greatest proportion of students experienced the extremely severe level of stress, with 182 individuals comprising 49.9 percent, followed by 107 students, accounting for 29.3 percent, who reported severe level of stress. Additionally, 76 students, each representing 20.8 percent, reported moderate stress levels. Notably, none of the students reported normal-mild stress levels. This absence was attributed to the minimum stress score being 29 points, while the maximum was 100 points, with the median stress score approximately at 61 points, as illustrated in Figure 1.

Table 1. Frequency and percentage of student stress level

Stress Level	Frequency	Percentage
Normal-Mild	0	0.0
Moderate	76	20.8
Severe	107	29.3
Extremely Severe	182	49.9
Total	365	100.0

Figure 1. Histogram of Student Stress Scores

Table 2 revealed that among the 365 students in the Faculty of Science, 211 were females, making up 57.8 percent, while 154 were males, constituting 42.2 percent. The largest group comprised first-year students, totaling 124 individuals, representing 34.0 percent. This was followed by 85 second-year students at 23.3 percent, 75 third-year students at 20.5 percent, and 81 fourth-year students at 22.2 percent. In terms of average grades point average (GPA), the majority of students had the GPA between 2.51 and 3.00, accounting for 34.8 percent (127 students), followed by 28.2 percent (103 students) with the GPA between 3.01 and 3.50, and 17.3 percent (63 students) with the GPA of 3.51 and above. Additionally, 15.6 percent (57 students) held the GPA between 2.01 and 2.50, and a minority of students (4.1 percent, or 15 individuals) had the GPA lower than 2.01.

Table 2. Number and percentage of students classified by gender and college year and GPA

Variables		Frequency	Percentage
Gender	Male	154	42.2
	Female	211	57.8
College year	Year 1	124	34.0
	Year 2	85	23.3
	Year 3	75	20.5
	Year 4	81	22.2
GPA	Less than 2.01	15	4.1
	2.01 – 2.50	57	15.6
	2.51 – 3.00	127	34.8
	3.01 – 3.50	103	28.2
	3.51 and more	63	17.3
Total		365	100.0

Spearman's Rank Correlation Coefficient

Table 3 revealed that there is no statistically significant relationship (at the 0.05 significance level) between any of the personal factors and stress levels in online learning among Faculty of Science students. The spearman's ranked correlation coefficients revealed that the six most least influential predictors of stress levels in online learning were improper time management, followed by lack of online learning supported devices, online learning rules, reduced support from lecturers and peers, expenses related to online learning, and online testing rules, respectively.

Table 3. Spearman's rank correlation coefficient of independent variables

Independent variable	Spearman's rank correlation coefficient	p-value
Gender (X_1)	.043	.418
College year (X_2)	.031	.555

Department (X ₃)	-.009	.865
GPA (X ₄)	-.052	.320

Table 3. Spearman's rank correlation coefficient of independent variables

Location during online learning (X ₅)	-.056	.287
Weather and noise (X ₆)	.215	.000
Effects of covid-19 to the family (X ₇)	.481	.000
Difficulty of subjects (X ₈)	.112	.032
Task quantity and time (X ₉)	.270	.000
Lecturer-student miscommunication (X ₁₀)	.422	.000
Internet problems (X ₁₁)	.073	.164
Improper time management (X ₁₂)	.643	.000
Reduced support from lecturers and peers (X ₁₃)	.511	.000
Online learning rules (X ₁₄)	.550	.000
Online testing rules (X ₁₅)	.505	.000
Expenses related to online learning (X ₁₆)	.510	.000
Lack of online learning supported devices (X ₁₇)	.585	.000

Multiple regression analysis

A multiple regression analysis was conducted to identify factors influencing the online stress levels of Faculty of Science students. The Stepwise Regression Procedure (see Table 4) was employed to select independent variables for inclusion in the model equation. The predictive equation for stress levels in online learning among Faculty of Science students, presented in raw scores, was as follow:

$$\hat{y} = 23.152 + 5.756(X_{12}) + 1.793(X_{17}) + 3.256(X_7) + 1.630(X_{15}) + 0.954(X_{16}) + 1.083(X_{11}) + 1.616(X_{14}).$$

Table 4. Regression coefficients of multiple regression analysis with the stepwise regression procedure

Model	Regression coefficient	Std. error	p-value
(Constant)	23.152	2.102	0.000
X ₁₂	5.756	0.604	0.000
X ₁₇	1.793	0.456	0.000
X ₇	3.256	0.490	0.000
X ₁₅	1.630	0.609	0.008
X ₁₆	0.954	0.434	0.029
X ₁₁	1.083	0.466	0.021
X ₁₄	1.616	0.438	0.032
adjusted R-Square = 0.627			

It was evident that stress level among Faculty of Science students was influenced by various factors, including the effects of COVID-19 on the family (X_7), internet problems (X_{11}), improper time management (X_{12}), online learning rules (X_{14}), online testing rules (X_{15}), expenses related to online learning (X_{16}), and lack of online learning-supported devices (X_{17}). All of these variables exhibited a statistical significance at the 0.05 level. Furthermore, the stress levels in online learning among Faculty of Science students, represented by adjusted R^2 equal to 0.627, were attributed to 7 variables (X_7 , X_{11} , X_{12} , X_{14} , X_{15} , X_{16} , X_{17}) as mentioned above, explaining approximately 62.7% of the variance. The remaining 37.3% of the variance was accounted for by other variables. The study also addressed a multicollinearity by assessing the Variance Inflation Factor (VIF). The VIF value exceeding 5 indicates a lack of independence among independent variables. In this analysis, if the VIF values were not greater than 5, it suggested that the regression model was deemed appropriate (see Table 5).

Table 5. Variance Inflation Factor of independent variables in the regression model

Independent variables	VIF
X_7	1.173
X_{11}	1.041
X_{12}	1.474
X_{14}	1.856
X_{15}	1.672
X_{16}	1.849
X_{17}	2.216

Figure 2. Scatter Plot of Regression Standardized Residual vs Predicted Value

Figure 2 revealed a distribution devoid of discernible patterns, suggesting a constant variance in the errors. Conversely, examining Figure 3, the Normal Probability Plot indicated a linear trend, signifying that the errors conformed to a normal distribution.

Figure 3. Normal Probability Plot of Regression Standardized Residual

Discussion

On March 26, 2020, Thailand initiated its inaugural COVID-19 lockdown under the leadership of then-Prime Minister General Prayut Chan-o-cha. This action was taken in accordance with the Emergency Decree on Public Administration in Emergency Situations 2005, which mandated a state of emergency across the entire Kingdom (Article19, 2022). Among the strategies implemented to curb the transmission of the virus was the closure of high-risk locations, including universities, international schools, and tutoring institutes starting from March 18, 2020. Educational institutions were directed to rigorously enforce disease prevention protocols stipulated by the Ministry of Public Health. Additionally, venues such as boxing stadiums, sports stadiums, horse racing tracks, pubs, entertainment establishments, traditional massage parlors, and theaters in Bangkok and its environs were ordered to shut down. The suspension of classes in Thai universities was initially announced on March 23, 2020, with specific dates varying depending on individual university policies and the prevailing COVID-19 situation. For instance, Kasetsart University declared the cessation of teaching and learning activities from March 16, 2020 (Kasetsart University Announcement, 2020).

This study identified several factors contributing to stress level among students participated in this study:

- 1) The stress level experienced by students was partly attributed to the impact of the COVID-19 pandemic on their families. With cities under lockdown, economic activities such as trade, production, and tourism has been disrupted, leading to job losses and financial instability. Many students' families struggled to make ends meet, as businesses were shut down or operated below capacity, resulting in reduced income and financial strain (OECD, 2020).

2) Another significant challenge was the inadequate internet infrastructure, particularly in remote areas where many students reside. Slow internet speeds and unreliable connections hindered online learning, making it difficult for students to access educational resources and to participate in virtual classes effectively. The increased demand for online learning further exacerbated these connectivity issues, impeding students' academic progress (Aroonsrimarakot et al., 2023).

3) Many students struggled with managing their time effectively for online studies. A lack of self-discipline leads to distractions such as gaming and social media, as well as neglecting academic responsibilities for household chores. Additionally, inappropriate study schedules, such as prolonged study sessions or studying at non-optimal times, resulted in decreased productivity and motivation (Chukwu et al., 2022).

4) The stricter regulations imposed during the pandemic for online learning and examinations add to students' stress levels. The pressure to comply with these regulations while adapting to remote learning environments can be overwhelming for students, affecting their mental well-being and academic performance (Elsalem et al., 2021; Akpınar, 2021).

5) The costs associated with online learning, including purchasing necessary equipment; such as computers, tablets, headphones, video camera. and microphones, posed a significant financial burden on students. Additionally, expenses for internet access and educational software further strain their finances. Moreover, the increased electricity consumption for online learning added to the overall financial strain experienced by students (Tavitiyaman et al., 2021).

Conclusion

The emergence of the COVID-19 pandemic had necessitated a swift transition from traditional in-person teaching to online instruction. Students and teachers have had to quickly adapt to this new mode of learning, albeit temporarily. However, the shift to full online learning; including online exams, online assignments, and other online activities, presented a novel challenge for many students and required significant adjustments. Prolonged hours spent in engaging online learning exacerbated this situation, contributing to heightened levels of stress among students.

The findings from this study revealed that approximately half (around 50%) of Faculty of Science students experienced significantly elevated extremely severe stress levels due to online teaching amidst the COVID-19 pandemic. Notably, none of the students reported having normal to mild stress levels. This underscores the fact that exclusively relying on online teaching induced stress across all learners. Consequently, educators should steer clear of organizing teaching activities solely online.

Through a comprehensive analysis using multiple regression, seven key factors had been identified as

significant contributors to this stress level experienced by students at the Faculty of Science, Kasetsart University during the COVID-19 pandemic. These factors included improper time management, lack of online learning supported devices, the effects of covid-19 to the family online testing rules, online learning rules, expenses related to online learning, and internet problems. Collectively, these factors explain approximately 62.7% of the variance in stress levels observed among students.

Abstract: This article presents the new concept of phronesis 2.0. The latter is defined by the academic social responsibility of business schools and what they have to deliver in terms of learning outcomes and when readying the next generation of graduates. Simultaneously, phronesis 2.0 deviates starkly as today's business environments differ significantly from what the ancient Greeks faced. The time span available cannot cover a lifetime, more is not always better as knowledge gets outdated, the source of inspirations and locus of control over the process of phronesizing diverges as well. Finally, the integration of modern ethical considerations and humanism in business is a prerequisite in today's world of ongoing moral crises, signs of unsustainability, and more diverse cultural norms colliding. This article presents conceptual progress made over time and discusses implications for business schools.

Keywords: Business schools, academic social responsibility, learning, practical wisdom, phronesis.

Introduction

Models, facts, figures, and insights on strategizing, leadership, and change can be downloaded from the internet at zero or low costs. Technological changes also decrease costs and allow for more flexible learning journeys via massive open online courses (MOOCs) (Burd et al., 2015) on, for example, Kotter's (2012) eight steps for managing change. On average, as many as four new leadership books are published per day, amounting to more than 57,000 volumes available on Amazon (Iarocci, 2015). The COVID-19 crisis starting to spread internationally in early 2020 also encouraged top business schools and faculty members to intensify their free access to thought leadership content in the form of webinars on leadership and strategizing in turbulent times. Knowledge is therefore not in short supply. Nevertheless, leaders and managers frequently find themselves at a loss when it comes to the question of what they actually should do or should have done in a specific situation.

The example of Nokia's previous CEO, Stephen Elop, is a case in point. He surprised his colleagues, the shareholders, industry peers, and journalists with his helplessness when ending a press conference in 2013 with the statement, "we didn't do anything wrong, but, somehow, we lost" (Harrison, 2016). This happened after the company became the official world market leader, enjoyed tremendous economies of scale and thus advantageous cost structures, and built up unique strengths at that time, such as the world's first music streaming included for free in their service packages. Yet, success bred a culture of fear inhibiting innovations and organizational evolutions as Harrison (2016) outlines.

This depiction of a rising adversity in a VUCA world – volatile, uncertain, complex, and ambiguous (VUCA) (Betof et al., 2014) has implications on success statistics as outlined in the following two sections. A number of authors – although primarily in qualitative terms without quantifying their claims – that practical wisdom could help with the following insufficiencies. Thereby, the failure rates relate to all dimensions of corporate strategy moves.

These types of problems have repercussions for business schools (Brown et al., 2015), which need to ensure that their program graduates have the right capabilities to match the demands they will face. Phronesis now appears progressively in the management literature (Bachmann et al., 2018). Practical wisdom, i.e. phronesis, appears to be of the utmost importance in order to cope with business environments' adversity. In this context, Flyvberg (2017) regards Aristotelian phronesis as referring to "practical judgment, practical wisdom, common sense, or prudence."

If wisdom grows in importance, the questions emerge whether an executive education offer adds the right value and, if this is in doubt, how it can do so? This research project investigates the crucial role of phronesis – practical, applied, and actionable wisdom – as a desirable target of executive education. In order to endow the study with a clear focus, the objective is to address the research question: How do executive education course participants perceive the phronesizing process in business schools? Phronesizing refers to the process of creating phronesis in the form of practical wisdom. Answering this research question is the primary research objective.

There is, however, also a secondary research objective. Scholars have posited the world has become a VUCA (Betof et al., 2014). Antonacopoulou (2018) outlines that this VUCA world necessitates new forms of accelerated learning and an emphasis of learning leadership. It entails a different set of targeted learning outcomes. She posits that learners ought to acknowledge and embrace their vulnerability to avoid being surprised, but to continue their self-development. Furthermore, they should remain unnerved by ambiguity and the unknown, and even feel personally challenged and enticed to thrive in spite of it. Moreover, learners should show more candor and remain open to experience an awaking. Her four features of a learner in VUCA times form a corresponding VUCA acronym for learning leadership underlining this vulnerability, unnervedness, candor, and awakening. Conger and Xin (2000) similarly foresee a change of executive education in the 21st century along six dimensions including the learning needs of individuals and their organizations, learning andragogy, content, the role of and value added by instructors, the types and mix of participants, and approaches

to secure and foster integration of learning during and after programs. This article targets the concept of phronesis, which has to be understood differently in a VUCA world.

Literature review

Jackson (2016) underlines the strong role phronesis plays as a stream within social sciences research. Extending the view of the above-mentioned Greek knowledge-related constructs as shared by Aldwin (2012) allows phronesis to be positioned within the context of other knowledge and learning-related constructs and semantics. More precisely and as illustrated in the following figure, Millo and Schinckus (2016) specify that Aristotle's semantics comprise several parts relevant for learning. All of these parts extend beyond mere *doxa* – an individual, rather unsubstantiated opinion. *Techne* refers to practical knowledge and skills. *Episteme* zooms in on theoretical knowledge, focusing far less on any kind of application. *Praxis* sheds light on principled action. Even if certain contextual details were to change, relying on key principles can help a praxis-oriented learner achieve results. *Sophia*, in turn, refers to wisdom about theory, while phronesis addresses wisdom that is solely focused on application.

Figure 1. Overview of phronesis versus other knowledge-related constructs

Source: Based on Millo and Schinckus (2016)

Phronesis is the meta-capability to strategically deal with complexity encountered over time, requiring recurring learning and unlearning to serve humanism in business. Phronesizing is the process of developing this capability. This definition addresses and overcomes the following weaknesses identified in the partial or more integrative view of the definitions found in the literature and therefore has the following strengths: First, phronesis is clearly positioned as a capability representing a non-fatalistic view. It is an endogenous, not an exogenous, variable and construct. Research has long dealt with the question to what extent personalities or leaders are born rather than made. The first such study on the impact of genes dates back to Galton's 1869 study. Steinbeis et al. (2017) maintain that the emergence of the developmental cognitive neuroscience field has advanced the available body of knowledge massively. Cognitive abilities, which include wisdom, are – to a

critical extent – malleable.

Second, phronesis is a meta-capability; owing to its importance, it should be clarified before other skills are. Third, phronesis serves a humanistic purpose, which overcomes the lack of clarity regarding what ethics other definitions refer to. Fourth, phronesis needs to serve more than one situation. It is about coping with challenging situations not once but over time. Environments are in flux (Betof et al., 2014), and as Strebel (2004) outlines, over time, companies ought to shift their main overall trajectory as part of a holistic, survival-ensuring trajectory management. Fifth, phronesis, if understood as a capability, can therefore not only emerge within one phronimos, but within a social group at a team, organizational, or even societal level.

Sixth, phronesis is no longer viewed as the “capacity of understanding hidden truths” (Delahunty, 2000, p. 418) because in a truly ambiguous environment the dynamics at work might no longer be fully understood. This train of thought resonates with the reasoning of others. Bennett and Lemoine (2014) outline that ambiguity implies two aspects. First, ambiguity means knowing very little about the situation, e.g., any causal relationships, and there are no relevant precedents to learn from. Second, the results of one’s actions are almost impossible to predict. Equally, Courtney et al. (1997) propose a framework with four levels of uncertainty. They define ambiguity as the highest form of uncertainty, making accurate assessments and predictions impossible. These hidden truths become undetectable, and predictions about their unfolding are both invalid and unreliable. As a consequence, stating problems will be more challenging. Seventh, context-wise, phronesis is most needed in complex situations. Seijts et al. (2010) regard complexity as “one of the salient hallmarks of the 21st century.” However, the ambiguity above is only one of the four drivers of this complexity, with diversity, interdependency, and flux (indicating the number of directions in which change occurs and the overall speed of change) representing the other (cf. Maznevski et al., 2007).

Eighth, the focus on learning and unlearning clarifies that phronimos, either as individuals or as social entities, may well be encouraged to resist the temptation to reapply past solutions. Thus, it is in line with Berthrong’s rather Confucian understanding of phronesis as a lifelong learning journey (Berthrong, 2008). Nevertheless, while there might be a cumulative effective endeavor due to lifelong learning, the gained phronesis has a shelf life. Martin de Holan et al. (2004) argue their case for a much-needed organizational forgetting of all that is no longer important.

Ninth, the above deliberations imply that phronesis naturally varies within individuals. This is in line with Kristjánsson’s (2021) hypothesizing that there is an interpersonal variance to perceive quandaries, a person-specific quality of decisions, and execution. Although he strongly emphasizes moral aspects in the phronesis while still including emotional regulation and prosocial behavior, this research project views phronesis as more than merely scalar – it is multidirectional. Tenth and finally, including the notion of strategy in a definition takes a clear stance on a teleological approach to phronesis. The notion of strategy refers to enabling a winning recipe. It should no longer be about the more neutral phrasing when applying judgment. Phronesis serves the purpose of winning as an individual, organization, or another grouping.

These considerations and explanations of the emerging phronesis 2.0 definition led to the overview and juxtaposition presented in Table 2 below. The numbering of 2.0 ought to indicate a bigger deviation from original assumptions as done by neo-Aristotelian thinking (cf., e.g., MacIntyre, 2013, 1981), which remained still strongly inspired by Aristotle while becoming partly less political, balancing relativist views with absolutes, opening up to empirical research, and distancing itself from prejudices against non-Greek and women. While the accomplishments of phronesis 1.0 are acknowledged, the contingency view and idea of fit require phronesis to be reinterpreted for the 21st century's characteristic trait, which is complexity (Seijts et al., 2010).

Method

We conducted a constructivist grounded theory based on Charmaz's (2014) approach. We interviewed alums of a globally top-ranked EMBA cohort. Interviews took place online to offer convenience advantages to all participants. Memoing, constant comparison, transcribing, and interim visualizations took place as prescribed by the approach. Saturation materialized after 32 interviews. Due to space constraints of this 10-page submission, we focus on adding other parts of the research instead of adding more method-related details. (Please contact Prof. Wolfgang Amann at Wolfgang.Amann@hec.edu for more details.)

Results

The research yielded the model presented in the following figure.

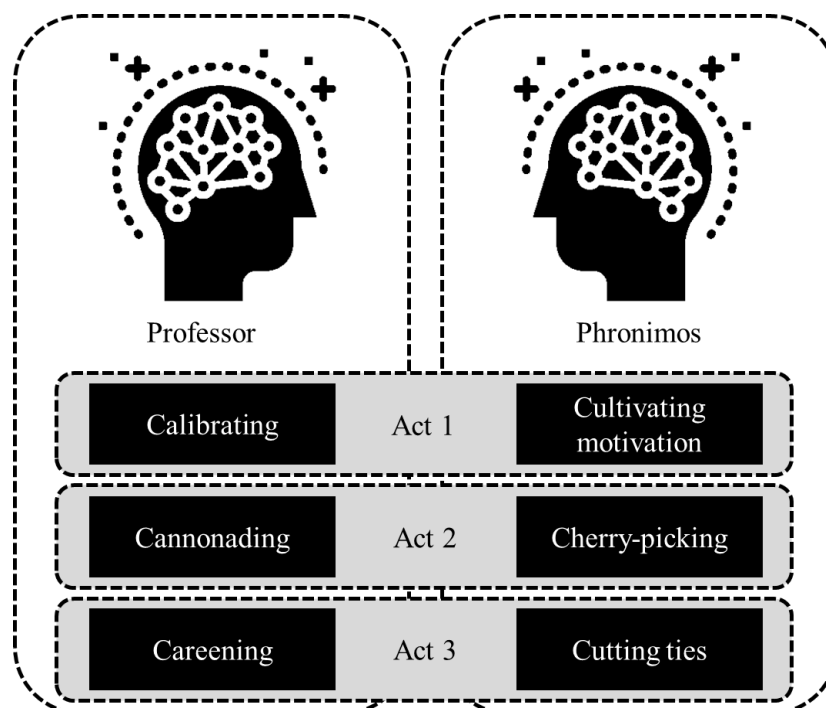

Figure 2. The 6C-duolog theory on building practical wisdom grounded in data

Phronesizing takes place based on what two core participants do. This is why the notion and analogy of a duolog from the world of theatre enters the fray. Other stakeholders, such as program directors or peers, possibly supportive employers or program managers were not mentioned as relevant. Both the learner as well as the faculty have three Cs to carry out as tasks – sequentially. Phronesis-building faculty members calibrate. They tailor their content and andragogy to the course participants, which many do not. Faculty members equally offer a plethora of stimuli as it is hard to anticipate who needs what kind of approach to learning. This is reflected in the cannonading. Careening is equally important. It is a wording for fixing boats by putting it out of the water and fixing them. Faculty members ought to be effective and direct. Their responsibilities do not end with teaching. They need to give direct feedback and ensure actual change.

In contrast, learners ought to clarify their motivation. Extrinsic focus on the diploma is not conducive. They need to cherry pick those key learning nuggets which serve them best. Finally, they must cut ties so as to not over rely on faculty to convey what is important and catalyze learning. They need to be independent and drive their own development.

Limitations and Suggestions

During the research process, a series of decisions provide a clear focus and limitations as outlined in the following. Five main areas put the study into context. These limitations relate to several factors, such as the relatively strong focus of the study objectives, the choices made when fixing the research methodology in alignment with the research question, the maturity of constructive grounded theory, and its quality assessment system proposed in the literature. Equally, limitations stem from a specific choice made when narrowing down the interviewee pool, and finally, measuring the success of learning more holistically. These five aspects are detailed in the following subsections.

1) Focused study objectives

The first decision addresses the research objectives. They are focused and narrow by choice. This study aims at a better understanding of the phronesizing phenomenon. In order to ensure sufficient depth within the analysis, a first boundary stems from the focus on executive education only, not all learning in business schools, such as undergraduate or pre-experience master's programs. The literature review clarified that according to Moldoveanu and Narayandas (2018), executive education takes place elsewhere, too, such as at strategy consultancies, human resource consultancies, personalized and remote learning platforms, and firm or organization-internal corporate universities or training departments directly delivering services to individual learners or organizations. CABS (2017) reasons that to ensure a crucial degree of depth, the activities of these other organizations, which account for at least 80% of the market, are out of scope.

Would the formation of phronesis be fundamentally different if an executive-education-level learning intervention is to be delivered by a non-business school training provider or management consultancy? Future research is encouraged to explore convergences and divergences and shed light on the remaining 80% of the market. A second boundary – exploratory in nature – originates from the type of research pursued. The boundary entails a how-based research question, which explains how the phenomenon and related dynamics are perceived if answered. While this matches the early stage of maturity, the available body of knowledge is in when it comes to the specific context of executive education in business schools; moreover, this choice in favor of a descriptive study is a choice against a primarily prescriptive one. Study outcomes, therefore, reach less far into practical recommendations as would be the case otherwise. Therefore, the second suggestion for future research is to complement this study with further research embracing prescriptive outcomes. Linked to these two initial limitations is the insight that the literature on phronesizing in executive education is thin and that the literature does not appear to be too clear on segmenting the offering. CAPS (2017) and Moldoveanu and Narayandas (2018) help understand that forms, scope, lengths, content, targets, learning levels, spaces, or andragogy and technologies diverge. Future research is suggested to first segment offerings better, placing particular emphasis on phronesis needs and learning constraints. Shorter programs clearly have less time available than longer learning journeys and interventions to grow phronesis.

2) Overall research methodology

The second decision addresses the methodological and method-oriented decisions that match the research question with a corresponding epistemological and ontological research design. This limits the study's data collection and eventual impact in terms of generalizability. Quantitative data were not gathered. No hypothesis was tested, although authors like Schulze (2003) identify the potentials of mixed-method studies. Walker and Baxter (2019) argue similarly and share their priority of more research value in the form of a better understanding in direct comparison incompatibilities of debates on epistemology. This study gathered qualitative, not quantitative data. Future studies can address the potentials of quantifying observed dynamics and generate different and complementing datasets.

3) Maturity of the evaluation system for constructivist grounded theories

A third limitation links to the perceived maturity of constructivist grounded theory as an approach. While an increasing number of sample studies rely on it emerges, a more enabling framework and guidelines for evaluating studies do not exist. Available articles and guidelines elaborate on the positioning of the approach within the available more extensive set of research methodologies and methods than on detailed guidelines for integrating axes and categories. Most pertinently, how to evaluate one's own or others' studies remains ambiguous to a certain extent. This is an opportunity for future research. Two directions emerge.

The one direction is to advance, enrich, and mature the available body of knowledge to evaluate constructivist grounded theory studies. The other direction is to encourage researchers to add more self-evaluations. This train

of thought mirrors a corresponding one by Gibbert et al. (2008) for the field of case studies. These authors ask what can pass as a rigorous case study and report more adequately about the design choices and outcomes for case studies. Future research ought to, of course, continue the quality assurance of coding, categorizing, and integrating empirical insights without feeling too constrained by reporting obligations or too tight guideline "corsets," as this would not necessarily be in line with the method's flexibility and constructivist nature. More transparency in future studies can help with the credibility of the research outcomes and the broader acceptance of constructivist grounded theory in an otherwise already very contested field with substantial polarization.

4) Focusing on versus complementing the learners' with the faculty's views

This research acknowledges the previously mentioned insight shared by Blaxter et al.'s (2006), who reason that research is the "art of the feasible" (p. 157). A strong focus on doing one method right, or as right as possible in practical, pragmatic terms, was a priority. Genuinely understanding the experiences and perceptions of the study participants was crucial to achieving the research objectives. It required resources in terms of time and attention as well as concentration. Scrutinizing the learner and subjective experiences is also in line with a learning philosophy of self-regulated learning (Pintrich, 1995). The interview choices allowed for the construction of the 6C-duolog theory to contribute to the available body of knowledge not on phronesis in general but on the process of phronesizing within executive education – all within the research context of this study.

One limitation originates from this focus on interviewing course participants. Faculty members and potentially additional individuals, such as highly professional and motivated executive coaches, program directors, facilitators, and program managers as part of the delivery team, help form the context and study experience, several of them in a more directional or transformational role, others as merely supporting the execution of a plan for a learning journey.

Pashler et al. (2008), for example, reason that learning becomes more effective when the instructors acknowledge and comply with the meshing hypothesis. The meshing hypothesis states that learning experiences become more impactful if faculty adopts formats in line with the learner's preferences. Newton and Miah (2017) reveal that the majority of teachers believe in this train of thought – yet only a minority behaves accordingly and brings the meshing hypothesis to life. Based on such other studies, there is a case to explore the faculty's contribution as the other group of actors in the 6C-duolog model. They design the learning experience in their module, provide a buffet of ideas, and ensure a conducive context for learning. Calma (2016) reasons that the school, the program director, and the faculty members as suppliers of the opportunity of a learning experience should have a straightforward approach to assurance of learning. According to Calma, many accreditation boards and bodies require corresponding documents that link program-related and module-related learning goals to specific means to measure them. Prusak (2010) clarifies that not everything can be measured, and not everything that is measured is managed well. However, in more professionally run top-ranked schools, the faculty members represent a potentially rich source of insights.

5) From taking an initial stock to evaluating outcomes more holistically

This train of thought of including more than the learner's perception does not have to stop with the faculty members. Philips and Philips (2011) suggest a model to depict learning holistically beyond the emotional reaction of course participants in the form of satisfaction and satisfaction scores on course evaluations. Higher levels of measuring learning include testing for actual learning, and this could entail qualitative or quantitative tests of learning progress on phronesis. Philips and Philips (2011) likewise argue that the outcome of learning could be measured in improved contributions of study participants at work and then in how employer organizations benefit as part of a holistic return on education or return on investment decision. The study at hand emphasizes experiences, not such a stakeholder-oriented perspective on returns. Future studies could render the perception of phronesis more objective by triangulating it with an evaluation of faculty members and an impact analysis in the workplace of graduates.

Conclusions

This article builds on the insight that business schools suffer from tremendous adversity. Multiple dimensions of business schools and their executive education offering are subject to change in the 21st century (Conger & Xin, 2000). However, as Iñiguez de Onzoño and Carmona (2012) argue, tough competition has so far caused a Red Queen effect known from evolutionary biology. The Red Queen effect originally stems from Carroll's (1871) *Through the Looking-Glass* as part of Alice's Adventures in Wonderland, in which the Red Queen shares the following with Alice: "Now, here, you see, it takes all the running you can do, to keep in the same place" (p. 33).

This quotation clarifies that even substantial innovation and organizational development efforts might not render it easy for institutions to leap. All these efforts risk institutions facing similar struggles as when they started their efforts. Too little competitive advantage could be achieved, let alone sustained, as competitors evolved as well. What also has not changed is the ongoing quest to add more value and step up. As CAPS' (2017) data suggest, 2/3 of executive education programs add no value in terms of staff engagement, staff or customer satisfaction, or profits and sales. In parallel, when it comes to complying with the Principles of Responsible Management (PRME), which also includes an addendum principle, more progress is needed. According to Godemann et al. (2014), this PRME addendum calls on business schools to become role models in ethics, innovation, and ongoing professionalization efforts. This thesis helps address the adversity of business schools and the call for more value and values. In times of knowledge becoming a commodity, graduates benefit from a unique value-added when the focus shifts from knowledge to wisdom. In a wiggly VUCA world, Antonacopoulou (2018) clarifies that learning must adapt. The same is true for practical wisdom – be it in strategizing (Nonaka & Toyama, 2007), leadership (Nonaka & Takeuchi, 2011), or in more general terms, any burning issue in organizations (Flyvberg, 2008). Deans of business schools and executive education providers received the main elements of a balanced scorecard granting centerstage position to phronesis. The idea is not

merely to add phronesis to an otherwise untouched educational system but to reorient it to add more value in VUCA and COVID-19 times. Also, each business unit setting is likely to have idiosyncratic forces for and against change, as the analysis of types of executive education providers and, for example, them suffering from “accreditocracy” (Julian & Ofori-Dankwa, 2006, p. 225) clarified.

The ensuing discussion on horses for courses, i.e., implications for staffing and faculty development, clarified the following. Within a reconstructivist view on the purpose of education, the 6C-duolog model requires more from faculty members. Faculty ought to dare more, truly fulfilling their calibrating, cannonading, and careening responsibilities as outlined in the 6C-duolog model.

Embracing a shift towards phronesis and the 6C-duolog theory requires change. For Byrne (2020), the COVID-19 crisis represents an opportunity for such change amidst all of the adversity it caused. It represents one of those critical incidents, which allowed for a catalyzed change in the past and can have the same impact today! This logic holds for executive education providers, faculty but also learners alike. COVID-19 might well have rendered institutions, instructors and learners more agile and digitally savvy while rendering curricula more up to date, as outlined by De Novellis (2020). If schools, faculty, and learners embrace value potentials from phronesis more, they can draw on insights gained from the research in this study. To my best knowledge and understanding of the literature on executive education, this is the first empirical study aimed at opening this black box of phronesizing. As the research objectives clarified from the very beginning, the emphasis of this study is on creating a better understanding of how phronesizing unfolds – how participants in an executive education program perceive the phenomenon. While this study is descriptive and exploratory, it prepares future research and can inspire practice.

There are implications for each learner as well. Passively expecting a higher return on education will not do justice to the rather active role they have to play in terms of cultivating a conducive learning motivation, cherry-picking, and cutting ties. It is a true interactive, interdependent duolog that can lead to more practical wisdom. Aristotle left subsequent generations a wealth of insights, one of them in the form of his deliberations on phronesis. He also reckoned that “the pleasures arising from thinking and learning will make us think and learn all the more” (Aristotle et al., 2009, p. 1153a). This research project closes with the hope that course participants will benefit from gaining more phronesis from their duologs and these very pleasures that encourage them to continue to learn. As Antonacopoulou (2018) reasons, it is the only means to survive and thrive in a VUCA world.

Abstract: Gamification is one of the novel teaching strategies, which has an effective role in developing students' learning, mainly in second language acquisition. In Saudi Arabia, the implementation of gamification as a strategy in English language teaching is a fairly new concept in Early Childhood Education (ECE). The primary goal of this study is to analyze the effect of Early Childhood (EC) teachers' beliefs on their attitudes toward applying gamification activities while teaching English as a Second Language (ESL). The sampling includes ($n=422$) of (EC) teachers in Saudi Arabia, who were selected randomly. Data collection was done via a self-administered questionnaire and it was analyzed through using a descriptive analyses approach. Results revealed that there was a significant positive correlation between teachers' beliefs and practices of using gamification in teaching ESL in ECE. Some teachers indicated that they experienced several barriers relating to lack of training and knowledge in terms of implementing gamification in EC settings. The results of this study are useful to policy and decision makers, regarding the need to enhance the digital skills of EC teachers through the provision of an appropriate training program. Future researchers are advised to conduct further study on the digital professional competencies of EC teachers in relation to teaching ESL.

Keywords: English language, games, students' learning, motivation, early childhood schools.

Introduction

The boom in technology and the economy has encouraged an increase in the labor market requirements for skilled workers who are fluent in English as an important, global language. In 1927, ESL was presented in secondary schools in Saudi Arabia without a precise curriculum (Alkhuzay, 2015). English was presented later in 1953 at secondary and high schools with a well-defined curriculum (Al-Subahi, 1989). In the last century, the teaching of ESL was not integrated into Early Childhood (EC) curricula in Saudi Arabia. Within the Saudi New

Vision 2030, the government emphasizes the integration of bilingual education into EC (Allehyani, 2022a). At the end of 2021, the Ministry of Education incorporated English language into the first grade of primary schools to accomplish the strategic goals of the Saudi New Vision 2030 (Ministry of Education, 2022). Without doubt, learning ESL is not a simple task for young students as they usually face many intellectual difficulties in mastering the skills of writing, reading, speaking and listening fluently (Al-dosakee & Ozdamli, 2021; Hong, 2016). Some language activities in the classroom, such as translation, are time consuming, which is a burden on the teacher, especially in large classrooms (Kamaruddin et al., 2019). In this case, teachers need to apply inventive teaching techniques to engage all students in learning a new language, so that they form part of that culture (Jetzkowitz, 2018).

Classroom gamification is a relatively new trend in Early Childhood Education (ECE). Gamification refers to a problem-solving strategy that uses game design features and techniques within modern learning contexts (Werbach & Hunter, 2012). In preschool classrooms, implementing a gamification strategy is important in stimulating the minds of young children to learn. The use of games is common in educational institutions, but the application of a gamification strategy is a fairly new concept, especially in ECE in Saudi Arabia. As such, there is little research on this topic in the field of ECE in Saudi Arabia. Gamification in teaching English is one of the effective ways to motivate children and develop their interests in learning a second language (Zhang, 2018). Most scholars have confirmed that well-designed games can increase students' motivation to learn (Gee, 2003; Fullerton, 2014; Eichenbaum et al., 2014; Eguia & Contreras, 2016; Ahmed et al., 2022). By applying gamification in the classroom, teachers can motivate their students to learn, as it is one of the most beneficial strategies in the educational process (Garland, 2015). Gamification has proven effective in increasing students' efficiency in the educational process (Al-dosakee & Ozdamli, 2021).

Besides, gamification provides an atmosphere of social cooperation among students during learning. Gamification allows interaction and communication between students without any obstacles (Ahmed et al., 2022). In social contexts, gamification is used to encourage students to express themselves and their emotions freely (Pantazidou et al., 2021). In public schools in Saudi Arabia, for a long time, English was taught without much focus on developing learners' communicative abilities (Al-Nassr, 2015). The contents of English language curricula in Saudi Arabia often contain isolated subjects and inferential activities that result in limiting the progress in vital elements such as communication skills and critical thinking (Almukahhili, 2022). Nowadays, teaching English in kindergarten and primary schools in Saudi Arabia has become a central focus for developing learners' competency (Mitchell & Alfuraih, 2017). In light of this educational development, English language teachers are trying to use more creative and enjoyable teaching methods to maintain students' attention and drive for learning (Al-jifri & Elias, 2017). Gamification is useful in developing children's language skills in speaking, listening, reading and writing in English language contexts (Khosiya, 2023). There are many applications of language games that stimulate children's English language learning, which are commonly used in ECE.

When reviewing the existing literature that dealt with gamification in EC, it was found that there is lack of

literature on several points. First, most of the current studies were limited to short-term evaluations and a small number of samples (Turan et al., 2016; Koivisto & Hamari, 2019). Secondly, the studies that investigated the effect of teachers' beliefs and practices toward applying gamification strategies on teaching young students ESL, especially in primary school, are very few (Su & Cheng, 2015; Yildirim, 2017). Finally, most of the current literature focused on the field of application of gamified activities in e-learning systems is mainly linked to computer science education, which increases the issue of generalization to other learning areas for instance: languages (Park, 2019). More importantly, there are few studies that deal with EC teachers' use of gamification to motivate children to learn ESL, specifically in Saudi Arabia, and this is what the current study seeks to focus on. Zhang and Hasime (2023) recommend that future researchers focus more on investigating using gamification in kindergarten and elementary stages. To the best of our knowledge, existing studies on game-based learning mostly ignore the vital role that EC teachers play (Jong & Chang, 2015). Therefore, the primary purpose of this study is to gain a deeper understanding of the beliefs and practices of EC female teachers, and barriers they face in applying gamification in their classrooms based on the following three research questions:

1. What are EC teachers' beliefs and practices toward applying gamification in the classroom?
2. Is there a statistically sufficient correlation at the significance level ($\alpha = 0.05$) between the degree of practices and beliefs towards the use of gamification in teaching ESL?
3. Is there an effect of teachers' beliefs on practices towards the use of gamification in teaching ESL?

Literature Review

Gamification definitions

Gamification is one of the new educational phenomena that aim to incorporate some digital components from games into enhancing learning, especially in ECE. Gamification is a fashionable and active area of research (Kasurin & Knutas, 2018). Deterding et al. (2011) defined the use of game mechanisms and strategies in different contexts such as playing digital games for learning purposes. These entertainment contexts include virtual rewards, player points, game levels, and instructions on game mechanics (Hamari, et al., 2014). The mechanisms integrate into gamified online learning systems to support learners' education (Simões et al., 2013). Digital technology has a great potential to expand and improve the quality of education and students' learning outcomes, providing teachers with innovative digital tools, to motivate students in appropriate ways. Gamification refers to the employment of games that promote teaching and learning through fun, to support and motivate activities that occur in the classroom (Meza et al., 2020). It is very important to distinguish between the definitions of games and gamification. Foncubierta and Rodríguez (2014) "recognize the game as something concrete, while gamification is based on didactic content, that is, the elements and thoughts of the game are used to spice up the proposed activities" (p.63). In engaging activities, students gain knowledge as if they were playing a game (Simoes, 2013; Romero & Espinosa, 2019). Hamari and Koivisto (2013) recognized that gamification affects students' behavior, because it allows them to form new experiences, and provides them with the ability to exercise self-control and feel motivated.

Motivational Impulse in Gamification

In EC settings, educators can apply play-based strategies such as gamification as most effective for teaching young children a second language. The widespread use of gamification in recent years is likely due to its impact on the user's motivation and learning (Garland, 2015; Kapsalis et al., 2020). This is essential in second language education, where motivation has been reliably associated with learning (Brown, 2007). There are two types of motives that are widely noted as important in increasing the learners' desire to learn, namely extrinsic and intrinsic. The theory of Self-Determination was introduced by Ryan and Deci's work, which was published in 1985 (Miller et al., 1985; Manzano-León et al., 2021). In this theory, the authors discussed extrinsic and intrinsic motivations. Lepper (1988) explained the learners' external behavior, which involves actions taken to obtain the reward or avoid external punishment for a specific activity. Intrinsically motivating behavior is defined as that which is displayed to achieve the pleasure it provides, the learning it allows, or for the purpose of evoking a sense of accomplishment (Lepper, 1988). Intrinsic motivation can be achieved when someone enjoys doing something (Ellis, 2015; Manzano-León et al., 2021).

In contrast to intrinsic motivation, extrinsic motivation results were lower in learners' motivation levels in the learning process over time, in gamification contexts (Hanus & Fox, 2015). Learners tend to perform better when they are intrinsically motivated (Lepper, 1988). Despite these differences, educators can incorporate extrinsic motivational tools into activities and use them in a way that enhances learners' intrinsic motivations and behaviors (Landers, 2014). Gamified activities can be used for increasing learners' intrinsic and extrinsic motivation. Learning ESL is related to learners' motivation. Gamification increases learning motivation and engagement levels, and develops students' learning performance (Araya et al., 2019; Dehghanzadeh et al., 2019; Shortt et al., 2021). Within the Second Language (SL) context, integrative motivation into classroom play a significant role in increasing a student's desire to devote time to schoolwork (Cook, 2016). Several scholars agreed that games are a useful educational method to engage children in learning English because they can enhance students' motivation and self-confidence (Boudadi & Gutiérrez-Colón, 2020; Edwards, 2022; Jiang, 2008; Kuo, 2008). Since children's attention span is short at this early age, the application of the gamification strategy is appropriate to attract their attention toward achieving great learning (García et al., 2021).

Despite the fact that gamification has proven to be an effective method for enhancing engagement and motivation when it comes to teaching, further research is required to deliver strong proof of its improvements on both students' emotional states and learning outcomes (Dicheva et al., 2015). Learning ESL for students requires a long period of time to study vocabulary, grammar, pronunciation, and other skills to master the second language (Cook, 2016; Lin, 2016; Seibert-Hanson & Brown, 2019; Martin, 2020; Shortt et al., 2021). A previous study by Wang et al. (2011) found that students had a positive attitude towards the effect of using games on improving their motivation and their acquisition of vocabulary. In addition, gamification can offer learners immediate feedback on their learning progress, which is crucial to improve and track their learning outcomes in the second language context (Khosiya, 2023). Scholars such as Edwards (2022) and Wang (2023) found that if students do not have any kind of motivation, they will not be inspired to continue learning and will

likely be left behind academically. Therefore, the role of teachers is to develop motivation in students to ensure the sustainability of learning in a positive environment.

Teachers' Implementation of Gamification

Nowadays, technological devices surround children in their daily lives. Thus, some teachers prefer to integrate technology into children's learning at school. Teachers' digital competence is essential to adapt the modern teaching model to meet students' digital needs (García et al., 2021). However, continuous teacher training in this field is needed. Ciganda (2018) argued that teacher training programs related to gamification strategies should focus on promoting the development of related knowledge and skills to employ modern technology to enhance children's learning. In the same vein, Birova (2016) found that teachers have positive attitudes towards games in ESL teaching, as they have proven to be a useful method in teaching practice. Additionally, the gamification method was found to be necessary and very useful for all student age groups and levels (Birova, 2016). The teachers revealed that there is a lack of fun activities and exercises in the foreign language textbooks, which burdens them; therefore, the game method is useful for teaching a foreign language (Birova, 2016). This finding acknowledges that teachers suffer from a lack of appropriate teaching resources, and guidelines in foreign language curricula. The teachers' instructions to the students while playing online games were very important in arousing enthusiasm to participate in the lesson and understand its content (Wang et al., 2011). The results of the Kaur (2019) study showed that the use of language games to teach a second language was effective, as the games attracted students and increased their interest during learning.

There are many free, online English language applications that teachers can easily access and download. These applications enhance learning English language skills. Several scholars agreed that online games such as Kahoot and Duolingo are the most common commercial applications (Bustillo, et al. 2017; Gafni, et al. 2017; Hung, 2017; Iarenenko, 2017; Mateo-Gallego & Ruiz Yepes, 2018). These are free game-based online platforms established by the Norwegian University of Science and Technology, which encompasses design features that encourage educational activities such as (timetables, points, effects, sound, leaderboards, nicknames). Teachers can create quizzes, discussion boards and surveys in a basic and straightforward indicative method. Gafni, et al. (2017) reported students' positive attitudes and satisfaction with using Duolingo as an enhancer of supporting their language learning courses. Kahoot proved to be an effective tool in English lessons where students felt positively about it (Dellos, 2015; García et al., 2021; Wang & Tahir, 2020; Zarzycka-Piskorz, 2016). A comparative study by Khosiya (2023) examined the effectiveness of gamification between two groups of children who used traditional and modern methods through gamification in learning ELS. Learners who used their favorite gamified apps in learning language skills such as grammar, vocabulary, or pronunciation obtained higher scores than other learners who used the traditional method (Khosiya,2023). The study found that learners who use the gamified platforms are more stimulated and engaged than learners who use traditional language learning methods (Khosiya,2023).

Developing students' vocabulary has an important function in the language, as vocabulary is considered

significant for mastering speaking skills. Games are the best e-learning strategy to help students learn vocabulary in English (Kapp, 2012). A previous study by Kaur (2019) indicated that all teachers agreed that language games can increase students' vocabulary learning. By acquiring a large number of vocabularies, learners can master four skills in English which include: listening, reading, speaking and writing (Hamer & Lely, 2019). For example, the Pictionary game develops learners' language acquisition, which is highly effective for individual learners and provides language practice in different English language skills (i.e., listening and speaking, reading and writing) (Bendo, 2019; Hamer & Lely, 2019). Another example of a language game is Two Truths and a Lie. A previous study found that this game was positively effective on students' ability to speak to learners of English as a foreign language (Hariyati, 2018). Hot Seat is suitable game for any level of learner; it assists students to build their vocabulary and practice speaking and listening skills (Hariyati, 2018). Games are an effective tool for learners to gain new skills; although they take a long time and a lot of effort on the part of the teacher until they are well organized and managed (Bendo, 2019). A recent study by Jordán Buenaño (2021) found that using gamification has a great impact on developing learners' pronunciation skills while learning vocabulary in the target language, using a wide range of game elements to simplify the learning process. Besides, students' English vocabulary significantly improved as result of gamifying language activity (Jordán Buenaño, 2021). Hence, gamifying activity in ESL classes is very effective for developing students' language skills.

Methodology

Research Design

The aim of this study is to analyze the influence of EC teachers' perspectives and attitudes towards gamifying language activity to motivate children to learn ESL. This study targeted teachers in EC settings in the first-grade age, from 7 to 8 years in public schools in Saudi Arabia. The quantitative method was used in order to better analyze and define the problem and results of this research. This research design is suitable for this investigation. Aliaga and Gunderson (2002) stated that quantitative research is analysis into a social problem, which describes the phenomena by collecting numerical data that are examined by applying statistically based methods. The questionnaire was used as the best tool to reach a larger number of the sample and to achieve the purpose of the study.

Sampling

This study includes ($n=450$) participants of EC teachers in Saudi Arabia, who were selected randomly and agreed to participate voluntarily in this research. Data collection occurred via the questionnaire with the intention of gathering information on the teaching experience, practices, barriers, and attitudes of EC teachers regarding the implementation of gamification during ESL lessons. Prior to the data collection process, the researchers ensured that all participants had fulfilled the purposes of the current study, while maintaining the privacy of their personal information, which will only be used for the purpose of the study.

Instrument and Ethical Procedure

The self-administered questionnaire was created using (Microsoft Forms) and it was distributed via EC schools' official email and social networking sites such as WhatsApp. The questionnaire contains three main sections: the first is the demographic information of the teachers, including (years of experience, professional training, and the barriers they may face in using gamification in teaching ESL to children; responses from the second and third sections are based on the Likert 5-point scale. The second section asks teachers about their role in motivating students' English learning via applying various language games in the classroom. The response has a range of answer options that go from (always=5 to never=1). The third section asks teachers about their perceptions of applying gamification as strategy to motivate students to learn ESL. The response has a range of answer options that go from (strongly agree= 5 to strongly disagree=1).

Prior to conducting data collection, at the first stage, the questionnaire was subject to content and context examination by the experts of the Kind Saud University Ethics Committee to ensure that all elements were scientifically correct and relevant to the subject of the research. All the questionnaire, research questions and methodology were submitted to the committee in both languages, Arabic (as the mother tongue of the local community) and English, to be assessed and examined ethically by the specialized academics. At the next stage, the final evaluation was conducted by two experts in the Higher Committee for Scientific Research Ethics. Their assessment and recommendation were taken into account in the final version of the questionnaire. After obtaining the final approval from the head of the University Ethics Committee (No: KSU-HE-23-148), the questionnaire was validated before the study, using an experimental group.

Statistical Analysis

The descriptive statistics were analyzed via using Statistical Package for the Social Sciences (SPSS version26). Frequencies and percentages were analyzed and presented to summarize the questionnaire questions.

Results

Demographic Information

The researchers have used statistical description and an analytical method to examine the data by using (SPSS) in analyzing the sample characteristics to calculate the frequencies and percentage of the population sample. The study sample consisted of (n=450) EC English language teachers, and after applying data collection for the field study, the collected data were coded, entered into the computer, and then processed, analyzed and the statistical results were extracted using SPSS. Table (1) indicates the distribution of the English language teachers as a result of the study sample for the experience variable in teaching English: nearly (33.1%) of those teachers had from 1 to 3 years' teaching experience in ECE, while the rest of teachers (26.9%) reported that they had from

nearly 10 years and more as English teachers. Further analysis revealed that three-quarters of all English teachers (71.8%) indicated that they encountered various practical obstacles when applying the gamification method in the classroom. When those teachers were asked about the types of obstacles, the majority of responses (27.8%) revealed they had lack of digital gamified training.

Table 1. Background characteristics of English teacher respondents

Characteristics	Subgroup	Frequency	Percentage
Experience	1-3 years	149	33.1
	4-6 years	86	19.1
	7-9 years	94	20.9
	10 years and more	121	26.9
Gamification barriers in the classroom			
	Yes	323	71.8
	No	127	28.2
Barriers			
	Lack of digital gamified training	99	27.8
	Lack of knowledge on gamification	112	24.9
	Lack of time to prepare gamified activities	59	13.1
	Inappropriate classroom setting for gamified activities	20	4.4
	Does not fit subject schedule	13	2.9
	Other	7	1.6

Likewise, about (24.9%) of teachers reported that they had lack of knowledge on gamification (see Table 1). These are the most influential barriers mentioned by English teachers, which need to be tackled by government education policy-makers.

Judgment Standard

Means (M) and Standard Deviations (SD) were analyzed for each concept and related items. These items were then ranked in a descending order according to the following scale: (Less than 2.33 = low, 2.34 – 3.67 = medium, and 3.68 - 5 = high).

EC teachers' practices and beliefs toward applying gamification in teaching ESL

Table 2 shows the results of research question (1): What are EC teachers' beliefs and practices toward applying gamification in the classroom? The mean and standard deviation were analyzed for EC teachers' practices and beliefs toward using gamification in teaching ESL, showing the rank of the mean and its importance level

according to the class interval. As presented in Table (2), most of English teachers in EC settings reported that they implemented gamification when teaching ESL to children. The arithmetic means for this variable ranged between (2.86 – 2.98) with a general average mean value of ($M=2.91$, $SD=1.404$) on the five-point Likert scale. Interestingly, the most common game used by those teachers was (Pictionary), in order to increase students' vocabulary, with an arithmetic mean value of ($M=2.98$), which is the highest arithmetic mean among all the phrases of the axis, with a standard deviation of ($SD=1.469$).

Table 2. EC teachers' beliefs and practices toward using gamification in teaching ESL

<i>EC teachers practices toward using gamification in teaching ESL</i>				
No	Practices	M	SD	Level
1	I use game activities such as (Pictionary) to increase students' vocabulary	2.98	1.469	medium
2	I stimulate young children's learning grammar, spelling, listening, and writing via games such as (Word Jumble Race, Where Shall I Go?, The Mime, and What's My Problem?)	2.94	1.456	medium
3	I use game activities (such as Hot Seat, and Board Game, Broken Phone) to develop young children's listening, speech and social skills	2.90	1.382	medium
4	I stimulate young children to "guess" the meaning of unknown words and phrases in an interesting context instead of giving meanings instantly, in games such as (Continue the story, I spy with my little eye)	2.89	1.402	medium
5	I apply games such as (Two Truths and a Lie, Show and Tell) to enhance students' speaking and sense of belonging via sharing unique things about themselves with others	2.86	1.396	medium
Total mean and standard deviation		2.91	1.404	medium
<i>EC teachers' beliefs toward using gamification in teaching second language</i>				
No	beliefs	M	SD	Level
1	Young children's attention span is short, so I use language games to keep them in focus and have fun at the same time	3.72	1.207	High
2	Gamification is a good way for learners to self-assess (what they have learned, predict the outcomes of future behavior, and see how far they need to go to succeed)	3.72	1.207	High
3	I prefer to apply a gamification approach to motivate and engage young children in learning	3.71	1.249	High
4	The gamification technique encourages children to use language creatively and naturally	3.68	1.255	High
5	I use games in the class just because they are the perfect warming-up activities	2.95	1.364	medium
Total mean and standard deviation		3.55	0.960	medium

Results revealed that those teachers stimulate young children's learning grammar, spelling, listening, and writing via using games, with a mean value of ($M=2.94$, $SD=1.456$). Subsequent analysis showed that teachers reported that they were less likely to apply social games such as (Two Truths and a Lie, Show and Tell) to enhance young learners' speaking skills and sense of belonging, which enable children to share unique things about themselves with others; this category displayed the lowest arithmetic mean value of ($M=2.86$, $SD=1.396$). EC teachers' beliefs toward applying gamification within teaching ESL were also examined as demonstrated in Table (2). The majority of English teachers agreed on the value of implementing gamification in teaching ESL axis, where the arithmetic means for this variable ranged between (2.95 – 3.72) with a general average of ($M=3.55$) on the 5-point Likert scale, and a standard deviation ($SD=0.960$).

Further analysis revealed that most of the teachers agreed that young children's attention span is short; therefore, gamifying language activities assist children to maintain their focus, have fun at the same time and motivate them to engage more in learning. This category displayed an arithmetic mean value of ($M=3.72$, $SD=1.207$). More importantly, English teachers agreed that gamification is an effective technique for learners to self-assess their learning progress, with an arithmetic mean value of ($M=3.72$, $SD=1.207$). These results are significant as they reflect EC teachers' awareness of the real value of gamification within the ESL context as it builds children's engagement and strengthens skills through an activity-based approach to learning.

Interestingly, a few teachers expressed that they partially agreed with applying games in the class just because they are the perfect warming-up activities for young learners. This category displayed an arithmetic mean value of ($M=2.95$, $SD=1.364$) (see Table 2). Regarding answering the second research question: Is there a statistically significant correlation at the significance level ($\alpha = 0.05$) between the degree of practices and beliefs towards the use of gamification in teaching ESL in early years. The Pearson correlation coefficient was calculated between practices and beliefs towards the use of gamification in teaching ESL .As shown in Table 3, the significant value of practices towards beliefs of the use of gamification in teaching ESL is (0.001), which is (F) $p<0.005$. It indicates that the correlation is significant. The Pearson Correlation is (0.740 or 74.0%), which affirms that there is a positive relationship between practices and beliefs. In addition, the degree of importance of practices toward beliefs is (74.0%).

Table 3. Correlation between practices and beliefs towards the use of gamification in teaching ESL

		Practices	Beliefs
Practices	Pearson Correlation	1	.740**
	Sig. (2-tailed)		.000
	N	450	450
Beliefs	Pearson Correlation	.740**	1
	Sig. (2-tailed)	.000	
	N	450	450

** . Correlation is significant at the 0.01 level (2-tailed).

In relation to answering the third research question: Is there an effect of teachers' beliefs on practices towards the use of gamification in teaching ESL? Simple Linear Regressions calculated the effect of practices on beliefs towards the use of gamification in teaching a second language, as shown in Table 4.

Table 4. Simple Linear Regressions between practices and beliefs towards the use of gamification in teaching ESL

	Unstandardized		Standardized							
	Coefficients		Coefficients							
	B	Std. Error	Beta	T	sig	R	R Square	Adjusted R Square	F Change	Sig. F Change
Constant	2.115	0.072		29.291	0.000	0.723a	0.523	.522	491.122	0.000
Practices	0.49	0.022	0.723	22.161	0.000					

5

a. Predictors: (Constant), beliefs

b. Dependent Variable: practices

As shown in Table 4, the value of the correlation coefficient (R) for the independent variable practices and beliefs is ($r=0.723$). This indicates that there is a strong direct correlation between the two variables, and that the coefficient of determination is ($r=0.523$); this indicates that the percentage of variance in the dependent variable is (52.3%), through which we can predict the independent variable. Based on the value of Adjusted R Square, the predictive ability (variance) practices amounted to ($r=0.522$). Therefore, when a change occurs in the independent variable by one correct amount, the dependent variable will change by 0.522 directly. Taken together, the results display that there is a significant (f) test, with a value of ($f= 491.122$), and a statistical significance level of ($Sig. = 0.000$), which is a smaller value when compared to the statistical significance level ($\alpha = 0.05$).

Discussion and Conclusion

Gamification is a useful and fun tool in teaching children a new language in an interactive way, which increases their motivation, desire and effective participation in the learning contexts. The present study intended to provide an in-depth analysis of the influence of EC teachers' beliefs on their practices: on the use and application of gamification in teaching ESL to Saudi children. Additionally, the current study explored the barriers EC teachers may face in teaching ESL since it is a new curriculum in ECE in Saudi Arabia. Interestingly, the current research findings confirm the influence of teachers' positive beliefs about implementing gamification on their teaching practices for improving children's ESL. This result is a valuable contribution to EC literature, as there is lack of empirical research investigating teachers' beliefs and attitudes toward integrating gamification in teaching ESL in EC settings. Jong and Chang (2015) argued that there is need

for shedding light on the teachers' role in game-based learning contexts, which has been ignored in previous literature.

Broadly speaking, gamification has been found to be a vital and fundamentally enjoyable tool in language education in ECE; an additional motivation and enhancer technique in teaching ESL. It has been proven that EC teachers' positive perspectives toward gamification enhance students' enthusiasm and motivation in ESL. This result is in line with previous findings showing that teachers agreed on the significant role of game-based contexts, as students were more empowered and motivated toward learning new language (Boudadi & Gutiérrez-Colón, 2020; Edwards, 2022; Jiang, 2008; Khosiya, 2023; Kuo, 2008). Consequently, it directs and constructs the new language learning and teaching process into enjoyable tasks.

Interestingly, EC teachers in the current study reported their strong belief that gamification is the ideal tool to capture children's attention in the early language learning context. This finding is consistent with previous research that implementing gamification within language learning contexts captures children's attention, due to the entertaining nature of games (García et al., 2021). However, some EC teachers acknowledged that they encounter several barriers when applying games in learning contexts. The most influential and significant barriers those teachers face are the lack of knowledge on gamification and digital gamified training within ECE. Several scholars emphasized the importance of teachers' ongoing training in the digital education domain (Birova, 2016; Ciganda, 2018; García et al., 2021). Based on the results obtained in this study, it can be claimed that EC teachers should urgently be retrained as well as upskilled.

More specifically, our finding confirms that teachers have positive beliefs and practices toward using gamification for developing children's vocabularies, grammar, spelling, listening, and writing skills in English language contexts. This result supports previous critical findings on the influence of implementing gamification on children's learning outcomes in learning ESL (Bendo, 2019; Hamer & Lely, 2019; Kaur, 2019). In the same vein, teachers hold positive beliefs and practices in using gamification as assessment tools for improving children's second language learning outcomes. This result is consistent with previous finding by Khosiya (2023), who found that gamification offers learners immediate feedback on their learning progress, which is crucial for them to track and improve their learning outcomes in a second language context. All in all, the results of the current study indicated that there is an important relationship for children between learning English as a second language and using online games as a supportive pedagogical approach. These results prove that Saudi EC teachers consider gamification as the ideal technique for children to learn new vocabulary and improve their reading, writing and speaking outcomes, while evaluating the progress of their language skills.

Implications, Limitation and Recommendation for Future Research

The findings of this study yield several pedagogical implications. The results of this research can be used as essential evidence to convince EC teachers, who still apply the traditional teaching method, specifically in

teaching children ESL, to start shifting their thinking and change their method of teaching to implementing more attractive and enjoyable techniques. These techniques should suit the characteristics and needs of young students to improve their educational performance. An additional important implication of gamification is that it encourages children to acquire hands-on experience effectively in the context of learning a new language, as it involves playing games within an active, experimental, and problem-solving learning environment. The results are valuable for use in planning the professional development of teachers in the field of technology in ECE, which has become a requirement for teachers and learners to teach and learn English as an official second language in the Saudi education system.

Despite the significant results of our study, a certain limitation needs to be highlighted. The limitation of the study lies in the reliance on the use of the quantitative method through the self-administered questionnaire in data collection; it is worth mentioning here that the use of other mixed qualitative research methods such as observations and interviews can enrich future results in revealing EC teachers' digital competencies in teaching ESL to children. The outcomes of this study may be important for policy makers and syllabus designers to create more digital and interactive courses for ESL young learners, through gamifying activities. As mentioned earlier, integrating the English language curriculum into ECE is new direction in Saudi education, which aims to enable young children to speak English and develop their essential skills. Accordingly, more attention is needed to providing suitable and flexible training programs to improve EC teachers' digital competencies based on children's developmental needs. In the light of the current results, the researchers suggest additional research on the role of the home environment in supporting children's acquisition of second language learning. The recent study might serve as a valuable reference for further examination into developing EC digital skills to promote young learners' skills in ESL through the implementation of gamification into the ECE classroom.

Less Is More: The Role of Lexical Complexity in The EFL Lexicon on TOEFL Reading Comprehension Outcomes

Arifi N. Waked

Prince Mohammed Bin Fahd University, Saudi Arabia,  <https://orcid.org/0000-0003-1222-0978>

Abstract: This study examines the role of receptive vocabulary knowledge on outcomes of the TOEFL reading comprehension task. Participants included 18 native speakers of Spanish learning English as a foreign language and 17 native speakers of English ranging in age from 19-25 years. Lexical stimuli were presented auditorily and were divided into “easy” and “hard” words based on both frequency and lexical neighborhood density. To increase difficulty, stimuli were distorted to simulate what is heard through a cochlear implant (CI). Linear regression showed that, for bilingual participants, higher scores on the TOEFL reading comprehension task were predicted by higher rates of accuracy for “easy” words. The theory of complementary distribution within the bilingual lexicon indicates that if a bilingual individual has a higher proportion of English-language words in their lexicon that are more colloquial (easy), they are less likely to have proficient knowledge of higher-level vocabulary necessary for university-level reading comprehension. This indicates that educators of English as a foreign language learners must work to improve knowledge and proficiency of more difficult vocabulary tokens.

Introduction

Every year, nearly one million non-native speakers of English take the Test of English as a Foreign Language (TOEFL) in the hopes of proving their English language capability. This test was developed in 1963 by the National Council on the Testing of English as a Foreign Language. Although the use of this exam has evolved over time, the original intent was to determine the language preparedness of English as a foreign language (EFL) learners hoping to enter English-medium institutions of higher education in the United States. The possibilities afforded by success on this exam have now expanded such that it can potentially allow one entry into over 7,500 employment and educational opportunities in over 130 countries around the world (Educational Testing Services, 2021).

While some institutions focus exclusively on the overall scores of the examination, others may additionally consider independent scores on the exam's measures of the four language competencies: Listening, speaking, writing, and reading. In the case of the TOEFL's examination of reading comprehension, two passages, approximately 700 words in length, are provided for analysis. These passages are excerpts from university-level textbooks. Comprehension is examined through five skills: Guessing vocabulary (the ability to use context cues), reference (e.g., identifying the referent of a pronoun), main idea (comprehension and identification of the primary themes of the passage), inference (determining the author's implied conclusion), and stated detail (identification of an explicitly stated fact; Educational Testing Services, 2021).

It is essential to examine reading comprehension through a multitude of skills as it is a complex task requiring knowledge of the orthography, morphology, and syntax of a language in addition to a large and comprehensive vocabulary (Nguyen et al., 2020). It has been estimated that in order to adequately comprehend a written passage, readers must understand a minimum of 95% of the words used (Ha, 2021; Hartono & Prima, 2021). For native speakers of English, frequently-used lexical items are naturally acquired throughout the developmental process (e.g., Höhle et al., 2020). However, this does not extend to the more complex and/or subject-specific vocabulary tokens necessary for academic success. In order to add these items to an individual's internal lexicon, or mental vocabulary storage, students must first be introduced to new lexical items.

As familiarity slowly increases over time with greater exposure to the novel word, retrieval becomes more automatized as it is assimilated into the internal lexicon. Nation & Coxhead (2013) classified the lexical knowledge required for this storage into three distinct dimensions. These are word form, word meaning, and word use. Repeated exposure to the word form helps to entrench both the form and its associated meaning into long term memory, the form of memory which stores items for a seemingly infinite length of time. Through the process of increasing familiarity, it becomes easier to quickly and efficiently retrieve these items into working memory (Bruning & Lewis-Peacock, 2020).

Working memory serves three important functions. Firstly, it retains input from immediate surroundings. Secondly, it retrieves information from long-term memory. Thirdly, and most importantly, working memory allows for the manipulation of this information long enough for it to be put to use (e.g., Waked et al., 2023). To successfully comprehend a written passage, readers must not only use their knowledge of the components of written language to extract meaning, but they must also retain the key concepts of what they have read in working memory. When reading a passage or text, it is important that readers only store the essential concepts, or "gist," of what they have read rather than each individual word and sentence. This allows for more efficient retention of what has been read into working memory, facilitating comprehension of forthcoming text (Nguyen et al., 2020).

Fluid reading relies on working memory to predict upcoming words, phrases, and sentences. Word prediction often relies upon the near-instantaneous process of word recognition that develops through increased exposure and familiarity. The development of word recognition is especially important for fluid reading in English as

many words in this language do not have phonemic orthography, that is, the sounds typically associated with the letters used to spell a word often do not align with the pronunciation of the word itself (e.g., Krepel et al. 2021). Additionally, English contains many words borrowed from other languages (e.g., “hors d’oeuvre”) that deviate from the typical sound/letter associations of English (Phuong, 2021). If a reader has a robust English-language vocabulary, s/he may be able to predict possible upcoming words and phrases that are grammatically and contextually in line with the overall meaning of the preceding text. Hence, a stronger vocabulary impacts the speed and accuracy of retrieval of linguistic information from long-term memory into working memory for more proficient reading comprehension (Carrol et al, 2020).

However, reading comprehension becomes increasingly difficult when the process of fluid reading is either interrupted or cannot be attained. For proficient readers, this can often be seen in sentences with syntactic or semantic ambiguity, in which either the grammatical structure or the written form of an individual word can potentially lead to multiple meanings. Evidence from eye-tracking studies shows that in such cases, readers may need to pause and re-read the portion of text that has interrupted the process of fluid reading before they are able to extract meaning (Hessel et al, 2021).

In some cases, readers may need to reread a larger portion of the preceding text to incorporate this meaning into what has already been stored in working memory (Nahatame, 2021). The interruption of fluid reading is often seen in EFL readers, particularly those with reduced vocabulary knowledge. Reduced knowledge of English-language vocabulary tokens may hinder one’s ability to successfully read and comprehend written text (Savasci & Akyel, 2022).

Reading is categorized as a receptive task as it is a means by which one receives, rather than produces, linguistic information. As such, receptive vocabulary has been found to predict reading comprehension outcomes in both native speakers of English as well as in EFL learners (e.g., Tong et al., 2023). In the case of EFL learners, it has been proposed that the lexical capacity of an individual is likely to provide easier access to certain words in their native versus non-native language in different environments and situations. Words in an individual’s native language are often used in casual and colloquial settings whereas the English-language words used by EFL learners may be most often used in formal or academic settings (Grosjean, 1989).

Additionally, greater use of certain words in English may lead to more rapid and efficient retrieval into the working memory of an EFL learner. The neighborhood density of a word in English, or the number of words with related phonological or semantic connections, may also contribute to the ease with which a word is retrieved by working memory. Words with greater neighborhood density may be in competition with a larger number of related words for retrieval, thus hindering the retrieval process.

Kirk et al. (1995) created a task intended to examine receptive vocabulary using words divided into the categories of “easy” and “hard” in the Lexical Neighborhood Task (LNT) and Multisyllabic Lexical Neighborhood Task (MLNT). This division was based on the factors of frequency and neighborhood density.

“Easy” words are those that are higher in frequency, meaning that they are heard or read more often, and are therefore more likely to be easily retrievable from long-term memory into working memory. They are also lower in neighborhood density and therefore less likely to be confounded with words that are semantically or phonologically similar.

Conversely, “hard” words are those that are lower in frequency, and are therefore less likely to have been encountered often enough to become easily retrievable from long-term memory into working memory. They are also higher in neighborhood density, making them more likely to be confounded with words that are semantically or phonologically similar. “Hard” words, as defined by Kirk et al. (1995) are more likely to have features associated with academia than those classified as “easy,” which are more likely to share features with colloquial speech.

In this study, we examine the relationship between receptive vocabulary and reading comprehension in both native speakers of English and EFL learners. Participating EFL learners are all native speakers of Spanish. Native speakers of English self-reported that they do not speak any language other than English. Receptive vocabulary is tested using the “easy” and “hard” words of the LNT/MLNT. Reading comprehension is tested using the reading comprehension portion of the TOEFL exam. In order to more effectively examine retrieval of the lexical tokens of the LNT/MLNT, items were presented in sets that were either unaltered or distorted to simulate what is heard through a cochlear implant (CI). A CI is a surgically-inserted prosthetic device that allows Deaf individuals to perceive sound (e.g., Waked et al., 2017). All participants were students at an English-medium university located in the United States.

As such, this study seeks to answer the following questions:

- 1) Is there a difference between the receptive vocabulary of native speakers of English and EFL learners as measured by “easy” and “hard” words in unaltered and distorted conditions?
- 2) Is there a relationship between reading comprehension and the receptive vocabulary of native speakers of English and EFL learners as measured by “easy” and “hard” words in unaltered and distorted conditions?

Hypotheses are as follows:

- 1) As EFL learners typically possess robust vocabularies in their native language, lexical knowledge from their first language will likely lead to greater neighborhood density for the words used in this task (Ring & Dijkstra, 2023). In addition to the fact that “hard” words have greater semantic and phonological neighborhood density in English, there are also related words in an EFL learner’s native language that share overlapping features with target words in this study. As such, it is hypothesized that EFL learners will show greater difficulty retrieving “hard” words relative to their native-English-speaking peers. It is also hypothesized that no such difference will be found with regards to “easy”

words in the unaltered condition. Although these words will also likely have greater neighborhood density for EFL learners by virtue of participants' bilingualism, the fact that these words have lower neighborhood density in English may reduce the impact of this factor. Additionally, as "easy" words are presumed to be heard more frequently, EFL learners may have greater familiarity with these words and, as such, have the capability to more quickly retrieve them into working memory for immediate use.

It is additionally hypothesized that in distorted conditions, both language groups will show lower accuracy, as neighborhood density will be increased for both "easy" and "hard" words. Distortion in this study simulates what is heard through a CI. As such, words in the distorted condition lack a considerable degree of auditory frequency information. This form of distortion is also often described as robotic in nature, as the reduced frequency information causes language to lack the natural inflection found in typical speech. By distorting words in this way, neighborhood density will increase for both language groups as the limited information provided by this form of distortion will cause the quantity of words with similar potential auditory forms to increase (Han et al., 2015). Relative to their native-English-speaking peers, EFL learners will contend with both reduced familiarity with lexical items as well as even greater overall neighborhood density. As such, it is hypothesized that in this condition, native speakers of English will outperform EFL learners with regards to both "easy" and "hard" words.

- 2) Vocabulary knowledge is an essential aspect of fluid reading and reading comprehension (Ha, 2021; Hartono & Prima, 2021). As such, it is hypothesized that higher scores on the reading comprehension portion of the TOEFL exam will most strongly correspond to higher scores on the perception of "hard" words in both language groups. This is due to the fact that the features of "hard" words are more likely to correspond to those used in academic texts, whereas those of "easy" words are more likely to correspond to those used in colloquial speech. As the distorted condition will likely increase neighborhood density of both "easy" and "hard" words (Han et al., 2015), it is hypothesized that greater receptive vocabulary knowledge will be best reflected by recognition of words in the distorted condition. As such, higher reading comprehension scores are likely to be predicted by "hard" words in the distorted condition.

Reading is largely an automatic process for native speakers of a language (Roembke et al., 2021). Yet for EFL learners, this automaticity may not exist. As such, they may be more dependent upon a robust academic vocabulary to succeed in the reading comprehension task. As such, it is hypothesized that, for EFL learners, there will be a stronger predictive role of "hard" word retrieval in the distorted condition on reading comprehension than will be found for their native-English-speaking counterparts. It is additionally hypothesized that, in the case of EFL learners, there may be a similar, though potentially less notable, predictive role of the retrieval of "easy" words in the distorted condition on reading comprehension outcomes.

Method

Sample and Sampling

Prior to beginning this study, approval was attained from the University of Maryland's Internal Review Board. Participants were then recruited through the Department of Psychology at the University of Maryland and were compensated with course credit. Participants in this study included 17 native speakers of English and 18 EFL learners. EFL learners were native speakers of Spanish who were first exposed to English at ages ranging from 0 to 12 years. Despite this discrepancy, no significant correlations were found between age of first language exposure and any variable measured in this study. As such, all EFL learners were considered as one homogenous group. Participants in the native English speaking group ranged in age from 19 to 25 years with an average age of 20.9 years. Participants in the EFL group ranged in age from 19 to 23 years with an average age of 21.3 years. Native speakers of English included 12 female and 5 male participants. EFL learners included 13 female and 5 male participants. As such, groups were balanced with regards to both age and gender.

Materials and Procedure

After providing informed consent, participants completed a pre-screening form collecting general information such as age, gender, education level, whether they had working knowledge of any language other than English, and whether they had been diagnosed with a learning and/or processing disorder/difference. Participants who reported no such diagnoses were then tested for hearing level. Qualifying participants had audiometric thresholds of 20 dB HL or lower between the frequencies of 250 and 8,000 Hz, indicating typical hearing. As such, they were deemed fit for receptive vocabulary testing via auditory presentation of lexical items.

Receptive vocabulary was tested using single words from the LNT/MLNT. These tasks were originally intended for use with children who use a CI. Kirk et al. (1995) used words compiled by Logan (1992), who tabulated lexical entries in the Child Language Data Exchange System (CHILDES). This database contains transcripts from published studies of child language development. These corpora have been validated against several similar lists (Kirk et al., 1999) and have been shown to be equally valid in tests of both children and adults (e.g., Meyer et al., 2003). Both tasks are divided into two sets, each comprised of 50 concrete nouns. Half of all words in each set belong to either the categories of "easy" or "hard."

In the present study, the first set of each of these measures were combined and used in the unaltered condition. Following a brief training period, the second set of these two measures were combined and used in the distorted condition. Previous research has used similar testing of receptive vocabulary using words presented in noise (Kaandorp et al., 2016). However, as the LNT/MLNT was intended to be used by individuals with a CI, CI-simulation was used. Performance on both "easy" and "hard" items in these two conditions were tabulated as percentage correct, which were then converted to rationalized arcsine units (RAU). This was done to reduce the risk of violating the assumption of normality in further calculations.

Participants were first presented with unaltered items from the LNT/MLNT and were asked to repeat each lexical item immediately following its presentation. They were then presented with ten sentences altered to simulate what would be heard through a CI. These sentences were taken from the Harvard IEEE sentence corpus (Rothaus, 1969) and were used to familiarize participants with this form of distorted speech. Participants first heard these sentences in their distorted form and were asked to repeat what they had heard. They then received auditory feedback in which stimuli were replayed in their unaltered speech form followed by repetition of the same sentence using CI-simulating distorted speech. Participants were also concurrently provided with visual feedback using text presented on a computer screen. Following this training period, participants were presented with the second set of LNT/MLNT words in their distorted form and were asked to repeat each lexical item immediately following its presentation. All listening took place in a double-walled, sound-attenuating booth. Participants were accompanied by a researcher who manually recorded the accuracy of each target stimulus.

Following receptive vocabulary testing, participants were given a five- to ten-minute break before beginning the reading comprehension task. Reading comprehension was measured through the use of a passage from a practice examination of the TOEFL exam. Testing took place in the same double-walled sound-attenuating booth in order to reduce distractions and was administered as a hard copy. Participants were unaccompanied during this portion of the study. As per the directions given for this passage, participants were given 20 minutes to complete the reading comprehension task. The passage used was titled *Meteorite Impact and Dinosaur Extinction*. It consisted of 683 words distributed among 7 paragraphs. Each paragraph was 4-5 sentences in length. Every fifth line was numbered in the page margin in order to assist participants in locating information relevant to specific questions. Questions examined participants' abilities in five areas of reading comprehension: Guessing vocabulary (the ability to use context cues), reference (e.g., identifying the referent of a pronoun), main idea (comprehension and identification of primary themes in the passage), inference (determining the author's implied conclusion), and stated detail (identification of an explicitly stated fact; Educational Testing Services, 2023). Passages were manually scored by two researchers. Test re-test reliability was 100%. Scores were tabulated as percentage correct, which were then converted to RAUs to reduce the risk of violating the assumption of normality in further calculations.

Results

A paired sample repeated measures ANOVA was calculated to examine differences between the two language groups. In the unaltered conditions, both "easy" and "hard" words were at ceiling for both language groups. However, in distorted conditions, native speakers of English significantly outperformed EFL learners at the $p < 0.01$ level. As such, native speakers were found to have higher scores of receptive vocabulary relative to EFL learners. No significant difference was found between the two language groups in reading comprehension scores.

Pearson correlations were also calculated for reading comprehension scores and each of the four vocabulary conditions. For EFL learners, a significant negative correlation was found between scores of reading comprehension and “easy” vocabulary items in the distorted condition at the $p < 0.01$ level. No other significant relationships were found. Linear regressions indicate that lower scores in the “easy” vocabulary items in the distorted condition predict improved reading comprehension outcomes. This may suggest that more proficient EFL readers have greater difficulty retrieving these “easy” words as they may instead have greater familiarity with “hard” words that are likely to share the features of words associated with academia. As such, these learners may have less experience recognizing and retrieving “easy” words, which are more likely to share features associated with colloquialisms. This may cause more proficient EFL readers to have greater difficulty retrieving “easy” words into working memory for use.

Discussion

In this study, the relationship between receptive vocabulary knowledge and reading comprehension was measured in both native speakers of English and EFL learners at an English-medium university located in the United States. Lexical tokens were taken from Kirk et al. (1995)’s LNT/MLNT tasks and were used as an auditory measure of receptive vocabulary. Items in these tasks are classified as either “easy” or “hard” based on both frequency and neighborhood density. As lexical items in these tasks are separated into two distinct lists, both “easy” and “hard” items from one list were first presented to participants in their unaltered form. Then, following a brief familiarization period with CI-simulating speech, items from the second set were presented in their distorted form. Reading comprehension was measured through a passage from the reading comprehension portion of the TOEFL exam. It was discovered that, for EFL learners, lower scores on “easy” items in the distorted condition predict improved reading comprehension outcomes.

This study sought to answer two research questions:

- 1) Is there a difference between the receptive vocabulary of native speakers of English and EFL learners as measured by “easy” and “hard” words in unaltered and distorted conditions?
- 2) Is there a relationship between reading comprehension and the receptive vocabulary of native speakers of English and EFL learners as measured by “easy” and “hard” words in unaltered and distorted conditions?

For the first research question, it was hypothesized that native speakers of English would outperform EFL learners in all receptive vocabulary conditions. While this was not the case with unaltered words, this result was found for both “easy” and “hard” words in the distorted condition at the $p < 0.01$ level. As these words were taken from a data set originally designed for use with children over the age of five years (Kirk et al., 1995), it is unlikely that this difference arises from a lack of knowledge of these words by EFL learners. However, the difference between receptive vocabulary scores among native speakers of English and EFL learners may

potentially be due to a combination of factors related to the design of the vocabulary task.

One such factor is that native speakers of English may have greater familiarity with these words simply by virtue of the fact that they have used the English language over a longer period of time relative to their EFL learning peers. This may allow for greater entrenchment of lexical items into long-term memory. This may also have led to a relatively increased number of situations in which these words were retrieved into working memory. As such, native speakers are likely to be able to more quickly and accurately recognize words in a condition in which much of the auditory information has been removed. This may allow native-speakers of English to more effectively retrieve these words into working memory such that they can be successfully used (Nguyen et al., 2020).

A second possible reason for this difference is that bilingual EFL learners may simply have larger neighborhood density for the lexical items used as compared to their monolingual, native-English-speaking peers. The Lexical Neighborhood Theory posits that reading or hearing a single lexical item activates a network of related phonologically and semantically related items. Activated items then in turn activate a further set of phonologically and semantically related lexical items in a seemingly endless cycle. The larger a network cast by an initial lexical prompt, the more difficulty an individual will have retrieving the appropriate item (Peereman & Content, 1995). For EFL learners who have knowledge of the vocabulary of their native language as well as that of English, such neighborhoods are inevitably significantly larger than those of their monolingual, native-English-speaking peers. As such, when phonological information is reduced through distortion, the number of possible target words activated by the vocabulary items in this study likely causes far more difficulty with rapid and efficient word retrieval.

The second research question of this study addresses the relationship between receptive vocabulary scores on reading comprehension. Vocabulary items were presented in the “easy” and “hard” conditions in either an altered or distorted form. The hypothesis for this question posited that higher receptive vocabulary scores of “hard” words would predict improved reading comprehension, particularly for EFL learners. It was predicted that this would be particularly apparent in the distorted condition as greater effort would be required to overcome the effects of neighborhood density to retrieve the correct lexical token into working memory for use. However, this result was not found. Instead, an inverse result was found whereby reduced receptive vocabulary for “easy” words in their distorted form predicted improved reading comprehension outcomes for EFL learners at the $p < 0.01$ level.

There are several potential reasons for this finding. One possibility is that a floor effect exists for these “hard” words due to the nature of the distortion used. CI simulation greatly reduces the amount of linguistic information available to the listener while simultaneously causing speech to present in a robotic form. It has been shown that typically-hearing children and adults can learn to understand this form of distortion after a four-hour training period (Waked et al., 2017). However, in the current study, participants were only given a brief familiarization period. As such, it is possible that these “hard” words were presented at a level at which an

accurate measure could not be obtained.

A second possible reason may arise from the ways in which EFL learners store and retrieve the lexical items of their languages of use. Theories exist proposing that the internal lexicons containing items from each known language overlap (e.g., Kroll & Stewart, 1994), while others indicate that lexical items are stored separately according to each language of use (e.g., Lambert et al., 1968). There are further theories that items from each lexicon overlap asymmetrically that are subject to factors such as frequency and environment of use (e.g., de Groot et al., 1994). There are additional theories that suggest that these items overlap rarely if at all (e.g., Bialystok & Luk, 2012).

The Separate Storage Model hypothesizes that there are separate representational systems for each language. In this model, the language not in use is considered to be completely deactivated in situations in which the other language is activated for use (Hamers & Lambert, 1972). Support for this model has come from early work using questionnaires, recall, and word association tasks. For example, Lambert et al. (1968) studied two groups of bilingual individuals, one consisting of speakers of both French and English and the other consisting of speakers of both Russian and English. Both groups were presented with various lists for free recall. Some lists were constructed such that all words presented across languages were semantically related, while others were given lists in which words presented across languages were semantically unrelated.

Lists either contained items in only one of the participant's known languages or items from both known languages. These items were administered simultaneously within one task. Because participants showed semantic benefit in the mixed-language condition, even with lexical items from their other known languages potentially interfering with one another, researchers concluded that participants' lexicons are able to switch rapidly between their active and inactive states. According to the hypotheses of this study, had a reduction in accuracy occurred in conditions in which semantic foils had been presented across target languages, this would have presented evidence that lexical items across languages are connected at the conceptual level. As this was not found to be the case, researchers concluded that bilingual individuals store lexical information in two separate, language-specific lexicons.

Conversely, some models propose that the two lexicons known by bilingual individuals overlap completely. The Concept-Mediation Hypothesis purports that lexical items in a bilingual individual's second language are linked to their first language at the conceptual level. In this model, the conceptual level contains both linguistic and non-linguistic concepts that are common between the two words in each language. Potter et al. (1984) examined this theory by studying two groups of individuals. These included Chinese-English bilinguals who were proficient in both languages and native English speakers learning French in high school. Members of the second group were not proficient in their second language. Participants were asked to identify either line drawings or written words. Half of the written stimuli were presented in a participant's native language and the other half in their second language. Both groups named images in their second language more quickly than was assumed necessary to translate a word in an individual's first language into the corresponding word of their second

language. Results were interpreted as showing unification of lexical items across all known languages rather than a rapid switch of language activation and deactivation as is assumed in the Separate Storage Model.

Unlike the Concept-Mediation Hypothesis, there are additional models and theories that propose that the two lexicons of bilingual individuals only partially overlap. Some also hypothesize that this overlap may be asymmetrical. Among these is the Distributed Model, which hypothesizes that some word types have relatively separate storage, whereas others generally overlap in what are termed “conceptual nodes.” Concrete words (e.g., nouns) and cognates, words found in both languages that are similar in both phonetic and semantic features, are assumed to share more features than grammatical items (e.g., pronouns) and abstract items (e.g., feelings). Because of these differences, this model predicts an asymmetrical overlap in which some types of words have shared representation while other types do not (de Groot et al., 1994).

Yet another theory of bilingual language storage is the Complimentary Distribution Theory. This theory is rooted in the bilingual disadvantage seen in many young, bilingual children. This disadvantage relates to the fact that, while bilingual children possess the same number of total lexical items as their monolingual peers, the number of items present in each language is reduced relative to monolingual individuals who are only exposed to one linguistic set of lexical items. The words in a bilingual child’s internal lexicon are divided based on both frequency of use in each language as well as the environment in which words in each language are used. Bilingual individuals in the United States are more likely to show reduced English-language vocabulary for words that are typically labeled as both frequent and common, i.e., colloquialisms. This is presumed to be due to the fact that these words are first acquired in an individual’s native language and are primarily used with family and friends. While some argue that this lexical imbalance becomes largely resolved as bilingual individuals age and become more fully immersed in the socially-dominant English-language community, others argue that some degree of imbalance persists throughout the lifespan (Bialystok & Luk, 2012).

As the Complimentary Distribution Theory posits that environment plays a role in the distribution of lexical items across the total internal lexicon of a bilingual individual, it is possible that EFL learners who are more proficient English-language readers possess a higher proportion of words that are associated with academia due to a potential focus on classroom learning. As such, these students are more likely to use their native language for words that can be classified as more frequent and common rather than using corresponding words in the English language. Such words are reflective of features of the “easy” tokens used in the LNT/MLNT receptive vocabulary task. As such, reduced knowledge of “easy” words in English may allow for a greater proportion of their overall internal lexicon to store words related to the academic environment, corresponding to features of the “hard” words in the LNT/MLNT task. If EFL learners are more frequently receiving exposure and semantic reinforcement of “hard” words, it is likely that they will have less robust representations of “easy” words in long-term memory. This may cause difficulty in retrieving “easy” words into working memory for immediate use. As such, lower scores on “easy” words may indicate that an individual has greater knowledge of the type of lexical items required for both fluid reading and reading comprehension.

Conclusion

Vocabulary knowledge is a fundamental aspect of fluid reading and reading comprehension (Nguyen et al., 2020). For native speakers of English, frequently used words, such as those sharing the features of the “easy” words in this study, are often acquired from everyday interactions. But unlike native speakers, EFL learners frequently learn the majority of their vocabulary in the classroom environment (Nugroho et al., 2020). EFL learners who are academically inclined may be more likely to gain knowledge of new lexical items through direct education, interactions in the classroom, and external educational endeavors. As such successful EFL learners are likely to focus their use of English on academic activities, thereby gaining familiarity with the written form of English-language words and reinforcing their related meanings. Familiarity with a novel word and reinforcement of its meaning is what is required to successfully “know” a word as it is used in written text (Nguyen et al., 2020). As such, successful EFL readers are likely to have the ability to more easily access and retrieve words sharing the features of the “hard” type of lexical items used in educational settings. These are less likely to include items sharing the features of “easy” words, which can be acquired through more casual interactions. Conversely, if an EFL learner gains knowledge of new lexical items primarily through casual social interaction, s/he will likely possess greater knowledge of words sharing the features of “easy” vocabulary items. This may hinder academic success, as the EFL learner will have spent a lower proportion of her/his time using the English language to become familiar with academic vocabulary.

The value of the reduced ability to rapidly and effectively use “easy” lexical items may prove to be useful to EFL educators working to improve students’ reading comprehension. This information can be used to create activities both inside and outside academic environments that increase the use of lexical items sharing the features of “hard” words. This in turn may reduce the proportion of students’ time spent immersing themselves in activities reinforcing the retention of lexical items sharing the features of “easy” words. Such activities can involve explicit vocabulary instruction; however, many such tasks require rote memorization, which is often an ineffective method of retaining knowledge (Torlakli, 2019). It may instead be of interest to examine how the four language competencies can be used together to expose EFL learners to new words, increase their familiarity with the written and auditory forms of these words, and reinforce the meanings of these words through speaking and writing. Such activities may help EFL learners come to “know” novel academic vocabulary items such that they can be used to improve the students’ ability to truly comprehend what they read.

Recommendations

This study raises several possibilities for future research. Among these is the opportunity to replicate this study with a larger number of participants. The current study examined 17 native speakers of English and 18 EFL learners. Replication with a larger sample size may allow for more definitive answers to the questions examined in this study. This study could also be replicated with individuals from a wider variety of linguistic backgrounds in order to determine if results are generalizable only to native speakers of Spanish or if they are applicable to

EFL learners as a broader population.

Another possible opportunity for further examination lies in the way in which distortion was used. Previous work by Waked et al. (2017) has shown that typically-hearing native speakers of English can learn to understand speech that has been distorted to sound like what is heard through a CI; however, this was achieved through a four-hour training process. Participants in the current study were provided with only a brief familiarization period consisting of ten sentences. Had participants received more extensive training, perhaps the floor effect on “hard” words found in the distorted condition would not have arisen.

It may additionally be beneficial to examine the intrinsic nature of participants themselves. Factors such as self-efficacy and learning orientation have been shown to impact learning outcomes. Self-efficacy refers to an individual’s innate sense of control over their life and life circumstances. Students with greater self-efficacy are more likely to be motivated to face difficult situations from the viewpoint that they are in control of their opportunity to overcome them. However, students with lower self-efficacy are more likely to view such circumstances as out of their control and are less likely to feel that they are able to work through difficult situations and succeed via their personal abilities (Pilotti, 2022a). Additionally, learning orientation may play a role in EFL students’ decisions regarding the context of their primary use of English. Students who approach education from a grade-oriented approach are more likely to exert academic effort primarily in ways that can be directly viewed as earning the tangible outcome of a high grade. Students who approach education with a learning-orientation approach however are more likely to work towards acquiring the skills centered on learning outcomes (Meyer et al., 2019; Pilotti et al., 2022b). EFL students with higher self-efficacy and a learning-orientation approach may be more successful in acquiring the academic vocabulary required to succeed in reading comprehension and less likely to devote their English-language learning experience to acquiring the high-frequency, more colloquial, vocabulary items that are less likely to help them to succeed in their academic endeavors.

Acknowledgments

I would like to thank the faculty and student research assistants at the University of Maryland who assisted in the creation of the data set used in this study.

Abstract: Writing in a second language is an effortful activity that relies on the attentional resources of the writer's working memory for information processing. According to the interference account, anxiety affects students' writing performance because it depletes the resources necessary for the storage, retrieval, and manipulation of information in working memory. In the present correlational study, we asked whether STEM and non-STEM undergraduate students differ in their writing anxiety (i.e., somatic anxiety, behavioral avoidance, and cognitive anxiety) as well as in the quantity and quality of their writing output. We also examined the extent to which different types of anxiety predict writing quantity and quality indices in the two subject groups. We hypothesized that if STEM and non-STEM students approach the task of writing in a second language differently, they and their writing outputs will be susceptible to different types of anxiety. Participants were Arabic-English speakers during their first year of college who were classified as moderate or competent users of the English language. They were asked to write about their college life and then complete a questionnaire on writing anxiety. In this study, STEM students experienced less somatic anxiety and behavioral avoidance than non-STEM students but wrote fewer words per sentence. For STEM students, all types of anxiety predicted shorter text with fewer high-frequency words. For non-STEM students, only behavioral avoidance predicted shorter and less coherent text. It was concluded that differences not only in the amount but also in the type of anxiety experienced by STEM and non-STEM students might be a useful tool for interventions devoted to ameliorating writing in a second language.

Introduction

During the freshman year, undergraduate students encounter many challenges in their attempts to meet the demands of college courses. One of such challenges for students who have English as their second language is writing. Undoubtedly, writing in a second language is a complex and demanding activity (Zailaini et al., 2015).

The challenge of writing in a second language may be addressed either as an opportunity or a threat. According to the cognitive appraisal model of Folkman & Lazarus (1985), learners may assess challenging and potentially stressful situations with an opportunity framing, which entails seeing potential gains as more salient than potential losses (Vandewalle et al., 2019). As such, they approach challenging situations, such as the possibility of poor performance, with little anxiety because they rely on beliefs about the value of additional effort when a setback occurs. Threat framing, on the other hand, emphasizes potential negative outcomes, thereby increasing people's anxiety and with it the desire to avoid the situation and/or activity that is perceived as the source of the threat (Sanner & Evans, 2019). It follows that the possibility of poor performance raises the fear of a negative evaluation, which devalues additional effort since it could further expose the learner to the experience of failure.

The affective filter hypothesis (Krashen, 1982), applied to writing in a second language, suggests that adverse emotional factors (e.g., low motivation, low self-confidence, and high anxiety) may reduce the amount of information that the writer can process, thereby leading to a degraded output (Deb, 2018). Evidence exists that anxiety is associated with impaired cognitive performance (Derakshan & Eysenck, 2009; Naveh-Benjamin, 1991) especially when the task to be performed is complex and attention-demanding, such as writing in a second language (Quvanch & Si Na, 2022). A more detailed account of how anxiety may affect information processing is provided by the interference account (Stout et al., 2017; Sari et al., 2017). According to this account, writing heavily relies on working memory, which is the "sketchpad of conscious thought" where information that the writer has gathered externally or from long-term memory is kept to be processed through limited attentional resources (Miller et al., 2018, p. 463). In one's working memory, the experience of anxiety involves the presence of various task-irrelevant thoughts (e.g., worries), which reduce the attentional resources that are available to be allocated to writing, a task-relevant activity (Stout et al., 2017; Sari et al., 2017). One of the most detrimental effects of anxiety is that retrieving the information needed for writing becomes difficult (Derakshan & Eysenck, 2009; Naveh-Benjamin, 1991). Consequently, it is not surprising that in the interference account, anxiety is expected to lead to poor writing, including declines in both quality and quantity. If poor writing is the correlate of anxiety, are there individual differences?

The present study was motivated by comments made by freshmen who were asked in focus groups ($n = 60$) how they approached the task of writing in English (i.e., a second language; Pilotti, 2022). Answers tended to differ by major. The vast majority of Science, Technology, Engineering, and Mathematics (STEM) majors described

an opportunity approach, whereas most non-STEM students tended to report answers that fitted a threat approach. This finding was not surprising because of the ecosystem in which STEM students reside. Consider, for instance, the scientific reading materials (e.g., textbooks, articles, etc.) to which STEM learners are mostly exposed, which tend to be written in a highly technical language whose content is concept-dense and abstract (Aydoğan & Koc, 2022; Fang, 2005; Hubbard, 2021; Lampropoulos & Admiraal, 2023; McSween, 2024; Toscano, 2023; Pham, 2021). Not surprisingly, STEM students report experiencing more difficulties in reading the technical language of their textbooks than non-STEM students (Pilotti et al., 2023). Yet, STEM courses are uniquely suited to emphasize a problem-solving approach to class activities (Al-Zohbi et al., 2022; 2023; Felder & Brent, 2016), thereby fostering the adoption of an opportunity approach when facing difficulties to ensure academic success in such courses.

In our study, we asked whether indeed STEM and non-STEM students differed in the anxiety experienced when writing in a second language. We hypothesized that if the differences reported by students regarding their approach to writing were solid, they would translate into differences in the amount and types of anxiety experienced. We considered three types of anxiety: somatic anxiety, behavioral avoidance, and cognitive anxiety (Cheng, 2004). Somatic anxiety pertains to self-reported symptoms of intensified autonomic arousal and nervousness, such as hyperventilation, sweating, trembling, and palpitations.

Avoidance behaviors may include withdrawing, procrastinating, and evading. Because writers with anxiety view writing as an unrewarding activity, avoidance behaviors exemplify their attempts to circumvent situations where writing is demanded (Daly & Miller, 1975). Cognitive anxiety refers to disruptions of thought processes, which may include intrusive thoughts, difficulties in keeping one's attention focused, and excessive worrying. Cognitive manifestations of anxiety include appraisal concerns, such as fears of being negatively evaluated, and communication apprehension, such as fears of not being able to communicate effectively (Cheng, 2004).

Interestingly, most studies on students' anxiety related to writing in a second language involve beginners. We focused on moderate and competent writers (as per scores on standardized tests) to determine the extent to which writing anxiety plays a role in this often neglected population. In our study, hypotheses were specifically formulated based on the assumption that STEM education promotes an opportunity-framing approach to academic challenges. As a result, we predicted that if STEM students see difficulties (e.g., reading textbooks and articles written in a technical language and writing in a second language) through the eyes of an opportunity framing, they would experience overall less somatic and cognitive anxiety as well as engage in less behavioral avoidance than non-STEM students (H1). If anxiety differs between subject groups, quantity and quantity measures of the output of writing should follow suit (H2). Furthermore, anxiety would predict declines in the quality and quantity of the written output, but differently for STEM and non-STEM learners. In non-STEM students, a threat approach would make avoidance behavior dominant over the other types of anxiety. Thus, avoidance behavior would more strongly predict declines in the quality and quantity of the written output for non-STEM students than for STEM students (H3).

Method

Participants

Participants were a convenience sample of 553 female undergraduate students who were enrolled in a written communication course of the general education curriculum of a Saudi Arabian University. The university complies with a US curriculum, which is to be taught through student-centered instruction. Students were Arabic-English speakers who had attained at least a 6.0 IELTS overall score and a 5.5 IELTS writing score (range: 0-9). Thus, the selected sample included second-language learners ranging from modest to competent users, who are often neglected in the extant literature in favor of introductory-level learners. The students' average age was 19.51 ($SD = 1.57$). In the sample, 42.86% were STEM majors (i.e., engineering, computer science, or architecture), and 57.14% were non-STEM majors (i.e., business, law, or interior design), which reflected the first-year enrollment ratios of the selected University. The participation rate was 97.53%.

Materials and Procedure

After giving informed consent, participants were assigned two tasks to complete. First, they answered a few demographic questions (i.e., age, major) and then wrote a brief paragraph regarding their college life. A minimum of 50 words was required by the instructions. A loose 15-minute timeline was allocated to the latter task. Second, students completed a revised version of the Second Language Writing Anxiety Inventory (SLWAIR) of Cheng (2004). The inventory, which served to assess students' writing anxiety, consisted of 22 statements. Surface changes in the wording of some statements ensured second-language speakers' intuitive comprehension. For instance, the phrase "write English composition" was changed to "write assignments in English".

Participants were asked to respond to each statement by selecting a value on a 5-point scale from strongly agree (+2) to strongly disagree (-2) with 0 serving as the neutral point. Cronbach's alpha was 0.91. Items were organized into three dimensions of anxiety, as advised by Cheng (2004): somatic anxiety, avoidance behaviors, and cognitive anxiety (including appraisal concerns and communication apprehension).

Data Analyses

The text written by participants was organized into two sets of indices: one measuring quantity and one measuring quality. The TextEvaluator® software developed by the Educational Testing Services (ETS) was used to automate scoring (Chen & Sheehan, 2015; Sheehan et al., 2014). Quantity measures included the number of words used, the number of sentences written, and the mean number of words per sentence.

At the word level, the quality measures of each participant included a word unfamiliarity score and a word concreteness score. Word unfamiliarity (range: 1-100) was computed from two corpora, one consisting of 400

million words developed by ETS, and one consisting of 17 million words developed by Zeno et al. (1995). Word concreteness (range: 1-100) relied on the concreteness ratings developed by Coltheart (1981). Higher word concreteness scores indexed the greater use of concrete words, whereas lower word unfamiliarity scores reflected the greater use of high-frequency words. Either score signified degrading quality. At the sentence level, an index of syntactic complexity (range: 1-100) incorporated the mean length of sentences, the mean number of modifiers per noun phrase, the mean number of dependent clauses per sentence, and a measure of sentence depth, which reflected the memory load imposed by sentences with varying syntactic structures (Yngve, 1960).

In addition, a lexical cohesion score measured the frequency of word repetition across contiguous sentences and the use of connectives. It was intended to reflect the extent to which a written output is a coherent message instead of an array of unrelated sentences. Higher coherence values indicate lower text complexity (i.e., degrading quality).

Quantity indices were used to assess whether anxiety was related to changes in students' word output. At the word level, quality indices were intended to test whether anxiety predicted the use of fewer low-frequency words and more concrete words (i.e., a more elementary writing output). At the sentence level, quality indices, such as syntactic complexity and lexical cohesion, were intended to assess whether anxiety predicted qualitative declines in students' written output.

Differences between STEM and non-STEM students in writing anxiety, and quantity and quality measures of written outputs were assessed via independent samples *t*-tests. Pearson correlations were computed for each subject group to determine the extent to which measures of students' written outputs would be predicted by each anxiety type (somatic anxiety, avoidance behavior, and cognitive anxiety).

Results

Table 1 reports the mean (*M*) and standard deviation (*SD*) of writing anxiety, quantity, and quality measures for STEM and non-STEM students. Statistical analyses are organized by the questions they answer.

Are There Group Differences?

STEM students reported less somatic anxiety [$t(551) = 2.05, p = .041$] and behavioral avoidance [$t(551) = 3.20, p = .001$] than non-STEM students. These findings partially supported H1. Of course, if anxiety differs between the two groups, quality and quantity measures should also differ. However, the only quality measure that yielded a difference in favor of non-STEM students was the number of words per sentence [$t(551) = 3.19, p = .002$]. Namely, non-STEM students wrote longer sentences than STEM students. No group differences were observed for qualitative measures. H2 was not supported.

Table 1. Descriptive Statistics

Variables	STEM		Non-STEM		Sign.
	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	
Somatic Anxiety	-.54	.98	-.37	1.02	*
Behav. Avoidance	-.94	.75	-.73	.78	*
Cognitive Anxiety	-.13	.75	-.02	.80	
<i>Quantity Measures</i>					
No. of words	69.34	30.82	66.97	28.51	
No. of sentences	3.61	1.93	3.34	2.05	
No. words per sentence	21.98	11.11	25.84	16.00	*
<i>Quality Measures</i>					
Word Unfamiliarity	41.03	17.40	40.48	18.17	
Word Concreteness	38.72	10.88	39.35	11.22	
Syntactic Complexity	59.60	20.17	61.21	22.82	
Lexical Cohesion	47.17	6.68	47.16	6.33	

Note: Significant group differences are marked with an asterisk.

Does Anxiety Predict Quantity or Quality Measures?

The level of anxiety suffered by students matters not only for their wellbeing but also for their performance. Table 2 displays the Pearson correlation coefficients between anxiety measures and quality or quality indices. The top panel refers to STEM students, whereas the bottom panel refers to non-STEM students. In STEM students, all types of anxiety related to a lower number of words and sentences used, and to a greater use of high-frequency words (i.e., familiar words). Non-STEM students' writing performance was primarily linked to behavioral avoidance. Greater behavioral avoidance was associated with fewer words and sentences used (i.e., brief text), as well as with a less coherent text (i.e., higher scores correspond to less coherence). H3 was only partially supported.

Table 2. Pearson Correlation Statistics

STEM students	Somatic	Behav.	Cognitive
	Anxiety	Avoid.	Anxiety
<i>Quantity Measures</i>			
No. of words	-.234	-.130	-.234
No. of sentences	-.149	-.143	-.134
No. words per sentence	<i>ns</i>	<i>ns</i>	<i>ns</i>
<i>Quality Measures</i>			
Word Unfamiliarity	-.152	-.213	-.151
Word Concreteness	<i>ns</i>	<i>ns</i>	<i>ns</i>

Note: ns = non-significant correlation.

Lexical Cohesion	<i>ns</i>	+.143	<i>ns</i>

Note: ns = non-significant correlation.

Discussion

The results of the present study can be summarized in three points. First, even though very little or no anxiety was reported by most students, STEM learners exhibited less somatic and behavioral avoidance than non-STEM learners, whereas no differences emerged for cognitive anxiety. H1 was partially supported. Second, quantity and quality measures did not display similar group differences. Only one index, that is, the number of words per sentence, displayed a difference but in favor of non-STEM learners. Namely, non-STEM learners wrote longer sentences than STEM learners, which could be due to their conforming to the Arabic language's tendency to use long sentences (Akan et al., 2019). H2 was not supported. Third, contrary to the prediction of H3, in STEM learners, all types of anxiety predicted text that was shorter and with fewer unfamiliar (i.e., low-frequency) words. Instead, in non-STEM learners, only behavioral avoidance predicted shorter and less cohesive text.

The findings of our study suggest that there are indeed differences in the emotional approach to writing in a second language of STEM and non-STEM students. When proficiency ranges from moderate to competent, anxiety may be less prevalent in STEM learners. Nevertheless, anxiety is related to only minor quantitative and qualitative aspects of the learners' writing performance. Thus, for these learners, interventions intended to enhance the quality and quantity of their writing may focus on other variables, such as self-efficacy (i.e., confidence in one's abilities; Sabti et al., 2019). Of course, there is the possibility that students underreported their writing anxiety, thereby making the association with quality and quantity measures either weak or null.

One of the limitations of our study is that we did not consider vocabulary and syntactic errors, but merely measures of quantity and quality of learners' written products. Furthermore, our sample was composed of speakers whose proficiency varied from moderate to competent. If a broader sample of speakers at the lower end

of the performance distribution were to be included, relationships between anxiety and performance measures (including quantity and quality indices) might have been stronger. Most importantly, our study required students to write within a limited timeframe without any impending assessment of their performance. The latter might have contributed to underreporting the anxiety usually experienced when writing for a class assignment.

Conclusion

Our study was based on the assumption that STEM students' approach to writing in a second language was guided by their view of writing as an opportunity, thereby restricting the experience of anxiety to low levels. Although writing anxiety was more dominant in non-STEM students, it did not translate into written outputs that were qualitatively inferior. Anxiety seemed to mostly affect quantity measures, which points to a potentially positive outcome of anxiety. That is, writing anxiety may lead students to reflect on their writing, making them more cautious and thoughtful. Bailey (2019) argued that moderate levels of anxiety have a positive impact on students' use of writing strategies, such as the adoption of a problem-solving approach to writing. Bailey's argument applies to STEM students' purported approach to writing (Pilotti, 2022). However, it does not fit the threat approach attributed to non-STEM students who also exhibited moderate levels of anxiety.

Of course, the approach that students exhibit when tackling a task, such as writing in a second language, is usually related to other individual-difference variables, such as their being grade- versus learning-oriented (Vandewalle et al., 2019), and their self-efficacy (Deb, 2018). Thus, a direct assessment of such variables may offer valuable insights into this population of writers. Furthermore, it is important to keep in mind that the students selected to participate in our study possessed Arabic as their first language. Arabic is structurally and graphemically quite different from English. As such, interference between languages might have been minimal (Derakhshan & Karimi, 2015), thereby contributing to keeping anxiety at relatively low levels.

Recommendations

Our findings suggest that even for speakers whose proficiency in a second language is moderate or competent, interventions devoted to enhancing their writing in that language may need to acknowledge that different types of anxiety are experienced by STEM and non-STEM students. Yet, a focus on anxiety is to be intended as a mere conduit to interventions that foster an opportunity approach to all academic matters (Vandewalle et al., 2019), including writing in a second language. It is this approach that leads not only to students' well-being but also to their academic success.

Acknowledgment

We thank the members of the Undergraduate Research Society and the colleagues of the Cognitive Science Research Center for their helpful feedback.

Abstract: In 2019, the World Health Organization (WHO) described the COVID-19 pandemic as putting governments in a vulnerable position. Initially, it affected only the people of China. Then later, it has spread worldwide and became a global issue. Beyond the immediate health consequences, the COVID-19 pandemic is also expected to have a significant impact on the global economy. Therefore, it is crucial for the countries to urgently implement effective preventive measures to control the spread of COVID-19. The aim of this study is to investigate the engineering consultant on the impact of pandemic COVID-19 in Malaysia. Three independent variables were studied to investigate the engineering consultant towards the impact of pandemic in Malaysia. Quantitative study was chosen with a total of 120 respondents involved. The results revealed that three of the independent variables existing positive correlation to the dependent variable. In conclusion, the engineering consultants received adequate information about the pandemic COVID-19, which shows highest impact on perception, follow with awareness and readiness. It is recommended that the engineering consultant should prioritize on the readiness so that immediate mitigation can be adopted to control the outbreak of pandemic in Malaysia engineering consultant industry.

Introduction

It has been a significant period of time since the last pandemic that affected countries worldwide, causing millions of death cases. The most recent pandemic that was discovered and spread globally was the Swine flu influenza pandemic in 2009, resulting in over 500,000 deaths (Madhav, Oppenheim, Gallivan, Mulembakani, Rubin, & Wolfe, 2018). This explains the severe impact that pandemics can have on a global scale, causing high mortality rates. Historically, pandemics have had a long-standing presence, with notable examples such as the Black Death Pandemic that originated in 1347. Fortunately, the majority of epidemics have primarily occurred in mainland China and European countries, while Malaysia has experienced three significant epidemics in its history – Pandemic SARS, H1N1 and COVID-19.

In the year of 2019, the world witnessed the emergence of the most recent pandemic – COVID-19, which affected every country without exception. Globally, there have been 766,865,075 reported cases and 6,935,889 deaths (ILO, 2021). To prevent the rapid spread of the COVID-19, countries implemented lockdown measures, leading to significant challenges for all sectors, particularly the construction industry. For Malaysia, this pandemic represents the most severe health crisis experienced to date. Malaysians were urged to “stay-at-home” and practice self-isolation to curb the spread of the COVID-19 pandemic. Consequently, all sector operations were forced to stop and shut down for lockdown precautions. Construction faced unique challenges as it could not be conducted virtually. In the meantime, it is also the most crowded place because all the people who operate works are gathered there, which caused it to be the most likely place for pandemic outbreaks to occur.

Review of Literature

Construction has been an important sector of a country’s economy for centuries, playing a key role in its development and making a significant contribution to increasing the Gross Domestic Product (GDP). The construction industry on average contributes 7% of total global employment, employing approximately 220 million people (ILO, 2021). In other words, construction is a major source of employment in any country. At the same time, it offers small companies the opportunity to play an important role in a country’s development. Decades ago, Malaysia’s construction industry had gradually developed into a relatively advanced sector. In late 2019, however, a devastating crisis befell Malaysia: the COVID-19 pandemic.

In addition, the construction industry faces the significant challenge of ensuring the health and safety of its workers. The incubation period of COVID-19 is 14 days, and symptoms may not be immediately recognized. This poses a risk of large outbreaks if a positive case occurs on a construction site, leading to delays in construction activities. Furthermore, the role of the engineering consultant is crucial in construction projects. However, during the Movement Control Order (MCO) period, the government-imposed restrictions on the engineering consulting industry, requiring them to work from home and prohibiting evaluations at the actual construction site. This directly affects the ability of engineering consultants to understand the exact impact of

the COVID-19 pandemic on construction sites, as their work heavily relies on physically presence at the construction site. Therefore, this study focuses on examining the impacts of engineering consultants in the construction industry upon the COVID-19 pandemic period. It aims to illustrated the consultants navigate the challenges posed by the pandemic and adapt their practices to ensure the continued progress of construction projects.

To understand how impactful the COVID-19, engineering consultant's perception level is one of the crucial factors to be look into it. Perception involves the reception and processing of external information by various parts of our brain, forming our understanding or perception of something (Qiong,2017). For instance, individuals primarily obtain COVID-19 news and information through visual and auditory channels such as social media, television, newspapers, or discussions with friends. Consequently, the perception of engineering consultants plays a crucial role in assessing the impact of the pandemic on the construction industry. Due to the MCO restriction, engineering consultants were compelled to work from home, leading to a distinct working environment that directly influences their perception of the pandemic's impact. The shift to remote work limits their physical interactions and reduces their ability to make on-site observations, thereby potentially altering their perception of the challenges and consequences faced by the construction sector.

Another important factor in this study is awareness. Awareness explained as in comprehending risks, value, consequences and other factors. Self-awareness involves recognizing one's own strengths and weaknesses, improving personal values, and shaping attitudes (Sutton, 2016). Therefore, individuals need to be aware of the impacts of pandemic in order to develop effective strategies for prevention and mitigation. Understanding the awareness of engineering consultants regarding the impact of the pandemic able to evaluate the engineering consultant's knowledge and understanding of the challenges posed by the pandemic and respond ability to formulating strategies and measure to address the impact of pandemic on construction industry in Malaysia.

Lastly, readiness is determined to investigate on individual in assimilate available information, make informed judgements about the impact, and act to achieve the goals (Hall & Ripine, 2021). When individuals are ready, individuals have the capacity to collect and process relevant information related to the COVID-19 from reliable sources, such as government guidelines, industry reports, expert advice to ensure what's are the actions to address the impact of COVID-19 on engineering consultants. These traits played a crucial role when investigating the impacts of pandemic on engineering consultant in construction industry. By assessing their level of awareness, perception and readiness, valuable insights can be gained with regards to their ability to adapt and overcome challenges during the pandemic period. This includes considering factors such as workforce safety, supply chain disruptions, project delays and financial implications. In this regards, the following research objectives are forms: -

- a. To explore the statistical relations on the trait factors towards the impact on the engineering consultant in Malaysia upon COVID-19 period.
- b. To investigate the trait factors that impacting the engineering consultant in Malaysia upon COVID-19

period.

The above objectives aim to answer the issues that happening in the Malaysia engineering consultant industry. To enrich the knowledge base on the research objectives that form from the literature and reviewing on the previous studies and current industry scenario, the following questions are developed: -

- a. What are the statistical relations on the trait factors towards the impact on the engineering consultant in Malaysia upon COVID-19 period with regards to the significant level ($p=0.05$)?
- b. How the trait factors in this study impacting the engineering consultant in Malaysia upon COVID-19 period?

Research Methodology

Data Selection and Interpretation

Quantitative methods were chosen. The dependent variable in this study is the impacts of pandemic on engineering consultants. The measurement of this variable's questionnaires was adapted from Bolisani, Scarso, Ipsen, Kirchner & Hansen (2020). The independent variables include perception (Garg & Van, 2015), awareness (Bonyan, AL-Karasneh, EL-Dahiyat & Jairoun, 2020) and readiness (Cvetković, Nikolić, Radovanović, Öcal, Noji & Zečević, 2020). The conceptual framework illustrating the relationships between these variables is depicted in Fig 1. To assess these variables, a 5 Point Likert Scale was employed, ranging from scale 1 (Strongly Disagree) to scale 5 (Strongly Agree). The analysis of the data was conducted using the Statistical Package for Social Sciences (SPSS) software.

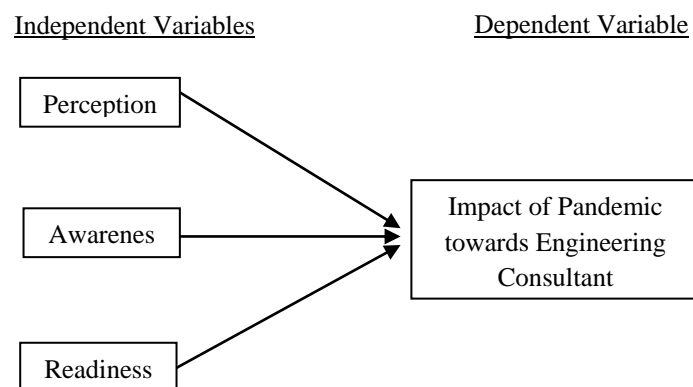

Figure 1. Conceptual framework of the study

Data Analysis Method

This study employed a probability sampling method for data collection, specifically targeting consultant engineering companies. The aim was to distribute the questionnaires equally among these companies. To ensure a diverse sample, a combination of simple random, quota and snowball sampling methods were utilized. This

approach facilitated data collection by leveraging the connections and networks of other respondents (Kabir, 2016). Before conducting the data collection, a pilot test (Cronbach Alpha > 0.8) was carried out using a sample of 30 questionnaires.

The purpose of the pilot test was to assess the understanding of the questionnaires by the respondents and identify any potential errors in data analysis (Ismail, Kinchin & Edwards, 2017). Following the verification of questionnaire reliability, data collection commenced and a total of 129 numbers of data were collected from engineering consultants. However, during the screening process, 9 samples were identified as unreliable and invalid, and subsequently removed from the dataset to ensure the integrity of the data collection process.

Table 1. Summary of Demographic Profile of Consultant Respondents

	Respondent	Cumulative Respondents	%	Cumulative %
Gender				
Male	86	86	71.67	71.67
Female	34	120	28.33	100
Age				
20 – 29 Years Old	75	75	62.50	62.50
30 – 39 Years Old	30	105	25.00	87.50
40 – 49 Years Old	9	114	7.50	95.00
50 – 59 Years Old	4	118	3.33	98.33
60 Years Old Above	2	120	1.67	100
Highest Academic Level				
Primary Education	0	0	0	0
Secondary Education	0	0	0	0
Pre-University Programmed	0	0	0	0
Undergraduate Programmed	108	108	90.00	90.00
Postgraduate Programmed	12	120	10.00	100
Position Level				
Admin	0	0	0	0
Technical	113	113	94.17	94.17
Sales	7	120	5.83	5.83
Management	0	120	6.04	100
Working Experiences				
0 – 5 Years	76	76	63.33	63.33
6 – 10 Years	25	101	20.83	84.16
11 – 15 Years	7	108	5.84	90.00
16 – 20 Years	5	113	4.17	95.83
20 Years Above	7	120	5.83	100

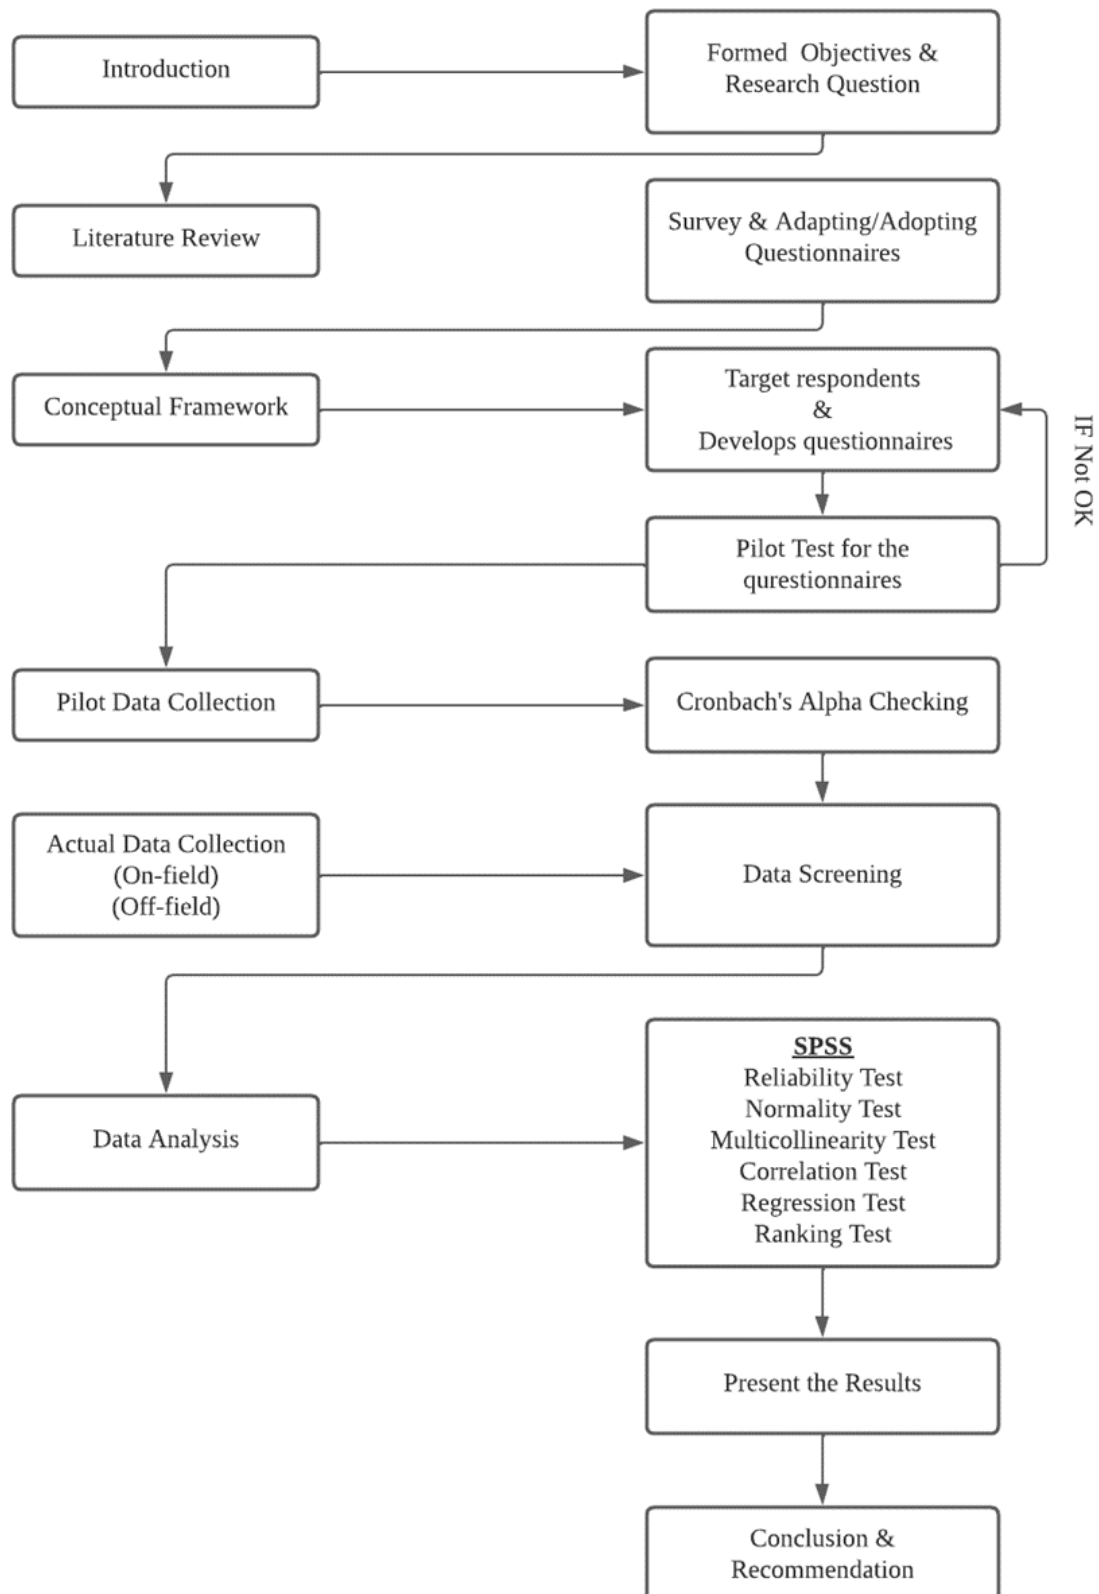

Figure 2. Methodology Flowchart of the study

Table 1 shows the demographic profiles of consultant in this study. The gender, age, highest academic level, construction parties, position level and working experiences are obtained through questionnaires from a total of 120 copies of usable respondents. The demographic indicated the distribution of the respondents and most of the respondents are worked as technical with minimum qualification of bachelor degree holder. These results reveal strong indication the appropriate respondents were selected.

The data were then gone through sreening process. After removing the unreliable data, the collected dataset was subjected to further analysis using SPSS software. Several statistical tests were conducted to examine the relationships and patterns within the data. First, a Reliability Test ($\alpha \geq 0.8$) was performed to assess the internal consistency of the questionnaire items. The reliability coefficient (Cronbach's alpha) of 0.8 or above was considered acceptable, indicating a reliable measurement instrument.

Next, a Normality Test was conducted to evaluate the distribution of the data. The Z-score range of -1.96 to +1.96 was used as the criterion for determining normality. If the results fell within this range, the data were considered normally distributed and vice versa. To assess the presence of multicollinearity among the independent variables, a Multicollinearity Test is conducted. The Variance Inflation Factor (VIF) is used as a measure, with values between 1 and 10 indicating acceptable levels of multicollinearity (Daoud, 2017).

To measure the interaction of the variables, either Spearman's Rho or Pearson Correlation coefficient is used depending on the normality of the data. Spearman's Rho is used for non-normally distributed data, while Pearson Correlation is used for normally distributed data. This test helped determine the strength and direction of the relationships between the independent and dependent variables.

Finally, Regression Analysis is performed to examine the relationship between the independent variables and the dependent variable. This test allowed for determining whether the independent variables had a positive or negative relationship with the dependent variable. The entire methodology, including the data analysis steps, is summarized in a flowchart represented in Figure 2.

Results and Discussion

In order to maintain the theoretical and conceptual consistency and accuracy of this study, the conceptual framework has been formulated as shown below – Figure 3.

Fig 3 shows the formation of conceptual framework of the study, which includes the independent variables and dependent variables. All of the variables were assessed using relevant questions and demonstrated acceptable levels of reliability, with Cronbach Alpha, $\alpha > 0.8$ as presented in Table 1.

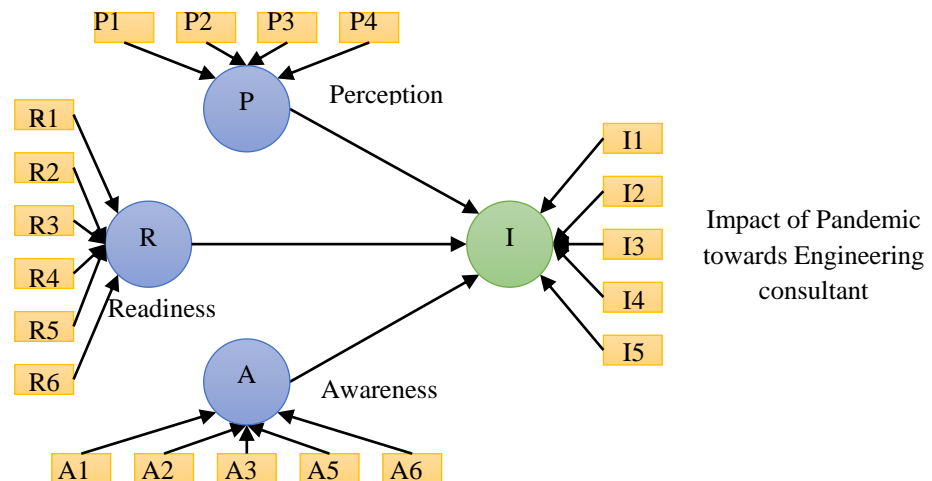

Figure 3. Formation of Conceptual Framework of the Study.

Table 1. Reliability Test

	Cronbach's Alpha	Number of Items
Independent Variables		
Perception (P)	0.801	4
Awareness (A)	0.805	5
Readiness (R)	0.886	6
Dependent Variable		
Impact of Pandemic (I)	0.805	5

A Normality Test was conducted to determine whether the data were prior to normal or non-normal. Since the number of data sets is greater than 85, this study selects Skewness and Kurtosis to conduct the normality test using a dataset of 120 samples. The results revealed that the z-scores for all statements within the range of -1.96 to +1.96 (Ghasemi & Zahediasl, 2012). Therefore, the dataset in this study exhibited a normal distribution was considered parametric. Multicollinearity analysis was conducted to examining the correlation between each of the independent variable in this study, as shown on Table 2. The analysis helps to identify if there is a high degree of correlation among the independent variables, which can impact the reliability and interpretability of regression results.

Table 2. Multicollinearity

Independent Variables	Tolerance	VIF value
Engineering Consultant's Perception (P)	0.643	1.556
Engineering Consultant's Awareness (A)	0.820	1.219
Engineering Consultant's Readiness (R)	0.759	1.317

Based on the results in Table 2, the Variance Inflation Factor (VIF) values fall within the range of 1 to 5, which

mean that there is no significant multicollinearity among the independent variables (Daoud, 2017). This means that the variables are not highly intercept with each other, ensuring the reliability of the regression analysis in this study.

Consequently, Pearson Correlation Analysis is utilized to perform the correlation test. Table 3 presents the significance level (p value) for each of variable, indicating that all values are lower than 0.01, which mean is significance. Apart from this, the results show the positive correlation, indicating that the dependent variable and independent variables moving in the same direction. The correlation analysis reveals that the perception exhibits the highest correlation coefficient 0.774, indicating a strong positive correlation coefficient with the impact of pandemic. Following perception, awareness shows a strong positive correlation with a coefficient of 0.652, indicating as the strong positive correlation coefficient to the impact of pandemic also. Lastly, readiness exhibits a moderate positive correlation with a coefficient of 0.481 (Senthinathan, 2019).

Table 3. Pearson Correlation Test

		Perception (P)	Awareness (A)	Readiness (R)	Impact of Pandemic (I)
Perception (P)	Correlation Coefficient	1	0.422**	0.489**	0.774**
	Sig. (2-tailed)		0.000	0.000	0.000
	N	120	120	120	120
Awareness (A)	Correlation Coefficient	0.422**	1	0.169	0.652**
	Sig. (2-tailed)	0.000		0.065	0.000
	N	120	120	120	167
Readiness (R)	Correlation Coefficient	0.489**	0.169	1	0.481**
	Sig. (2-tailed)	0.000	0.065		0.065
	N	120	120	120	120
Impact of Pandemic (I)	Correlation Coefficient	0.774**	0.652**	0.481**	1
	Sig. (2-tailed)	0.000	0.000	0.000	
	N	120	120	120	120

*. Correlation is significant at 0.05 level (2-tailed)

Apart from that, regression analysis was conducted to determine which variable has the most significant impact on the dependent variable. And lastly, ranking test reveals the variables that affecting the engineering consultants the most towards the impact of covid-19. Table 4 shows that the p value of all three traits are lesser than 0.05, indicating that all the hypothesis are accepted and the independent variables have a significantly effect to the dependent variable. In addition, all three independent variables show a positive relationship with the dependent variable ($B > 0$).

Table 4. Regression Test

Coefficients					
	Unstandardized		Standardized		
Model	Coefficients		Coefficients		Sig.
	Std.				
	B	Error	Beta	t	
(Constant)	-.738	.318		-2.323	.022
Perception (P)	.509	.056	.528	9.034	.000
Awareness (A)	.370	.047	.403	7.797	.000
Readiness (R)	.232	.081	.155	2.883	.005

Based on the results in Table 5, it can be observed that perception has the greatest impact on the pandemic, followed by the awareness traits. The readiness traits have the least impact on the pandemic among the three variables.

Table 5. Ranking Test

Independent Variable	Standardized Coefficients, Beta	Correlation	Ranking
	(β)		
Perception (P)	0.528	0.774**	1
Awareness (A)	0.403	0.652**	2
Readiness (R)	0.155	0.481**	3

With a quantitative study, although the ranking test provided the level of influence of each variable, it is crucial that investigating individual question's performance would provide detail explanation for the findings. Table 6 elucidates the mean ranking for each question. The mean can be used to represent the typical value and therefore serves as a yardstick for all observations.

Table 7 summarizes the results of the hypothesis testing in this study. In overall, the results show that all three independent variables have the positive correlation towards the impact of pandemic. The results reveal that engineering consultants in Malaysia observe highest Perception level on the COVID-19 follow with the Awareness and Readiness.

Table 6. Means and Standard Deviations of the Responses of the Study Participants towards Respective Variables

Impact of Pandemic on Engineering Consultant				
No.	Item	Mean	Standardized Coefficients	Ranking
1	During COVID-19 pandemic period, I'm working more hours at home than normally	3.90	0.814	2
2	During COVID-19 pandemic period, I'm getting less productivity at home than normally	3.80	0.894	5
3	During Covid-19 pandemic period, my work at home is more demanding than normally	3.87	0.819	3
4	The information that I have gotten make me feel well prepared for working at home	3.83	0.792	4
5	I can keep a good relationship with my colleagues when I'm working from home	4.43	0.984	1
Perception of Consultant Engineering				
No.	Item	Mean	Standardized Coefficients	Ranking
1	During COVID-19 pandemic period, I felt that I would be able to balance my job and personal life while I'm working from home.	4.34	0.983	2
2	During COVID-19 pandemic period, I felt that my productivity will increase while I'm working from home.	3.79	0.925	4
3	During COVID-19 pandemic period, I miss physical interaction with others to coordinate complex task while I'm working from home	4.42	0.940	1
4	During COVID-19 pandemic period, I felt that contextual information is likely to get lost with electronic correspondents while I'm working from home.	3.98	0.761	3
Awareness of Consultant Engineering				
No.	Item	Mean	Standardized Coefficients	Ranking
1	During pandemic period, I aware that work from home is effective for preventing the spread of COVID-19.	4.58	0.857	1
2	During COVID-19 pandemic period, I aware that work from home can avoid contact with sick people in office.	4.54	0.849	2

3	During pandemic period, work from home order should be enforced by government to prevent COVID-19 spreading.	4.54	0.888	2
4	During COVID-19 pandemic period, I aware that work from home can avoid close contact with person who has active respiratory symptom to prevent further transmission of disease	4.58	0.837	1
5	During pandemic period, I aware that work from home can reduce the possibility to contact with contaminated materials or surfaces to prevent further COVID-19 transmission.	4.58	0.888	1

Readiness of Consultant Engineering

No.	Item	Mean	Standardized Coefficients	Ranking
1	Upon working from home, I find myself individually ready to respond to emergencies work from office	3.99	0.601	2
2	Upon working from home, I find that my company is prepared to respond to emergencies caused by COVID-19 pandemic.	3.95	0.620	4
3	Upon working from home, I find that my company has sufficient knowledge to respond properly to emergencies caused by COVID-19 pandemic.	3.88	0.643	6
4	Upon working from home, I find that my company is trained enough to respond properly to emergencies caused by COVID-19 pandemic.	3.91	0.661	5
5	Upon working from home, I find that my company has sufficient support to assist the employees.	4.02	0.635	1
6	Upon working from home, I find that my company has sufficient guidelines to assist the employees	3.98	0.635	3

Table 7. Hypothesis Test

Hypothesis	Results	Decision
H ₁ : There is a relationship between engineering consultant's perception to impact of pandemic to engineering consultant in Malaysia construction industry during pandemic period	Correlation = 0.774** (Positive; Significant) $P = .000 < 0.01$ $\beta = 0.528$	H ₁ is supported and accepted. Ranking: 1
H ₂ : There is a relationship between	Correlation = 0.652**	H ₂ is supported

engineering consultant's awareness to impact of pandemic to engineering consultant in Malaysia construction industry during pandemic period	(Positive; Significant) $P = .000 < 0.01$ $\beta = 0.403$	and accepted. Ranking: 2
H ₃ : There is a relationship between engineering consultant's readiness to impact of pandemic to engineering consultant in Malaysia construction industry during pandemic period	Correlation = 0.481** (Positive; Significant) $P = .000 < 0.01$ $\beta = 0.155$	H ₃ is supported and accepted. Ranking: 3

Conclusion

The covid-19 that happened since 2020 has brought a huge impact to Malaysia construction industry. The pandemic forces the engineering consultants' company to work-from-home (WFH). Indeed, construction industry hugely depending on the site monitoring that would requires engineering consultant to physically observes and monitor the progress at the project site. Therefore, engineering consultant's accomplishment towards the impact is crucial. This study is conducted by investigating the engineering consultant's accomplishment upon the pandemic period. We can conclude that the awareness, perception and readiness have positive correlation with the impact towards engineering consultant in Malaysia. The engineering consultants are well aware and perceive the seriousness due to the influence from the pandemic problems. However, compare among the three variables, engineering consultants need to adapt the changes fast so that the engineering consultant are ready to overcome the sudden change which could lead to the immediate construction planning losses.

Recommendations

This study provides a valuable insight into the traits of engineering consultants and the impact of pandemic in Malaysia construction industry. The findings suggest that perception, awareness and readiness are related to the impact of the pandemic on engineering consultants. In between these traits, the perception of engineering consultant plays a major role in understanding the impact of pandemic. This is because all the engineering consultants were forced to work from home during the pandemic period as the government implement the MCO to control the COVID-19 in Malaysia. Consequently, engineering consultant have received sufficient information from the government regarding the pandemic COVID-19.

However, despite the government's efforts to disseminate news and raise awareness about COVID-19, it remains the huge impact on Malaysia history. It is crucial to create the awareness of the engineering consultant to be prepared for the next wave, so that the enhancement on the engineering consultant readiness could provide effective strategies and solution to mitigate the impact of future epidemics or pandemics in Malaysia.

Abstract: Questions exist as to whether AI tools, such as ChatGPT, can aid learning. This study examined whether in-class exercises involving error detection in text generated by ChatGPT can aid students' foreign language writing. Participants were Arabic-English speakers who were classified as ranging from modest to competent English users according to IELTS standards. There were two conditions, each involving four sections of an English communication course, distributed across consecutive semesters and taught by the same instructor. In the treatment condition ($n = 101$), students performed error detection exercises using text generated by ChatGPT. In the control condition ($n = 112$), students performed the same exercises without ChatGPT. Then, they wrote a descriptive essay. It was hypothesized that if ChatGPT exercises enhanced students' confidence as writers, they would write longer essays. If ChatGPT exercises enhanced attention to detail, the exercises would increase writing quality (e.g., greater use of low-frequency and abstract words, and greater reliance on complex syntactic structures). In this study, students exposed to ChatGPT exercises used more low-frequency words and wrote more sentences but of shorter length than control condition students. The number of words did not differ, suggesting that ChatGPT exercises enhanced writers' attention to the shorter sentence length of the English language and its vast vocabulary. The results of this study suggest that ChatGPT exercises yield minor benefits for improving the writing of second-language speakers. Yet, extensive and broader exercises may yield more substantial benefits.

Introduction

In November of 2022, a controversial artificial intelligence (AI) chatbot, Chat Generative Pre-trained Transformer (ChatGPT), was released by Microsoft's OpenAI. ChatGPT uses Large Language Model (LLM) Functionality to generate written output intended to imitate human-like responses to prompts. ChatGPT has both an open access version, available online, as well as a paid version with several additional features available to subscribers. This application has gained international attention among instructors of all educational levels due to its ability to produce responses to human-initiated prompts that are accurate, informative, and lexically and semantically coherent in a wide variety of genres (Lo, 2023). As such, many educators are concerned about the possible ethical ramifications of the use of ChatGPT and other forms of LLM functionality. This is of particular concern for instructors of writing courses, the aim of which is to improve students' compositional abilities.

When used unethically, LLM Functionality programs, such as ChatGPT, may impede student learning as well as lead to unearned, inflated grades. However, when used ethically, ChatGPT offers a variety of valuable learning opportunities to students. It can serve as a fast and reliable replacement to traditional search engines when determining answers to content-based questions. It can also be used to allow students to practice their linguistic skills by providing immediate feedback in the form of grammatical correction when their own writing is entered as a prompt (Huang et al., 2022). Indeed, ChatGPT can address a wide range of writing queries concerning syntax, semantics, language style, pragmatics, and format (Barrot, 2023). This may be of particular assistance in allowing students of writing classes the opportunity for sustained practice without fear of judgment, thereby potentially reducing writing anxiety (Beck & Levine, 2023). For educators teaching English-language writing to English as a foreign language (ESL) learners, it may have positive implications as a pedagogical aid within the classroom as well (AlAfnan et al., 2023). Text generated in response to prompts entered into ChatGPT can be used by writing instructors for in-class exercises such as error detection, correcting essay structure, and evaluating the appropriateness of generated content (Kohnke et al., 2023).

However, educators must also remain aware of the risk that ChatGPT may be detrimental to learning and yield serious challenges to instructors. For instance, the availability of ChatGPT may increase students' dependency on automation. This in turn may reduce their opportunities to develop, exercise, and practice critical thinking skills. More broadly, dependence on AI reduces students' development of academic agency, fostering a grade-oriented approach to learning. Students are known to display two basic and broad approaches toward their academic work (Pilotti, 2022; Pilotti et al., 2022): grade orientation (i.e., work whose goal is to receive a desired

grade) and learning orientation (i.e., work whose goal is to learn useful skills and acquire valuable knowledge). Grade orientation is recognized as counterproductive to learning and as discouraging of the adoption of advantageous study habits and ethical conduct (Daumiller & Janke, 2020; Kinne et al., 2022; Meyer et al., 2019). The danger of unwarranted dependency on automation intensifies when writing assignments do not require personalized answers that rely on critical thinking skills or do not incorporate particular lectures and textbook materials. Such writing assignments are easily completed by LLM Functionality programs, increasing the temptation of this form of plagiarism. For such assignments, it may be challenging for instructors to differentiate work produced by a student independently from work produced by AI (AlAfnan et al., 2023; Rudolph et al., 2023). As such, some academic institutions have temporarily banned students from using ChatGPT and other AI-based algorithms (Barrot, 2023). However, given the similarity of ChatGPT output to human writing, this can be difficult to enforce.

The extant literature on the possible uses of ChatGPT and other AI-powered tools is growing in two parallel directions. One developing genre of literature includes commentaries which describe the features of particular AI-powered tools. In these commentaries, reasoned arguments are often used to illustrate the potential benefits or pitfalls of each feature or set of features (e.g., Hong, 2023; Imran & Almusharraf, 2023). Empirical studies on the impact of specific uses of AI-powered tools on writing have also begun to emerge. These studies have provided evidence regarding the relative benefits, limitations, and pitfalls of these tools (e.g., Athanassopoulos et al., 2023; Baskara, 2023; Yan, 2023). For instance, Athanassopoulos et al. (2023) examined whether students' reliance on ChatGPT could improve vocabulary and grammar in German as a foreign language writing. In their study, students first were asked to write a message to a friend describing their favorite sport. They were then shown a grammatically improved version of their message with context-appropriate vocabulary as generated by ChatGPT. After reviewing this output, students were asked to write another message on a similar topic. Athanassopoulos et al. found that this exercise not only increased the length of the texts written by students (as measured by the number of words), but also the length of sentences in this writing, as is consistent with the syntactical structure of standard German writing. This exercise was also found to improve text quality as measured by the use of 'unique' words. These findings suggest that particular modes of use of ChatGPT can positively impact both the quantity and the quality of students' writing in a foreign language. Namely, notwithstanding its potentially nefarious uses, ChatGPT can aid the learning of a second language, including serving as a platform for practicing writing and offering timely suggestions for improvement.

However, when using ChatGPT as a pedagogical tool, it is important to remember that artificial intelligence is not comparable to human intelligence. LLM functionality programs retrieve information exclusively from what is available online. As such, these programs are prone to producing written output with the types of errors commonly made in human writing. For native speakers of English, learning to writing in their native language is a complex skill requiring a high working memory load along with repeated rounds of revision and error correction. However, with time and practice, native speakers of English may be able to detect the errors in ChatGPT output. This allows students to interact with the output in a way that not only improves their proofreading abilities but may also reinforce their own knowledge of the complex rules of English-language

writing. As with more traditional exercises in error analysis, this may assist writers in producing future writing of their own that is free of the errors they have detected (Karr, 2022). Writing in one's second or foreign language is even more complex due to factors such as age of language acquisition, age at which one first began writing and potential transfer effects from one's native language. This may make EFL learners even more susceptible to the temptation to rely upon AI tools such as ChatGPT. However, when EFL learners rely on AI tools such as ChatGPT, they are potentially less likely to have the ability to accurately assess ChatGPT output for errors and inaccuracies than their peers for whom English is their first language.

For EFL students, one issue of concern that may impact writing in one's second language is the similarity or difference of the learner's first language. This may impact the degree to which first language interference may complicate developing English-language writing skills. Diab (1996) described the phenomenon of language interference as the detrimental role that the innate knowledge of one's native language has on the ability to learn a second or foreign language. Due to unique differences between the morphosyntactic, orthographic, and phonological structures of English and Arabic, specific types of linguistic transfer may be more commonly found in the English-language writing of native speakers of Arabic. Modern Standard Arabic (MSA) is the high level of the diglossic linguistic systems existing within the Arabic-speaking nations of the Middle East and North Africa. Diglossia may be defined as a linguistic environment in which a language exists in two distinct forms, one viewed as the higher-level form and the other as the lower-level form. In the situation of Arabic, the lower level form is the regional dialect of colloquial Arabic which is acquired naturally and used in informal situations. The higher-level form, MSA, is standardized throughout Arabic-speaking nations and is used in formal situations. Education in Arabic-speaking nations often takes place primarily in MSA with English language instruction introduced at varying levels of education (Daqar et al., 2018).

One key difference between MSA and English is that the base form of a root word in Arabic is often a verb consisting of three consonants which can be inflected to produce nouns as well as other verbs reflecting person, tense, number, and gender (Scott and Tucker, 1974). Differences in word order and the rules of subject-verb agreement may lead to some of the common errors found in the writing of native Arabic-speaking second language learners of English. Sentences written in MSA often begin with a verb and may only state a noun or pronoun once in a paragraph. As written MSA allows subject drop, this feature often crosses over into the English-language writing of EFL learners who are native speakers of Arabic. The comma (,) also plays a notably different role in writing in MSA as compared to its role in English-language writing. This form of punctuation often functions in the capacity with which the period (.) is used in English. As such, it is not uncommon for paragraphs written in MSA to be comprised of what a native speaker of English perceives to be a single sentence with main ideas separated by commas alone. All of these grammatical features of MSA may be found in the writing of native Arabic speaking students when writing in English (Khatter, 2019).

Grammatical errors found by Diab in his 1996 study of the writing of EFL learners who were native speakers of Arabic living in Lebanon included errors in subject-verb agreement, the use of appropriate modifiers in relation to singular and plural nouns, accurate use of prepositions, and the appropriate inflection of nouns to produce

both plural nouns as well as their associated adjectives and adverbs. For native speakers of Arabic living in Saudi Arabia, Alkhudiry and Al-Ahad (2020) found that writing errors primarily occurred in subject-verb agreement, verb inflection, sentence and word structure, spelling irregularities, and vocabulary. Khattar (2019) also found that the majority of errors in the English-language writing in Saudi Arabian EFL students were found in punctuation. All of these areas differ greatly between MSA and English, and, as such, are prone to appear as part of the transfer effects in the English-language writing of students who have primarily been educated in MSA.

The present study examined the impact of error analysis of ChatGPT output on English-language writing for EFL native speakers of Arabic. Participants included freshman students in an English-language introductory academic writing class. Participants proficiency in written English ranged from moderate to competent. As such, this study did not focus on writing errors, but rather on the quality and quantity of various factors in participants' English-language writing. The amount written (as indexed by the number of words, number of sentences, and their length) was intended to gauge their fluency (Maisa, 2018). The quality of their writing (as indexed by the use of low-frequency words, abstract words, complex syntactic structures, and coherent content) was intended to gauge the complexity of their writing (Johnson, 2017). The in-class ChatGPT output error analysis exercise aimed to help students identify and correct errors in their own writing. These were thought to potentially include grammatical form and structure, correct selection of vocabulary to convey intended meaning, and proper essay structure and format.

This study began in the fourth week of two consecutive semesters. It began immediately prior to the assignment of a descriptive essay on a topic of the students' choice. This was the students' first assigned essay in an introductory-level academic writing course. Instruction in the first three weeks of class focused on the form and structure of the three primary sections of a standard five-paragraph essay in English (the introduction paragraph, body paragraphs, and the conclusion paragraph) as well explicit instruction on morphosyntactic rules that differ between writing in English and MSA. Prior to beginning this assignment, the study began with analysis of an instructor-generated prompt for ChatGPT to write a descriptive essay in the standard five paragraphs structure. The prompt used was "Write a five-paragraph descriptive essay on haloumi cheese. Include an introduction, three body paragraphs, and a conclusion." Haloumi cheese is a popular Middle Eastern food with which all students were familiar. Students were then provided the output in the form of a Microsoft Word document and given 15 minutes to read the output and correct errors based on their both their own knowledge and information previously learned in class. The students and instructor then engaged in a class discussion in which students shared errors they had identified in the ChatGPT-generated output. Each error identified was then discussed as a class as to how it should be corrected. The types of errors discussed primarily included grammatical and semantic errors, errors in lexical cohesion, errors in the connectivity between consecutive paragraphs, and errors in the structure and form of the essay produced. The instructor also directed students' attention to specific areas of the output produced by the program and assisted students' detection and correction of errors that students had not identified. In her instruction, the particular strengths and limitations of ChatGPT as a "writer" were underscored and students' writing competence, as indexed by their sense of agency, was emphasized. In the

control condition, students were exposed to a similar practice prior to beginning their own assigned descriptive essay, but the text examined was intentionally generated by the instructor herself with a variety of intentional errors. These including grammatical and semantic errors, errors in lexical cohesion, errors in the connectivity between consecutive paragraphs, and errors in the structure and form of the essay. As per the ChatGPT condition, the class first engaged in a discussion of their own error detection and ways in which these errors could be corrected. The instructor then assisted in error identification and correction, and in the recognition of correct forms and formats of errors that students had not identified in their independent work.

This field study was guided by two assumptions about the impact of these particular ChatGPT exercises on students' foreign-language writing, one entailing their confidence in the process of writing, and the other involving their attention to the products of their writing. Specifically, the comparison between the treatment and the control conditions gave rise to two complementary hypotheses:

H1 If ChatGPT-driven error detection exercises enhanced students' confidence as writers, students would write longer essays (i.e., the number of words and sentences used) than those of the control condition.

H2 If ChatGPT-driven error detection exercises enhanced students' attention to their writing, the exercises would enhance the quality of the essays produced by students compared to those of the control condition. Aspects of writing affected would be the use of low-frequency (rare) and more abstract words, as well as the use of complex syntactic structures and consideration of text cohesion (quality measures).

Method

Sample and Sampling

Participants included 213 freshmen enrolled in one of eight sections of a communication course devoted to EFL academic writing. Students were freshmen who were native speakers of Arabic and foreign-language learners of English. Participants ranged in age from 18 to 25 years. To enroll in the course, students had to obtain at least a 6.0 total score and a 5.5 writing score (range: 0-9) in the International English Language Testing System (IELTS). Thus, the selected participants included EFL learners who were classified as ranging from modest to competent users of the English language. The course aimed to teach freshmen how to write in academic English by offering practice leading to compositions in four genera that are clear, concise, and semantically, syntactically, and structurally accurate.

Prior to beginning this study, participants were given a three-weeks period of class focused on the form and structure of the three primary sections of a standard five-paragraph essay in English (the introduction paragraph, body paragraphs, and the conclusion paragraph) as well explicit instruction on morphosyntactic rules that differ between writing in English and MSA. In the fourth week of the semester, four sections of this course received ChatGPT error-detection exercises (treatment condition: $n = 101$), and four sections served as the control

condition ($n = 112$). To ensure that information about the ChatGPT error-detection exercises did not spread to the control condition, two consecutive semesters were selected. The four sections assigned to the control condition were situated in the first semester and the four sections assigned to the treatment condition were situated in the ensuing semester. The course was taught by the same instructor with 17 years of university-level teaching experience. The instructor was bilingual in English and Arabic and had been exposed to both languages since birth. Institutional records suggested that the student samples in these two semesters were demographically similar, including the number of hours in which they were enrolled [$F(1, 211) < 2.29, ns$]. The sample included only students who provided informed consent and completed all phases of the study as described below. Excluded from the sample were 29 students (11.65%) who did not complete the assignment or whose output was judged by SafeAssign as being more than 15% similar to other sources, including institutional databases, global databases, and the Internet. If content that was suspected to potentially be AI generated was found in more than 40% of students' essays, their submission would also receive a score of 0 unless the student was able to provide evidence that the work submitted was in fact their own writing. This percentage was selected due to the high instances of false identification of AI generated content among many AI detection programs (Sadasivian et al., 2023).

Materials and Procedure

The error-detection exercises used in all class sections included in this study were based on the premise that one key aspect of writing practice is helping students identify and correct errors in written communications. These exercises will in turn assist students in avoiding such errors in their ensuing writing. Such errors may include grammatical structure, meaning, and proper essay structure and form. The ChatGPT class exercises began with an instructor-generated prompt for ChatGPT version 3.0 to write a descriptive essay in the standard five-paragraph essay format. The prompt used was "Write a five-paragraph descriptive essay on haloumi cheese. Include an introduction, three body paragraphs, and a conclusion." Students were then given 15 minutes to read the output and identify errors. Following this, a class discussion ensued in which students discussed how to best correct the problems identified. The instructor then alerted students to further errors which had not yet been discussed and assisted the students in determining how they should best be corrected. Errors examined primarily included grammatical and semantic mistakes, errors in lexical cohesion, errors in the connectivity between consecutive paragraphs, and errors in the structure and form of the output produced. The particular limitations of ChatGPT as a "writer" were also highlighted. Conversely, students' agency in creating the content of their own writing was heavily emphasized. In the control condition, students examined text generated by the instructor with a variety of errors, including grammatical and semantic mistakes, errors in lexical cohesion, errors in the connectivity between consecutive paragraphs, and errors in the structure and form of the essay. As per the ChatGPT condition, through students' independent work, class discussion, and the assistance and guidance of the instructor, errors were identified, corrections were made, and attention was directed by the instructor to additional errors that had not been identified by students. Although comparisons could not be made between AI generated output and students' agency as writers in the control condition, students were praised for their abilities to identify these errors and were reminded of their agency in producing well-written compositions as EFL learners.

Beginning in the class immediately following this exercise in error analysis, after giving informed consent, participants wrote a descriptive essay on a topic of their choosing using the standard five-paragraphs essay format. They were directly informed that their work would be checked for plagiarism through SafeAssign as well as for AI generated content through an AI detection program. If their writing was found to be more than 15% similar to other sources, including institutional databases, global databases, and the Internet, it would be returned to them with a score of 0. If content that was suspected to potentially be AI generation was found in more than 40% of students' essays, their submission would also receive a score of 0 unless the student was able to provide evidence that the work submitted was in fact their own writing. This percentage was selected due to the high instances of false identification of AI generated content among many AI detection programs (Sadasivian et al., 2023).

Data Analyses

The descriptive essay written by each of the 213 students was submitted to TextEvaluator® software (Chen & Sheehan, 2015; Sheehan et al., 2014) developed by the Educational Testing Services (ETS). This software calculated a set of indices that measured variables relating to both the quantity and the quality of these written products. These measures were submitted to one-way Analysis of Variance (ANOVA). Condition served as the between-subjects factor (the control group and the group taught using ChatGPT).

Quantity measures included a count of the number of words and sentences in an essay, as well as the mean number of words per sentence. Quality measures were organized into those at the word level, and those at the sentence level. All scores ranged from 1 to 100. At the word level, quality measures included a word unfamiliarity tally, which reflected the extent to which the writer used low-frequency words, and a word concreteness tally, which reflected the writer's use of concrete words. A low score for unfamiliar words and a high score for concreteness indicated low-quality text. Word unfamiliarity was based on two corpora. One of these consisted of 400 million words developed by ETS, and the other consisted of 17 million words developed by Zeno et al. (1995). Concreteness ratings used a method developed by Coltheart (1981). These were used to compute an index of concreteness (i.e., the property of a word whose meaning can be experienced through one's senses or actions). Words that refer to concrete concepts have a behavioral advantage, which allows them to be cognitively processed more quickly and accurately than abstract concepts (Connell & Lynott, 2012).

At the sentence level, quality measures included a syntactic complexity score and a lexical cohesion score, all of which ranged from 1 to 100. The syntactic complexity score tallied a series of indices, such as the mean length of sentences, the mean number of modifiers per noun phrase, the mean number of dependent clauses per sentence, and a measure of sentence depth. The score reflected the memory load imposed by sentences with varying syntactic structures (Yngve, 1960). The lexical cohesion score indicated the extent to which a textual product provides a coherent message rather than an array of unrelated sentences. It also measured word repetition across contiguous sentences and the use of connectives. Thus, a low syntactic complexity score and a

high coherence score would indicate a text that is less complex and easy to read.

Results

Table 1 illustrates the mean of each quality and quantity measure along with the standard error of the mean. Students exposed to ChatGPT exercises wrote a greater number of sentences [$F(1, 211) = 5.26$, $MSE = 119.15$, $p = 0.023$, $partial\ eta^2 = 0.024$] but of shorter length [$F(1, 211) = 4.63$, $MSE = 78.24$, $p = 0.033$, $partial\ eta^2 = 0.021$] as compared to students assigned to the control condition. Students exposed to ChatGPT exercises also used more low-frequency words than students in the control condition. No other values reached significance [$F_s \leq 3.71$].

Table 1. Descriptive Statistics

Variables	Control Condition		ChatGPT Condition		Sign.
	<i>M</i>	<i>SEM</i>	<i>M</i>	<i>SEM</i>	
<i>Quantity Measures</i>					
No. of words	466.464	14.691	491.911	15.470	
No. of sentences	25.813	1.031	29.248	1.086	*
No. words per sentence	20.207	.836	17.596	.880	*
<i>Quality Measures</i>					
Word Unfamiliarity	54.446	1.337	64.178	1.408	*
Word Concreteness	48.616	1.050	47.822	1.106	
Syntactic Complexity	61.250	1.045	58.327	1.101	
Lexical Cohesion	44.964	1.023	45.950	1.078	

Note: Significant group differences ($p < .05$) are marked with an asterisk. The values in bold characters signify greater values.

Discussion

This study examined the impact of student-centered error analysis of ChatGPT output on the writing of EFL students completing their first writing assignment in an introductory-level academic writing class. This exercise led EFL students to exhibit two advantageous features in their writing. First, they segmented their writing into shorter sentences as compared to students in the control group. This led to an increased number of sentences in students' writing, and thus to text that more closely approximated English writing conventions. Second, they adopted a greater number of low-frequency words, thereby improving the complexity (quality) of their written products. These findings, which were obtained through a between-subjects design and from a homogenous sample of native speakers of Arabic, suggest that exercises using ChatGPT output can assist EFL students in

produce writing that is more closely aligned with the conventions of English (e.g., shorter sentences in English).

Our findings parallel those of Athanassopoulos et al. (2023) who reported that the feedback of ChatGPT on students' who are foreign-language learners of German led them to write longer sentences, as is consistent with German syntactical structure. This study differs from ours in the homogeneity of participants as those in their study had a variety of linguistic backgrounds. Furthermore, the impact of ChatGPT was measured through a within-subjects design (i.e., assessment before and after the use of ChatGPT-based exercises). However, the observed changes in students' writing indicated that ChatGPT-based exercises encouraged students to write sentences that more closely approximated the conventions of students' foreign language (Cooper, 1976). Similar to our findings, in which students in the testing condition were found to use an increased amount of low-frequency words, Athanassopoulos et al. also reported an increase in students' use of "unique" words following exercises utilizing ChatGPT. Although the exercises used by Athanassopoulos et al. were different from ours, both improved foreign-language learners' attention to their writing, leading to the generation of more conceptually complex words and sentences that more closely aligned with the syntactic rules of their foreign language.

Conclusion

The results of the present study are promising as they indicate that ChatGPT can potentially serve as a pedagogical tool for improving students' attention to specific aspects of their writing, thereby offering a supportive learning environment (Yan, 2023). More extensive exercises with ChatGPT output may be able to impact key writing qualities of EFL learners, such as sentence complexity and coherence. Whether exposing learners to ChatGPT output (as per our study) is a more or less effective educational strategy than asking ChatGPT to improve student-produced text (as per Athanassopoulos et al., 2023) is a matter to be investigated. The specific limitations of our study are to be considered in future research. They include a homogenous sample of foreign-language learners with a writing competency above that of novices and a first language which might present challenges that differ from those faced by native speakers of Arabic. The breadth of the exercises and their duration of use are other limitations that are to be examined as independent variables in future research.

Recommendations

Technological innovations cannot be ignored or discarded by educators. Irrespective of the opinion that an educator might have regarding ChatGPT and other forms of LLM Functionality, such AI tools will be used by students. As such, educators must work to foster an environment in which the ethical uses of AI as tools that can enrich students' learning opportunities is emphasized. Educators must demonstrate how various forms of AI can be used to help students critically analyze their academic tasks and products, including their writing. In order to discourage the use of AI tools as shortcuts for unpopular academic activities (Kim et al., 2023), educators need to emphasize the advantages of students' adoption of a learning orientation rather than a grade orientation

approach to education (Pilotti et al., 2022).

Abstract: Rainfall is a climatic factor that plays a significant role in hydrology applications and water resources management, particularly in dealing with the flood and drought scenarios. Conventionally, rainfall data was measured by the rain gauge. Therefore, the malfunction of the rain gauge is the main challenge to ensure a completeness of collected rainfall data. Hence, it is important to have an appropriate method to fill in the missing data. The objective of this study is to investigate the performance of Inverse Distance Weighting (IDW) and Local Polynomial Interpolation (LPI) for monthly rainfall in Peninsular Malaysia. The interpolated values from both approaches were compared with the ground observations. The performance of the approaches was evaluated using a series of statistical analyses, consisting of R^2 , MAE and RMSE. Since it has a higher R^2 as well as lower MAE and RMSE, the LPI shows a better performance than that of the IDW.

Keywords: Inverse Distance Weighting; Local Polynomial Interpolation; Missing data; Spatial Interpolation

Introduction

In hydrological modelling, rainfall data is considered as one of the most important parameters. Since the climate change has become an unavoidable trend, it shows its significance especially for the prediction of extreme events such as floods and droughts. However, due to the geographical constraint, especially in the mountainous areas, it is often resulting in an inadequate network of rain gauge stations, and thereby hindering comprehensive data collection. As a consequence, the available data is insufficient to fully capture the highly variable rainfall patterns and their distribution across different areas. This has become a major challenge in both developing and underdeveloped countries (Ceron et al., 2021; De Silva et al., 2007).

In light of the issue, it is essential to establish reliable methods for rainfall estimation in regions where direct measurements are lacking. Leveraging the data from nearby meteorological stations is the common method to fill in the gaps of missing data. It is crucial while developing frameworks for extreme events prediction, as well as carrying out the flood risk assessments and drought studies in an ever-changing global climate (Ceron et al., 2021; De Silva et al., 2007; Keblouti et al., 2012).

Spatial interpolation techniques have shown its importance in rainfall forecasting. In the context of environmental management, continuous geographic data, also referred to as spatial continuous surfaces, holds immense importance for effective planning, risk assessment and decision making. However, obtaining such data is not always a straightforward procedure. It can be a challenging yet costly task, particularly in hilly or aquatic regions. Field surveys are typically conducted to collect the environmental data from specific point sources. Despite varying objectives, both engineers and scientists share the common need for accurate and precise geographic continuous data, albeit for different objectives. Engineers utilise it to make confident and effective choices over a wide area, while scientists apply it to draw valid and well-founded conclusions (Ahrens, 2006; Jamaludin et al., 2021; Tanjung et al., 2020).

The importance of spatial continuous data for environmental variables has grown significantly, driven by the increasing capabilities of geographic information systems (GIS) and modeling techniques in conserving natural resources and protecting biodiversity. Consequently, the need to infer attribute values at unsampled locations has led to the use of spatial interpolation from existing datasets, allowing the creation of continuous spatial data (Fabian, 2014; Hong et al., 2005). Moreover, spatial interpolation becomes essential when the surface displays varying degrees of resolution, cell density, or inclination (Lam, 1983; Liang et al., 2021). Additionally, in cases where a continuous region contains different types of information and the available data is insufficient to fully cover the region of interest, spatial interpolation becomes crucial (Burrough et al., 2015; Lam et al., 2015).

This study aims to investigate the performance of spatial interpolation approaches for the rainfall in monthly scale. By leveraging GIS and modeling approaches, the research aims to address the challenges posed by data gaps and variations in spatial characteristics. It is expected to achieve a better understanding and utilization of rainfall information for environmental management and decision-making.

Method

A number of 550 rain gauge stations in Peninsular Malaysia were identified for this study. The rainfall data of the respective stations were collected from Department of Irrigation and Drainage (DID) Malaysia. The study period of this study was 10 years, from year 2011 to year 2020. To ensure the consistency and reliability of the rainfall data before applying it for analysis, a thorough quality check process is required.

Due to the ability to provide a complete information on the rainfall pattern of a particular area, the rain gauge without missing data were considered acceptable to be applied in the analysis. However, further preprocessing procedure should be applied to the rain gauge stations with missing data. For this study, the rain gauge stations were divided into two groups based on extent of missing. The stations with less than 10% of missing data was sorted into a group, while the stations with more than 10% of missing data was labelled as another group. Burhanuddin et al. (2017) reported that the data with less than 10% of missing values is considered as good quality data. According to his findings, the rain gauge stations with more than 10% of missing data were excluded from the study due to their potential negative impact on the accuracy of the analysis.

Furthermore, Chow et al. (1988) proposed arithmetic procedure to repair the rainfall data. The arithmetic procedure was applied to estimate the missing observation for the rain gauge stations falling under category of less than 10% of data. By following the quality check procedures, it assists in ensuring the consistency and reliability of rainfall data for the study.

The arithmetic mean is a basic statistical technique that shows the simple average of a series of number. For the arithmetic mean calculation, it should start with the summation of all the numbers in a given dataset, and then divided by the total number of in the dataset. For the cases where the number are evenly distributed, the arithmetic mean is equivalent to the middlemost number, making it a useful representation of the central tendency of the data.

In addition, the arithmetic mean is suitable for the areas with uniform rainfall patterns. In such cases, every rain gauge station is given the same weight in the calculation, irrespective of their relative positions or other influencing factors. This approach helps to provide a fair representation of the overall precipitation in the region. The equation of arithmetic mean is shown in Eq. (1).

$$(1) \bar{p} = \frac{\sum_{i=1}^n p}{n}$$

where:

\bar{p} = combined mean for the rainfall station

n = number of the rainfall station

i = individual rainfall station

In this study, the arithmetic mean approach was applied to the rain gauge stations with less than 10% of missing data for data repairing purpose. The missing values were identified and filled using the rainfall data from the nearest stations that exhibited similar characteristics. To facilitate a better comparison and analysis, the daily rainfall data was aggregated into monthly scales. After implementing the aforementioned pre-processing procedures, a total of 515 stations were selected in the study.

In this study, the tasks, include maps creation, geographic data compilation and mapped information analyses, were performed via the ArcMap10.8 (a geographic information system (GIS) software). Spatial interpolation is a technique that allows the rainfall estimation at a location without recorded data by leveraging the known readings from nearby weather stations. It involves generating a surface representation from a set of sample points, which can then be utilised for assessment and modelling purposes. Basically, the common assumption while applying the interpolation methods is, the points in close proximity will have higher correlations and similarities compared to those further apart. Li and Heap (2014) carried out a study on commonly used spatial interpolation methods, investigating their suitability and application for different variables.

Two spatial interpolation methods, which are Inverse Distance Weighted (IDW) and Local Polynomial Interpolation (LPI), were assessed in this study. The methods were selected based on their relevance to the study objectives and their ability to produce reliable rainfall estimates across the study area. In terms of IDW, the degree of correlation between neighbouring points is directly related to the distance separating them. This relationship is defined by a distance reverse function for each location, which plays a crucial role in the interpolation process. In IDW, it is a challenging task to specify the nearby radius and determine the appropriate power of the distance reverse function. It depends on the setting of the sufficient number of sample site (where the ideal number is at least 14), and an appropriate degree of dispersion at the local scale level. In addition, the accuracy of the inverse distance interpolator is highly influenced by the value of the power parameter. Overall, the effectiveness of the IDW is highly dependent on the selection of parameters such as nearby radius, power parameter, and distribution of sample sites in the study area. The equation that involves in IDW is:

$$(2) Z_o = \frac{\sum_{i=1}^s Z_i \frac{1}{d_i^K}}{\sum_{i=1}^s \frac{1}{d_i^K}}$$

where:

Z_o = Predicted value at the unsampled site

Z_i = Observed value

D_i = The distance between the prediction and measured locations

S = The number of measured sampling points within the neighbourhood

K= Power parameter defining the rate of reduction of weights as distance increase

IDW can be considered as an accurate interpolator, where it helps to avoid the division by zero issues at sample points when $d_i = 0$. Also, through this method, the maximum and minimum values of the interpolated surface are constrained to the data points. Although playing a significant role in rapid interpolation, IDW exhibits some limitations, such as susceptibility to outliers and data clustering. In addition, the major drawback of this method is the lack of implicit evaluation for the estimation accuracy.

On the other hand, LPI is a powerful method used to fit the polynomials within the overlapping neighbourhoods. The selection of neighbourhoods are based on a search neighbourhood criterion. The criterion offers the flexibility in choosing the form, size and organization. Using the LPI, the short-range variations can be captured effectively, and hence making improve its suitability to produce surfaces which is highly sensitive to the local changes. In addition, LPI has the ability to adjust the width of the neighbourhood and introduces a power parameter through a slider. The power parameters impose an effect on the weight assigned to each sample point in the neighbourhood, depending on its distance from the interpolated point. By adjusting the parameters, LPI can provide the surface that account for more localised variations.

To assess the performance of the spatial interpolation methods, statistical analysis plays an essential role. Three statistical metrics were identified and applied in this study, which are determination (R^2), mean absolute error (MAE) and root mean square error (RMSE). The metrics collectively provide valuable insights into the model accuracy and reliability.

Results and Discussion

The spatial interpolation was carried out using IDW and LPI. The result was then compared with the ground observation data in the monthly scale. Figures 1 (a), (b), (c) and (d) show the comparison of monthly rainfall intensity in unit millimeter using IDW and LPI methods, presented in ArcGIS Map. In addition, the performance evaluation indexes, including R^2 , MAE and RMSE, to assess the IDW and LPI was tabulated in Table 1.

Referring to Table 1, the R^2 value for IDW approach range from 0.33 to 0.82 while the range is between 0.40 to 0.85 for LPI approach. In terms of methods comparison, LPI outperformed than that of IDW for every single month. From the perspective of monthly assessment, November and December show the highest R^2 for both methods, recorded at a value larger than 0.80. Meanwhile, March is the month with the lowest R^2 , showed a value of 0.33 and 0.40 for IDW and LPI respectively. Comparing the results in terms of MAE, the highest value is 2.01 and 1.87 for IDW and LPI respectively, in the month of December. Meanwhile, the lowest value is recorded at 0.80 in July for IDW, and 0.78 in March for LPI. A lower MAE is always favourable. Therefore, LPI is preferable than IDW, as its MAE is generally lower than that of IDW.

From the perspective of RMSE, the value ranges from 1.04 to 3.34 and 1.01 to 3.04 for IDW and LPI respectively. The lowest value is recorded in July while the highest value is recorded in December, for both approaches. In general, LPI shows a lower RMSE than IDW for every single month. After conducting the statistical analyses based on R^2 , MAE and RMSE for the application of IDW and LPI methods on the monthly basis assessment, it is noticed that the LPI exhibits a better performance than that of IDW, as it has a higher R^2 , as well as a smaller MAE and RMSE.

Table 13. Performance of IDW and LPI while comparing to ground based rainfall data in monthly basis

Month	IDW			LPI		
	R ²	MAE	RMSE	R ²	MAE	RMSE
Jan	0.65	1.44	2.19	0.70	1.31	2.01
Feb	0.38	0.87	1.33	0.46	0.80	1.23
Mar	0.33	0.82	1.13	0.40	0.78	1.04
Apr	0.46	1.16	1.60	0.52	1.09	1.48
May	0.38	1.11	1.58	0.40	1.10	1.53
Jun	0.45	0.81	1.07	0.45	0.80	1.07
Jul	0.46	0.80	1.04	0.49	0.79	1.01

Aug	0.46	0.90	1.27	0.47	0.89	1.25
Sept	0.70	0.91	1.25	0.70	0.89	1.24
Oct	0.61	0.93	1.29	0.62	0.93	1.26
Nov	0.82	1.37	1.91	0.83	1.31	1.82
Dec	0.81	2.01	3.34	0.85	1.87	3.04

Conclusion

Rainfall data maps were generated in a monthly scale. Through rigorous statistical analyses encompassing R^2 , MAE and RMSE, the efficacy of two different interpolation techniques, which are Inverse Distance Weighting (IDW) and Local Polynomial Interpolation (LPI), was evaluated. It indicates that the LPI approach outperforms the IDW approach. This conclusion was drawn because LPI has shown a lower MAE and RMSE value and a higher R^2 while comparing with the IDW.

Recommendations

In terms of future work recommendation, it is suggested that the study period can be expanded over a period of 10 to 15 years. This is to improve the data reliability and hence potentially mitigate the intrinsic performance errors associated with shorter duration. Additionally, it is advisable to explore other well-established methodologies, for example, triple collocation analysis. In summary, the future study could involve temporal expansion and methodological diversification, ensuring a more comprehensive and meticulous analysis.

Abstract: The need for humans to live in a community produced the state. The state and law are the subjects of philosophers of all times. From ancient times to the present, the state and law have come a long way. They started as undeveloped empirical concepts, always at the level of human societal relations. Over time, these relationships underwent tremendous change and expansion in form and content. With the development of the state, laws also developed, including the ever-widening field of social activity. To define the concept of the state and that of law, it is necessary to study their genesis, the concepts and interpretations of the philosophers of antiquity and those of our era. From the philosophical-political point of view, we can better highlight the evolution and configuration of the state, not only from the conceptual point of view, from the accepted rules and sanctions, but also from the philosophical, legal, economic, and moral points of view. This paper focuses on a detailed theoretical and practical analysis of the need and importance of educating people regarding the organization of the state, politics, and governance, as well as the role of the state in our time.

Keywords: Civic education, state development, politics and tolerance.

Introduction

A common feature of philosophers of all times is the visualization and presentation of their concepts and ideas about the state as a product of human society. Strengthening the system of democracy remains the duty of every citizen, state bodies, and educational structures for the education of youths. Since the basis of a state and the democratic character of a democratic society are determined by free and fair elections, it is a primary task of the state to educate citizens and other state and social structures regarding the democratic principles and norms associated with the conduct of these elections. Openly or indirectly, the presence of the state appears in almost every human activity of a country, from education, economic administration, social welfare, health, maintaining order within the country to territorial defense. The state plays a general and universal role: it shapes and controls

its organs; however, it does not modify or control but regulates, supervises, authorizes, or prohibits individuals or phenomena. Also, pronounced personal and private issues, such as marriage, divorce, abortion, religious worship, etc., cannot avoid the role and influence of the state as well as relations with the state. Politics is often understood as the rule of the state. Naturally, ideological debate and political parties tend to revolve around the function or role of the state: what should the state do, and what should be left to the individual and society? The nature of state power has today become one of the most fundamental issues of political analysis, where the debate about the state affects some of the most fundamental divisions of political theory.

All democratic changes are closely related to the presence, level, and aspirations of society. Sometimes, democratic changes go in the right direction, and at other times, they are realized for the benefit of a group of people or clans with certain interests. In both cases, they are presented to be for the benefit and in the name of the vital needs of the society itself. This is because true democracy originates from the people. Only the interests of the people justify all the socio-economic, political, and cultural upheavals of a society. The people are the true sovereigns who must hold the scepter of democracy in their hands because they are its source and producer. For this reason, the construction of an advanced society remains a permanent ideal for the construction of a developed democracy. In this study, we focused more on understanding the state and its functions and responsibilities. An understanding of the state is treated as an expression of the need that society feels for the existence of an organized power equipped with the appropriate means of coercion, protection, and support for the citizen as well as direction for the society. Political power, which is secured through the state, is not an end in itself but has been and remains the means to implement certain policies.

Methodology of the study

The study relies on some philosophers' ideas in various publications written by Albanian and foreign authors. It is an examination of notions with a broader meaning. In other words, it is an attempt to have a general look at the way of handling the state and state-forming elements by philosophers who have dealt with this topic. The paper aims to verify the hypothesis that the state, one of the most important stages of people's socialization, is also the ground where the subsequent arguments for the rights of human society are examined.

State and society

Building a democratic state is a product of citizen participation. While the essence of the rule of law is related to the protection of the rights of citizens and their freedom, it also constitutes the juridical-social guarantee of the state in the complex relations between state institutions and civil society, ordinary people, or those with outstanding intellectual merits. In the relationship between state institutions and the individual, despite common interests, sharp contradictions arise between them. In addition to the role of the regulator in an organized and modern society, the state simultaneously manifests limitations and even obstacles to the new and bold ideas of citizens and their elites with special interests and tendencies.

Machiavelli is one of the philosophers who analyzed and pointed out better than anyone else these hidden contradictions, which represent obstacles in the relationships that seek to build a new power with the old power and the people themselves. He pointed out the difficult circumstances that a new ruler has to face, as follows: *“The ruler in question is convinced that there is nothing more difficult to handle and more dangerous to rule than to become a ruler and try to introduce a new order. This is because when a new ruler comes, he has as enemies all those who have gained privileges from the old power, while those who expect to benefit from the new institutions will remain only lukewarm defenders. This insecurity of the lukewarm defenders comes from the little faith of the people to take the new propositions as true, as long as they do not see them realized and touch them with their hands.”* (Machiavelli, 2003, p. 10).

In this sense, the intellectual elites have a revolutionary character and seek qualitative changes, playing in society the role of an engine that seeks to increase the speed of society and the state machine. But with the state lacking flexibility, it has a tendency to prefer the status quo or a positional attitude. This is also due to the fact that the leaders of high state rank at any time and in any place issue rules and laws for themselves to enjoy privileges in relation to other layers of the population. Any change demanded by the intellectual elites and the discriminated working masses endangers their privileges. In this sense, the leaders of the state are on the opposite side of the barricade and the demands for change. They will seek to the end to use the power of state structures to limit and rein in the working masses and the intellectual elites. Not resolving these conflicts peacefully, at the right time and place, can lead to clashes or fierce matches between them. The election of people with high intellectual capacity into the leadership of the state would be a general good for both sides, which amounts to putting social developments on the two opposite sides of the barricade.

The problem of drafting and implementing laws has been the subject of the studies of the ancient Greek philosopher Aristotle, *“who interprets them as a product of the state and gives him the role of an arbitrator who, through rules and sanctions, must create this product. Law, according to Aristotle, is the tool that makes ethical norms efficient”*. (Aritotele, 2003, 83). Through laws, the state must create legal awareness in society. The state is treated as an efficient means of enabling people to achieve their goals as human beings. Aristotle connects the existence of the state with the mission of fulfilling the moral and intellectual goals of human life. In this regard, Montesquieu's views also present a special interest in laws, the state, and the people who lead it. According to him, *“laws constitute the necessary connection that derives from the nature of things, that is, that all beings have their own laws.”* (Montesquieu, 2000, p.17). Just as there are God's laws, the material world has its laws; the higher beings have their laws; the animals have their laws; so humans have their laws.

Examining the views of Aristotle and Montesquieu regarding the characteristics of state leaders, one cannot fail to notice their commonality: the need to lead the state as an intelligent being. Jean-Jacques Rousseau associates the leadership of a democratic society with individuals who know how to draft laws, as follows: *“He who drafts the law knows better than anyone else how it should be implemented. A good leader of the state should not be influenced by personal interests in the exercise of state affairs, and the misinterpretation of laws by the*

government is a lesser evil than the corruption of the legislator, which is a consequence of individual interests. In this case, the concept of the state is misinterpreted in its very essence, and any of its functions become impossible because the general will can no longer be that of proper governance.” (Rousseau, 2007, p.137). From Rousseau's concepts come the lessons of sound morality that should characterize the heads of state institutions. By correctly applying the laws themselves, their drafters give their own example to the law, which is the sovereign before whom all members of society, from the top of the state pyramid to the base, are equal.

Even John Locke was an irreconcilable enemy of law-breaking policymakers. He states: *"In a government where the legislative bodies are permanent or in the hands of a ruler, there is a danger that they will think of themselves as distant from the common people and thus increase their wealth and power by taking advantage of the people that they consider more appropriate."* (Lock, 2005, p.78). Although the teachings of these philosophers of the European Renaissance refer to the conditions in which they lived, their foresight is still valid today, especially in the circumstances that democracy is going through in our country (Albania). Concerning power, John Locke says: *"People must agree to have laws, but the laws must be in synchrony with the rights that man possesses in his core."* (Lock, 2005, p.81). John Locke formulates law as follows: *"... as a guide, as a phenomenon that serves the general good of people through rules and norms. The essence of the law should be evident based on the protection and development of freedom. Under the influence of laws, people's freedom rests on the existence of a stable rule, while breaking this rule makes people lose their freedom because breaking the legislation makes them subject to sanctions and consequently lose their freedom."* (Lock, 2005, p.79)

Machiavelli's thoughts on law and the state also provide special interest. In his work titled "The Prince," he reveals his interpretation of the state and, especially, the person who leads it. According to him, the *"prince must possess some special skills: intelligence, foresight, the ability to react to disasters, to choose the best, and the ability to be a fox or a lion, as the case may be, considering the latter as the main virtue of a powerful one"*. (Machiavelli, 2003, p. 85). Machiavelli also does not exclude cases where an ordinary man, as he calls him, who does not meet certain criteria becomes a prince and ruler. He called such people incompetent because they are neither genius nor brave, and logically, they don't even know how to command when they come to power. Thus, they remain dependent on the will of those who have entrusted them with power. Such a situation is observed even today, on a larger and more general scale. Today, the intellect or intelligence of the leader is not primary, but the implementation of the orders of the one who placed him in that position. The relationship between the law and the state, as well as their functions, supports the principles of the rule of law.

The rule of law finds its support in the individual, while the individual finds in the rule of law the spaces of freedom. The democratic state rises to the mission of respecting the law as well as protecting and respecting human rights. The notion of human rights is understood in relation to institutions and the guarantee of human rights by the relevant institutions. In this sense, the term right should be seen as a natural continuity that man possesses from biological birth to his integration into democratic society. Thomas Aquinas, a thinker of the Middle Ages, sees the state as created by God with a function given by him. The main function of this state is to

ensure the general good of the people by maintaining peace and organizing the actions of citizens for a better life. So the state, with its function to achieve the common good, must also be the guarantor of achieving the well-being of the citizens.

Rousseau was a philosopher who dealt extensively with the relationship between the state and society. Analyzing the state's relationship with society, he asserts the superiority of the state over society, but not to the extent of enslaving the people to its orders. As an essential condition for the functioning of the state-society relationship, Rusoi emphasizes the respect of human rights by state institutions as well as the functioning of institutions respecting and implementing the law. Rousseau points out that a democratic state cannot coexist with people who would not support their government. A citizen who does not contribute to the proper functioning of his state cannot claim to have a good government. An individual who corrupts state officials cannot claim to eradicate corruption. An individual who violates the rights of another individual and extends his freedom by limiting the freedom of another individual cannot claim the normal functioning of the so-called rule of law.

The role of citizen and society

The essence of a democratic state depends on the establishment of a mutual relationship between the citizens and the state itself. This relationship, on the one hand, is characterized by the democratic spirit and climate, which lead to society's need for the establishment of democratic norms and laws, which are best fulfilled by a legal state that represents and fulfills the interests of the people. On the other hand, the relationship between citizens and the state can be identified with the right of the state to establish norms and laws and the obligation of the citizens themselves to respect these norms. In a state, true democracy rules only when the laws that govern it are drawn up by its citizens.

In light of the fact that the community of individuals constitutes society itself, we must see the indissoluble unity and mutual dependence between the individual and society. The distortion of this relationship in different areas of a person's life, especially in the economic area and the distribution of material goods, leads to the creation of irreparable hostilities between both parties. The drafters of laws are generally people mandated by the people, but in many cases, they are driven by the idea of getting rich quickly and the privileges they want to secure for themselves. Thus, it is noted that, no matter how many groundless contradictions the biggest political parties in Albania show among themselves regarding reforms in the legal or legislative field, when it comes to defining these privileges, they have always found a common language by providing themselves and their families with conditions that would be the envy of even the most developed countries in the world. Albanian democracy suffers from violations and distortions of relations between ordinary people and their chosen ones in all kinds of powers.

Even the ancient philosophers underlined the phenomenon that the individual can destroy order and the state, just as the state can harm the individual. Plato points out that *"The best way to know an honest man is to analyze*

the nature of his state, and it is necessary to demand that everyone say justice in that state." (Plato, 1999, p. 45). The history of the birth and development of the state faithfully reflects the historical eras that man had to go through in human society. Plato pointed out that *"The state is a natural institution because it reflects the structure of human nature. The origin of the state is a reflection of the economic needs of man. After a state begins to exist, because an individual is not self-sufficient, we all have many needs."* (Plato, 1999, p. 68).

An interesting point of view is presented by Aristotle's world view on the facts and circumstances of the conditioning of the universe by the individual. The view expresses the inseparable relationship between the state and the individual. Just as a building stands on a strong foundation, the democracy of society is at a satisfactory level when it guarantees the rights and freedoms of the individual.

In fact, the state of the state-individual relationship is one of the most convincing and objective ways to prove and show the degree of democracy in a country. Consequently, the happiest, most self-realized people with a higher level of well-being are those who live in the most developed and democratic countries. Aristotle points out the connection between the individual and the state when he states that *"He who is not able to live in a state, or he who does not need because he is self-sufficient, must be either a beast or a god"*. (Aristotele, 2003, p.12) From this conclusion, the function of the state to create material goods and human happiness at the highest level is self-evident.

The state is sovereign and exercises absolute and unlimited power, so it stands above all other institutions, associations, or groups in society. Based on this feature of the state, Thomas Hobbes portrayed the state with absolute and unlimited power as *"a great 'Leviathan', a gigantic monster, commonly described as a sea creature."* (Heywood, 2002, p. 109) Unlike the private institutions of civil society, state institutions are public. Government apparatus is considered public, while autonomous bodies are considered private, such as businesses, unions, clubs, families, etc.

Public organizations are responsible for making and implementing collective decisions, while private organizations or institutions, such as businesses, fulfill their personal interests. Habermas did not believe that the institutions of a state are reasonable, but that they should be forced by the public sphere to be so. The opposite point of view to that of Hobbes regarding the position of the institutions of the state is expressed by John Rawls, who highlights that *"The institutions of the state, if properly understood from the philosophical point of view, are themselves rational."* (Rawls, 2000, p. 28)

Conclusions

In a democratic society, special priority is given to the education of citizens for the implementation of laws and rules. Such education should prevail in the consciousness of every citizen. The goal of this education begins with the recognition and implementation of the principles of the democratic state by citizens and society. These

principles are embodied in them in the form of legal consciousness and institutional consciousness. Moreover, every person should know both his rights and his duties towards the state and society, as well as what rights and duties the state institutions have towards him.

The democratic system creates great opportunities for the direct participation of citizens in the construction of a legal state, which means not only the drafting of laws but also their consequent implementation. Philosophical heritage teaches us that whatever form a government may take, it must be based on the concepts of justice and equality. In the democratic system, the essence of the state is that the force of law rules all its citizens, and thanks to these laws, they enjoy guaranteed rights. Only the members of a society equal before the law can build a prosperous democracy and society to shape their future.

Abstract: One of the essential skills that pharmacy students should develop is the ability to evaluate randomized controlled trials (RCTs) to assess the clinical efficacy and safety of pharmaceuticals. This study aimed to enhance the RCT evaluation skills of fifth-year pharmacy students. It employed the CASP checklist application to assess clinical studies on new drugs. The teaching approach combined theory and hands-on CASP checklist application for RCT assessment, comprising four stages: 1) introducing principles and providing example RCT evaluations, 2) assigning individual students the RCT analysis tasks, 3) instructor feedback, and 4) collaborative group assignments for new drug evaluations using CASP. Student performance was evaluated with a rubric. The study identified notable improvements in students' RCT evaluating skills, with an initial average score of $71.11 \pm 5.57\%$. While room for improvement in understanding, summarizing, and clear expression of opinions exist, incorporating instructors' feedback led to a significant improvement ($96.11 \pm 8.32\%$) in individual assignments. Group scores for new drug evaluations averaged over 80% ($86.61 \pm 6.93\%$). These findings demonstrate that students developed RCT evaluation skills and enhanced understanding, critical thinking, and problem-solving abilities. In conclusion, this teaching approach effectively improved students' RCT evaluation skills through the CASP checklist application, fostering their proficiency and understanding. This equips students with essential tools for future pharmacy practice and professional development.

Keywords: CASP checklists, randomized controlled trial, pharmacy student, critical thinking

Checklist. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 353-359), Antalya, Türkiye. ISTES.

Introduction

In today's era of evidence-based medicine, pharmacists play a pivotal role in evaluating a plethora of documents and data concerning medications (Cameron et al., 2022; Faria et al., 2021; Patwardhan et al., 2012). The development of skills in reading and critically assessing research works stands as a cornerstone for lifelong learning (Khamis et al., 2020). As pharmacists navigate through various documents, they must sift through multiple information sources to ensure credibility, allowing for tailored recommendations adaptable to individual patient needs. Given the diverse array of patient variables, comorbidities, and complications, each treatment decision must be carefully considered to achieve the optimal outcome. Consequently, the ability to assess the reliability of research documents becomes imperative, empowering pharmacists to review, adapt, and apply information effectively for patient care.

At the forefront of evaluating medication efficacy lies the gold standard of Randomized Controlled Trials (RCTs). These trials not only serve as a benchmark for assessing medication properties but also aid pharmacists in evaluating the validity and quality of research. However, the process extends beyond mere efficacy assessment. Pharmacists must consider various factors such as drug pricing, adherence to treatment regimens, frequency of administration, side effects, drug reactions, and patient acceptance. Thus, the assessment of research reliability emerges as a pivotal determinant in guiding clinical decisions and utilizing data effectively for patient care (Styles & Torgerson, 2018; Tsourounis, 2000).

To aid in this assessment, the CASP checklist has emerged as a widely utilized tool (Critical Appraisal Skills Programme, 2021). Tailored specifically for evaluating the reliability of research works, the CASP Randomised Controlled Trial checklist offers a structured approach encompassing various facets of research evaluation. From assessing the conformity of research works with RCT standards (Questions 1-3) to evaluating internal consistency (Questions 4-6), outcomes (Questions 7-8), and the clinical relevance and applicability of experimental methods for local settings (Questions 9-11). The CASP checklist provides a comprehensive framework for analysis. However, it's important to note that CASP checklists do not prescribe scores for individual questions; rather, they serve as guidelines for assessing the reliability and suitability of research works for practical application, emphasizing the importance of evaluator discretion.

Despite the availability of such tools and theoretical teaching methods, students often encounter challenges in translating their knowledge into practice (Saifan et al., 2021; Straus et al., 2013). While they may learn the theoretical aspects of evaluating RCTs and research methodologies, applying this knowledge to real-world scenarios remains a hurdle. This gap becomes evident when students embark on internships and realize a deficiency in systematically reading and analyzing research. Hence, this study aims to bridge this gap by

developing teaching methodologies focused on enhancing students' skills in evaluating RCTs using the CASP checklist. Additionally, it seeks to cultivate critical thinking skills essential for pharmacists in continuously analyzing disease and medication-related issues, ultimately aiding in optimal patient treatment. Thus, pharmaceutical students must be equipped not only with the ability to evaluate clinical study data but also with the critical thinking skills necessary to interpret and apply this information effectively in real-world contexts.

Method

This study engaged fifth-year students enrolled in the "565 313 New Drugs" course during the 2022 academic year, totaling 18 participants. Ethical oversight was ensured through review by the Human Research Ethics Committee under certification number COE 65.0204-023.

To cultivate skills in evaluating RCTs, the teaching approach relied on the Critical Appraisal Skills Program (CASP). Specifically, the CASP Randomized Controlled Trial Standard Checklist, comprising 11 questions, served as a tool to gauge the reliability and utilization of clinical trial data for assessing the efficacy and safety of medications. This checklist was downloaded from <https://casp-uk.net/checklists/casp-rct-randomised-controlled-trial-checklist.pdf>.

The teaching methodology encompassed 3 phases

1) Preparation Phase: This phase involves preparing the groundwork, setting objectives and outcomes, and planning the instructional approach among teaching teams. Scoring criteria (rubric scores) as per Table 1 was devised. Lesson plans were then structured to align with the identified learning objectives.

2) Instructional Phase: This phase focuses on the active teaching and learning process, where students engage with course materials and participate in guided activities.

Step 1: Students grasped the intricacies of the teaching format for medication assessment and outcome evaluation through lectures, practical examples of medication assessment, CASP utilization, and hands-on practice in medication assessment within the classroom setting.

Step 2: Individual RCT assessment tasks were assigned, prompting students to independently delve into the content, conduct research, and employ the CASP tool to assess the reliability of medication-related research.

Step 3: The faculty provided constructive feedback to each of the students on their work, suggesting enhancements to refine medication assessment skills and research reliability evaluation. Students subsequently re-evaluated individual medication assignments (with new clinical studies) using CASP.

Step 4: Students collaborated in small teams to present new medications of interest and their assessments. Discussions ensued within these groups, culminating in presentations tailored to meet predefined learning objectives. Faculty offered feedback and evaluated group endeavors.

3) Evaluation Phase: This phase encompasses the evaluation of student learning outcomes, provision of

feedback, and contemplation of the effectiveness of instructional methodologies employed. Firstly, teaching teams conducted assessments to appraise students' proficiency in RCT assessment, employing rubric scores to evaluate both individual and group performances. Secondly, students engaged in self-assessment exercises aimed at evaluating their comprehension and aptitude in RCT evaluation, both preceding and following instructional sessions. Lastly, students were invited to assess their satisfaction levels regarding the adopted teaching format.

Data Analysis

Descriptive statistics, including percentages, means, and standard deviations (SD), were employed to present the findings. Student's t-tests were utilized to discern differences in assessment scores before and after faculty feedback.

Table 1. Rubric and Score Criteria for Assessing Pharmacy Student's RCT Evaluation Skills

Evaluation Criteria	Excellent 4 points	Good 3 points	Fair 2 points	Improvement needed 1 points
1. Is the basic study design valid for a RCT?	Evaluating the research design, research inquiries, population selection, and appropriate bias mitigation measures accurately and clearly.	Assessing pertinent data but not comprehensively covering all aspects.	Evaluating incomplete data, resulting in inadequate research appraisal.	Inadequate data compilation leading to an inappropriate assessment of the research.
2. Was the study methodologically sound?	Identifying and analyzing the research methodologies comprehensively and accurately, encompassing all pertinent issues.	Conducting analyses and evaluations correctly, albeit not addressing all aspects.	Erroneous analyses and evaluations.	Absence of analyses and evaluations.
3. What are the results?	Providing a comprehensive and accurate account of the research	Presenting research findings, albeit with unclear implications.	Offering research findings with incomplete implications and	Failing to present research findings and their

	findings and their implications, with completeness and precision.		lacking procedural steps.	implications.
4. Will the results help locally?	- Deciding on the applicability of research outcomes and data beyond the study population. - Demonstrating a clear grasp of the research principles or theories, with lucid summarization and understanding.	Showing an understanding of research principles or theories and data, with the ability to expound on their practical application.	Displaying an understanding of research principles or theories and data, albeit only partially addressing their underlying practical applications.	- Revealing a deficiency in understanding research principles or theories and data. - Absence of an application summary.
5. conclusion	Exhibiting a clear understanding, with the capacity to succinctly summarize and articulate opinions effectively, with practical applicability.	Capable of summarizing and articulating opinions partially, with some ability to elucidate applicability.	Demonstrating partial summarization and articulation of opinions, but lacking the ability to explicate applicability.	Inability to summarize and articulate opinions, coupled with an inability to explicate applicability.

Results

Development of RCT Evaluation Skills

Following theoretical lectures, students were tasked with individual assignments to study and evaluate RCT research papers. They independently delved into the content, aligning with the learning objectives, conducted research, and utilized the CASP tool to gauge the reliability of medication-related research. Subsequently, instructors provided feedback on students' evaluations of RCT papers, offering insights for enhancing medication evaluations and the credibility of research on new drugs. This feedback aimed to improve both individual assignments in subsequent sessions and group assignments. The evaluation scores of RCT evaluation skills, assessed using the rubric, are detailed in Table 2.

Following the lecture period, the average score for individual assignments was $71.11 \pm 5.57\%$. Students

identified clarity in summarizing and expressing opinions, as well as practical application, as key areas for improvement. Post-feedback and guidance from instructors, including insights for improvement, students' performance in evaluating new medication papers significantly improved. The average score surged to $96.11 \pm 8.32\%$, a statistically significant improvement. Notably, students effectively achieved the learning objectives in evaluating medications using the CASP tool.

Table 2. RCT Evaluation Skill Assessment Scores

	Assignment Scores	
	Pre-Feedback	Post-Feedback
Maximum (%)	80	100
Minimum (%)	55	75
Average \pm SD	$71.11 \pm 5.57^*$	$96.11 \pm 8.32^*$

*p-value < 0.0001

Upon refining skills through individual assignments, students undertook group tasks to comprehensively study and report on new medications, mirroring tasks performed as pharmacists in medication evaluations. The evaluation scores by instructors are depicted in Table 3.

Table 3. Group Assignment Scores in RCT Evaluation

Maximum	100
Minimum	76.60
Average \pm SD	86.61 ± 6.93

Students attained a maximum score of 100%, with an average of $86.61 \pm 6.93\%$. Evaluation of these new medication assignments revealed students' development of professional pharmaceutical evaluation skills in medication assessment post the course's teaching and learning process.

Students' Self-Assessment

Self-Assessment Regarding Knowledge and Skills in RCT Evaluation

Before the course's conclusion, students self-assessed their knowledge for RCT evaluation using the CASP. Table 4 outlines the results. Pre-course, most students exhibited limited knowledge in RCT evaluation, averaging $36.67 \pm 10.29\%$. Post-course, self-assessment using the CASP saw a remarkable improvement, averaging $80.00 \pm 9.70\%$. This denotes a significant enhancement in students' self-perceived knowledge for RCT evaluation.

Table 4. Self-Assessment of Knowledge for RCT Evaluation

	Students' Self-Assessment	
	Pre-Course	Post-Course
Average \pm SD	36.67 \pm 10.29*	80.00 \pm 9.70*

*p-value < 0.0001

Table 5. Self-Assessment Regarding Knowledge and Skills for RCT Evaluation

	Very High % (N)	High % (N)	Moderate % (N)	Low % (N)	Very Low % (N)
Please rate your level of knowledge and understanding regarding RCT evaluation using CASP11 after the instructional sessions.	38.89% (7)	61.11% (11)	0% (0)	0% (0)	0% (0)
Please rate your level of skill in RCT evaluation using CASP11 after the instructional sessions.	44.44% (8)	44.44% (8)	11.11% (2)	0% (0)	0% (0)
Please rate your improvement in critical thinking and problem-solving skills after the instructional sessions for RCT evaluation using CASP11.	27.78% (5)	72.22% (13)	0% (0)	0% (0)	0% (0)
Please rate your ability to apply the acquired knowledge in your future studies and work after the instructional sessions for RCT evaluation using CASP11.	50.00% (9)	50.00% (9)	0% (0)	0% (0)	0% (0)
Overall benefits derived from the instructional sessions for RCT evaluation using CASP11	55.56% (10)	44.44% (8)	0% (0)	0% (0)	0% (0)

Table 5 reflects the students' self-assessment following the completion of the teaching and learning process. It illustrates that all students rated their comprehension and proficiency in RCT evaluation using CASP11 at high to the highest levels, reaching 88.88%. Their assessment indicates a significant enhancement in critical thinking and problem-solving skills, collectively totaling 100%. Moreover, they acknowledged the holistic benefits derived from the educational experience, including the practical application of acquired knowledge in their career.

Students' Satisfaction with Teaching Format

Students' satisfaction towards teaching management and skill development in pharmaceutical evaluation was gauged through a questionnaire, with results summarized in Table 6.

Table 6. Students' Satisfaction towards Teaching Format

	Very satisfied % (N)	Satisfied % (N)	Neutral % (N)	Dissatisfied % (N)	Very dissatisfied % (N)
Satisfaction with	66.67%	33.33%	0%	0%	0%

	Very satisfied % (N)	Satisfied % (N)	Neutral % (N)	Dissatisfied % (N)	Very dissatisfied % (N)
Instructors	(12)	(6)	(0)	(0)	(0)
Satisfaction with Feedback Process	72.22% (13)	22.22% (4)	5.56% (1)	0% (0)	0% (0)
Satisfaction with Assignment Workload	61.11% (11)	22.22% (4)	16.67% (3)	0% (0)	0% (0)
Overall Satisfaction with Teaching Format	72.22% (13)	27.78% (5)	0% (0)	0% (0)	0% (0)

Students expressed highest satisfaction with the overall teaching format, particularly praising the feedback process at 72.22%. This was followed by satisfaction with the instructor team, and assignment quantity at 66.67% and 61.11% respectively. Additional feedback provided by students included

- Assignments were deemed appropriate.
- The course was enjoyable, with instructors lauded for their teaching prowess, knowledge provision, and adept analysis and selection of medications.

Discussion

The objective of this study was to devise a teaching approach where instructors assumed the role of coaches to enrich the professional aptitude of pharmacy students in evaluating randomized controlled trials (RCTs) of novel medications, utilizing the Critical Appraisal Skills Programme (CASP) checklist as a tool for self-directed learning. The outcomes of the study were in line with the instructional goals established by the educators. Following evaluation by instructors, students exhibited heightened proficiency in RCT assessment, showcasing enhanced knowledge, comprehension, and analytical abilities. Self-assessment by students indicated further enhancements in RCT evaluation, critical thinking skills, problem-solving capabilities, and the aptitude to apply acquired knowledge in their prospective careers. Additionally, students expressed contentment with the instructional format, providing feedback on the suitability of the timeframe allocated for RCT evaluation using CASP, typically within 7-14 days.

Critical thinking encompasses several facets: 1) attitude, which involves the capacity for strategic planning, adaptability, persistence, self-correction, mindfulness, and the adept utilization of information; 2) knowledge, inclusive of foundational principles and those acquired through the learning process to navigate towards solutions; and 3) thinking skills vital for problem-solving and clinical reasoning, culminating in informed clinical decision-making (Alfaro-LeFevre, 2019).

Impediments to critical thinking encompass: 1) perception, where students harbor the belief that they possess the

acumen to resolve issues and may fail to grasp the importance of acquiring this skill; instructors are thus encouraged to guide students towards assimilating information, diverse knowledge, and honing thinking skills to enrich critical thinking; 2) metacognitive skills, where students arrive at conclusions without undergoing additional evidence assessment; and 3) fixed mindset, whereby students exude confidence in their abilities and intelligence, often perceiving critical thinking as an innate skill that requires no further development. However, critical thinking necessitates deliberate training and effort (Cone et al., 2013; Persky et al., 2019; Silberman et al., 2021). After instructional sessions, all students reported improvements in their critical thinking and problem-solving skills, as evidenced in Table 5. This evidence indicates that the teaching methodology employed in this study, utilizing CASP as a tool, effectively enhances critical thinking among pharmacy students.

Furthermore, skill development necessitates repeated practice as well as feedback from instructors. Evaluation scores using a rubric scorecard revealed that students primarily needed improvement in comprehending, summarizing, and articulating clear viewpoints that could be practically applied. From the study results in Table 2, it was found that after receiving feedback, students significantly improved their assignment scores. Additionally, according to Table 6, students also expressed the highest level of satisfaction with feedback. Subsequent to receiving feedback on individual assignments and discussing improvement strategies, students showed observable advancements in their ability to work independently on new assignments. Moreover, group tasks involving the presentation of novel drug information received assessment scores exceeding 80%, underscoring the importance of effective and efficient feedback for instructors.

The development of teaching methodologies to augment knowledge and skills encompasses diverse strategies. In this study, we employed the following approaches: 1) fostering comprehension through clear articulation of learning objectives and instructors providing foundational knowledge on drug evaluation, alongside introducing the CASP tool for assessment, 2) practical application and analysis involved students identifying key issues, accessing problem-solving strategies, and engaging in self-analysis through structured exercises outlined by instructors, 3) essential feedback was provided through assessment scores using rubric scores, facilitating reflections on student work, exploration of future assignment ideas, and offering guidance for subsequent tasks, 4) encouraging lifelong learning through comprehensive hands-on practice, where students undertook self-assigned tasks post-feedback, followed by collaborative teamwork in full-scale drug assessments mirroring real-world pharmacy evaluation scenarios. Instructors evaluated student work, provided feedback, and offered suggestions and guidance for future tasks. Students self-assessed and applied knowledge and experiences gained from the teaching process for ongoing advancement. This teaching methodology is aligned with various research endeavors aimed at designing teaching methodologies to enhance students' learning skills (Askew, 2000; Patphol, 2018; Valdez et al., 2014).

This study was conducted with a small number of students, and the feedback process proved to be effective, leading to positive learning outcomes. Moreover, students were at a high academic level, displaying responsibility in their work. The workload assigned was appropriate, without being excessive. If this teaching methodology were to be applied in larger classrooms, instructors would need to consider suitable feedback

mechanisms tailored to the class size.

Conclusion

The development of teaching methodologies to enhance knowledge and skills involves various strategies. In this study, we employed approaches such as fostering comprehension through clear articulation of learning objectives, providing foundational knowledge on drug evaluation, introducing the CASP tool for assessment, practical application, and analysis, essential feedback using rubric scores, and encouraging lifelong learning through comprehensive hands-on practice. This teaching approach effectively improved students' RCT evaluation skills through the CASP checklist application, fostering their proficiency and understanding, which equips them with essential tools for future pharmacy practice and professional development.

Teaching With Purpose: Indonesian Educators' Response to The Challenges of Society 5.0

Sri Nurhayati

IKIP Siliwangi, Indonesia,  <https://orcid.org/0000-0002-2273-9143>

Safuri Musa

Singaperbangsa University, Indonesia,  <https://orcid.org/0000-0001-8461-9780>

Abstract: The central aim of this research was to uncover how educators in Indonesia live out their life's calling, striving to create a widespread positive impact not only for their students but also for the surrounding environment. Adopting a qualitative case study approach, data was collected through in-depth interviews with 20 educators from all over Indonesia. These interviews were systematically transcribed, coded, and analyzed to draw out thematic insights, providing a lens into the educators' experiences, challenges, and triumphs in the backdrop of the evolving landscape of Society 5.0. This super-smart society, characterized by the integration of technologies such as AI and IoT into daily life, necessitates a fresh educational perspective. The narratives from the educators highlighted their unwavering commitment to effecting transformation, showcasing positive progress in their personal journeys, their students' lives, and their immediate communities. Amidst the technological tide of Society 5.0, the study underscores the indomitable spirit of educators in effecting change. Recommendations, rooted in the voices of these educators, are proposed for policymakers, educational stakeholders, and future research.

Keywords: Indonesian educators, Society 5.0, Transformational impact, Educational challenges, Life's calling.

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 360-372), Antalya, Turkiye. ISTES.

Introduction

Indonesia, with its vast geographical diversity and socio-economic variances, faces distinct challenges in embracing Society 5.0 within its educational system (Musa et al., 2022; Nurhayati et al., 2023; Nurhayati & Musa, 2020; Setiadi et al., 2023; Winarti et al., 2022). This period represents more than a technological shift; it is a comprehensive paradigm change. Indonesian educators find themselves navigating this new landscape, attempting to integrate advanced technologies into their teaching while maintaining cultural relevance and addressing local needs (Ghofur & Nurhayati, 2023a, 2023b; Iskandar et al., 2023; Marsegi et al., 2023; Nuraeni & Nurhayati, 2023; Nurhayati et al., 2023; Nurmalia et al., 2022; Octaviani et al., 2023; Sadiah et al., 2021;

Tiarawati et al., 2023). The concept of Society 5.0, originated in Japan, represents an advanced socio-economic vision where digital and physical spaces are integrated to create a human-centric society. This fusion, particularly relevant to the field of education, necessitates a paradigm shift towards technology-enhanced learning environments. In educational contexts, Society 5.0 underscores the importance of leveraging advanced technologies like artificial intelligence (AI), the Internet of Things (IoT), and big data to facilitate innovative teaching and learning processes. This review explores how these technological integrations are shaping educational methodologies globally and within Indonesia.

Globally, educational systems are undergoing transformative shifts due to the integration of cutting-edge technologies. Literature in this domain highlights the growing influence of AI and IoT in reshaping educational methodologies, steering them towards more personalized, adaptive, and student-centered learning experiences (Vongkulluksn et al., 2020). This pedagogical evolution favors collaborative, inquiry-based learning approaches, diverging from traditional, teacher-centered models. These advancements are not merely technological but also pedagogical, as they redefine the roles of educators and learners within the educational process. Turning to the Indonesian context, the education system is characterized by its efforts to incorporate technology and modern teaching methodologies. However, literature reveals that Indonesian educators face unique challenges in this adaptation process. These challenges include limited resources, disparities in technological infrastructure, and a pressing need for effective teacher training programs (Musa et al., 2022; Musa & Nurhayati, 2021; Nurhayati & Musa, 2020; Winarti et al., 2022). Studies highlight the varied readiness and capacity among Indonesian educators to integrate new technologies and pedagogies into their teaching practices, reflecting a complex landscape of opportunities and hurdles (Fauziddin et al., 2021; Hardiyanti & Alwi, 2022; Nuraeni & Nurhayati, 2023; Nurhayati, 2021; Rukanda & Nurhayati, 2023). This review identifies a significant gap in the literature concerning the specific experiences of Indonesian educators in the context of Society 5.0.

While there is a substantial body of research on the global impact of technological advancements in education, there is a scarcity of studies that delve into the personal experiences and perspectives of Indonesian educators. This gap highlights the need for qualitative research that can capture the nuanced realities of educators in Indonesia as they adapt to and navigate the challenges and opportunities presented by Society 5.0. While there is extensive literature on the global impact of technological advancements in education, there exists a notable gap in research specific to the Indonesian context, particularly in the era of Society 5.0. Studies often overlook the nuanced challenges and innovative practices emerging in developing countries like Indonesia, where the integration of technology in education is influenced by unique cultural, economic, and infrastructural factors (Zhan et al., 2022). This research aims to bridge this gap by providing an in-depth analysis of Indonesian educators' experiences. The primary objective of this study is to explore the lived experiences of Indonesian educators in adapting to Society 5.0, with a focus on the challenges they encounter and the strategies they employ. The guiding research questions are: What are Indonesian educators' perceptions of Society 5.0's impact on their teaching practices? What challenges do they face in integrating new technologies into their educational settings? How do they overcome these challenges, and what innovative approaches are being adopted? This

study is pivotal as it explores the intersection of Society 5.0 and education within the Indonesian context—a perspective often overlooked in global discourse. The novelty of this research lies in its focus on Indonesian educators' firsthand experiences, shedding light on how they are adapting to and navigating the complexities of a rapidly evolving digital era. This exploration is particularly significant in understanding the unique strategies and solutions developed within a developing country's context, thus contributing new insights to the broader field of educational technology.

Method

This study adopted a qualitative research approach, utilizing a case study method to explore the experiences and perspectives of Indonesian educators in response to the evolving challenges of Society 5.0. The qualitative case study approach was deemed appropriate as it allows for an in-depth exploration of complex phenomena within their real-life context. Participants were selected using a purposive strategy to ensure a diverse representation of experiences across Indonesia's varied educational landscape. Twenty educators were chosen based on their geographic location, teaching experience, and the level of education they were involved in (primary, secondary, or tertiary). The diversity in participants' backgrounds aimed to provide a comprehensive understanding of the challenges and strategies educators use across different contexts. Data was collected through in-depth, semi-structured interviews, conducted between April-September 2023. Each interview lasted approximately 60-90 minutes and was carried out in Indonesian or English, based on the preference of the participant. Interviews were conducted virtually, using secure video conferencing platforms, to accommodate geographical spread and ensure participant convenience.

The interview protocol comprised open-ended questions designed to elicit detailed responses about educators' experiences, challenges, and strategies in adapting to Society 5.0. Key areas explored included their understanding of Society 5.0, perceived impact on educational practices, technological adoption, and the support systems available to them. All interviews were recorded with permission, transcribed verbatim, and translated where necessary. Transcripts were then systematically coded. A thematic analysis approach was employed to identify and analyze patterns within the data. Initial codes were generated, categorized into potential themes, and then reviewed and refined to form the main thematic findings of the study.

To ensure data validity, the study employed several strategies. Triangulation was used by comparing and cross-verifying the data and findings from different participants. Regular debriefing sessions were held with a team of researchers to discuss and challenge emerging themes, ensuring a comprehensive and unbiased interpretation of the data. Additionally, participants were provided with summaries of their interviews (member checking) to validate the accuracy and resonance of the interpretations. The validity of the interview protocol was established through a pilot study conducted with a small group of educators not included in the main study. Feedback from the pilot study was used to refine the interview questions for clarity and relevance. The interview protocol was also reviewed by a panel of experts in qualitative research and education to ensure the questions were effectively

capturing the intended themes and information.

Results

Analysis of Indonesian Educators' Perceptions of Society 5.0's Impact on Teaching Practices

Indonesian educators perceive Society 5.0 as an era that brings both opportunities and challenges to their teaching practices. Their responses indicate a nuanced understanding that balances the integration of technology with traditional educational and religious values. Educators recognize the importance of incorporating technology into their teaching methodologies. However, they emphasize the need to align this integration with traditional values, particularly in religious education. One educator illustrated this approach, stating, "We have a program to eradicate religious and Quranic illiteracy... we always prepare Quran study sessions every Sunday". This response highlights a commitment to maintain the core essence of their educational philosophy while adopting new tools and methods.

The transition to Society 5.0 is not without its challenges for these educators. Many expressed concerns about practical difficulties, such as resource limitations and infrastructural constraints, which hinder the seamless integration of new technologies. One educator commented on the priority given to spiritual and moral development over technological advancement, noting, "Most teachers improve children in terms of their knowledge... we, the religious teachers, focus on the spiritual aspect. It's all about the heart from which various moral characters of students emerge". This sentiment reflects a cautious approach to adopting technological changes, ensuring they do not overshadow the fundamental objectives of education. The educators' reactions to Society 5.0 vary, with a noticeable generational gap influencing their perceptions.

While younger educators are more inclined towards embracing technological advancements, older educators, particularly those nearing retirement, show less interest in adapting to new technologies. This disparity underscores the diverse attitudes towards the impact of Society 5.0 on educational practices. A key insight from the interviews is the holistic approach to education that the educators advocate. They view Society 5.0 not just as a technological era but as an opportunity to enrich their teaching with a blend of modern tools and traditional values. The emphasis is on a balanced educational experience that develops students' technological skills alongside their moral and character strengths.

Despite various challenges, there is a noticeable commitment among the educators to continuous learning and adaptation. Many express a willingness to update their skills and methodologies to remain relevant in the changing educational landscape. As one educator put it, "In this digital era, I have to develop myself; if I don't follow the development, I will be far behind those who are already using digital methods or media". This proactive stance highlights their dedication to evolving their teaching practices in response to Society 5.0's demands.

Analysis of Challenges in Integrating New Technologies

Indonesian educators face several significant challenges in integrating new technologies into their educational settings, as revealed in the interview data. A primary concern is the **resource limitations**. Educators are constrained by insufficient access to modern technology and tools, including a lack of computers and unstable internet connectivity. These resource constraints severely limit the ability to integrate technology effectively in teaching.

The **cultural resistance to change** emerges as another critical challenge. Many educators, particularly those more accustomed to traditional teaching methods, show a reluctance to adopt new technologies. This resistance is rooted in a strong commitment to traditional educational values, as one educator pointedly expressed: "Most teachers improve children in terms of their knowledge... we, the religious teachers, focus on the spiritual aspect". This indicates a cultural inclination towards maintaining established educational practices over embracing technological innovations.

A significant barrier is the **lack of technological literacy and training** among educators. Many express unfamiliarity with new technologies and a gap in their ability to integrate these tools into their teaching methodologies. An educator highlighted this challenge, stating, "In this digital era, I have to develop myself; if I don't follow the development, I will be far behind those who are already using digital methods or media". This gap in technological literacy underscores the need for enhanced training and development in this area.

Moreover, a **generational divide** is evident in the attitudes towards technology adoption. Educators nearing retirement are less inclined to adapt to new technologies, indicating a disparity in technology acceptance across different age groups. This divide can create inconsistencies in the adoption and implementation of technological tools in educational settings.

The challenge extends to **administrative and systemic issues**. Effective technology integration requires not just access to hardware and software but also significant changes in administrative processes and systems. The effort to train educators in using laptops for administrative tasks and in applications like SIAGA and EMIS for data management exemplifies this systemic aspect.

Finally, educators are challenged to balance the integration of technology with the preservation of **traditional educational values**. The focus of Indonesian education on moral and character development necessitates a careful approach to ensure that technology enhances rather than replaces traditional teaching methods. In conclusion, the challenges faced by Indonesian educators in integrating new technologies are multifaceted and complex. They encompass resource constraints, cultural resistance to change, a gap in technological literacy, generational divides, administrative complexities, and the need to balance modern methods with traditional educational values. Addressing these challenges requires a holistic strategy that includes enhancing technological literacy, providing adequate resources, and developing supportive policies that align with

Indonesia's unique educational ethos.

Overcoming Technological Challenges in Indonesian Education

Indonesian educators are emphasizing the importance of self-development and continuous learning in response to the challenges of integrating new technologies. They recognize the need to stay updated with technological advancements, as encapsulated by one educator's statement: "In this digital era, I have to develop myself; if I don't follow the development, I will be far behind those who are already using digital methods or media". This approach underlines their proactive attitude towards personal and professional growth amidst rapid digital changes.

Collaborative learning and peer support have emerged as essential strategies for overcoming technological challenges. Educators are creating groups to share knowledge and skills, building a supportive community of learners. An example is the organization of monthly training sessions for peers to enhance practical skills, such as laptop usage for administrative tasks: "We took time once a month specifically to practice using laptops... every religious education teacher must be able to manage their administration without relying on others". This community-based approach not only improves individual competencies but also strengthens the collective capability of the educators.

Community engagement is a key strategy in ensuring successful technological integration. Educators are involving various stakeholders, including school committees and parents, to create a cohesive and supportive educational environment. This strategy is illustrated by the coordinated effort among different parties: "We synergize with many parties, from the principal to the school committee and parents... to coordinate and ensure every program runs smoothly". Such efforts ensure that technological initiatives in education are well-supported and effectively executed.

Innovative Approaches in Educational Technology

Educators are increasingly using digital platforms like SIAGA and EMIS for effective data management. This shift towards digital administrative solutions is a significant step towards modernizing the educational system. The adoption of online teaching tools such as Google Meet and other self-directed learning resources represents a significant advancement towards interactive and flexible teaching methodologies. This integration signifies a balanced approach to preserving traditional teaching methods while embracing modern technology. The strategies and innovations employed by Indonesian educators showcase their commitment to overcoming the challenges posed by technological integration. Through continuous learning, collaborative training, community engagement, and the adoption of digital tools, they are paving the way for a more integrated and effective educational system. Their efforts represent a dynamic transition from traditional to modern educational methodologies, ensuring the relevance and effectiveness of education in an increasingly digital world.

Discussion

Analysis of Indonesian Educators' Perceptions of Society 5.0's Impact on Teaching Practices

The educators' emphasis on integrating technology while preserving traditional values aligns with Fang and Nie (2021) and Suharyat et.al (2022) study, which highlights a global trend in education where technology is seen as a complement, not a replacement, for traditional pedagogical approaches. Similarly, in the context of Indonesian education, our findings echo Nguyen et al.'s (2021) research on the importance of cultural and religious values in educational settings, even in the face of technological advancements.

The challenges identified by Indonesian educators, such as resource constraints and infrastructural issues, resonate with the broader challenges documented in developing countries by Papadopoulos et.al. (2021). These authors argue that such challenges can significantly hinder the effective integration of technology in education, a sentiment mirrored in our findings. The generational gap observed in the responses is consistent with findings by Wang et.al (2022) and Winarti et.al. (2022), who noted varying levels of technological adaptability among educators based on age and experience. This variation is a critical factor in understanding the diverse attitudes towards technology integration in educational settings.

Our findings on the holistic approach to education find parallels in the work of Saravanakumar et.al (2023), who emphasize the growing importance of a balanced educational experience that incorporates technological skills and traditional values. This approach is increasingly relevant in the context of rapid societal and technological changes. The commitment to continuous learning and adaptation among Indonesian educators aligns with the conclusions drawn by Adarkwah et.al. (2021). They highlight a global trend where educators are increasingly recognizing the need for ongoing professional development to keep pace with technological advancements.

The analysis reveals that Indonesian educators view Society 5.0 as a complex era that necessitates a careful balancing act between embracing technological advancements and preserving the core values of traditional education. While they recognize the importance of integrating technology to stay relevant, there is a clear consensus on the need to ensure that this integration enhances, rather than replaces, the fundamental aspects of moral and character development in education.

Comparative Analysis with Current Research in Educational Technology

The **resource limitations** faced by Indonesian educators, particularly inadequate access to technology and infrastructure, resonate strongly with global trends in educational research. Studies like Aljarrah et al. (2022) have highlighted similar challenges in developing countries, where limited access to technological resources impedes effective integration in education. This mirrors the issues faced by Indonesian educators in terms of insufficient computers and unstable internet connectivity, showcasing a common barrier in technology adoption across diverse educational settings.

The **cultural resistance to change** among Indonesian educators is a phenomenon that is not unique to Indonesia. Musa et.al (2022) notes that educators' resistance to technology integration is often rooted in traditional pedagogical beliefs or discomfort with new technologies. This parallels the Indonesian context where educators prioritize traditional educational values over technological advancements, as one educator revealed, "Most teachers improve children in terms of their knowledge... we, the religious teachers, focus on the spiritual aspect". This indicates a broader challenge in aligning traditional educational practices with modern technological approaches.

A key challenge identified is the **lack of technological literacy and training**, a universal issue in the realm of educational technology. Educators often lack the skills and training necessary to effectively incorporate technology into their teaching (Marsegi et al., 2023; Novitasari & Fauziddin, 2022; Nurhayati et al., 2023; Winarti et al., 2022). This is reflected in the words of an Indonesian educator, "In this digital era, I have to develop myself; if I don't follow the development, I will be far behind those who are already using digital methods or media", highlighting the need for professional development in this area.

The **generational divide** in attitudes towards technology adoption in Indonesia mirrors findings by Taylor & Fazal et.al (2021), who observe that older educators tend to be less comfortable with new technologies compared to their younger counterparts. This is evident in the reluctance among some senior Indonesian educators to engage with digital tools, suggesting a need for tailored approaches to technology integration across different age groups.

Administrative and systemic challenges play a critical role in the successful integration of technology in educational settings. Akram et.al. (2022) emphasizes that without adequate administrative support and infrastructure, technology integration efforts can be ineffective. The Indonesian experience, where educators are trained to use laptops for administrative tasks and data management applications, aligns with this global perspective, underlining the importance of systemic support for technology integration.

Finally, the unique challenge in Indonesia of **balancing traditional values with modern technology** reflects a growing trend in global education. Barksdale et.al. (2021) argue for the integration of technology in ways that respect and preserve cultural and educational values. This is particularly relevant in the Indonesian context, where there is a strong emphasis on moral and character development alongside academic learning. The challenges faced by Indonesian educators in integrating new technologies into their educational settings find parallels in global educational trends. From resource constraints and cultural resistance to the need for enhanced technological literacy and systemic support, these challenges highlight the complexity of adopting technology in educational contexts. Moreover, the distinctive aspect of balancing traditional educational values with modern technological methods underscores the nuanced nature of this integration. This comparative analysis not only validates the experiences of Indonesian educators but also contributes to the broader discourse on technology integration in education, offering insights for policy development and strategic planning in similar contexts.

Overcoming Technological Challenges in Indonesian Education

The emphasis on self-development and continuous learning among Indonesian educators aligns with current research highlighting the importance of teacher professional development in technology integration. Studies have shown that continuous professional development is crucial for educators to effectively incorporate new technologies into their teaching practices (Musa et al., 2022; Nurhayati, 2020; Rukanda & Nurhayati, 2023). This is consistent with the proactive attitudes observed in the educators, as one mentioned, "In this digital era, I have to develop myself; if I don't follow the development, I will be far behind those who are already using digital methods or media".

The collaborative approach adopted by educators resonates with recent studies that emphasize the role of collaborative professional learning communities in enhancing technological integration (Alemdag et al., 2020). By sharing knowledge and skills, educators can collectively navigate the complexities of digital technologies, as evidenced by the organization of peer training sessions.

Innovative Approaches in Educational Technology

The use of digital platforms for administrative tasks reflects the global trend towards digitalization in education management (Marsegi et al., 2023; Musa et al., 2022; Novitasari & Fauziddin, 2022; Rukanda & Nurhayati, 2023; Winarti et al., 2022). This approach, as seen in the use of SIAGA and EMIS by the educators, is supported by research indicating the efficiency and accuracy improvements brought by digital administrative systems. The integration of online teaching tools like Google Meet is consistent with the global shift towards blended and online learning environments, a trend accelerated by the COVID-19 pandemic (Iskandar et al., 2023; Nuraeni & Nurhayati, 2023; Nurhayati et al., 2023; Nurmalia et al., 2022; Tiarawati et al., 2023). This shift represents a balance between traditional and modern educational methods, aligning with the educators' efforts to adopt technology while preserving essential pedagogical values. The strategies and innovations of Indonesian educators, as observed in the interviews, are in line with global trends and research in education technology. Their commitment to professional development, collaborative learning, community engagement, and the adoption of digital tools reflects an understanding of the complexities and opportunities presented by Society 5.0. These efforts contribute to the broader discourse on technology integration in education, showcasing a dynamic transition towards a more modern, efficient, and effective educational system.

Conclusion

This research has illuminated how Indonesian educators perceive and navigate the challenges and opportunities presented by Society 5.0, particularly in integrating new technologies into their teaching practices. The educators' approaches, characterized by a strong emphasis on self-development, collaborative learning, and

community engagement, demonstrate a proactive and adaptive response to the evolving educational landscape. These strategies align with global trends in educational technology, reflecting a universal shift towards more integrated and digitally enhanced learning environments.

The study reveals that despite resource constraints and a cultural inclination towards traditional teaching methods, Indonesian educators are actively seeking ways to blend modern technological tools with established pedagogical values. Their efforts in adopting digital platforms for administrative efficiency and incorporating online teaching tools signify a significant move towards a more dynamic, interactive, and flexible educational methodology. These findings contribute to the broader discourse on technology integration in education, showcasing how educators in a specific cultural and socio-economic context respond to the challenges and opportunities of a digitally advanced society. The insights from this research offer valuable implications for policymakers, educational leaders, and practitioners, highlighting the need for continued support, resources, and training to facilitate the effective integration of technology in educational settings. Ultimately, the study underscores the resilience and adaptability of educators in the face of rapid societal and technological changes, paving the way for a more modern, efficient, and effective educational system in Indonesia.

Recommendations

To enhance technology integration in Indonesian education, it is recommended to focus on structured professional development for educators, ensuring they are proficient in both technology and pedagogy. This should be coupled with increased investment in digital resources, providing the necessary tools and infrastructure for effective teaching and learning. Additionally, fostering community engagement is crucial; involving educators, parents, and local stakeholders can create a supportive environment for technology adoption. Lastly, policy support is essential to facilitate the use of innovative educational technologies while upholding traditional values. These measures will collectively strengthen the educators' ability to navigate the challenges of Society 5.0, enriching Indonesia's educational landscape.

Acknowledgements

The authors express sincere appreciation to the educators who participated in this study, whose contributions were indispensable to the research success.

Abstract: To create a Futures Literacy course. Background: A previously developed and tested Framework to develop IT courses for emerging technologies was used to develop a Futures Literacy course. A literature review was conducted to discover theories, models, and frameworks that could be used to create IT courses. A Course Development Framework was used to develop the contents and delivery options for a Futures Literacy course. This Futures Literacy course could be used as a basis to create and develop unique future literacy courses. Using the Course Development Framework assisted in ensuring learning theory, design and motivational model issues were covered. Practitioners could use this Futures Literacy course as a basis to develop unique future literacy courses. Support and encourage practitioners to develop better Futures Literacy courses. Future research could examine new and improved ways to develop and present Future Literacy courses.

Keywords: Futures literacy, framework, motivation, course development

Introduction

We are continually looking to the future, looking at trends, having visioning meetings, brainstorming ideas and so on to decide what to do next (Webb, 2019). Information Technology (IT) such as Artificial Intelligence (AI), 5G, Robotics, etc., contributes to the uncertainty of the future and the difficulty of making long-term strategic plans. What is needed are not once-off interventions and the development of five-year plans, but rather providing students, employees (and especially executives) with Future Literacy. Futures Literacy is a practical skill that individuals can acquire through a course (Miller, 2018; UNESCO, 2019). Many businesses and

organizations have or are looking at Futures Literacy, these include Accenture (2021), Bain and Company (Vohong, 2021), Deloitte (Briggs & Buchholz, 2020), Gartner (Burke, 2020), IBM (Butner et al, 2020), McKinsey (Conn & McLean, 2020; De Smet et al., 2021), Oracle (2020), UNESCO (Damhof et al., 2020; Miller, 2018, UNESCO, 2019) and WEF (Schwab & Zahidi, 2020). This paper looks at how a higher learning institute or a business could create such a course.

Before designing a course, many questions must be answered. Questions include the wh-questions; why, who, what, which, where, when, and finally the how question. In no particular order the questions can include: Which learning theories and design models will be used, how will the course be developed, what is Futures Literacy, why is Futures Literacy important, what are the phases of Futures Literacy, what areas influence Futures Literacy, who is the course to be designed for, what special resources if any are required, what is the syllabus and planned contents of the course, what is the learning outcome of the course, what prerequisites if any are needed, what activities are planned, and how will the course be delivered and assessed?

Before starting to research Futures Literacy, it was decided to look at learning theories and models that could be used to build the course.

Literature Review

A systematic literature review process was followed as described by Brereton et al. (2007). Google Scholar was the main source of academic literature, and the filter “Since 2017” was used to focus on recent literature. Some older references were used particularly concerning learning theories and course design methods and models. Only papers published in English were included, and the main idea behind the literature review was to find best practices in course development. The following themes emerged from the literature review: learning theories, course design models, Bloom’s taxonomy, a course development framework, and Futures Literacy.

Learning Theories

Learning theories attempt to explain how learning takes place in an individual, how an individual learns and acquires knowledge, and how an individual retains and recalls knowledge (Illeris, 2018; Sahin & Dogantay, 2018). As such, learning theories should influence course creation and delivery (Illeris, 2018). Many learning theories have been developed from a wide range of in-fluences (Illeris, 2018), three fundamental learning theories that are widely used are Behaviourism, Cognitivism, and Constructivism as described in Figure 1 (Stevens-Fulbrook, 2019).

The constructivism theory seemed the best learning theory for developing courses in areas that were emerging rather than established (Scoppio & Luyt, 2017), and constructivism “encourages active learning and builds on previous knowledge” (van Wyk et al, 2020, p.30). Constructivism theory takes cognisance of a learner’s

previous experiences and knowledge (Juvova et al., 2015).

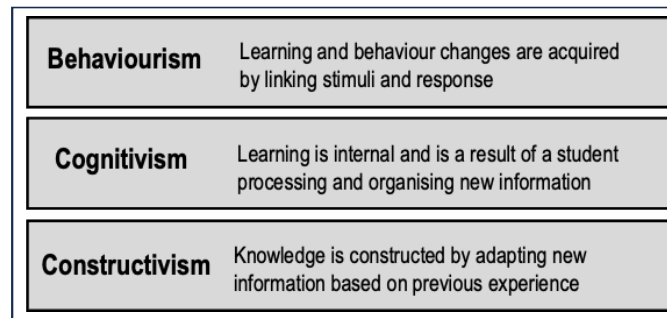

Figure 1. Three fundamental learning theories (Stevens-Fulbrook, 2019).

“Constructivism propagates an epistemological dimension for creative/artistic and spontaneous problem-solving processes to solve messy, problematic situations defined by ambiguity, volatility and distinctive-ness” (Pande & Bharathi, 2020, p.4). Pande and Bharathi (2020, p.4) defined three propositions of constructivism:

- “Understanding is in our interactions with the environment: This proposition is about the fact that what is learned and how it is learned are inseparable. The content, the context, the learner’s activities, and the learner’s goals are the key ingredients of an effective learning outcome.
- Cognitive conflict or puzzlement is the stimulus for learning and determines the organization and nature of what is learned: The stimulus for learning comprises what the learner attends to, what is the learner’s prior experience in developing an understanding of what is being taught and what is the eventual understanding developed in the learner.
- Knowledge evolves through social negotiation and the evaluation of the viability of individual understandings: A careful reconciliation is called for between the viability of one’s understanding (knowledge) and the viability of understanding the social environment of which one is part. Group activities provide both intra and inter-collaboration avenues to en-rich, interlace and broaden the understanding of a given phenomenon.”

It should be noted that Pande and Bharathi (2020) refer to a singular learning outcome.

Course Design Models

Course design models are designed to help identify design flaws when designing courses and to connect theory to practice (Robinson et al., 2021). Just as with Learning theories, there are numerous course design models, three of which are ADDIE, ARCS, and ARCS-V, which were reviewed by van Wyk et al., (2020).

ADDIE (Analysis, Design, Development, Implementation, and Evaluation) is a popular and widely used course design model which follows the 5 steps which give it its acronym (Budoya et al., 2019; Ghani & Daud, 2018). ADDIE keeps the complexities of learning and instructional design to a minimum while facilitating the use of different learning methods (Alnajdi, 2018). ADDIE has been criticised for being inflexible, linear, and time-

consuming (Jung et al., 2018).

The ARCS (Attention, Relevance, Confidence, Satisfaction) and ARCS-V (Attention, Relevance, Confidence, Satisfaction and Volition) models developed by Keller (2010, 2016) attempt to place the learner's motivation at the centre of the design (Chu, 2017), similar to constructivism. Keeping a person motivated to participate and engage in learning, is key to developing a successful course (Khan et al., 2019). To motivate learners, the ARCS model states that the course needs to “(1) catch and sustain students' attention; (2) state why the students need to learn the content; (3) make students believe that they can succeed if they exert effort; and (4) help students feel a sense of reward and pride” (Li & Keller, 2018, p.54). The ARCS model follows a four-step process of Define, Design, Develop, and Evaluate, which is very similar to the five steps of ADDIE (Analysis, Design, Development, Implementation, and Evaluation).

Categories	Instructor's Self-Analysis	Instructor's Analysis of Learners
Attention	Am I excited about this learning experience and how I can make it interesting?	Are the learners going to be interested? What tactics will stimulate their curiosity and interest?
Relevance	Do I believe that this learning experience will be valuable for my learners?	Will learners believe it is valuable? What can I do to help them believe it is important?
Confidence	Am I confident in my ability to lead this learning experience effectively and interestingly?	Will the learners feel confident about their ability to learn this? What do I need to do to help them be confident?
Satisfaction	Do I expect to have positive feelings about this learning experience?	What can I do to help the learners feel good about their experience and desire to continue learning?
Volition	Will I provide effective supervision and support to the learners throughout this learning event?	What can I do to help the learners maintain their goal orientation and task-focus throughout this learning event?

Figure 2. Creation aid for motivational strategy design (Keller, 2016).

Keller (2016) found that ARCS did not account for learners who had persisted in their learning when their

motivation had faded or learners who abandoned their learning despite needing the results. As a result, Keller (2016) added a fifth category called Volition (power to make own decisions) to the ARCS model, creating the ARCS-V model. Keller (2016) provided the creation aid in Figure 2 for developers to assess motivation.

A course following the ARCS-V model should start by gaining the attention of the learners, then obtaining their agreement on the relevance of the course, and then giving them the confidence needed to complete the course (Keller, 2010; Li & Keller, 2018).

Bloom's Taxonomy

Bloom's taxonomy is widely used to design and evaluate courses. Bloom's taxonomy is a hierarchy of thinking skills into six categories (Remembering, Understanding, Applying, Analyzing, Evaluating, and Creating) (Fastiggi, 2019), and is useful in guiding the development of learning outcomes. Learning activities progress from the low-level thinking skills of remembering and understanding to ultimately creating new knowledge (Agarwal, 2019). Newton et al., (2020) analyzed 47 lists of Bloom's taxonomy verbs and constructed a master list of verbs for each category as shown below.

Knowledge (Remembering): Define, Label, List, Name, Recall, Repeat, and State.

Understanding (Comprehension): Classify, Discuss, Explain, Generalise, Locate, Paraphrase, Report, Summarise, and Translate.

Applying: Apply, Choose, Demonstrate, Operate, Prepare, Produce, Solve, and Use.

Analyzing: Analyze, Calculate, Categorize, Compare, Contrast, Differentiate, Discriminate, Distinguish, Examine, Experiment, Infer, Outline, Question, and Test.

Evaluating: Assess, Evaluate, Judge, Justify, and Rate.

Creating: Argue, Compose, Create, Design, Formulate, Plan, Revise, and Support.

Course Development Framework

Using the constructivism learning theory, ADDIE course design model, and applying the ARCS-V model, van Wyk et al., (2020) created and tested a course development framework for emerging technologies as shown in Figure 3.

The van Wyk et al., (2020) Course Development Framework was used to develop a course on emerging technology, namely the Internet of Things (IoT). The IoT course was developed and has been successfully presented at a German university since 2019. Responses obtained from the students who attended the course were largely positive, despite them being asked to list both positive and negative comments (van Wyk et al., 2020). Although the Framework was designed to guide academics when developing a course for emerging technologies, it was thought the Framework could be used to develop a Futures Literacy course for students or employees.

Figure 3. A course development framework for emerging technologies (van Wyk et al., 2020)

Futures Literacy

Although the Framework was designed to guide academics when developing a course for emerging technologies, it was thought the Framework could be used to develop a Futures Literacy course for students or employees

What is Futures Literacy (FL)?

Futures Literacy (FL) is a practical capability, a skill that individuals can acquire (Miller, 2018; UNESCO, 2019). Futures Literacy “allows people to better understand the role of the future in what they see and do. Being futures literate empowers the imagination, and enhances our ability to prepare, recover and invent as changes occur” (UNESCO, 2019).

“A future literate person has acquired the skills needed to decide why and how to use their imagination to introduce the non-existent future into the present. These anticipatory activities play an important role in what people see and do” (Miller, 2018, p.15). Stated simply, Futures Literacy is the skill to “know how to imagine the future, and why it is necessary” (Larsen et al, 2020, p.2). Futures Literacy as a capability was developed by UNESCO and academics to provide a means to approach challenges by “using the future to innovate the present” (de Boer et al, 2018, p.1), the capability or skill to use the future now (Balcom Raleigh et al., 2018). A growth mindset is needed to develop Futures Literacy, people with a growth mindset are those who believe that their intelligence can be improved with effort and guidance, and who view feedback as positive (Limeri et al, 2020).

Why is a Futures Literacy course needed?

No one knows what the future holds, we have to live and deal with uncertainty. We know the future is uncertain, what we don't know are the details of the uncertainty. Negative images of the future lead to despair, hopelessness, and wars, while positive images of the future inspire hope, collaboration and peace (UNESCO, 2019). One of UNESCO's aims is to be a global educational think tank on Futures Literacy (Jourdan et al., 2020). "Democratizing the origins of people's images of the future opens up new horizons in much the same way that establishing universal reading and writing changes human societies. This is an example of what can be called a 'change in the conditions of change'. A potent transformation in what people can know, imagine and do. Futures Literacy is such a change" (UNESCO, 2019). Futures Literacy aims to empower everyone to transform the future into something positive (Jourdan et al., 2020).

Figure 4 highlights why Futures Literacy is important, and the capabilities it aims to deliver, such as Innovation, Discovery, Choice etc. This is an important section to 'sell' the topic and to make Futures Literacy less vague, perhaps each point in Figure 4 needs to be expanded on.

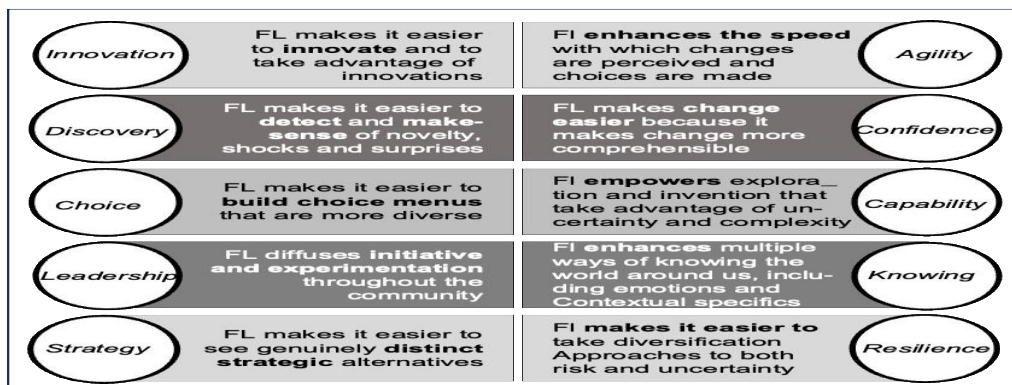

Figure 4. Futures Literacy (UNESCO, 2019)

What are the phases or steps of Futures Literacy?

A challenge to managers, educators, parents, and individuals is how to prepare to use the future more effectively and efficiently. One way is to introduce and push individuals to be competent in Futures Literacy (UNESCO, 2019). There are many Professors of History, but few Professors of the Future. Futures Literacy, a universally accessible skill that builds on the innate human capacity to imagine the future, offers a clear, field-tested solution to poverty-of-the-imagination" (UNESCO, 2019).

Figure 5 shows the first three phases (Reveal, Reframe and Rethink) of the learning cycle of Futures Literacy, it is important to tailor these phases to the local societal context (Miller, 2018). Phase four is to Repeat the process.

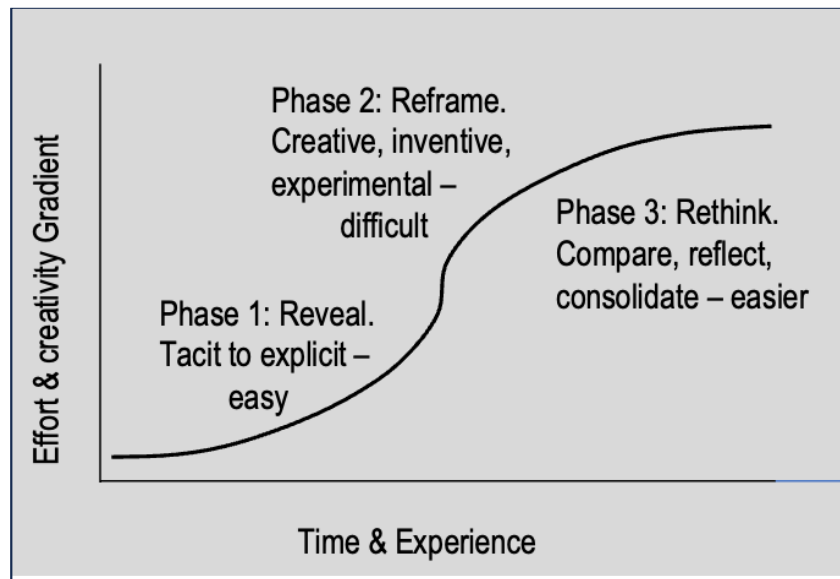

Figure 5. The first three phases of the learning cycle (Miller, 2018)

The four phases of the learning cycle of Futures Literacy are:

1) Reveal. Make anticipatory assumptions about the future explicit (clear and detailed) and observable, these assumptions are relatively easy to share (Miller, 2018). This stage is also referred to as Awareness (Toivonen et al., 2021).

2) Reframe. Unsettle and disturb the assumptions, by being creative, inventive, experimental, and questioning, and reframing an imaginary future. This is the most difficult phase as it is disruptive, it should embrace change, complexity, innovation, and uncertainty. People need to become comfortable with change, complexity, innovation, and uncertainty, and view them as resources rather than as threats (Miller, 2018). This stage is also referred to as Discovery (Toivonen et al., 2021).

3) Rethink. Compare, reflect, consolidate, and identify new questions and new ways to use the future in the present (Miller, 2018). This stage is also referred to as Choice (Toivonen et al., 2021). “By becoming futures literate, as individuals and organisations, it is possible to improve how we generate and consume futures, with the end goal of making more effective decisions to plan and prepare for the range of possible futures” (RISCS, 2020).

4) Repeat. Repeat the process.

What areas influence Futures Literacy?

Many subjects, ideas, concepts, and constructs influence Futures Literacy. We broke them down into the four broad areas of Science, Art, Design and Strategy clustered around Futures Literacy as shown in Figure 6, which

shows some of the complexity and interconnectedness of Futures Literacy. While this is not an exhaustive list, and many areas overlap, it covers areas a Futures Literacy course could touch on.

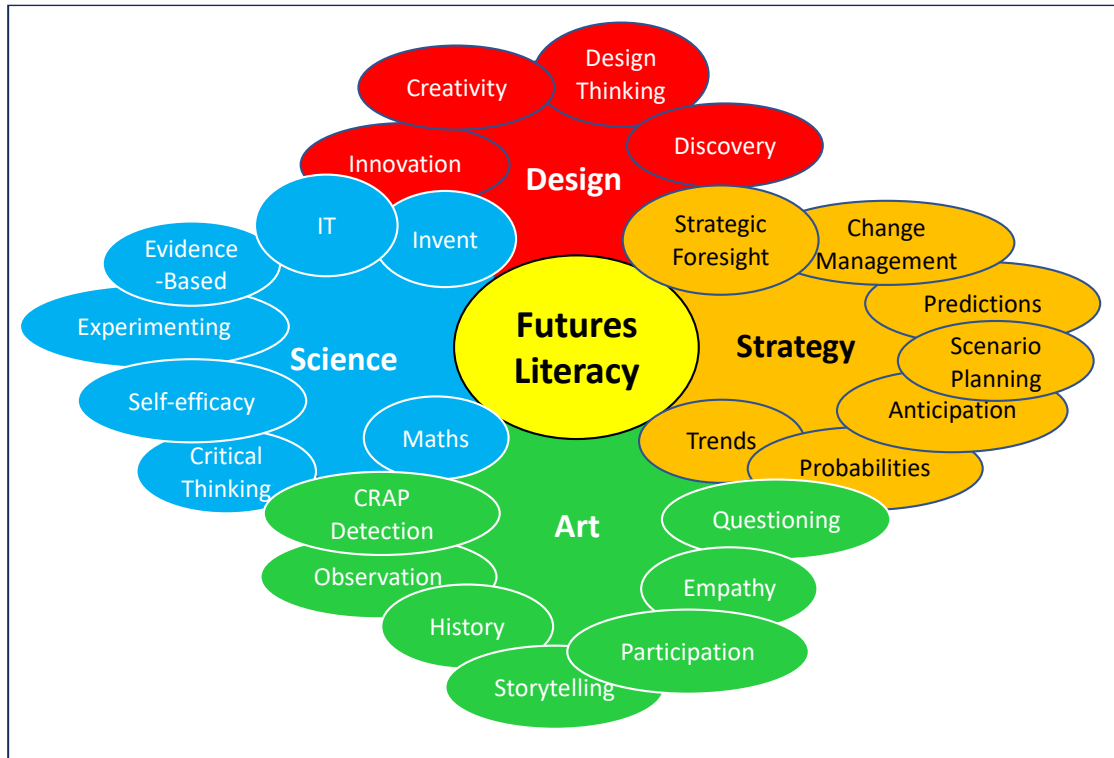

Figure 6. Broad areas supporting Futures Literacy.

Science. The Science Council (2021) defines Science as “the pursuit and application of knowledge and understanding of the natural and social world following a systematic methodology based on evidence.” The science includes critical thinking (de Boer et al, 2018), inventing (Bal-com Raleigh et al., 2018; de Boer et al, 2018), self-efficacy (de Boer et al, 2018), IT (and related issues such as AI, Automation, Big data, IoT, Edge Computing, 5G, visualization, deep learning, advanced data management and many more) (Jourdan et al., 2020; Kurki & Wilenius, 2016; Lively et al., 2021), evidence-based (de Boer et al, 2018; Lively et al., 2021), mathematics (Miller & Sandford, 2019), and experiments (Miller & Sandford, 2019). The physical and digital worlds are so intertwined and continually evolving that most people can engage with ever-increasingly complex IT (Briggs & Buchholz, 2020).

Art. “Art has always been a domain of specific application for philosophy, in the sense that art raises numerous questions of a philosophical nature” (Andina, 2017, p.2). Imagination and skill are required to create art, and art has always been used to express ideas and feelings. For this paper, art includes questioning (de Bo-er et al., 2018; de Smet et al., 2021), empathy (Cripps & Hood, 2017; de Boer et al., 2018), history (Bal-com Raleigh et al., 2018; Miller, 2018), participation (Toivonen et al., 2021) storytelling (Lively et al, 2021), and observation. Harvard Medical School requires students to complete formal training in art observation to improve students' observational skills. The students attend eight 75-minute observation exercises at an art museum followed by an

hour-long lecture (Naghshineh et al., 2008).

Design. Steve Jobs said, “Design is not just what it looks like and feels like. The design is how it works.” The design includes design thinking (Cagnin, 2018), innovation (de Boer et al., 2018), creativity (de Boer et al., 2018), and discovery (Balcom Raleigh et al., 2018).

Strategy. The strategy may be defined as “a cohesive core of guiding decisions” to use “resources and opportunities in uncertain environments” (Khalifa, 2020, p.39). The strategy includes Anticipation (Damhof et al., 2020; Miller, 2018), change management (Baker, 2020), scenario planning (Balcom Raleigh et al., 2018; Larsen et al., 2020), probabilities (Lively et al., 2021), predictions (Alonso, 2020; Briggs & Buchholz, 2020; Peters, 2020; Schwab & Zahidi, 2020), strategic foresight (Baker, 2020; Burt & Nair, 2020; OECD, 2021; Sarpong, Eyres & Batsakis, 2019), and trends (Accenture, 2021; Burke, 2020; Cleary, 2020; Lively et al., 2021).

What would be the learning outcome for a Futures Literacy course?

Most educational engagement is neither inclusive nor equitable, and “is still largely problem-oriented and geared towards predetermined learning outcomes” (Jour-dan et al, 2020, p.60). This prevents courses from engaging with multiple aspects relevant to the learners, to address multiple possible futures. Pande and Bharathi (2020) refer to a singular learning outcome, and this idea of a single learning outcome is supported by Robinson et al., (2021).

The learning outcome for a Futures Literacy course is that participants would be future literate and able to answer the question, “What is the future and how do I use it?” (Miller 2018, p. 6). Breaking this down slightly, “being futures literate is the capacity to identify, design, target and deploy AA” (Miller 2018, p. 24), where AA is anticipatory assumptions.

Research Methodology

The research methodology was a literature review to answer the questions identified in the Introduction to develop a course in Futures Literacy. The research methodology followed the methods described by Saunders et al., (2019). Figure 7 provides a summary of the research methodology followed.

Purpose	Exploratory
Philosophy	Interpretivist
Approach	Inductive
Time Horizon	Cross-sectional
Strategy	Qualitative

Figure 7. Summary of research methodology.

Course Development

The course will follow a constructivist learning approach, which puts the participant at the centre of the learning activity. Constructivism is ideally suited to Futures Literacy, as Futures Literacy is ambiguous, messy, volatile and problematic, and needs creative and spontaneous problem-solving processes. Learning is an active approach in which participants find, contextualize and process information to construct knowledge. The three propositions of constructivism are:

- "Understanding is in our interactions with the environment"
- "Cognitive conflict or puzzlement is the stimulus for learning and determines the organization and nature of what is learned," and
- "Knowledge evolves through social negotiation and through the evaluation of the viability of individual understandings" (Pande & Bharathi, 2020, p.4).

Each of the constructivism propositions is included in the course. Participants are expected to draw on their own experiences, interact and draw on the personal experiences of fellow participants, interact with academia, and the environment to source information and develop knowledge as part of the Reveal phase of Futures Literacy.

The Reframe phase of Futures Literacy will create and deal with cognitive puzzlement and conflict, while the Rethink phase will deal with the evaluation and negotiation of individuals' understandings.

The following approaches will be followed to ensure participants are active in constructing knowledge.

- Supported learning - providing scaffolding and bite-sized chunks plus feedback. Participants are provided with literature and videos of topics.
- Exploratory learning - participants are encouraged to explore and discover new knowledge, and to source literature and videos.
- Collaborative learning - participants obtain multiple perspectives and critical thinking skills and collaborate.
- Problem-based learning - participants are encouraged to raise problems, ask questions and then attempt to solve the problems and answer the questions.
- Evidence-Based Management (EBM) or practice, uses four main sources of evidence: Scientific literature, Professional expertise, internal Organizational data, and Stakeholders' values and concerns.

The EBM approach consists of Ask, Acquire, Appraise, Apply and Assess (Wilson et al., 2021).

It is important to stress that all details and figures from this point are for illustration and to repeat that a Futures Literacy course should be built by taking cognisance of the learners' previous experiences and knowledge (Juvova et al., 2015), their social situation and environment (Pande & Bharathi, 2020), and it must be relevant to the particular learners.

The single learning outcome is the capacity to identify, design, target and de-ploy anticipatory assumptions (Miller 2018). Each course could have unique learning objectives depending on the situation and the participants. The skills participants need to develop, and the attitudes they need to possess make up the learning

objectives (Robinson et al, 2021). Participants may already possess certain skills such as presentation skills and thus would not be included, while they might need to develop a skill such as visual literacy and need to enhance skills such as storytelling and CRAP detecting.

Additional issues to be covered could include “What is your why?”.

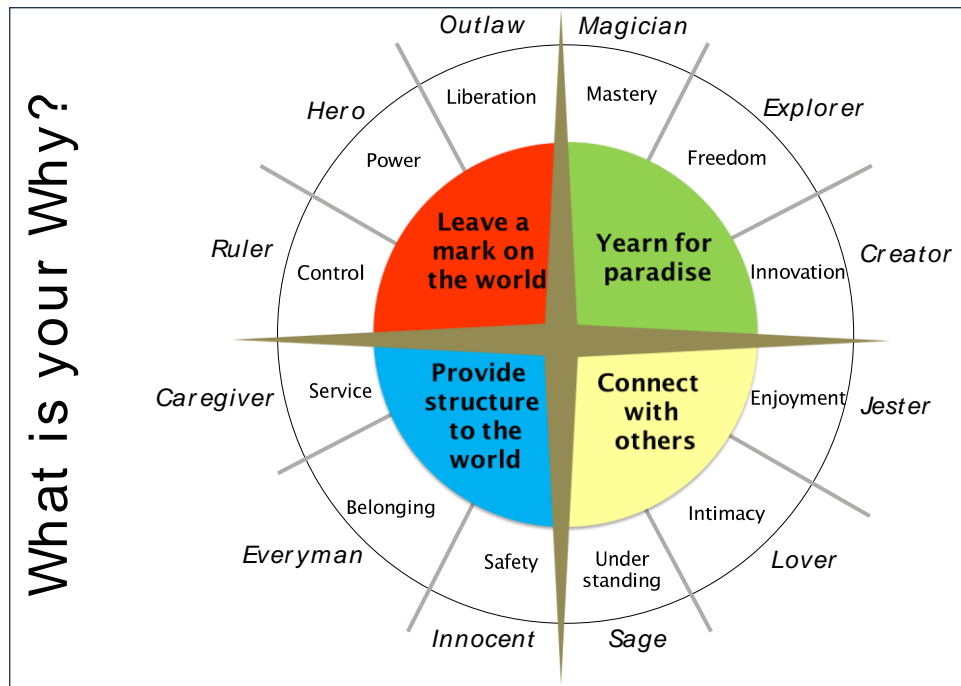

Figure 8. What is your Why? (Eyre, 2019).

Course Description Futures Literacy			
Course Scope	Equipment Requirements	Syllabus	Course Topics
<p>Course Length 8 weeks</p> <p>Course Description The course firstly aims to introduce individuals to FL, and secondly to develop FL capabilities and skills.</p> <p>Prerequisites No special prerequisites apart from a growth mindset</p>	<p>Required IT All participants are expected to have a mobile device with stable internet connection. The mobile device must be ON in all activities, and need to last throughout a session without needing to be charged.</p>	<p>No text books A range of articles, readings and videos may be provided. Participants will be required to search for and find information relevant to the topics under discussion.</p>	<ul style="list-style-type: none"> • Introduction • Art • Science • Strategy • Design • FL • Reveal – understanding • Reframe – cognitive puzzlement and conflict • Rethink – evaluation and negotiation

Figure 9. Course Description.

Other ideas such as Leadership Canvas (Eyre, 2019) should also be used. The Course Development Framework in Figure 3 was used to build a Futures Literacy course. Figure 9 shows the Course Description for the Course, including possible topics or modules to be covered.

This should ideally be a course for postgraduate students, or employees who have had several years of real-world work experience. Figure 10 shows possible assessments and grading values, there will be no examinations or tests on the course. There should not be a rigid approach to how the students (or employees) deliver activities.

Contributions will be assessed on a simple 3-point scale based on the following criteria:

- 3 Excellent, demonstrates knowledge, understanding, insight, and or creativity.
- 2 Good answer, most points covered, shows some knowledge of the subject matter, perhaps some application.
- 1 Shows some knowledge of the subject matter, no application.

Questions and Answers in seminars	10%
Sourcing of Videos and literature	10%
Reflection	10%
Demonstration of “insatiable curiosity”	10%
Human & Social Capital Metrics	10%
Project Presentation	50%
TOTAL	100%

Figure 10. Course assessments and grading values.

An alternative is to require participants to demonstrate an “insatiable curiosity” (as Kipling put it) of the world around them, wide reading, and the ability to observe phenomena and interpret those observations. Ways to test that could be to require participants to attend a live orchestra performance, a ballet, opera, sports event, play, or art gallery or even require them to spend an hour in a class of preschool kids. Participants must then describe what was going on - in the class, on the stage, in the orchestra, in the audience, in administration, in preparation, in marketing, in finance etc. (A.Hooper, personal communication, June 16, 2021).

Human and Social Capital Metrics could follow the Cartedo (2021) model:

- Problem-solving (0-5)
- Research, analysis, Decision making.
- Ideation (0-5)

How participants generate ideas and solutions through Questioning, how they reveal their Point of View (POV), how they then REFRAME ideas through Sketching, Prototyping, Brainstorming, Brainwriting, Worst Possible

Idea, etc.

- Collaboration (0-5)

Communicating clearly, actively listening, taking responsibility for mistakes, sharing evidence, and respecting the diversity of colleagues.

- Communication (0-5)

Listening and Comprehension, Presentation, asking questions, answering questions, evidence, use of digital media and visual displays, body language (eyes, voice, posture, gestures).

- Empathy (0-5)

Could use Vossen et al.'s (2015) questionnaire and or observation to assess Cognitive (understanding how another person feels) and Affective empathy (sharing the feelings of another person).

- Critical Thinking (0-5)

Key critical thinking skills are analysis, interpretation, inference, explanation, self-regulation, open-mindedness, and problem-solving. How they use the RED model (Recognise assumptions, Evaluate Arguments, Draw Conclusions).

Various methods such as Strategic Foresight, Design Thinking, Critical Thinking, CRAP Detection and Questioning from the four broad areas in Figure 6 could be explored and explained. Skills could be developed in the three levels (cognitive, emotional and active). Participants could then select one or more methods and skills to Reveal, Reframe and Rethink an issue (such as listed in Appendix 1) with one or more technologies (such as listed in Appendix 2), and finally, participants could present the results.

Module X: Reveal-Understanding			
Blooms' Taxonomy: Remember Understand Apply Analyse Evaluate Create			
ARCS-V: Attention Relevance Confidence Satisfaction Volition			
BLOOMS Remember	Learning Outcomes List issues around the area of focus	ARCS-V A R V	Resources Videos on Reveal and or anticipatory assumptions – sourced by students
Apply	Prepare clear and detailed anticipatory assumptions about the future	A R V R C	Links to further information, models, theories, best practices etc. Slides by Lecturer
ARCS-V A R C S	Activities Post readings and videos onto LMS	ARCS-V A R C S V	Assessments Class exercise: Students to develop individual anticipatory assumptions
A R C S	Post own anticipatory assumptions on LMS	A R C S V	Participation in class: Students will be paired into teams to develop anticipatory assumptions
A R C S V	One student to be Scribe – to ensure all discussions etc recorded and posted on LMS		

Figure 11. Example of Reveal Module

Figure 11 shows an example of one of the course modules (Reveal module) –one needs to be developed for each module. The blue blocks show Bloom’s Taxonomy levels for each part of the learning outcomes, while the orange blocks show the ARCS-V criteria for each of the chosen activities, assessments and course content.

“The course activities should provide a choice of themes or ask the students to choose their ideas as a development project and in doing so, provide satisfaction by seeing their ideas brought to reality through the course-work,” (van Wyk et al., 2020, p. 38). Participants should also be involved in selecting and changing activities, in the IoT course, for example, participants asked for guest speakers, pop quizzes, and a programming aspect to be added to the course. The course needs to develop activities that make use of the learner's existing skills and experiences (Arghode et al., 2017). The appendices contain examples of possible exercises and possible technologies to consider.

Conclusion

Many educators forget the purpose of education. The purpose of education should be to increase the survival prospects of the group, by expanding individuals’ capacity and desire to find meaning, truth and enjoyment in life. Educators often use outdated syllabi, with little discovery or questioning, they don’t seek truth, and they seek obedience to whatever serves their political masters’ cause. Survival is adapting to change, but many educators are devoted to conserving old ideas and concepts, to looking backwards as we hurtle into the future.

Many students fail, some fail to achieve the required marks, while others fail to develop to their full capacity. Students are taught to be afraid of failing, of disappointing, of displeasing, of making mistakes, and of being wrong. As John C. Maxwell said, “Fail early, fail often, but always fail forward”. Failing forward is about iteration, about risking failure, knowing it’s okay to fail. Sadly, many things in education are boring, trivial, dull and make limited demands on one’s intelligence. Students should not be encouraged to work for petty rewards such as gold stars and marks, or for the ignoble satisfaction of feeling better than someone else. Futures learning aims to develop each student's capacity to create their own view and understanding of their future.

Conclusion

Learning theories and design models were examined, and a course development framework was found on which to build a Futures Literacy course. Futures literacy was defined and its importance was clarified. A possible syllabus, learning outcomes and planned contents of the course were defined. An IoT course was designed that used a Course Development Framework that in turn used constructivism, ADDIE and ARCS-V to put the learner at the centre of the course and to build on the learner's knowledge and experience (van Wyk et al, 2020). The course has run successfully twice a year since 2019.

Abstract: The United Arab Emirates has embraced inclusive education across all academic levels since 2006. However, the degree of teacher acceptance of inclusive practice varies. This mixed-methods case study investigated 48 primary school teachers' concerns, self-efficacy, attitude, and intentions on inclusive pedagogy in English literacy for bilingual dyslexic students aged 5-11. It also identified challenges faced by teachers in mainstream classes. Using correlation analysis, results showed negative associations between teachers' concerns and efficacy, attitude, and intentions for inclusive practices. On the other hand, positive associations were found between teacher efficacy, attitude, and intentions for inclusive practices. Challenges included reconciling the bilingual curriculum for dyslexic students, providing individual support, and managing large class sizes. The teachers underscored prioritizing inclusive support from inclusion champions, offering ongoing professional development, having an additional teacher or skilled assistant in the classroom, and reducing the student-to-teacher ratio in each class as few of the key success factors in inclusive education.

Keywords: inclusion, dyslexia, bilingualism, teacher challenges

Introduction

Inclusive education has been recognized worldwide as a fundamental human right which all people should be entitled to, regardless of their circumstances. However, even though nearly 240 million children all over the world live with disabilities, only a small fraction of them receive education due to their disabilities (Shelton & Gezer, 2023). These children are still denied an equal chance of quality education (UNICEF, 2021). This distressing statistic highlights the urgent need for inclusive education policies and practices that take all students into consideration, whether they are gifted or challenged, disabled or not, male or female, or whether they are from different ethnic or linguistic backgrounds.

According to Ydo (2020), the fundamental principle of inclusive education is that every child, regardless of their differences, can learn in the same classroom with his or her peers. It is a social model which contends that disability is a result of societal inequalities and not the deficiencies of the individual. Involving students with different learning styles and needs in an inclusive classroom allows them to develop and achieve their full potential with the help of their peers and teachers. Research shows that inclusive environments can be a source of academic enhancement and social-emotional development for children with and without disabilities (Dell'Anna et al., 2020). Classrooms that are inclusive help to build empathy, respect diversity, and ensure the students are ready to face the world with its increasing diversity. Moreover, inclusive education corresponds with the global development targets that emphasize quality education for all people as a means of equality and social justice.

Over the past years, the concept of inclusive education, with an aim in promoting equity in education, has gained notable momentum and progress worldwide, including the United Arab Emirates (UAE). Inclusive education is one of the key foci of the country's educational policies. The UAE has introduced inclusive education as part of its profound commitment to giving each student an equal opportunity to learn, regardless of disability or non-disability. This approach certainly will create a learning environment where each student feels valued, recognized, and supported within mainstream education (Arif & Gaad, 2008).

The purpose of the UAE to incorporate inclusive education is based on the idea that diversity should be honored and welcomed within society (Alborno & Gaad, 2014). The idea of inclusive education in the country reflects the stand of the UAE leaders and the attitude of the whole community towards diversity and tolerance. This dedication goes beyond the four corners of the classroom and encompasses all aspects of its community.

Gaad (2004) articulated that preparing for and implementing effective inclusive education is not just a physical placing of students with disabilities into regular classrooms but also creating a learning environment where all learners are supported. It is a comprehensive model which has modifications in the curriculum, support services and teacher training to make sure that students with disabilities are treated equally with their peers in the education system. Furthermore, the UAE's efforts for inclusive education are aligned with the global trends and

the best practices for special education. Alghawi et al. (2017) further detailed that the UAE government is trying to achieve this by building a diverse educational system that will not only provide a learning environment that is accessible to all but also one that will encourage empathy, understanding and respect among students. It is evident that the government is dedicated to inclusive education through its numerous activities such as the allocation of resources, the formulation of inclusive policies, and the regular campaigns to educate people about the importance of diversity in educational settings. This very promise is a manifestation of the UAE's goal to create a society that gives everyone an opportunity to become the best version of themselves and to be a part of the country's progress. This policy, to be implemented by the UAE, will help raise the level of social integration and reduce the level of stigmatization of people with special needs or disabilities. Additionally, it reflects a government commitment towards meeting international standards such as the Sustainable Development Goals, particularly Goal 4 which focuses on ensuring quality inclusive education for all (UNDESA DISD, n.d.).

However, the process of introducing high-quality inclusive education is not without its own challenges. Teachers who are the most effective in implementing inclusive education are the ones who face multiple challenges and difficulties in the course of their work. As for the main issues and challenges that teachers face, they may include lack of training and knowledge in inclusive education, insufficient resources and support, dealing with the different needs and capabilities of students in the classroom, addressing behavior problems, adapting curriculum and instructional materials to the needs of the students, making sure that all students have equal opportunities, and working together with other professionals (Glazzard, 2011).

Abongdia et al. (2015) stated that teachers' concerns and challenges can be decisive factors in the degree of their self-efficacy, attitude, and intentions use inclusive pedagogy. The lack of proper addressing of these concerns and challenges may decline teachers' confidence and make them doubt their ability to implement inclusive practices effectively. This decrease in the confidence of teachers may, in turn, impact their view of inclusive education. This argument is supported by Alghazo & Gaad (2004) which emphasized that teachers may become more reluctant or unwilling to adopt inclusive education if they are not sure about their skills or do not have enough support to meet different needs of students. Teachers who experience a lack of professional development, training and resources may struggle with how to adjust the curriculum and the instructional materials to be responsive to the various needs of their students. On top of this, the extra task of supervising behavior problems and making the children feel welcome and included in the classroom can also lead to the teachers being overloaded.

Moreover, the challenge of collaboration with other industry professionals, such as special education teachers, speech therapists, and counselors, is another layer of complexity to effective implementation of inclusive education. Teachers and other professionals express difficulty to allocate time for meaningful discussion about transformative inclusive pedagogy due to time constraints. The excessive volume of administrative tasks they face hinders their profound desire to explore effective inclusive pedagogy. The school management should be aware that an environment with proper collaboration among school professionals is critical to the provision of services that meet the diverse needs of students, whereas inadequate communication and coordination among

professionals can prevent the smooth integration of services (Horne & Timmons, 2009).

Hammond & Ingalls (2003) elaborated on the notion that if educators continue to face such challenges, this may potentially lead to a decline in their self-efficacy and confidence. Consequently, this could also influence their attitudes and willingness to completely adopt and embrace inclusive pedagogy. Recognizing the complex nature of these problems and giving specific aid to teachers to allow them to cope with these challenges is highly important. Through the holistic consideration of these issues and challenges, and the provision of ongoing professional development and resources, teachers can be more equipped to develop a more positive and confident mindset, which will in turn lead to the successful implementation of inclusive education.

While there is a consistent demonstration of the continued dedication to creating a more equitable and inclusive education system for all students in the UAE, there seems to be a lack of comprehensive literature discussing how self-efficacy, attitude, and intentions of the teachers to implement inclusive pedagogies are affected by the concerns they encounter in schools and classrooms. Moreover, there is a need to explore the challenges that teachers are dealing with in teaching in a mainstream classroom, where students with and without disabilities are present, is also required. These factors need to be deeply considered to adequately provide the teachers the necessary support and resources to enable them to effectively implement inclusive education practices in the country.

Purpose of the Study

This study aims to address the complex relationship between primary teachers' concerns and their self-efficacy, attitude, and intentions towards the implementation of inclusive pedagogy in English literacy classrooms for bilingual dyslexic students in the United Arab Emirates. Through the exploration of these factors, the study seeks to reveal the underlying issues and impediments that teachers may face in supporting the implementation of the inclusive pedagogy. To determine the impact of teachers' concerns, its linear relationship or association with self-efficacy, attitude, and intentions were measured through correlation coefficient.

Significance of the Study

This study holds considerable significance within the field of primary and inclusive education. The results shed the light on essential approaches that lead to a more developmentally-appropriate, supportive, inclusive, and equitable educational environment in the UAE. In addition, the results of the study could be highly significant and beneficial to the various stakeholders in primary education as follows:

Students

It is the main target of this research that students should get to know the issues and the concerns which are faced by primary teachers while implementing inclusive pedagogy for bilingual dyslexic students in English language classrooms in the UAE. Through this exploration of teachers' self-efficacy, attitudes, and intentions, students

can acquire invaluable information that will help to explain the dynamics of their learning environment. This research therefore can be a stepping stone towards the improvement of those support systems which are customized to the needs of bilingual dyslexic learners and as a result the classrooms will be more welcoming and comfortable. This study may possibly result in an improvement of the educational experience and outcomes of students with dyslexia, thus allowing the primary education to be more equitable and inclusive in the UAE.

Teachers

This study holds great importance to teachers as it covers the intricate associations between their concerns, self-efficacy, attitudes, and intentions relevant to implementing inclusive pedagogy for bilingual dyslexic students in English literacy classrooms in the UAE. In this sense, the research by identifying the issues and barriers that teachers may encounter in such a situation, provides precious information for the purposes of professional development programmes that would meet the particular needs. Knowledge on how concerns affect self-efficacy and attitudes allows teachers to face challenges, improve their confidence and improve their teaching abilities to support the diverse learning needs of bilingual dyslexic students. In the end, the results of this study may contribute to a much more open and tolerant teaching atmosphere, facilitating better learning outcomes for all students in the UAE.

Management, Curriculum Developers, and Policymakers

This study is of great interest to management, curriculum developers, and policymakers as it focuses on the critical intersection of primary teachers' concerns, self-efficacy, attitudes, and intentions towards inclusive pedagogy for bilingual dyslexic students in English literacy classrooms in the UAE. Through the analysis of these factors, the study offers important information that can guide the creation of policies, curriculum frameworks, and professional development programs to promote inclusive practices in educational institutions. The knowledge of how teachers' concerns influence their capability and aspiration to implement inclusive pedagogy is critical in the development of focused interventions and support systems that help educators to overcome the challenges and improve their teaching practices. In the end, findings of this study have the ability to foster systemic changes that will ensure equal access to quality education to bilingual dyslexic students and in turn improve the education system in the UAE.

Parents

This study is particularly relevant to parents since it provides information about the factors that affect primary teachers' ability to implement inclusive pedagogy for bilingual dyslexic students in English literacy classrooms in the UAE. Through comprehension of the influence of teachers' concerns on their self-efficacy, attitudes, and intentions, parents can understand the obstacles their child's teachers might encounter in delivering effective support. This learning empowers parents to work together effectively with the teachers and school management in establishing strategies to address these concerns and develop a more supportive and equitable learning

environment for their children. Ultimately, the results of this study could foster stronger partnerships among parents and teachers, which would surely result to improved educational achievements and outcomes, and better support system for bilingual dyslexic learners in the UAE.

Literature Review

The section provides an overview of previous research on concepts and approaches for inclusive education. In addition, it covers the impact of teachers' concerns on their attitude towards inclusive education, self-efficacy, and intentions of implementing inclusive pedagogy. Lastly, it introduces the theoretical foundation that guides the study by providing a structure for comprehending, analyzing, and interpreting data.

Learning for All: The Concepts of Inclusion in Education

Inclusion in education, as described by Armstrong et al. (2009), is the practice of making certain that all students, regardless of their different backgrounds and abilities, receive quality education and are actively participating in the learning process. This argument was also supported by Ralić et al. (2020) who underscored that inclusive education is more than just access to education for all students, it is also concerned with creating a supportive and friendly setting where every student is valued and encouraged to learn. This approach acknowledges and honors the individual strengths and difficulties of every student, fostering the feeling of inclusivity and tolerance in the classroom.

Inclusion in education also encompasses the use of different teaching approaches and materials to cater for distinct learning styles and abilities (Mena et al., 2021). It encourages teamwork among students, teachers and parents; therefore, nobody's needs are left out and all students have the opportunity to achieve academically, socially and emotionally. In addition, it emphasizes the importance of creating a positive and inclusive school culture, which values diversity and respect among students and staff (Yasin et al., 2023). This also includes addressing systemic obstacles and biases that can prevent a student from gaining relevant learning opportunities. Carrington & Elkins (2002) specified that this might entail promoting policy changes, providing teacher training to enhance knowledge and understanding of diverse learners, and working to eliminate discriminatory practices within the education system. An inclusive environment in education is the product of a change of the way of thinking and dedication to equity and social justice. It is all about recognizing and valuing the unique contributions of every individual to the learning community and actively working to develop a learning environment where every student is seen, heard, and supported.

Inclusive education is more than only addressing the needs of students with disabilities or special needs; it is about celebrating the richness of diversity in all its forms and fostering a culture of belonging where all students can succeed (Kozleski & Yu, 2016). This encompasses recognizing and appreciating the different cultural, linguistic, and ethnic diversities that exist in the school community and providing chances for students to pick

up each other's life experiences and outlooks. St-Amand et al. (2017) further explained that the primary purpose of inclusion in education is to establish an educational setting where all learners can reach their maximum capacity and acquire a sense of control over their learning process. It is the development of empathy, tolerance, and respect for each other and teaching students to be successful in a multi-cultural and interdependent world. It involves promoting equity in education by supporting policies and practices that cater for the diverse needs of all students including those from the minority or underrepresented groups. Ultimately, inclusion in education is a concept that aims at creating a learning situation in which all students are appreciated, respected, and allowed to excel.

Inclusive Pedagogy: A Transformative Approach towards Equity in Education

Inclusive pedagogy is a transformative approach that aims at achieving equity in education by ensuring that all students, regardless of their origin or abilities, have access to quality education (Santos et al., 2020). It is not only about getting access, but also about embracing and appreciating the diversity of the students in the classroom. Inclusive pedagogy promotes educators to establish a classroom that is respectful to all students and where all students feel valued and empowered to participate in their learning. Lawrie et al. (2017) discussed that this approach acknowledges that every student has a different point of view and life experience and wants to use this diversity to make the learning process more interesting for all.

Inclusive pedagogy also promotes the use of various teaching methods and materials that cater for the varied learning styles, needs, and choices of the students. This may involve embedding multicultural perspectives in the curriculum, varied modes of representation and expression, and differentiation in assessments to cater for different abilities. Inclusive pedagogy aims at removing obstacles for learning and guaranteeing academic achievements for all students by adapting the teaching practices for different types of learners (Rix et al., 2009). This argument was further substantiated by Florian et al. (2010), explaining that inclusive pedagogy encourages educators to critically analyze their own personal biases and stereotypes, and to work towards creating a prejudice-free and stereotype-free learning environment. This involves encouraging open and honest dialogues about social justice, equity, and inclusion, and fostering empathy and understanding among students. By creating a respectful and accepting culture, inclusive pedagogy aims to offer fair learning opportunities and to foster a feeling of belonging and community in the classroom.

Inclusive pedagogies can be brought into the classroom using many approaches and practices that give priority to the diverse needs of students. Educators can use differentiated instruction, which enables them to adapt their teaching to students' strengths, interests, and learning styles (Penner, 2018). This method is not only suitable for different types of learners but also contributes to the development of a personalized and inclusive learning environment. Furthermore, Mirawati et al. (2022) underscored that collaborative learning activities and group projects can create a community and shared learning experiences among students, which removes the barriers and promotes mutual understanding and respect.

Inclusive pedagogy includes Universal Design for Learning (UDL). UDL supports a teacher to come up with a variety of instruction modalities in the classroom to tap into different students' learning styles (Meo, 2008). An instance is when a teacher will present the content through a video, lecture and a hand-out to ensure that you get to understand in a way that suits your style. On the contrary, they would enable students to perform tasks such as writing, visuals and speeches depending on their strengths and needs. Doing this research activities also can lead to breaking such walls and offer equal opportunity for those students who are different (Jando et al., 2017). Studies reveal that UDL proves quite effective in academic success as well as learning engagement for these students and for others.

Alrawi & Alkahtani (2021) highlighted another crucial point to mention is that culture responsive teaching practices are part of inclusive pedagogy. It is the process of integrating the cultural backgrounds, traditions, and histories of the students into the curriculum so that the students can perceive themselves in their learning experiences. Thus, the educators acknowledge and respect the personal identities and perspectives of their students, making the learning environment more inclusive and empowering. In addition, Hallqvist (2014) detailed that the offering of open discussions on social matters and current events may also contribute to the creation of an inclusive classroom by allowing students to express their thoughts, ideas, and feelings, and in the process, to foster empathy, comprehension, and critical thinking. Teaching that is culturally responsive embraces the students' cultural richness in the form of background, identity, context, and perspective. It combines these elements in the classroom curriculum and in the classroom culture. We can take an example, when the text with the main characters of different cultural background and eras are demonstrated, the students can express themselves freely. Teachers act as organizers for the group: they set the platform for sharing and modeling as students explain their cultural experiences about the subject at hand. This builds on an assemblage of an equitable environment where students are the best of themselves, cared for, giving opinions, and involved (Ydo, 2020). The research shows the effectiveness of the culturally relevant strategies in reduction of the dropouts and literacy rates in the minority group students.

Griner & Stewart (2012) explained that customized instruction could be interpreted as the teacher creating training methods tailored to the student's own needs. Teachers can design tiered activities that revolve around some levels of complexity, offer texts of different reading levels, set up learning stations for several learning modes, and let students have a choice of assessment methods. Research supports the idea that differentiated instruction can result in several positive outcomes for student achievement as it helps students in learning at the level matching with their learning characteristics.

Students are greatly influenced by inclusive pedagogies (Inclusive Education - What Does the Research Say?, 2017). Since this exhibits a positive and tolerant classroom environment, students feel appreciated and respected. Consequently, learners are more engaged in their learning, have the liberty to communicate and express themselves, and a greater sense of belongingness to their school community. Peer supports aid to developing social skills and relationship building. Diversity, awareness, and empathy are shaped by people's exposure to cultural differences (Carter et al., 2015). The argument was supported by Carter et al. (2007)

mentioning that accommodations that are given to disabled students reduce stigma, make them more self-assured, and aid them in achieving their best. Acknowledging and incorporating respect, dignity and welcoming character as essential elements enhances productivity. Building a community of equal chances for people with barriers is a necessary step for individuals with limitations. Finally, access to education is the key that opens the door to equal opportunities in the future for everyone (Medina-García et al., 2020). Hence, an inclusive system encourages all-around development of students. Inclusive pedagogies also enhance academic performance, as they cater to the varied learning requirements of the students, thereby increasing motivation, participation, and achievement at all levels. Furthermore, inclusive pedagogies foster understanding and empathy and help students acquire essential social and emotional competences, which will make them active and responsible citizens of the diverse and inclusive society.

The Impact of Teachers' Apprehensions on their Self-Efficacy, Attitudes, and Intentions of Implementing Inclusive Education Practices

Teachers are the key players in the success of inclusive education practices. However, they are confronted with a myriad of concerns or worries in the classroom that affect their attitude, self-efficacy, and intentions. Florian et al. (2010) emphasized that the apprehensions teachers have can significantly affect their interactions with students, parents, school administrators, and other stakeholders. Teachers' apprehensions across various subjects significantly contribute to their capacity to learn as well as offer students appropriate support in the classroom (Helsing, 2007). Teachers are faced with so many concerns in the class ranging from trying to cater to everyone, responding to behavior issues, and having almost no breaks and resources for proper planning. That teachers should accommodate the gifted and the challenged learners at different levels of learning and debilities. It is probable that it will be a challenge, especially in cases of large classes. Teachers also need to manage the balance between rules of play, classroom rules and relations between the students (Yang & Chao, 2021). It is a challenge that the imbalance between these factors in the class can sometimes disrupt the learning process. A fundamental challenge that is faced by the majority of teachers is that there always seems to be less and less planning time provided to prepare high-quality lessons, and to make modifications for diverse learners. Mahvar et al. (2018) stated that the successful adoption of inclusive education is very much dependent upon teachers being equipped with support, training, and resources which they can use to promote effective learning for all the learners.

Another teacher concern is handling, communicating, and establishing sound relationship with the students' parents. Mag et al. (2017) highlighted that the teachers reach out to the parents regarding the student's progress and any difficulties that they are facing and those regarding behavioral issues. Even though most parents are understanding, still, there are some who might doubt teachers' practices and profess their skepticism of our concerns about students' mental health. The teachers try to achieve a balance between playing the role of a children's supporter and remaining a cohesive partner of parents. The teacher-parent lack of communication and interactions are key barriers to team effort that should be in place for fostering inclusion (Dewi & Rapisa, 2020). Should the parents have an attitude that special classes are not useful, they might not indeed push their kids to

work hard or provide necessary resources.

Another pertinent point to add to teachers' concern is the support they receive from school administrators (Scarlet, 2021). In the communication process, teachers, on their part, highlight the need for the support team in the field of education, the optimal size of classes, free planning time and the opportunity to attend trainings. Supporting personnel in the school serves as the backbone of inclusive schooling. Thus, administrators of educating schools should ensure that the educators are given enough staffing help, supportive services, and training on differentiating instruction and dealing with students who have different needs (Motitswe, 2014). If educators feel like they are being made to bear the added burden of administration, teacher burnout is more likely to be the result. Once this phenomenon happens, the capacity of the teacher to bring about the required mental health and inclusion is greatly limited. Teachers can give useful feedback and input as this is the way to make administration understand how they should improve inclusion implementation.

Conrad & Brown (2011) explained that the chances of inclusive education to result in success strongly depend on the solution of these usual problems which classroom teachers have. Learning that meets the needs of all learners will be possible when teachers are accepted and are given access to the required support, resources, empowerment, and respect. The teachers, students and school administration are the main people of this collaborative and supportive approach.

Dignath et al. (2022) described teachers' self-efficacy in the context of inclusive teaching involves educators' belief in their capacity to effectively deliver learning to all students belonging to different needs population in the general education setting. This is where the coordination of support and services, differentiated instruction, effective classroom management, effective collaboration across fields and creating a comfortable environment for all students comes into the picture. Malinen et al. (2012) elaborated that teachers with high self-efficacy feel that any obstacles arising from inclusion do not worry them and are certain of their capability to effectively teach any student in an inclusive setting, whereas teachers with low self-efficacy question whether they can successfully teach all students in an inclusive setting.

The teachers whose whole career was built in a way that used to exclude the students with special needs, certainly face some apprehensions about the implementation of inclusive education (Thomas, 2020). They could be negative about feeling prepared enough, receiving supervision and leadership, having access to resources, as well as time allocated for talks and discussions. Teacher self-efficacy is influenced by the multiple dimensions of inclusion which is, in turn, negatively associated with teacher burnout. It may be punctuated with thoughts like 'I am not sure that I am ready to the whole responsibility by myself, ' 'how to deal with kids who are not satisfied with the classes?' and 'what if someone needs more assistance? '. If teacher concerns are not addressed well, teacher suspects the situation being impervious to any effect leading to a withdrawn sense of self-efficacy (Lev et al., 2018).

Loghmannia et al. (2018) explained that while educators who have the fewest worries about inclusion are very

likely to have the confidence necessary to carry it out effectively, those who harbor several concerns are less likely to have the confidence for successful implementation of inclusive education. The statement is backed by Artino (2012), stating that when teachers' particular concerns are getting recognized and solved diligently by proper professional development, example, leadership support, co-teaching arrangements and adequate planning time given, the problems will be minimized while self-efficacy will be increased. Teachers who feel supported in the advent of a more inclusive approach to instruction are not distracted from devising ways to educate effectively and promote growth in their students. Their confidence plays as an engine that doesn't give up despite the hardships. Thus, terms such as 'special education' and 'regular education' would become obsolete regarding the perception of educators as all would be capable of teaching all students in inclusive classes (Thomas, 2020).

The signification is the fact that unaddressed teachers' concerns will cause reduction of teachers' self-efficacy towards inclusive education. District and their directors should develop the practice of targeting and solving teacher issues as a way of strengthening the teachers' skill and optimism on delivering quality education.

Teacher attitude towards inclusive education is the attitude which looks at how teachers tend to look at or perceive inclusive education as a tool that brings students with disabilities and exceptional needs into the mainstream education classroom setting (Hsien et al., 2009). The provision of highly trained teachers, competent to deal with students with different needs and including them in the mainstream education curriculum, is a part of the inclusive education system. Mulyadi (2017) described teacher attitude about inclusive education is an essential aspect of teaching which includes teacher's beliefs that they have the capacity to provide suitable and correct accommodations and modifications for disabled students and furthermore, their conviction about the educational and social benefits of inclusion for all students.

Jordan et al. (2009) underscored that observably, the teacher's anxiety affects and brings up their disposition and methods for the inclusive class. Teachers who have many criticisms and reservations regarding the inclusion are more likely to have negative views and are less sympathetic to the positive aspects of the inclusion. This statement is supported by Monsen et al. (2013), mentioning, that the stressor that is usually faced by teachers when dealing with special needs students involves the lack of resources, time and help from other staff members to provide specialized instruction of students with additional needs, while also meeting the needs of the rest of the class. Moreover, teachers complain about lack of proper training, knowledge, and competence required for tailoring the instruction, dealing with the behavior matters, promoting social interaction, and making correct arrangements for students with disabilities (Tristani & Bassett-Gunter, 2019).

More experienced teachers who have a great deal of concern are at higher risk of going through frustration, overload, and stress when faced with the challenge of including learners with an additional need as requirement in their classes (Forlin et al., 2008). They could be more aggressive against the students with special needs if they are not prepared to take the responsibilities on their shoulders. They may be more radical or conservative, tending to assume that classes, factors, and people are separated and heterogeneous, hence, dissimilar to

inclusive models. Through a process of teachers' concerns being alleviated via greater support, training, and resources, their mindset can transform to become more welcoming and sensitive towards inclusive teaching approaches. Teachers' tendencies to be knowledgeable, self-confident, and driven can become even stronger through effective addressing of their doubts and questions, as they will feel empowered to work for the inclusion of all children (Martínez et al., 2021).

The above-mentioned arguments explain how higher levels of teacher being concerned versus inclusion pose a challenge to them and they, therefore, become resistant and skeptical of inclusion. On the other hand, lower or decreased concern shifts the teachers towards being more positive and supportive of inclusion. The extent of teachers' concern influences the teacher's looking in various perspectives without any constraints.

Teacher intention about inclusive teaching means that the teacher has a plan and commitment to employ instructional strategies and techniques that achieve the objective of educating all students with different backgrounds and learning needs while they are in the same classroom (Penner, 2018). These transformations are possible through redevelopments of the curriculum, assessment, and conducting of classes according to the individual needs of the learner regardless of what disabilities they have or what additional needs they may have.

Sijuola & Davidova (2022) mentioned that the extent to which educators have concerns about the application of inclusive education methodologies in their classrooms can greatly influence their reasoning and enthusiasm to use it. It is likely that a teacher with many worries, for instance, about their own knowledge, skills, and confidence in implementing the instruction, is going to be more bold or resistant in trying this new form of instruction. Providing services also to the teachers with concerns on how to manage a mixed-ability learning group, different learning needs and the lack of appropriate supporting resources and services is less likely to be easily adopted. Teachers who feel more secure and believe in their competency were shown to be more likely to value the importance of inclusive teaching by developing good intentions and attitudes regarding this (Woodcock & Jones, 2020).

Woodcock & Hardy (2017) added that it is important to prioritize the focus of training, which involves equipping teachers with up-to-date knowledge and foundational principles. This is essential for transitioning towards a more inclusive and supportive teaching approach. This is done by the extensive time and the provision of support for them to learn, strategize adaptations, and develop confidence in by use of new instructional skills which tackle their fear. González-Gil et al. (2013) also explained that school leaders should advocate for teachers to have access to tools such as instructional assistants, different types of learning resources, assistive technologies, and planning time to meet the varying learning needs. Common belief among the teaching staff that everyone can contribute to the classroom and a collaborative culture that supports inclusion not only school-wide but also in the classroom makes it possible for teachers to implement the most effective inclusive teaching methods. Adequate training, resources, and support may lead to these teachers' concerns being solved eventually, and, thus, when they focus on all students in the inclusive classrooms, their intention to succeed will be high (Martínez et al., 2021).

Theoretical Framework

In the field of inclusive education, one of the prevalent theory is the Social Cognitive Theory suggested by Albert Bandura (Nabi & Prestin, 2017). In this theory, teachers' concerns about inclusive education, as well as everyday worries they experience in school, can have a major effect on their attitude towards inclusion, self-efficacy and intentions to implement inclusive pedagogy. Apprehensions of teachers about inclusive education may result in a negative attitude to accommodating diverse learners in the classroom. These fears may be as a result of lack of resources, support, or training, which can affect their confidence in their capacity to teach all students (Peter & Nderitu, 2014).

(Schwab & Alnahdi, 2020) also elaborated that teachers' self-efficacy, which is the belief of the teachers in their own capacity to implement inclusive practices, is closely related to their concerns and attitudes towards inclusive education. If teachers are not confident in their capacity to change their teaching styles to suit the needs of the diverse learners, they will be less likely to adopt inclusive pedagogy. Teachers' self-efficacy in inclusive education is influenced by factors such as previous experiences, professional development opportunities, and access to resources, all of which affect their intentions to effectively implement inclusive practices in their classrooms (Dignath et al., 2022).

Furthermore, teachers' readiness to implement inclusive pedagogy is determined by their fears, beliefs, and self-efficacy (Specht et al., 2015). If teachers perceive inclusive education as too challenging or complicated because of their anxieties, they may be unwilling to participate fully in the incorporation of inclusive practices. Conversely, teachers with positive attitudes towards inclusion and high self-efficacy are likely to have strong intentions to integrate inclusive pedagogy into their teaching practices (Yang & Chao, 2021). The concerns of the educators should be resolved, self-efficacy should be escalated, and positive attitudes towards inclusion in education should be established to support the successful implementation of inclusive pedagogies in the classroom.

The theory focused on self-control and goal setting in behavior. When it comes to inclusive education, teachers who are involved in goal setting and self-regulatory practices are likely to diminish their concerns and fears and thus, enhance their self-efficacy and attitude and intention towards implementation of inclusive education practices (Woodcock et al., 2023). It implies that professional development and support programs that are aimed at enhancing teachers' self-regulation skills and goal-setting abilities will help them to overcome their fears and worries, thus, creating an inclusive educational environment.

This study utilizes Bandura's Social Cognitive Theory to determine how teachers' concerns about inclusive education and everyday problems they face in the school impact their attitudes about inclusive education, self-efficacy, and intentions. Bandura's theory enables the researchers to investigate cognitive and affective

processes that determine teachers' reactions to inclusive education. This framework offers a holistic perspective to analyze the relationship between teachers' concerns, their self-efficacy in implementing inclusive practices, and their orientation to inclusive education. Using this approach, the study seeks to provide an understanding of the determinants of teachers' attitudes and intentions towards inclusive education, thus, providing useful implications for professional development and support programs designed to promote inclusive practices in educational settings.

Research Questions

Based on the background, problem statement, and literature review, the following research questions were framed for this study:

- Is there a significant relationship between:
 - a) teacher concerns and self-efficacy to implement inclusive pedagogy?
 - b) teacher concerns and attitudes towards inclusive education and its implementation?
 - c) teacher concerns and intentions to adopt inclusive teaching practices?
 - d) teacher self-efficacy and attitudes?
 - e) teacher self-efficacy and intentions?
 - f) teacher attitude and intentions?
- What are the main challenges that teachers experience when implementing inclusive pedagogy in mainstream classroom settings?

Method

Research Design

This study employed a case study research design within the field of education to examine the relationship between teachers' concerns and their 1) self-efficacy to implement inclusive pedagogy, 2) attitudes towards inclusive education, and 3) intentions to adopt inclusive pedagogy among elementary English teachers within a private bilingual school setting in Dubai. In addition, the research investigated the primary challenges that the teachers faced when they sought to incorporate inclusive pedagogical practices in regular classrooms.

This case study used a mixed-methods model. The researchers collected, examined, analyzed, interpreted, and drew inferences by merging the qualitative and quantitative approaches. This methodological pluralism enabled the researchers utilise and leverage the gathered data extensively and synergistically.

Site and Participants

The study was conducted in a private bilingual, English and Arabic languages, IB curriculum school in Dubai, United Arab Emirates. With a focus on implementing inclusive pedagogy in mainstream English literacy classes

with bilingual dyslexic students in the primary years, the researchers used the purposive sampling, selecting all the grades 1-5 English teachers assigned in classes with bilingual dyslexic students regardless of the ethnicity, gender, age, highest qualification earned, years of experience, and other confounding variables.

There were 49 elementary English teachers in the school. However, out of the potential participants, only 48 consented to take part in the research as 1 was on maternity leave during the administration of the study.

Data Collection Tools

Concerns about Inclusive Education Scale (CIES)

The researchers utilized the CIES to measure the participants' degree of concern on implementing inclusive teaching practices stemming from the challenges that he or she faces in everyday classroom (Sharma & Desai, 2002). There are four factors considered in the tool. The first were concerns on resources, which are in terms of resources and financial support. Second, were the concerns of acceptance and tolerance, which encompassed, but not limited to, the acceptance of regular students with special needs students. Third, were the concerns of academic success and standards locally and worldwide. Finally, the fourth factor was the worry about the teachers' administrative and teaching workload in a mainstream school setting that implements inclusive education. The scale contains 21 items. Each item can be answered on a 4-point Likert-type scale classification with responses varying from extremely concerned (4), very concerned (3), little concerned (2), to not concerned at all (1). The CIES provides a total score which is calculated by summing the value of responses on each item. The total score is valued between 21 and 84. A higher score of CIES means that a respondent is more worried about his or her ability to implement inclusive pedagogy.

Teacher Efficacy for Inclusive Practices (TEIP) Scale

The TEIP scale evaluates teachers perceived self-efficacy in implementing inclusive practices (Sharma, Loreman, and Forlin, 2012). It evaluates teachers' self-efficacy in teaching students with diverse needs in inclusive classrooms. Teacher's self-efficacy considers 3 factors: 1) efficacy to use inclusive instructions, factor related to a participant's perceptions of his or her teaching efficacy in using inclusive instruction, 2) efficacy in collaboration, factor related to an individual's perceptions of teacher efficacy in working with parents and other professionals on topics about inclusive education, and 3) efficacy in managing behaviour, factor related to self-perceptions of The scale consists of 18 items with a six-point Likert scale from 1, strongly disagree to 6, strongly agree. The total score can be calculated by summing the responses for each item and ranged from 18 to 108 with higher scores indicating that participants have a high sense of perceived teaching efficacy for teaching in inclusive classrooms.

Attitude towards Inclusion Scale (AIS)

The AIS was developed to assess the attitudes of teachers towards inclusion. It includes ten seven-point Likert

items, with responses ranging from 1, strongly disagree, to 7, strongly agree. This scale is used to assess the beliefs, perceptions, support, and attitudes of teachers about the inclusion of students with diverse needs in regular classrooms. It includes a set of statements or questions about inclusive practices, and teachers are asked to indicate their level of agreement or disagreement with each statement on a scale (Sharma & Jacobs, 2016).

Intention to Teach in an Inclusive Classroom Scale (ITICS)

The ITICS, as Sharma and Jacobs (2016) described, was formulated in a manner to depict the educator/s intentions to teach in an inclusive classroom, or in a mainstream class that have special needs students. The questions focused on the teaching in relation to working with students who need additional support. The items in this scale were more action oriented rather than belief oriented. This scale also employed a 7-point Likert-type response format in which the scores varied from extremely unlikely (1) to extremely likely (7). Constructs of the ITICS are the intention to implement curriculum changes, and intention to consult with others.

Interview

An interview was conducted to determine the factors which serve as challenges when teachers bring about inclusive learning in the mainstream classroom. The teachers were asked one open-ended question where teachers were asked to cite all the difficulties that they have faced or still have as they try to teach in a class where both dyslexic and regular bilingual students are together. This way, teachers were able to explain in more detail what the exact obstacles were when it comes to adapting the curriculum, inventive methods of instruction, social and behavioral issues, management issues, and any other part of mainstream education that entails implementing inclusive educating strategy. The qualitative data garnered from this level of enquiry provides ideas on ways teachers can be assisted to make their classrooms more friendly for the learners.

Data Gathering Procedures

As an integral component of ethical research practices, the researchers ensured compliance with the ethical standards and safeguarding the welfare of all the institution's stakeholders involved in the research process. The researchers obtained the necessary permissions and consent to ensure that the study is carried out in a morally responsible approach. This process involved distributing and collecting signed 1) letter of request to the institution from the school principal, and human resource head, and 2) participant information sheets, and consent forms from the 48 primary English teachers. These actions ensured transparency and accountability in requesting access to the research setting, as well as the autonomy and understanding of the research objectives and the rights of the research participants.

The researchers distributed the questionnaire, containing the CIES, TEIP, AIS, and ITCS scales, to the participants. Two weeks were allocated for retrieval of the research instrument to allow sufficient time to understand, seek questions, and complete the questionnaire. Throughout the administration of the research

instrument, the researchers visited the school daily to ensure that any concerns from the participants were addressed promptly and accordingly.

Lastly, one-on-one interview to all 48 elementary English teachers was conducted for two weeks after the retrieval of the questionnaire. The participants were asked to share the challenges they faced and still have as they implement inclusive pedagogy to mainstream classes with bilingual dyslexic students. This approach enabled thorough investigation of the views, experiences, and feelings of each participant, thus producing rich and detailed data. Furthermore, the private nature of the one-to-one interview allowed the participants to openly share their thoughts and feelings without the fear of being judged, influenced by social pressure, or putting their jobs at risk which resulted in more honest and candid responses.

Data Analysis

The questionnaire, which included the CIES, TEIP, AIS, and ITCS scales was used to measure the following: 1) degree of the participants' concerns or apprehensions related to implementing inclusive education practices due to the challenges they encounter within the school environment; 2) degree of perceived efficacy in carrying out inclusive practices in their classrooms; 3) degree of the attitudes of the teachers towards inclusion in mainstream education; and 4) degree of the participants' intention to implement inclusive pedagogy in their classes. The researchers employed data interpretation through mean scores to review, analyze, and draw relevant conclusions by calculating the average scores across the gathered data set. The mean interpretation table was then adapted by the researchers from Rouse and Dreyfus (2021) to examine, identify trends, recognize patterns, and convey complex information. The modification was validated by 6 faculty members of the Higher Colleges of Technology in the faculty of education. All the validators possess doctoral degrees holders, hold the position of assistant professor, and boast over 25 years of teaching experience.

The researchers then utilized the Pearson Correlation Coefficient (r) to measure the degree of linear relationship between 1) teacher concerns and self-efficacy to implement inclusive pedagogy, 2) teacher concerns and attitudes towards inclusive education, 3) teacher concerns and intentions to adopt inclusive teaching practices, 4) teacher self-efficacy and attitudes, 5) teacher self-efficacy and intentions, and 6) teacher attitude and intentions. The t-statistic for testing the significance of a correlation coefficient was then computed to test whether the observed correlation coefficient is statistically significant, or the events although seem correlated occurred by chance.

Lastly, the researchers noted the challenges that the 48 primary English teachers face during the implementation of inclusive classroom practices in their mainstream classes with bilingual dyslexic students. The data gathered from this tool offers insights into how educators can be supported in creating a more inclusive and equitable learning environment for their students.

Results

The Degrees of Teachers' Concerns, Self-Efficacy, Attitudes, and Intentions of Implementing Inclusive Pedagogy

The 48 primary English teacher participants' degrees of concerns, self-efficacy, attitudes, and intentions of implementing inclusive classroom practices were determined by calculating the mean scores of the gathered results from 1) Concerns about Inclusive Education Scale (CIES), 2) Teacher Efficacy for Inclusive Practice (TEIP), 3) Attitude towards Inclusion Scale (AIS), and 4) Intention to Teach in an Inclusive Classroom Scale (ITICS). The mean scores were then analyzed statistically by adapting the mean interpretation table from Rousse and Dreyfus (2021). Modifications were employed accordingly to aligned with the gathered data from the utilized research instruments.

Degree of Teachers' Concerns in Implementing Inclusive Pedagogy Influenced by the Challenges Encountered in Everyday Teaching

Table 1 displays the modified mean interpretation table used to analyze the calculated mean score from the Concerns about Inclusive Education Scale (CIES).

Table 1. Teacher Concerns' Mean Score Interpretation

Mean Score	Interpretation
3.51 – 4.00	To a very high degree
3.01 – 3.50	To a high degree
2.51 – 3.00	To some degree
2.01 – 2.50	To a low degree
1.51 – 2.00	To a very low degree
1.00 – 1.50	Not at all

As presented in table 2, the teachers express a high degree of concern about implementing inclusive education practices in their classrooms, considering several numbers of challenges they face in their day-to-day teaching. However, considering the standard deviation is around 1.1, this suggests that there is considerable diversity in responses. The data show that among all the factors considered in the CIES, the teacher participants conveyed that they have no to a very low degree of concern in the following: 1) lack of knowledge and skills in implementing inclusive pedagogy, 2) lack of incentives in return of the additional responsibilities that inclusive education entail, and 3) decline of academic achievements of regular students.

Table 2. Mean Score from the Concerns about Inclusive Education Scale (CIES)

Mean Score	Standard Deviation	Interpretation
3.1002	1.1074	To a high degree

Degree of Teachers' Self-Efficacy to Implement Inclusive Pedagogy

The Table 3 illustrates the adapted mean interpretation table utilised to draw valuable insights from the calculated mean score from the *Teacher Efficacy for Inclusive Practices (TEIP) Scale* completed by the 48 primary English teachers.

Table 3. Teacher Self-Efficacy' Mean Score Interpretation

Mean Score	Interpretation
4.16 – 5.00	To a very high degree
3.33 – 4.15	To a high degree
2.50 – 3.32	To some degree
1.67 – 2.49	To a low degree
0.84 – 1.66	To a very low degree
0.00 – 0.83	Not at all

The table 4 shows that the teachers have high degree of self-efficacy for inclusive practices. The findings indicate that teachers feel confident in their knowledge, competencies, and abilities to actively engage in fostering inclusive classroom environments through the implementation of effective and successful teaching methods. The value of the standard deviation reflects that there are sections in which the teachers' responses vary.

It is important to note that teachers express that they are not confident in 1) preventing disruptive behavior in the class before it happens, 2) designing learning opportunities that cater the individual needs of the students with disabilities, and 3) informing colleagues and other stakeholders who know little about the laws and policies about inclusive education. The results suggest a call for providing teachers with increased opportunities to attend trainings, workshops, and other avenues aimed at enhancing their knowledge and skills in inclusive education.

Table 4. Mean Score from the Teacher Efficacy for Inclusive Practices (TEIP) Scale

Mean Score	Standard Deviation	Interpretation
4.0134	1.1484	To a high degree

Degree of Teachers' Attitudes on Inclusive Education and its Implementation

The meaningful interpretations from the computed mean score from the Attitude towards Inclusion Scale (AIS) was formulated by adapting the mean interpretation table, as presented in Table 5.

Table 5. Teacher Attitudes' Mean Score Interpretation

Mean Score	Interpretation
5.85 – 7.00	To a very high degree
4.69– 5.84	To a high degree
3.52 – 4.68	To some degree
2.35 – 3.51	To a low degree
1.18 – 2.34	To a very low degree
1.00 – 1.17	Not at all

Table 6 illustrates that teachers exhibit extremely highly favorable attitudes towards inclusive education and its implementation to their classes. Low standard deviation implies that the gathered data present consistent and homogeneous answers. This demonstrates that teachers have very strong and positive attitudes toward the principles and practices of inclusive education, particularly in how they implement them in their own classes, and the concrete efforts of UAE to include people of determination in mainstream education as reflected in the Ministerial Resolution No. 647 for the year 2020 on the policy of inclusive education.

Table 6. Mean Score from the Attitude towards Inclusion Scale (AIS)

Mean Score	Standard Deviation	Interpretation
6.8333	0.3701	To a very high degree

Degree of Teachers' Intentions to Adopt Inclusive Teaching Practices

The primary source of the generated discerning analyses from the calculated mean score from Intention to Teach in an Inclusive Classroom Scale (ITICS), was the adapted mean interpretation table, as presented in Table 7.

Table 8 shows that teachers have a very high degree of intentions to implement inclusive education. The results imply that the teacher participants are extremely motivated, enthused, and committed to implement inclusive pedagogy in their classrooms. However, it is important to note that teachers express reluctance of the idea of including students with severe disabilities in the class.

Table 7. Teacher Intentions' Mean Score Interpretation

Mean Score	Interpretation
5.85 – 7.00	To a very high degree
4.69– 5.84	To a high degree
3.52 – 4.68	To some degree
2.35 – 3.51	To a low degree
1.18 – 2.34	To a very low degree
1.00 – 1.17	Not at all

Table 8. Mean Score from the Intention to Teach in an Inclusive Classroom Scale (ITICS)

Mean Score	Standard Deviation	Interpretation
6.1875	1.0062	To a very high degree

Relationship between Teachers' Concerns, Self-Efficacy, Attitudes, and Intentions to Implement Inclusive Pedagogy

The linear associations between the following variables: 1) teachers' concerns and self-efficacy to implement inclusive pedagogy, 2) teachers' concerns and attitude towards inclusive education and its implementation, and 3) teachers' concerns and intentions to implement inclusive pedagogy were generated by employing Pearson correlation coefficient test and testing the significance of the correlation coefficient, as illustrated in Table 9.

Table 9 presents that there is a strong negative relationship between teachers' concerns and their self-efficacy. The results imply that the higher level of concerns in implementing Inclusive Pedagogy, which are influenced by the challenges encountered in everyday teaching, the lower level of confidence in incorporating inclusive teaching practices.

In addition, the table also shows that there is a strong inverse relationship observed between teachers' concerns and their attitudes towards inclusive education and its implementation. This indicates that the higher the level of teachers' concerns in implementing inclusive pedagogy, which are impacted by the challenges encountered in their daily classroom teaching, the more negative attitudes towards the purpose of inclusive education and incorporating inclusive practices into mainstream classrooms.

Lastly, a moderate negative relationship exists between teachers' concerns and their intentions to adopt inclusive classroom practices is illustrated by the table. This suggests that as the teacher participants increase, their commitment to implement inclusive pedagogy effectively decreases to a moderate extent.

Table 9. Relationship between Teachers' Concerns, Self-Efficacy, Attitudes, and Intentions

	Pearson's correlation (r)	P-value
Predictor: Teachers' Concerns		
Self-Efficacy	-0.927	.000**
Attitudes	-0.885	.000**
Intentions	-0.749	.000**

Notes: Significant using the Pearson's correlation test at *P<0.05, **P<0.01

Table 10 illustrates the linear relationship between 1) teachers' self-efficacy and their attitudes towards inclusive education, and 2) teachers' self-efficacy and their intentions to adopt inclusive teaching practice after applying

the Pearson's correlation coefficient formula and testing the significance of the calculated correlation coefficient.

The findings show that there exists a strong positive relationship between the 48 elementary English teachers' self-efficacy and their attitudes. This indicates that a higher degree of self-assurance in executing inclusive pedagogy is linked to a more positive outlook towards inclusive education and its implementation.

Moreover, Table 10 displays that the teachers' self-efficacy and their commitment to adopt inclusive classroom pedagogy demonstrate a strong positive association. This implies that higher level of self-confidence in implementing inclusive practice are correlated with greater and more profound intentions to adopt them.

Table 10. Relationship between Teachers' Self-Efficacy, Attitudes, and Intentions

	Pearson's correlation (r)	P-value
Predictor: Teachers' Self-Efficacy		
Attitudes	0.978	.000**
Intentions	0.844	.000**

Notes: Significant using the Pearson's correlation test at *P < 0.05, **P<0.01

The table 11 displays the result after the application of Pearson's correlation coefficient formula and testing the calculated correlation coefficient to determine if there is a relationship between the teacher participants' attitudes towards inclusive education and its implementation, and their intentions to adopt inclusive pedagogy. The findings reveal that there's an observed strong positive linear association the two factors: teachers' attitudes and intentions. This relationship suggests that teachers who have positive attitudes towards inclusive education, considering it beneficial and necessary, are more likely to use inclusive teaching techniques in their classrooms. These attitudes may be caused by different reasons such as opportunities for professional development, a school culture that is supportive, and personal beliefs that are in line with the values of diversity and equity. Consequently, these teachers show a higher degree of motivation and dedication to implement inclusive practices, which are aimed at meeting the diverse needs of their students and ensuring equitable educational outcomes.

Table 11. Relationship between Teachers' Attitudes, and Intentions

	Pearson's correlation (r)	P-value
Predictor: Teachers' Attitudes		
Intentions	0.882	.000**

Notes: Significant using the Pearson's correlation test at *P<0.05, **P<0.01

Discussion

Teachers' Concerns in Implementing Inclusive Pedagogy Influenced by the Challenges Encountered in Everyday Teaching

The research findings underscore how every challenge they encounter in teaching contributes on the teachers' concerns in implementing inclusive pedagogy in mainstream classes (Mokala, 2020). The results reveal that teachers show an increased degree of concern to effectively implement inclusive pedagogy because they face a lot of challenges and problems within their classrooms. Ediyanto et al. (2023) highlighted that these apprehensions include the overwhelming challenge of meeting diverse learning needs, large number of students per class, lack of teaching aides, dealing with behavioral problems, covering colleagues' classes, struggling with short breaks and limited resources for effective teaching. Although teachers are putting in all their efforts, the lack of solutions to these daily challenges increases their anxiety about the successful implementation of inclusive teaching practices.

In addition, the results highlight the importance of addressing teachers' concerns in the context of the complexities of inclusive education. This supported the research conducted by Beyene & Tizazu (2011) mentioning that underscored that teachers have deep concern about their capacity to manage inclusive teaching practices in the presence of daily unattended challenges and perceived lack of support. The findings highlight the isolation felt by educators who undertake the laudable task of implementing inclusive education without the necessary resources or support systems. This brings out the critical necessity for schools and other stakeholders to focus on helping teachers to deal with these challenges (Forlin et al., 2008).

The findings reveal that in the presence of these problems, teachers have no option but to reconsider their acceptance of inclusive teaching approaches (Shelile & Hlalele, 2014). Faculty members are likely to feel overworked, frustrated, and professionally alienated when their work is continuously interrupted, either due to unforeseen circumstances or lack of the required support. And in such cases, they are usually very helpless and doubtful about their possibility of achieving success in inclusive education. We see from the data that they are not only obstacles to the successful implementation but may arise even when teachers are supportive of it in principle.

The conclusions derived from the study highlight the critical need for school management and other stakeholders to provide full support to teachers. The schools, as discussed by Su et al. (2022), can help to reduce the teachers' worries and create a friendly environment for the successful implementation of the inclusive pedagogy by addressing the underlying challenges like resource inadequacy and the overbearing class sizes. Moreover, continuous support and professional development activities help teachers to equip themselves with the required tools and strategies to manage the inherent challenges of inclusive education successfully. In the end, schools that actively respond to the concerns of the teachers and strengthen their support systems, create an inclusive learning environment where all students succeed.

Teachers' Self-Efficacy to Implement Inclusive Pedagogy

The findings on the teachers' self-efficacy to implement inclusive pedagogy identify several factors that affect educators' confidence in this regard. It is important to note that the level of teachers perceived self-efficacy is greatly affected by the quality and availability of training and professional development opportunities offered by the school (Schwab & Alnahdi, 2020). Teachers who are provided with thorough training and continuous support in inclusive education practices tend to feel more competent and confident in putting inclusive pedagogy into practice in their classrooms. The regular providing of such training by the school plays a crucial role in improving the self-efficacy of teachers in this area (Donath et al., 2023).

In addition, the support level and availability of resources greatly influence the self-efficacy of teachers in implementing inclusive pedagogy. This backs up the study conducted by Mena et al. (2021), elaborating that schools that focus on giving teachers the support networks, materials, and resources that are specific to inclusive education practices have teachers who are more confident in their ability to address diverse learning needs effectively. A positive classroom environment with manageable class sizes, conducive physical spaces, and supportive student behavior can enhance teachers' self-efficacy in applying inclusive pedagogy.

Although training and support bring benefits, the self-efficacy of teachers is also affected by the challenges they encounter in their everyday teaching. Many challenges that teachers face in the school setting, such as large class sizes, behavioral problems, and limited resources, can affect their confidence in their ability to implement inclusive pedagogy successfully (Taole, 2018). Given this, it is important to deal with these daily challenges together with the provision of training and support to teachers. Through resolving the underlying challenges experienced by educators, schools will create a positive environment for teachers to feel empowered and competent in the implementation of inclusive pedagogy, which will in turn benefit all students in the classroom.

Teachers' Attitudes towards Inclusive Education and its Implementation

The results demonstrate the teacher participants' highly positive attitudes towards inclusive education and its implementation. Alghazo & Gaad (2004) pointed out that teachers show a strong support to UAE's praiseworthy objective of inclusion of special needs students into the mainstream educational environments. Khalid & Othman (2022) added that the positive attitudes noted in the teachers represent a shared dedication to creating inclusive learning environments that value diversity and accommodate all students. This consistency with the wider objectives of inclusive education highlights the commitment of teachers to generating inclusive classrooms where every learner is appreciated and included.

Nevertheless, though teachers show positive attitudes to inclusive education, their perspective is also affected by the challenges that they face in their daily teaching. Teachers, however, may have worries and anxieties due to different challenges in the school environment despite their positive attitudes. These challenges, which include

big class sizes, poor resources, and behavioral problems, may affect teachers' confidence in the success of inclusive pedagogy (Peter & Nderitu, 2014). Consequently, even with a positive stance towards inclusive education, teachers may lose interest if they find the implementation process to be too difficult or impractical.

In this context, it is clear that the daily problems that teachers have to deal with are the most important issue to be addressed regarding the successful implementation of inclusive education practices. As emphasized by the research of Forlin et al. (2008), through recognition and resolution of the educators' concerns, a supportive environment is created in schools where teachers are given the power to implement inclusive pedagogy successfully. This highlights the need to take a comprehensive approach to inclusive education that not only fosters positive attitudes among teachers but also deals with the practical problems they face in their everyday teaching. By working together and with support from school authorities and other stakeholders, barriers to inclusive education can be overcome and inclusive learning environments can be created where all students can succeed.

Teachers' Intentions to Adopt Inclusive Teaching Practices

The research findings on teachers' intentions to adopt inclusive teaching practices reveal genuine commitment and intentions among the 48 elementary English teachers to incorporate inclusive pedagogy in their classrooms. Ismail et al. (2022) explained that teachers show profound desire to apply inclusive education approaches, consistent with the positive findings about their attitudes towards inclusive education and its implementation, in line with the UAE's laudable goal of mainstreaming special needs students. This dedication is a manifestation of not only their commitment to promote inclusive learning environments but also their understanding of the significance of diversity and inclusion in education. The positive intentions noticed in teachers highlight their readiness to adopt inclusive pedagogy and to develop classrooms which are friendly to all students irrespective of their abilities and backgrounds (Taole, 2018).

Nevertheless, although teachers have good intentions to embrace inclusive teaching practices, their ability to apply these practices is also affected by the difficulties they face in their everyday teaching. The results are aligned with the study of Schwab & Alnahdi (2020), mentioning that although teachers are genuinely willing to implement inclusive pedagogy, they may encounter many barriers in the school environment. Some of these challenges, such as limited resources, large class sizes, and behavioral issues, can influence teachers' self-efficacy in implementing inclusive practices in their classrooms. Therefore, teachers with good intentions may get discouraged if they see the process as overwhelming and unattainable.

Given these results, it is essential to deal with the daily problems teachers have and to encourage them to adopt inclusive teaching practices. Through support and resources to educators and practical barriers to inclusive education, schools will enable teachers to operationalize what they intend to achieve (Chiner & Cardona, 2013). Moreover, creating a collaborative school culture that appreciates and emphasizes inclusive education will increase the readiness of teachers to implement inclusive pedagogy successfully. In the end, by solving the

issues that the teachers encounter and by fostering their desire to adopt inclusive teaching practices, schools can develop inclusive learning environments where all students have the chance to succeed (Peters, 2002).

Relationship between Teachers' Concerns, Self-Efficacy, Attitudes, and Intentions to Implement Inclusive Pedagogy

The research results reveal a negative association between 1) teacher concerns and their self-efficacy to practice inclusive pedagogy, 2) teacher concerns and their attitudes towards inclusive education and its application, and 3) teacher concerns and their intentions to adopt inclusive teaching practices. The results reinforce the study conducted by Malinen et al. (2012) citing that the more teachers worry about the implementation of inclusive pedagogy, the less confident they become in their ability to implement inclusive practices. Such negative association implies that teachers' apprehensions, for instance, about how to address diverse student needs or lack of support, may reduce their self-efficacy, attitudes, and intentions towards inclusive education. The reasons for these findings may be due to the fact that teachers are overwhelmed by the challenges in the classroom such as limited resources, large class sizes, and lack of training in inclusive practices. The above concerns are critical to the empowerment of teachers and to the development of positive attitudes towards inclusive education.

On the other hand, the study shows positive associations between 1) teacher self-efficacy and attitudes, 2) self-efficacy and intentions, and 3) attitudes and intentions. Teachers with higher self-efficacy in implementing inclusive pedagogy tend to have positive attitudes towards inclusive education and stronger intentions to practice inclusive teaching (Çetin, 2015). This positive association implies that the self-efficacy of teachers is an important factor in determining their attitudes and intentions towards inclusive education. Teachers who have confidence in their ability to execute inclusive practices are more likely to adopt inclusive pedagogy and promote its use in their classrooms. This highlights the need for teachers to be provided with sufficient training, support, and resources to improve their self-efficacy in implementing inclusive pedagogy, as it can affect their attitudes and intentions towards inclusive education (Lautenbach & Heyder, 2019).

In summary, teacher worries have a strong impact on their self-efficacy, attitudes, and intentions towards inclusive education. The addressing of these concerns and the necessary support and resources to teachers is essential in empowering them and fostering a favorable attitude towards inclusive education. Through improving teachers' self-efficacy in using inclusive pedagogy, schools can foster positive attitudes and intentions towards inclusive education, thus generating inclusive learning environments where all students are respected and helped (Xue et al., 2023). Moreover, the creation of a positive school culture, which appreciates diversity and supports inclusive practices, can play a role in developing positive attitudes and intentions of teachers towards inclusive education. Through professional development opportunities, collaborative support networks, and a supportive school environment, teachers are empowered to overcome challenges and embrace inclusive pedagogy wholeheartedly (Donath et al., 2023).

Teachers' Challenges in Implementing Inclusive Pedagogy in Mainstream Classroom Settings

Apart from these two main issues, the findings present a number of other common, yet significant barriers that teachers face when trying to implement inclusive classroom practices successfully. The challenges range from adapting the instructional materials and methods to the different learning styles and abilities, managing the classroom dynamics to ensure equal participation and engagement, fostering positive attitudes and relationships among peers with different backgrounds and abilities, and addressing the administrative constraints and resource limitations that impact the implementation of inclusive practices (Van Mieghem et al., 2020). The results underscore the holistic and systemic nature of inclusive education and emphasize the importance of a strong support system and rich resources to enable the teachers to overcome these challenges successfully.

The results imply the need for focused and personalised interventions and collaborative efforts in solving the prevalent problems and promoting inclusive and equitable learning environments (Makhalemele & Nel, 2015). Some effective solutions may include the establishment of specialized training programs that provide educators with the necessary knowledge, skills, and resources to tackle and deal with the intricacies of inclusive pedagogy appropriately. Furthermore, the development of interdisciplinary partnerships among educators, specialists, and stakeholders can support collaboratively in creating tailored interventions and sharing of best practices to cater the varied needs of the students. Another pertinent point to add is the effort to promote policy reforms and provide adequate resources to support inclusive education programs can increase the capability of schools and teachers to deliver equitable learning opportunities to all students, regardless of their background or ability. Working on these challenges together and in advance, educators can create inclusive learning environments that foster the holistic development and academic achievement of all students (Sengupta et al., 2019).

Conclusion

This research has examined the degrees of teachers' concerns (Beyene & Tizazu, 2011; Ediyanto et al., 2023; Forlin et al., 2008; Mokala, 2020), self-efficacy (Donath et al., 2023; Mena et al., 2021; Schwab & Alnahdi, 2020), attitudes (Alghazo & Gaad, 2004; Khalid & Othman, 2022), intentions (Ismail et al., 2022; Schwab & Alnahdi, 2020), and challenges in the implementation of inclusive pedagogy in mainstream classrooms. The findings show a number of apprehensions or worries among teachers, which are caused by different teaching problems, including diverse learning requirements, large classes, and insufficient resources. These worries reveal the intricacy of inclusive pedagogy implementation and the necessity for support structures that will help teachers to overcome their fears and to implement inclusive pedagogy successfully. In addition, the research highlights the need to consider the teachers' concerns in the complexities of inclusive education, stressing the critical requirement for schools and stakeholders to offer support systems and resources that would enable the teachers to navigate these challenges successfully (Chiner & Cardona, 2013; Forlin et al., 2008; Peter & Nderitu, 2014; Peters, 2002; Shelile & Hlalele, 2014; Su et al., 2022; Taole, 2018)

Moreover, the study examines the association between teachers' concerns, self-efficacy, attitudes, and intentions to use inclusive pedagogy. The results suggest a negative relationship between teacher apprehensions and their self-efficacy, attitudes, and intentions towards inclusive education, highlighting the adverse effects of fears on teachers' willingness to embrace inclusive practices. On the other hand, self-efficacy, attitudes, and intentions are positively related, indicating the importance of training, support, and resources in building teachers' confidence and promoting positive attitudes towards inclusive pedagogy. These results verify studies of researchers (Çetin, 2015; Donath et al., 2023; Lautenbach & Heyder, 2019; Malinen et al., 2012; Xue et al., 2023) who highlighted the need to address teachers' concerns and improve their self-efficacy through focused interventions to promote favorable attitudes and intentions towards inclusive education.

In addition, the study explores the difficulties that teachers encounter when they have to apply inclusive pedagogy in mainstream classroom contexts. Educators face complex challenges which require customized interventions and collaborative efforts, from reconciling bilingual curricula to managing classroom dynamics and dealing with resource constraints. The study highlights the holistic and systemic character of inclusive education showing that teachers need to be supported by strong systems and rich resources to overcome these challenges successfully. Efficient answers can be special training programs, interdisciplinary collaborations, and policy changes to promote inclusive education initiatives and provide teachers with the required knowledge, skills, and resources to create inclusive learning environments where all students can succeed (Makhalemele & Nel, 2015; Mieghem et al., 2018; Sengupta et al., 2019).

Recommendations

This study could serve as an impetus for investigating potential connections between teachers' demographic characteristics such as ethnicity, gender, age, highest level of qualification attained, and years of experience, and how these variables influence the degrees of their concerns, self-efficacy, attitudes, intentions, and challenges in implementing inclusive pedagogy. Regression models could be used in quantitative analyses to evaluate the effect of these variables on teachers' perception and experiences, whilst controlling for potential confounders. Moreover, qualitative research could investigate how different identities influence teachers' views and actions, providing detailed information about the diversity of inclusive education. Through the consideration of these demographic variables, researchers can create a broader picture of the factors that influence readiness and capability of teachers to appropriately support bilingual dyslexic students in English literacy classrooms, and therefore, inform targeted interventions and support initiatives that are designed to meet the diverse needs of educators in the UAE.

Notes

Acknowledgements: The authors thank the participating students, teachers, and management of the school for their cooperation. In addition, the authors would like to express their profound gratitude to the validators of the

research instruments of this study.

Authors' contributions: All authors have equal contributions.

Competing interests: The authors declare that they have no competing interests.

Ethics approval and consent to participate: The researchers got approval from the school principal, human resource head, and participating teachers to conduct the study by signing the request form, participant information sheets, consent forms, and data collection forms. In addition, the researchers used pseudonyms to conceal the identity of the participants.

Abstract: The research aimed to examine primary teachers' experiences using inclusive pedagogy to serve bilingual pupils with dyslexia. Nine international elementary teachers participated in the study conducted at The International School, a multilingual International Baccalaureate (IB) institution in the United Arab Emirates. The school placed significant emphasis on fostering language and cultural diversity by implementing a dual-language education approach and offering a biliteracy curriculum in both English and French/German. Teachers' perspectives were gathered through qualitative interviewing and analysed thematically. The results highlighted the need for fair and inclusive learning settings and the benefits and pitfalls of inclusive pedagogy. The research demonstrated a shift towards equitable and personalised inclusive strategies that prioritise individual needs and fairness over conventional approaches. The task of reconciling bilingual education with dyslexia help posed a significant challenge, necessitating a prioritization of language assistance and inclusive support by teachers. Literacy was enhanced through structured phonics and multisensory materials, and successful bilingual instruction was supported by a collaborative effort among teachers and the implementation of translanguaging strategies. The research findings highlighted the value of individualised, team-based approaches in helping dyslexic children in a multilingual environment, adding to the conversation on inclusive education.

Keywords: bilingual education, dyslexia, inclusive education, translanguaging

Introduction

Students' scholastic achievement and self-esteem are seriously hampered by dyslexia (Donato et al., 2022), a neurological special learning need marked by reading, writing, and spelling issues. In the United Arab Emirates (UAE), a multicultural school context where several languages are spoken, and bilingualism is common, meeting the requirements of students with dyslexia can be challenging. The confluence of many language

systems causes this complexity, which makes it challenging to provide appropriate dyslexia support (Shaaan et al., 2021). This research explores primary teachers' experiences with inclusive pedagogy while assisting dyslexic students in reading within the distinctive setting of a multilingual school in the UAE. The research attempts to fully comprehend the difficulties experienced and approaches that educators use in promoting successful learning for dyslexic children, by investigating this unique setting.

According to estimates made by Tabari, 5–10% of school-aged children in the UAE have dyslexia, which is close to the global prevalence, and this number of prevalence emphasises the importance of efficient and focused literacy assistance tools in the classroom (Tabari, 2022). As students are required to traverse two languages, Arabic and English, during their educational journey, bilingualism adds an extra degree of complication. Due to this polarity, teaching dyslexic students reading skills requires a sophisticated approach (Rfissa, 2023). Additionally, previous studies on inclusive education by Sanger (2020) emphasised the crucial part that instructors play in creating inclusive learning environments where students with various learning needs may succeed.

A mindset that supports equal opportunity for all students, regardless of their talents or impairments, is known as inclusive education. The UAE's emphasis on inclusive education is aligned with international frameworks like the UNCRPD, which emphasises the right to education without discrimination (Gaad, 2019). The UAE Cabinet Resolution No. 35 of 2020 also emphasises that students with impairments, including dyslexia, have the same access to high-quality education as their classmates. The UAE's inclusive education system has changed significantly due to this decision (Dubai.gov.ae, 2020). This resolution demonstrates the UAE government's dedication to ensuring that children with disabilities, including those with dyslexia and other learning challenges, have the right to an equal opportunity to receive a high-quality education. The Cabinet Resolution No. 35 of the 2020 resolution denotes a commitment to provide the assistance and accommodations required for the achievement of students with disabilities and acknowledge the exceptional learning requirements of such children (Dubai.gov.ae, 2020).

Significantly, the resolution strongly emphasises dyslexia and other learning difficulties. The UAE government recognised its student population's wide range of learning demands by openly addressing dyslexia and other learning disorders. This acknowledgement is a step toward developing a more diverse and equal educational system that considers each student's unique talents and difficulties (bin Kashah Alshemeili, 2023). However, Buhumaid (2022) argued that numerous ramifications and difficulties are anticipated from UAE Cabinet Resolution No. 35 of 2020. On the one hand, it represents a development in favour of a more inclusive educational setting, encouraging a sense of dignity and belonging for students with impairments. Nevertheless, for implementation to be effective, extensive solutions are needed, such as providing support services, modifying the curriculum, and training teachers. The school system has to be significantly improved and funded.

The resolution also recognises the significance of early detection and intervention by focusing on dyslexia and other learning difficulties. The UAE fosters awareness, research, and best practices to help students with these issues. However, a comprehensive strategy for inclusive education should also cover a variety of impairments beyond dyslexia, considering that each condition has specific traits and requirements (Moe.gov.ae, 2023). To promote inclusive education, the UAE Cabinet Resolution No. 35 of 2020 emphasises the right of children with disabilities, including dyslexia and other learning difficulties, to obtain a high-quality education. Despite this statutory framework, little research has been conducted on primary teachers' experiences and difficulties while applying inclusive pedagogies, particularly in the context of dyslexia and multilingual education.

Examining the unique difficulties and possibilities elementary teachers face in bilingual educational contexts was crucial. The success of dyslexic students' literacy programmes depended on various variables, including teacher preparation, classroom resources, linguistic skills, and cultural influences. In general, our study aimed to unearth crucial environmental cues that would improve the support system for children with dyslexia (Schick et al., 2023). In line to this, our study intends to get an insightful understanding of the methods used by primary teachers to meet the literacy demands of dyslexic pupils in a multilingual environment by probing their experiences. In addition to adding to the body of evidence already available on inclusive education, our research attempts to provide helpful advice for improving teacher professional development programmes and creating educational policies that meet the varied requirements of children in the UAE.

Collectively, our current study focuses on primary teachers' experiences as they work through the difficulties of assisting pupils with dyslexia with their literacy at a bilingual school in the UAE. This study supports continuing efforts to develop an equitable and inclusive learning environment for all students by filling in research gaps and illuminating inclusive pedagogy's difficulties and triumphs.

Research Aims and Objectives

This study aims to explore the primary teachers' inclusive pedagogy experiences in literacy support for students with dyslexia in a bilingual setting.

The primary aims of this study that determined the research directions are:

To identify the key barriers to literacy support for dyslexic students in a bilingual setting.

To determine the effective pedagogical practices of teachers in a bilingual classroom.

To analyse the underlying issues regarding the dual literacy learning of dyslexic bilingual students.

Research Questions

How do teachers support dyslexic students' literacy in a bilingual setting?

What challenges do teachers have in providing literacy help for students with dyslexia?

Literature Review

Introduction

The research's literature review chapter delves deeply into thoroughly examining important topics that collectively help us understand the experiences, difficulties, and potential advantages of supporting dyslexic students' literacy needs in a bilingual IB school. In order to shed light on the complex interactions between dyslexia, bilingual education, and effective pedagogical practises, this chapter synthesises previously published academic research, establishing the groundwork for well-informed and situational-appropriate insights.

The nature of dyslexia and its substantial effects on language learning and acquisition are thoroughly examined in the first part. This paper clarifies educators' challenges while supporting language development in dyslexic pupils by exploring the cognitive and linguistic causes of dyslexia. The following section provides an overview of bilingual education within the International Baccalaureate (IB) framework, building on the knowledge gained in the previous segment. This section examines the difficulties involved in teaching individuals with dyslexia two languages at once while also highlighting the specific benefits of bilingualism.

After that, a methodical approach to addressing the prevalence of dyslexia in bilingual schools is taken, building on empirical research to provide precise knowledge of its incidence in this particular educational setting. This study helps to contextualise the investigation of teachers' knowledge and understanding of dyslexia, which sheds light on how well-prepared instructors are to meet the various demands of pupils. The literature study also explores educators' difficulties when trying to teach dyslexic pupils in a multilingual IB setting. The difficulties are supported by recent research, which connects the cited problems to the larger context of bilingual education and inclusive pedagogy.

The chapter concludes by looking at the possible advantages of properly addressing dyslexia within the bilingual IB context as the literature review progresses. These advantages, supported by empirical data, offer a prospective viewpoint consistent with the research's goal of identifying valuable suggestions to improve the literacy assistance programmes for dyslexic pupils in bilingual schools. This chapter's literature review integrates the many study strands to present a complete picture of the complex dynamics involving dyslexia, bilingual education, and pedagogical techniques.

Understanding Dyslexia and its impact on Language Learning

The definition and understanding of dyslexia, a complex and dynamic condition, have changed. It has significant consequences for language development. The conceptualisation, classification, etiology, and treatment modalities of dyslexia have all been gradually moulded by the development of scientific studies (Elliott, 2020). This section examines the development of dyslexia's definition over time, considers its neurobiological and environmental causes, and emphasises its significant impact on language development.

Although dyslexia is characterised by difficulty with reading and spelling, early conceptions of the condition were mired in discussions about its distinctiveness and how it related to other disorders (Snowling et al., 2020). The World Federation of Neurology's classification of dyslexia as a reading problem within average intelligence, a term later criticised for its lack of specificity (Critchley, 1970; Rutter, 1982), served as an example of historical ambiguity. Rutter, who favoured a more thorough approach, established diagnostic criteria that included hyperactivity and reading problems, cognitive abnormalities, soft neurological symptoms, clumsiness, and electrophysiological differences. However, the advancement of scientific ideas has been seen in the definition of dyslexia as it has changed through time. The International Dyslexia Association (IDA) proposed a neurobiologically based definition of dyslexia in 2002 that emphasised phonological processing issues (IDA, 2002). This definition anchored dyslexia within the context of specific learning impairments by highlighting the complex relationship between cognitive ability and the efficacy of classroom teaching.

Moreover, dyslexia affects several facets of language development in addition to its influence on reading difficulties. The paradigm change in the identification and separation of various reading obstacles is emphasised by Fletcher (2009). These include dyslexia-related single-word decoding, automatic word and text reading, and comprehension problems brought on by the interplay of decoding and fluency abilities. This categorisation highlights how cognitive and neurobiological variables influence different reading characteristics. The Dyslexia Research Trust emphasises that dyslexia is a condition that affects intellectual people who struggle to learn how to read, spell, or write despite receiving appropriate training (DRT, n.d.). Such people frequently struggle with expressive language issues, finding it challenging to convey their ideas and understand spoken language.

Dyslexic people may experience difficulties with motor skills, sequencing, and time management, impacting their everyday functioning (KHDA, 2023). Physical aptitudes, including coordination, fine and gross motor control, and dexterity, are all in the motor skills category. Studies have demonstrated that dyslexic people frequently display motor skill deficiencies, which can hinder tasks requiring deft motions like writing by hand or tying shoelaces. According to Stevani and Tarigan's (2022) research, there is a connection between dyslexia and motor ability deficiencies due to overlapping brain connections. These motor impairments interfere with daily and intellectual chores, causing dissatisfaction and low self-esteem. Behmard et al. (2022) categorised occupational therapy, and specialised exercises are two interventions that concentrate on improving motor skills and have shown promise in easing these difficulties. Another area of issue for dyslexic people is time management. According to research, people with dyslexia frequently struggle with executive functions, including time management, organisation, and planning (Indrarathne, 2019). These difficulties made it difficult to finish tasks on time, fulfil deadlines, or manage everyday tasks. As per Jacob et al. (2022), it is necessary to provide specific education and time management enhancement techniques for dyslexic pupils, such as visual aids, checklists, and technological resources.

Moreover, sequencing, which includes placing information in a particular sequence with care, is essential for activities like reading, spelling, and organising ideas. Dyslexic people frequently suffer from sequencing, making it difficult to decode words, remember the sequence of letters, and follow directions. Given that

sequencing is essential for comprehending the sequence of sounds in spoken language, this difficulty has been related to underlying deficiencies in phonological processing (Sarwat et al., 2023). Interventions emphasising explicit phonics instruction and multisensory learning techniques have successfully addressed sequencing difficulties (Premeti et al., 2023). Thus it is signified by various literature sources that dyslexia affects more than just reading; it also causes problems with motor skills, sequencing, and time management.

In lights of the above-mentioned literature-based facts this growing picture of dyslexia, based on scientific research, emphasises how diversely it affects language development. The transition from old arguments to new definitions reflects the dynamic interaction of environmental, neurological, and cognitive variables. As this section explains, understanding the complexities of dyslexia deepens our understanding of the difficulties people have learning languages and promotes a more inclusive and sympathetic approach in educational and cultural contexts.

Overview of Bilingual Education in IB School

A paradigm change in how language acquisition is thought of has evolved in the modern global environment marked by increased globalisation and a greater emphasis on inclusion to affirm cultural identities. Even though bilingual education is becoming more popular worldwide, there is still debate about whether it is appropriate for all students (Bialystok, 2018). Beyond the language courses, bilingual education comprises the organised and systematic use of two languages as teaching modalities throughout crucial components of the academic curriculum (Pham and Unaldi, 2022; Cenoz and Gorter, 2022).

The International Baccalaureate Primary Years Programme (IB-PYP) is a curriculum designed to support primary school students (ages 7–12) development as inquirers both within and outside the classroom. As long as specific requirements are satisfied, this programme may be used in any language, guaranteeing that teachers and students fully understand all aspects of the curriculum. Starting at age seven, PYP-adopted schools allow pupils to acquire two languages; their mother tongue and the host nation's language (Dix and Sniedze-Gregory, 2020). According to research by The American Council for International Education (2018), bilingual education programmes are being used in 30% of the world's 868 PYP schools participating, with Latin America having the highest adoption rates. The prevalence of bilingual policies or programmes and the effective implementation of PYP, including improved language competency in extra languages, were shown to be inversely correlated. As a result, bilingual education, focusing on multilingual abilities, is consistent with the core "learning by doing" methodology inherent to IB programmes.

A wide variety of curriculum ideas are included in bilingual PYPs, most of which are based on how much time is spent teaching the two languages. This distribution differs between academic disciplines and grade levels. For instance, a 50/50 model, which equally divides the instructional time between the two languages across all grades, is a popular strategy in the United States. However, some schools first prioritise the target language (L2) before shifting to a 50/50 split (Garcia, 2022). In addition, Green (2020) emphasised that language allocations at

bilingual PYPs worldwide reflect a range of interests, from a focus on the native language to a spotlight on the target language at various phases of primary school. As observed in situations like those in Mexico, Quebec, and the UAE, these allocations frequently comply with legislative requirements. Each bilingual PYP school creates a distinctive model adapted to meet its particular requirements, considering elements including teacher availability, governmental requirements, student demographics, and the broader educational interests of the school community. The variety of implementation strategies highlights how adaptable to are programmes' adaptability. In addition, the importance of multilingual education in enhancing personal identity and self-esteem, particularly among minority populations, is stressed by academics like Kasic et al. (2021). It can cause emotions of personal devaluation when a person's everyday language is marginalised and judged inappropriate for education. In contrast, linguistic acceptance in society and education raises self-esteem. The improvement of self-esteem has a beneficial effect on learning motivation.

Moreover, a global viewpoint and intercultural understanding are fostered via bilingual education. The IB programmes place a high prioritisation to intercultural awareness, providing them with the information and skills they need to navigate an increasingly varied environment successfully. People from different cultural origins are now living together, working together, and developing connections, as noted by the previous IB Director General George Walker (Walker, 2010: 69). The benefits of bilingual education for learners' language and literacy ability in both languages are consistently demonstrated by research. Reljić et al. (2015) conducted a thorough meta-analysis and found that bilingual education improves English reading outcomes to a moderate level. Notably, bilingual education leads to better results in Spanish for Hispanic students in the United States, and English results are equivalent to mainstream English programmes.

These findings are consistent with the effects of bilingual education projects in several nations across various circumstances and languages. This pattern is a well-researched Canadian French immersion programme best shows this pattern uses French as the primary language of teaching to educate Anglophone youngsters in Canada. Over decades of research, it was shown that even when the principal language of instruction was originally French, these students' English ability was on par with or even higher than that of their peers in English-speaking programmes.

Similar to English, results for French language skills ranged from moderate to high, albeit they fell short of those for children who speak French natively (Valentino and Reardon, 2015; Joye, 2019; Xu et al., 2022). In light of the abovementioned literature, it is signified that IB-PYP bilingual education offers a flexible method that encourages cognitive development, language competency, self-esteem, and intercultural awareness. The flexibility of bilingual PYPs in adjusting to various language ratios and ensuring successful implementation is highlighted by research findings. Ultimately, this strategy is consistent with the IB's focus on holistic education, preparing students for success in a multicultural and multilingual environment.

Prevalence of Dyslexia in Bilingual Education Institutions

The frequency of dyslexia among college students has come under increased international scrutiny, particularly at multilingual educational institutions. While dyslexia research has picked up in English-speaking nations, the UAE has also realised how crucial it is to examine the condition in the context of that nation's linguistic and educational system. With the aid of important research papers, this literature overview explores the frequency of dyslexia in bilingual educational settings.

Up to 10% of school-age children worldwide are affected by developmental dyslexia, a learning impairment that hampers reading competencies (Taha et al., 2022). Estimates from several sources suggest that around 10-15% of the population in the Gulf area has dyslexia, with severe instances making up 4-5% of all cases. Students with dyslexia often struggle with reading, spelling, and writing tasks, exacerbating their reading issues (Benkohila, 2018). On the other hand, despite the lack of precise statistics about students with dyslexia in the UAE, a study carried out across 15 schools in Dubai by the Lexicon Reading Centre provided helpful information. According to this assessment, 65% of students have a high chance of developing dyslexia, with another 17% showing a mild-to-moderate risk (Noor, 2016). These figures highlight the urgent need for specific intervention measures in the educational landscape of the Gulf region, particularly in multilingual environments like the UAE.

Worldwide studies have revealed variable incidence rates of dyslexia among pupils. The prevalence of alphabetic languages has been reported to range from 5% to 17%, with some studies revealing a higher incidence than in non-alphabetic languages, according to Lin et al. (2020) research performed in the bilingual educational context. In addition, dyslexia frequency among Uyghur youngsters in the Xinjiang region, China, was investigated. The Turkic family of phonetic languages, which the Uyghurs speak, is akin to alphabetic languages. In bilingual elementary schools, Uyghur students showed a greater prevalence of dyslexia (7.0%) than Han children (3.9%). These results highlight the complex link between language structure and the incidence of dyslexia. As universities are among the most rigid blends of multilingual educational settings, seminal research conducted in the UAE during the academic year 2007/2008 indicated a prevalence of symptoms associated with dyslexia at 17.6%. Importantly, these issues were present in the students' first and second languages, Arabic and English. The study also showed that dyslexic students preferred career-oriented courses, which may have been affected by their coping mechanisms and professional goals.

There are gender differences in the incidence of dyslexia, with male children typically having a risk ratio of 3.71:1 greater than female children. However, other studies contend that subject selection biases and referral practices may contribute to this gender gap, thus inflating prevalence statistics (Yang et al., 2022). The importance of these research findings is that they demonstrate the necessity of comprehensive dyslexia screening programmes in bilingual educational institutions. Although English and Arabic have very different languages, dyslexia tends to transcend linguistic barriers, highlighting the significance of customised therapies in bilingual educational contexts (Smith, 2022). Previous studies on the incidence of dyslexia in bilingual educational settings have found varying percentages in various language environments. While there are still gender differences, the complicated link between language structure and the incidence of dyslexia makes it more challenging to comprehend this illness.

Teachers' Knowledge and Awareness of Dyslexia

Various researchers explored the knowledge and awareness among teachers about dyslexia teaching. In line with this one of the prominent studies by Yin et al. (2020), Chinese-speaking early literacy teachers in Mainland China were surveyed about their knowledge of dyslexia. Five hundred sixteen instructors from various locations participated in a survey that evaluated their knowledge in three areas: basic information, symptoms and diagnoses, and therapy. The findings showed that compared to kindergarten and primary school teachers from developed areas (KDRs and PDRs), primary school teachers from less developed regions (PLDRs) had lower scores. In PLDRs, misconceptions and ignorance were more common. Chinese instructors have comparable misconceptions about dyslexia, although having less expertise on the condition than their counterparts in Western nations. In order to improve early literacy instruction, the study emphasised the importance of teachers' exposure to dyslexia cases in developing their understanding. It emphasised the necessity for in-depth dyslexia training, especially in less developed regions. Similar to this prominent study in Turkey by Sümer Dodur and Altındağ Kumaş (2021) revealed inadequate preparation of teachers for teaching dyslexic students and a lack of dyslexia information. Enhancing teacher knowledge through in-service training, seminars, and conferences is advised to close this gap. This emphasises how important it is to prioritise professional development to fill the knowledge gap. The consequences of the study are placed within the perspective of previous research. Even in the European Context, Chourmouziadou (2016) established that Teachers' understanding of dyslexia varies significantly, and they frequently have knowledge gaps and misunderstandings. The study also reveals a lack of knowledge on successful interventions and techniques for dyslexic pupils. The study offers recommendations for improvements in teacher training and outlines possible directions for future research projects.

Challenges and Benefits of Teaching students with Dyslexia in a Bilingual School

Teaching dyslexic students in a bilingual setting has complex problems beyond linguistic, educational, and support-related areas. These issues are clarified by research studies, which also show educators' difficulties in creating inclusive and productive learning environments. Eikerling's (2022) study focused on multilingual instructors' difficulties with language. It was shown that dyslexic students frequently struggle with speaking two languages, which might make reading and writing challenges worse. It is difficult to conduct consistent treatments in bilingual classrooms because teachers must address language-specific subtleties and differences in literacy development. The requirement to distinguish training for various language proficiencies, a process that necessitates a significant amount of time and effort, further increases this linguistic complexity. In addition to these results, Bortz (2022) research focused on the nuances of pedagogy. It highlighted educators' challenge in balancing bilingual curricular requirements with the best practices for dyslexia intervention. Considering how dyslexic students' requirements connect with language development, teachers must modify evidence-based practises to fit the multilingual setting. This pedagogical juggling act necessitates continual professional development and collaboration and requires a thorough grasp of dyslexia and multilingual education. Both studies also emphasised the dearth of dyslexia specialists in multilingual classrooms. This scarcity makes it

difficult for educators to obtain specialised advice and makes it difficult to carry out focused interventions. Lack of sufficient preparation time appears as a recurring issue, restricting instructors' ability to design varied classes that cater to various learning requirements successfully.

There are several advantages to teaching dyslexic students in a bilingual setting that support their academic achievement, cognitive growth, and general well-being. These benefits are supported by research from the UAE and other regions of the world, which sheds light on the beneficial effects of bilingual education for dyslexic students. Greater language awareness and metalinguistic abilities are promoted through bilingual education. According to research by Vender and Melloni (2021), phonological awareness, spelling, and vocabulary development, all areas where students with dyslexia frequently struggle, were all improved by bilingualism. This is especially important for UAE multilingual schools where students go back and forth between Arabic and English. Moreover, the stimulation of the brain and improved executive skills that bilingualism offers are two critical advantages. For people with dyslexia, cognitive flexibility, problem-solving skills, and metalinguistic awareness are critical characteristics that bilingual students frequently demonstrate (Xu et al., 2023). Bilingual Arabic-English students showed improved phonological awareness and memory abilities, which are crucial for reading acquisition and dyslexia remediation, according to research by Gharaibeh et al. (2021) conducted in the UAE.

Students with dyslexia benefit from bilingual schools' inclusive culture that embraces linguistic variety and fosters a positive self-concept. According to Salazar et al. (2022) research, bilingual education favours children with learning difficulties' motivation and self-esteem. In line with this, in the context of the UAE, the bilingual setting can assist pupils in embracing their linguistic identities and overcoming dyslexia-related challenges. Students with dyslexia can benefit substantially from collaborative learning and peer interactions, which are essential to multilingual education. Students with dyslexia benefitted from peer-assisted learning to enhance their reading abilities. Students with dyslexia can obtain peer assistance and participate in meaningful interactions in bilingual schools because they offer a rich environment for collaborative language acquisition (Mize et al., 2019). Thus, the cited literary sources indicated that teaching dyslexic students in a bilingual setting has several benefits that enhance their cognitive functioning, language awareness, and self-esteem.

Methodology

Introduction

This section describes the approach to investigate primary teachers' inclusive pedagogy experiences in supporting dyslexic students' literacy in a bilingual setting. The study analyses how instructors handle the combined issue of meeting students' second language (L2) requirements and meeting their literacy demands due to dyslexia. The methodology comprises essential components, such as the backdrop of the study environment, the research design, data collecting methods, sampling strategy, ethical issues, data analysis process and the methodological limitations. By examining these elements, the research intends to decipher the complex

dynamics of inclusive education in multilingual classrooms, illuminating successful approaches and possible areas for development.

Research Setting Background

This research study was conducted at The International School, with an International Baccalaureate (IB) that offers bilingual education in the UAE to over 1,790 local and international students. The school provides a biliteracy programme that can be accessed in English and French/German that promotes increased understanding of linguistic and cultural diversity and academic endeavours through two languages as a means of classroom instruction. The International School is the only school in the UAE that offers an Advanced Bilingual Diploma in secondary school (11-19-year-old students) and also offers a boarding school experience with purpose-built boarding houses on the school campus. Being one of the most diverse and cosmopolitan schools in the UAE, there are over a hundred nationalities and forty native languages spoken in the school. As one of the premium IB world school providers globally, its mission is anchored on bilingual pathways that acknowledge the unique potential of every learner to perform an essential part in a multicultural and global world.

This research study is focused on the Primary Years Programme (PYP) or elementary school (7-12 year old students) with two classroom teachers co-teaching using English and French/German, with a maximum of 26 students per class. The setup for student learning is not learning about the language but learning through language use. Hence, subjects are taught in both languages through a co-teaching approach in which English and German/French teachers plan together to create an integrated curriculum. The subject content taught in each language is complimentary. Additionally, students with specific language needs and those needing inclusive assistance receive specialised support across three languages aligned with their unique requirements and challenges. This comprehensive strategy includes a variety of interventions, including tailored learning plans, customised assessments, and specialised language and inclusion support, to provide an inclusive learning environment that meets the requirements of all students.

Research Design

An interpretive approach was used in this study, which is strongly related to social constructionism. It attempted to probe into participants' meaning-making processes related to co-teaching experiences, with particular emphasis on investigating complex social phenomena. The method of choice is consistent with the qualitative paradigm and emphasises the creation of detailed, nuanced descriptions. This attitude made it easier to comprehend the participants' points of view and the complex interactions within bilingual education. By adopting this interpretative perspective, the study attempted to clarify the intricacies of inclusive pedagogy and examine how educators manage the interaction between bilingual instruction and dyslexic literacy support (Wiltshire and Ronkainen, 2021). Qualitative research aims to understand how individuals perceive their life experiences and how they create meaning for them (Merriam and Tisdell, 2016). Hence, it is an appropriate

design as we aimed to investigate the primary teachers' inclusive pedagogy practices on the literacy support for dyslexic students in a bilingual setting and how they make sense of their experiences.

Researcher's Positionality

Being a qualitative researcher under an interpretive research paradigm, understanding and interpreting the participants' viewpoint on our research topic, and presenting their accounts in context should be grounded on the generated data (Kivunja & Kuyini, 2017). Accordingly, it is vital to be mindful of our biases and presumptions regarding the choice of topic to investigate. As an English language support teacher at The International School and inclusion support teacher in the past years, Author 1 was cognizant of the teachers' challenges in their effort to support students through their inclusive pedagogical practices and the language acquisition challenges of students in a dual literacy setting. With this in mind, Author 1 kept track of his assumptions through reflections in a research journal.

Sampling Technique

Sampling and selection of participants are critical strategic elements of qualitative study as they directly affect whether and how generalization is achieved. This includes developing a suitable link between the sample and the larger world and comprehending how this relates to your intellectual puzzle (Mason, 2018). Therefore, participants were specifically chosen based on their experience with bilingually teaching dyslexic students. This intentional selection ensured that the chosen participants had personal knowledge of the complex difficulties and approaches involved in assisting dyslexic students in a multilingual educational setting. After obtaining Gatekeeper's approval to conduct our research, I sent invitations via email to participate, discussing the study's purpose and rationale. Prospective teacher participants who accepted the invitations were scheduled for an interview. Author 1 sent invitations to 15 potential participant teachers in grades 2 to 5, having the students' ages between 7-12 years, but only 9 participants agreed to participate. Seven teacher participants worked in a bilingual co-teaching classroom, 1 grade 3 STEAM class teacher, and 1 grade 5 inclusion teacher participated in the study.

Confidentiality and Ethical Concerns

The application of ethical considerations is grounded in the principle that every individual possesses inherent dignity that necessitates reverence, encompassing the fundamental human entitlement to express their autonomy (Kivunja & Kuyini, 2017). Therefore, it was imperative to prioritize the safeguarding of study participants' confidentiality in order to cultivate confidence and facilitate the acquisition of dependable data. Before the interview process, all participant teachers were assured of their anonymity in this research study through the use of pseudonyms. It was also explained, in an information letter and at the beginning of each interview, that audio recordings and transcriptions of the interviews would be stored securely.

Table 1. Participants of the Study

Pseudonyms	Role in School	Years of Teaching Experience
Paula	Grade 2 French teacher	21 years
Emily	Grade 2 French teacher	5 years
Rachelle	Grade 5 German teacher	20 years
David	Grade 4 English teacher	6 years
Ann	Grade 4 French teacher	5 years
Gail	Grade 5 English teacher & assistant head	11 years
Nicole	Grade 5 German teacher	18 years
Prince	Grade 5 English teacher	5 years
Sheryn	Grade 5 Inclusion support teacher	10 years

Method and Data Collection

Qualitative interviews were employed by researchers to gain insights into the cognitive processes and belief systems that constitute the realm of human experience (Mason, 2018). This methodology smoothly integrates with the interpretative strategy and the researcher's positionality, creating a unified framework that explores participants' viewpoints and meaning-making processes. Knowledge is being tightly braided within situational, contextual, and interactive elements, adopting a qualitative researcher's perspective. Based on the established groundwork and adherence to recognised qualitative research protocols, we employed semi-structured interviews as a pivotal method for collecting pertinent data (Merriam and Tisdell, 2016).

Individual interviews are praised in the literature for their ability to elicit complex, nuanced human experiences, allowing participants to express their points of view and offer rich, in-depth insights (Cohen et al., 2022). This methodological decision fits the interpretative paradigm adopted in this study ideally, enabling a thorough investigation of primary teachers' contacts with inclusive pedagogy in the bilingual classroom. Interviews thoroughly explain how instructors negotiate the complex convergence of dyslexia needs assistance and bilingual education by engaging in discussion. This provides a unique perspective into their solutions, obstacles, and the larger pedagogical environment.

We formulated a set of open-ended questions because they facilitated the generation of rich qualitative data and allowed the participants to explore in detail experiences that were pertinent to them (Wengraf, 2001). These questions aligned with our research questions and required more detailed responses as necessary. Participants were given a detailed letter outlining the purpose and direction of the research before the interviews, as well as guarantees of confidentiality and ethical protections. Non-verbal body language details that were not noticeable

on the digital recording were noted during the interview. The majority of the interviews were carried out in a tranquil environment devoid of any potential disturbances. Nevertheless, certain teachers expressed a preference for being interviewed within the confines of their classrooms. Reflections and descriptive notes were noted down in Author 1's research journal after each interview. Journaling is essential for documenting researcher thoughts, assisting with data analysis, and maintaining transparency, legitimacy and dependability (Gangal and Yilmaz, 2023).

Data Analysis

We adopted Braun and Clarke's (2008) thematic analysis model to perform the data analysis process systematically. First, Author 1 started with the 'key phase' where he transcribed all the audio recordings using the software application 'Descript'. In order to secure the accuracy of the transcription, Author 1 checked the transcripts against the original verbal data and edited the errors found in the transcriptions. This paved the way to becoming familiar with all the aspects of data that are seen as an interpretative act instead of a mechanical act of writing spoken sounds down (Lapadat and Lindsay, 1999). As Author 1 actively immersed himself in the data that included repeated reading, I took down notes and observed ideas for code that I would return to in later rounds.

Secondly, to find the underlying properties of the data, initial codes were established by organizing the entire dataset into appropriate groupings (Tuckett, 2005). This was done by coding the data manually by writing notes on the transcriptions and indicating probable patterns using coloured markers and highlighters. While carrying out this process, Author 1 gave complete and thorough consideration to each data set to identify intriguing characteristics that might form a foundation of recurring patterns throughout the collected data. Author1 also took measures to ensure that every essential data extract was assigned codes to group them beneath the appropriate code. This process included transferring data extracts from different transcripts into combined codes as a distinct file. In order to determine what would be interesting potential themes or patterns, I coded as many possible extracts. However, to avoid a typical critique of coding, which needs more context (Bryman, 2001), maintaining an adequate amount of the surrounding data of the coded extracts is relevant to keep the context.

Next, I initiated the exploration of underlying themes by shifting the analytical process to a broader scope. This involved organizing different codes into potential themes by gathering all relevant data extracts that were classified under each respective topic category. I used an application called 'Canva' as a visual representation (thematic map), to help sort the different codes into themes. This graphic organiser assisted Author 1 in considering the link of ideas between codes and themes.

Finally, the themes were carefully examined and improved by analyzing the data extracts associated with each topic. Special attention was given to ensuring that the themes were clear and identifiable, while also verifying that the data extracts within each theme exhibited consistent and meaningful patterns. Through this analytical process, Author 1 generated the following themes; inclusion and practice in a bilingual context, balancing

students' second language (L2) and dyslexia needs, monolingual vs. bilingual Instructions for dyslexic Learners, bilingual pedagogical strategies, teachers' support needs, which have been used to structure the Findings and Discussions chapter presented below.

Findings and Discussions

Inclusion and Practice in a Bilingual Context

The thematic analysis brought out the complex interrelationship between inclusion tactics and teaching techniques in a bilingual educational context. According to Ann, grade 4 French teacher;

"I think it's amazing cuz it's not just the inclusion students that can benefit from what, whatever we plan. Like it's, it's really like the whole class, whole class, if they need it, they know that it's accessible. It's not just, you know, for the equation, kid who has a personal or whatever it's called, like program"

This statement established that the focus of inclusive practices in bilingual settings, especially for students with specialised needs like dyslexia, is more towards providing equal opportunity to all students with diversified needs rather than just focusing on specific individual student's needs. This strategy adopted by Ann fits with a change in the inclusive education paradigm, which Puigserver Nadal's (2018) study has brought to light. It is clear how the inclusive school model has developed from aiming for unity in educational sphere to guaranteeing equal opportunity for all pupils. Although the move towards equal opportunity in inclusive education is to be applauded, it is essential to recognise the possible drawbacks of this strategy. According to Hayes and Bulat (2017), equal opportunity unintentionally supports the "one size fits all" paradigm, which is insufficient to meet the various requirements of all pupils. A consistent strategy can only meet their needs since each student is different in their abilities, problems, and learning preferences. Educators should pay attention to the need for individualised interventions and assistance, considering each student's unique circumstances in pursuing equal opportunity. Some students may need specialised approaches and resources that stray from the conventional approach, especially those with more complicated demands. Therefore, even if equal opportunity policies try to advance justice, they unintentionally exclude those who must fit the present framework. Additionally, equal opportunity only sometimes implies fair results since it ignores the different starting places and existing inequalities among pupils. Accurate equity demands deliberate efforts to address the particular problems marginalised or underprivileged groups confront (Ho, 2021). The idea of equal opportunity should thus be viewed critically, with the knowledge that it requires adding policies that cater to individual needs, encourage inclusion, and advance true educational fairness.

Incorporating children with special needs into regular classrooms is just one aspect of inclusive education; the entire educational system must be redesigned to meet the individual needs and abilities of every student in order to promote equity and a sense of belonging. Ann's viewpoint emphasises how crucial universal design is in schooling. Everyone's educational experience is improved by providing learning settings that are open, adaptable, and catered to different learning requirements and styles (Jeffery, 2021). This strategy is even more

critical in multilingual classrooms because students have a variety of language and cultural backgrounds. This viewpoint does not, however, discount the need to provide students with dyslexia and other specialised needs with specialised help. Instead, it emphasises that the advantages of inclusive practices permeate the whole classroom, favourably affecting all students' learning experiences (Mendenhall et al., 2021). Ann's comment highlights how the motivation for inclusive practices in multilingual settings has shifted from educational unity to equitable opportunity.

Additionally Nicole, German grade 5 teacher stated that;

“And in, in, in theory, yeah, these things [The ideas and concepts of inclusion practice involved in the planning] are written down and in theory, these things are shared amongst us teachers, but in practice it is, it is highly, what can I say? It is highly, um, intense. Mm-hmm. To prepare those and have these. Like resources, all always ready, always printed out. Mm-hmm. Because we are talking about, uh, a normal lesson plan, and then we are talking about that adapted lesson plan. And very often, um, I, I don't think that this is [00:11:00] done, uh, with justice to all the inclusive learners”.

Nicole's observations show educators' complex difficulties when implementing inclusive education initiatives by bridging the gap between theory and practice. The requirement to provide specialised resources and modify lesson plans to meet the needs of various learners places a heavy strain on educators (Page et al., 2021). This is especially important in multilingual educational environments because the students' complicated language backgrounds increase the demands. Nicole's views in the setting of a heavy workload are consistent with earlier research that highlights the heavy effort teachers deal with in inclusive classrooms. Studies by Carver-Thomas et al. (2021) and Bishop (2021) have repeatedly shown the severe effort instructors encounter while catering to the particular needs of a wide range of students. This responsibility includes developing adapted lesson plans, producing or modifying materials, considering students' various learning preferences, and managing classroom dynamics. Additionally, Nicole's comment on the difficulty of having materials close at hand emphasises how time-consuming planning is in inclusive settings. The substantial effort instructors put in outside of class to adapt curriculum materials and develop instructional methods that accommodate different learning preferences is highlighted by research by Furey (2020). Thus, the extra planning and preparation that instructors do add to their total workload.

Furthermore, Nordgren et al. (2021) research, which emphasises that teaching efficiency is directly impacted by the amount of time teachers spend planning and preparation, shows the connection between workload and instructional quality. When a teacher's workload becomes excessive, it may affect their capacity to provide inclusive learning environments that cater to the various needs of pupils. This may unintentionally interfere with the equal use of modified lesson plans for all learners. Nicole's experience could be more exceptional regarding the strain of a heavy workload in the context of inclusive education. According to research by Bishop (2021), thorough administrative assistance and less non-teaching activities are essential to reducing the workload strain on teachers and allowing them to concentrate better on providing inclusive education. In line with this, at the International School, administrators make efforts to balance teachers' well-being through events like staff social

gatherings, morning Yoga and Zumba sessions within the campus. Collectively, Nicole's comments provide insightful information on the intricate interactions between inclusive education, flexible lesson design, and the urgent problem of high workload.

In addition to this, thematic analysis of teacher interviews revealed the importance of professional development in the context of inclusion and practice in bilingual education. According to the statement of Rachelle, grade 3 STEAM teacher;

“About inclusive pedagogy. Okay. Uh, differentiated instructions, strategies for supporting students with diverse learning needs. Um, things like workshops, conferences, webinars, and online [00:18:00] courses can enhance our knowledge as educators, uh, and to, to provide the knowledge and skills for, for, um, learning disabilities”

The statement made by Rachelle emphasises the value of ongoing professional development in fostering inclusive pedagogy and practical methods for helping students with a range of learning difficulties. This is consistent with Ferreira et al. (2020) previous research, which emphasises the crucial role that continual teacher preparation plays in improving educational practices. Numerous studies demonstrated the benefits of professional development on instructors' knowledge, abilities, and teaching strategies. Teachers receive up-to-date material, evidence-based practices, and creative techniques to address learning disorders like dyslexia through workshops, conferences, webinars, and online courses (Dumitru, 2023). Shaturaev (2021) asserts that excellent professional development enhances teaching strategies and student performance. Additionally, the importance of chances for instructors to use new techniques in the classroom and ongoing involvement and cooperation is well established. Educators would develop inclusive settings that meet the different needs of their students, including those with learning impairments, by remaining up to date on the most recent research and approaches (Vadivel et al., 2021; Martinez, 2022; Mystakidis et al., 2021). Finally, research demonstrating the significance of thorough professional development opportunities supports Rachelle's insight. Learning outcomes for all students, including those with learning impairments, are enhanced by educators committed to lifelong learning because they can better apply differentiated teaching, respond to the unique needs of their students, and promote inclusive classrooms.

Balancing Students' L2 and Dyslexia Needs

The complex difficulty of reconciling students' second language (L2) and dyslexia demands within the framework of bilingual education is brought to light by the theme analysis of the interview transcript. Teachers gave insightful explanations of the intricate interactions that these expectations frequently cause. Nicole, a fifth-grade German teacher, emphasised that deciding whether to give language help or inclusion requirements more importance might be challenging. She stated;

“Okay, so this is a quiet of a conflict that we experience at school. We have a language support team. Mm-hmm. As well as an inclusion team. Mm-hmm. Very often the children are first identified with a language support need, and later on we [00:20:00] realize, no, actually it's not a language support

need, it's an inclusion need. Mm-hmm. Um, very often these two go hand in hand. You see a lot of children that are in language support. They also have inclusion needs. Yes. And a lot of children vice versa as well. So it's sometimes it's difficult to find the best approach. Is it best to support their language or is it the best, is it best to support their barriers to learning? So I feel that it is, it is, it's different from child to child and in some cases I feel it's, it's important to understand that language support is needed until a child can follow the curriculum in that language of instruction"

Nicole's comment highlights the complex balancing act that instructors must perform to satisfy the demands of second language (L2) learning needs and inclusion learning support needs. The choice is between putting the demands of dyslexic pupils' inclusion over language support. Nicole highlighted the overlap between language support and inclusion requirements, emphasising how closely these issues are related. Children frequently needing language support also have inclusion-related needs, and vice versa; therefore, a complete strategy that covers both elements is required (Nelis et al., 2023). Nicole's observations highlight how vital it is for parents, educators, and inclusion experts to work together to set and track specific goals. Comprehensive approaches to addressing these interrelated challenges is demonstrated by establishing an intensive support programme that includes interventions such as morning reading sessions and pull-out and push-in language and inclusion services. Nicole's description of the length of language acquisition support, which usually lasts between six months and two years, is noteworthy because it provides a baseline for comprehending the complexity of children's learning needs (Darling-Hammond et al., 2020). Prolonged periods may indicate underlying issues, calling for a more targeted and comprehensive assessments that may lead to the identification of learning disabilities or inclusion needs. Successful methods must manage the complex confluence of inclusion and language hurdles for the best possible student development. This requires a holistic and collaborative viewpoint. Nicole's viewpoint is consistent with the findings by Heineken et al. (2012), which show how bilingual educators work with stakeholders to establish and monitor student goals. This is consistent with The International School's all-encompassing approach, demonstrated by the inclusive support programme. The alignment of objectives with language competency frameworks like the CEFR (The Common European Framework of Reference for Languages) shows a commitment to bridging students' language skills and academic needs throughout language learning. Nicole's comment highlights the challenging nature of balancing inclusion and language learning requirements, emphasising the need for a team-based and comprehensive approach (Reraki, 2022). Moreover, the fact that many students with language assistance requirements also have inclusion issues highlights the interconnectedness of learning difficulties. This overlap calls for a full grasp of each student's profile, highlighting the value of thorough assessments and personalised intervention programmes (Gyll and Hayes, 2021). Hence, teachers encounter various challenges due to the complex relationships between language support, inclusion requirements, and bilingual education. It is challenging to strike the ideal balance between language learning and inclusion needs; this calls for extensive individual assessments and adaptive interventions. The International School strives to be a data driven school with the use of various internal and external assessments which include The New Group Reading Test (NGRT), a standardised reading assessment in comparison to the national average, The Cognitive Abilities Test (CAT4), an assessment of developed abilities in areas known to make difference to learning and achievement, WIDA Model (Measure of Developing

English Language) used as an English Language proficiency assessment. These assessments produce data that are used to drive instructions in the classroom.

In addition to the discussion of this theme, English teacher Prince, who teaches grade 5, revealed his multilingual classroom management techniques. He stressed the significance of developing interesting classes and multilingual materials by saying:

"It's just on the edge of they can learn things, but how can they apply it and how they can push it and, It's a fun lesson. Children learn through fun mostly. So it'll be quite an engaging lesson. In a bilingual [00:03:00] setting, um, I make sure all the, uh, resources are bilingual and French and English. I try and make the learning as fun as I can by getting the children involved and just entertaining them, um, giving them a fun like scenario to work with and how they could apply it to whatever we're learning".

Identical to this Rachelle, grade 3 STEAM teacher emphasised;

"Something like a balanced language instruction, like creating a balanced approach to language instruction where both languages, English and another language are valued and keep and given equal, uh, importance, uh, language rich [00:09:00] environment. Foster language rich environment by displaying, uh, print materials and signs in both languages. Uh, this helps students to see and interact with written language, uh, in various contexts promoting their dual, uh, literacy development, uh, code switching and translanguaging. Uh, as of to recognize and support the natural tendency of bilingual students to code switch or trans language using elements of both languages and communication"

This strategy tries to assist both language learning and dyslexia-related difficulties. This method of generating multilingual materials and a welcoming learning environment with the element of 'fun' which could mean learner engagement in the classroom. This demonstrates an intentional attempt to balance the demands of students' second language (L2) acquisition with dyslexia-related difficulties. Prince and Rachelle both attempt to accommodate a range of language skills by guaranteeing that all resources are available in French and English, making educational materials accessible to all pupils. This strategy aligns with studies that highlight how crucial it is to modify materials to fit each student's individual learning profile, especially those with dyslexia (Nez Soto, 2021). However this particular approach appears to be successful on the surface, but there are essential factors to consider. According to Shikina et al. (2023), due to the complexity of dyslexia, bilingual resources may help with language learning, but their efficacy in addressing dyslexia-specific challenges varies. This emphasises the need for specialised support that addresses the issues associated with dyslexia.

Additionally, a more thorough strategy involves including targeted interventions and explicit phonics instruction in bilingual classrooms. Prior studies have highlighted the advantages of multisensory and explicit education modalities for dyslexic pupils. As a result, while bilingual resources aid in language learning, they should be combined with methods specifically aimed towards dyslexia (Boe, 2023). Collectively, Prince's strategy emphasises the need for inclusive education but raises concerns about the ability of multilingual resources to meet complicated dyslexia demands adequately. Personalised dyslexia support and language learning must

coexist harmoniously, necessitating careful planning for available materials, preparation time, and teaching strategies.

Moreover, Sheryn, a grade 5 inclusion teacher, discussed the need for tailored help. She clarified;

"I found that really, um, in-class support is obviously huge and massive and wonderful. Um, but having that targeted time to really focus in on specific skills in a small group setting is absolutely invaluable"

This statement critically indicated the push-in and pull-out support from the inclusion and language support teacher. A critical analysis clarifies the push-in and pull-out support model's consequences for student learning outcomes. In inclusive education, the push-in and pull-out assistance models are common strategies, each having certain benefits and drawbacks. A cohesive learning environment is promoted via push-in support, which includes special education teachers working together in the general classroom. This approach encourages social contact and reduces interruptions so students can learn the primary curriculum and get individualised help. However, due to high-class numbers and various demands, it could need more focus and be easier to implement successfully. The pull-out strategy, in contrast, briefly removes children from the classroom for specialised education. While this allows for individualised attention and targeted skill-building, it disturbs classroom engagement and may cause missed material (Meijer and Wessels, 2019). While pull-out support can offer customised treatments in line with Individualised Education Plans (IEPs), it also runs the danger of isolating pupils and can necessitate more teacher collaboration (Huang et al., 2020). This remark emphasises the hazard of pull-out assistance, which is that it might separate students from their classmates and can cause emotions of stigmatisation or segregation. According to Manitsa et al. (2023) research, students who are repeatedly taken out of the regular classroom may feel alienated from their peers, which can be detrimental to their self-esteem and feelings of belonging. Additionally, because peer relationships and the development of social skills are essential elements of holistic education, this seclusion might impede them. Practical teacher cooperation is essential to addressing this issue since it may help close the gap between pull-out support and the regular classroom, guaranteeing that children receive individualised attention while retaining a sense of inclusion and social integration (NCLD, 2021). The scheduling of committed time, however, is essential. When students are pulled out of class, Dawson (2014) emphasises a gap between classroom teachers and support personnel. This difference may result in the coverage of some topics needing to be improved. To be clear, level 3 children in Author 1's setting get pull-out help, as directed by IEPs and ILPs with SMART objectives for academic and language development. Pull-out sessions concentrate on developing crucial skills that align with predetermined objectives, even if they may cause missed classroom activities. As a result, even if there may be a brief absence from class, pull-out help guarantees that these pupils will gain specific skills.

Furthermore, it becomes clear that there should be designated periods during the school day for in-depth targeted interventions students with dyslexia. According to research by Hurwitz and Vanacore (2022), pull-out sessions that concentrate on developing a single ability can successfully help dyslexic pupils. As a result of these sessions, students' academic and language development has improved because they are given the individualised attention they need to meet their specific learning demands. A dedication to maximising the

efficacy of disability assistance and promoting the holistic development of dyslexic pupils is also shown in the acknowledgment of the necessity for set times during the school day for these interventions. This makes it easier to match the objectives of an individual education plan (IEP) with its actual execution and documentation. In line with this, Barton (2016) already established that together with the classroom teacher, an inclusion or special education teacher joins the class to support students and promote co-teaching. By enhancing assistance for students with different needs, this cooperation encourages a more inclusive and productive learning environment. Barton further emphasises the value of co-teaching in smaller classroom settings between general and special education instructors. According to Barton's argument, co-teaching in smaller classrooms by general and special education teachers has distinct advantages that improve the learning environment. With this strategy, students with various learning difficulties may receive the individualised attention they require, ensuring their needs are adequately satisfied. It promotes a collaborative environment where the two instructors may combine their knowledge, leading to more profound and more thorough training. Co-teaching has several benefits, including lowering stigma, preserving the privacy of support services within the classroom, and fostering an inclusive environment where all students feel appreciated and encouraged in their academic endeavours.

The critical review highlights the complexity of the push-in pull-out concept and its effects on student learning in its conclusion. When maximising the assistance given to students with impairments, the significance of time allocation, professional development, and collaborative teaching techniques becomes clear. These direct quotes from the respondents support the theme analysis's conclusions. The educators' observations highlight the necessity of individualised strategies that consider each student's language and dyslexia requirements. Providing complete support within a multilingual context presents difficulties, underscoring the need for coordinated efforts and thoughtful interventions. This synthesis supports Cline's (2000) research, which emphasises the significance of finding a delicate balance in order to effectively serve the unique needs of dyslexic and second language learners.

Monolingual vs. Bilingual Instructions for Dyslexic Learners

Educators' views on the ideal teaching language for dyslexic students in multilingual contexts indicate a complex problem. According to Nicole, German grade 5 teacher;

“These children would probably benefit from a, uh, uh, from a language of instruction in one language. Mm-hmm. So I would suggest that children with a severe, uh, dyslexic, [00:27:00] um, profile, would learn in one language only”

Nicole's suggestions that students with severe dyslexia characteristics could benefit from education in a single language is consistent with earlier studies. Studies, including those by Drigas et al. (2022), showed that children with dyslexia would be better able to deal with linguistic issues if they concentrated on one language. This strategy reduces cognitive strain and offers a focused setting for focused therapy.

Similar to this Ann, grade 4 French teacher stated that;

“Like, I can try everything honestly. Like I can really try everything. Like, it doesn't, it doesn't, it doesn't work. Mm-hmm. So for me, it's, uh, They, they need, it's awful. But like, I would say they need to go to the monolingual. Because there's too many, there's too many [00:20:00] challenges for them and like they should tackle one challenge at a time”

Ann's perspective supports the notion that problems should be solved one at a time. Her recommendation that dyslexic students prefer monolingual education reflects reservations and challenging prospects over the numerous language difficulties they encounter in multilingual environments. These opinions are supported by Fletcher and Miciak's (2019) study findings, which accentuate the necessity for specialised strategies for learning focusing on particular language acquisition challenges. A legitimate worry is raised by Ann's viewpoint, which supports monolingual instruction for dyslexic pupils. Focusing on a single language may be a practical answer to learning challenges, but it also presents inclusion challenges. According to inclusive education, all students should have equal access to and involvement in educational environments. Inadvertently excluding dyslexic students from the advantages of bilingualism and the chances it provides in a varied, multilingual environment is the focus on monolingualism (Kalfountzou et al., 2023). The study results by Fletcher and Miciak support the necessity of specialised approaches to language learning problems. However, the key here is to balance addressing dyslexia-related issues and ensuring that dyslexic students may still profit from bilingual education's advantages. It is critical to think about customised strategies that meet the unique requirements of dyslexic students while preserving an inclusive learning environment that promotes linguistic variety and equal opportunity for everyone.

Moreover, Emily, grade 2 French teacher further added that;

“If you think about it, I mean, it should be a part of it, but you are using languages to, you know, jump from one language to another, to be skill together so they become fully bilingual. So I believe maybe. But that's only my personal opinion. It could be one of the cons of the bilingualism, you know? Mm-hmm. I don't think, like, this is what I say when I see a student, uh, who really struggle in learning new [00:34:00] languages, um, I, I don't recommend the parents to put them into bilingualism. I recommend them to focus on one language.

Emily offers a clear viewpoint, noting the potential disadvantages of bilingualism while recognising its difficulties. According to research by Gunnerud et al. (2020), bilingualism may benefit pupils cognitively, but as Emily points out, individual challenges must be considered. Her approach emphasises that dyslexic students may find it particularly difficult to master the complicated skill of switching languages fluidly being bilingual. She emphasises that owing to their unique requirements and challenges, dyslexic students may not find this language shift to be acceptable for them all. The perspectives of these educators provide a nuanced view on the language of teaching for dyslexic children in multilingual settings, and it is recommended that individuals with severe dyslexia traits could benefit from studying in a single language to assist them in overcoming obstacles. Emily's point of view critically raises the consequences of bilingualism for dyslexic pupils in the context of inclusion. It is essential to see inclusion through the lenses of equitable access, opportunity, and involvement,

even though bilingualism can positively affect cognitive function. Inclusive education aims to meet all students' needs, and Emily's perspective emphasises the possible difficulties dyslexic individuals may have in learning language transitions. It is crucial to watch out that judgements made concerning language instruction do not unintentionally prevent pupils from receiving a well-rounded education (Luo and Chan, 2023). Unaffected by their level of language competence, dyslexic pupils should be able to succeed intellectually and socially with the help of specially designed support systems, according to an inclusive approach. It is essential to find a balance between treating specific difficulties and creating a welcoming environment that promotes the development of all children (Pulimeno et al., 2020). In order to provide equitable educational opportunities for all students, including those with dyslexia, in multilingual settings, it is necessary to carefully assess the broader aims of inclusion while acknowledging that some individuals may benefit from individualised language methods.

In contrast, the study of Vender (2018) provided an insightful argument. Children with dyslexia, both monolingual and multilingual, performed worse than controls on activities requiring clitic formation. In the simple present, bilingual children responded similarly to their monolingual classmates, suggesting linguistic immaturity rather than a detrimental effect of multilingualism. However, both bilingual groups had more difficulties with the present perfect, indicating that bilingualism may worsen problems in challenging settings. Notably, no detrimental bilingualism impact was shown in the clitic generation when vocabulary was controlled. This emphasises the significance of lexical competence for native-like performance.

These results provide an essential contribution to the current discussion about teaching strategies that meet the needs of dyslexic pupils in the multilingual educational environment of the UAE. They draw attention to the intricacy of the problem and the intersection of task difficulty, lexical proficiency, and the language of teaching. Understanding that variables other than bilingualism play essential roles in their academic path require a comprehensive approach when addressing the demands of dyslexic learners. The study contributes to our understanding of how dyslexia interacts with bilingualism and helps us build successful educational practices specifically suited to the unique needs of dyslexic children in the bilingual environment of the UAE.

Bilingual Pedagogical Strategies

With a particular emphasis on aiding students with dyslexia, the interview extracts offered insightful information on the pedagogical strategies used in bilingual classrooms. Differentiation, Structured Phonics Programmes, Student Agency and Autonomy, Technology, Multisensory Resources, Co-teaching Models, and Translanguaging were some of the important topics covered by the theme results. These tactics helped create a comprehensive and inclusive bilingual education programme for dyslexic students.

As per Rachelle, grade 3 STEAM teacher;

“Uh, differentiation is important, is an important aspect of teaching students. Uh, it involves also tailoring instruction to meet individual needs, learning styles, abilities of the students. Some strategies

for differentiation that I use is the flexible grouping group students, uh, based on their needs, allowing for targeted instruction and support, uh, modified assignments and, uh, assessments”

Differentiation, which emphasises individualised instruction to meet each student's requirements and learning preferences, has emerged as a vital strategy for successfully educating bilingual students with dyslexia as (Platt, 2018) established that every student possesses unique characteristics, including their specific learning preferences, demands, and interests. Hence, it is readily apparent that the implementation of differentiation is vital in every educational setting. According to Westwood (2001), effective unique education integration depends on varied instruction considering each student's learning preferences. This idea emphasises the significance of flexible grouping, modified tasks, and scaffolded instruction to accommodate various learning profiles. By implementing differentiation tactics, educators want to give dyslexic children a tailored support system that will enable them to interact with the educational material more effectively and overcome the challenges of their condition (Dreeszen, 2009 ; Reyes, 2021 ; Rochester 2021). Although the differentiation strategy has the potential to help dyslexic students, it is essential to recognize its limits. The strategy's efficacy strongly depends on the depth of instructors' knowledge of dyslexia and teaching techniques and materials. However, according to studies, instructors frequently fail to acquire thorough training to successfully handle specific learning challenges, including dyslexia, which can hamper the implementation of differentiation (Thwalaa et al., 2020). Furthermore, it can be challenging to personalise teaching for every dyslexic kid in a bilingual classroom with a range of competency levels, which could put an undue burden on teachers (Quintanilla, 2023; Biza & Giannakou, 2022). Additionally, Reading Rockets (2023) established that if not carried out carefully, this strategy might unintentionally isolate dyslexic students and impede their social integration. Hence, while differentiation could have certain advantages, it may also be less successful owing to poor training, a lack of resources, and potential societal repercussions. However, this method acknowledges the need to attend to individual needs to obtain the best learning results and is consistent with the more extensive educational debate on inclusive pedagogies. It is evident that the use of differentiation approaches emphasises a commitment to inclusion and instructional effectiveness, especially for bilingual pupils with dyslexia (Anderson 2023 ; Coupland 2019). This viewpoint subsequently leads to thoroughly comprehending how specialised teaching strategies may effectively handle learning difficulties and foster academic achievement.

In line to differentiation, the concept of structured phonics is also largely discussed. Emily, grade 2 French teacher established that;

“We really emphasis on the phonics, not the, the, the whole language. You know, when you learn, uh, reading, they have different, um, technique. So, And then there's also, uh, learning new vocabulary. So if you do the phonic, you really teach the sound and you really teach them to, to shrink the words”

Structured phonics is a method of teaching reading (Dilgard et al., 2022). Programmes are crucial tools for improving language acquisition and literacy abilities in dyslexic pupils, and they should be in line with methodologies like Orton Gillingham that are supported by research (Ntousas, 2019; Sayeski et al., 2019). In order to successfully meet the requirements of struggling students, Paige (2017) highlighted the need for

foundational skills programmes that include regulated phonics with exciting texts. Systematic, multimodal training in phonological awareness, phonics, fluency, vocabulary, and comprehension is offered via research-based teaching techniques like Orton Gillingham. Although structured phonics methods like Orton Gillingham show promise for enhancing dyslexic pupils' reading abilities, it is essential to understand their limits in certain situations. The ability of educators to properly execute such programmes is crucial to their success. While structured phonics can be advantageous, research indicates that the level of training needed for teachers to use these techniques effectively may only sometimes be practical, especially in settings with limited resources (Boyd, 2022). Furthermore, the emphasis on a multisensory approach does not necessarily correspond with the realities of classroom settings, where various learning demands and time restraints make it challenging to implement such approaches completely (Yu, 2023). Furthermore, structured phonics' usefulness is constrained if not combined with broader reading comprehension techniques, which may impede the general growth of dyslexic pupils as confident readers (Kuschel, 2022). In conclusion, although structured phonics methods provide helpful strategies, their application might be complex because of the necessary training, real-world restrictions, and possible inadequacies in addressing more considerable reading abilities. Despite this limitation it is appeared as a fact that structured phonics programmes are recognised as a pillar for developing reading skills in dyslexic students confirms the need for precise, methodical instruction. Using evidence-based strategies like Orton Gillingham contributes to discussing practices in education. These programmes help pupils develop core abilities and increase their comfort level while using other languages. This demonstrated the need for specialised pedagogies that pair regimented phonics with exciting content to help dyslexic students improve their reading (Mitofsky Neuss, 2021; Nugra, 2021). By implementing such tactics, educators support the continuous effort to provide a successful, inclusive education and see the potential for these approaches to give students more control over their academic progress.

Additionally within the practice of structured phonics the multisensory phonics programs gained attention. According to Rachelle, grade 3 STEAM teacher:

“I find, uh, some, a variety of resources effective for that, but, uh, we can just like name some of them, like structured literacy programs where research based approach is specifically designed for students with, uh, dyslexia. Uh, these program provide systematic, explicit, and multi-sensory instruction that targets, uh, their chronological awareness, phonics and fluency, vocabulary and comprehension”

This viewpoint is inclined towards multisensory phonics programs. Integrating such programmes into multilingual settings is consistent with research that highlights the value of personalised treatments for dyslexic students in a range of language situations (Langille and Green, 2021). Due to the interaction of many languages, bilingual students with dyslexia experience additional challenges. Multisensory phonics programmes can offer a well-organised framework to address phonological elements unique to a language and improve reading abilities (Petrescu and Helms Park, 2021). Whilst The International School aims for consistency of structured phonics program for English across the Early Years (EY) and PYP, it uses specifically ‘The Little Wandle Phonics Program’ for English. Additionally, while organised literacy programmes excel at teaching decoding and phonemic awareness, more enormous linguistic and cognitive difficulties associated with dyslexia, such as deficiencies in vocabulary and understanding, require specialised attention (Godó, 2023). Strategies that address

both language development and issues related to dyslexia should be incorporated when integrating these programmes into a comprehensive bilingual educational framework. The potential of multimodal phonics programmes as valuable instruments in bilingual educational procedures for dyslexic students is therefore highlighted by Rachelle's support. However, implementing such programmes necessitates addressing training requirements, language issues, and complete support to ensure successful intervention.

The multisensory phonics program is one of the key virtues of technology. In the modern era of teaching technology appeared as one of the most inevitable features of the instructional and learning dynamics. In alignment to this Prince, grade 4 English teacher stated that; *"And luckily we've got a lot of apps that can help translate and look at the word types to them"*. In addition to this further elaboration is provided by Rachelle, grade 3 STEAM teacher;

"And of course, the assistive technology and tools like using intro, introducing assistive technology tools, resources that support both language learning and dyslexia, uh, challenges. This may include bilingual dictionaries or Lear language learning apps for students with dyslexia. Text-to-speech software, speech-to-text tools or dyslexia friendly font can, uh, can be very beneficial"

According to the teacher's statements technology offers assistive features and multimodal resources to improve learning experiences, making it a valuable tool for aiding dyslexic students in multilingual classrooms. Students that struggle with language acquisition benefit from a multimodal, direct teaching method, according to Sparks and Miller (2000), similar to how text-to-speech software, speech-to-text programmes, and dyslexia-friendly typefaces offer helpful solutions for reading and writing difficulties. Sparks and Miller's language learning method supports the notion that understanding different learning preferences enhances comprehension. Including technology and multisensory materials in bilingual classrooms is consistent with the emphasis on inclusivity and varied instruction in the larger educational discourse (Sommadosi, 2022; Boardman, 2020; Newman, 2019). Because of its potential to increase inclusion and participation, especially in bilingual settings, using assistive technology to facilitate language learning in schools has drawn attention. According to research, monolingual and bilingual students may benefit from technology and multimodal materials, which can help with language learning and comprehension (Guan, 2023). It is important to remember that the usefulness of assistive technology varies depending on the technology used, the requirements of each student, and the environment in which it is used. There is no one-size-fits-all answer regarding pedagogical tactics and the alignment with students' learning preferences, even while technology can offer personalised learning experiences (Alamri et al., 2020). Technology as a leveler in education reflects how pedagogy changes and digital technologies are used to close learning gaps, that are not limited to students with learning difficulties like Dyslexia.

Gail, grade 5 English teacher added that;

"So I would say giving, um, skills and student autonomy in terms of allowing access to materials. So really giving them ownership of what is available to them, which builds confidence, which builds all kinds of other skills as well as self-management skills"

Similar to this Nicole, German grade 5 Teacher added that;

“So sometimes it's good to just give them a timeframe and say, you know, it doesn't actually matter how you spell it. Mm-hmm. Write it as you could. So the stories flow. It's not impacted by too much thinking”

These statements critically indicated that in order to foster self-efficacy, empowerment, and intercultural competence in dyslexic students, student agency and autonomy are essential components of effective bilingual instruction. According to Tsunematsu (2022), international students encounter difficulties with intercultural competency, forcing them to prioritise their agency and autonomy when navigating their cultural identities. Similarly to this, educators place a strong emphasis on encouraging student ownership of their learning, decisions, and triumphs (Huang and Benson, 2013). The importance of student agency and autonomy in bilingual pedagogy and intercultural competency is acknowledged, underscoring the learner-centered emphasis in the larger educational discourse (Felix, 2020). The findings of Tsunematsu support the notion that autonomy is essential when pupils face cross-cultural difficulties. The educational tenet that encourages resilience and adaptation through self-directed learning informs educators' techniques. Stressing student autonomy and agency bridges the gap between the development of intercultural competence and the objective of successful bilingual teaching for dyslexic pupils. Teachers help students develop a sense of ownership and independence that enhances their ability to interact productively in various circumstances (Quintanilla, 2023 ; Rerri, 2022; Chua, 2020). This comprehensive approach recognises the connection between instructional practises and the growth of intercultural competence, eventually preparing students for effective involvement in both the academic and societal arenas.

The statement of Emily grade 2 French teacher established;

“Okay. So, uh, Laura and I, we've been working together in the co-teaching model for the past three years, and this year after, after the, after three years together this year was very successful. I believe for us into the, the way we installed this bilingualism, uh, it was. Way [00:23:00] much more stronger than the previous year. Uh, cuz we finally found out, you know, it takes time”

A viable strategy for developing inclusive learning settings that meet the requirements of dyslexic students is co-teaching models. At the International School, EY and PYP have 2 teachers (English teacher and French/German teacher) in each classroom catering dual literacy and bilingual education. To provide individualised instruction and assistance inside the mainstream classroom, these methods include collaboration between general education instructors and special education teachers or other professionals (Tam and Leung, 2019). The claim made by Dillon and Gallagher (2019) that co-teaching solid relationships and administrative assistance are essential aligns with how the educational landscape is changing. According to Ehsan et al. (2019), Co-teaching stands out in several teaching methods, including conventional, differentiated instruction, and inclusive education, because it can close gaps and provide varied yet coherent learning environments.

Due to the standardized methods used in typical classrooms, dyslexic students suffer, on the account of one size fits for all approach. Differentiated instruction seeks to remedy this, but co-teaching improves individualised support through in-class collaboration. Co-teaching enhances inclusive education, which focuses on including students with disabilities, as it breaks down barriers and fosters a collaborative learning environment (Sundqvist et al., 2021; Hackett et al., 2021). Co-teaching uses a variety of methods, such as translanguaging and classroom management. Classroom management is improved by combining the talents of the two teachers, and translanguaging benefits bilingual dyslexic students. This strategy is consistent with current educational discourse, which strongly emphasizes the value of accommodating a variety of learning profiles (Murphy, 2022). However, as Dillon and Gallagher note, co-teaching must be implemented with clear administrative direction. Administrative assistance ensures that instructors have the tools and training they need to work together smoothly, promoting a more peaceful learning environment.

The increased individualized attention, a decrease in the stigma associated with dyslexia among pupils, and the sharing of teaching methods are all advantages of co-teaching. Nevertheless, it is also vital to acknowledge difficulties. To minimize misunderstanding, co-teachers must have similar teaching principles and communicate well (Pappamihel, 2012). However, Abnett (2013) argued that balancing instructor dynamics, material delivery, and assessment alignment can be challenging. Additionally, educators need enough time and opportunity for professional development to prepare successfully, reflect on, and improve their co-teaching techniques. Collectively contextualized within conventional, differentiated instruction and inclusive educational models, co-teaching approaches correlate well with inclusive pedagogical practices for dyslexic students.

In alignment with this Rachelle, grade 3 STEAM teacher enlightens the importance of translanguaging;

“Encourage students to use both languages strategically and, uh, understand the context where each language is appropriate. Uh, collaborative learning, like promote collaborative, uh, learning activities where students can interact with peers, uh, who speak the same language across. And, uh, those who speak different languages”

Translanguaging is a sophisticated method that improves bilingual education by smoothly combining languages, giving dyslexic pupils better language competency and cognitive flexibility. Wawire and Barnes-Story (2023) emphasise that translanguaging instruction promotes deeper topic comprehension and links between home and school languages by supporting the development of biliteracy and language competence. Similar to how educators in the current study stress the value of combining languages for dyslexic pupils. The idea that bilingual education entails language translation is refuted by translanguaging (Pontier, 2022; Dikilitaş et al., 2023). Its inclusion is consistent with recent studies emphasising that multilingualism promotes cognitive development and academic achievement. The results of Wawire and Barnes-Story's study highlight the advantages of translanguaging for language proficiency. This is complemented by the observations of educators, who show how effective language integration may be used to improve cognitive flexibility, linguistic competency, and learning continuity, particularly for dyslexic pupils. By fostering the linguistic skills and cognitive agility of dyslexic pupils, translanguaging techniques in bilingual classrooms meet their demands

(Dornet and Schiller, 2023). These results are consistent with more general debates on the advantages of bilingual education and inclusive practices. Educators enable a comprehensive learning experience that fosters both language growth and better comprehension by relying on the concepts of translanguaging (Ndhlovana and Charamba, 2023; García and Otheguy, 2020). This is in line with the changing educational environment, which emphasises the value of linguistically varied approaches that consider students' different learning preferences while questioning preconceived notions about bilingual education.

Thus, the educational techniques used in bilingual classes for dyslexic students show a thorough and inclusive approach. Differentiation, Structured Phonics Programmes, Student Agency and Autonomy, Technology, Multisensory Resources, Co-teaching, and Translanguaging all help to create an atmosphere that is both supportive and empowering for learning.

Conclusion

Our research examined the challenges that bilingual primary teachers in the UAE faced while trying to help dyslexic students with their literacy. The strategies used by bilingual primary teachers in the UAE to help dyslexic pupils' literacy and language learning abilities were examined in this research study. Through thorough thematic analysis, the study filled in significant gaps in the literature by highlighting the accomplishments and challenges of inclusive education. The results of the study underscored the necessity of implementing educational reforms that effectively address the unique requirements of individuals, while also promoting inclusive education. These findings shed light on a shift in inclusive educational practices, moving away from a focus on uniformity towards prioritizing equal opportunities for all. To promote equal education in multilingual environments, this strategy is crucial.

The study also highlighted the challenging balance bilingual educators must achieve between addressing second language (L2) learning and dyslexia-specific requirements. Due to the conflicting needs of these two factors, problems must have unique solutions. Although bilingual resources can help with language acquisition, they cannot appropriately address issues associated with dyslexia. The study emphasised the value of setting aside time for concentrated assistance, focusing on small-group interventions, adaptive planning, and ongoing professional development to handle these multiple difficulties successfully. The viewpoints of educators give insight into the complexities of language acquisition for dyslexic pupils in multilingual environments. Nicole, Ann, and Emily's points of view illustrated various approaches to treating dyslexia, such as education in a single language and monolingual learning. These methods highlight the necessity of individualised techniques that consider students' cognitive needs, language abilities, and personal traits. The study provided sophisticated methods for assisting dyslexic students in the challenging multilingual setting of the UAE.

The study's overall findings highlighted the crucial support needs for bilingual education for dyslexic pupils. It underscored the significance of continual professional growth, inclusive pedagogies, and efficient tactics. The

study also highlighted the difficulties brought on by workload, highlighting the need for extra preparation time and team collaboration, particularly in multilingual environments. To successfully address these complicated demands, suggestions were made for including dyslexia specialists, involving families, and creating a specialised bilingual curriculum. The study's conclusions support the argument for adaptable strategies to meet the various learning demands of all children, which aligns with the broader conversation on inclusive education.

Recommendations

Future studies should further examine the numerous important recommendations provided to enhance the inclusive pedagogy experiences for dyslexic students in a bilingual school setting based on the research's findings and taking into account its limitations:

Professional Development: To improve bilingual teachers' comprehension of dyslexia, efficient teaching methods, and inclusive practices, schools should fund extensive professional development programmes. Differentiation, structured phonics, co-teaching models, and multisensory teaching strategies should be the main topics of workshops and training sessions.

Individualised Support Plans: To create individualised support plans for dyslexic children, schools should create a collaborative framework incorporating dyslexia experts, teachers, parents, and students. These plans must include precise objectives, modifications, and interventions catered to every student's individual learning requirements and preferences.

Workload balance: Evaluating the distribution of workload among teachers in bilingual schools is crucial in order to effectively meet the demand for bilingual education and ensure the production of high-quality instruction and teaching materials.

Comprehensive Assessments: Bilingual educational institutions should prioritize the importance of comprehensive assessments in order to gain a comprehensive understanding of each dyslexic student's profile.

Multilingual Resources for Dyslexia: Teachers must have access to materials that address difficulties unique to dyslexia in multilingual contexts. Teachers can be helped in developing an inclusive learning environment that satisfies various language and learning demands by developing specialised materials and resources that integrate language learning and dyslexia support.

Longitudinal Studies: Conduct longitudinal studies to examine the long-term effects of particular inclusive pedagogies and support methods on the academic development, self-esteem, and general well-being of dyslexic students in bilingual settings.

Acknowledgements

Author 1's acknowledgements

First and foremost, my heartfelt gratitude to Almighty God for providing me with strength, resilience, and unwavering faith that sustained me throughout the arduous process of completing my dissertation. To my family back home, your emotional support and enduring faith in my abilities have been my rock and inspiration. To my wife, who stood by my side through the nights of research and moments of self-doubt, your patience, understanding, words of encouragement, and love are well appreciated. I am grateful for your steadfast presence in my life.

With profound gratitude and immense appreciation to Professor Anthony Maher for his invaluable guidance and unwavering support throughout the entire process of my dissertation. His insightful feedback and constructive criticism have been instrumental in refining my research paper and I am truly fortunate to have had the privilege of working under his supervision. I am grateful for his constant encouragement during challenging times and for the countless hours of meetings and patiently addressing my questions and concerns and guiding me through the intricacies of research methodology, data analysis, and academic writing. Thank you for being an exceptional mentor.

Lastly, I wish to extend my appreciation to my colleagues who participated in my research study and to our school leadership, particularly Ms. Ruth, the Head of School, and Ms. Shona, the Head of Primary School, for their invaluable support and permission to conduct this research.

Profiles, Characteristics, Challenges and Opportunities of Transnational Education Providers in the Philippines

Grace Severo, Ph.D.

National University, Philippines,  <https://orcid.org/0000-0003-0779-9938>

Ormon Angel Andes, Ed.D.

National University, Philippines,  <https://orcid.org/0009-0006-7504-1554>

Abstract: Transnational Education (TNE) is a relatively new educational concept in the Philippines that focuses on accessibility, open learning, and distance education. Defined by the Commission on Higher Education (CHED) as the education provided by universities and institutions from the home countries to students working and studying abroad that offers a double degree. Since its implementation in 2016, no research exists on its achievements and milestones in the academe. Hence, this research investigates to determine common profiles, characteristics, challenges, and opportunities of TNE providers in the Philippines. Qualitative phenomenological design elicited data from three out of ten legitimate TNE providers who participated in the study. Data was analyzed using Braun and Clarke's procedures, data familiarization, initial code generation, theme search, theme review, and theme definition. Results revealed that empowerment of human capital, program collaboration and partnership were the common profiles of TNE providers. Whereas education quality and support in programs, quality in facilities, and accreditations are the common characteristics. However, internationalization is a challenge as well as an opportunity for TNE providers. Hence, this research highlights that TNE is critical to the internationalization of education and its competitiveness and employability of Filipinos in the global economy of today and tomorrow.

Keywords: Transnational education, Higher education institutions, Distance education

Introduction

In a developing country like the Philippines, the most economically rewarding jobs are secured by college degree holders. This demand resulted to various higher education institutions. As of 2021-2022, records from Commission on Higher Education (CHED) showed that the country has 1,963 HEIs (excluding satellite campuses of state universities and colleges). From this record, 242 are public HEIs, while 1,721 are private

institutions. Alongside with this supply and demand is the mandate of the state to protect and promote the right of all citizens to quality education. This fundamental law also mandates that education shall be assigned with the highest budget. These mandates are triggered by the challenges of globalization and internalization of educational services. As a result, the Philippines seriously considered transnational education as a response to the increasing pace and international qualification demands in services fueled by trade arrangements and developments in information and communication technologies. As technology becomes more accessible to schools all over the world, there has been a global shift as education becomes infused with technological usage. With that technological usage, many other methods of learning have been realized and created. In, states that from being the catalyst in developing multimedia and information technologies to using the internet as a means for educational purposes, e-learning has created radical changes in the traditional process of teaching.

Transnational Education is defined by CHED as the education provided by universities and institutions from the home countries to students working and studying abroad that offers a double degree. The Philippines TNE model is a work in progress, that will serve as test case for neighboring countries to emulate given the challenges and opportunities it may offer to higher education institutions. In 2014, the Open Distance Learning Law was implemented to expand the possibilities, opportunities, and modes of learning to those who are far away from the country. It utilizes print, audio-visual, internet, and face to face methods to ensure that the students may have quality education best suited to their needs and in August 2019, the Transnational Higher Education Act or RA 11448 was enacted, in order to expand “access to educational services through the establishment and administration of Transnational Higher Education”. The TNE act will enable and accelerate Transnational Education partnerships between foreign and local universities, increasing the access of Filipino students to quality international programs and standards.

The new law mandates the CHED to establish a dedicated office to handle TNE matters, as well as to develop a comprehensive TNE program. While there are existing TNE programs in the country, RA 11448 opens opportunities for more models, beyond collaborative TNE arrangements, such as franchising, articulation, validation, and branch campus among others. CHED will support the implementation of locally relevant TNE models in the undergraduate, graduate and post graduate levels. According to the British Council in 2019, one of our leading partners in TNE, this law will also expedite the processing of applications and permits of foreign students and faculty. According to the TNE Act, the ultimate purpose of bringing international standards and expertise to the Philippines is to modernize and make higher education in the country globally competitive. In, sees the TNE’s purpose as a way to draw in gifted students, faculty, and personnel, in order to enhance the country’s human resource base. Therefore, any Philippine Higher Education Institutions with programs recognized by CHED may also offer services offshore, provided that they preserve the reputation of the Philippines as a provider of quality higher education as well as abide by the laws, rules, and regulations of the host country. While Philippine legislation on transnational education is a critical development in strengthening higher education system, it poses a big challenge on educational and digital access due to the country’s geography, socio-economic status of students, internet connection in other areas like the provinces in Mindanao and the Visayan region. Now that a new norm will be observed in schools after the global pandemic, the

Department of Education and the Commission of Higher Education are strongly considering online platforms. However, the readiness of infrastructure and technology as well as the implementation of this platforms remains a challenge. Although the potential of distance education and TNE has been discussed because of its value in raising the quality of education in the Philippines, there is not much information on how to proper lead and implement TNE and distance education. In, there are ten pioneer schools who offered TNE but there is not enough literature on how this platform is delivered. Since the internationalization of higher education in the Philippines through TNE program is not yet truly recognized despite its effort and initiative, it is deemed necessary to find out the milestones and achievements since its implementation in 2016. Therefore, this study aims to explore and investigate the implementation, common characteristics, qualifications, and best practices of leading TNE providers in Manila.

Research Objectives

Specifically, the study aimed to provide answers to the following objectives:

1. Describe the common profile and characteristics of the TNE institution providers in terms of:
 - 1.1 Human capital and leadership styles
 - 1.2 Programs, partnerships, and accreditations
2. Identify the challenges and opportunities in implementing TNE in terms of:
 - 2.1 Curriculum and Instructions
 - 2.2 Technology innovation on mode of delivery
 - 2.3 Teaching and learning management.

Background

The world as we know it has become a global community. Part of its realization is the advent of the internet and the internationalization of education. In its broadest sense, internationalization of higher education is the expansion of learning within and beyond national borders which is sometimes referred to as cross-border education. There are two pillars of internationalization: home-based and cross-border. Home-based involves networking and other forms of linkages with foreign HEIs and students' study without moving out of their country while cross-border requires students to study in a foreign country. This study, however, will focus only on transnational education providers in Manila. Transnational education includes all types of higher education study programs, set of courses of study, or educational services (including those of distance education) in which learners are located in a country different from the one where the awarding institution is based (CMO No. 55,s. 2016). TNE is one of the key features of higher education in the global era considering the freer flow of students and workers within and across the ASEAN region and the necessity of international linkages to facilitate sharing of knowledge, innovation, and technology.

The implementation of TNE is grounded on the Philippine's policy in education under Article XIV Section 4 (2)

of the 1987 Constitution, Sec. 123 of the Corporation Code and Investment Act of 1991. Its primary goal is to ensure quality of education that would translate into a development of a competitive resource capital. The goal is grand and noble, but the researchers has observed that there are very few schools that offer TNE. In its first year of implementation, there are only 10 HEIs who participated. Until now, TNE is unpopular in the country and only those students who are well-off can afford to study and earn international degrees without moving out of the country. This premise has motivated the researchers to study and explore further the reasons why very few HEIs offer TNE and why many schools are not even qualified to offer it.

Method

Qualitative phenomenological design elicited data from three TNE higher education institutions (HEI) in the National Capital Region (NCR) of the country who participated in this study. These HEIs were the only institutions who willingly participated in interviews. The sensitivity of the data that was gathered from the study was one of the major considerations under the Data Privacy Act as pointed out by the respondent prospects. For data privacy, the name of the university participants will not be mentioned in this research report.

Phenomenological research design was used to examine contemporary context or setting of the existing TNE providers which started in 2016. An open-ended questionnaire and semi-structured online interview were utilized. The researchers also heavily relied on the use of secondary sources from the HEIs websites and multi-media accounts to gather public documents to enrich the qualitative findings. These documents served as exhibits for the thematic analysis of TNE standards and qualifications.

Results and Discussion

A. TNE Profiles

A.1. Human Capital and Leadership Styles

In terms of Human Capital and Leadership Styles, the thematic analysis of the responses of the co-participants during the interview showed one theme, that is, “Empowerment.” This word encompasses the idea of investing in and developing human capital, leadership styles, and employee commitment and engagement, as well as the overall goal of achieving success and effectiveness for the organization. Based on the findings of the investigation into the separate experiences of the co-participants, this theme is categorized into three codes, namely: (1) Ensuring Employee Commitment and Engagement; (2) Employing Various Leadership Styles; and (3) Improving Human Capital. Each table in the next pages are used to present the references and core ideas of each thematic code.

. Table 1. References and core ideas of the code

Code	References and Core Ideas
Ensuring Employee	Participant 1.1: Employees have a high level of commitment and engagement;

Commitment and Engagement	<p>they are provided several training opportunities.</p> <p>Participant 1.2: Their performance rating has consistently been between superior and excellent.</p> <p>Participant 1.4: Retain employees' superior level of performance and customer service orientation; high levels of commitment and engagement.</p> <p>Participant 1.5: To improve – training in use of technological tools for data collection, maintenance, and analysis; improve English language proficiency – in writing.</p> <p>Participant 1.6: Yes, because our employees rate the performance and style of the managers and leaders, and they give high ratings for all levels of management</p>
Employing Various Leadership Styles	<p>Participant 1.3: The leadership style of management is democratic.</p> <p>Participant 2.2: The leadership style is top-down management style.</p> <p>Participant 2.3: I would like to improve by observing participatory management. It advocates sense of ownership.</p> <p>Participant 3.1: Top-down leadership style</p>
Improving Human Capital	<p>Participant 2.1: The human capital is excellent because they are trained based on international standards.</p> <p>Participant 2.4: A wider involvement of all stakeholders will be very good for the university.</p> <p>Participant 3.2: I would like to retrain highly competitive TNE partners.</p>

The thematic code, “Ensuring Employee Commitment and Engagement,” seems to suggest that the co-participants ensured employee commitment and engagement by creating and sustaining a work environment in which employees are inspired, invested, and committed to the success of the organization. This can be accomplished through a variety of tactics, such as offering growth and development opportunities, building a pleasant and supportive work culture, and successfully conveying the organization's goal and values. As mentioned in, a key part of running a successful organization is maintaining staff dedication and interest. Methods for accomplishing this goal include encouraging team members to share ideas and opinions, providing them with opportunities for professional growth, and creating a welcoming workplace. Putting money into employee engagement has been shown to boost output, boost morale, and decrease turnover. Employees are more likely to be dedicated and engaged in their work if they are given opportunities to have input into important decisions, if there is a strong culture of rewards and recognition, and if they feel like they have a place in the organization.

Whereas “Employing Various Leadership Styles” theme, implies that the co-participants thought that the ability of leaders to modify their approach dependent on the environment and the folks they are leading is referred to as employing several leadership styles. Different leadership styles can be more effective in different circumstances,

and the ability to employ multiple styles can help leaders achieve their objectives more effectively. Based on the responses, one of the common themes is leadership style. Specifically, the statements suggest that there may be a lack of consistency or agreement among participants in regard to the leadership style within the organization, with some describing it as democratic, others describing it as top-down, and one suggesting a preference for participatory management. Such ideas can be found in the following statements: Participant 1.3: “The leadership style of management is democratic.”; Participant 2.2: “The leadership style is top-down management style.”; Participant 2.3: “I would like to improve by observing participatory management. It advocates sense of ownership.”; and Participant 3.1: “Top-down leadership style.” One possible takeaway from the responses is that there is little consensus on how leadership should be exercised inside the group. The leadership style has been described as both democratic and top-down by the participants. This could reflect a genuine divergence of opinion amongst those involved, or it could suggest a breakdown in leadership clarity and communication inside the company. In addition, one respondent expresses a desire for participatory management, which promotes a feeling of ownership; this seems to suggest that this could be an indication that the current leadership style isn't pleasing the employees completely and that they want to have a greater hand in making decisions. As described in, to be an effective leader, one must be able to employ a variety of leadership styles, each tailored to the specific needs of the organization and its members. In some cases, and with some groups of people, one leadership style may work better than another, and must be able to modify his or her approach based on the needs of the group they're in charge of and the circumstances at hand.

The theme “Improving Human Capital,” seem to suggest that co-participants believed that improving human capital means investing in and growing an organization's employees' skills, knowledge, and talents. This can be accomplished through a variety of ways, including the provision of training and development opportunities, the creation of a good and supportive workplace, and the provision of competitive salary and benefits. Based on the responses, one of the common themes is related to improving the quality of human capital and involving more stakeholders in the university. For example, Participant 1 describes the human capital as excellent, but also suggest that training should be based on international standards. Participant 2 suggests involving more stakeholders in the university will be beneficial. Lastly, Participant 3 suggests retraining to be more competitive TNE partners. Overall, the theme is about finding ways to improve the quality of the human capital and involving more stakeholders to increase the competitiveness of the university. The key impression is that the participants understand the value of incorporating more constituents in university decision-making and the need to invest in the human capital of the institution. They think that the university's competitiveness can be improved through retraining and conforming to worldwide norms. Hence, to maintain its position as a leader in higher education, the university must continually engage in the training and development of its staff and foster possibilities for collaboration and partnerships with a diverse set of constituents.

A.2. Programs, Partnership, and Accreditation

In terms of Program and Partnership, the thematic analysis of the responses of the co-participants during the interview showed one theme, that is, “Collaboration.” Collaboration is the process of working with others to

accomplish a shared aim or objective. This may involve the sharing of resources, knowledge, and talents, as well as the coordination of efforts and good communication. Collaboration can occur among individuals, teams, companies, and even businesses or sectors. Often, the purpose of collaboration is to attain an outcome that would be difficult or impossible to accomplish alone. Collaboration can result in increased creativity, efficiency, and production, as well as enhanced communication and interpersonal interactions. According to the findings of the investigation into the separate experiences of the co-participants, this theme is categorized into three codes, namely: (1) Providing Programs and Curriculum; (2) Working on Partnerships and Employment; and (3) Strengthening Partnership with Another University. These codes are presented in Table 2.

Table 2. References and core ideas of the codes

Code	References and Core Ideas
Providing Programs and Curriculum	Participant 1.1: Programs are transformational, quality standards of education based on international standards, innovation is encouraged and there is a culture of research.
	Participant 1.2: We have partners from the UK and Australia because we deliver their curricula in the Philippines.
	Participant 1.3: We are transnational education provider with a good number of academic and industry partners in the UK, Australia, and Switzerland.
	Participant 1.4: We would like to continue to provide transnational education and are continuously exploring partnerships with more universities in the UK, USA, and Australia to ensure top-up opportunities for our students.
Working on Partnerships and Employment	Participant 2.1: Yes, we are satisfied with our current partners since they are excellent universities and program providers in the UK.
	Participant 2.2: We continue to have high employability rates of our graduates - 95%-98% of graduates find employment or entrepreneurship opportunities here and abroad within 6 months to a year of graduation.
	Participant 2.3: More partners where we deliver their curriculum in the Philippines to open up to additional programs or courses.
	Participant 2.4: Well managed academic partners. Majority of the students are coming from academic partners (almost 95%).
	Participant 2.5: The program and partnership is innovative and focused on academic excellence. It is also consultative to provide students of what they need.
	Participant 2.6: The government should be responsive and adaptable to enhance TNE services. I would like to retain the online education

	because it is innovative and flexible.
Strengthening Partnership with Another University	<p>Participant 3.1: Partnered with UK-Liverpool Hope University. The partnership is program pairings/ twinning arrangement and joint/dual degrees as defined in TNE guidelines.</p> <p>Participant 3.2: We recognized by CHED, research based, internationally focused curriculum, more on practical skills, delivers intellectually stimulating and culturally enriching programs.</p> <p>Participant 3.3: Harmonize higher education system across ASEAN with improved quality assurance and degree recognition.</p>

The theme “Providing Programs and Curriculum,” as shown in the references and core ideas, responses seem to suggest the act of offering various educational programs and courses to students. This can include traditional classroom-based instruction as well as online and distance learning options. Based on the findings, the insight is that the group is dedicated to offering high-quality education that is in line with worldwide standards and is actively looking to extend its collaborations with universities from other countries to increase the options available to its students. They foster a mindset that values discovery and new information. They operate as a global education provider, collaborating with numerous institutions and businesses across the globe. As cited in, stated that offering programs and curriculum means that the institution makes effort to provide instruction that is up to par with global norms for educational quality. Maintaining a culture of inquiry is essential, as is providing transformative and innovative programming. This indicates a commitment to provide a wide variety of courses that are both interesting and useful to their pupils and up to par with global norms. In addition, as mentioned in, TNE is used to describe educational initiatives and programs in the Philippines that facilitate the movement of students, teachers, and materials between Philippine and foreign educational institutions.

The thematic code “Working on Partnerships and Employment,” means that the co-participants explained the act of forming partnerships with other organizations, particularly universities and industry partners, in order to provide more opportunities for students. Based on the responses, one of the common themes is partner universities and graduate employability. The co-participants’ feedback suggests that the universities and service providers they are already working with are meeting their needs. They also stress the need of fostering new partnerships to increase the breadth of their course offerings and the high employability of their grads. On top of that, they highlight the need of having well-managed academic partners, as many of their students come from these organizations. Furthermore, they place an emphasis on student input, academic rigor, and ground-breaking new approaches to program design and collaboration. They also stress the value of online education as a versatile and forward-thinking alternative and call for the government to be more responsive and adaptable in order to improve TNE services. Hence, working on partnerships and employment means establishing and strengthening ties with academic institutions in order to deliver first-rate courses and internships to students. It is also desired to broaden these collaborations and investigate additional programs and courses in order to provide students with a wider variety of options. In addition, these collaborations highlight the significance of creativity and adaptability, particularly in the context of distance learning.

In the theme code “Strengthening Partnership with Another University,” co-participants clarified the process of developing and maintaining a strong relationship between two universities. This can involve various activities such as sharing resources, collaborating on research projects, and offering joint or dual degree programs. The goal of strengthening a partnership with another university is to enhance the educational opportunities and resources available to students, as well as to promote academic excellence and innovation. Based on the responses, one of the common themes is the focus on transnational education (TNE) partnerships and program offerings, with a specific emphasis on the partnership with UK-Liverpool Hope University and adherence to TNE guidelines. Additionally, there is a focus on ensuring quality and recognition in the higher education system, both domestically and internationally. One takeaway on this implies that aligning with the principles of international education, the relationship includes program pairs, twinning arrangements, and joint/dual degrees. The universities have been approved by the CHED, offer a curriculum based on academic research and an international perspective that places an emphasis on practical skills development, and present intellectually stimulating and culturally enriching courses and events. They are also committed to advancing quality assurance and degree recognition within ASEAN in an effort to standardize the region's higher education system.

B. TNE Common Characteristics

The thematic analysis of the responses of the co-participants during the interview showed one theme in terms of facility and accreditation levels, that is, “Quality.” The quality of a university's education depends on the caliber of its faculty members. Universities should place a high priority on its employees' development and growth and invest in their faculty to provide a high-quality education for its students, as evidenced by the hundreds of training programs it offers to employees at all levels and to managers. Based on the investigation into the separate experiences of the co-participants, the theme is categorized into two codes; that is, Faculty and Training; and Quality Assurance and Standards.

Table 3. References and core ideas of the codes

Code	References and Core Ideas
Faculty and Training	Participant 1.1 Faculty, trained in the British education practices and requirements
	Participant 1.2 Research opportunity; technology support is excellent as shown by our performance during then pandemic years.
	Participant 1.3 Excellent learning resources from partner universities.
	Participant 1.4 High employee retention rates and hundreds of training programs for all levels of employees and management.
	Participant 1.5 Recruitment of more qualified faculty.
	Participant 1.6 Strat planning to create the elements of the School of the Future which is already NOW.

	Participant 1.7 Build more partnerships with industries-especially multinational corporations.
	Participant 1.3 Recruit more faculty
	Participant 2.1 Accredited by ISO, veritas and Philippine associations like PACUCOA
	Participant 3.1 CHED-Autonomous level, Philippine Accrediting Association of Schools, Colleges, and Universities (PAASCU), ASEAN University Network Quality Assurance (AUNQA)
Quality Assurance and Standards	Participant 3.2 Granted Institutional Accreditation status by the Federation of Accrediting Agencies of the Philippines (FAAP)
	Participant 3.3 CHED named fourteen academic programs as Centers of Excellence (COEs) and five academic programs as Centers of Development (CODs).
	Participant 3.4 Improve the assessment standards per program.
	Participant 3.5 It should meet both the standards of the local and international qualifications.

The thematic code "Faculty and Training," means that the co-participants shared their thoughts on the educational backgrounds of the university's teaching staff. They stressed the importance of the faculty's training in British education practices and requirements, which implies that the university places a premium on the quality of its teaching staff. Responses seemingly suggest, one of the common themes is the quality of education and resources provided by the university, specifically through the use of British education practices and partnerships with other universities for research and technology support. It suggests that the common thread among these declarations seems to be a commitment to developing the institution's human and material resources by means of activities like faculty recruitment and development, expanding the scope of available research, embracing technological advancements, forging relationships with relevant businesses, and implementing long-term strategic plans. It is stressed that the institution is at the vanguard of educational theory and practice. The term "training" is commonly used to describe the process of learning what one needs to know and how one might improve one's performance on a given job or task. Training for faculty members is essential in the context of higher education because it allows them to maintain expertise in their fields, enhance their teaching abilities, and meet the requirements of their students. The institution's dedication to its teachers and staff, as seen by its strong retention rates and the sheer number of training programs it offers, suggests it places a premium on their professional growth and provides them with the tools they need to succeed in their professions.

As mentioned in, the term "faculty" is commonly used to refer to the group of teachers and professors at a university or college. They are the ones whose job it is to teach the material and help the pupils along the way. The term "training" is commonly used to describe the process of learning what one needs to know and how one

might improve one's performance on a given job or task. Training for faculty members is essential in the context of higher education because it allows them to maintain expertise in their fields, enhance their teaching abilities, and meet the requirements of their students. The institution's dedication to its teachers and staff, as seen by its strong retention rates and the sheer number of training programs it offers, suggests it places a premium on their professional growth and provides them with the tools they need to succeed in their professions. TNEs span a greater scope when it comes to accommodating for the educational requirements of nations. Hence, teaching experience and adaptability of the teachers are two crucial components of TNE.

Furthermore, the term "Accreditation" means that institutions are being evaluated and certified as having high quality standards in the field of education. It is a process by which a school or program demonstrates that it adheres to quality criteria established by a recognized body, either nationally or internationally. Due to the confidence, it instills in prospective students and teachers that the institution or program is up to par, this approach can increase enrollment and faculty retention. TNE providers also emphasized that accreditation can be used as a marketing tool to attract students and staff to the university, which is a key takeaway from the discussion so far. According to the findings of the investigation into the separate experiences of the co-participants, this theme is categorized into one code; that is, Quality Assurance and Standards.

Consequently, "Quality Assurance and Standards" is the theme that emerged from co-participants which seemingly suggest that they are focused on the standards and quality assurance in education within their institution. They shared information about the many initiatives now underway at the university to improve teaching and research. The relevance of accreditation in luring customers was also highlighted, as was the promotion of the reciprocity doctrine. Based on the responses, one of the common themes is accreditation and quality assurance in higher education. The participants are discussing the importance of recruiting more faculty, being accredited by various organizations and agencies, and meeting both local and international standards for academic programs. They also mention specific accreditation and recognition received by the institution and the need to improve assessment standards for each program. Findings seemingly suggests that accreditation and educational quality assurance serve as a unifying theme here. Accreditation and quality assurance measures attained by the educational institution are being discussed, including ISO and PAASCU accreditation, and the significance of recruiting more faculty. They also stress the need for higher quality assessments that are in line with global norms. The overall goal is to guarantee that the children receive an excellent education. As stated in, the term "quality assurance and standards" is used to describe the procedures and measures taken to guarantee that educational programs consistently deliver on promised quality and excellence. Assessment standards for various programs and accreditation by various bodies fall under this category. The overarching point of this discussion is the need of quality assurance and standards in ensuring that schools offer effective teaching and curriculum that caters to the diverse needs of their students. Furthermore, learning methods are the strategies that are used to facilitate the acquisition of new information and abilities. Quality Assurance is a staple when it comes to methods in improving the standards of TNE. Hence, when assessing the efficacy and worth of a school or university, it is crucial to consider the institution's quality, accreditation, and curriculum.

Accreditation and other forms of evaluation, as well as the hiring of skilled instructors and the ongoing refinement of assessment tools, can help institutions meet these benchmarks. Based on the number of accreditation and recognition levels, it can be concluded that these TNE providers are achievers who sport excellence in delivering quality education that is in accordance with the provisions of RA No. 7722 which states that institutions offering transnational education must have (1) accreditation or certification by the respective higher education ministry/commission or appropriate regulatory body for higher education; (2) legal standing in its country of origin and/or other countries in which it conducts business as well as the recognition of its qualifications including those delivered through TNE; (3) academic reputation in academic communities ; (4) qualifications and/or experience of academic staff with regard to teaching and research, when tutoring/academic support is provided by the offshore partner; (5) quality and accessibility of student learning support services such as ICT infrastructure and facilities, library, computing services, bandwidth availability, meeting rooms, virtual learning environment and learning management system; (6) quality teaching and learning resources such as open education resources ; (7) institutional and national quality assurance procedures for TNE including published standards and reports; (8) appropriate student support services including, when international students are to spend a period of time in the Philippines as part of course or program requirements, information on legal requirements and accommodation arrangements, subject to the Bureau of Immigration requirement for international students; (9) strictly followed the processes of application to operate transnational education.

C. Challenges and Opportunities in Implementing Transnational Education

The thematic analysis of the responses of the co-participants on TNE's challenges and opportunities during the interview showed one theme, that is, "Internationalization." To improve an organization's viability and global standing, its leaders may choose to engage in a process known as "internationalization." This involves forming and maintaining relationships with counterparts in other countries. In order to do this, the school must conform its programs and activities to worldwide norms and partners, seek authorization from government authorities like CHED, and establish new programs and collaborations with universities in other countries. In order to ensure the long-term success of the school, it is crucial that it expand its worldwide reach through fostering new programs and mutually beneficial academic partnerships.

According to the findings of the investigation into the separate experiences of the co-participants, this theme is categorized into three codes, namely: (1) Obtaining Approval from CHED and Partner Universities; (2) Identifying and Developing New Programs and Partnerships; and (3) Aligning Programs and Activities with International Partners and Standards.

Table 4. References and core ideas of the codes

Code	References and Core Ideas
Obtaining Approval from	Participant 1.1 Obtaining approval from CHED, it takes years to get approval of programs and by the time they are approved, the partner university has improved

CHED and Partner Universities	<p>and revised the content of these programs.</p> <p>Participant 1.2 Keep following up requests for approval. Speak to representatives of CHED.</p> <p>Participant 2.1 Government policy on approval of programs. 3 to 5 years before approval.</p> <p>Participant 2.2 Merged programs of partner institutions abroad not aligned with local programs.</p> <p>Participant 2.3 Multilateral participation... work together with government agencies. Consultation of both partner institutions.</p> <p>Participant 2.4 CHED activities and programs must be participated by stakeholders, universities and partner institutions.</p> <p>Participant 2.5 Engage with experience TNE programs</p> <p>Participant 2.6 Outsource human capital and seek more educational partners</p> <p>Participant 3.1 Government policy on approval of programs. Twinning programs require fast approval from CHED</p>
Identifying and Developing New Programs and Partnerships	<p>Participant 1.3 Identify new programs which are getting to be critical part of the school of the future</p> <p>Participant 1.4 New programs and/or new partners in the USA and in Germany</p> <p>Participant 1.5 Through meetings with representatives of selected universities</p>
Aligning Programs and Activities with International Partners and Standards	<p>Participant 3.2 Hiring internationally qualified faculty and staff</p> <p>Participant 3.3 CHED activities and programs must be aligned with international partners</p> <p>Participant 3.4 Establish international linkages</p> <p>Participant 3.5 Acquire and adapt to new technologies and teaching approaches</p>

The theme code “Obtaining Approval from CHED and Partner Universities,” means that the co-participants talked about applying to the Commission on Higher Education (CHED) for recognition of a program or partnership with an international institution. The amount of time it takes to get clearance from CHED and the possibility that the content of these programs will alter by the time they are approved seem to be causing participants some concern. Based on the responses, one of the common themes is the challenges and difficulties in obtaining program approvals from CHED and the impact of government policies on program approvals and alignment with partner institutions abroad.

In addition, another theme that is common in the responses is the challenges and obstacles in obtaining approval for international partnerships and programs, and potential solutions such as engaging with government agencies, involving stakeholders, and seeking out more educational partners. Based on the findings, participants gained knowledge about the complex, potentially years-long process of seeking clearance for international education programs from the CHED. This can be a concern because the content may have already been altered by the

partner school by the time the programs are authorized. Those involved advise following up on requests for approval and communicating with CHED officials in an effort to hasten the procedure. Further, questions remain about the consistency between federal initiatives and local initiatives, as well as the consistency between programs offered by partner universities. Participants propose coordinating efforts amongst government agencies, joining forces with established TNE programs, and expanding the network of educational allies to tackle these problems. They also recommend including stakeholders, universities, and partner institutions in CHED activities and programs. And CHED needs to approve Twinning programs quickly. It can be difficult and time-consuming to secure CHED accreditation and establish international partnerships with universities. Participants report that the approval process might drag on for years, during which time the content of the programs at the partner university may have been updated and amended. The licensing procedure for CHED activities and programs can be streamlined by enlisting the support of established TNE programs and expanding the network of educational partners already in place. In sum, getting CHED's stamp of approval and forming partnerships with international universities is a process that calls for open lines of communication, teamwork, and flexibility as programs develop and change.

The theme code "Identifying and Developing New Programs and Partnerships," means that the co-participants discussed the process of locating and establishing mutually beneficial academic collaborations with universities in the United States and Germany. They believe that creating and promoting such innovative programs and collaborations is crucial to the institution's future viability. Based on the responses, one of the common themes is identifying and establishing new programs and partnerships with universities in the USA and Germany. Findings seem to suggest that according to the insights provided by these three individuals, it is becoming increasingly vital for schools to create new programs and collaborations in order to future-proof themselves. The first respondent argues that innovative programs will be essential in tomorrow's schools, while the second and third say that collaborating with colleges in the United States and Germany could help get there. The third individual suggests holding meetings with representatives from other educational institutions to achieve this goal. It's possible that participants think that forming relationships with universities is a good method for schools to adapt to changes in the educational landscape.

Hence, developing new programs and partnerships is the process of finding and putting into action projects, classes, or collaborations that will benefit students and further the school's stated goals. Finding innovative ways to fill in the gaps in the current curriculum or set of services requires exploration of various program and partnership options, as well as the identification of those gaps. Schools can better meet the needs of their students, and act in accordance with the school's vision and goal, by continually seeking out and creating new programs and partnerships.

The references and core ideas of the theme code "Aligning Programs and Activities with International Partners and Standards," means that the co-participants talked about the method by which the institution ensures that its programs and activities correspond to those of its international partners and are up to international standards. In addition, the need of acquiring and adapting to new technology and teaching methodologies, as well as the

importance of coordinating CHED operations and programs with foreign partners, was emphasized by the attendees. Based on the responses, one of the common themes is the ways to bring an international perspective to the school's education. Hiring internationally qualified faculty and staff can bring different cultural perspectives and experiences to the classroom. Based on the findings, participants shared their appreciation for the importance of bringing a global perspective to the classroom. To this end, they recommend acquiring and adapting to new technology and pedagogical approaches, as well as hiring internationally skilled teachers and staff and coordinating CHED activities and programs with worldwide partners. This indicates that the participant recognizes the value of a culturally and racially diverse faculty and staff and understands that conforming to international norms and collaborating with like-minded organizations can open doors for students. The collective wisdom of the focus group suggests that its members agree that an international perspective is crucial in modern education, and that various approaches, such as recruiting internationally qualified faculty and staff, aligning CHED activities and programs with international partners, establishing international links, and acquiring and adapting to new technologies and teaching approaches, can help accomplish this.

As mentioned in, "aligning programs and activities with international partners and standards," we mean making sure that the school's courses, services, and operations are in line with the norms and guidelines set forth by authoritative bodies on a global scale. Thus, to ensure that the school's programs and activities are of the highest quality and excellence on a worldwide scale, it may choose to associate itself with international accreditation bodies, professional associations, and other educational institutions.

Conclusions

The detailed drawn conclusions and its implications were discussed in the Results and Discussions part. However, the following are the specific highlights:

1. Transnational education is critical to the internationalization of education, and the future-proof competitiveness and employability of Filipinos in the global economy
2. The versatility of Transnational education with regards to the multitude of systems are specialized to cater to the needs of Philippine and Foreign Higher Education Institutions.
3. The lack of timely regulatory support established processes, and frequent changes in policies and goals contributed to the slow growth of transnational education in the Philippines compared to its regional neighbors.
4. TNE providers in the country must establish a healthy partnership with foreign HEIs.
5. Program approval is not consistent with the revision and review cycles of international academic partners.

Recommendations

In view of the significant findings and conclusions of the study, the following recommendations were hereby

offered:

1. The Commission on Higher Education may simplify and optimize regulatory processes and methods with regards to the creation, modification, and validation of TNE programs to expedite development of TNE providers within the country.
2. CHED'S TNE Technical Panel may focus and implement stringent rules and policies on panel attendance during program reviews.
3. The government must support the development of TNE in the Philippines at the basic, secondary, and tertiary levels.
4. CHED may work with TNE providers to ensure significant change in the processing of permits and documents need for program recognition.
5. CHED may include easing regulations for implementation, tax relief, quicker regulatory oversight, and financial aid for students participating in various exchange programs.
6. Future researchers may use this study as a guide to explore changes in the TNE implementation and verify improvement in the regulatory process that may ease the challenges of becoming a TNE provider in the Philippines.

Acknowledgements

This research was partially supported by the researchers' affiliated universities. The researchers are thankful to the participants who provided expertise that assisted in the completion of contents of the research.

Evaluating Mobile Apps Features for Learning English Speaking Skills

Harwati Hashim

Faculty of Education, Universiti Kebangsaan Malaysia, Malaysia,  <https://orcid.org/0000-0002-8817-427X>

Khairunnisa Hasnan

Faculty of Education, Universiti Kebangsaan Malaysia, Malaysia

Abstract: The demand for mobile apps, especially for second and foreign language learning, has been rapidly growing with the gradual introduction of mobile technology into learning and the evolutionary growth of mobile technology. The widespread utilization of mobile phones has massively affected learning methods. Nonetheless, exploration towards utilizing the mobile application in cultivating English language learning specifically, English speaking, persists limited. Concurrently, speaking is seen as one of the most challenging aspects among second language learners despite the advancement of universal learning. This paper investigates and evaluates the features of three selected mobile apps for English-speaking learning. This study employed qualitative content analysis to analyse three chosen English-speaking learning apps- Duolingo, ELSA, and Speak English Conversation. The findings focus on the quality app features of these apps which include categories of curriculum, pedagogy, and app design. These findings will potentially lead some directions to educators, teachers, learners, and app makers when selecting a well-designed app.

Keywords: Mobile apps, Speaking skills, English speaking app, App features

Introduction

In the era of implementation of emerging machineries universally, the roadmap of language teaching and learning has seen significant improvement. Undoubtedly, English language is acknowledged to be a medium of language to communicate internationally, and ought to support individual development competencies that are fluent in English so that our learners would be prepared to achieve their best in the Fourth Industrial Revolution (Lie & Yunus, 2018). Additionally, mobile technologies have been progressively integrated into learning these days. In many contexts, the widespread utilization of mobile phones, portable, and wireless gadgets has massively affected learning methods, along with language learning (Kukulska-Hulme, 2009).

The use of Information Communication Technologies (ICT) in Malaysia's education system is ever increasing in the country and is continuing to modify strategies that are employed by both teachers and students in teaching

and learning (Hanapiah, 2017). In the fourth industrial revolution, education is now inculcating innovative technology and creating several new types of mediums for teaching and learning, offering information, and encouraging alternative ways of performing assessments. To understand the need for Malaysian education and to address the problem posed by low speech skills, the incorporation of mobile technologies and English learning are used to become a great platform for learners to practice language skills in a fun and leisurely way. Based on the Common European Framework of Reference about languages, for the development of learning English as a second language, speaking is the second component of learning. Making it an important aspect of language learning for learners. This supports and is on par with Malaysia Education Blueprint 2013-2025 aspiration, whereby integrating technology in the acquisition of English learning in formal and informal settings is equally essential.

Speaking skills is a crucial skill to learn any language (Parveen, 2016). His study indicated that technologies should be practiced in the English classroom as it motivates playfulness of learners in learning the targeted language, he further supports those learners need a stronghold of English-speaking ability as people would often be judged based on their capability to speak. Mustafa (2018) states that both social networking and educational mobile applications work to nurture learners' oral skills, modern technologies available like YouTube, WhatsApp, Skype, and Duolingo are some famous choices that are free for learners to utilize. Additionally, the software "Learn to Speak English" is a noteworthy mobile application that cultivates the speaking skill development of learners (Farman, 2018). In this technological era, portable electronic equipment that can connect to the internet, especially a smartphone or tablet computer is getting more and more common in today's world due to the advancement in technology. Simultaneously, there are countless mobile applications designed and published for users of mobile devices. Unquestionably, language learning application is one of the useful applications that is used by most people to learn or improve a language. In this context, English is the language that the majority of people want to enhance by using mobile applications as it is the most used and spoken language around the world (Klappenbach, 2019). There are countless present mobile application that provides a different range of English learning tools for free. This indirectly encourages people to boost their language, especially English on their mobile devices as it is convenient and easy to use. Learning a language can be carried out anytime and anywhere if there is an internet connection and mobile devices (Andrew, 2019).

A myriad array of teaching materials that focus on language learning, especially digital learning content is widely available on the internet for teachers and students to venture into. Nevertheless, this endless selection may also be a potential challenge and appear daunting for teachers in selecting appropriate digital tools like mobile apps for their teaching and learning practices (Aryee et al., 2016). An extensive number of apps in the market could overwhelm both teachers and students in choosing suitable language learning apps. Thus, one way is by referring to the app description on the app store as guidance (Chik, 2014). On the contrary, Robles et al. (2021) pointed out that poor description and labeling of the app by developers may stir a problem as apps are context sensitive. Developers often rely only on learning context that fits only certain learning visions, hence, meticulous planning in building a language learning app is vital to support learning context for different variables and context. Accordingly, Larkin (2013) reminded us that due to differences in every user's learning

experience in accessing the app, the app description presented on the web will not be an adequate measure to match a valid verdict for everyone.

Developing a mobile learning app relies strongly on pre-existing evaluation criteria. It is with great importance that quality language learning mobile apps entail between life learning context, inculcate social interaction for engagement and self-directed learning (Nino, 2015; Kukuska-Hulme & Traxler, 2007). Several researchers recommended quality and useful learning apps to be built based on curriculum, pedagogical, technical, and design criteria. Sweeney and Moore (2012) proposed language learning apps to include pedagogical and technical measures. These measures are- Interactive, learning materials, and context are multimedia appropriate, have great functionality with clear context relevance, and self-directing and autonomous acquisition. Elena et al. (2014) also supported the quality criteria for the creation of digital learning that combines pedagogic and technical characteristics. Pedagogical characteristics emphasized are cognitive value and pedagogic coherence, content quality, motivation, interactivity and adaptability, and capacity to generate learning. On the other hand, technical features are usability, accessibility, visibility, compatibility, and layout and format.

Furthermore, the adaption of instructional sequence from Chamot and O'Malley by Nisbet and Austin (2013) highlighted curriculum and pedagogical features for a valuable mobile app. The criteria that make up a practical mobile learning app include- the able to trigger users' background knowledge, clear presentation of the usage of the app, highlight advantages and app functions, and feedback opportunities on the user's overall experience. In general, these studies focus on the pedagogical, design, and curriculum aspects of mobile learning app evaluation criteria. Consequently, these three aspects are used as the base categories for this study's preliminary app evaluation and are the root of this study's in-depth analysis. This study intends to come out with a comprehensive app evaluation tool that would benefit users in selecting appropriate language learning apps based on an in-depth analysis. A preliminary app evaluation checklist is needed in response to this study, this acts as a core analysis matrix and benchmark for easier evaluation of the selected language learning app. This preliminary app evaluation checklist is based on the three vital aspects evaluated by several studies, these include curriculum aspect, pedagogical aspect, and design aspect. A quality guide of the preliminary app evaluation checklist by Luyi (2018) has been adopted in this study. This app evaluation was chosen as it has a similar analysis vision in which the researcher delves into language learning apps in a vocabulary context while this study intends to explore language learning apps in the context of speaking.

Methodology

This study incorporates qualitative content analysis as the research method. Gao (1996), Weber (1990), and Creswell (2007) defined content analysis as a medium for scholars to analyze organized, replicable practices that consist of many words, texts, audio, pictures, or videos into fewer content categories to describe the central phenomenon rather than using statistics. In this study, qualitative content analysis is applied to obtain in-depth insights into the app features of selected ESL learning apps. Content analysis is used as both the research

method and the data analysis method of this study. This study is firstly carried out deductively as a set of preliminary checklists was adopted. Further analysis based on the pre-existing categorization matrix chosen eventually changed it to inductive analysis as emergent categories and criteria on the chosen ESL learning app appear. This study employed content analysis to explore the usage, content, features, and practicality of chosen speaking language learning apps. This study includes various forms of textual and non-textual analysis, which are writing presented in the app, sounds, graphics, videos, icons, logos, and game activities in the speaking app.

Sampling Units: Selecting the Apps

According to Neuendorf (2017), sampling is a crucial part of data collection where it requires the researcher to narrow down related research from the larger pool of studies. Through the sampling process, the researcher could select apps for greater analysis. The apps chosen were purposefully sampled from app store in Google Play Store and Apple App Store. This study comprises an app that is:

- 1) downloadable in mobile devices using IOS and Android operating system. Example: iPhone, iPad, smartphones, and tablets.
- 2) accessible in both Google Play store and Apple App store
- 3) designed as a language learning app
- 4) either free or freemium

Keywords used to search on the web, Google Play store, and Apple App Store are English Learning Apps, ESL, Speaking Apps, and English and Language apps. From 20 resources that recommended ESL and language learning apps, a total of 145 times of recommendations for 38 apps appeared as a preliminary list for data analysis. These recommended resources are based on literature readings, blogs and websites, professional resources, and advertisement recommendations. Some apps (e.g., Duolingo, Busuu, and Babbel) are recommended on several resources. To ensure app information from the recommended list of resources is affordable, each app was verified on the Google Play store and Apple App Store. From the list of 145 times of recommendation, this study only takes into consideration apps that meet all criteria listed for this study and apps that include speaking skills as one of the main language focuses. Based on the recommended apps, language focus varies from listening, writing, reading, speaking, vocabulary, spelling, and pronunciation. Apps that were chosen were at least recommended twice based on the list of resources.

Chosen Apps for in-depth Study

This study focuses on the content analysis of Mobile Language Learning Apps for Speaking skills. To learn and understand the development, content, functionality, and quality of app characteristics, three language-learning apps were further chosen. To begin with, speaking capabilities integrate many other skills components for it to be successfully executed. Rizqiningsih and Hadi (2019) emphasized several elements that build speaking skills. They mentioned the importance of vocabulary elements in which sufficient vocabulary helps to express

messages verbally; grammar elements to avoid miscommunication and the right access to the meaning of each word; pronunciation element that determines the correct way sounds are articulated; fluency element that creates a natural stream of communication; comprehension element to ensure speakers understand the discussion and important points made during speaking. To ensure a proper content analysis of this study, apps were chosen based on the recommended source compiled with these speaking skills elements. The three language learning apps that focus on speaking skills chosen are- Duolingo, Elsa and Speak English Conversation.

Materials

Content Analysis of this study used three different devices to gain access, explore, and collect data in all these chosen apps. Devices used to access these three apps are Samsung S9+, iPhone 12 Pro, and iPad 7th Generation. Samsung S9+ device is used to analyse through the Android operating system, iPhone 12 Pro is for iOS, while iPad is to look at the differences of chosen apps layout as compared to mobile phones. Throughout the in-depth study of these apps, data collected for the three apps were saved in the form of screenshots and Microsoft Word files. The collection of screenshots and proper recording of raw data is critical to transform emergent findings into analysable representations.

Procedures

This study uses both inductive and deductive content analysis as the research methodology. There are three phases during the data analysis process which are preparation, organization, and reporting. Neuendorf (2017) stated that the analysis of the unit is the core of content analysis for raw data and emergent findings to be reported in a more organized manner. Unit is an element that is derived from numerous styles of text, which can be broken down into phrases, words, and sentences. Researchers need to determine significant components such as the objectives, what and how to analyse data, and the criteria involved to determine samples. Based on the criteria listed previously, out of 145 times of recommendations, this study chose 3 language learning apps with a focus on speaking skills- Duolingo, ELSA, and Speaking English Conversation as the sampling unit.

The second step of this data analysis is organizing the data found and collected. Each data and analysis done are coordinated and kept using Microsoft Word. The preliminary app evaluation that was introduced earlier was used as a guide at the beginning of this study (refer Table 1), it is then modified accordingly to fit the emergent findings which situate better in-depth analysis to be done. This resulted in the development of a new temporary matrix of data analysis (refer Table 2).

It is later grouped for further analysis. Reporting is the last phase in the data analysis procedure. According to Elo and Kyngas (2008), the reporting phase is crucial as the researchers need to consider and truly analyse the description of the analysis process. On the qualitative analysis of recommended apps by several resources, a tabular table is presented in the following table (refer Table 3).

Table 1. Preliminary Apps Evaluation Checklist

Types	Description	Remark
Curriculum	Articulates learning objectives that are achievable through the app's content.	
	Provides rich, appropriate learning content through different learning activities (e.g., level challenges, and games, etc.).	
	Has accurate learning content	
	Provides content activities.	
Pedagogy	Gives feedback to learners.	
	Articulates the levels of difficulty of the learning content.	
	Allows social interaction among learners.	
	Integrates social contexts.	
	Provides personalized options that can satisfy users' individual needs.	
	Facilitates autonomous learning.	
Design	Contains different forms of multimedia (e.g., video, audio, and image, etc.) that are purposefully incorporated in the learning content and activities.	
	Has off-line functions.	
	No pop-up elements during the use of the app.	
	No technical elements that influence learner's overall learning experience.	

Table 2. Modified Analysis Matrix

Types	Description
Curriculum	Objectives
	Learning Content & accuracy
	Assessment
Pedagogy	Feedback

	Social Interaction & context
	Autonomous learning
	Gamification
Design	Multimedia integration
	Pop-up elements
	App support
	Technical elements

The sample units of this study were Duolingo, Elsa, and Speak English Conversation. This study utilizes both deductive and inductive content analytical approaches. Findings and data found that fit the categorization of the preliminary checklist matrix are analysed deductively, while those data that did not fit any categories or themes

in features listed in the matrix are analysed inductively. This cause new categories to be emerged. All reported findings are followed with a description of apps in each category of speaking language learning apps.

Findings and Discussion

Based on the in-depth content analysis of the Spoken language learning apps showed that all three of the learning apps portrayed learning and practice activities for users. However, only Duolingo showed gamification elements in their language learning process with features like hearts that act as life bars limiting users with a number of mistakes. Common features such as learning topics and lessons are included in all these apps. This section of findings features is divided into Curriculum, Pedagogy, and App design.

Curriculum

The findings from various literature showed that a potential language learning app contains five curriculum criteria: learning objectives, rich and appropriate learning content, content accuracy, content activities, and learning topics. Of the three analysed speaking apps in this study, these three apps did not meet all the criteria listed.

Duolingo managed to include a list of keywords on the main page of a lesson, creating easier access for users to understand the overview of lesson content. These keywords act as learning objectives of each lesson. Elsa and Speak English Conversation also include this feature with phrases and short sentences for extra details on each language learning lesson that is portrayed as learning objectives. For example, Elsa stated details such as talking about your hometown, career, and more under the Self-Introduction topic, while Speak English Conversation included phrases such as a trip to the lake conversation under the trips & vacation category.

From the perspective of learning topics, rich and appropriate learning content, Elsa contained a variety of learning topics and categories that are rich with learning content. Topics and categories included in speaking skills vary and are suitable for users of different backgrounds, interests, and language skills. Users have access to countless free speaking lessons. Elsa also includes appropriate speaking practice involving pronunciation lessons with videos as a learning guide and speaking practices that evaluate the user's accuracy of uttering words and speaking. Likewise, Duolingo also contained hundreds of lessons intended for language learning. It is likely users can attain high levels of English proficiency through the extensive lessons provided. Unlike Duolingo and Elsa which teach lessons in micro and macro-English learning, Speak English Conversation learning content and lessons are cantered only on everyday life conversation learning. Various categories and topics provided in this app present rich and appropriate learning opportunities for users to pick up their speaking capabilities in distinct conversation settings.

Regarding accuracy, Elsa showed the best performance in detecting inaccuracy and mispronunciation made by

users. Extensive justification, audio examples, and detailed explanations to improve made learning how to speak easier for users to attain. In addition, the app also addresses vowel sounds, word and sentence stress, intonation, and consonant sounds that highly contribute to proper pronunciation and speaking abilities. However, natural elements such as accent and noise cancellation on background sound may make speaking lessons difficult as suggested by reviews. On the other hand, Duolingo's failure to detect mistakes made during the speaking lessons of the researcher's experience should be avoided. Inaccuracy of feedback and detection may cause users to unconsciously repeat the same mistakes, affecting their learning progress and effectiveness. Undoubtedly, this influences their affective filter when challenged with their learning pace, self-confidence, learning motivation, and interest (Krashen 1989). A high affective filter that is caused by the inefficiency of the app may jeopardize the user's comprehensible input and overall learning experience.

In terms of activities provided in these apps, Duolingo includes lessons and quizzes in the forms of word matching, speaking activities following audio provided, translation, and so on for their lesson content. Elsa also includes lessons with the addition of videos and phonetic transcript, while quizzes are in the form of word matching to audio sound and testing of pronunciation following given audio and text phrases. Nonetheless, Speak English Conversation with countless learning topics offered limited learning activities as compared to the other two apps. Activities are straightforward with conversation transcript, simple multiple-choice questions for the quiz, turn-taking speaking activity, and recording of the whole conversation. A predicted sequence of learning activities may decrease user's interest and motivation, subconsciously lowering their affective filter during their learning progress.

Pedagogy

Analysis and findings found during the content analysis of this study portrayed certain pedagogical features that are exceptionally important for language learning apps. These features include app feedback during lessons, social elements, gamification features, and personalized options for users. Feedback in language learning plays a vital element in stimulating the user's learning progress. The absence of efficient feedback will not guarantee successful learning productivity (Smith & Higgins, 2006). It is argued by Little and Uchida (1998) stating feedback is one of the most important stimuli to learning, they further emphasize responses create awareness for learners, and interaction of assessing errors promotes effective learning. Instant feedback allows students to determine their quality of work and effort as to the knowledge acquired (Krystalli & Arvanitis, 2018). This study found that Duolingo, Elsa, and Speak English Conversation all provide feedback to users. All three apps provide instant feedback after each question and quiz for users, however, the feedback given was not satisfying for Duolingo and Speak English Conversation. Based on Krashen (1989), language learners attain language knowledge in an environment that is beyond their current language level. Hence, effective feedback with extensive justification over mistakes made, detailed explanations, and suggestions for improvement for future attempts would provide quality learning and increase comprehensible input for users. Elsa proved a great pedagogical aspect in feedback when it included these features for their users, it also allows users to click on specific words for more elaborations. Speak English Conversation showed the least interactive feedback with

only ‘correct’ and ‘incorrect’ feedback after each question in the quiz. Unfortunately, users may not be able to relate to mistakes made when there is zero input or extensive explanation for them, users will not capture meaningful learning, and this diminishes the effectiveness of learning in general.

From the perspective of social aspects, these apps analysed integrated a certain level of social interaction. Duolingo and Elsa both have leader boards and score boards that allow users to participate with other users for a spot on the board list. Elsa offers an interactive platform called Elsa Communities whereby Elsa users can interact with one another, make friends, open a discussion, and seek assistance. Alternatively, Duolingo includes a language club for its users to communicate and track their team progress, this app also offers an opportunity to start a discussion in the comment section of each question for users to exchange opinions. The accessibility and communication capabilities from the social participation of these apps can boost learning motivation. Barcene et al. (2015) commented that countless apps have inadequate social interaction. This can be seen in Speak English Conversation which showed the lack of social engagement made available for users, and no opportunity for participation and interaction among users throughout the language lessons. Supporting statement by Barcene et al. (2015), there also seems to be a lack of collaboration features in these apps. Users are not able to learn and work together with others to solve language activities, language learning is highly learned independently.

Fithriani (2021) emphasized the significant attention towards gamification or gamified language learning along the robust and revolutionary technologies advancement, especially in the field of language education. Gamification features are found through the in-depth analysis of this study. The familiar features included in gamification learning tools are rewards, scoreboards, mistake constraints, and time restrictions. Gamification features are widely seen in the learning design of Duolingo, it offers users rewards in the form of gems tokens, XP points, and badges. This app also includes mistake constraints in the feature of a heart, users are limited to five mistakes before their learning progress is paused. Mistakes made directly affect the user’s time constraints in the learning process, the user needs to wait a few hours for the hearts to reload before continuing the lessons. Regrettably, limiting users to mistakes and time restrictions could negatively affect users, blocking their mental capacity to learn, and increase users’ affective filter (Krashen, 1989).

Apps Design

The apps analysed in this study looked into several features of the app design. Features include integration of multimedia, pop-ups, and ads, and technical and app support. The findings of this study show that all three of these apps employ integration of multimedia in their lessons, activities, and overall learning design. It is found that Duolingo includes text, images, animation, and sounds; Elsa has multimedia integration of text, images, animation, charts, sounds, and videos; Speak English Conversation includes text, images, and sounds. Duolingo utilizes animation and images during their lessons the most when introducing new content to users, while Elsa is the only app among the three to include video as a medium of their learning. Varies animation images and the inclusion of video content during lesson learning enable users to stay interested and motivated, users receive learning content not only through reading the text but are engaged through their listening and analysing

capabilities utilized when watching videos and animations. These features may also boost users' understanding substantially and the amount of comprehensible input (Krashen, 1989) during their learning. However, not all media features in the app are well-designed. Speak English Conversation lessons are majorly dependent on long text of conversation scripts, audio of the conversation scripts, and images to represent the speaker in the conversation. Learning progress could be more efficient by incorporating other forms of relevant and interesting media to increase user's comprehensible input. According to Beach & O'Brien (2015), there is a great possibility for students to remain motivated and participate in active English learning through the multimedia integration of downloaded digital tools. Hence, it is imperative to include various forms of multimedia features in these apps for users to remain motivated and interested in learning.

Ads in between lesson learning are the common pop-up elements found in this study's learning app. All these apps analyzed include pop-up ads that appear after every lesson, which may be very distracting and irritating to the learning progress of the user. Even when it is mentioned by developers of Duolingo and Elsa that these ads make learning free, users could not help but complain. Most of the pop-up ads are to promote in-app purchases to upgrade from the free to the paid version, this is aligned with Sweeny & Moore (2012) emphasizing developers' dependency on in-app upgrades or short ads in between usage of the app to cover the marketing expenses. While these ads may be disturbing and could increase user's affective filter (Krashen 1989), ads have a reason to exist, especially from the perspectives of app developers.

The findings show that all the apps provide app support for users. Speak English Conversation provides a feedback option in the form of email, users can access the link through the support page and any feedback would be directed straight to the support team. On the other hand, Duolingo and Elsa have the report button for easier feedback access. Users can access this feature after every question in the lesson, users are free to click on some of the suggested and common feedback categories. Duolingo and Elsa provide constant and regular app updates based on user's feedback for a better learning experience, assuring users that their concerns are heard and developers' initiative to restructure the app-built aligning to users' interests. Regrettably, Speak English Conversation is not well up to date as no recent version update made by app developers.

Table 4. Comparison of App Features among Duolingo, ELSA, and English-Speaking Conversation Apps

Category	Duolingo	ELSA	Speak English Conversation
Objectives	Key Words stated	Short phrase of objectives stated	Key words stated
Learning content & accuracy	Lessons and quizzes in the form of multiple-choice question, translation, and word match.	Lessons in the form of multiple-choice questions, videos, record speaking.	Lessons in the form of dialogue conversation listening, speaking recording and multiple-choice question quiz.
	Pronunciation inaccuracy		

	detected.	Pronunciation inaccuracy detected.	No inaccuracy detected.
Assessment	Placement test	Placement test	No assessment
Feedback	Instant feedback after each question, no extensive explanation	Instant feedback after each question, offers extensive explanation	Instant feedback of correct and incorrect answers only, no extensive explanation
Social Interaction & context	Leader board, language club. Learners cannot collaborate in learning activities but are able to comment and discuss.	Leader board, ELSA communities. Learners cannot collaborate directly in learning activities but are able to interact and discuss especially through ELSA communities.	Learners cannot collaborate in learning activities.
Gamification	Heart, gems, XP 5 mistakes (heart) limit	No mistake limit	No mistake limit
Multimedia integration	Animation, text, images, sounds	Text, animation, videos, images, sounds, charts	Text, images, sounds
Pop-up elements	Has ads after every lesson	Has ads after every lesson	Has ads after every lesson
App Support & transaction	Updates about once to twice every week Send feedback to developers through report button Has in-app purchases (Duolingo Plus)	Updates about once every week Send feedback to developers through report button Has in-app purchases (ELSA Pro)	Updates about three times per year, but latest version was updated once in 2020 Send feedback to developers via email Has in-app purchases (Removal Ads & Offline Mode)
Others	Saves learning progress Has user's overall learning achievement	Saves learning progress Has user's overall learning achievement	Does not save learning progress No overall user's learning achievement

Implication

Mobile application is an effective approach to stimulate positive change in users' behaviour and attitude towards language learning. It is common in this advanced and fast-paced learning environment we are living in to witness the direct integration of technology into the education curriculum. Blending fun technology elements with active learning in a leisure game-like environment through ESL learning apps helps to increase users' engagement and motivation which eventually contributes to better learning and knowledge retention. Proponents of mobile apps in language learning assert that gamification features-based apps enhance users' problem-solving and thinking skills, besides encouraging cooperative and collaborative learning. Through collaborative learning, users can interact and communicate for greater creation and knowledge sharing (Anderson, 2007).

In this digital age, users can become autonomous and independent learners as they take sole responsibility for their learning while using the mobile app. In the context of language learning apps, the apps analysed support Krashen's theory, especially in terms of autonomous and independent learning. This is because students can use the speaking app to study on their own time, anywhere and whenever they desire. They can enhance their level of "+1" at their desired pace without having to depend on anyone to teach them.

From the practical pedagogy perspective, language learning apps have been accepted as a fun method to learn. This is attributed to multimedia integration and app elements such as appealing colour, animations, interesting videos, images, clear audio, helpful text, and organized charts found in the language apps. The fun elements help users to increase their interest and intrinsic motivation to learn in an entertaining environment. Application of language learning through English learning apps provides a partial solution to users' poor motivation and engagement in traditional classroom learning. It could also be a remedy for users who find themselves alienated by traditional instructional methods. Learning to speak could be a challenge to many, users may be shy to speak out in class or to partake in any discussion. With language learning apps made accessible to everyone, users may opt for fun speaking learning lessons through digital apps instead.

Furthermore, fun learning elements in language learning apps help to enhance users' attention, interest, and creativity and motivate them to learn. Çağlar and Kocadere (2016) reminded us that users' diversity in their learning style remains a major challenge in the implementation of learning. It is a fact that everyone has their style of learning, thus, they may demonstrate different reactions toward language learning apps. Users are free to select the learning content they wish to learn, and set target duration learning, which allows users' free control to dictate the flow of their learning. This supports personalized learning as learning content is developed based on the characteristics of the users. Language learning apps could be used to create a positive learning experience apps that have been extensively used by users globally, enable users to engage and learn through their digital gadgets outside the classroom activities. This helped users to improve their learning experiences (Zhao, 2019). Language learning apps significantly allow users to take responsibility for their learning.

Conclusion

The findings of this study show all three speaking language learning apps include app features in the categories of curriculum, pedagogy, and design. Even when each of the apps analysed contains these categories, the app features need amendments and improvement for a better learning experience. Such advancement includes the addition of social aspects features, providing varies multimedia integration, including extensive feedback, and limitations of pop-up distractions. mobile learning becoming an increasingly popular trend in the language learning field, there is a critical need for educators to understand the design, implementation, and impacts of language learning through mobile applications to harness its benefits. The undertaken study revealed the most common speaking apps recommended are Duolingo, Elsa, and English-Speaking Conversation. There is limited literature to evaluate language learning app quality, in response to this, this study investigated app features of chosen speaking learning app. The findings can serve as a guide for parents, educators, app developers, curious language learners, and policymakers to select suitable English learning apps.

The impact of pandemic learning has resulted in a drastic shift from traditional classroom lectures to technology-integrated online learning. This has created an opportunity for educators to evolve their teaching practices through the incorporation of language learning apps and mobile apps that have shown immense increases in learner's attention, motivation, communication, and healthy learning. Furthermore, the drastic shift to home-based or self-learning creates the perfect chance for app developers all over the world to build educational apps for learners. This study recommends opportunities for future research. Future research could explore the potential of other apps that were not chosen in this study. This study only chose apps that are free as it is accessible to every user, future studies could look into paid apps and investigate the differences and the advantages of purchasing paid language learning apps. Additionally, future studies should explore beyond the context of the evaluation app checklist. The evaluation app checklist in this study is limited to three big categories curriculum, pedagogy, and app design. Researching more categories or extensive features beyond this checklist would provide substantial discoveries for educators, app developers, and language learning app users.

Abstract: The paper presents an original constructive solution for conveying some liquids with the help of a rotating volumetric pump. The pump can transport pure or suspended fluids, viscous fluids, polyphase fluids. Compared to reciprocating machines used to transport the same fluid flow rate, the energy consumption is lower at profiled rotating machines because the motor torque at the shaft level is almost entirely transmitted to the transported fluid. The influence of rotor length, radius, and rotating piston height on pump flow rate and driving power is noted. Afterwards, the influence of the functional parameters is presented: pump speed, pressure increase between suction and discharge on flow rate and pump driving power. The increase in machine speed is limited by the fact that the speed of the fluid in the suction connection of the rotating machine must not exceed approximately 1 m/s. The effective efficiency of this machine, which can also be used as a fan or low-pressure compressor is clearly superior to other similar machines in the field of fluid flow.

Keywords: rotating volumetric pump, profiled rotors, rotating pistons

Introduction

This paper continues the theoretical and experimental research in the field of rotating machines equipped with profiled rotors; this research aims to improve the actual efficiency of rotating machines. The efficiency increase can also take place by optimizing the interior architecture of these machines; there are different shapes for both the rotating pistons and the shape of the rotors [1][2]. To build the rotors, a calculation program was developed and later the processing of the rotors was carried out at a numerical processing center (C.N.C) [3].

In the field of fluid hydrodynamics, machines are divided into two categories [4][5]:

1. Motor machines in which the main purpose is to yield maximum mechanical work to the machine to be driven.

2. Working machines, which must be constructed so as to absorb a minimum mechanical work at the coupling.

In working machines (fans, pumps, compressors) it is aimed to have a certain correlation between the internal architecture of the machine and the fluid flow parameters [6][7]. In rotating machines, the motor moment received from the outside is $M = F \cdot b \cdot \sin\alpha$, where $\alpha=90^\circ$, so the product between the force (F) and the arm (b) is maximum; this is a main advantage of rotating machines with profiled rotors [8][9]. In [10] the authors states that the presence of blades on the rotor is a significant feature affecting the device performance. In [11] the effect of geometry and rotor speed on power consumption and shear rate profile in the investigated mixer is discussed.

Considering the theoretical and experimental research carried out, this rotating working machine can be used in agriculture to compensate for the soil water deficit, ensuring the controlled supply of soil and plants with the amounts of water according to the calculated soil moisture maintenance regime, but also in pumping stations to remove excess water from the soil and drainage, as this rotating machine can also transport dirty water with solid particles in suspension.

The positive effect foreseen by the modernization of the land improvements is the improvement of the operating efficiency of the pumping aggregates, the reduction of electricity consumption and implicitly the reduction of expenses for water pumping. Also, this rotating machine, depending on the materials used in its construction, can transport food fluids such as oil, wine, alcohol, spirit, etc. The construction of the rotating machine with profiled rotors of the original shape could be constructed on a larger scale, depending on the water requirement requested by the beneficiary.

Method

Figure 1 shows three cross-sections through the rotating machine, offset by 90° . Two gears (7) are mounted on

the machine shafts (7 and 9), which constitute a cylindrical gear that ensures a synchronous rotation of the two rotors [12]. Thus, the pistons of the rotor (6) enter the cavities (10) of the lower rotor (3).

Figure 1. The working principle of the rotating volumetric machine

1 -suction chamber; 2 -lower case; 3 -lower rotor; 4 -upper rotor; 5 -upper case; 6 -rotating piston; 7 -driven shaft; 8 -driving shaft; 9 -discharge chamber; 10 -cavity into which the piston of the upper rotor enters.

The fluid in the chamber (1) is taken up by the rotating pistons (6) and transported to the discharge chamber (9).

After one rotation of the machine, the fluid in the useful volume V_u (figure 1.c), that is, in the space between the pistons, the lower case (1) and the lower rotor (2), will be sent to the discharge chamber.

At a complete rotation of the shaft (9) two such volumes will be transported from suction to discharge [13][14].

$$\dot{V}_u = 2 \cdot \left(\frac{\pi R_c^2}{2} - \frac{\pi R_r^2}{2} \right) \cdot l \left[m^3 / rot \right] \quad \square \square \square$$

The casing radius (R_c) is the sum of the rotor radius (R_r) and the piston height (z), (fig. 1.b).

$$R_c = R_r + z [m] \quad (2)$$

result:

$$\dot{V}_u = \pi \cdot l \cdot z \cdot (z + 2R_r) \left[m^3 / rot \right] \quad (3)$$

The volumetric flow rate of fluid pumped by a single rotor of length l [m] and speed n_r [rot/min] will be:

$$\dot{V}_u = \pi \cdot l \cdot z \cdot (z + 2R_r) \cdot \frac{n_r}{60} \left[m^3 / s \right] \quad (4)$$

Since the machine has two identical rotors, the fluid flow through the machine will be:

$$\dot{V}_u = 2 \cdot \left(\frac{\pi R_c^2}{2} - \frac{\pi R_r^2}{2} \right) \cdot l \left[m^3 / rot \right] \quad (5)$$

The driving power of the two-rotor rotating machine can be calculated as:

$$\dot{V}_u = 2 \cdot \left(\frac{\pi R_c^2}{2} - \frac{\pi R_r^2}{2} \right) \cdot l \left[m^3 / \text{rot} \right] \quad (6)$$

where:

* \dot{V}_u – volumetric flow rate;

* Δp – represents the pressure increase between suction and discharge $[N/m^2]$.

For the same pressure value, the volumetric efficiency is higher in large-sized pumps, because the volumetric losses increase more slowly than the flow rate increase. In low-flow pumps, achieving high volumetric efficiency involves processing with high technological precision.

Results

In Figure 2 the two gears (7) are mounted outside the machine on the shafts (3) and (4); lubrication of the cylindrical gear formed by these gears is provided by the oil in the box (5).

Figure 2. Rotating volumetric pump with profiled rotors

1 -oval casing; 2 -profiled rotor; 3 -driving shaft; 4 -driven shaft; 5 -oil box; 6 -side wall; 7 -gear wheels;
8 -bearing; 9 -bearing cover; 10 -rotating piston.

The theoretical driving power of the rotating machine can be calculated from relation (6) where [15][16]:

$$\Delta p = \rho \cdot g \cdot \Delta H \left[N / m^2 \right] \quad (7)$$

where:

* Δp – pressure increase;

* ΔH – pumping height [m];

* ρ – density of the transported fluid [kg/m³].

The total pressure increase achieved by the pump (Δp) changes when the pump speed increases; the hydrostatic load and pressure losses occurring in the hydraulic circuit of the pump are rated at about 4 mH₂O.

$$\Delta p = \rho_{H_2O} \cdot g \cdot H = 10^3 \cdot 9.81 \cdot 4 = 0.3924 \cdot 10^5 \text{ Pa} \quad (8)$$

Next, based on the values of the flows previously obtained, one can calculate the theoretical driving power. For $n_r=500$ [rpm], substitute the values in relation (6) and obtain:

Variant I – piston in a rectangular blade shape (Figure 3):

$$P = \dot{V}_u \cdot \Delta p = 0.010205 \cdot 0.3924 \cdot 10^5 = 400.44 \text{ [W]} \quad (9)$$

Performing similar calculations, the values of P are obtained for the speeds of 100, 200, 300, 400 and 500 rpm shown in table number 1.

Table 1. Table values of $P = f(n_r)$

n_r [rpm]	100	200	300	400	500
P [W]	80.08	160.17	240.26	320.35	400.44

Variant II – piston in an isosceles triangle shape (fig. 3):

$$P = 0.00983 \cdot 0.49 \cdot 10^5 = 481.67 \text{ [W]} \quad (10)$$

Table 2. Table values of $P = f(n_r)$

n_r [rpm]	100	200	300	400	500
P [W]	77.14	154.29	231.43	308.58	385.72

Variant III– curvilinear shaped piston (fig. 3):

$$P = 0.00983 \cdot 0.49 \cdot 10^5 = 481.67 \text{ [W]} \quad (11)$$

Table 3. Table values of $P = f(n_r)$

n_r [rpm]	100	200	300	400	500
P [W]	74.93	149.87	224.81	299.75	374.69

Based on the data from tables 1, 2 and 3, the function for the three constructive variants was graphically represented in Figure 4.

Figure 3. Rotor with rotating pistons

1 – rectangular blade; 2 – triangular profile; 3 – curvilinear profile

Variant I – piston in a rectangular blade shape $R_r = 50$ [mm], $z = 30$ [mm];

Variant II: The rotating pistons have the shape of an isosceles triangle $R_r = 50$ [mm], $z = 30$ [mm];

Variant III: The rotating pistons have a curvilinear shape $R_r = 50$ [mm], $z = 30$ [mm].

Figure 4. Graphical representation of the function $P = f(n_r)$ for the three constructive variants.

Figure 4 shows a linear dependence between the theoretical drive power and the speed of the rotating machine.

The calculation of the power consumed by viscous friction between the tip of the rotating piston and the case is made for a single rotor. The gap size between the piston tip and the rotating machine case is of size $s \times l$. From

the paper [17], $s = 0.01 \cdot 10^{-3}$ m and the length of the rotor is $l = 50 \cdot 10^{-3}$ m.

The velocity of the fluid will be:

$$w = \omega \cdot r_p \left[\frac{m}{s} \right] \quad (12)$$

where: ω – angular speed [rad/s]; r_p – piston radius [m].

The viscous frictional force between the piston tip and the case will be:

$$F_f = \tau \cdot S \left[N \right] \quad (13)$$

where S represents the friction surface in the radial direction, which is taken equal to half a cylinder of radius r_p and length l :

$$S = \pi \cdot r_p \cdot l \left[m^2 \right] \quad (14)$$

result:

$$F_f = \eta \frac{\pi \cdot \omega \cdot r_p^2 \cdot l}{s} \left[N \right] \quad (15)$$

The friction moment between the piston tip and the fluid is given by the relation:

$$M_f = F_f \cdot r_p = \eta \frac{\pi \cdot \omega^2 \cdot r_p^3 \cdot l}{s} \left[W \right] \quad (16)$$

Since the rotating machine has two profiled rotors, the power required to overcome viscous friction on radial surfaces will be:

$$P_{m,r} = 2(\omega \cdot M_f) = \eta \frac{2\pi \cdot \omega^2 \cdot r_p^3 \cdot l}{s} \left[W \right] \quad (17)$$

The following are known: $\eta_{H_2O} = 10,4 \cdot 10^{-4} \left[N \cdot s / m^2 \right]$; $\omega = \frac{2\pi \cdot n_r}{60} = \frac{\pi \cdot n_r}{30}$; $r_p = (50 - 0,01) \cdot 10^{-3} \left[m \right]$.

For water and $n_r = 200$ rpm it results:

$$P_{m,r} = 2(\omega \cdot M_f) = 10,4 \cdot 10^{-4} \frac{2 \cdot 3,14 \cdot 20,93^2 \cdot (49,99 \cdot 10^{-3})^3 \cdot 50 \cdot 10^{-3}}{0,01 \cdot 10^{-3}} = 1,788 \left[W \right] \quad (18)$$

Carrying out the calculations in a similar way for speeds between 100...500 rpm, the data from table 4 results.

Table 4. Table values of $P_{m,r} = f(n_r)$

n_r [rpm]	100	200	300	400	500
ω [rad/s]	10.467	20.933	31.400	41.867	52.333
$P_{m,r}$ [W]	0.446	1.7877	4.0223	7.1507	11.1730

Based on the data obtained in table 4, the graph of the power function required to overcome viscous friction was drawn in Figure 5.

Figure 5. Graphical representation of the function $P_{m,r} = f(n_r)$.

From figure 5 one can see that the value of $P_{m,r}$ increases with the increase in the speed of the rotating machine. Calculation of the power consumed by viscous friction between the rotors and the case side walls of the will be:

$$P_{m,f} = 2(\omega \cdot M_f) [W] \quad (19)$$

The resisting elementary moment due to viscous friction between the rotor and the casing walls will be:

$$M_r = \frac{\pi \cdot \eta \cdot \omega}{s} \cdot (r_r^4 - r_a^4) [N \cdot m] \quad (20)$$

where:

- the outer radius of the rotor is: $r_r = 50 \cdot 10^{-3} [m]$;
- the radius of the shaft on which the rotor is mounted is: $r_a = 9 \cdot 10^{-3} [m]$.

result:

$$P_{m,f} = 2 \frac{\pi \cdot \eta \cdot \omega^2}{s} \cdot (r_r^4 - r_a^4) [W] \quad (21)$$

Performing the calculations for revolutions between 100...500 rpm, the data presented in table 3.7 results.

$$P_{m,f} = 10.4 \cdot 10^{-4} \frac{2 \cdot 3.14 \cdot 20.93^2}{0.01 \cdot 10^{-3}} \left[(50 \cdot 10^{-3})^4 - (9 \cdot 10^{-3})^4 \right] = 1.786 [W] \quad (22)$$

Table 5. Table values of $P_{m,r} = f(n_r)$

n_r [rpm]	100	200	300	400	500
ω [rad/s]	10.467	20.933	31.400	41.867	52.333
$P_{m,r}$ [W]	0.4467	1.7869	4.0205	7.1475	11.1680

Based on the data obtained in table 5, the graph of the power function required to overcome viscous friction was drawn in Figure 6.

Figure 6. Graphical representation of the function $P_{m,r} = f(n_r)$.

Calculation of the total power consumed by viscous friction between the rotors and the casing will be:

$$P_t = P_{m,r} + P_{m,f} [W] \quad (23)$$

Based on the data in table 4 and table 5, the data in table 6 resulted.

Table 6. Table values of $P_t = f(n_r)$

n_r [rpm]	100	200	300	400	500
$P_{m,r}$ [W]	0.8936	3.5746	8.0427	14.2982	22.3409

Based on the data obtained in table 6, the graph of the power function required to overcome viscous friction was drawn in Figure 7.

Figure 6. Graphical representation of the function $P_t = f(n_r)$.

The relations that determine the performance of a machine at various operating regimes, different from the calculation (nominal) one, are called the characteristics of the respective machine.

Relations can be analytical, graphical, and theoretically or experimentally determined.

Discussion

The flow rate for variant I is the highest, then the drive power will also be higher (variant I).

In Figure 6 the function $P = f(p)$ is graphically represented for two constructive variants:

Figure 6. Graphical representation of the function $P=f(\Delta p)$ for two constructive variants.

From figure 6 one can observe that the drive power of the rotating machine increases similarly with the increase in pressure achieved by the machine.

The pump flow rate varies as follows:

- Depending on the geometric parameters: l – rotor length [m]; R_r – rotor radius [m]; z – piston height [m].
- Depending on the functional parameters: n_r – machine speed [rpm]; Δp – pressure increase [N/m^2].

Conclusion

1. The driving power is influenced by the flow rate (that is, by the parameters mentioned above) by the pressure increase (Δp) achieved by the pump between suction and discharge, by the nature of the transported fluid.

The pressure increase achieved by the pump must overcome the hydrostatic load and the pressure losses that occur on both the suction circuit and the discharge circuit of the pump.

2. In variant I (pistons in the form of rectangular blades) the flow rate transported by the rotating machine will be the highest compared to variants II and III.

This high flow will require a higher driving power of the machine $P_I > P_{II} > P_{III}$ [W] .

Abstract: Mobile payments are one of the modern, convenient, and secure growing payment options. It has evolved into a different way to pay than with cash or a credit card. A number of reasons have influenced the adoption of M-payment. This study aims to investigate a few of the variables that have been postulated to influence M-payment usage. Because of the recent pandemic (covid-19), M-payment use has grown in Saudi Arabia. People were forced to rely on online transactions or near-field communication. However, some people are hesitant to use it because they distrust technology or are afraid of fraud. Numerous factors have been put forth as potential influences on how people behave when using M-payment. Nearly all the participants in this study, which took place in Saudi Arabia, were Saudi citizens. Perceived value, convenience value, and low risk value all correlate favorably with the inclination to use M-payment in the Kingdom of Saudi Arabia. The link between the monetary worth on the other hand, is antagonistic. the social value and enjoyment value impact is neutral.

Keywords: Mobile payments, Perceived value, Technology adoption, Economic growth, Sustainable development, Digital transformation

Citation: Al-Duries, R. F., Adnan, N., Sanyal, S. (2024). Unlocking the Power of Perception: Exploring the Influence of Perceived Value on Mobile Payment Adoption in Saudi Arabia. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 519-535), Antalya, Turkiye. ISTES.

Introduction

This study's main terms are M-payments, perceived risk, perceived value, convenience value, social value, enjoyment value, monetary value, and propensity to use M-payment. M-payment is a term for using a mobile device to make purchases or payments. The development of mobile technology and wireless communication

rendered this payment method obsolete. It facilitates consumer payments (Au & Kauffman, 2008). It operates similarly to conventional purchasing in that consumers exchange money for the product or service's value (Au and Kauffman, 2008). M-payment is essentially the payment of products or services via mobile devices. It contains both near-field communication (NFC) and remote payment methods. (Karnouskos and Fokus, 2004; Chandra, Srivastava and Theng, 2010). To make a remote M-payment, the user must possess the business's or customer's payment information, or it may be stored in the application (de Reuver & Ondrus, 2017). Similar to a point of sale (POS), proximity payments necessitate a connection between the mobile device and the card reader in order to transmit information. It operates by storing card information in one of the mobile secure software or embedded hardware element applications, such as the most popular wallet (de Reuver and Ondrus, 2017). Near field communication (NFC) is the technology used by wallet apps to transmit payment information by wafting a mobile device in close proximity to a card reader without making contact (Tan et al., 2014). The remote M-payment is the first type of M-payment and a vital component of M-commerce payment (Kreyer et al., 2002; Slade, Williams, and Dwivedi, 2013). However, proximity M-payment is an emerging method of payment that supplements cash and credit cards (Slade, Williams, et al., 2015). Over time, this payment method began to demonstrate its efficacy and convenience to acquire consumers' trust. Utilization of proximity M-payment is dependent on consumer trust in this technology and their willingness to substitute it for cash and cards. M-payment is superior to other payment methods for both consumers and merchants. It is more straightforward, expedient, and practical. It is possible to increase the number of daily transactions, reduce transaction costs, and increase consumer loyalty. Numerous studies investigate the reasons for M-payment's sluggish global adoption, despite the technology's many benefits. Apple Pay and Android Pay have contributed to a rise in M-payment users, but it is uncertain whether this trend will persist. Statista is a company that specializes in market and consumer data. It anticipated a rise in M-payment utilization. However, additional research is required to determine why this increase was delayed and what obstacles prevented people from taking advantage of it. The complexity of the infrastructure and the familiarity with extant payment methods is one of these obstacles. However, these obstacles progressively began to diminish. Numerous factors, including privacy and security, positively influence the adoption of mobile payments. RFID (radio frequency identification) and NFC (near-field communication) advancements have made M-payment more user-friendly, secure, and pervasive. 52% of 2015 study participants are conversant with M-payment, but only 18% actually use it. Currently, mobile devices are an integral part of society, and M-payment usage is on the rise. However, numerous studies indicate that individuals' adoption of M-payment has increased due to a variety of factors. Examples include technological acceptability, perceived utility, social influence, perceived convenience, trust, cost, and compatibility. According to a study (Koenig-Lewis, Marquet, Palmer, and Zhao, 2015), M-payment adoption is affected by perceived utility, convenience, risk, technology knowledge, and social value. Age, security, and convenience all influence the adoption of mobile payments, according to a 2014 Arvidsson study (Kiser.A, Washington.R, Torres.R, 2018). This study does not examine gender differences in the adoption of M-payments, nor does it examine how reducing perceived risk influences the propensity to adopt M-payments. These two absences are regarded as research spaces. This study's variables are perceived risk, perceived value, value of convenience, social value, enjoyment value, and monetary value. The user's sense of loss or insecurity resulting from a lack of trust in the technology is perceived as a risk. (Alhallaq, Younas, Kamal, and Champion, 2019). Perceived value

is the value a customer obtains from utilizing a service in comparison to the value that service provides. This service's functionality is essentially its convenience value. The positive self-perception of the m-payment consumer is social value. Enjoyment reflects the positive emotions experienced by the consumer as a result of utilizing the service. (Alhallaq, Younas, Kamal, and Champion, 2019) The monetary value is the value the consumer receives for the quantity paid, such as a discount or savings. Understanding specific psychological and behavioral economic concepts in relation to M-payment. M-payments, perceived risk, perceived value, convenience value, social value, enjoyment value, monetary value, propensity to use are the key terms of this study.

Main Research Contributions:

M-payment simplified people's lives and accelerated and facilitated payment. It enhances e-commerce and the economy, which is part of Saudi Arabia's 2030 vision. After the introduction of covid, the use of M-payment by Saudis increased because people found it convenient to use in near field communication and e-shopping because it reduces the need to interact with others. M-payment was intriguing not only because of its simplicity and convenience, but also because of its enjoyment and social value. This research will aid in gaining a thorough understanding of the factors that encourage Saudis to utilize M-payment, there forward better understanding of how to enhance the economy in KSA by using better technology in payment . This study employs a theoretical model of the additional values of M-payments and how these added values affect its use among Saudis. This research is supported by data analytics derived from survey responses, and it will aid other researchers in making theoretical contributions given the paucity of research on this topic. The research examines Saudis using a number of suggested factors that influence the propensity to use M-payment. Despite its extended availability, this technology was adopted slowly. It has also been stated that the pandemic had an effect on the adoption of M-payment. This study contributes to our understanding of the adoption of m-payment in Saudi Arabia by discussing in detail how certain factors influence the perceived value of m-payment and, in turn, the propensity to use it. Future theoretical contributions could include investigating why users are reluctant to implement this technology and how factors such as the covid pandemic have affected its adoption. These factors are perceived risk, perceived value, convenience value, social value, enjoyment value, monetary value.

Literature Review

Problem implementing m-payment in KSA:

Even though M-payment has a number of appealing features, research indicates that its adoption has been slower than anticipated. In 2007, this study was conducted. Another study conducted in 2022 (Mustafa.A.Raza.A.Kiani.U.Ullah.S.2022) confirmed that m-payment usage is still minimal in several nations despite its many advantages. According to (Phillips.T,2020), near field communication (NFC) M-payment accounted for 25 percent of all point-of-sale payments in Saudi Arabia in September 2020. The managing director of Saudi Payments, Fahad Al-Akeel, stated that the development of digital and mobile payments has

exceeded expectations. Al-Akeel suggested that Covid-19 influenced individuals to switch to contactless payment, and that this was the primary reason for its growth (Phillips.T, 2020). According to a study (Alabdan.R, Sulphay, 2020) on the comprehension of proximity payment in Saudi Arabia, acceptance of M-payment varies by gender. Males take M-payments more readily than females. In general, males are influenced by innovation and compatibility, while females are influenced more by usefulness and social pressure. (Alabdan.R, 2019) conducted research at Saudi Arabia's Majmaah University. Among the 257 individuals who responded to the survey, 198 use a smart phone and 143 use M-payment; 60.6% were females and 39.39% were males. People between the ages of 25 and 34 have the greatest percentage of M-payment users. The same study identifies security and trust as one of the primary obstacles to using M-payments. In another study conducted by Alswaigh.N and Aloud.M on the factors that influence M-payment adoption in Saudi Arabia, the relationship between M-payment adoption and perceived utility was found to be positive. The main reason why people adopt M-payment is because it simplifies and expedites the payment process. This study also found that perceived usability has a positive correlation with the adoption of mobile payments. Using STC pay, for instance, facilitated the exchange of funds during covid. Similarly, security, facilitating conditions, affirm support, and trust had a substantial impact on the adoption of M-payment. People felt more assured using M-payment during quarantine because they received payment confirmation messages. The purpose of this research is to determine why there is an increase in the use of M-payments in Saudi Arabia and how the added value of M-payments affects consumers' propensity to use them. Adoption of mobile payments is crucial for Saudi Arabia due to its impact on its enterprises and economy. Improving the economy is a component of Saudi Arabia's vision 2030. This research will fill a void in the improvement of the economy by shedding light on the added value of mobile payments and their social effects.

Research Aim and Objectives:

This study investigates the factors that impact the added value of M-payments and how these factors (perceived value, enjoyment value, convenience value, risk value, social value, and monetary value) influence the propensity to use it. The following objectives are included:

- Examine how these suggested factors affect propensity to use M-payment in Saudi Arabia.
- Determine how these factors influence the added value of M-payment and people's attitudes towards its use in KSA.
- Determine which of these factors have a positive effect on and increase the propensity to use mobile payments.
- Determine which of these factors have a negative impact on the propensity to use mobile payments.
- Having a better understanding of Saudis behavior towards this technology will help them to know how to encourages the use of m-payment by highlighting on the factors that increase the willingness to use it and reducing the factors that decrease the willingness to use it there forward it will enhancing the economy in KSA.

Research Questions:

- How does perceived value influence the propensity to use M-payment?
- Does the perception of risk prevent individuals from using mobile payment?
- How do monetary value, social value, enjoyment value, risk perception, and convenience value affect the perceived value of M-payments?

History of M-Payment:

The first mobile payment via brief message services (SMS) occurred in Finland in 1997 (Dahlberg, Guo, and Ondrus, 2015). Using mobile network operators (MNOs), handset manufacturers made M-payment a reality (Ondrus, 2015). Since then, numerous researchers have investigated M-payment, its related issues, and a system that regulates the operation of mobile networks (Heijden, 2002; Dahlberg, Mallat, and Oorni, 2003). M-payment is essentially a digital cash-based transaction that incorporates the contactless feature (Ondrus, 2015), which has become a necessity as e-commerce has evolved into m-commerce (Ondrus and Pigneur, 2006; Chen, 2008). Japan, South Korea, Hong Kong, and other Asian nations adopted M-payment first (Ondru and Pigneur, 2009). Nokia, Sony, and Philips founded proximity M-payment in 2004. The intent of Near Field Communication (NFC) was to implement a communication protocol using touch-based consumer interaction. When MasterCard and Visa began using this feature in mobile devices, Samsung, Microsoft, and Motorola joined them. Now, all manufacturers of mobile devices support near field communication (de Reuver and Ondrus, 2017). Over the years, as M-payment began to be utilized on a daily basis, the number of researchers investigating this technology and its prospective applications has increased. Typically, researchers will focus on three key areas: the investigation of M-payment strategies and ecosystems, M-payment technology, and M-payment consumer adoption (Dahlberg et al., 2015).

Mobile Payment Technology:

Payment technology can be discussed at various points. For instance, a greater understanding of the various applications of this technology, a focus on security issues, the discovery of new M-payment solutions, and the improvement of its security.

Perceived Value Theory and its Conceptualizations:

The theory of perceived value is a value-based theory. It is a theory that based on the value that the customer is expecting or will received that will make them adopt something new. This study employs this theory because of its applicability. Regarding the concept of value in relation to technology, there are various definitions, including perspective, perceived value, consumer value, consumer perceived value, and consumption value (Sánchez-Fernández, Iniesta-Bonilla, and Holbrook, 2009), (Zeithaml, 1988), and (Sheth, Newman, and Gross, 1991). According to Eggert and Ulaga (2002), perceived value can be explained by three common factors. Initially, perceived value is the exchange of benefits and costs. Second, consumers acknowledge that value is a

subjective concept that can be perceived differently by different customers. Third, market alternatives are compared to the perceived value.

Method

Research Design:

The purpose of this study is to determine the dependability of the suggested variables in influencing the propensity to adopt M-payment. In order to accomplish this, a survey is conducted to determine the opinions of the public. The quantitative method is utilized to validate hypotheses and theories (Bhandari, P., 2020). The research relies on quantitative methodology, which consists of a survey with various types of multiple-choice questions. Each variable is accompanied by at least four questions or sentences designed to elucidate the influence of that variable on people's propensity to use M-payment. The options represented varying degrees of agreement with this sentence or question. The options are concurred, disagree, agree strongly, disagree strongly, and disagree strongly.

Hypotheses:

Value Perceived (H6): People weigh the perceived value of the technology against the sacrifices or hazards they are taking. Kim et al. (2007) found that the greater the service's benefits, the more willing people are to adopt this new technology. The perceived value of digital hedonic artefacts increases behavioral intent and propensity to provide word-of-mouth recommendations (Turel, Serenko, and Bontis, 2010). Another study (Cocosil and Trabelsi, 2016) indicated that perceived value positively influences behavioral intention. Due to the aforementioned, the following hypothesis was proposed:

H6: Perceived value has a positive impact on willingness to use the M-payment.

Monetary Value (H1): This is the perceived value that customers place on the products or services they purchase. According to Sweeney and Soutar (2001) and Pura (2005), a customer's perception of the value of a product or service is based on the perceived value of the benefits they will receive. According to (Pihlstrom and Brush, 2008), M-payment is used to save money, so consumers view it favorably because it can offer them direct and indirect financial benefits. Direct Financial benefits include cashback, loyalty programs, discounts, promotions, and any other financial incentive that encourages customers to use a company's services (Meuter et al., 2000; Mimouni-Chaabane and Volle, 2010; Liu, Zhao, et al., 2015). The indirect financial benefit is the service that enables users to reduce their spending. (Ching and Hayashi, 2010) It has been demonstrated that customers favor payment methods that allow them to limit or reduce their expenditure, such as credit cards, debit cards, and cash. According to Hayashi (2012), M-payment can help us control expenditures and stick to a budget. (De Kerviler, et al., 2016; Park, et al., 2019) Economic benefits of M-payments have a positive effect on propensity to use it.

H1: Monetary Value of M-payment Has a Positive Impact on the perceived value.

High self-esteem or a positive self-image when utilizing particular services is what is indicated by social values (H2). Some utilized services, such as M-payment, can demonstrate a positive self-image and unique identity (Park et al., 2019). Social value is an additional justification for using M-payment. It may be regarded as an influential factor. There is a positive correlation between customer propensity or intention to use M-payment and social value, according to studies (de Kerviler et al., 2016). When individuals are observed using cutting-edge technology, such as M-payment, they experience a sense of self-respect.

H2: The Social Value of M-payment Increases Its Perceived Value.

Convenience Value (H3): Utilizing M-payment facilitates the completion of various duties and has functional performance. According to Brown (1990), the use of convenience services has four dimensions: time, location, and acquisition. Use and acquisition related to the ease of using M-payment at any time and place reduce the limit to use the service, prevent squandering time, and facilitate access because the device is always on the user's person (Zhou, 2013). According to (de Kerviler et al., 2016; Gao and Waechter, 2017), there is a positive correlation between the convenience offered by M-payment and enrollment in or use of M-payment.

H3: There Is Positive Contribution From M-payment Convenience Value and The Perceived Value.

Enjoyment Value (H4): Emotional value is a crucial factor in people's acceptance of technology. (Sheth et al., 1991; Pura, 2005) "enjoyment value" refers to the positive emotion consumers experience when utilizing this technology. (Pihlstrom and Brush, 2008) Technology payment is not only about utilitarian benefits, but also about emotional value. Several studies have demonstrated a correlation between M-payment and satisfaction (Koenig-Lewis et al., 2015; Cocosila and Trabelsi, 2016). According to other studies (de Kerviler et al., 2016; Park et al., 2019), enjoyment is one of the reasons individuals use M-payment. The subsequent hypothesis is supported by these investigations.

H4: Enjoyment Value of Using M-payment Increases Its Perceived Value.

Perceived Risk (H5): The consumer's belief or sense of loss or risk resulting from uncertainty-inducing behaviours that can have negative consequences. This emotion influences consumer behavior, particularly in relation to financial decisions (Slade, Williams, et al., 2015). Intangible and intricate financial services, such as M-payment, instill in some individual's apprehension or a reluctance to use something of which they are unaware, which may have unforeseeable consequences. Customers are more likely to employ this payment method if they are familiar with the monetary transactions (de Kerviler, et al., 2016). Researchers demonstrate that the anticipated risk of M-payment affects the propensity to use it. Using M-payment makes some individuals feel as though they are jeopardizing their safety. According to Chandra et al. (2010), in order for consumers to utilize new technologies such as M-payment, they must have faith in the system. There are three

concepts that influence the propensity to adopt new technology: honesty, competence, and altruism. Integrity is customers' confidence that service providers will fulfil their promises. Customers must be confident that service providers have the necessary skills to fulfil their obligations. Consideration for the consumer's best interests is benevolence (Zhou, 2011). Studies (Slade, Williams, et al., 2015; Khalilzadeh, et al., 2017) have demonstrated the positive effect of trust on the propensity to use M-payment. The value of M-payment is affected by a sense of sacrifice or danger. This was the foundation for the subsequent hypothesis.

H5: Perceived Risk of M-payment has a negative impact on its Perceived Value.

Hypotheses diagram

Research Population:

According to (Sarstedt and Mooi, 2014), "the population is the complete set of cases from which a sample is drawn." In this study, the population consists of the 102 individuals who responded to the survey; 54 are females (52.9%), 48 are males (47.1%), 5 are not Saudi (4.9%), and 97 are Saudi (95.1%). Nonetheless, 95 people (93.1%) reside in Saudi Arabia. 20.6% are between the ages of 18 and 25, 40.2% are between the ages of 26 and 34, 6.9% are between the ages of 35 and 43, and 32.4% are at least 44 years old.

Research Instrument:

The questionnaire consists of 30 multiple-choice questions. There are four to five queries for each of the six suggested independent variables to determine how they influence the propensity to use M-payment. In addition, some inquiries concern age, gender, nationality, and level of education. Each option was designated uniquely.

Pilot Research Study:

As mentioned previously, six variables influence the propensity to use M-payment in this study. The pilot sample consists of 20 respondent, and it is evaluated using mean, mode, and standard deviation. The mean is the average of the responses. The mode is the response frequency that occurs most frequently. The standard

deviation indicates the mean's reliability, and the closer it is to zero, the more reliable the data. Nonetheless, the first four queries of the survey concern the perceived value of M-payment. These are the questions or sentences: PV1: I prefer mobile payment over cards or currency, PV2: mobile payment has added value for its users, PV3: I am willing to use mobile payment due to its added value, and PV4: the perceived value of using M-payment is greater than the risk associated with its use. The total mode of the PV is 1, (strongly concur), which is the most frequently occurring option. Nonetheless, the second four queries concern monetary value. MV1: mobile payment helps me regulate my spending, MV2: people who use M-payment spend less than those who don't, MV3: mobile payment helps me reduce my expenses, and MV4: mobile payment helps me save more. The mean monetary value of the twenty responses is 3.86, and the mode is 3.75, which indicates disagreement. The third variable is social value, and it consists of the following four questions: SV1: people use mobile payment to flaunt, SV2: people who use mobile payment appear wiser than those who use cash or credit cards, SV3: I feel cool and intelligent when I use mobile payment, and SV4: people who use mobile payment appear wealthier than those who use cash or credit cards. The total mean for the social value is 3.62, and the mode is 2.50, indicating that the majority of respondents are neutral. The fourth variable is the convenience value, which has four queries. CV1: I find mobile payment simple and convenient, CV2: mobile payment is functional, CV3: mobile payment saves me time, and CV4: mobile payment is more convenient than card or currency. The cumulative mean for the four sentences or questions is 1.61, and the mode is 1, indicating that the sample does strongly agree with these statements. The fifth variable is the enjoyment value, with the following sentences: EV1: paying with currency or a with credit card is tedious compared to mobile payment. EV2: mobile payment positively affects my emotions EV3: there is a sense of enjoyment when using M-payment as opposed to paying with cash or a with credit card; EV4: I appreciate using mobile payment. The enjoyment standard deviation is 0.94 and the mode is 3, indicating that the majority of the sample neutral with these statements. The final variable is the risk perception. Unlike the other variables, it consists of five sentences with which the majority of individuals strongly agree. PR1: using mobile payment is risky, PR2: using M-payment increases the likelihood of fraud, PR3: using M-payment makes me feel uncertain and unsafe, PR4: some people do not use mobile payment because it is risky, and PR5: I feel safer using card or cash than mobile payment. With a mean of 2.66 and a mode of 2.2, the entire sample falls between agreeing and neutral.

Data analysis:

Researchers have distributed almost 150 links via email and different social media platform and we received 102 valid responses. use m-payment. Moreover, 68% response rate was relatively better than that reported in previous studies such as Lin et al. (2012) and Xiu et al. (2022). For the perceived value the mode is 2 which means it is the most frequent number, it represent that the 102 responses of the survey agrees with perceived value questions. The perceived value increase the willingness to use m-payment. For the second variable which is MV, monetary value the mode is 4 which means the responses disagree that monetary value increase the perceived value to encourage the willing to use m-payment. Regarding the social value the most frequent response was 3 which mean the responses feel natural about it impacting the perceived value and willingness to use m-payment. Covariance value mode is 2 which means they agrees it increases the perceive value there for

increases the willingness to use m-payment. Enjoyment value 3 which means it is natural it does not impact the perceived value or willingness to use m-payment. Perceive risk most frequent answer is 2 which means they agrees it decrease the perceived value there forward it decreases the m-payment.

Control Variables:

The researcher recognized several supposedly relevant control variables. The recent research controlled the demographic of the respondents which can influence the potential differences in willingness to adopt M-Payment behavior. In the line of this research, the controlled variables are respondents income gender, education level and age because these may influence willingness to adopt m-payment. The dependent variable that does not change throughout the course of the study and influences other variables (Bhandari.P, 2021). The dependent variable in this investigation is willingness to use M-payment. The independent variables are monetary value, social value, convenience value, enjoyment value, perceived risk, and perceived value.

Results

Statistical Analyses

The most frequently occurring number in the perceived value sentences is 1, which corresponds to the strongly agree option, according to a survey of over a hundred individuals and an analysis of a sample representing. The survey results indicate a correlation between propensity to use M-payment and its perceived value. The monetary value, the second variable, has two modes: 4 and 5. The most common response for the first two statements (MV1: mobile payment helps me control my budget and MV2: people who use M-payment spend less than those who don't) is 4, which indicates disagreement. People firmly disagree with the last two sentences regarding the monetary value (MV3: mobile payment helps me reduce my spending and MV4: mobile payment helps me save more). In general, the responses disagrees with the notion that monetary value influences propensity to use M-payment. The average of the social value's various modes is 3.75, which places them neutral. Therefore, it can be concluded that social value do not increases the propensity to utilize M-payment. Regarding the value of convenience, all respondents strongly concur that it influences willingness to use M-payment in Saudi Arabia, indicating that the mode is 1. In addition, the majority of respondents feels natural regarding the enjoyment value. The final variable is the perceived risk, which agrees with the sentences frequently.

Discriminant Validity:

As shown in table 1 below, the descriptive statistic represents the pilot study's research. Twenty survey respondents out of 102 were selected to examine the results in depth. This table displays the range statistic, which represents the difference between the greatest and lowest, or maximum and minimum, selections in the pilot. The range is essentially the difference between the utmost and minimum value. The meaning is the

average of responses, which is calculated by dividing the total number of responses by the number of responses. The standard deviation measures the data's proximity to the mean; in other words, it indicates whether the mean is comparable or not.

Table 1. Descriptive Statistics

Descriptive Statistics								
	N Statistic	Range Statistic	Minimum Statistic	Maximum Statistic	Mean Statistic	Std. Error	Std. Deviation	Variance Statistic
PV	102	4	1	5	2.2304	0.08622	0.87079	0.758
MV	102	4	1	5	3.6765	0.9285	0.93779	0.879
SV	102	4	1	5	3.6642	0.8529	0.86136	0.742
CV	102	4	1	5	1.8529	0.7125	0.71956	0.518
EV	102	4	1	5	3.0319	0.7841	0.79188	0.627
PR	102	4	1	5	2.7275	0.8488	0.85725	0.735

Structure Model Evaluation:

In addition to being customers and consumers, some users of m-payment services are also producers and vendors. Some theories, such as the rational behavior theory and the acceptance model theory, measure the adoption of online payment (Huang.W, Chuan Chen, S,2022). Value-based adoption model (VAM) is a theory that suggests people's beliefs and emotions regarding the benefits they receive from using a product or service influence their willingness to use or purchase it. Tam is another theory stated that the acceptance of the new technology depends on two things: ease of the use and the usefulness. These two points summarize users attitude towards new technology. If people believe this technology will increase their performance and make their life easier, they will adopt it (Davis, Bagozzi and Warshaw, 1989). TAM is the most used model in research's regarding m-banking, m-commerce and M-payment (Slade, Williams and Dwivedi, 2014).(Huang.W, Chuan Chen, S,2022) Additional people's perspectives or perceptions of the value of m-payments could influence their propensity to use it. The perceived gain and loss affect the perceived value, which in turn influences the propensity to use M-payments. (Huang.W, Chuan Chen, S,2022). It is anticipated that the variables chosen for the research model will affect the perceived value. Monetary value (H2), social value (H3), convenience value (H4), enjoyment value (H5), and perceived risk (H6) impact perceived value (H1). These variables are anticipated to increase or decrease the perceived value of the M-payment, thereby influencing the propensity to utilize it. Before utilizing M-payment, individuals compare the benefits and drawbacks and weigh the risks. Kim et al. (2007) found that consumers' willingness to implement M-payment increases in proportion to the number of benefits they anticipate receiving. This is why these variables were selected as the primary factors in this study. The purpose of this study is to determine how these factors affect the perceived value, both positively and negatively, and how this, in turn, affects the willingness to use M-payment in Saudi Arabia. Monetary value refers to the discount consumers can receive when using M-payment. This value also aids in budget management (de Kerviler et al., 2016; Park et al., 2019). Regarding monetary value, however, the survey results were negative; respondents did not agree that monetary value encourages them to use M-payment. On the other hand, , convenience value, contribute benefits or increase the perceived value that motivates people to adopt M-payment, and survey respondents concur. Additionally, they concur that risk perception dictates their propensity to use M-payment. the social value enjoyment value results were neutral.

Reliability of the Construct:

Table 2 below demonstrates construct reliability and validity. This table contains various metrics of reliability. In 1951, Lee Cronbach created Cronbach's Alpha theory. It determines the consistency of the data to determine its dependability. It is a value between zero and one, with zero indicating that there is no correlation and one indicating that the data is more reliable. Analysts are well aware that 0.7 is acknowledged as a reliable measure (Frost, J). Cronbach's Alpha is greater than 0.7 for all variables, indicating that the data in this study are reliable. Composite reliability is another reliability metric. Both are employed to ensure the variables' internal consistency. Cronbach's Alpha is utilized in exploratory factor analysis (EFA), whereas composite reliability is utilized in confirmatory factor analysis (CFA). Similar to Cronbach's alpha, 0.7 indicates Composite reliability. Almost all variables are greater than 0.7, which is acceptable. Average variance extracted (AVE) gauges measurement error variance. 0.5 is the minimal acceptable AVE measurement. The table below demonstrates that AVE is acceptable.

Table 2. Construct reliability and validity

	Cronbach's alpha	Composite reliability (rho_a)	Composite (rho_c)	reliability	Average variance extracted (AVE)

Discussion

The purpose of this study is to investigate the factors that could increase the propensity to use M-payment. It selects suggested factors from previous research that have been shown to influence the propensity to use M-payment. This quantitative research is conducted in Saudi Arabia with the majority of participants being Saudis. After examining the survey results in detail, the following can be determined: In Saudi Arabia, the perceived value, and convenience value, can increase the propensity to use M-payment. However, monetary value, social value, enjoyment value, and perceived risk do not increase the propensity to use mobile payments. In another study conducted in the U.K the enjoyment value and the social value shows a positive impact on willingness to use m-payment unlike this study, these two factors are related to the culture and this could be the reason why the results are different. Also, monetary value results were different. However, convenience, perceived value and

perceived risks had the same results. After recognizing its benefits, a large number of Saudis adopted M-payment. Since the pandemic began, the number has been growing. However, research indicates that global adoption of this novel technology is slow. This may be due to aversion to change, ignorance of the purported benefits of M-payment, or unwillingness to abandon traditional payment methods. The end user is ultimately responsible for determining whether the perceived value of M-payment warrants a trial. Knowledge and emotions of the user are the primary motivations for employing this technology.

Conclusion

Saudi Arabia is on an ambitious journey to transform its economy and society through Vision 2030, an initiative encompassing various domains like tourism, agriculture, women's empowerment, art, health, and technology. As part of this vision, the country is embracing mobile payment (M-payment) technology, which holds the potential to significantly boost economic growth. This shift to M-payment represents more than just a technological upgrade; it is a leap toward modernizing everyday transactions, making them quicker, more efficient, and cost-effective. In response to the COVID-19 pandemic, Saudi authorities made it mandatory for all retail stores to have card reader machines, laying the groundwork for a cashless society. M-payments play a key role in this transition, offering convenience to both consumers and businesses. However, for M-payments to be successful, a secure infrastructure and high-speed internet connections are crucial. Saudi Arabia's progress in developing robust technological systems and broadband networks is a significant step in this direction. To encourage the widespread adoption of M-payments, it's essential to address public concerns and misconceptions. Raising awareness about the benefits of M-payments and emphasizing their security features can reduce skepticism and build trust. A survey conducted as part of this study gathered responses from 102 Saudis, providing insights into their attitudes toward M-payments. Despite the limited sample size, the survey highlighted key factors influencing the willingness to adopt M-payments, as well as perceived barriers, such as concerns over security risks. The study's findings offer valuable information for policymakers and business leaders in Saudi Arabia. While many respondents acknowledged the convenience and speed of M-payments, some were hesitant due to concerns about data privacy and potential fraud. Addressing these issues requires a concerted effort to educate the public about the safety measures in place and the advantages of a cashless economy. As Saudi Arabia moves toward its Vision 2030 goals, the successful integration of M-payment technology is a significant indicator of progress. By reducing barriers to adoption and reinforcing the security of M-payments, the Kingdom can continue to advance toward a modern, digitally connected society that benefits all its citizens.

Limitations and Future Directions

The study relies on responses to a survey about how respondents feel about specific sentences and to what extent they concur with them. The accumulation of the survey's data is the study's limitation. 102 individuals responded to the survey in total. The survey has been created and distributed at random to acquaintances, family

members, and coworkers. 102 people is a small number compared to the population of Saudi Arabia. As a possible future trajectory, this study could be expanded to include a larger sample of Saudis in order to gain a clearer understanding of their perspectives on M-payments. Future research could also be conducted on the feasibility of implementing digital payment in its entirety. This could take some time to occur. However, now that the Saudi government has mandated that all establishments provide electronic payment devices, Saudis can make all purchases using M-payment and cards. In addition, the simplicity and convenience of payment applications altered the Saudis' lifestyle, which could lead to their exclusive use of digital currency. This research could be implemented in other nations as a potential next step. This study examined how the perceived value of M-payment affects the propensity of Saudi Arabian citizens to adopt it. It could also be conducted in multiple nations.

Acknowledgements

The researchers would like to express their gratitude to PMU and COBA for their assistance in conducting this study.

Abstract: Saudi Arabia's Vision 2030 aims to revolutionize its economy and reduce its reliance on oil. The region is known for its tourism offerings, including top-notch hotels and vibrant nightlife. As part of this plan, the government recognizes the importance of developing and growing the tourism sector. Various initiatives and projects have been put in place to promote tourism actively. This study focused on analyzing Vision 2030's impact on enhancing the tourism industry in Saudi Arabia. The researcher used stratified random sampling to collect responses from 100 respondents. Sequential Equation Model (SEM) and Confirmatory Factor analysis were applied to investigate the attitudes, perceptions, and intentions of tourists toward tourism and how they align with the objectives of Vision 2030. The analysis involved dimensions measured using six variables. An analysis of the participant's responses, including the means and the standard deviations, showed variable deviations from the means were above 0.7357, with the highest record at 0.88912, showing discrimination in the variable indicators. The results suggest a positive but low degree correlation between Saudi Tourism and elements of Vision 2030, including Conservation and Preservation of Natural Resources (CPN), Economic Diversification Through Tourism (EDT), and Empowerment and Inclusion of Local Communities (EILC). There was also a positive correlation between the Development and Maintenance of Tourism Infrastructure (DMTI) and the Quality of Tourism Services and Hospitality (QTSH). The research findings suggest that Vision 2030 projects and initiatives are crucial to turning the country into a tourism hotspot that substantially contributes to the diversification of the economy.

Keywords: Saudi Arabia, Vision 2030, Tourism, industry, economic development

Introduction

Having long been renowned as one of the world's foremost oil and natural gas producers, Saudi Arabia has embarked on a transformative journey with Vision 2030. A pivotal aim drives this ambitious blueprint: to diversify revenue streams beyond the nation's historical dependence on oil exports. At its core lies the recognition that sustainable economic growth and stability necessitate reducing reliance on the petroleum sector. This paradigm shift is critical for economic sustainability and imperative for generating employment opportunities and ensuring long-term prosperity for the Saudi population (Grand and Wolff, 2020).

While the impetus for this shift is clear, a comprehensive assessment of Vision 2030's tourism initiatives' specific impact on the economy and society remains conspicuously absent within existing literature. This research endeavors to fill this gap, delving into the intricate web of strategies, programs, and projects that constitute the developmental backbone of Saudi Arabia's burgeoning tourism sector. Beyond mere scrutiny, this study seeks to proffer a multifaceted evaluation that encompasses not only economic implications but also the broader societal resonance of these initiatives. In order to achieve this, an extensive sample size of 245 respondents participated in an online survey, meticulously selected through stratified random sampling techniques (Grand and Wolff, 2020; Ibrahim et al., 2021).

A theoretical framework rooted in the destination development theory underpins this research endeavour. This theory provides a robust platform for unraveling the diverse factors that underlie the allure and competitiveness of a tourism destination. Here, elements such as infrastructure, cultural heritage, and the overall visitor experience take center stage, offering a holistic lens through which to assess the sector's evolution (Cavalheiro et al., 2020). Drawing from this framework, six critical variables emerged: Conservation and Preservation of Natural Resources (CPN); Economic Diversification Through Tourism (EDT); Empowerment and Inclusion of Local Communities (EILC); Alignment of Policies with Sustainable Tourism Principles (APST); Development and Maintenance of Tourism Infrastructure (DMTI); and Quality of Tourism Services and Hospitality (QTSH).

Within the contours of Vision 2030, Saudi Arabia has meticulously outlined strategic focal points designed to catalyze the growth of its tourism sector. Central to this blueprint is the imperative of refining and enriching the visitor experience. A concerted investment in tourism infrastructure projects seeks to augment accessibility and convenience for both domestic and international visitors. Moreover, the promotion of domestic tourism serves as a dual-purpose strategy, not only enhancing local engagement but also fortifying the sector's resilience against external economic fluctuations. In tandem with these efforts, the harnessing of digital marketing technologies stands as a testament to Saudi Arabia's commitment to not only embrace but also lead in the digital age (Ibrahim et al., 2021).

In a paradigm-shifting move, Aramco, a linchpin in Saudi Arabia's economic landscape since its establishment in 1938, has embarked on an innovative training program. Launched in late 2018, this program epitomizes Aramco's dedication to instilling a culture of hospitality and elevating customer service standards among its

workforce. By doing so, Aramco not only reaffirms its commitment to Vision 2030's goals but also exemplifies how even traditional industries can be at the vanguard of transformative change (Ibrahim et al., 2021).

In sum, Saudi Arabia's Vision 2030 is more than a strategic plan; it represents a resolute commitment to chart a new course toward economic diversification and sustainable growth. Within this framework, the tourism sector emerges as a linchpin, poised to drive not only economic prosperity but also to weave a tapestry of societal benefits. This research endeavors to shed light on the nuanced interplay of strategies and their far-reaching consequences, providing a compass to navigate the uncharted waters of Saudi Arabia's tourism revolution. Through meticulous analysis and insightful exploration, it is our aspiration that this study will contribute meaningfully to the ongoing narrative of Vision 2030 and, by extension, to the future trajectory of Saudi Arabia itself.

Literature Review

Overview of Saudi Arabia's Tourism Sector:

Saudi Arabia boasts a wealth of heritage and natural beauty, making it an extraordinary tourist destination. The country is home to notable cultural sites such as Madain Saleh and Diriyah, both UNESCO World Heritage sites (Al-Tokhais & Thapa, 2020). These remarkable attractions offer glimpses into the Saudi state's civilization and birthplace. Moreover, Saudi Arabia offers captivating attractions like the Rub Al Khali desert and Al-Hijr. The tourism industry presents an avenue for employment growth in the country. The Kingdom has implemented measures to enhance its tourism infrastructure by developing airports, hotels, and transportation networks.

Religious tourism has always played a crucial role in Saudi Arabia's tourism industry, with the annual Hajj pilgrimage to Mecca and Medina. Every year, millions of Muslims from all over the world visit these cities. However, Vision 2030 has set its sights on expanding beyond religious tourism to explore leisure, business, and cultural areas. In addition to improving infrastructure, Saudi Arabia has implemented policies to make the country more appealing for domestic and international tourism. For instance, in 2010, the government lifted the ban on women driving to empower them as breadwinners (Saudi Tourism Authority, 2023). Another noteworthy aspect of Vision 2030 is its focus on promoting tourism in regions outside the cities across the Kingdom. These policy changes created economic opportunities for women and provided families with additional leisure activities.

While Saudi Arabia's tourism sector has developed over decades, it also faces significant challenges. An increase in tourist arrivals in recent years can be attributed to the introduction of the electronic visa system in 2019 that streamlined visa processes for international visitors (Khan, 2020). However, more must be done to expand the variety of tourist attractions. There's still room for improvement regarding the marketing strategy promoting Saudi tourism. Efforts tend to be region-specific rather than national campaigns targeting tourists nationwide.

The Implementation of Vision 2030:

The Kingdom of Saudi Arabia (KSA) is transforming significantly to become a premier tourist destination in the Middle East and the world. The implementation of Vision 2030, a strategic plan aimed at reducing dependence on oil revenues and diversifying the economy, plays a crucial role in this transformation. Albuhlul (2022) established that tourism drives economic diversification, that is, substitute revenue sources for oil revenues. Saudi Arabia has always been marketed as an attractive destination for luxury travel due to the numerous historical sites and the breathtaking nature it hosts. The country offers diverse natural landscapes, such as the Al-Najd plateau, the expansive Rub' al Khali desert in Eastern Saudi Arabia, and the Red Sea coastline on its western border.

The tourism vision 2030 plan is built on three key pillars. The foundation of Vision 2030 comprises a dynamic community, a flourishing economy, and an aspiring nation. According to Khan (2020) and Ibrahim et al. (2021), each pillar encompasses a set of goals and objectives designed to address the country's most pressing challenges and unlock its full potential. The first pillar is a vibrant Society. This pillar promotes cultural diversity, enhances social cohesion, and preserves the nation's rich heritage. It aims to build a strong national identity, promote healthy lifestyles, and provide world-class educational opportunities for the Saudi population. Many government members maintain that it strives to create jobs for the country's youth by developing new industries. It is also meant to increase tourism and diversify the economy. Therefore, the pillar seeks to remove the country's dependence on oil revenues by developing alternative sources of income, such as technology and tourism.

The KSA government recognizes the need to diversify its economy and reduce dependence on oil revenues, identifying tourism as a crucial sector for development. However, there is limited research on the strategies and initiatives taken to develop the tourism sector under Vision 2030 and the potential impacts of these efforts on the economy and the Saudi population. The thriving Economy pillar targets the diversification of the economy by encouraging private sector growth and developing non-oil industries. The government aims to generate novel employment prospects and aid small and medium-sized businesses (SMEs). According to Al-sakkaf et al. (2020), the Ambitious Nation pillar aims to improve the efficiency and effectiveness of government institutions, enhance transparency, and combat corruption. Saudi Arabia's Export Strategy for Tourism 2020+. The Ministry of Commerce and Investment (MOCI) released a report highlighting its plans to promote tourism and develop the country into a top international destination by 2020. The initiative aligns with Saudi Arabia's objective to expand its economic horizons and lessen its reliance on oil-generated income, as stipulated in Vision 2030. The "Tourism 2020+" strategy is a collaborative effort between several government agencies to create favourable investment conditions to achieve the objectives outlined in Vision 2030. Therefore, the Vision involves investing in advanced technologies, promoting e-government services, and strengthening the rule of law to create a more stable and prosperous nation.

Tourism plays a crucial role in the achievement of Vision 2030. Ambitious goals have been established by the government for the tourism industry, such as augmenting the count of inbound international visitors and

elevating the sector's contribution to the country's GDP. According to Grand and Wolff (2020), to achieve these goals, the government has initiated several mega-projects, such as the Red Sea Project, NEOM, and the development of historical sites like AlUla. Moreover, the government has implemented various reforms to facilitate tourism, such as introducing tourist visas and relaxing certain social norms. Saudi Arabia aims to create new job opportunities, stimulate economic growth, and improve its citizens' overall quality of life. Vision 2030 provides a comprehensive roadmap for the nation to transform into a leading tourist destination, contributing to a more vibrant, diversified, and prosperous future for the Kingdom. As such, the government is proactively preserving its heritage and developing new industries to generate employment opportunities for citizens.

Role of Tourism in Vision 2030:

Tourism is a critical component of Saudi Arabia's Vision 2030. It can significantly contribute to the country's economic diversification and the region's development. According to Grand and Wolff (2020), investing in and promoting the tourism sector has allowed the government to achieve several key objectives outlined in its strategic plan. It can be attributed to the fact that this sector plays a critical role in the national economy. It has continued to generate many jobs and generates income, provides investment opportunities, and contributes to the overall well-being of Saudi citizens. The tourism sector is designed to provide several benefits to the Kingdom. It often enhances international interest in Saudi Arabia by attracting foreigners who want to visit this spectacular country. At the same time, it contributes significantly to meeting national development goals by stimulating economic growth and creating jobs for citizens. The country currently has only a few of its large population engaged in tourism-related activities & also lacks a comprehensive plan for promoting tourism.

Economic diversification is another vital issue. Developing the tourism industry helps to reduce Saudi Arabia's reliance on oil revenues and create a more resilient economy. Chalastani et al. (2020) found that oil and gas accounted for most of the country's total revenue in 2017. According to Waheed (2022), the income from the tourism industry can be earmarked for new developments that are not dependent on oil revenues, thus reducing Saudi Arabia's vulnerability to fluctuations in oil prices. Recognizing the importance of tourism has allowed the Saudi government to launch several mega-projects to develop this sector. It has also expanded the tourism sector, allowing the government to generate new revenue streams and foster the growth of hospitality, retail, and transportation.

Job creation is a significant advantage of the strategic plan. As the tourism industry grows, it creates numerous direct and indirect employment opportunities for Saudi citizens. According to Alahmadi et al. (2022), jobs have been created in hotels, restaurants, tour companies, and other tourism-related businesses. These jobs can be more attractive than most available positions in the private sector since they offer flexible hours and enable employees to work part-time. The tourism industry is also a source of employment for women and minorities who often face limited job prospects in the labour market. Investing in and promoting tourism protects and showcases Saudi cultural heritage, enhances its international reputation, creates diverse job opportunities, and

improves its people's overall quality of life. The tourism sector also supports the growth of related industries such as construction, further contributing to job creation. Therefore, tourism plays a vital role in achieving the Kingdom's vibrant, prosperous, and sustainable future.

Tourism enables Saudi Arabia to showcase and safeguard its cultural heritage, historical landmarks, and natural wonders. Shabir and Sharma's (2019) findings suggest that Saudi tourism raises awareness about the country's treasures while strengthening its national identity. It fosters a sense of pride and unity among those who take pride in their history and culture. Tourism also contributes to growth by stimulating other business sectors and expanding the country's export opportunities. As a result, there has been an increase in income from tourism-related activities.

The Saudi tourism sector has witnessed extensive growth in recent years. Saudi Tourism Authority (2023) records show that in 2008, around 4.4 million tourists visited the country for leisure, business, and religious purposes. By 2015, this figure had jumped to 8.2 million tourist arrivals and is expected to reach 12.3 million by 2020. Much of this can be attributed to the introduction of new airline routes and the expansion of specific tourist sites, such as Al Ula, in 2009. As a result, tourism enriches inhabitants' living standards, rendering the nation more appealing for residency, employment, and visitation. Therefore, developing the tourism sector is integral to the success of Saudi Arabia's Vision 2030.

The current literature on Vision 2030 mainly focuses on its economic diversification and overall development goals. Launched in April 2016 by Crown Prince Mohammed bin Salman, the Vision seeks to transform the Kingdom into a global investment hub by fostering innovation, supporting the private sector, and enhancing the quality of life for its citizens. According to Al-Malki et al. (2022), developing the tourism sector complements other pillars of the Kingdom's Vision 2030. The Kingdom has a strategy to develop the tourism sector that supports these objectives. The focus is on increasing the attractiveness of Saudi Arabia as a destination and fostering foreign investment. Therefore, the primary effect is creating employment opportunities and stimulating growth in domestic industries. As such, the plan will help Saudi Arabia achieve its goal of becoming a major international tourist destination.

A critical review of existing literature on the impact of Vision 2030 on the tourism sector in Saudi Arabia yields mixed results. Saudi Arabia's Vision 2030 is a comprehensive reform plan aimed at diversifying the country's economy away from its heavy reliance on oil revenues. Among its many ambitious goals, Vision 2030 seeks to transform Saudi Arabia into a global tourism hub. For instance, Abuhjeeleh (2019) delved into Vision 2030 policy initiatives, infrastructure development, and marketing strategies, providing a holistic view of the subject. Some studies adopt a multidisciplinary approach in investigating the impact of Vision 2030 on Saudi tourism, combining insights from economics, tourism studies, and political science (Aliedan et al., 2021). This interdisciplinary perspective offers a more nuanced understanding of the complex dynamics at play. Other studies incorporate empirical data, including surveys, interviews, and statistical analysis on the impact of Vision 2030 on Saudi tourism (Alshammari et al., 2023). This empirical evidence adds credibility to their arguments

and allows for a more grounded assessment of the impact. The preponderance of previous research offers comprehensive coverage of the various aspects of Vision 2030's impact on tourism. They have different strengths, weaknesses, and limitations – creating a gap in the literature for this study to fill.

Most previous studies on the impact of Vision 2030 on Saudi tourism tend to be overwhelmingly positive about Vision 2030's potential for the tourism sector. They lack a critical analysis of the challenges and potential drawbacks, such as environmental concerns, cultural preservation, and socioeconomic inequalities. For instance, Aliedan et al.'s (2021) study relied heavily on official government statements and documents. Moreover, Abuhjeeleh's (2019) study did not consider the dynamic nature of Vision 2030 and the tourism sector. While these sources provide valuable insights, they may lack objectivity and could be influenced by political agendas, raising questions about their credibility. This study will add a more recent source to the existing literature, capturing the latest developments and assessing whether the initial expectations are being realized.

Transformation of Saudi Arabia's Economy through Vision 2030 and Tourism:

In analysing the growth and development of tourism in Saudi Arabia and its progress, it is crucial to analyze the past research works of authors that have also addressed the topic. Ayad et al.'s (2022) study reviews the history of Saudi tourism dating back to when the country welcomed its first religious pilgrims. Over the years, the Saudi government has taken deliberate action to promote and develop the tourism sector. It has not only created opportunities for residents but also contributed to the growth of other industries. Presently, Saudi Arabia's tourism industry is thriving, with an influx of tourists arriving at airports and seaports every month. While there are benefits associated with promoting tourism, there are also challenges that need to be addressed to achieve Vision 2030 goals. One major challenge policymakers face in Saudi Arabia is balancing promoting tourism and preserving its historical sites, natural attractions, and cultural artefacts.

During the early phases of Saudi tourism development, most visitors were pilgrims who travelled to Mecca and Medina for the Hajj pilgrimage and Umrah. In the 1950s, a few individuals also started visiting the country for leisure, often taking road or rail routes to Egypt or Jordan. According to Alhamad and Singh (2021), in 1969, when King Faisal bin Abdulaziz Al Saud became the monarch, a hotel was constructed in Madinah. Through a walkway, the King Faisal International Hotel was directly connected to the Prophets Mosque (Masjid al Nabawi). At that time, Madinah and Riyadh had three hotels. However, by 1980, the number of hotels had increased to 85. Today, over 3,000 hotels are operating across Saudi Arabia. Thus, the government's contributions to the tourism industry focused on providing services catering to religious pilgrims' needs.

In the 1960s, the Saudi government began recognizing the potential of tourism as a means to drive growth and diversify the economy. It established the Ministry of Information in 1968 to support this vision. This ministry was responsible for promoting tourism and developing infrastructure for visitors (Saudi Tourism Authority, 2023). In 2000, an important milestone was reached by establishing the Saudi Commission for Tourism and National Heritage (SCTH). As an independent commission reporting directly to the King, SCTH plays a vital

role in diversifying the economy. It oversees the Ministry of Culture and Information, established in 1975. Saudi Arabia boasts more than 333 registered archaeological sites, carefully maintained, restored, and promoted by SCTH for international tourists. The government has implemented programs to ensure these cultural heritage sites remain sustainable. Through Al Shoura (Citizens Consultative Assembly), different interest groups within society are consulted to determine how best to utilize tourism as a tool for development while preserving Saudi cultural assets. The government has long had the Vision of making Saudi Arabia a region that attracts tourists from across the globe.

Expansion beyond religious tourism comes with the growing recognition of the potential of tourism. Saudi Arabia began to explore opportunities beyond religious tourism. The government has identified areas with potential for growth, including historical and leisure tourism. According to a study conducted by Bhatti et al. (2022), the development of these tourist attractions has been a focus at regional and international conferences like the Arab Tourism Forum, World Travel Market, and Arabian Travel Market. In 2003, King Abdullah bin Abdulaziz Al Saud declared that 2011 would be the "Visit Saudi Arabia Year" to promote the country to tourists worldwide. This initiative was followed by the International Tourist Year in 2013 and the National Tourism Sector Year in 2015. Efforts were made to improve infrastructure and create attractions, like museums, archaeological sites, and recreational facilities, to cater to a wide range of tourists.

Tourism in Saudi Arabia reached a different level with the launch of Vision 2030. The government set goals for the industry, such as attracting international tourists and increasing tourism's contribution to the national GDP. Several mega projects like the Red Sea Project, NEOM, and the development of sites like AIUla have been initiated to achieve Vision 2030 targets. Furthermore, existing attractions are being renovated to attract more tourists. Although Vision 2030 aims to promote Saudi Arabia and make a \$45.5 billion contribution to the GDP, its implementation is an ongoing process that will require time. The government has introduced reforms such as issuing tourist visas and relaxing norms as part of efforts to facilitate tourism. These reforms reflect the history of tourism in Saudi Arabia and its transition to a more diverse industry encompassing cultural, historical, and leisure sites. Incorporating such reforms into the Vision 2030 agenda highlights the government's dedication to nurturing the industry. It showcases the promise of tourism as a catalyst for employment generation and socioeconomic advancement within the Kingdom.

Previous Research Frameworks:

Scholars have examined the relationship between Saudi Arabia's tourism industry and Vision 2030 using different frameworks and theoretical approaches. The Destination Competitiveness Model has been utilized to evaluate Saudi Arabia's competitiveness as a tourist destination. This model assesses factors such as tourism infrastructure, cultural resources, natural attractions, policy environment, and human resources to determine how attractive and competitive the country is in the tourism market. The model informed the study on Saudi Arabia's adherence to Corporate Social Responsibility (CSR) guidelines for all its operations by promoting sustainable business practices. The country's approach to responsibility is a twofold process focusing on social

responsibility and providing tourists with a positive experience. The "Daughters of Allah" program is an example of an initiative that fosters responsibility in an environment where women are primarily targeted. Still, men can also participate if their workplace is supportive. Such initiatives highlight the Saudi authorities' commitment to implementing safety, environmental protection, and responsible product development programs.

The other framework is Cultural Tourism. Saudi Arabia's cultural heritage and historical sites play a significant role in its tourism sector. The research focuses on the country's cultural and historical sites and their potential for further growth in this sector. As this research is ongoing, recent publications have used different frameworks. The tourism industry in Saudi Arabia is primarily domestic, but demand for international tourism is rising steadily, especially from neighboring countries within the Middle East and Asia. Saudi Arabia aims to diversify its tourism offerings by expanding beyond religious tourism into other markets, such as business and leisure tourism, to boost its appeal as a tourist destination. Saudi Arabia has sought to attract more visitors through its marketing initiatives, highlighting its cultural heritage and religious sites as top attractions. Therefore, research studies have employed cultural tourism frameworks to examine the potential of Saudi Arabia's cultural assets and heritage sites in attracting tourists, preserving cultural heritage, and promoting sustainable tourism practices.

The study used the theoretical frameworks as guidelines for developing and attaining its research objectives. The Destination competitiveness model will oversee the preservation and promotion of Saudi Arabia's cultural and natural heritage through sustainable tourism practices to enhance its cultural tourism potential and positively influence visitor satisfaction and destination loyalty. It will guide effective stakeholder engagement and collaboration in developing and implementing sustainable tourism initiatives in Saudi Arabia, leading to improved governance, policy alignment, and overall destination sustainability. The cultural tourism model will inform the enhancement of quality tourism infrastructure, including accommodation facilities and transportation networks in Saudi tourism and cultural sites, which positively influence the competitiveness and attractiveness of Saudi Arabia as a tourism destination.

Government Policies and Strategies for Tourism Development:

Over the years, the Saudi Arabian government has implemented various policies and strategies to develop and promote the tourism sector. Efforts have been made to diversify the industry, enhance infrastructure, and attract international visitors. Almathami and Mair (2023) investigated the Saudi Commission for Tourism and National Heritage (SCTH) and its efforts toward planning, regulating, and promoting tourism. Their findings highlighted the commission's functionalities, including formulating tourism policies, safeguarding and promoting Saudi heritage, and overseeing the licensing and regulation of tourism-related businesses. In 2005, a National Tourism Strategy was launched to build a competitive tourism sector by focusing on developing infrastructure, nurturing human resources, and implementing effective marketing strategies. These initiatives marked the beginning of an era for Saudi Arabia's tourism program, showcasing its historical sites, cultural attractions, recreational spots, and eco-friendly activities. The King declared 2013 the "International Tourist Year" and 2015 the "National

Tourism Sector Year." These declarations laid a foundation for the sector's growth by providing a vision and roadmap for advancing tourism within the country.

Figure 5.Vision 2030 Transformation Economy in Saudi Arabi (Ranjan, 2016)

Saudi Arabia's Vision 2030 was introduced in 2016 to reduce its dependence on oil revenues and diversify its economy. Al Shoura, or Citizens Consultative Assembly, approved the 14-year government plan. It aimed to contribute more than \$86 billion to the Kingdom's GDP. Vision 2030 aims to create over 450,000 job opportunities and increase the oil sector's contribution to around half of the country's GDP (Saudi Tourism Authority, 2023). Tourism is a crucial aspect of the vision, which is expected to play a vital role in expanding opportunities and reducing unemployment. The government has set targets for tourism, including attracting international tourists and boosting its contribution to the national GDP. Several large-scale projects have been initiated as part of this strategy, such as the Red Sea Project, NEOM, and developing sites like AlUla. Significant changes were made to Saudi Arabia's visa policies in 2019, enabling tourists from 49 countries to obtain e-visas for leisure travel. The decision was made to encourage tourism and improve the country's accessibility to tourists from multiple countries.

The Saudi Commission for Tourism and National Heritage (SCTH) launched the "Visit Arabia" campaign to promote tourism. The 2012 project explored Saudi Arabia's historical and cultural sites and other tourist attractions, such as recreational destinations and ecotourism activities. According to Abuhjeeleh (2019), the project was followed by National Tourist Year (2013) and International Tourist Year (2013). The project is focused on developing a sustainable and competitive tourism industry by focusing on critical areas such as infrastructure development, human resources, and marketing. Investment in infrastructure is when the

government has significantly improved the country's infrastructure to support the growth of the tourism sector. It includes the development of airports, roads, and public transportation systems; therefore, the development of the Vision has led to the construction of new hotels and tourism facilities.

The Public-Private Partnerships (PPPs) launched spur investment and development in the tourism sector. The government has encouraged public-private partnerships. According to Chalastani et al. (2020), the collaborations involve the government and private sector entities working together on various tourism projects, such as developing new attractions and improving existing facilities. The government has tried to attract more tourists by improving the country's infrastructure, providing services and amenities, and developing a national brand. Visitor arrivals in the country were estimated at 2.67 million in 2013, according to Saudi Arabia Tourism Statistics. The number of visitors has increased significantly since 2002, when the total number was 1.4 million. In 2008, the Ministry of Culture and Information launched a five-year plan to develop the tourism industry by promoting cultural heritage landmarks and developing new attractions. Therefore, the program is intended to promote tourism by preserving and increasing public awareness of Saudi Arabia's unique cultural heritage sites and adding new sites through community-based programs for tourists and international tour operators.

The government has been actively promoting Saudi Arabia as a tourist destination through marketing campaigns, participating in international tourism fairs, and collaborating with global partners in the tourism industry. According to studies by Al Malki et al. (2022) and Khan (2020), these efforts aim to increase awareness about the country's attractions and position Saudi Arabia as a top choice for leisure and business travellers. The Saudi Arabian government has implemented policies and strategies to support the growth of the tourism sector. These initiatives have successfully transformed the industry from being focused on tourism to encompassing a wider range of experiences, such as cultural, historical, and leisure activities. The government's continued dedication to developing this sector demonstrates that incorporating tourism into the Vision 2030 strategy is crucial for driving growth and social progress in the Kingdom.

Case Studies of Successful Tourism Projects:

Tourism festivals in Saudi Arabia attract visitors, stimulate the economy, and showcase the country's cultural heritage. Some notable examples include the Riyadh Season festival, the Red Sea Project, and the NEOM and AIUla. Ibrahim et al.'s (2021) study defines the Riyadh Season as a festival of culture and entertainment held in Saudi Arabia's capital city. Since its launch in 2019, the event has featured a range of activities such as concerts, theatre performances, and food festivals. The festival has attracted millions of visitors from both international backgrounds, leading to growth in the region's tourism sector. These tourism projects bring benefits and contribute to broader economic and social development across Saudi Arabia. Moreover, there is evidence of a correlation between increased per capita income and domestic investment. Opening new hotels, offices, and other tourism-related facilities stimulates growth and contributes to job creation in the Kingdom. The success of Riyadh Season showcases the potential of cultural and entertainment events to attract tourists and stimulate economic activity.

The Red Sea Project is an ambitious tourism development initiative aimed at creating a luxury destination along the pristine coastline of the Red Sea. The project includes the development of luxury resorts, residential areas, and entertainment facilities on more than 50 islands. According to Al-sakkaf et al. (2020), at the opening ceremony for the project in September 2018, Mohammad bin Salman Al-Saud, Crown Prince of Saudi Arabia, said that "the Red Sea Project created an unprecedented economic and social impact" on the region where it is located. The statement indicates this project's intended impact on the local community and the broader economy. This project contributes to development in many areas, including infrastructure and transportation. The Red Sea Project is a long-term plan that profoundly motivates visiting tourists and increases economic impact in the region. The Red Sea Project promotes tourism by integrating eco-friendly technologies and practices such as renewable energy, water preservation, and preserving the region's unique ecosystem. Its success demonstrates how sustainable luxury tourism can attract visitors and contribute to the growth of the country's tourism industry.

Another significant undertaking is the NEOM project, a planned mega-city in northwest Saudi Arabia. Covering an area of around 26,500 kilometers, this project presents an opportunity for diversifying development in the region. NEOM is being developed to attract high-end international tourists by highlighting distinctive attractions and providing luxurious services. Apart from becoming a destination itself, NEOM also aims to draw visitors from all over the world. It boasts cutting-edge technology and opulent hotels, resorts, and vacation spots. The city is envisioned as a centre for innovation, technology, and sustainability, focusing on nine sectors, including tourism. NEOM's plans for tourism encompass the creation of resorts, cultural landmarks, and thrilling adventure sports facilities while emphasizing practices and environmental conservation. The project seeks to allure both global tourists and businesses and investors contributing to the expansion of the tourism industry in the area.

Figure 6. Tourism Progress concerning Vision 2030 In Saudi Arabia (WEF).

Located in northwest Saudi Arabia, AlUla is a region that boasts numerous archaeological sites, including the renowned ancient city of Hegra – which is recognized as a UNESCO World Heritage site. The Saudi government has taken steps to transform AlUla into a cultural tourism destination. Waheed (2022) explains that the 'AlUla Program' aims to safeguard and enhance sites, enhance the transportation infrastructure, and upgrade facilities at tourist attractions. This comprehensive initiative not only promises growth but also has the potential to create up to 30,000 jobs in the region. The initiative aligns with Vision 2030 since it aims to attract visitors from around the globe and promote tourism. It embodies the Saudi government's aspiration of establishing Saudi Arabia as a sought-after, culturally-diverse tourist hotspot. Crucial components of these efforts include establishing the Royal Commission for AlUla (RCU), which oversees the development and formulation of the AlUla Framework Plan. The commission outlines sustainable tourism growth objectives for the area. AlUla's success as a tourism destination is a testament to Saudi Arabia's commitment to leveraging its heritage to stimulate growth through a vibrant tourism sector.

Research Gap:

Previous studies on the impact of Vision 2030 on Saudi Arabia's tourism sector have inherent gaps and limitations. Abuhjeeleh's (2019) study did not address the environmental and sustainability implications of Vision 2030's tourism objectives. This is a significant gap, as the rapid development of infrastructure and mass tourism could have adverse effects on Saudi Arabia's delicate ecosystems. Aliedan et al.'s (2021) study did not comparatively evaluate the Saudi Arabian tourism sector against other successful or struggling examples that would provide valuable insights. Such a scholarly inquiry could help identify best practices and potential pitfalls in tourism development. Moreover, there is limited research exploring the potential social and cultural impacts of increased tourism. The effects on local communities, cultural preservation, and social dynamics remain understudied.

While the existing literature on the impact of Saudi Arabia's Vision 2030 on the tourism sector offers valuable insights, it exhibits some notable strengths and weaknesses. The strengths lie in its comprehensive coverage, use of empirical data, and multidisciplinary approaches (Alshammari et al., 2023). However, weaknesses include an overly positive bias, overreliance on official sources, and temporal limitations (Aliedan et al., 2021). To advance the field, this study aimed to address the gaps related to the Conservation and Preservation of Natural Resources (CPN); Economic Diversification Through Tourism (EDT); Empowerment and Inclusion of Local Communities (EILC); Alignment of Policies with Sustainable Tourism Principles (APST); Development and Maintenance of Tourism Infrastructure (DMTI); and Quality of Tourism Services and Hospitality (QTSH). The researcher approached this topic with a critical and balanced perspective to provide a more accurate assessment of the challenges and opportunities associated with Vision 2030's tourism goals.

Conceptualisation of Frameworks and Hypothesis Development:

The main goal of the cultural tourism framework is to assess Vision 2030's potential for promoting tourism

growth in Saudi Arabia. The objective is to understand factors that contribute to tourism and explore how they are interconnected. Such factors include Environmental Sustainability, Economic diversification through tourism and Empowerment, and inclusion of communities in tourism development. Sustainable tourism has emerged as an approach that complements traditional models in tackling contemporary challenges. The framework explores the relationships and connections between these dimensions, acknowledging that a comprehensive and integrated approach is necessary for tourism development in Saudi Arabia. For instance, it investigates how sustainable practices can affect both visitors' experiences and the economic benefits generated by the tourism industry. It also explores the role of governance and policies in driving tourism activities without compromising the local community's well-being.

This study utilized the destination development theory to investigate the impact of Vision 2030 on the Saudi tourism industry. Cavalheiro et al.'s (2020) findings suggest that the theory provides a framework for understanding the factors that influence the appeal and competitiveness of a tourism destination. It considers infrastructure, services, cultural heritage, natural attractions, and visitor experience. The researcher used this theory to examine the socioeconomic impacts associated with tourism growth in Saudi Arabia. The tourism industry has significant implications for all aspects of Saudi society, including its economy and international standing.

Destination Development Theory:

The destination development theory was used to assess the measures taken by Saudi Arabia in upgrading its tourism sector, focusing on Vision 2030. Such measures include creating new attractions, improving infrastructure, and providing services that meet the expectations of both domestic and foreign visitors (Mir & Kulibi, 2023). In addition, it was relevant to consider the development of a new image for Saudi Arabia as a destination that is suitable for high-end international tourism. Such an approach would help the Saudi government to demonstrate its commitment to Vision 2030 by touting the changes it has implemented thus far. The Saudi government's program was unveiled in December 2014 and aims to diversify the economy and make it less dependent on oil revenue to reduce its large fiscal deficit. The destination development theory was also used to comprehensively assess Saudi tourism development's potential economic and societal impacts under Vision 2030. It helped in understanding how the growth of the tourism sector can contribute to job creation, economic diversification, and quality of life for Saudi citizens.

The destination development theory provided a comprehensive framework for understanding the multifaceted aspects that contribute to the growth and sustainability of tourism in Saudi Arabia. It served as a lens through which the impact of various variables on the success of Saudi Arabia's tourism industry were analyzed. The variables identified included Conservation and Preservation of Natural Resources (CPN), Economic Diversification Through Tourism (EDT), Empowerment and Inclusion of Local Communities (EILC), Alignment of Policies with Sustainable Tourism Principles (APST), Development and Maintenance of Tourism Infrastructure (DMTI), and Quality of Tourism Services and Hospitality (QTSH) - represent critical components

in the destination development process.

The hypotheses formulated aligned with the key principles of the destination development theory, emphasizing the interconnectedness of environmental, economic, social, governance, and infrastructure factors in shaping a sustainable and attractive tourism destination. The first hypothesis (H1) postulated that integrating environmental sustainability measures within Vision 2030 positively affects tourists' intention to engage in tourism activities in Saudi Arabia. This was based on the perception that the destination is environmentally responsible and attractive. The measures include the preservation and protection of natural resources, reduction in water and energy consumption, and effective waste management practices. This aligned with the destination development theory, which emphasizes the importance of environmental sustainability in attracting and retaining tourists.

The second hypothesis (H2) suggested that economic sustainability initiatives implemented under Vision 2030 positively influence tourists' intention to engage in tourism activities in Saudi Arabia. The perception was that the destination offers economic opportunities and benefits for local communities, including increased foreign exchange earnings, job creation, and safety measures. Economic diversification through tourism is a key element in the destination development theory, emphasizing the role of tourism in stimulating economic growth and providing socio-economic benefits. Hypothesis three (H3) focused on social sustainability factors, asserting that Vision 2030's emphasis on cultural preservation, community engagement, and inclusivity positively influences tourists' intention to engage in tourism activities in Saudi Arabia. The perception is that the destination is socially responsible and offers authentic experiences. The destination development theory underscores the significance of community involvement and cultural preservation in creating a unique and attractive destination.

The fourth hypothesis (H4) posited that effective governance and policy measures implemented under Vision 2030 positively influence tourists' intention to engage in tourism activities in Saudi Arabia. This was based on the perception that the destination is well-regulated, safe, and secure. The destination development theory emphasizes the role of governance and policy in shaping the overall tourism experience and ensuring the safety and satisfaction of tourists. Hypothesis five (H5) suggested that the development and improvement of tourism infrastructure and resources under Vision 2030 positively influences tourists' intention to engage in tourism activities in Saudi Arabia. The perception was that the destination provides convenient and high-quality services and facilities. The destination development theory recognizes the crucial role of infrastructure in enhancing the overall attractiveness and accessibility of a destination.

Table 14. Indicators of the Conceptual Framework

Dimensions	Variables	Indicators
Environmental Sustainability	Conservation and	Percentage of protected areas
	Preservation of Natural	Water and energy consumption reduction measures

	Resources (CPN)	Waste management practices
Economic Sustainability	Economic Diversification Through Tourism (EDT)	Contribution of tourism to GDP Foreign exchange earnings from tourism Number of jobs created in the tourism sector
Social Sustainability	Empowerment and Inclusion of Local Communities (EILC)	Percentage of tourism businesses owned by locals Community engagement in tourism decision-making Local participation in cultural events and festivals
Governance and Policy	Alignment Of Policies with Sustainable Tourism Principles (APST)	Existence of sustainable tourism policies and regulations Stakeholder engagement in policy development Monitoring and enforcement of sustainable practices
	Alignment Of Policies with Sustainable Tourism Principles (APST)	Existence of sustainable tourism policies and regulations Stakeholder engagement in policy development Monitoring and enforcement of sustainable practices
Infrastructure and Resources	Development And Maintenance of Tourism Infrastructure (DMTI)	Number of hotels and accommodations Quality of transportation networks Availability of skilled workforce in the tourism sector
Visitor Experience	Quality Of Tourism Services and Hospitality (QTSH)	Customer satisfaction ratings Cultural authenticity ratings Safety and security measures

Figure 7. Conceptual Research Model.

Hypotheses:

The factors in the table 1 and the conceptual model above were considered in developing the hypotheses for the study. Vision 2030's focus on enhancing the overall visitor experience by introducing new attractions, cultural events, and entertainment options positively influences tourists' intention to engage in tourism activities in Saudi Arabia, as they perceive the destination as offering unique and memorable experiences. As a result, the following hypotheses were developed.

H1: Integrating environmental sustainability measures within Vision 2030 positively affects tourists' intention to engage in tourism activities in Saudi Arabia, as they perceive the destination as environmentally responsible and attractive. These measures include preservation and protection of natural resources, water and energy consumption reduction, and effective waste management practices.

H2: Economic sustainability initiatives implemented under Vision 2030 positively influence tourists' intention to engage in tourism activities in Saudi Arabia, as they perceive the destination as offering economic opportunities and benefits for local communities. These initiatives include increasing foreign exchange earnings, creating jobs, and implementing safety measures in tourist destinations.

H3: Vision 2030's emphasis on social sustainability factors, such as cultural preservation, community engagement, and inclusivity, positively influences tourists' intention to engage in tourism activities in Saudi Arabia, as they perceive the destination as socially responsible and offering authentic experiences.

H4: Effective governance and policy measures implemented under Vision 2030, including increased availability of accommodation, improved emergency response systems, and involving all stakeholders in policy implementation, positively influence tourists' intention to engage in tourism activities in Saudi Arabia, as they perceive the destination as well-regulated, safe, and secure.

H5: The development and improvement of tourism infrastructure and resources, such as transportation networks, availability of quality hotels and accommodation, and availability of skilled personnel, under Vision 2030 positively influence tourists' intention to engage in tourism activities in Saudi Arabia, as they perceive the destination as providing convenient and high-quality services and facilities.

Research Methodology

Sampling Method:

Appropriate choice of sample size is crucial in quantitative research to identify the requisite comparisons and correlations. A sample size of 245 was chosen to assess variables using structural equation modelling. The process involved selecting respondents who could provide an accurate position on the state of Saudi tourism. The researcher used stratified random sampling to collect responses from 100 respondents. The choice of respondents for this study was based on their potential perspectives on how Saudi Arabia's Vision 2030

integrates initiatives in the tourism sector.

The survey focused on the participants' views on the need to offer a range of attractions to cater to different types of tourists. Smith and Abuhjeeleh's (2019) findings suggest efforts have been made to streamline the visa process and enhance the tourist experience. The survey was sent to representatives from hotel chains to provide a perspective on Saudi Arabia's hospitality industry, highlighting challenges related to workforce development, regulations, and competition. They were expected to share perspectives on growth opportunities in the sector, such as increased demand for leisure tourism and the necessity for friendly accommodations. The survey was also sent to consultants to outline the challenges faced in the tourism sector, including recruitment of employees and a lack of international events or sports competitions. They were expected to leverage their expertise on growth opportunities from increased tourists from Gulf Cooperation Council (GCC) countries and Asian nations. The researcher contacted 100 industry experts who provided insights about the industry's state.

Measurement variables:

The research methodology integrated quantitative data collection techniques such as surveys investigating the impact of Vision 2030 on Saudi Arabia's tourism industry. Al Almathami and Mair's (2023) research findings highlight governments' initiatives to enhance the tourism sector. Such efforts focus on infrastructure development, marketing strategies, and collaborations between private entities. Multiple journal articles on government policies and strategies for tourism growth were reviewed to obtain secondary data.

This research used a quantitative approach to understand the Saudi tourism industry and its challenges. The design addressed opportunities and potential for growth compared to other destinations in the Middle East, such as Dubai. Smith and Abuhjeeleh (2019) also compared Saudi Arabia's tourism industry with Dubai, examining the differences in cultural and social aspects, tourism offerings, and sustainability initiatives. The choice to utilize quantitative research in this study was informed by the need to empirically examine the social and cultural factors that impact the growth of Saudi Arabia's tourism sector.

A survey using Google Forms was conducted to gather primary data. Secondary data was collected from credible sources, including journal articles, books, government policies, and reports on the Saudi tourism industry. This comprehensive process yielded information regarding the state of the industry and the government's developmental plans vis-à-vis Vision 2030. The study adopted a framework rooted in tourism theory, offering insights into the factors influencing a specific destination's development and its standing within its region. Moreover, sustainability perceptions and industry development were examined in different tourist locations. The survey was distributed to stakeholders within Saudi Arabia's tourism industry, including government officials, experts, and representatives from tourism-related businesses. The study findings provided insights into challenges faced by the industry and opportunities and growth potential – from a Vision 2030 perspective.

Table 15. Respondents Demographic Characteristics

Characteristic	Classification	Frequenc y	Percentage (%)
<i>Gender</i>	Male	61	61.10
	Female	39	38.90
<i>Age</i>	Under 18	2	1.60
	18–29	4	4.10
	30–39	14	13.50
	40–49	19	19.20
	50 and above	62	61.60
<i>Education level</i>	Primary School	20	19.70
	Secondary School	44	44.40
	Diploma	22	22.00
	Bachelor's Degree	13	13.30

Data Analysis and Procedure:

This research study utilized the Sequential Equation Model (SEM) and Confirmatory Factor analysis. The analysis examined the attitudes, perceptions, and intentions of tourists towards tourism and how it aligns with the objectives of Vision 2030. It relied on data on various aspects of environmental sustainability, economic sustainability, social sustainability, governance and policy infrastructure and resources, and visitor experience. The questionnaire employed a Likert scale where respondents rated their level of agreement or disagreement on a scale ranging from 1 to 5. Before conducting the survey, we conducted a pilot test with a group of potential respondents to assess our questionnaire's clarity, comprehensibility, and reliability. Based on feedback from the pilot test participants, we made necessary revisions to improve any unclear items while ensuring face validity.

Descriptive Statistics:

Environmental Sustainability. Fifty-nine respondents agreed (26 strongly agreed and 33 agreed) that the KSA government has implemented strategies to protect and preserve its natural resources. In comparison, 41 respondents (26 strongly disagreed and 15 disagreed) observed otherwise, and 23 remained neutral. On water and energy reduction measures, 32 strongly agreed, and 35 agreed that the KSA administration has to initiate strategies to regulate water and energy consumption.

The study also sought the participants' opinions on implementing waste management practices in various management sites. The data shows that 12 tourists strongly agreed, and 36 agreed that the KSA had

implemented waste management practices at various tourist sites. Thirty-three participants (21 disagreeing and 12 strongly disagreeing) opposed the existence of these waste management activities, whereas 24 participants remained neutral about the matter. Alternatively, the study sought the participants' opinions on the KSA government modifying its education and career sectors to facilitate increased availability of skilled tourism personnel.

Economic Sustainability. 26 and 32 respondents strongly agreed and agreed that tourism contributes significantly to KSA's GDP. Twenty-four remained neutral, while 36 (10 disagreed and 26 strongly disagreed) felt otherwise. On the foreign exchange earnings that KSA derives from tourism and their contributions to the Saudi Arabian economy, 26 respondents strongly agreed, and 30 agreed that tourism earnings have a mammoth effect. Twelve disagreed, and 26 strongly disagreed that tourism-backed foreign currencies do not impact the KSA economy. In all cases, 22 respondents remained neutral on the issue. The researcher also sought the respondents' opinions on the impact of tourism job opportunities due to the implementation of Vision 2030. Thirty-five strongly agreed, and 30 agreed that the Vision 2030 goal has increased tourism jobs in the country. However, 17 disagreed, and 35 strongly disagreed, affirming that the strategic plan has not created additional jobs in the Saudi tourism sector. However, 12 respondents opted to take no side on the job opportunities issue. The respondents also opined on the presence of safety measures that have influenced their tourism satisfaction and dissatisfaction in KSA. Eighteen respondents strongly agreed, 29 agreed that safety measures influenced their tourism experiences in the KSA, 15 disagreed, and 18 strongly disagreed. However, 24 respondents remained neutral on the safety measures matter.

Social Sustainability. Asked about locals owning and operating tourist spots and sites in the KSA, 42 respondents agreed, and 13 strongly agreed that the locals own and operate most of the businesses. While 20 respondents remained neutral, 16 disagreed, and 13 strongly disagreed that it is not the locals who own and operate a majority of these Saudi Arabian tourism businesses. Whether Saudi Arabian locals have a say in formulating tourism-related decisions, 18 respondents strongly agreed, 31 agreed, 22 remained neutral, 18 disagreed, and 18 strongly disagreed. The researcher also asked the respondents if they had spotted Saudi Arabian locals participating in festivals and cultural events that pertain to the country's tourism. Fifteen strongly agreed, 46 agreed, 26 remained neutral, five disagreed, and 15 strongly disagreed.

Further, 45 respondents indicated they had encountered instances where KSA's tourism offerings violated the country's cultural authenticity, while 55 replied no. The compromise triggered the researcher to question the participants if it was paramount for Saudi Arabia to promote and maintain its cultural authenticity as a tourist attraction site and destination. Forty-one strongly agreed, 28 agreed, ten remained neutral, nine disagreed, and 41 strongly disagreed.

Governance and Policy. Questioned about their awareness of sustainable tourism policies and regulations in the Saudi Arabian context, 51 respondents agreed, whereas 48 indicated they did not know. Further, respondents opined on their level of satisfaction concerning stakeholder engagement in formulating tourism policies in the

KSA. Twenty strongly agreed, and 33 agreed with the level of stakeholder engagement in formulating tourism-related policies. Twenty-four remained neutral, whereas 17 respondents disagreed and 20 strongly disagreed with the current level of stakeholder engagement in policy formulation. On the need to improve emergency response systems and advance communication channels to enhance tourists' safety during their visits to the KSA, 17 respondents strongly agreed, 35 agreed, 21 remained neutral, 18 disagreed, and 17 strongly disagreed.

Infrastructure and Resources. The research asked the participants if they highly rated the availability and quality of Saudi Arabian hotels located in the country's tourist sites after implementing the Vision 2030 goal. Sixteen respondents strongly agreed, 28 agreed, 26 remained neutral, 17 disagreed, and 16 strongly disagreed. On their satisfaction with the existing transportation networks in the country's tourist attraction destinations, 17 respondents were strongly satisfied, 29 were satisfied, 15 remained neutral, 19 were dissatisfied, and 17 were strongly dissatisfied. The participants also opined on the availability of a skilled workforce in the Saudi Arabian tourism industry. 18 strongly agreed, 28 agreed, 24 remained neutral, 22 disagreed, and 18 strongly disagreed that the country's tourism sector lacks skilled personnel.

Respondent Profile:

The responses regarding if the participants were extremely satisfied with their general tourism experience in Saudi Arabia show that 18 strongly agreed, 33 agreed, 22 remained neutral, 16 disagreed, and 18 strongly disagreed. On whether Saudi Arabia's tourist destinations presented the respondents with authentic cultural experiences, 21 respondents strongly agreed, and 31 agreed. However, 12 disagreed, 21 strongly disagreed, and 27 remained neutral. The study also asked the respondents if they felt that Saudi Arabian tourist destinations were extremely safe, and 41 respondents strongly agreed, with 17 agreeing. Contrariwise, 9 respondents disagreed, while 41 others strongly opined that Saudi Arabian tourist destinations are not extremely safe. In all cases, 22 respondents remained neutral on the matter.

Results

Measurement model:

This study utilized the destination development theory to investigate the impact of Vision 2030 on the Saudi tourism industry. The theory provided a framework for understanding the factors that influence the appeal and competitiveness of Saudi tourism destinations (Cavalheiro et al., 2020). It formed the basis for examining the socioeconomic impacts associated with tourism growth in Saudi Arabia. The conceptual framework was developed from six variables identified based on the destination development theory. The identified variables included Conservation and Preservation of Natural Resources (CPN); Economic Diversification Through Tourism (EDT); Empowerment and Inclusion of Local Communities (EILC); Alignment of Policies with Sustainable Tourism Principles (APST), Development and Maintenance of Tourism Infrastructure (DMTI); and Quality of Tourism Services and Hospitality (QTSH)

Construct Convergent reliability and Discriminant validity

The researcher examined the coherence between intended latent and observable variables using a construct reliability test. The composite reliability scores were in the 0.760-0.841 range, and the Cronbach's alpha value was in the 0.715-0.826 range. These results suggested reliable internal consistency. The mean values also indicated reliability robustness of reliability. Moreover, there was no collinearity due to minimal correlations in independent constructs. There were significant correlations between variables, indicating convergent validity. This result indicated the variables effectively represented Saudi tourism. In sum, the analysis suggested satisfactory discriminant validity in the model.

Table 16. Convergent Validity Results.

Construct	Code	α	CR	AVE	VIF
Conservation and Preservation of Natural Resources	CPN	0.82	0.84	0.658	0.9
Economic Diversification Through Tourism	EDT	0.78	0.82	0.585	1.42
Empowerment and Inclusion of Local Communities	EILC	0.81	0.56	1.563	0.77
Alignment Of Policies with Sustainable Tourism Principles	APST	0.77	0.81	0.564	1.56
Development And Maintenance of Tourism Infrastructure	DMTI	0.84	0.85	0.699	0.98
Quality Of Tourism Services and Hospitality	QTSH	0.77	0.8	0.556	1.5

NB: α = Cronbach's Alpha; VIF = Variance inflation factor; C.R. = Composite reliability; AVE = Average variance extracted.

Table 17. Discriminant Validity Results

	1	2	3	4	5	6
1. Conservation and Preservation of Natural Resources	0.770					
2. Economic Diversification Through Tourism	0.286	0.726				
3. Empowerment and Inclusion of Local Communities	0.266	0.467	0.714			
4. Alignment of Policies with Sustainable Tourism Principles	0.439	0.448	0.467	0.709		
5. Development and Maintenance of Tourism Infrastructure	0.197	0.153	0.200	0.302	0.725	
6. Quality of Tourism Services and Hospitality	0.289	0.140	0.143	0.421	0.231	0.681

Structure Model Evaluation

The impact of Saudi Vision 2030 pillars on the tourism industry was also measured using the Structural Equation model (SEM) and Confirmatory factor analysis (CFA). According to Moreno et al. (2014), SEM relates response patterns to a set of latent factors based on multivariate regression. The Vision 2030 pillars investigated in this study included Visitor Experience (VE), Environmental Sustainability (E.S.), Economic

Sustainability (ECOS), Social Sustainability (S.S.), Government and policy (G.P.), Infrastructure and Resources (I.R.), and Sustainable Tourism (S.T.). The goodness criteria and adjusted theoretical model were modelled using Lagrange and Wald tests.

Item Analysis

From the conceptualization of frameworks section in Chapter 2, the analysis involved dimensions measured using six variables. The table below shows an analysis of the participant's responses, including the means and the standard deviations. The deviations of the variables from the means are above 0.7357, with the highest record at 0.88912, showing discrimination in the variable indicators.

Table 18. Descriptive Statistics (From IBM SPSS 24)

		CPN		EDT		EILC		APST		DMTI		QTSH	
		Statistic	Std. Error	Statistic	Std. Error	Statistic	Std. Error	Statistic	Std. Error	Statistic	Std. Error	Statistic	Std. Error
Mean		2.44	0.07	2.50	0.08	2.52	0.08	2.62	0.09	2.84	0.09	2.53	0.09
95% Confidence Interval for Mean	2.30		2.33		2.36		2.44		2.67		2.35		
	2.59		2.66		2.67		2.79		3.02		2.70		
5% Trimmed Mean		2.43		2.48		2.49		2.58		2.82		2.52	
Median		2.25		2.50		2.50		2.50		3.00		2.33	
Variance		0.54		0.68		0.61		0.79		0.81		0.79	
Std. Deviation		0.74		0.82		0.78		0.89		0.90		0.89	
Minimum		1.00		1.00		1.00		1.00		1.00		1.00	
Maximum		4.25		4.75		4.75		5.00		5.00		4.33	
Range		3.25		3.75		3.75		4.00		4.00		3.33	
Interquartile Range		1.00		1.19		1.00		1.00		1.00		1.50	
Skewness		0.24	0.24	0.24	0.24	0.50	0.24	0.47	0.24	0.33	0.24	0.12	0.24
Kurtosis		-0.45	0.48	-0.45	0.48	-0.15	0.48	0.04	0.48	-0.14	0.48	-0.88	0.48

The skewness analysis on the variable indicators showed an abnormal distribution; the Kolmogorov-Smirnov skewness scores were all less than 0.05, implying statistical significance.

Table 19. Test for Normality

Variables	Kolmogorov-Smirnov ^a			Shapiro-Wilk

Confirmatory Factor Analysis using IBM SPSS 24 and AMOS.

A factor analysis of the questionnaire sought to improve the survey by employing its three structural model configurations based on a maximum likelihood criterion predicated on item multivariate normality criteria. In this analysis, each model was mediated by a set of adjustment indices, and theoretical framework modifications were generated from the analysis of the parameter estimation variations, residual values, and modification tests.

The chi-square value of the above model suggests that the model is a good fit for the data. Similarly, the normed chi-square value was 1.697, greater than 0.3. The RMSEA of the model was 0.131, which is greater than the desired value of less than 0.08, confirming the model's fitness. An improved model was tested, as shown below

Figure 8. Model 1: With Two Factors

Figure 9. An Improved Model of Test Model 2

In the model of Figure 10 above, two disturbances were added, and the estimates were measured. All the variances for the disturbances were statistically significant, with a covariance of 0.017. Moreover, the multivariate normality had an absolute value of 8.814, greater than 5, confirming the denormal in the multivariate data.

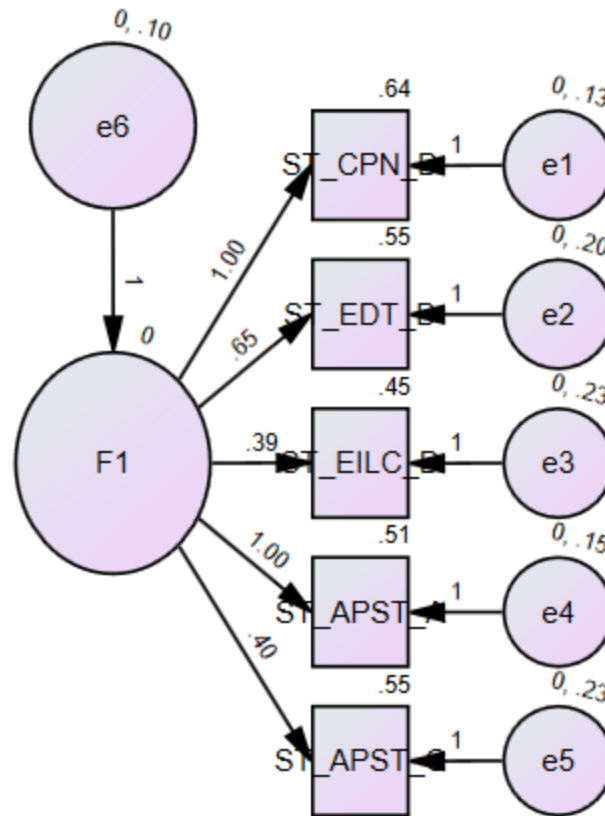

Figure 10. Improved the Dependent (Sustainable Tourism) Variable CF Analysis

In Figure 11, the dependent variable (vision 2030) model was tested, and the estimates show a chi-square value of 12.292 at a probability level of 0.031, implying the data fit the model well. In this analysis, the regression and standard regression weight values suggest that all the independent variables in the measurement of sustainable tourism had positive direct effects on sustainable tourism. In addition, the model fit of the data shows that there is no significant difference between the model and the underlying data in our assumptions.

The chi-square and normed chi-square values are 12.292 at a probability level of 0.031 and 2.458, respectively. The normed chi-square value is statistically insignificant and not greater than the recommended maximum value of 3, showing that the model does not violate our assumptions and is a good fit. In addition, the comparative fit statistics values, CFI, and Tucker-Lewis Index, TLI, in the baseline comparison table were found to be 0.803 and 0.408, respectively. These values are greater than the recommended minimum of 0.09, further indicating that our assumptions for the model fit have not been violated.

Sequential Equation Model (SEM) Analysis (Using IBM SPSS Amos).

The model in Figure 12 below was used in the analysis to determine the direct and indirect cause-effect of the factors.

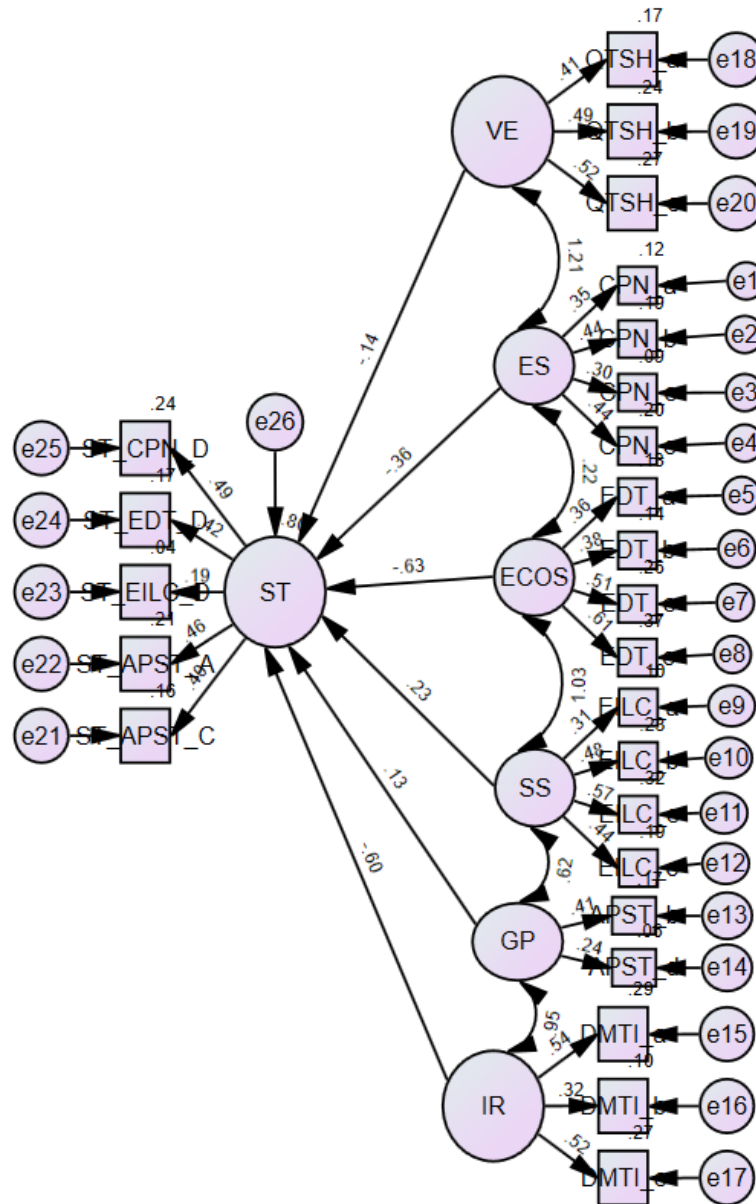

Figure 11. SEM Analysis

In the above path, the normality, estimates, and direct and indirect effects of the model were tested, and relevant values like regression weights, standardized regression, and model fit were determined. The chi-square and normed chi-square values were found to be 594.286 and 2.209, respectively. The normed value chi-square value is below the recommended value of 3, showing that there is no discrepancy with the underlying data. Therefore, the model is a good fit. Furthermore, the comparative fit statistics values, CFI, and Tucker-Lewis Index, TLI, in the baseline comparison table were found to be 0.277 and 0.126, respectively. These values are greater than the recommended minimum of 0.09, further indicating that our assumptions for the model fit have not been violated as shown in the below tables.

Table 23. SEM Model fit Summary

Discussion and Conclusion

This study sought to explore the strategies and initiatives taken by the KSA government to develop its tourism sector under Vision 2030 and the potential effects of these strategies on Saudi Arabians and the country's economy. The findings suggest that Saudi Arabians and tourists have seen sustainable practices by the Saudi government in various tourist destinations. 48% and 45% of the study participants indicated that they know the

Saudi government's efforts to protect and preserve its natural resources and waste management efforts in tourist scenes, respectively. Although some respondents remained neutral on the issues and another majority disagreed (33% and 31% for protecting natural resources and waste management), it is evident that the Saudi government has executed various strategies and practices to guarantee its environmental sustainability. It is a strategy to meet the tourists' changing consumption trends as they visit locations that value, protect, and conserve the environment.

Recently, tourists have become more environmentally conscious, opting to tour areas that conserve and preserve the environment. Grand and Wolff (2020) asserted that the NEOM project would become a successful venture for the Saudi Arabian tourism sector because it prioritizes environmental protection using innovative means. This explains why environmental sustainability is one of the key pillars of Saudi Arabia's Vision 2030 strategy. This study's findings validate the study's first hypothesis (H1) since current and potential tourists view Saudi Arabia as an environmentally responsible and attractive place, prompting them to visit it.

The study investigated the impact of Vision 2030 on the Saudi Arabian tourism sector's economic sustainability. 49% of the respondents stated that tourism has contributed greatly to the country's GDP, while 30% disagreed. 50% of the respondents affirmed that the tourism sector had increased the number of available employment opportunities after implementing Vision 2030, whereas 40% disagreed. The results suggest that tourism has contributed significantly to the country's economy. According to Albuhlul (2022), tourism contributes to the Saudi economy through foreign exchange, which helps stabilize the national currency. Moreover, tourism creates extensive job opportunities for the Saudi Arabian people. It directly employs people in hotels, transportation, and tour agencies and indirectly through stimulating other sectors, such as agriculture, handicrafts, and retail. The employees earn salaries and wages, improving the living standards while also earning the Saudi government revenues for developing its sectors. The development paints Saudi as a country that invests in its people and economic sectors. Consequently, more tourists will want to tour Saudi Arabia because the place has a conducive environment that favors the nourishment of economic development initiatives.

On the role of tourism in Saudi Arabia's social sustainability, the current study focused on cultural preservation, stakeholder engagement, and inclusivity. 54% of the respondents agreed that the country should maintain and promote its cultural authenticity to attract tourists. However, 39% refuted the stance. Shabir and Sharma (2019) averred that the Saudi Arabian government can increase the pride of its tourism sector by investing more in its culture. The investment would increase the people's pride in their cultures, making it an attractive feature for tourists to come and see.

Moreover, increased community engagement would increase tourists' experiences in the Saudi Arabian sites. Roxas et al. (2020) affirmed that engaging all stakeholders in governance was necessary to share tourism benefits effectively. It helps to determine the local communities' long-term interests concerning tourism. Further, there are situations where people view tourism as harming their ecological systems. Involving them in

the governance will help minimize the problems, for instance, investing in green technologies, increasing waste management, and advancing firm performances to meet locals' and tourists' expectations. Therefore, increased stakeholder engagement and cultural preservation initiatives increase the sector's value chain, increasing the likelihood of tourists visiting Saudi Arabian tourist sceneries.

The study findings validate hypothesis (H3) that tourists will likely visit places that promote social sustainability. Su et al. (2020) established that when tourists positively attribute a location's social responsibility to their intrinsic motives, they increase their trust in the region, increasing their likelihood of visiting it. As tourists view Saudi tourist destinations as culturally authentic and value the festivities of its locals, they will trust the place to offer them the best experiences. Therefore, increased participation of locals in tourist activities and policy implementation increases the country's tourism sector, helping it attain its Vision 2030 tourism goals.

Sustainable governance and policing are critical to the success of any country's tourism sector. 51 respondents indicated that they know the country has implemented and adheres to these policies and regulations, while 48 were unaware. 46% of the respondents were also satisfied with stakeholder engagement in formulating tourism-related policies, while 34% were not. The responses show that tourists and locals see the impact of the Vision 2030 strategic plan through stakeholder engagement in developing tourism policies, regulations, and security measures. Iswan et al. (2021) argued that Vision 2030 improved Saudi Arabia's tourism sector by introducing tough regulations that have increased its offerings, minimized pollution, increased infrastructural development, and promoted tourism. The policies have increased security measures and emergency systems in the tourist sceneries, making them safe for tourists and other stakeholders' operationalization to give them the best experiences. Thus, these findings justify H4, which held that tourists are likely to visit Saudi Arabia because the country is safe, secure, and with effective regulations.

The investigation findings show that more respondents (48%) were extremely satisfied with their tourism experiences in Saudi Arabia. Engagement in environmental sustainability initiatives, proper infrastructures, safety measures, skilled workforce, and local community participation in festivities increased the clients' experiences. Arslan (2020) argued that there is a high likelihood for satisfied customers to become loyal and long-term customers. Since the tourism industry is highly competitive globally, satisfying the tourists' needs puts Saudi Arabia at the forefront when tourists think of a place to tour next time. Consequently, the country will have a large and loyal tourism database.

The study also focused on the impact of Vision 2030 on the tourist destinations' infrastructure and resources. 43% of the respondents highly rate the availability and quality of hotels and accommodations in tourist destinations. Al- Almathami and Mair' (2023) noted that after implementing the Vision 2030 strategic plan, several world-class hotels extended their operations into the Saudi market, offering five-star hospitality facilities and services that meet and exceed the expectations of global tourists seeking high-quality accommodation and hotel services. As these potential clients know that there are hotel and accommodation facilities that will effectively cater to their needs, their likelihood of visiting Saudi tourism destinations increases, justifying the

study's hypothesis (H5). Further, 48% of the respondents were satisfied with the transportation networks in various tourist destinations, whereas another 38% were dissatisfied. Most respondents noted that the country had developed its transport and communication networks to facilitate easy and effective movement of tourists in, around, and out of their destinations. Kozak and Buhalis (2019) established that better transportation networks improve connectivity, accessibility, time efficiency, and tour packages and support local economies, bolstering tourism. Robust transport networks, including roads, railways, and airports, allow tourists to connect from one place to another and visit multiple destinations during their Saudi trip. It also enables them to discover new and lesser-known tourist destinations, enabling the country to spread tourism benefits beyond the well-known sites and cities. Therefore, Vision 2030's rapid development of infrastructure and other resources is bound to increase the number of tourists visiting Saudi Arabia because of the increased availability of high-quality infrastructure.

Conclusion

The study aimed to investigate the effects of Vision 2030 on the Saudi Arabian tourism sector. The findings suggest that the strategic plan has promoted environmental sustainability in the tourism sector. Saudi Arabians and tourists have encountered various operations to protect and preserve the country's natural resources, manage wastes, and reduce water and energy utilized for various tourism activities. They showed that Vision 2030 had enhanced the country's economic sustainability by contributing significantly to its GDP, increasing foreign exchange earnings, and increasing the available employment opportunities. Vision 2030 has also increased the number of local tourism businesses owned and operated by Saudi locals, their involvement in formulating tourism-related decisions, and their participation in cultural festivities. The research also confirmed that the Vision 2030 strategic plan developed the country's tourism infrastructure with high availability and quality hotels, transportation networks, and skilled personnel.

The study findings showed that Vision 2030 has transformed the Saudi Arabian tourism industry, making it more attractive for current and potential tourists. As more tourists become environmentally conscious, they will visit locations that protect and conserve the environment. As Saudi protects its natural resources, reduces its water and energy consumption, and implements waste management activities under the Vision 2030 framework, it becomes more attractive for tourists to tour it for being environmentally friendly. With more tourists visiting Saudi Arabia, the country will generate more foreign currencies, stabilize its currency, create more employment opportunities in the tourism sector and interconnected sectors, propel infrastructure and resource development, and increase the cultural authenticity of the Saudi Arabians. Consequently, Vision 2030 will make the Saudi tourism industry attractive to new tourists while retaining the current ones.

The findings of this study were important for policy-making in academia and the tourism sector. The study insights will help guide the current and future initiatives implemented by different Saudi Arabian tourism sector stakeholders. It will guide them in improving facets, such as safety measures, transport networks, waste management, and water and energy reduction. Further, the study adds insightful findings to the academic world. It adds to the pool of scholarly publications on the Saudi Arabian tourism industry, and the works can act as the

basis for future research works. The study's findings are crucial in guiding Saudi Arabian policymakers in enforcing appropriate tourism policies. The findings show how Vision 2030 has transformed the sector, exposing its strengths and opportunities that the stakeholders can exploit with the right amending of the strategic plan. Therefore, the current study adds valuable information to revolutionizing the Saudi Arabian tourism sector by adhering to and modifying the Vision 2030 framework.

Recommendations

Tourism is a viable alternative as Saudi Arabia seeks to diversify its economy away from the oil industry. With the right tuning of the Vision 2030 tourism initiatives, the industry can soar and help the country attain this socioeconomic step. Based on the research findings, the study proposes the following recommendations:

Advancing natural resource preservation and protection initiatives in the country's tourist destinations. These efforts will include engaging all the stakeholders, including the community members, to ensure that the natural resources remain safe and secure to attract tourists.

Implementation and execution of water and energy reduction measures for tourism businesses and destinations. Water is scarce, making it a significant environmental challenge in the country, mandating tourism businesses to use it efficiently to minimize its negative environmental impact. Since the tourism industry is energy-intensive and the Saudi Arabian one relies on non-renewable energy sources, cutting its usage will minimize its carbon footprint and increase its environmental stewardship in the region.

Adopting effective waste management practices in various Saudi Arabian tourist destinations. These practices include source segregation, installing recyclable and non-recyclable waste bins, recycling initiatives, minimizing single-use plastics, waste audits, and public awareness campaigns. The measures guarantee environmental protection and sustainability, making its sites more appealing to tourists.

Implementing effective safety measures will guarantee the tourists' safety in various destinations. It will entail measures such as robust security and policing in hotels, accommodations, and public spaces, assuring them of security and deterring potential criminal activities, installing effective response systems; establishing tourist information centers and safe transportation options.

Encouraging the local people to participate in tourism-related festivities through local artisans, cultural workshops and demonstrations, community-backed event planning, and holding cultural festivals in rural areas.

Maintaining and promoting authentic Saudi Arabian cultures through preserving the country's historic sites, promoting cultural events and festivities, emphasizing traditional arts and cuisines, developing cultural heritage museums and interpretation centers, and using traditional performers in modern tourist destinations. The endeavors will ensure that Saudi Arabia offers its tourists genuine and immersive experiences while

safeguarding its culture for future generations.

Future Work

This study investigates the impact of Saudi Arabia's Vision 2030 pillars on the tourism industry. Future research should explore the reason for inconclusive results on the impact of increased stakeholder engagement on tourism policies and the role of skilled personnel in boosting tourism activities in the Saudi Arabian market. The studies should focus on the significance of implementing education and career development initiatives to increase the availability of skilled tourism personnel and its impact on tourism productivity within the Vision 2030 strategic plan. It is significant to focus on education and career as education is another critical aspect in the strategic plan and its effect on other economic sectors, in this context, tourism. Additionally, future research should focus on the impact of stakeholder engagement levels and their influence on tourist experiences and policies governing the industry. The research initiative will establish the impact of the local community's involvement in tourism activities and tourists' overall experiences. These works will provide the insights and fundamentals for additional research to boost and develop the Saudi Arabian tourism industry globally.

Abstract: Large Language Model (LLM) Functionalities, such as Chat Generative Pre-Trained Transformer (ChatGPT), are a form of artificial intelligence (AI) that have the ability to produce human-like writing in response to a wide array of input. As this technology has become a staple of everyday life, many educators find themselves rapidly redefining best assessment practices regarding this new area of potential plagiarism. As it becomes increasingly difficult to discern between well-written assignments produced by students and those that have been generated by AI, educators may turn to AI-detection programs to determine whether work submitted by students is in fact their own. However, these programs notoriously return a high rate of false detection of AI-generated text. This phenomenon leads to the increased likelihood that students will be unfairly academically penalized. In this study, hand-written examinations for a university-level introductory academic writing class were submitted to different AI-detection programs. Results indicate an association between higher exam grades and greater false detection of AI-generated writing. These results suggest that educators must carefully consider the benefits of such programs when assessing students' work.

Keywords: Education, Assessment, ChatGPT, Artificial intelligence, writing, AI writing detection

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 573-586), Antalya, Turkiye. ISTES.

Introduction

In November of 2022, Microsoft's OpenAI released a program that would forever change the way that individuals are able to produce a wide range of AI-generated outputs. This program was a Large Language Model (LLM) known as a Generative Pre-Trained Transformer (ChatGPT) (Lo, 2023). In addition to the production of other forms of AI-generated output, this program is well known for its ability to deliver text that strongly replicates that of human-generated text. Large Language Models, such as ChatGPT, are trained on an incredibly vast array of text data. As a result, they are currently able to respond to queries, provide translations, generate computer coding, and generate human-like writing (Kasneci, 2023). Currently, ChatGPT is able to produce responses to human-initiated prompts that are accurate, informative, and both lexically and semantically coherent in a wide variety of languages and genres (Lo, 2023). Generative AI has become extremely easy to access and use due to free programs online. ChatGPT and others like it develop the ability to produce human-like output by learning from both written content available online and AI-generated output of both their own and other programs. Using advanced natural language processing techniques, these programs analyze existing text to generate original output that is similar in style and content to what is present in its training dataset. As such, these programs must be trained on a large dataset of text to have the ability to produce more diverse outputs. They often use machine learning to refine production through the analysis of their own output. That is, the more users interact with a text-generative AI program, the more opportunities the program has to refine its output as it continually develops and learns (Sadasivan et al., 2023). In essence, the more a user engages with an AI-text generative program, the better the program becomes at predicting the type of output the user requires.

When used ethically, these programs can prove to be an excellent educational tool for learning academic writing skills. They may be used as a prompt to assist students in writing assignments when facing writer's block or to provide automatic, instantaneous feedback regarding both factual and grammatical accuracy. Such features may be of particular use to students learning English as a foreign language. These programs can also be used to create study guides via prompts to summarize chapters of books or slides (AlAfnan et al., 2023; Athanassopoulos et al., 2023; Baskara, 2023; Barrot, 2023; Beck & Levine, 2023; Cotton et al., 2023; Hong, 2023; Huang & Fryer, 2022; Imran & Almusharraf, 2023; Yan, 2023). However, with the recent proliferation of free AI-text generative programs, many instructors are now faced with questions regarding appropriate assessment methods. Tools such as SafeAssign and Turnitin have long existed to detect plagiarism as applied to the submission of work taken directly from online or previously submitted sources (e.g., Chandere et al., 2021). Yet, fewer options exist for the detection of AI-generated written submissions (e.g., Sadasivan et al., 2024). When applied to the level of higher education, this situation is of particular concern to instructors of written composition courses. Instructors of such courses are responsible for ensuring that students are able to produce written work that not only consists of correct orthography and grammatical structure but also is lexically and structurally cohesive in a variety of genera. It is essential that students in academic writing courses develop the skills needed to succeed when writing in their subsequent university courses. As such, introductory-level academic writing instructors are entrusted with the task of guiding students through the process of developing

the essential components of all academic essays (e.g., introduction, body, and conclusion sections), lexical flow, reducing syntactic ambiguity, and the use of appropriate transitions between paragraphs and sections of written compositions (Al-Jarf, 2022). These skills must be concurrently taught in a manner that applies to a variety of genres to better facilitate students' abilities to transfer the skills learned in one writing assignment to subsequent tasks.

Instructors of academic writing courses for English as a foreign language (EFL) students in English-medium universities may also be tasked with similarly advanced responsibilities regarding the instruction of this form of writing. However, there are unique challenges faced by EFL writing instructors. Chief among these is that of negative language transfer, also known as language interference. Diab (1996) described the phenomenon of language interference as the detrimental role that the innate knowledge of one's native language has on the ability to learn a second or foreign language. Differences between the morphosyntactic, orthographic, and phonological structures of English and a student's native language may lead to unique errors not found in the writing of native English speakers (Alkhudiry & Al-Ahad, 2020; Daqar, 2018; Daumiller & Janke, 2020; Diab, 1996; Elhadary, 2023; Khatter et al., 2019; Scott & Tucker, 1974). Word choice can also be problematic for EFL writers due to both direct translations from the native language as well as potentially limited vocabulary size (Zahiroh, 2021). Students may also vary vastly in their English-language writing competence. These differences may be dependent upon factors such as the age of first exposure to English and the age at which students were first taught to write paragraphs in English (Waked et al., 2023). Instructors may be unaware of which students have had greater opportunities to develop their English-language writing skills relative to their classmates. In such a situation, it may become difficult to differentiate the work of students from high-experience English-language backgrounds from that of lower-experience backgrounds who may have submitted AI-generated work rather than their own written compositions.

There are numerous reasons why students may elect to submit AI-generated output rather than their own writing. One of the most likely reasons may be the accessibility of these programs. Such easy access to AI-text generative programs may increase the temptation for EFL university students to engage in this form of plagiarism. In addition to the pressure of perceived time constraints felt by many university students (Wolters et al., 2021), the use of these programs may in part be due to the unique forms of writing anxiety experienced by different EFL populations. Anxiety regarding the fear of poor assessment and poor self-perception of one's own proficiency may be of particular concern to EFL university students, such as those who are native speakers of Arabic studied by Waked et al. (2023). Participants in this study showed both assessment and proficiency anxiety, meaning that they experienced acute concerns about their English-language writing ability as well as apprehension regarding assessment. When students elect to engage in plagiarism via the submission of AI-generated text, they are likely able to avoid these forms of writing anxiety.

An additional incentive to using AI-generated text rather than one's own work is the fact that writing itself is an extremely difficult task. Even in one's native language, writing is in many ways one of the most difficult of the four language competencies (speaking, listening, reading, and writing) due to its comparatively heavy demand

on cognitive skills (Johnson, 2017). As such, writing assignments become particularly vulnerable to avoidant behavior, such as plagiarism (Cheng, 2024). Writing is heavily dependent on working memory, the aspect of memory responsible for retrieving items from long-term memory or the immediate environment and allowing conscious accessibility long enough for these items to be manipulated and used (e.g., Vasylets & Martin, 2021). As such, writing is an incredibly demanding task. Writing is best learned through the process of producing an initial composition, receiving corrections, revising the work, and repeating this cycle. Given the amount of time and effort needed to develop this skill, the option to submit AI-generated output may be especially appealing to EFL students who have had fewer opportunities to work with the English language prior to beginning their university career. These students face considerable challenges in producing English-language written work relative to classmates with greater English-language experience. Large-classroom environments and classes that are restricted in the number of weekly meetings may lend themselves to creating an environment in which students may be able to successfully submit compositions that are in fact AI-generated output. In such classes, it may not be possible for instructors to review students' work from the beginning of the composition process, thus avoiding the revision cycle required for developing the complex skills involved in writing. This instructional limitation makes instructors less likely to successfully identify whether final submissions reflect earlier drafts of said work (Berrett, 2012; Rudolph et al., 2023).

Undoubtedly, text-generative AI programs offer students the opportunity to complete writing assignments using output that is nearly indistinguishable from human-generated text. To counteract this phenomenon, programs have been developed to detect such text. AI-detection programs often employ a method of machine learning that is similar to the training methods of AI-text-generating programs to detect plagiarized work. AI detection training data vary between programs, but typically datasets contain both human- and AI-generated text. Programs are trained to detect specific differences between these two types of data sets. Two primary characteristics that AI detectors are trained to detect are "perplexity" and "burstiness." Perplexity refers to how complex and unpredictable text is. Vocabulary selection in AI-generated text tends to have high predictability and is relatively limited in the number of items used. In comparison, human-generated text tends to offer more variability in the number and type of words used. The second main characteristic of AI-generated writing that detection programs are trained to perceive is "burstiness." This refers to how varied sentences are in both length and structure. Human-generated writing tends to show greater variability in both of these areas whereas AI-generated text often shows a steady pattern of similar sentence length and structure (Leechuy, 2024).

While AI-detection programs serve an important purpose, there is no guarantee of accuracy in their actual ability to discern between human- and AI-generated text. AI-detection programs test the probability that an item is generated by AI based on specific features. However, different programs often return different results when presented with the same text. One reason for this lack of reliability is that no two AI-detection programs are trained using the same dataset. Although the size of these datasets is often comparable, their content is selected by the individuals who develop these programs. Additionally, some programs are trained primarily on either human-generated writing or AI-generated output while others are trained on a relatively equal combination of the two (Sadasivan, 2023). As such, the predicted likelihood of AI generation of any submitted text may vary

from 10% when using one program to over 70% when using another. Given the fact that perplexity and burstiness are the primary features these programs are trained to detect, students who complete concise and well-structured academic writing may be particularly vulnerable to false detection of AI-generated writing, and hence, become more likely to face undeserved negative consequences.

Because academic writing is often required to be concise and only include content that is directly relevant to the task at hand, the likelihood of predictability in the vocabulary used increases. Additionally, sentences remain relatively homogenous in both structure and length due to the format required by many academic courses. Since AI-detection programs are trained to detect these features as non-human writing, students who have worked the hardest and produced work that is most in line with the requirements of an assignment may be the most at risk for falling victim to false detection. Essentially, students face a higher risk of punishment when completing an academic writing task successfully.

Due to the high likelihood of inaccuracy in the detection of AI-generated writing, this study examined the false detection rate of AI-generated output on the handwritten final exams of 90 EFL students in four sections of an introductory-level academic writing class. Participants were all female EFL learners taught by the same instructor to ensure the comparability of the results earned in the handwritten final examination. Students attended a university in Saudi Arabia that follows an American curriculum with student-centered pedagogy. In the extant literature, the most often studied population is introductory/beginning-level EFL learners. The population of the present study is rather unique in that all members had been judged to be moderate to proficient English-language users, as assessed by the International English Language System (IELTS) exam.

Handwritten writing samples were separated into three categories, each consisting of thirty exams. Categories included high-scoring, median-scoring, and low-scoring examinations. Exams were digitized and entered into seven free online AI-detection programs. These programs were selected as they are both readily accessible to instructors and/or have been reviewed in empirical studies (Akram, 2023; Weber-Wulff et al., 2023). A repeated measure analysis of variance (ANOVA) was used to determine if differences exist between the false positive rates of these three categories of exams when entered into the selected AI-detection programs.

This study seeks to answer the following questions:

- 1) Is the handwritten writing of EFL university-level students subject to false detection of AI generation by the selected AI-detection programs?
- 2) Is there a difference in the false detection rate of AI generation in the handwritten work of EFL students based on the instructor-generated grades of the writing samples?

The following hypotheses are tested:

- 1) Most, if not all, of the handwritten work submitted to the selected AI-generation detection programs will be judged to be AI-generated output by the selected AI-detection programs.
- 2) The writing samples of students who earned the highest grades on the handwritten final exams will be judged to have a higher percentage likelihood of consisting of AI-generated output than those whose

work falls into the median- and low-scoring categories.

Method

Sample and Sampling

Participants included 90 freshmen EFL students who were native speakers of Arabic. These students were enrolled in one of four sections of an academic writing course. Participants ages ranged from 18 to 25 years. To enroll in the course, students were required to have obtained a total IELTS exam score of at least 6.0 and a 5.5 writing score (range: 0-9). As such, the selected participants included EFL learners who were classified as ranging from modest to competent users of the English language. The course aimed to offer freshmen practice with academic English writing by offering training leading to compositions in four genera that are clear, concise, and semantically, syntactically, and structurally accurate. The sample included only students who provided informed consent.

Our study took place in the Fall semester of 2023. As ChatGPT had only recently been released in the preceding November, this was the first semester in which plagiarism via the submission of AI-generated output became a concern for instructors (Lo, 2023). Participants in this study were enrolled in one of four sections taught by the same instructor with 17 years of university-level teaching experience. The instructor was bilingual in English and Arabic and had been exposed to both languages since birth. Institutional records suggest that the student samples in these four semesters were demographically similar, including the number of hours in which they were enrolled and their academic level (first-semester freshmen).

Writing samples were taken from the final exams of the introductory academic writing course in which students were enrolled. As noted above, this course was dedicated to teaching essay writing in four academic genres. The course began by focusing students' attention on the form and structure of the three primary sections of a standard English-language five-paragraph essay (the introduction paragraph, body paragraphs, and the conclusion paragraph) as well as explicit instruction on morphosyntactic rules that differ between writing in English and writing in Modern Standard Arabic (MSA). MSA is the primary language of instruction used in most schools attended by participants in this study and differs in many ways from the written structure of academic English (Alkhudiry & Al-Ahad, 2020; Daqar, 2018; Daumiller & Janke, 2020; Diab, 1996; Elhadary, 2023; Khatter et al., 2019; Scott & Tucker, 1974). The course assessment focused on the production of four essays in the genres of descriptive, compare and contrast, argumentative, and informative. A midterm exam was given following the completion of the second essay and a final exam was given at the end of the semester following the completion of all four essays. Both the midterm and final exams were handwritten and consisted of an essay writing portion that was worth 2/3 of the total grade and a section testing students' general knowledge of essential aspects of academic writing worth 1/3 of the total exam grade. The essay writing portion of the final exam was included in the present study. Samples were selected based on the grade earned on this section alone rather than the overall final exam grade.

Materials and Procedure

The handwritten final exam consisted of two portions that were completed over a period of two hours. The first of these consisted of writing three paragraphs of an argumentative essay: an introduction, an appropriate final body paragraph, and a conclusion. All students were given similar writing prompts, “Should children under the age of 13 years be allowed to use [Social Media Platform]?” The platforms selected for the different examinations were Snapchat, X (formerly known as Twitter), Twitch, and TikTok. This portion of the exam was scored out of 10 points and was used to judge both eligibility for and categorization within this study. The second portion of the exam consisted of multiple choice and true/false questions related to APA 7 style citations and various categories of academic sources. This section was not included in the current study. Exams were completed with all personal items removed from students and placed in an isolated area of the examination room. Two proctors ensured that students did not use any hidden electronic devices to complete their work.

Of the 132 completed exams across the four sections, 90 were selected for inclusion in this study. Exams were selected based on the grade earned on the writing portion of this exam. Exams were separated into three categories consisting of the highest 30 grades (90%-100%), the lowest 30 grades (5%-50%), and 30 exams of median-scoring grades (60%-82.5%). These handwritten exams were then manually digitized with all spelling and grammatical errors unedited. Seven free, online AI-detection programs were selected to examine these originally handwritten writing samples due to their ease of accessibility and/or their having been reviewed in empirical research (Akram, 2023; Weber-Wulff et al., 2023). As such, these programs would be likely available to and known by instructors. The programs included in this study can be found in Table 1.

Table 1: AI-Detection programs included in this study

Program	Training Material	Scoring Method	Interprets Score	Highlights AI-Generation
Zerogpt	Both human and AI-generated	Percentage likelihood of AI generation	Yes	Yes
Content at Scale	Both human and AI-generated	Percentage likelihood of AI generation	No	No
ChatGPT	Both human and AI-generated	Yes/No Binary Response	No	No
Scribbr	Both human and AI-generated	Percentage likelihood of AI generation	Yes	Yes
DetectBard	Both human and AI-generated	Percentage likelihood of AI generation	Yes	Yes
Contentdetector.ai	Both human and AI-generated	Percentage likelihood of AI generation	Yes	Yes
Detecting-AI.com	Both human and AI-generated	Percentage likelihood of AI generation	Yes	Yes

Although ChatGPT once served as a popular means of detection via the simple prompt, “Did you write this?”, it can no longer be used as a source of detection. Whereas output to this query previously included any segments that resembled previous output by the program, ChapGPT now only provides an affirmative response if the submitted text exactly matches an output that it has previously generated. Thus, even if a student has used ChatGPT-generated text to complete an assignment, ChatGPT will provide a negative response if his/her work has been slightly modified. As such, ChapGPT returned null findings for all submitted text and was not included in the calculations detailed in the following section.

Data Analysis and Results

Digitized versions of the 90 handwritten writing samples were entered into the six AI-detection programs selected for this study. All but one program reported the likelihood that the text was AI-generated in the form of a percentage. The program, Content at Scale, rated text by how “robotic” text appeared. The extent to which this program judged a given text to be robotic in nature was converted into a numerical scale with ‘human sounding’ as 1, ‘robotic sounding’ as 2, and ‘very robotic sounding’ as 3. Prior to conducting any analyses, all percentage detection scores were converted to rationalized arcsine units (RAU) to reduce the risk of violating the assumption of normalcy required for inferential statistics. Following this transformation, a repeated measures analysis of variance (ANOVA) was conducted with ‘group’ as the between-subjects factor.

As shown in Table 2, pairwise comparisons in a repeated measures analysis of variance (ANOVA) showed a significant difference between the mean percentage false detection of the high-scoring group and that of both the mid-range- and low-scoring groups. No significant difference was found between the mid-range- and low-scoring groups. This indicates that EFL students who are more proficient in the skills required for academic writing are more likely to be unfairly penalized when instructors use AI detection software as a measure of potential plagiarism.

Table 2: Pairwise comparisons of the average AI-detection of the high- median- and low-scoring groups

Group	Comparison Group	Mean Difference	Significance
1	2	0.045*	0.035
	3	0.057*	0.006
2	1	-0.045*	-0.035
	3	0.012	0.544
3	1	-0.057*	0.006
	2	-0.012	0.544

Discussion

This study examined the effectiveness of programs designed to detect the likelihood of AI-generated text. To do so, we submitted 90 handwritten final exams completed by EFL learners to six AI-detection programs. Results can be summarized into two points: First, all programs report detection of AI-generated text for some or all of the originally handwritten inputs. Second, samples belonging to the high-scoring group were rated as significantly higher in the probability of AI-generation than both the median- and low-scoring groups. The latter finding leads to the high possibility that students may be penalized for higher performance through false accusations of plagiarism when instructors use the currently available AI-detection programs.

Originally, we hypothesized that most, if not all, of the handwritten work submitted to these programs would be falsely identified as AI-generated. This hypothesis was found to be true. Although not all samples were deemed

to have a high likelihood of having been AI-generated, almost all programs predicted to a certain degree that these handwritten samples could have been generated by AI. This outcome applied to even the lowest-scoring text sample, which earned a grade of just 5%. The fact that samples were identified as likely to be generated by a program rather than a person exemplifies the severe unreliability of these programs in differentiating between human and AI-generated writing.

In our study, we also hypothesized that samples belonging to the high-scoring group would be given a higher percentage likelihood of having been generated by AI than those belonging to the median- and low-scoring groups. Our hypothesis was supported as shown by pairwise comparisons in a repeated measures ANOVA. A significant difference was found between the high-scoring group and both the median- and low-scoring groups. However, no difference was found between the median- and low-scoring groups. This finding indicates that among the EFL students who participated in our study, those who excel in academic writing with final exam grades of 90% or higher are the most at risk for potentially falling prey to false accusations of plagiarism via the use of AI. As such, it is the students who are the most proficient academic writers who are most likely to face undeserved negative repercussions when instructors use the currently available programs to screen for AI-generated submissions.

Our findings are not surprising when the algorithms and training databases of AI-detection programs are critically examined. As AI-detection programs are trained to determine repetitive vocabulary and sentence structure, EFL learners with limited vocabulary are at a higher risk of false detection than their native English-speaking peers. In addition to having a larger vocabulary, native speakers of English may also have greater knowledge, familiarity, and comfort with varying sentence structures that can be used in academic writing. These differences in both perplexity and burstiness between the writing of EFL students and those of native English-speaking students are argued by Liang et al. (2023) as the primary causes of the disadvantages faced by EFL writers when their work is analyzed by AI-detection programs.

Conclusion

The advent of AI-generated text as a potential form of plagiarism is a new phenomenon in the educational sphere. Students and educators alike are still learning how to best use LLM functionalities in the world of academia. Such programs have the potential to serve as tools to enhance education in a myriad of ways. However, they also have the potential to be used unethically by students to bypass the need to complete written assignments. While instructors are aware that this new tool of plagiarism exists, reliable technology is not yet available that can accurately detect and address such instances of plagiarism.

Researchers agree that AI-detection programs are in their infancy and cannot be used as a reliable plagiarism-detection tool (Sadasivan et al., 2023). However, there is a developing body of research aiming to inform educators that programs claiming to accurately detect AI-generated text are not reliably effective. Educators thus

have the opportunity to better understand the limitations of these programs. Understanding AI-detection programs may be particularly useful to instructors of EFL writing courses whose students may be unfairly penalized as their academic writing improves.

Ignoring technological developments is not an option. Members of the education community are better served by acknowledging that generative AI is now a part of regular life and will only continue to develop in ways that may impact nearly all aspects of academia. Individual educators as well as administrators of academic institutions must continuously educate themselves on the ever-evolving fields of generative AI as well as on how technological developments may be both ethically used and abused by students. It is only by understanding both the features of AI-generated text as well as the limitations of AI-detection programs that students and educators will be able to work together to use AI in ways that are both ethical and beneficial to students.

Recommendations

This study raises several opportunities for future research. One topic that can be further explored is the role of the first language in EFL writing. For instance, MSA typically consists of long sentences written in a cyclical rather than linear pattern. Paragraphs in MSA are written in a format that native speakers of English may perceive to consist of only one sentence because the comma (,) in MSA serves in the role of the period (.) in English. As such, EFL classes for this population often explicitly stress the concise structure of sentences in the English language (Alkhudiry & Al-Ahad, 2020; Daqar, 2018; Daumiller & Janke, 2020; Diab, 1996; Elhadary, 2023; Khatter et al., 2019; Scott & Tucker, 1974). Instruction stressing brevity may impact the factor of burstiness of AI-detection programs in a way that is not found in the English-language writing of speakers with other first languages. The false alarm rates of AI-detection programs in native speakers of English also need further examination. Such studies are few in number, and even fewer explicitly examine the differences between the false error rates on passages written by native speakers of English and those written by EFL learners (e.g., Liang et al., 2023)

Future research may also analyze explicit metrics of written compositions that are both more and less likely to be subject to higher rates of false detection by AI-detection programs. Future studies may work to determine if factors such as the use of more abstract rather than concrete words and more complex rather than formulaic sentence structures are either more or less susceptible to false detection. Such analysis is possible through the TextEvaluator Tool made available through the Education Testing Service (Sheehan et al., 2014). In addition to these linguistic features, this tool allows for the analysis of numerous other factors associated with determining the complexity and quality of writing.

Another potential area of examination is the intrinsic nature of the students themselves. Factors such as self-efficacy and learning orientation may play a role in both their use of AI-text-generative programs as well as their motivation to learn to produce written products that include more perplexity and burstiness. Self-efficacy

refers to students' innate sense of control over their lives and life circumstances. Students with greater self-efficacy are more likely to be motivated to face difficult situations from the viewpoint that they are in control and can overcome them. Instead, students with lower self-efficacy are more likely to view such circumstances as out of their control. Thus, they are less likely to feel that they can work through difficult situations and succeed on their own merit (Pilotti, 2022). Additionally, learning orientation may play a great role in students' decision to succumb to the use of AI text-generation programs as an easier solution to completing written tasks. Students who approach education with a learning-orientation approach to education are more likely to work towards acquiring skills and knowledge. However, students with a grade-orientation approach to education may instead prefer to "take the easy way out" by using such programs (Meyer et al., 2019; Pilotti et al., 2022). With regards to EFL learners in particular, personal dispositions, such as higher self-efficacy and a learning-orientation approach to learning may be helpful. Such dispositions may lead EFL students to strive to produce work of increasing complexity and uniqueness. Whether the latter properties of their writing will make them more or less susceptible to false detection in future AI-detection programs will be a critical matter to be addressed by computer programmers and educators worldwide. Including more varied training samples from a variety of writers with differing languages and linguistic skills to the datasets on which AI-detection programs are trained may aid in curbing current and future false detection issues.

Abstract: This case study examined the transdisciplinarity and complementarity of a double degree program in undergraduate chemistry and computer engineering, based on the perspectives of its graduates. Semi-structured interviews were conducted with eighteen graduates to explore how well the program integrated both disciplines and prepared them for the job market. Thematic analysis of the interviews revealed that the double degree program fell short of seamlessly integrating the disciplines of chemistry and computer engineering despite its intention to unify them. Challenges, such as incoordination between the departments involved and the rigidity of the curriculum, contributed to a fragmented learning experience and hindered students from bridging the two disciplines. The limited job opportunities that required skills from both chemistry and computer engineering among graduates raised questions about the relevance of the double degree program in responding to industry needs. These findings can inform educators and administrators on how to develop curricula that transcend traditional disciplinary boundaries by providing insights into how the two disciplines can be integrated and applied to understand complex phenomena and address real-world issues. This study lays the groundwork for future research aimed at enhancing the effectiveness of double degree programs.

Keywords: Double degree, Transdisciplinarity, Complementarity, Chemistry, Computer engineering

Introduction

An increasing number of higher education institutions worldwide have offered double or dual degree programs to students (Pineda et al., 2022). This trend can be attributed to the massification of higher education, whereby educational institutions seek ways to differentiate themselves in order to attract and retain more students. With a diverse student population entering higher education, educational institutions are pressured to accommodate a growing number of students with transdisciplinary interests or career aspirations that cannot be fully met by conventional single degree programs (Pineda, 2024).

Double degree programs at the undergraduate level can offer students a unique and enriching educational experience by providing them with the opportunity to earn two equivalent degrees, either from the same higher education institution or from collaborating higher education institutions. The former model of a double degree program allows students to pursue two distinct majors or programs of study concurrently by integrating coursework from both programs in one higher education institution, while the latter model necessitates students to complete coursework and the requirements of two separate programs from different higher education institutions. Collaborating higher educational institutions in the latter model can be either local or international (Knight, 2011; Pineda, 2024; Russell et al., 2008).

Double degree programs inherently promote transdisciplinarity by integrating knowledge and methods from different disciplines, thereby preparing students to address complex issues at work and in society (Agarwal et al., 2023). In contrast to multidisciplinary that involves engaging in multiple disciplines simultaneously and interdisciplinarity that focuses on transferring concepts or methods from one discipline to another, transdisciplinarity seeks to unify knowledge from multiple disciplines to achieve a holistic understanding of complex phenomena and address real-world issues (Nicolescu, 2016; Udovychenko et al., 2022). Multidisciplinary and interdisciplinarity are still anchored in a specific discipline, whereas transdisciplinarity transcends disciplinary boundaries (Nicolescu, 2016).

Studies show that the extent to which the two disciplines are complementary or closely related in double degrees has influenced students to pursue such academic programs (Banares & Gascón, 2013). Double degrees can be complementary, based on their conceptual understanding, methodological approaches, and practical applications. Ensuring complementarity involves aligning curricula and academic standards to provide seamless and enriching educational experiences for students (Russell et al., 2008).

Students find double degree programs appealing to pursue because of their practical considerations, personal aspirations, and intellectual curiosity. They seek to maximize their opportunities for career advancement and financial stability, alleviating their concerns about the uncertain landscape of the job market and the perceived diminishing value of university credentials. These students view double degrees as a means of preparing to serve others effectively, whether through innovative solutions to societal challenges or meaningful contributions to their communities. They value the opportunity to satisfy their intellectual curiosity in exploring diverse fields of

study, recognizing that each degree offers unique insights and perspectives that can enrich their learning (Banares & Gascón, 2013; Haupt et al., 2021; Pineda et al., 2022).

Offering double degree programs can significantly enhance a higher education institution's competitiveness and reputation (Chan, 2012). By offering these programs, a higher education institution not only demonstrates responsiveness to the evolving needs of students and employers, but also shows innovativeness and flexibility in providing students with holistic educational experiences that can meet the demands of a changing workforce and address pressing issues in society (Michael & Balraj, 2003; Russell et al., 2008). Additionally, double degree programs often involve collaboration with other renowned higher education institutions, both domestically and internationally, which can increase the educational institution's visibility and prestige on local and global scales (Lysak, 2017).

Research suggests that students enrolled in double degree programs demonstrate higher academic performance and personal satisfaction than those enrolled in single degree programs (Chumney & Ragucci, 2006). Contributing factors include heightened motivation and engagement in learning, strategic management of workload, deeper understanding of concepts requiring a cross-disciplinary approach to learning, and perspective-taking from collaboration with peers from other disciplines. Specifically, students in double degree programs are often driven to excel in their coursework. Despite the demands of taking combined degrees, they tend to manage their time and tasks effectively through careful planning and organization. By studying two complementary disciplines, they can explore the intersection between different fields of study and apply insights from one discipline to another (An, 2015; Chumney & Ragucci, 2006; Haupt et al., 2021).

Graduates of double degree programs are better prepared to succeed in a rapidly changing world. They often have a competitive edge in the job market. By acquiring expertise in two complementary disciplines, these graduates possess a broader skill set and a transdisciplinary perspective, which makes them attractive candidates for a wide range of career opportunities. This breadth of skills allows them to adapt to various professional environments and to excel in diverse roles and industries. These graduates can identify connections and synthesize ideas across different fields, enabling them to approach complex challenges from multiple perspectives and to develop innovative solutions. Their ability to think creatively and holistically sets them apart in an interconnected world in which cross-disciplinary collaboration is increasingly valued (Haupt et al., 2021; Holtzman & Sifontis, 2014).

However, the effectiveness of double degree programs relies on institutional support and the structure of the academic degree (Russell et al., 2008). Their perceived advantages may also vary, depending on the specific combination of degrees and individual student perspectives (Ou et al., 2019). Although the motivation to offer these programs is clear, their impact on graduates requires further investigation (Lysak, 2017).

Hence, this study examined the transdisciplinarity and complementarity of a double degree program in

undergraduate chemistry and computer engineering, based on the perspectives of its graduates. The findings of this study can inform educators and administrators on how to develop curricula that transcend traditional disciplinary boundaries, by providing a deeper understanding of how knowledge from different fields can be integrated and applied to complex phenomena and real-world issues. Understanding the transdisciplinarity and complementarity of such a double degree program can provide insights that can promote educational innovation, advance new transdisciplinary fields, and prepare graduates to meet the demands of the rapidly evolving job market and address complex issues in society.

Method

Qualitative research was conducted in this study, as the nature of inquiry is historically situated, complex, multifaceted, relational, and subjective (Gaudet & Robert, 2018). Specifically, a case study design was chosen as a qualitative research approach to investigate “a phenomenon within its real-world context” based on a “retrospective analysis of a case” (Edmonds & Kennedy, 2017, p. 143). In examining the transdisciplinarity and complementarity of a double degree program as a phenomenon, this case study aimed to gather insights from the meanings that graduates assigned to their experiences of undergoing such an academic program.

Setting and Participants

This case study examined a double degree program in undergraduate chemistry and computer engineering at Ateneo de Manila University, a higher education institution in the capital of the Philippines. As a Catholic and Jesuit educational institution, Ateneo de Manila University aims to form individuals dedicated to service and social justice by fostering moral and intellectual virtues imbued with the Ignatian spirit. Through excellence in teaching, research, and community engagement, the university strives to cultivate an inclusive, diverse, and sustainable community that promotes the greater glory of God and greater service of mankind (Ateneo de Manila University, 2022).

After obtaining ethics approval to proceed with the research, this study recruited graduates of the double degree program in undergraduate chemistry and computer engineering at Ateneo de Manila University as study participants. Email messages were sent to the participants to request an interview. Twenty-four graduates indicated their willingness to participate in the study. One graduate (4%) belonged to the age group of 25 to 29 years old, five (21%) in the 30 to 34 years old, two (8%) in the 35 to 39 years old, three (13%) in the 40 to 44 years old, three (13%) in the 45 to 49 years old, four (17%) in the 50 to 54 years old, and one (4%) in the 55 to 59 years old. Fourteen (58%) of them were males, whereas ten (42%) were females. Bachelor's degree was the highest educational attainment of the eighteen graduates (75%) included in this study, master's degree for four graduates (17%), and doctoral degree for two graduates (8%).

Data Gathering

Semi-structured interviews were conducted to examine the impact of a double degree program in undergraduate chemistry and computer engineering, in terms of promoting transdisciplinarity and complementarity. Interviews are suitable for generating data through conversation (Leavy, 2023). This method of gathering data can extract rich data from the narrations of study participants regarding their lived experiences (Gaudet & Robert, 2018).

The interview guide contained the following questions:

- (1) Why did you pursue a double degree program?
- (2) What lifelong skills were you able to gain from your double degree?
- (3) How did your double degree affect your job opportunities?
- (4) How long should a double degree program be completed based on your experience? Why?
- (5) How would you re-imagine a double degree program in undergraduate chemistry and computer engineering?
- (6) Would you recommend a double degree to others? Why or why not?

When necessary, additional questions were asked to probe the responses of study participants. Transdisciplinarity and complementarity were not explicitly used as terms during the interviews so that unbiased responses could be elicited from the study participants. The interviews were conducted using videoconferencing and recorded with permission. Each recorded interview lasted approximately thirty minutes.

Data Analysis

Transcripts from the recorded interviews were subjected to thematic analysis to understand the impact of a double degree program in undergraduate chemistry and computer engineering on graduates with respect to promoting transdisciplinarity and complementarity. Thematic analysis involved reading and re-reading transcripts to familiarize us with the data. Initial thoughts were written as memos. Meaningful units of information were identified and codes were assigned. Similar and related codes were grouped together as part of searching for patterns and identifying themes. The initial themes were thereafter reviewed against the transcripts to ensure coherence. When inconsistencies were encountered, discrepant themes were revisited and revised accordingly. Finally, recurring themes were reported as emerging themes that could provide insight into the interview responses. To ensure the trustworthiness of thematic analysis, the steps undertaken include engaging in reflexivity, seeking feedback and input from peers, and maintaining an audit trail of the decision-making processes (Creswell & Poth, 2016; Leavy, 2023).

Findings

An undergraduate degree in chemistry focuses on theoretical concepts, standard laboratory procedures, and chemical instrumentation, which are relevant to analytical and synthetic chemistry. In contrast, an undergraduate degree in computer engineering covers foundational concepts in the basic sciences, mathematics, software, and

engineering. Currently, the undergraduate degree on chemistry can be completed within four years, while computer engineering takes four and a half years in the Philippines.

A double degree program in undergraduate chemistry and computer engineering was established in 1983 at the Ateneo de Manila University. Students earn their undergraduate degree in chemistry within four years of full-time study, and their undergraduate degree in computer engineering after an additional year. Based on official documents from the university, the program aims to train students to integrate computers into scientific instruments and support initiatives to develop low-cost homebuilt instruments. Initially, the program focused on microprocessors and digital logic, but has since evolved to include mathematics, engineering, and electronics with the introduction of more software courses. However, the double degree program was discontinued in 2017 as enrollment significantly decreased, along with other double degree programs offered by the university becoming more popular among enrollees.

Transdisciplinarity

Many interviewed graduates found a mismatch between the intended transdisciplinary goals of the double degree program and their actual experiences of undergoing such a program. Despite the initial vision of coupling chemistry with computer engineering to reinforce each other, most graduates did not perceive a seamless integration between the two fields. For instance, they noted that the program's initial intention to amplify chemistry through computer engineering, particularly in the context of instrumentation, was not effectively realized in practice. There was a lack of cohesion between chemistry and computer engineering concepts, leading to a sense of learning each discipline in isolation. This mismatch suggests a disconnect between the program's design and implementation, raising questions about the effectiveness of unifying knowledge from different disciplines.

Most of the interviewed graduates felt that they were learning chemistry and computer engineering as separate entities rather than as integrated components of a transdisciplinary program. They expressed difficulties in bridging concepts between the two disciplines, particularly in the courses taught by different departments. The lack of alignment and coordination between departments offering chemistry and computer engineering courses hindered students from perceiving the interconnectedness between the two fields and gave them a fragmented learning experience. This disjointed approach could be attributed to factors, such as the lack of coherence in course design and the compartmentalization of courses taught by different departments.

The structure of the double degree program, including curricular constraints and limited elective options, also influenced the extent of transdisciplinarity experienced by students. Graduates pointed out that the predetermined courses that were geared towards supporting their second degree in computer engineering restricted their flexibility in choosing electives that aligned with their interests in chemistry. This curricular rigidity contributed to a sense of compartmentalization between the two disciplines, further limiting transdisciplinary learning experiences.

Additionally, the interviews revealed the limited application of their double degree in the job market, particularly in the Philippines. Despite the program's emphasis on instrumentation and integration of chemistry with computer engineering, job opportunities that necessitated both skill sets were scarce. While some graduates felt that their double degree provided them with a competitive edge and broader skill set, others questioned the relevance and use of certain aspects of the program, particularly in relation to their professional roles and responsibilities. This limited demand for transdisciplinary expertise reinforced the perception among graduates that they could pursue careers in either chemistry or computer engineering independently, rather than leveraging both disciplines simultaneously.

Despite the challenges and limitations encountered, several graduates identified opportunities for skill development in the chemistry and computer engineering components of the program. While the chemistry program of study provided a strong foundation in analytical thinking and problem-solving, the computer engineering program of study offered practical skills in instrumentation and programming. These graduates recognized the value of both skill sets in their career paths, albeit often in separate domains.

Furthermore, some graduates brought up instances where their double degree program facilitated transdisciplinary learning, particularly in the realm of instrumentation. Those who pursued careers in areas, such as IT consulting and software development, realized the importance of computer engineering applications in chemistry. They found that their specialization in both chemistry and computer engineering provided them with an advantage and allowed them to bridge the gap between their learning and practical application.

Complementarity

One aspect of complementarity lies in the alignment of curricula and academic standards in chemistry and computer engineering. Given this, most graduates expressed concerns about the lack of coherence in the curriculum, particularly in the connection between chemistry and computer engineering courses. This disconnect is evident in the emphasis placed on instrumentation within computer engineering, which some graduates felt was overshadowed by the broader scope of chemistry.

Complementarity involves the application of knowledge and skills from one discipline to enhance the understanding and practice of another. The focus of the double degree program was predominantly on instrumentation as part of strengthening the discipline of chemistry through computer engineering and leveraging the disciplinary rigor of chemistry to excel in computer engineering. While the program aimed to capitalize on the disciplinary strengths of chemistry and computer engineering, the extent to which complementarity was achieved in terms of skill acquisition and expertise appears to be limited. Only a few graduates perceived this emphasis on instrumentation as enhancing their understanding or application of both disciplines.

The ultimate test of complementarity is the extent to which the double degree program prepares students for successful career and professional development. While some graduates attributed their career opportunities to the complementary nature of the program, others questioned the relevance of their double degree in the job market. The perceived value of the program varied among graduates, with some highlighting the benefits of having expertise in both chemistry and computer engineering, while others questioned the practical use of their double degree in their chosen career paths. These mixed perspectives emphasize the complexity of achieving complementarity in terms of career readiness and professional outcomes.

While some graduates attributed their job opportunities to the complementarity of chemistry and computer engineering, others found that their career paths were influenced by the broader education and prestige of the university. They credited their career prospects and achievements to the critical thinking and problem-solving skills fostered by their university, rather than the degrees they earned. Although the double degree program may not have fully achieved its aim of complementarity, the broader educational environment at the university played a role in shaping the graduates' professional development and versatility in the job market.

Discussion

Graduates from the double degree program commented on the discrepancy between the intended transdisciplinary and complementary goals of their academic program and their actual experiences. They reported limited integration between undergraduate chemistry and computer engineering, which made it challenging for them to bridge concepts between the two disciplines when they were students. This lack of cohesion is attributed to insufficient coordination and alignment between departments offering courses in chemistry and computer engineering. Without effective coordination and support, students may find it difficult to integrate knowledge from combined degrees and navigate the complexities of transdisciplinary and complementary learning (Pineda, 2024; Russell et al., 2008). Such difficulties can lead to disillusionment among double degree students (Ou et al., 2019). Noticeably, the recurrence of this problem across various academic settings suggests that the challenges encountered are more knowledge-based than administrative (Pineda, 2024). These challenges often fall outside the traditional disciplinary organization of higher education (Russell et al., 2008).

This study showed that the structure of the double degree program led to a fragmented learning experience, with students perceiving chemistry and computer engineering as separate entities rather than integrated components. Curricular constraints also limited students' flexibility in choosing electives aligned with their interests, further exacerbating compartmentalization between the two disciplines. Curricular rigidity can lead to disengagement among students and hinder effective learning and integration between disciplines (Ou et al., 2019).

Research has shown that double degree students typically exhibit high levels of understanding and satisfaction when they successfully make meaningful connections between their combined degrees (Newswander &

Borrego, 2009). Thus, cohesive program design, effective teaching practices, and supportive learning environments are crucial for fostering transdisciplinary and complementary learning experiences (Ou et al., 2019). To address these challenges, strategies to improve course coordination, streamline timetabling processes, and ensure consistency in academic expectations across faculties are needed (Russell et al., 2008). Incorporating a foundational course or organized activities that promote integration across the various components of a double degree program can be useful (Wimshurst & Manning, 2017). A holistic approach to these challenges considers not only the academic content and structure of the double degree program, but also the broader educational ecosystem (Ou et al., 2019). Periodic monitoring and assessment of the double degree program should focus on supporting students to form epistemic and professional connections between the two disciplines (Wimshurst & Manning, 2017).

Several graduates of the double degree program experienced limited job opportunities, despite their expertise in both chemistry and computer engineering. As a result, they failed to appreciate the relevance of their program in the job market. While students may perceive value in expanding the scope of their knowledge through double degrees, the lack of direct benefits in terms of employment may diminish the apparent transdisciplinarity and complementarity of their programs (Ou et al., 2019). Students may lose the motivation to pursue their double degree if they do not receive the expected intellectual or economic returns (Pineda, 2024).

This perceived lack of job opportunities suggests a need to better align double degree programs with industry demands to ensure that graduates possess the skills and expertise valued by employers. Higher education institutions offering double degree programs should collaborate closely with industry partners to identify emerging trends, skill gaps, and evolving job roles (Ou et al., 2019). Furthermore, the gap between promised returns and the actual outcomes of combined degrees warrants meaningful integration and synergy between the two degrees. Simply combining degrees for the sake of prestige or academic novelty may not result in tangible benefits for graduates if the acquired knowledge and skills are not complementary or relevant to contemporary industry needs (Pineda, 2024).

Studies have shown that employers are unsure about their understanding of double degree programs, but they generally view graduates of these programs as highly driven and dedicated. Despite recognizing these advantages, employers expressed reservations about hiring double degree graduates because of concerns about retention, job fit, and salary expectations. They perceived double degree holders as seeking more challenging roles and being inclined to leave for better opportunities sooner (Culver et al., 2012).

These reservations underscore the importance of effectively communicating the value of double degree programs to employers and addressing any misconceptions or uncertainties. Stronger partnerships with the industry should be established by going beyond occasional interactions, such as casual meetings and site visits. It entails engaging industry partners in curriculum development and implementation to ensure that double degree programs align closely with industry demands and emerging trends. By actively involving employers in discussions about program design, content, and learning outcomes, higher education institutions can enhance the

practical relevance and employability of their double degree graduates (Culver et al., 2012).

Limitations and Further Research

This study offers significant insights into the challenges of fostering the transdisciplinarity and complementarity of a double degree program in chemistry and computer engineering. However, this study has several limitations that may affect the applicability of the findings to other settings. Despite these limitations, this study lays the groundwork for future research aimed at enhancing the effectiveness of double degree programs in promoting transdisciplinarity and complementarity.

First, the sample of graduates from a specific double degree program at Ateneo de Manila University may not be representative of the broader population of double degree students or higher education institutions offering similar programs. This lack of diversity could skew perspectives and limit the generalizability of the findings to other student populations and academic settings. Future studies should aim for a larger and more diverse sample to capture a broader range of experiences and perspectives.

Second, the findings of this study are based on a specific institutional and cultural context. The challenges and experiences identified in this context may not fully capture the nuances of other academic settings with different institutional structures, pedagogical approaches, and cultural norms. By conducting comparative studies across multiple institutions in various cultural contexts, researchers can identify common challenges and best practices. They can also gain insights into how cultural norms, educational policies, and socio-economic factors influence the implementation and outcomes of double degree programs.

Third, this study recruited participants based on their willingness to be interviewed, which could have introduced selection bias. Those who chose to participate may have had positive or negative experiences, thus influencing the study's findings. Future research could benefit from employing random sampling from a list of eligible participants.

Fourth, this research mainly focused on the perspectives of graduates of a double degree program in chemistry and computer engineering without comparing their experiences to those of graduates from single degree programs or other transdisciplinary programs. A comparison can elucidate the unique contributions and challenges of double degree programs relative to other academic programs. Insights from comparative analyses can inform the design and implementation of these academic programs.

Fifth, study participants may struggle to accurately recall past events or selectively remember aspects of their experiences of undergoing a double degree program. This recall bias could lead to incomplete or inaccurate narration of their experiences. Although the long-term impacts of double degree programs on the participants' careers and professional development were gathered in this study, interviewing them after the passage of time

since graduation could influence perceptions of their experiences in a double degree program. Future studies can undertake longitudinal research that periodically tracks the experiences and outcomes of double degree students over an extended period. Longitudinal research can provide insights into how students' perceptions and experiences evolve over time.

Sixth, study participants may have felt inclined to present themselves in a favorable light or conform to societal expectations during the interviews. As a result, they may recall their experiences in a way that aligns with perceived norms or expectations, rather than providing an accurate portrayal of their actual experiences. Future studies should ensure a supportive and non-judgmental environment in which participants feel comfortable sharing genuine experiences and perspectives.

Finally, qualitative studies may lack the statistical power and generalizability of quantitative approaches despite offering rich insights into participants' perspectives and experiences. Consequently, the findings of this study may be more indicative of individual experiences and perceptions rather than broader trends or patterns. By combining in-depth interviews with surveys or other quantitative assessments, researchers can triangulate the findings and provide a more comprehensive understanding of the factors influencing transdisciplinarity and complementarity in double degree programs.

Conclusion

Several challenges were identified in examining the transdisciplinarity and complementarity of a double-degree program in chemistry and computer engineering, based on the perspectives of its graduates. Despite the initial intention to integrate knowledge and methods from both disciplines, the program fell short of fostering meaningful connections and applications between chemistry and computer engineering. The fragmented learning experience resulting from incoordination among the departments concerned, lack of coherence in the curriculum, and limited flexibility in electives exacerbates compartmentalization between disciplines. Limited career integration among graduates was also observed, as there seems to be a mismatch between their skill sets and industry needs.

While these programs offer opportunities to develop transferable skills and foster integration across disciplinary boundaries, the significant challenges outlined underscore the need for greater attention and investment in improving double degree programs, particularly in chemistry and computer engineering. Addressing these challenges requires a concerted effort to align program design with pedagogical best practices, industry needs, and evolving educational paradigms. Attending to structural barriers, enhancing coordination between departments, and fostering a culture of transdisciplinary collaboration are ways that higher education institutions can engage in to better prepare students for the complexities of the modern workforce and equip them with the skills needed to tackle global challenges.

Acknowledgements

The conference presentation of this study was funded by Ateneo de Manila through its University Research Council, the School of Science and Engineering, and the Sanggunian ng mga Mag-aaral. It also received financial support from the local government units of Muntinlupa and Marikina and the American Chemical Society.

Abstract: The Calamba Ayta Community is an adopted community of NU Laguna since 2018. They are recognized by the National Commission on Indigenous Peoples. Their tribe is located Barangay Milagrosa and Barangay Makiling Calamba City with a total of 89 households. By conducting a comprehensive profiling through an ethnographic approach, the researchers were able to find out that the community is composed of 306 individuals as of September 6, 2023. They have 1 chieftain and 6 councilors which was elected through the guidance of the NCIP and tribal leaders from other Ayta tribes in CALABARZON. They have been residents of Calamba City, Laguna since the 1960's but are yet to be formally recognized by the local government of Calamba City as an IP/ICC. Furthermore, according to them, their parents and grandparents came from the Quezon province which makes them formerly a part of the Agta Lopez indigenous peoples. Lastly, most of them do not have a stable income and some are minimum wage earners with only a few of them included in the Philippine government's subsidy program for the poorest of the poor (4 P's).

Keywords: ethnography, indigenous peoples, social inclusion, marginalized

Introduction

Calamba City, Laguna, is formerly a part of Cabuyao until 1742, is usually known for its hot springs, sometimes it is also referred to as the team building capital of the Philippines. It is also well-known as the hometown of the recognized national hero of the Philippines, Jose P. Rizal. It became a city in 2001 by virtue of Republic Act 9024, making it the second component city of Laguna (first is San Pablo City). As of August 2023, it has a total population of 567,603 (<https://worldpopulationreview.com/world-cities/calamba-population>), with a total land area of 14,480 has(<https://www.calambacity.gov.ph/index.php/ct-menu-item-3/city-profile>). It has a total of 54

barangays 37 of which are classified as urban and 17 as rural. It also houses quite a number of industrial parks and educational institutions.

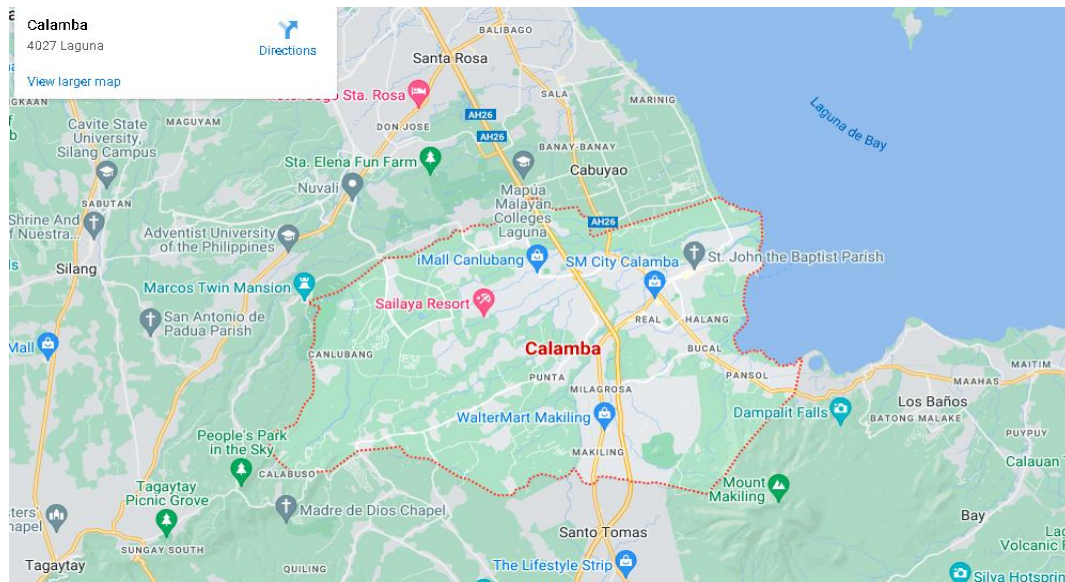

Image 1. Map of Calamba City (from <https://www.calambacity.gov.ph/index.php/visit-calamba/map-guide>)

On the north it is bounded by Cabuyao, Laguna, east by Laguna de Bay, South by Mount Makiling (Los Banos, Laguna), and in the west by Sto.tomas and Tanauan, Batangas (Image 1). What people don't know about Calamba is that it is also home to an indigenous cultural community/ indigenous people, the Ayta Community. There are around 110 major indigenous tribes around the Philippines (Waddington, 2002 & De Vera, 2007). They composed about 10-15% of the total population of the Philippines (UNDP, 2010). The Negritos are arguably the first inhabitants of the Philippine Archipelago. The first Filipinos are the indigenous people as they are the descendants of the inhabitants of a country or a region (Balilla, 2013). When the colonizers came, they were displaced and now, most of the indigenous communities can be found in the mountain ranges, rural areas, and other far-flung communities. At least, that is what the general population think. However, there are a few cases that indigenous communities can be found in urbanized cities. This is the case of an Ayta community in Calamba City, Laguna. The presumption of people who do know that there is an Ayta Community in Calamba City is that they came from Central Luzon and that they were displaced during the Mt. Pinatubo eruption during the early 90's.

Objectives

The objective of this study is to learn about the history and composition of the Ayta community of Calamba City, Laguna, specifically, this research aims to:

- 1.) trace the origin and history of Calamba Ayta Community;
- 2.) come up with a comprehensive demographic profile of the Calamba Ayta Community; and
- 3.) identify and describe the way of life of the Ayta Community living in Calamba City.

Related Literature

Aetas or Negritos as often referred to by the Spaniards during the Spanish colonization period are considered the first inhabitants of the Philippines. They are often nomadic, living in the hunting and gathering society. Males often go to the mountains where they hunt wild animals while females gathered wild fruits, root crops, and vegetables for their food (Grey, 2016). They are rich in their indigenous knowledge and practices that sustained their communities (Panes and Aguibador, 2008).

Most contemporary Negrito research and map research focused on Luzon, specifically the northeastern coast of the Sierra Madre according (Padilla, 2013) It was also concluded that the distribution and locations of the Negritos remained unchanged and are still within their natural territories and with this distribution they have more than 30 different languages. These natural territories are: Western Cagayan, Northern Sierra Madre, Southern Sierra Madre, Central Luzon, Southern Luzon, The Island Group and Mindanao. But Majority are usually from the eastern rural community of Luzon (Padilla, 2013). They are called in different names: Agta, Ita, Ayta, Aeta, or Ati. Traditionally due to their nomadic nature, they live in houses built out of grass and tree branches to easily vacate upon scarcity of surrounding food (Grey, 2016). Furthermore, traditionally, they do not have social rules and live according to their ancient customs. This practice is evident in the way they dress. According to Waddington (2002), they are commonly referred to as Negritos and they differ from other Filipino groups in their racial phenotype, characterized by curly hair, dark complexion, and small stature, and by their lifestyle strongly focused on foraging strategies. As part of the ethnic cultural minority, they have always been disadvantaged socially, politically, and economically. This was further highlighted during the Mt. Pinatubo explosion during the early 1990's. They were displaced to add to their already disadvantaged status (Grey, 2016). The Aeta are naturally skilled weavers and planters. Their most known products are winnowing baskets, rattan hammocks, and other household containers. Their traditional clothing are wraparound skirts for the young women and wear bark cloth for the elder women. For them men: loincloths for the elder men. The old women of the Agta group wear their bark cloth strip which passes between legs and is attached to a string around the waist. Decorative disfigurement is a traditional art most Aeta groups practice to decorate their bodies (Watcher, n.d.).

Method

An ethnographic approach was utilized in doing this research. We used key informant interviews, village walks, participant observation, focus group discussions, as well as secondary sources to gather information about their profile and history. The study lasted for seven months which started from January 2023 until July 2023.

Data Gathering Procedure

The first step done by the researchers was to seek the approval of the National Commission on Indigenous Peoples CALABARZON before doing this study. This was done by having a memorandum of understanding,

between the NCIP IVA and NU Laguna, part of the MOU allows NU Laguna to conduct a study about indigenous communities in the region. After that, a memorandum of understanding was also signed between the indigenous community involved and NU Laguna, and part of the MOU covers conducting a study. Once the MOUs and approval were given, the researchers performed a series of approaches in order to achieve the objectives of this study.

The village walk, in depth interviews and participant observation was done in February 2023 by one of the researchers as he was with the tribal chieftain and tribal councilors in the Barangay Milagrosa Calamba City. The second village walk, and key informant interviews was conducted this in May 2023 in Barangay Makiling, Calamba City by the other researchers. The focus group discussion was conducted in June 2023.

Locale of the study

The Ayta Community the study focused on resides in Calamba City of Laguna in the Philippines. The community is in two barangays of Calamba City, Laguna. These are Barangay Milagrosa and Makiling.

Barangay Milagrosa

Milagrosa was formerly known as Barangay Tulo is classified as a rural barangay, with a population of 9,687(PhilAtlas, 2020). With a total land area of 209.4 hectares, as shown in image 2. Milagrosa is bounded in the west by Punta and Kay Anlog, in the east by La Mesa, Maunog, and Saimsim, in the south by Makiling, and in the north by Turbina.

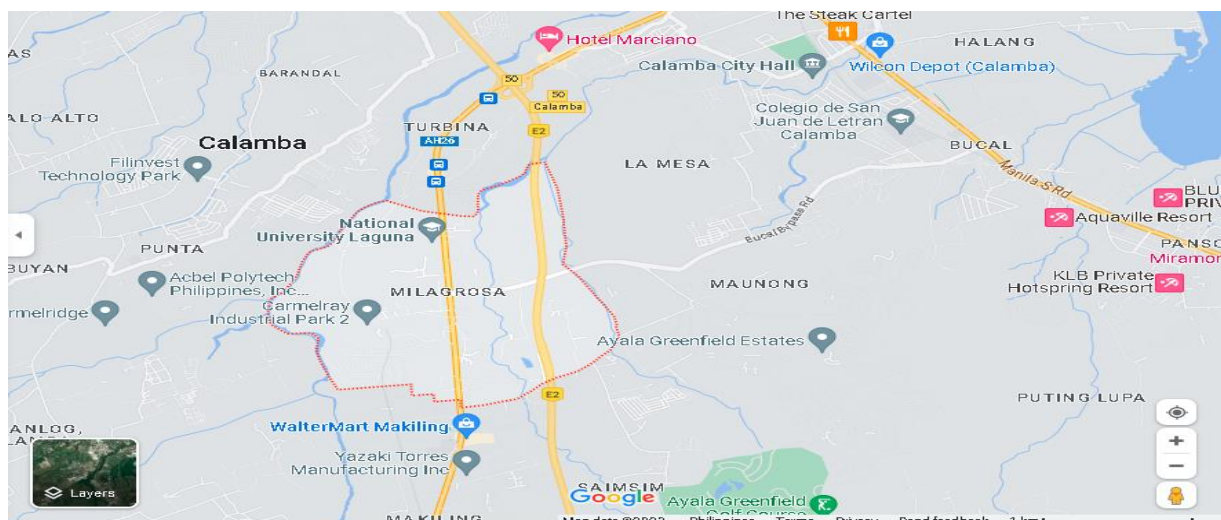

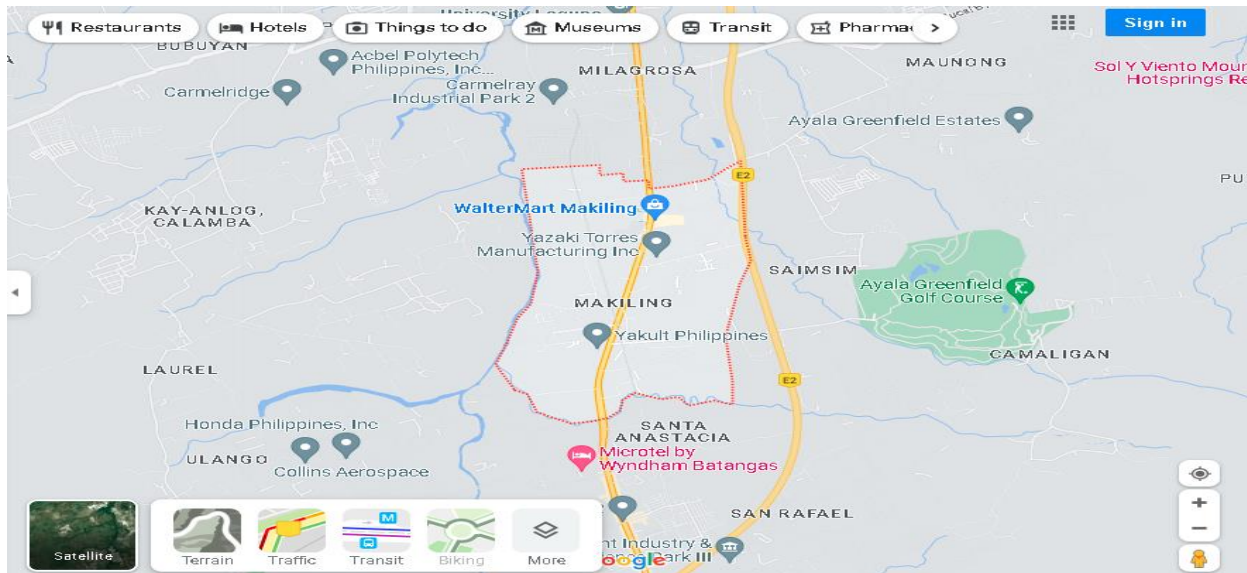

Image 2. Map taken from

Image 2. Barangay Milagrosa Map

Barangay Makiling

Makiling is classified as a rural barangay and has a population of 12,508 (Philatlas, 2020). It has a total lot area of 465.7 hectares. It is bounded in the west by Ulango, in the east by Saimsim, Camaligan, and Puting Lupa, in the south by Sto, Tomas, Batangas, and in the north by Tulo (Image 3).

Data Analysis

Since this is an ethnographic research, the data analysis is iterative and unstructured. First, data was described by recounting and describing of data, inevitably treating the data as fact. It was then analyzed and interpreted which builds an understanding or explanation of the data beyond the data points and analysis.

Results

Origin of the Calamba Ayta Community

By virtue of Resolution no.1 series of 2023, they prefer to be collectively called as Ayta. Part of the reason why they prefer to be referred to as Ayta is to have distinction from the Aeta ICC/IP from central Luzon. Majority, of them trace their origin from Quezon province (Figure 1). This is contrary to what most people who knows of their existence presume, that they migrated here from Central Luzon specifically during the time of the eruption of Mt. Pinatubo in the early 90's. Their ancestors used to move around from Quezon, their place of origin, to Laguna and Batangas as they are naturally nomadic. They crossed provincial borders to sell herbal medicine.

Before settling in Milagrosa and Makiling, most of them were initially located in Real, Calamba City, under the bridge, near the river (near School of Saint Benilde) and they were relocated to Milagrosa and Makiling sometime in the late 1960's to the early 1970's where they have been ever since being relocated there. They are headed by 1 chieftain who was elected in 2018.

The Calamba Ayta Community of Calamba is not reflected in the map of the Negrito Ethnic Groups in the Philippines published in 2021. They are not also indicated in those taken from the coffee table books officially published by NCIP in 2022 (Image 1 and 2). However, it is important to take note that they are recognized by the National Commission on Indigenous Peoples. It is also worth noting that they are one tribe even though they are in two separate barangays.

The Ayta community have been in Calamba even before 1960's and yet most people in Calamba are unaware of their existence in the city.

Image 4. Map of the Negrito Ethnic Groups in the Philippines (Larena et al., 2021)

Image 5. Map of the Races and Peoples of the Philippines by Blumentritt in 1890

Demographic Profile of the Calamba Ayta Community

There are 89 households in the Ayta Community of Calamba. Among them, 53 are in Milagrosa, Calamba City, and 36 are in Makiling, Calamba City. There is a total of 168 males and 138 females in their tribe. The tribe is dominated by male as seen in Table 1.

Table 1. Total Number of Households and Individuals

	Milagrosa	Makiling
Number of households	53	36
Number of Individuals	161	145
Male	84	61
Female	77	84
Total Number of Household	89	
Total Number of Individuals	306	
Total Male	168	
Total Female	138	

By age group

Majority of the Calamba Ayta Community belong to the age of 0-12 with a total of 123, followed by the age group 20-39 with 103, for the ages 13-19 there are 43, for the ages 40-59 there are 34 (Table 2). Lastly. For the age bracket 60 and above there are only 3. Meaning, there community is a relatively young community but balance in a way, albeit being dominated by the bracket 0-12 that composes the 40% of the entire population and bracket 13-19 with a total population of 166 out of the total population of 306. However, the distribution of percentages for the ages 20-39, 40-59, and 60 and above is 46% of the entire population.

Table 2. Age Distribution of the Calamba Ayta Community

Age Distribution	Milagrosa	Makiling	Total	Percentage
0-12	68	55	123	40%
13-19	27	15	43	14%
20-39	44	59	103	34%
40-59	19	15	34	11%
60 and above	3	0	3	1%
Total Number of Individuals		306		100%

Educational Status of the tribe

Only two tribe members are pursuing a college degree. While 4 have attained ALS and 12 are in the in the senior high school level. 13 are in the junior high school and 91 are in the elementary level (Table 3).

Table 3. Educational Attainment of the Calamba Ayta Community

	Milagrosa	Makiling
Elementary	65	26
JHS		13
Senior high school	2	10
Vocational		0
ALS		4
College		2

Employment Status and Skills

Most of them are employed as construction workers Twenty six are vendors of their own made herbal medicine. Some are employed as factory workers, domestic helpers and others (Table 4). In terms of skills (Table 5), the members of the community have skills are farming, construction and, deriving topical herbal medicines.

Table 4. Employment Status of the Calamba Ayta Community

	Milagrosa	Makiling
Farming	0	0
Construction	32	9
Selling herbal medicine in the public market	11	15
factory	0	8
Others	1	7

Table 5. Skills of the Ayta Community

	Milagrosa	Makiling
Farming	x	x
Construction	x	x
Deriving topical herbal medicine from plants	x	x
Others		

Other information

Out of the 89 household, only four are recipients of the Pangtawid Pamilyang Pinoy Program, a conditinal cah transfer scheme for the poorest of the poor in the Philippines. Their widely use Filipino/Tagalog as their primary language. In addition, majority of the tribe members who are of legal age are registered voters.

Indigenous Way of Life in the City

Social Structure

They are under one tribal chieftain who was elected under the guidance of other Ayta Tribes in CALABARZON and the National Commission on Indigenous Peoples. They also have six tribal councilors. The role of the chieftain is just like any other traditional chieftain from other tribes, they speak on behalf of the tribe, represents the tribe in meetings with other institutions and government agencies. However, when it comes to decision making, the decision of the tribe comes from the decision of the majority of the members of the tribe. It is also worth noting that even though they have this structure, they are very cooperative with their respective barangay officials. They strictly follow the policies and laws being implemented by the local government as well. Furthermore, according to the tribe leaders and the NCIP, they have not yet been formally recognized by the local government of Calamba City as an Indigenous Cultural Community.

Indigenous Livelihood

Majority of the women make and sell their herbal medicine. They get their ingredients from the mountains of Laguna, Batangas, and Quezon. This is used as a topical solution for simple tummy aches, headaches, and body pain. Women in the tribe sell these products in the market. The process of making the herbal medicine is sacred to them and they refused to show the actual process of making the medicine.

Some of the men hunt monitor lizards, turtles, and birds using traditional traps as well as using airsoft guns. They also catch fish in the nearby rivers using traditional means of fishing. All of which will be eaten or for consumption of their immediate families.

Family Composition

Most of them are pure Aytas in terms of family composition. However, there are members of the tribe who intermarried non-tribe members, particularly from the Tagalog ethnic group. Here, one member head of the family is an Ayta and the other is a Tagalog. The tagalogs are normally welcomed to the tribe as if they are also an Ayta and in doing so, they are also given the rights and privileges of indigenous peoples as mandated by law.

Discussion

The Calamba Ayta Community has been in Calamba since the 1960's. According to them, their origin from the Agta Lopez of Quezon, similar to what was described by Larena et al (2021). The Calamba Ayta Community is composed of 89 households located in Barangay Makiling and Barangay Milagrosa. Although located in two barangays, they are considered one tribe unlike the conventional Agta, Ita, Aeta, or Ati, as discussed by Grey in 2016 who are nomadic in nature, the Aytas of Calamba City live in permanent homes as evidenced that they have been in their residences dating back to the late 1960's to early 1970's. There are 306 individuals and majority are male. By virtue of a resolution, they would like to be collectively referred to as Ayta and not Aeta.

The Ayta Community of Calamba is a young community as 54% is 19 years old and below. However, out of those considered as young adults and that is why it is very alarming that only two are college degree holders. In terms of employment, only 16 can be considered to have a regular income due to their nature of employment and most of them are seasonal workers and the others rely on selling their own made (indigenous) oil. This implies that some of them are living on minimum wage and most are living on seasonal jobs and heavily relying on selling their topical herbal medicine. It is also worth noting that only 41 of them are considered employed albeit most are seasonal. This confirms the findings of Grey in 2016 that Aetas, in general, have always been disadvantaged socially, politically, and economically and it is also quite surprising that very few of them are recipients of poverty alleviation programs of the national government with some included only recently.

In term of skills, most of them are knowledgeable in planting or basic agriculture but do not know how to weave which partly goes against the conclusion of Catseye (2004). Furthermore, majority of the men are also laborers in construction. This means they have acquired skills not particularly associated with their group because they are living in an urban community. The women of the tribe are involved in tmaking their indigenous topical herbal medicine which is a practice that has been handed down from generation to generation in their tribe.

It is also worth noting that none of the tribe members speak their native language as they are now using *Tagalog* as their means of communication within the tribe. However, as found by the researchers, they have infused it with some of the terms from their native language. This is a result of their intermingling with the Tagalogs. This is a source of concern because they seem to be losing their own language. despite of it being over 30 years.

While they have a chieftain, tribal councilors, and the traditional social structure, it is also worth noting that the tribe is very cooperative with the local barangay leaders that has jurisdiction over them, this goes against the findings of Grey in 2016 that they do not have social rules and live according to their ancient customs. In fact, majority of the men and women who are in the legal age are registered voters and actually practice their right to suffrage. They also abide by the established rules and laws within the community they are living in.

In terms of livelihood, it is a fusion of traditional and urbanized means as they are still making indigenous topical herbal medicine, some of the men hunt monitor lizards, catch fish in nearby rivers. However, there are many tribe members who are now skilled laborers and factory workers which somehow partially goes against the findings of Panes and Aguiador in 2008. That the Aetas have sustained some their practices in their communities while they engaged in low/minimum wage-earning jobs.

Conclusion

The origin/roots of the Ayta Community of Calamba can be traced from the Agta Lopez from Quezon. They have been here in Calamba since the Late 1960's and they have been living in permanent houses ever since they can remember.

The Ayta Community of Calamba are composed of 89 households divided into two barangays: Makiling and Milagrosa, Calamba City, Laguna, Philippines. They are relatively a young tribe with no tribe member yet to earn a college degree. They are now using *Tagalog* as their language. Only a few are recipients of the national government's poverty alleviation programs.

They have embraced a new means of livelihood. However, they were able to maintain some of their indigenous traditions. Even though they have somewhat adjusted in their environment, they remain disadvantaged and marginalized.

Recommendations

In relation to the findings of this study, it is recommended that:

For Future Researchers

Further studies should be done to confirm their place of origin, follow-up research in the Agta Lopez area should be done for confirmation. A quantitative study to further confirm the findings of this research is strongly recommended.

It is also recommended that a needs assessment be done with the community so that it may become a basis for the local government and community development workers for future projects for the Ayta Community.

For the Local Government Officials

It is also recommended that the local government of the city of Calamba formally recognize them as an Indigenous Cultural Community (ICC) as this is mandated by law. This would allow inclusion of the Ayta community, formal recognition, and formal acknowledgement of their rights and privileges as members of the indigenous peoples.

For Community Development/Extension Workers

Finally, it is also recommended that livelihood projects and programs be formulated for them be based on the findings of this study. and aligned to the additional needs assessment of the Ayta community. This will ensure that these projects will be sustainable.

Acknowledgements

We extend our thanks to the National Commission on Indigenous Peoples Region IV for the technical support they provided. We also cite the Department of Science and Technology Laguna's response to the results of the study through the livelihood project they implemented in the community. We also give our thanks to the Ayta Community of Calamba City, headed by their chieftain, Ronnie Remo, for accommodating us and for actively participating in this research.

Abstract: Despite standardized engineering and administrative controls, accidents persist in chemistry laboratories owing to the inherent complexity of the experiments. As a result, there is an increasing need to strengthen safety culture, which is built on a safety mindset and refers to an institution's knowledge, attitude, and practice (KAP) of laboratory safety. However, a safety mindset has yet to be defined in relation to the safety KAP in a chemistry laboratory. Hence, this cross-sectional study investigated the relationship between safety mindset and KAP on laboratory safety. A pre-tested survey questionnaire was administered to chemistry students ($n = 104$), teachers ($n = 8$), laboratory technicians ($n = 3$), and analysts ($n = 8$) to measure their KAP and mindset regarding laboratory safety and collect information on confounding variables, such as age, affiliation, and safety training. After controlling for confounders, ordinal logistic regression ($\alpha = 0.05$) revealed that knowledge was not a significant predictor of safety mindset ($p = 0.56$), whereas attitude ($p < 0.001$) and practice ($p = 0.004$) were significant predictors of safety mindset. Such results indicate that demonstrating safety knowledge in a chemistry laboratory may not necessarily translate into a safety-oriented mindset. These insights offer a better understanding of how a safety mindset builds a safety culture through the components of KAP.

Exploring the relationship of safety mindset and knowledge, attitude, and practice (KAP) on safety in chemistry laboratories. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024 -- International Conference on Research in Education and Science* (pp. 613-625), Antalya, Turkiye. ISTES.

Introduction

Several serious incidents have occurred in academic settings worldwide. One notable case involved a postgraduate student who suffered severe consequences from accidental exposure to acryloyl chloride (C_3H_3ClO) during acrylation. The student experienced severe nose bleeding and stomach ulcers, which were not listed on the safety data sheet (Pathan et al., 2022). Despite the supervisor's reminder of wearing personal protective equipment (PPE), the laboratory accident occurred because the student did not comply with the safety protocols. These types of laboratory accidents occur despite laboratories' adherence to safety policies, the knowledge and experience of those conducting the experiment, and constant reminders from supervisors. Therefore, more data on laboratory safety attitudes, behaviors, and safety culture are urgently needed (Ménard & Trant, 2020).

According to the American Chemical Society ([ACS], 2012), safety culture refers to the actions, attitudes, and behaviors concerning the safety of an institution. This concept of safety culture aligns well with the framework of Knowledge, Attitude, and Practice (KAP), which is a recognized behavioral change model. The KAP model posits that beliefs and attitudes are drivers of behavioral change, whereas knowledge serves as the foundation for behavioral changes (Fan et al., 2018). Rav-Marathe et al. (2016) argue that practical application of knowledge should go beyond just acquiring it and should involve a shift in attitude toward safety practices. These interconnections within the KAP constructs effectively encapsulated the essential parameters of a safety culture.

Safety culture is built on a safety mindset, as agreed upon by ACS (2012) and Hill (2021), among others. Although there is no clear parameter for a safety mindset in the context of chemistry laboratory safety, Hill (2021) suggested that safety knowledge combined with continuous safety education can foster a strong safety mindset within each student. Furthermore, Botha et al. (2020) found in their study that there is a strong correlation between a safety mindset and safety performance or practice. These articles imply that a relationship exists between safety knowledge, practices, and mindsets.

Studies on the relationship between safety culture and safety mindset in chemistry laboratories are lacking. While Hussein and Shifera (2022) used the KAP model to study safety culture, there is limited empirical evidence linking safety mindset to the KAP model. Hill (2021) proposed that a safety mindset is based on the amount of safety knowledge; however, this relationship has not yet been investigated. Botha et al. (2020) measured the correlation between safety mindset and practice but not in the context of chemistry laboratory safety. Examining the relationship between the safety mindset and the KAP model is crucial because it can reveal common factors between the safety mindset and safety culture. In doing so, the safety culture can be better understood and improved within the context of chemistry laboratories.

Hence, this study explored the relationship between laboratory safety KAP and mindset by addressing the

following research questions:

- What are the mean scores of the study participants on safety KAP and mindset?
- Are there significant differences in safety KAP and mindset scores by age group, affiliation, and safety training experience?
- Can the components of the KAP predict safety mindset after controlling for age, affiliation, and safety training?

Method

This study adopted a cross-sectional, correlational research design, as it involved collecting data at a single point in time and analyzing the gathered data using regression. The cross-sectional design allowed for the examination of the relationships between variables, providing a snapshot of the associations present at the time of data collection. Additionally, the use of correlational research design offered a valuable tool for understanding the natural relationships between variables, as it does not require the administration of interventions or manipulation of variables.

Setting and Participants

This research was conducted at Ateneo de Manila University (ADMU), an institution of Jesuit higher education in the capital of the Philippines. The ADMU aims to contribute to Philippine and global society through excellence in teaching, research, and community engagement. The university's commitment to these three areas is reflected in its programs and initiatives, which are designed to produce graduates who are not only competent but also socially responsible citizens. Several of its programs and initiatives have catered to improve the practice of science in the country. One of its affiliated institutions is the Philippine Institute of Pure and Applied Chemistry (PIPAC), which offers capacity building in chemical and microbiological analysis, aside from responding to the needs of the industry for research and development in the field of chemistry.

To investigate the relationship between safety KAP and mindset in a chemistry laboratory setting, eligible participants in this study included individuals using the chemistry laboratories from ADMU and PIPAC as students, teachers, technicians, or analysts. Peduzzi et al. (1996) recommended a minimum event per variable (EPV) value of 10 for logistic regression. Considering that three independent variables (knowledge, attitude, and practice) and three confounding variables (age, affiliation, and safety training) were included in the regression model, a sample size of at least 60 participants was needed for this study.

In this study, a cluster sampling method was employed, which involved dividing the population into smaller groups or clusters and randomly selecting clusters as samples. This approach was chosen to ensure that the sample was representative of the entire population and increase the efficiency of the sampling process. The randomly selected clusters were undergraduate chemistry students enrolled in the Principles of Chemistry

Laboratory (CHEM 121.02), Organic Chemistry 1 Laboratory (CHEM 141.02), and Physical Chemistry 1 Laboratory (CHEM 171.42), chemistry department teachers, and chemistry laboratory technicians at ADMU as well as chemistry analysts at PIPAC. The sampling took place in the first semester of the academic year 2023–2024 after obtaining ethics clearance (reference number SOSEREC23009).

Research Instrument

The initial survey questionnaire contained 40 items (10 for each construct), which were pre-tested by administering it to 71 undergraduate students attending the General Chemistry 1 Laboratory (CHEM 21.12) in the first semester of the academic year 2023–2024. The item analysis of the ten multiple-choice questions on safety knowledge showed that eight of them had good discrimination ability and were, therefore, retained. The scale items measuring safety attitude, practice, and mindset were then subjected to an exploratory factor analysis using principal component analysis and varimax rotation. After eliminating problematic items, the three-factor solution derived from this analysis accounted for 56.36% of the variation in data, with three safety attitude, four practice, and five mindset items loading together on their expected components. These 12 items were retained and assessed for their reliability. Based on the recommendations of Raharjanti et al. (2022), the reliability of the 12 items was satisfactory, as their Cronbach's alpha was between 0.60 and 0.80 and the corrected item-total correlation was greater than 0.30.

Data Gathering

The research information or survey preface (the study's nature, purpose, potential risks, benefits, data collection methods, and level of participation) was made available to eligible study participants several days before the survey administration to provide them ample time for review. The pre-tested survey questionnaire was then administered to the study participants after coordination with the necessary offices. A survey of undergraduate chemistry students was conducted onsite during their laboratory period for ease of access. The survey questionnaire was distributed online to chemistry department teachers, chemistry laboratory technicians, and chemistry analysts so that they could complete it at their convenience given their busy schedules.

Data Analysis

Various statistics were carried out at a significance level of 0.05, to analyze the survey responses in view of the research questions. First, descriptive statistics, such as the mean and standard deviation (SD), were used to summarize the central tendency and dispersion of the dataset. To qualitatively understand the mean scores on the safety KAP and mindset, they were categorized according to the adjusted version of Bloom's cutoff points. Second, a bivariate analysis was conducted to determine whether there was a significant difference in the mean scores of each construct based on age, affiliation, and safety training experience. Kruskal-Wallis test and Mann-Whitney U test were performed to investigate whether the mean scores differed among multicategory groups (age and affiliation) and between dichotomous groups (safety training experience), respectively. Finally,

multivariate analysis was carried out using ordinal logistic regression to explore whether safety KAP can predict safety mindset after controlling for the confounding effects of age, affiliation, and safety training experience. To meet the assumption of ordinal data as the level of measurement, the mean scores of KAP and mindset were presented as interquartile ranges. Given the variance inflation factor (VIF) was 1.05 for knowledge, 1.12 for attitude, and 1.16 for practice, the regression model demonstrated insignificant to low multicollinearity. Finally, the assumption of proportional odds was not violated as the odds ratio for each predictor was greater than one. Jamovi software was used in this series of statistical analysis, with a p value of less than 0.05 indicating statistical significance.

Results

There were 189 individuals who were eligible to participate in this study. A total of 123 participants voluntarily completed the pre-tested survey questionnaire, representing a response rate of 65.08%. The study participants included 104 undergraduate chemistry students, eight chemistry department teachers, three laboratory technicians, and eight chemistry analysts.

Prior to the data analysis, composite scores were determined by tallying the number of correct responses for each safety knowledge item. A correct answer received a score of one, while an incorrect answer earned a score of zero. The maximum mean composite score attainable was eight. On the other hand, the mean scores for the scale items (attitude, practice, and mindset) were calculated by averaging the responses across the items. The highest possible mean scores were five for attitude (strongly disagree = 1 and strongly agree = 5), three for practice (never = 1 and always = 3), and six for mindset (strongly disagree = 1 and strongly agree = 6).

Mean Scores in Safety KAP and Mindset

The study participants garnered a mean score of 5.32 (SD = 1.43) for safety knowledge, 4.36 (SD = 0.67) for safety attitude, 2.56 (SD = 0.33) for safety practice, and 5.60 (SD = 0.40) for safety mindset. By categorizing the mean scores based on the adjusted version of Bloom's cutoff points, the study participants demonstrated a fair amount of safety knowledge and good levels of safety attitude, practice, and mindset. Table 1 shows the categorization of the mean scores.

Table 1. Categorization of Mean Scores using the Adjusted Version of Bloom's Cutoff Points

Variable	Cutoff Points		
	Poor (0–59.4%)	Fair (59.5–79.4%)	Good (79.5–100.0%)
Knowledge	0 – 4.75	4.76 – 6.35	6.36 – 8.00
Attitude	0 – 2.97	2.98 – 3.97	3.98 – 5.00
Practice	0 – 1.78	1.79 – 2.38	2.39 – 3.00
Mindset	0 – 3.56	3.57 – 4.76	4.77 – 6.00

Differences in Mean Scores by Age, Affiliation, and Safety Training

The study participants were categorized into four groups based on their age (in years). This age categorization was adapted from the questionnaire used by Al-Zyoud et al. (2019) and was based on the concepts of psychographics and age, as discussed by Ungureanu (2020). There were 98 participants in the 20 and below age group, nine in the 21 to 25 age group, 12 in the 26 to 30 age group, and four in the 31 and above age group.

Table 2. Mean Scores in Safety KAP and Mindset by Age

Age Group	Knowledge	Attitude	Practice	Safety Mindset
20 and below	5.24 (SD = 1.43)	4.30 (SD = 0.71)	2.50 (SD = 0.32)	5.56 (SD = 0.38)
21 to 25	5.67 (SD = 1.66)	4.41 (SD = 0.36)	2.56 (SD = 0.30)	5.60 (SD = 0.51)
26 to 30	5.58 (SD = 1.51)	4.69 (SD = 0.46)	2.90 (SD = 0.13)	5.87 (SD = 0.30)
31 and above	5.50 (SD = 0.58)	4.92 (SD = 0.17)	2.94 (SD = 0.13)	6.00 (SD = 0.00)
p value	0.89	0.02	< 0.001	0.002
ϵ^2	0.01	0.08	0.19	0.13

No steady increase in safety knowledge scores by age was observed in this study (Table 2). The Kruskal-Wallis test showed no significant difference in the safety knowledge scores among the age groups ($p = 0.89$). Notably, effect size was also small ($\epsilon^2 = 0.01$).

However, the safety attitude, practice, and mindset scores of the study participants increased with age (Table 2). The Kruskal-Wallis test revealed significant differences in safety attitude scores ($p = 0.08$), safety practice scores ($p < 0.001$), and safety mindset scores ($p = 0.002$) among the four age groups. The estimated effect sizes for safety attitude ($\epsilon^2 = 0.08$) and safety mindset ($\epsilon^2 = 0.13$) were medium, while the effect size for safety practice was large ($\epsilon^2 = 0.19$).

The study participants were classified into four groups based on their affiliations. There were 104 participants in the student group, eight in the teacher group, three in the laboratory technician group, and eight in the analyst group. Table 3 shows the mean scores for the safety KAP and mindset according to affiliation.

In terms of safety knowledge, the chemistry department teachers had the highest mean scores. However, the Kruskal-Wallis test reported no significant difference in safety knowledge scores by affiliation ($p = 0.82$). The calculated effect size was likewise small ($\epsilon^2 = 0.01$).

In contrast, chemistry laboratory technicians achieved the highest mean scores for safety attitude, practice, and mindset (Table 3). The Kruskal-Wallis test showed that the observed differences in mean scores across affiliations for safety attitude ($p = 0.02$), practice ($p < 0.001$), and mindset ($p = 0.003$) were statistically significant. A medium effect size was seen for safety attitude ($\epsilon^2 = 0.08$) and mindset ($\epsilon^2 = 0.11$), whereas a

large effect size was demonstrated for safety practice ($\varepsilon^2 = 0.16$). Noticeably, pairwise comparison revealed that there were significant differences in the mean scores by affiliation between undergraduate chemistry students and chemistry analysts for safety attitude ($p = 0.04$), practice ($p = 0.01$), and mindset ($p = 0.03$).

Table 3. Mean Scores in Safety KAP and Mindset by Affiliation

Affiliation	Knowledge	Attitude	Practice	Safety Mindset
Student	5.29 (SD = 1.46)	4.30 (SD = 0.70)	2.50 (SD = 0.32)	5.56 (SD = 0.40)
Teacher	5.75 (SD = 1.67)	4.46 (SD = 0.47)	2.78 (SD = 0.28)	5.75 (SD = 0.35)
Technician	5.33 (SD = 0.58)	4.89 (SD = 0.19)	2.92 (SD = 0.14)	6.00 (SD = 0.00)
Analyst	5.25 (SD = 1.04)	4.83 (SD = 0.36)	2.88 (SD = 0.13)	5.92 (SD = 0.15)
p value	0.82	0.02	< 0.001	0.003
ε^2	0.01	0.08	0.16	0.11

Only 28 of the study participants attended safety training and intervention, in addition to the requirements at the undergraduate level. The remaining 95 participants had no experience with safety training. Among the participants with safety training, ten were students, seven were teachers, three were laboratory technicians, and eight were analysts. Table 4 shows the mean scores in the safety KAP and mindset for those with and without safety training.

Table 4. Mean Scores in Safety KAP and Mindset by Safety Training

Safety Training	Knowledge	Attitude	Practice	Safety Mindset
With	5.32 (SD = 1.49)	4.67 (SD = 0.40)	2.75 (SD = 0.29)	5.84 (SD = 0.26)
Without	5.32 (SD = 1.42)	4.27 (SD = 0.71)	2.50 (SD = 0.32)	5.53 (SD = 0.40)
p value	0.98	0.004	< 0.001	< 0.001
r_{rb}	0.003	0.35	0.44	0.48

The mean scores for safety knowledge were similar for those with and without safety training experience. The Mann-Whitney U test further supported this observation ($p = 0.98$). In addition, the effect size was negligible (rank-biserial correlation [r_{rb}] = 0.003).

However, mean scores for safety attitude, practice, and mindset were higher among those with safety training than among those without such training. The Mann-Whitney U test revealed that the differences in mean scores between the study participants with and without safety training experience were statistically significant (Table 4). Moderate effect sizes were observed ($r_{rb} = 0.35$ to 0.48).

Safety KAP as Predictors of Safety Mindset

Ordinal logistic regression was performed to determine whether the components of the KAP were significant

predictors of the safety mindset in chemistry laboratories. The interquartile ranges shown in Table 5 were used in the multivariate analysis. Given that safety attitude, practice, and mindset scores varied significantly by age, affiliation, and safety training experience, these confounders were assigned dummy variables and included in the regression model. In doing so, the effects of the independent variables on the dependent variable can be isolated while holding the confounding variables constant (Nair, 2023).

Table 5. Quartiles for Safety KAP and Mindset

Percentile	Knowledge	Attitude	Practice	Mindset
25th	5.00	4.00	2.25	5.30
50th	5.00	4.67	2.50	5.80
75th	6.00	5.00	2.75	6.00

Based on the model fit, the resulting regression model in this study was effective in significantly predicting safety mindset ($p < 0.001$). Furthermore, an R^2 of 0.18 approximated from McFadden's formula indicated an 18% improvement in the model fit when additional predictors were included. The omnibus likelihood ratio test revealed that safety attitude ($\chi^2 = 21.94$, $p < 0.001$) and safety practice ($\chi^2 = 8.28$, $p = 0.004$) were the only variables that significantly affected the fit of the model. Safety knowledge ($\chi^2 = 0.33$, $p = 0.56$) and confounding variables, such as age ($\chi^2 = 0.44$, $p = 0.51$), affiliation ($\chi^2 = 0.01$, $p = 0.91$), and safety training ($\chi^2 = 2.61$, $p = 0.11$), did not play a significant role.

Ordinal logistic regression showed that safety knowledge ($\beta = 0.10$, $p = 0.56$) was not a significant predictor of safety mindset in a chemistry laboratory setting, after controlling for age ($\beta = 0.36$, $p = 0.52$), affiliation ($\beta = -0.06$, $p = 0.91$), and safety training experience ($\beta = 0.97$, $p = 0.12$). However, safety attitude ($\beta = 0.85$, $p < 0.001$) and practice ($\beta = 0.50$, $p = 0.004$) emerged as significant predictors of safety mindset when the effects of the confounding variables were considered. The odds of exhibiting a safety mindset would be at least twice as high if there was a unit increase in the safety attitude scores (odds ratio [OR] 2.34, 95% confidence interval [CI] 1.63 – 3.42). Additionally, the odds of manifesting safety mindset would be 1.65 times greater if there was an accompanying unit increase in safety practice scores (OR 1.65, 95% CI 1.17 – 2.35).

Discussion

Mean Scores in Safety KAP and Mindset

The results of the univariate analysis revealed that the study participants collectively demonstrated adequate safety knowledge, positive safety attitude, strong safety practice, and favorable safety mindset in a chemistry laboratory setting. Even if the study participants had only a fair understanding of safety protocols, the organizational culture of ADMU's chemistry department and PIPAC was likely responsible for these observations. Emphasis on laboratory safety culture in these institutions was evident through their well-established policies, protocols, procedures, and leadership support. The meticulous design and engineering of

their chemistry laboratories, which ensures a safe and conducive working environment, further contributed to an organizational culture of laboratory safety. Moreover, effective laboratory safety training programs and practical experience could have influenced the participants' levels of safety KAP and mindset.

Differences in Mean Scores by Age, Affiliation, and Safety Training

Bivariate analysis showed that the differences in safety knowledge scores according to age, affiliation, and safety training were statistically insignificant. These results could be due to safety knowledge being more reliant on standardized educational programs and training, which could be consistently delivered across age groups and affiliations (of the same discipline). Another reason could be that the study participants came from similar backgrounds in chemistry. On a more positive note, these results could also mean that the student participants were taught safety knowledge effectively at the level of teachers. No significant difference in the level of safety knowledge between those with and without safety training was observed, possibly because the safety training taught in educational institutions tends to be redundant.

Additionally, these results reflect the varying perspectives of O'Loughlin et al. (2017) and von Humboldt et al. (2023) regarding older individuals' flexibility and openness to change. Although older individuals are often perceived as less adaptable because of their reliance on existing knowledge and experience, their level of knowledge about laboratory safety may not necessarily differ from their younger counterparts. Differences in adaptability perceptions among age groups may be influenced by subjective biases rather than objective differences in abilities or knowledge. Therefore, the seemingly declining trend in the safety knowledge score as age progressed should not necessarily indicate a reliance on existing knowledge and experience among older participants.

The comprehensiveness of the survey instrument used to measure safety knowledge should not be overlooked. Although all survey items in the knowledge section exhibited a discrimination ability greater than 0.30 after a few revisions, increasing the number of items may have influenced the safety knowledge scores according to age, affiliation, and safety training. To obtain optimal results, a balance between the number of items in the knowledge section and their level of discrimination ability should be sought.

Bivariate analysis showed that the mean scores for safety attitude, practice, and mindset significantly differed by age. These results can be linked to principles of experience and exposure. Older individuals tend to possess extensive experience in scientific laboratories, leading to heightened awareness of safety protocols and a more mature perspective on safety. Moreover, various studies have indicated that adults exhibit increasingly cautious behavior as they age (Dohmen et al., 2018; Tymula et al., 2019). This behavior could be because older individuals have acquired cognitive skills that could affect their attitude and practice regarding safety in laboratory settings.

Significant differences in the level of safety attitude, practice, and mindset were likewise observed by affiliation,

particularly between student and analyst participants. Although a similar organizational safety culture could be found between ADMU's chemistry department and PIPAC, differences in safety attitude, practice, and mindset would be large if the mean scores of chemistry students were compared with chemistry analysts. Notably, most of the student participants in this study were first- and second-year chemistry students who were still adapting to the safety culture of the chemistry department. Therefore, these differences by affiliation may be related to discrepancies in age among the participants of this study. The number of working hours in the chemistry laboratory could also have contributed to the significant differences by affiliation. Students worked in the laboratory only two to three times a week for four hours a day, whereas analysts conducted laboratory work every day.

The mean scores for safety attitude, practice, and mindset of those with safety training experience differed significantly from those with no similar experience. Effective safety training interventions may have caused these study participants to internalize safety principles, significantly changing their mindset. Specifically, this group of study participants may have developed a heightened awareness of potential hazards and risks in laboratories, leading to a more proactive approach toward safety. Furthermore, safety training interventions could have provided them with more opportunities to apply safety knowledge in real-world settings.

Safety KAP as Predictors of Safety Mindset

Multivariate analysis showed that safety knowledge could not significantly predict safety mindset, whereas safety attitude and practice could do so, after controlling for confounders. Reason's (1998) Safety Culture Theory acknowledges the significance of knowledge in fostering safety, but also emphasizes that knowledge alone might not be sufficient. Therefore, knowledge of safety protocols may not automatically translate into a safety-oriented mindset in a chemistry laboratory setting. Nonetheless, safety knowledge, as not a significant predictor of safety mindset, does not mean that safety knowledge is not an important component of safety culture.

Fishbein and Ajzen's Theory of Planned Behavior (1975) supports the results that safety attitude and practice are significant predictors of a safety mindset. Specifically, this theory suggests that attitude toward a behavior reflects a safety mindset. In this study, a positive laboratory safety attitude was related to adopting a safety mindset.

The Theory of Planned Behavior also points out that perceived behavioral control is crucial for the consistent practice of safe laboratory behavior. Observance of safe behavior in laboratories contributes to a sense of control and self-efficacy, thereby reinforcing the intention to maintain a safety mindset. Specifically, following safe laboratory practices can motivate individuals to prioritize safety.

The regression model in this study revealed a significant improvement in predicting safety mindset when the components of KAP were added alongside the three confounding variables. However, the resulting McFadden's

R^2 exhibited only a moderate model fit, as the ideal value for a good model fit is 0.20 to 0.40 (Louviere et al., 2000). These results suggest that other variables affecting safety mindset were not accounted for.

Limitations and Further Research

The use of a cross-sectional, correlational research design can provide a snapshot of the relationships between variables at a single point in time. However, this research design is limited in establishing causality and the direction of the relationships between safety KAP and mindset. Future studies may adopt a longitudinal research design, which can offer more insight into how these variables change over time and how they likely influence each other.

While cluster sampling was employed in this study to ensure representativeness, the sample may not fully capture the diversity of individuals using chemistry laboratories. Biases in the selection of clusters or participants within clusters could affect the generalizability of this study. Future research can expand the sampling strategy to include a more diverse range of participants from different educational institutions or laboratory settings to enhance the generalizability of the results.

Although the sample size in this study met the minimum requirement for logistic regression, a larger sample size could enhance the statistical power and generalizability of the results. Given that other variables are unaccounted for in the regression model, future studies with larger sample sizes are needed to allow for the inclusion of additional variables in the regression model. To better understand the relationship between dependent and independent variables, future research should incorporate more diverse sample populations and control for potential confounding variables.

While efforts were made to ensure the reliability and validity of the survey instrument, self-reported measures may be subject to response biases, such as social desirability or recall bias. Additionally, the survey instrument primarily focused on quantitative measures, limiting the depth of understanding of the participants' perspectives. Future studies can benefit from triangulation by supplementing quantitative data with qualitative findings from interviews or focus groups to gain a deeper understanding of the relationship between safety KAP and mindset.

Although onsite administration of the survey to undergraduate students may have ensured higher response rates, administering the survey online to other participants may have introduced selection bias or response inconsistencies due to differing completion environments. To address this issue, future studies should carefully consider the target population and the most appropriate method of survey administration by taking into account the potential biases and inconsistencies that may arise from different completion environments.

Finally, this study relied on ordinal logistic regression to explore the relationship between safety KAP and mindset. Although larger sample sizes will provide more data to work with and potentially lead to more accurate results, future research should also consider employing more advanced regression techniques to better account

for the complex relationships between variables. The use of machine-learning algorithms can be explored to further improve the accuracy of regression models and provide more nuanced insights into the relationships between variables.

Conclusion

This study provides a better understanding of the relationship between safety KAP and mindset in a chemistry laboratory setting. Evidently, a strong organizational culture for laboratory safety can influence one's level of safety KAP and mindset. A safety culture in an organization includes well-established policies, protocols, procedures, and leadership support that can shape one's KAP and mindset regarding laboratory safety. Differences in the mean scores by age, affiliation, and safety training further demonstrate the importance of experience, exposure, and training on safety attitude, practice, and mindset. Additionally, safety attitude and practice can predict one's safety mindset, whereas safety knowledge cannot do so alone. These results highlight the importance of fostering positive safety attitude and practice while acknowledging the complexity of the factors contributing to the safety mindset in a laboratory setting. Opportunities for the practical application of safety knowledge are essential, as mere acquisition of knowledge is not enough to influence one's safety mindset. Hence, this study confirms that the laboratory safety mindset builds a safety culture through the components of KAP.

Gender-Affirming Care in Nursing Education: Students' Perceptions, Knowledge, and Attitudes

Marion Patti

Abstract: Discrimination and social determinants of health significantly affect patient care among transgender and gender diverse (TGD) people. The challenges that TGD people face within the healthcare setting are partially attributed to a lack of gender-affirming care education and training for health professionals. Although research is limited on gender-affirming care within nursing curricula, a study from McDowell et al. (2016) found that "of more than 1,000 baccalaureate nursing faculty in the United States indicated that nursing lags behind other health care professions in prioritizing transgender health education" (p. 476). Baccalaureate nursing programs dedicate an average of 2 hours to LGBT-related curricular content compared with schools of medicine, which dedicate an average of 5 hours (Lim et al., 2015). With nurses representing the largest segment of health professionals in the U.S., exploration of training and education of gender-affirming care within undergraduate nursing curricula may improve discrimination experienced by TGD people in the healthcare setting.

Keywords: Gender-affirming Care, Nursing Education, Transgender, Gender-diverse

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 626-637), Antalya, Turkey. ISTES.

Introduction

"Gender-affirming care is a supportive form of healthcare that consists of an array of services that may include medical, surgical, mental health, and non-medical services for transgender and nonbinary people" (OASH, 2023, para. 1). There has been a growing acknowledgment of the importance of providing gender-affirming care within the healthcare setting, especially in nursing practice. James et al. (2016) reported that approximately 25% of transgender and gender diverse (TGD) individuals reported delaying seeking healthcare due to fear of mistreatment, and 33% of TGD individuals reported having at least one negative experience within the healthcare setting. In a recent 2019 report, the Center for American Progress (CAP) found that TGD adults experience higher rates of adverse mental, behavioral, and physical health outcomes (Medina, 2024).

Unfortunately, there is "limited consideration for transgender health care in both educational nursing textbooks and nursing-based academic journals, perpetuating existing health disparities and invisibility faced by transgender people" (Guerin, 2021, p. 185). As a result, a lack of gender-affirming care education can leave students ill-prepared with the knowledge, skills, and attitudes necessary to deliver competent and compassionate care to TGD individuals. This study explored nursing students' perceptions, knowledge, and attitudes toward gender-affirming care before and after implementing TGD simulation training.

Recent studies have shown reduced empathetic and compassionate care in professional relationships among TGD patients (Mondatsou et al., 2020). Although compassionate and empathetic care is considered essential to building a therapeutic relationship between patients and healthcare professionals, Moudatsou et al. (2020) noted that healthcare professionals are challenged with adequate expression and utilization of empathy. Some contributing factors to a reduction of empathetic care included that patients believe healthcare providers do not understand their specific situations or that they come from different worlds.

Compassionate and empathetic care are closely related terms and are often used interchangeably. "Empathetic care is caregiving that supports clients' socioemotional capabilities and addresses their emotional needs. It is distinct from instrumental care, which involves assisting with physical needs such as activities of daily living" (Lamberton et al., 2013 para. 1). "Compassionate care is a process in which nurses interactively communicate with patients, try to explore patients' concerns by putting themselves in their positions and understanding their situations and do their utmost to eliminate these concerns" (Babaei et al., 2022, p. 239). Compassion and empathy are needed to provide and promote person-centered care in the clinical setting. "Person-centered care is holistic, individualized, just, respectful, compassionate, coordinated, evidence-based, and developmentally appropriate" (AACN, 2023, para. 1).

A reduction in compassion and empathy can lead nurses and nursing students to compassion fatigue. "According to a survey from the American Nurses Foundation, 81% of nurses reported feeling exhausted, and 71% reported feeling overwhelmed in 2021. Over time, these feelings can lead to compassion fatigue: a condition in which the cumulative burden and stress of nursing practice cause individuals to lose their ability to nurture and empathize with their patients" (Norwich University, 2023, para. 1). Yi et al. (2022) conducted a study that explored the prevalence of compassion fatigue among nursing students. The study results revealed that nearly one in five nursing students is at high risk for experiencing compassion fatigue. Other literature revealed that further research is needed to improve and foster compassionate and empathetic care among nurses and nursing students.

TGD Simulation Training

Empathy and compassion among nursing students are critical characteristics of promoting gender-affirming care. Novice nursing students can lack these key characteristics and need help developing therapeutic relationships and communicating confidently with TGD patients. Incorporating TGD simulation training among nursing students can elicit subjective understanding and learning, increasing empathy and compassion to foster

therapeutic relationships among TGD patients.

Developing TGD simulation training that immerses nursing students in realistic scenarios involving TGD patients can enhance their ability to provide compassionate and empathetic care. Simulation has been utilized as a transformative training tool in healthcare and nursing education, offering many advantages for the nursing curriculum. Simulation training can expose students to realistic clinical scenarios and provide tailored learning that is both repeatable and scalable. Simulation training can provide nursing students with an environment that ensures safe practice and ethical considerations. Embracing simulation training can enhance empathy, compassion, and understanding of transgender health content and can improve patient outcomes and the overall quality of gender-affirming care.

The development of the TGD training simulation proposed the following specific aims: Aim 1. Develop TGD simulation training for nursing students that simulates realistic scenarios with TGD patients. Aim 2. Assess the effectiveness of the TGD training in increasing gender-affirming care among nursing students. Aim 3. Examine the impact of compassionate and empathic care on the quality of gender-affirming care provided by nursing students.

Method

Study Design

The study included a descriptive quantitative design. All nursing students participate in a transgender standardized patient simulation as an assignment embedded in the nursing curriculum. To simulate realistic scenarios, standardized patients (SP) were recruited and trained to portray the role of a TGD patient. S.P.s were used in simulation training. Students who participated in the study answered demographic questions and pre-simulation and post-simulation questionnaires. Demographic questions were limited to only age and gender to protect the identity of the participants.

The questionnaire included questions measuring knowledge and attitudes towards providing health for TGD, questions exploring students' experiences with diversity, and knowledge of cultural competence. Students also answered open-ended questions regarding caring for transgender patients, experiences with diversity and knowledge of cultural competencies, and experiences with the simulation. The target population for this study included nursing students enrolled in a Bachelor of Science in Nursing (BSN) program at a University in Southern Mississippi.

Participants were 18 years of age or older. The researchers aimed to have at least 50 participants complete the online survey. The University of Southern Mississippi Institutional Review Board IRB-23-1042 reviewed and approved this study.

Study Tool

The survey tool measuring knowledge and attitudes toward providing health for TGD was developed in the Sherman et al. (2021) study specific to TGD health and the nursing student experience. The pre-simulation questionnaire is an 8-item, 5-point Likert scale with answers ranging from strongly disagree= 1 to strongly agree= 5. The questionnaire also included questions exploring students' experiences with diversity and knowledge of cultural competence and mental health resources for TGD patients with various 5-point Likert scale answers. Students also answered open-ended questions regarding caring for transgender patients, experiences with diversity and knowledge of cultural competencies, experiences with TGD education and training, and experiences with the simulation. See Table 1. Pre-simulation Survey Questions and Table 2. Post-simulation Survey Questions.

Table 1. Pre-Simulation Survey Questions

1.	As a nurse, I feel it is important for me to know about my patient's gender identity.
2.	I would feel comfortable interacting with a transgender or gender non-conforming ⁺ patient during clinical.
3.	*I would prefer not to care for patients who are transgender.
4.	*Knowing someone is transgender would negatively alter the way I perceive that person.
5.	I feel comfortable around people whose gender presentation is ambiguous
6.	*When I first meet a patient or colleague, I assume they are cisgender
7.	I have the skills to provide respectful care to meet the needs of a transgender or gender non-conforming ⁺ patient during clinical rotations.
8.	I am aware of resources where I can get more information or places, I can refer a transgender or gender non-conforming ⁺ patient who has needs I am not able to meet.
9.	How would you rate your level of awareness and understanding of different cultures, beliefs, diversity, equity, inclusion, and implicit bias?
10.	Have you received any training or education on cultural competence, diversity, equity, inclusion, and implicit bias in nursing?
11.	How comfortable do you feel providing care to patients from diverse backgrounds and/or with beliefs that may differ from your own?
12.	Do you believe that competence in diversity, equity, and inclusion is important in providing quality healthcare? If yes, please describe?
13.	Have you experienced any challenges or difficulties in providing care to patients from different backgrounds or with different beliefs? If yes, please describe.
14.	How often do you encounter situations where your own background, beliefs, and/or biases may influence your interactions with patients?
15.	What specific strategies or techniques can help nurses overcome biases and provide sensitive and equitable care to all patients?
16.	Have you ever witnessed or experienced any instances of implicit bias or lack of diversity, equity, or inclusion within the nursing profession? If yes, please provide examples.
17.	How comfortable do you feel addressing diversity, equity, and inclusion, and challenging implicit biases within the nursing profession?
18.	Have you received any training or education on learning to care for transgender patients in nursing school?

Table 2. Post-Simulation Survey Questions

1. As a nurse, I feel it is important for me to know about my patient's gender identity.
2. I would feel comfortable interacting with a transgender or gender non-conforming⁺ patient during clinical.
3. *I would prefer not to care for patients who are transgender.
4. *Knowing someone is transgender would negatively alter the way I perceive that person.
5. I feel comfortable around people whose gender presentation is ambiguous
6. *When I first meet a patient or colleague, I assume they are cisgender
7. I have the skills to provide respectful care to meet the needs of a transgender or gender non-conforming⁺ patient during clinical rotations.
8. I am aware of resources where I can get more information or places, I can refer a transgender or gender non-conforming⁺ patient who has needs I am not able to meet.
9. I believe that transgender and gender-diverse people have adequate mental health resources.
10. I have the skills to provide respectful care to meet the mental health needs of a transgender or gender conforming patient during clinical rotations.
11. I don't feel adequately prepared to care for transgender or gender non-conforming patients because of lack of education or knowledge.
12. Training and education prior to caring for transgender or gender non-conforming patients would have improved the patient care I provided during the simulation.
13. The simulation was beneficial and will improve my nursing skills to provide quality gender affirming care to my patients.

Study Population

The study participants ($n=40$) included students enrolled in a baccalaureate nursing program at a University in Southern Mississippi who participated in the TGD simulation training regarding gender-affirming care. Students were recruited via email. The researchers contacted the nursing faculty at the College of Nursing and Health Professions in the School of Professional Nursing Practice at a University in Southern Mississippi, responsible for conducting the simulation training. They requested that they forward a research announcement email to the students.

The announcement was sent before the simulation training was conducted. With the links provided in the announcement, participants were given access to two online questionnaires via the Qualtrics platform and were invited to participate in the research study, composed of a pre-simulation survey and a post-simulation survey. Participants were asked to complete a pre-simulation survey to gauge their baseline perceptions, knowledge, and attitudes toward gender-affirming care. Students then engaged in their simulation training. After the simulation training, students completed a post-simulation survey to assess changes in their perspectives and understanding of gender-affirming care. Both links were found in the same research announcement. Participants indicated informed consent to continue the questionnaire and completed each online survey in approximately 15 minutes. Qualtrics collected no identifying information. Students entered to win a \$50 gift card by completing both the pre-and post-simulation survey and providing an email in the email link in the post-simulation survey. Participation in the study was voluntary, and all responses were confidential.

Results

Pre-Simulation Survey Results

Analysis of the pre-simulation survey data revealed nuanced insights into nursing students' perceptions, knowledge, and attitudes towards gender-affirming care for transgender and gender-diverse (TGD) individuals. Responses to questions 1-2, 5, and 7-8 indicated a moderate level of gender sensitivity among students, with scores of 3 or higher. Conversely, analysis of responses to questions 3 and 4 revealed a higher degree of gender sensitivity, with scores of 3 or less. Notably, responses to question 6 reflected a lack of gender sensitivity, as students tended to assume patients' cisgender identities upon initial encounters.

Furthermore, when asked about their level of awareness and understanding of different cultures, beliefs, diversity, equity, inclusion, and implicit bias, approximately 78% of students reported being aware. Similarly, around 82% of students agreed that they had received training or education on cultural competence, diversity, equity, inclusion, and implicit bias in nursing. Additionally, a significant majority (88%) of students expressed feeling comfortable providing care to patients from diverse backgrounds or with beliefs that may differ from their own.

Post-Simulation Survey Results

After completing the simulation training, the post-simulation survey revealed notable changes in students' perceptions and attitudes towards TGD healthcare. Overall, there was a significant increase in gender sensitivity among students, as indicated by an average increase of 0.78 in scores for questions 1, 2, 5, 7, and 8. Conversely, a decrease of 0.38 in scores for questions 3 and 4, suggesting heightened gender sensitivity. Specifically, responses to question 6 demonstrated a slight decrease of 0.11, indicating an improvement in gender sensitivity as students became less likely to assume patients' gender identities.

Furthermore, students expressed varying opinions regarding their preparedness to care for TGD patients. While 65% of students disagreed that transgender and gender-diverse people have adequate mental health resources, 83% agreed that they possessed the skills to provide respectful care to meet the mental health needs of these patients. Additionally, 87% of students disagreed with the statement that they felt inadequately prepared to care for TGD patients due to a lack of education or knowledge. Moreover, 72% of students agreed that training and education before caring for TGD patients would have improved the patient care they provided during the simulation. Similarly, 85% of students agreed that the simulation was beneficial and would improve their nursing skills to provide quality gender-affirming care to their patients.

Qualitative Pre-Simulation Survey Findings

Open-ended responses from the pre-simulation survey highlighted students' perspectives and concerns regarding

TGD patient care. Themes such as the need for more Diversity, Equity, and Inclusion (DEI) training regarding gender identity and expression in nursing school, discomfort in providing care to TGD patients, and the importance of advocating for patients' rights emerged from the qualitative data. Additionally, students emphasized the significance of incorporating transgender patient care into the nursing curriculum and promoting respect for all individuals.

In summary, the pre-simulation and post-simulation survey results and qualitative findings provide valuable insights into the impact of TGD simulation training on nursing students' perceptions, knowledge, and attitudes toward gender-affirming care. Table 3 illuminates the overarching themes noted within the qualitative survey findings.

Table 3. Open-Ended Questions and Overarching Themes

Question: Do you believe that competence in diversity, equity, and inclusion is important in providing quality healthcare? If yes, please describe?

Overarching Theme: It is important in order to provide patient-centered care

Question: Have you experienced any challenges or difficulties in providing care to patients from different backgrounds or with different beliefs? If yes, please describe.

Overarching Theme: There have been challenges with language barriers

Question: How often do you encounter situations where your own background, beliefs, and/or biases may influence your interactions with patients?

Overarching Theme: Biases should not interfere with patient care, but personal religious practices and holiday celebrations may be different.

Question: What specific strategies or techniques can help nurses overcome biases and provide sensitive and equitable care to all patients?

Overarching Theme: Cultural sensitivity training, real-world experience and self-reflection or understanding.

Question: Have you ever witnessed or experienced any instances of implicit bias or lack of diversity, equity, or inclusion within the nursing profession? If yes, please provide examples.

Overarching Theme: A nurse would not check in on a patient as frequently as others because they felt uncomfortable.

Overarching Theme: Classmates say negative things about having to care for our transgender SIM patient

Question: Have you received any training any or education on learning to care for transgender patients in nursing school?

Overarching Theme: TGD has been introduces but it is not enough

Discussion

The simulation exercise emerged as a pivotal component in addressing the challenges surrounding transgender and gender-diverse patient care within nursing education. Our study's results underscore the transformative impact of TGD simulation training on nursing students' perceptions, knowledge, and attitudes towards gender-affirming care.

The quantitative analysis revealed a significant improvement in students' understanding of TGD issues and their confidence in providing gender-affirming care post-simulation. These findings align with previous research emphasizing the efficacy of simulation-based training in enhancing healthcare professionals' competencies and attitudes toward marginalized patient populations (Gillan et al., 2018). By immersing students in realistic scenarios involving TGD patients, the simulation exercise facilitated a deeper understanding of the unique challenges and healthcare needs of TGD individuals.

Moreover, the qualitative analysis unearthed a notable increase in empathy, awareness of TGD challenges, and enhanced communication skills among students following the simulation exercise. These qualitative findings resonate with the broader literature, highlighting the role of hands-on experiences, such as simulation exercises, in fostering empathy and cultural competence among healthcare professionals (Levett-Jones et al., 2011). By engaging students in experiential learning opportunities, such as TGD simulation exercises, nursing education can bridge the gap between theoretical knowledge and practical skills, cultivating a more empathetic and culturally competent nursing workforce.

Importantly, our findings underscore the broader implications of TGD simulation exercises in promoting inclusivity and equity in healthcare. By increasing gender sensitivity among students, TGD simulation exercises contribute to the creation of more inclusive healthcare environments where TGD individuals feel respected, understood, and valued. These findings align with the principles of person-centered care, emphasizing the importance of tailoring healthcare delivery to meet each patient's unique needs and preferences (AACN, 2023). In conclusion, our study highlights the pivotal role of TGD simulation exercises in nursing education in promoting better understanding, empathy, and inclusivity towards TGD individuals within healthcare settings. Continued integration of simulation-based training programs focusing on TGD healthcare issues is essential for preparing nursing students to deliver gender-affirming care competently and compassionately.

Limitations

While our study yielded valuable insights into the efficacy of TGD simulation training in enhancing nursing students' understanding and confidence in providing gender-affirming care, several limitations warrant consideration.

Firstly, the timing of the pre-simulation survey completion merits attention. While efforts were made to

administer the pre-simulation survey before the simulation exercise, it is essential to acknowledge that students may have engaged in preparatory activities, such as reading TGD articles and watching sensitive videos, before the survey. This exposure to TGD content outside of the simulation context could potentially influence students' baseline levels of gender sensitivity, thereby impacting the interpretation of pre-simulation survey results.

Additionally, the sample size of 40 students and the relatively short data collection period of one semester pose limitations to the generalizability and robustness of our findings. A larger sample size and longitudinal data collection spanning multiple semesters would enhance the reliability and validity of our results, allowing for more comprehensive insights into the long-term effects of TGD simulation training on nursing students' attitudes and behaviors toward TGD patient care.

Furthermore, high-fidelity mannequins for the simulation exercise may have introduced some artificiality to the experience. While high-fidelity simulation offers valuable opportunities for immersive learning, it may only partially replicate the complexity and nuances of real-life interactions with TGD patients. Future studies could explore alternative simulation modalities, such as standardized patients or virtual simulations, to provide a more authentic representation of TGD healthcare encounters.

Despite these limitations, our study contributes to the growing literature on TGD healthcare education. It underscores the importance of integrating simulation-based training into nursing curricula to promote gender sensitivity and inclusivity in healthcare practice. Addressing these limitations through larger-scale studies with more extended follow-up periods and diverse simulation modalities will be essential for advancing our understanding of effective strategies for preparing nursing students to deliver gender-affirming care competently and compassionately.

Conclusion

In conclusion, our study illuminates the transformative potential of TGD simulation training in nursing education, offering valuable insights into enhancing students' understanding, empathy, and confidence in providing gender-affirming care. By immersing students in realistic scenarios involving TGD patients, the simulation exercise effectively bridged the gap between theoretical knowledge and practical skills, fostering a deeper appreciation of the unique challenges and healthcare needs of TGD individuals.

Nursing programs promote equity and respect in healthcare by preparing nurses to provide competent care for TGD individuals. Our findings underscore the importance of investing in TGD education within nursing curricula to ensure that nurses are equipped to meet the diverse needs of their patients. By promoting diversity and empathy, nursing students can advocate for TGD individuals and other marginalized populations in healthcare, contributing to more inclusive and compassionate care delivery.

Furthermore, this study highlights the potential of TGD simulation exercises as a valuable educational tool in nursing education. By providing students with hands-on experiences that simulate real-world healthcare encounters, TGD simulation exercises enable students to develop the knowledge, skills, and attitudes necessary to deliver gender-affirming care competently and compassionately.

Our study emphasizes the importance of promoting gender-affirming care in healthcare settings. It underscores the critical role of nursing education in fostering inclusivity and respect for all patients, regardless of their gender identity or expression. By embracing TGD education and simulation training, nursing schools can play a pivotal role in shaping a healthcare workforce that is sensitive, competent, and responsive to the needs of TGD individuals and other marginalized populations.

Recommendations

Based on our study's findings and limitations, several recommendations emerge for future research and practice in the fields of nursing education and TGD healthcare. First, Nursing faculty should prioritize integrating TGD care education within nursing curricula. This could involve developing dedicated modules or courses that comprehensively cover TGD healthcare issues, including gender-affirming care practices and cultural competence.

Given the potential influence of exposure to TGD content on students' baseline levels of gender sensitivity, future studies should explore the impact of repeated exposure to TGD content within nursing education. Providing multiple opportunities for students to engage with TGD healthcare topics may lead to more sustained improvements in attitudes and behaviors towards TGD patient care.

To mitigate potential biases in pre-simulation survey responses, future studies should consider administering the survey immediately before the simulation exercise, ensuring that students have not been exposed to TGD content before completing the survey. This approach will provide a more accurate baseline assessment of students' knowledge, attitudes, and perceptions towards TGD healthcare issues.

While high-fidelity manikins were utilized in our study, future research could explore alternative simulation modalities, such as standardized patients or virtual simulations, to provide a more authentic representation of TGD healthcare encounters. Comparative studies investigating the effectiveness of different simulation approaches in promoting gender sensitivity and competence among nursing students would be valuable.

Future research should employ longitudinal study designs with larger sample sizes to enhance the generalizability and robustness of findings. Longitudinal studies allow for examining the long-term effects of TGD simulation training on nursing students' attitudes, behaviors, and clinical practice. Additionally, recruiting larger samples would facilitate subgroup analyses, enabling researchers to explore potential outcome variations

based on factors such as students' prior exposure to TGD content or their demographic characteristics.

Beyond examining the effects of TGD education and simulation training on nursing students, future research should also investigate the impact of such interventions on patient outcomes. Evaluating whether increased gender sensitivity and competence among nursing students translate into improved healthcare experiences and outcomes for TGD patients would provide valuable insights into the broader implications of TGD education in nursing.

In summary, by addressing these recommendations, future researchers can further advance our understanding of effective strategies for preparing nursing students to deliver gender-affirming care and promote inclusivity in healthcare settings.

Acknowledgments

Thank you to The University of Southern Mississippi for supporting our students and project.

English for the Workplace: Experiences and the Way Forward

Victoria Kalogerou

University of Nicosia, Cyprus,  <https://orcid.org/0000-0003-0871-5273>

Abstract: English is widely spoken in Cyprus especially in the areas of tourism and culture and most people in the country are familiar with using English with varying degrees of fluency. Often, even after years of exposure in the target language, people at the workplace may still lack the skills and/or the fluency to communicate effectively in English. The consecutive lockdowns imposed by COVID-19 required employees to communicate remotely to perform their day-to-day duties, which revealed the vulnerability of specific groups of workers. These could range from clerical assistants to senior managers. Consequently, the participants' expectations for the outcomes of any business English course would range from responding to phone calls and handling requests to negotiating agreements and reaching executive decisions. In this paper, I discuss the experience gained from custom-made, targeted Business courses for the Cypriot Market as well as how these needs required the development of particular courses for face-to-face meetings for adult learners. With 20 years long experience in teaching adults, I came to the conclusion that instructors who wish to develop and offer such courses need to have the flexibility to gear highly specialized professional niches to specific groups of people to produce highly successful courses. In this paper, I outline the needs of the particular market, describe the course and material development to address current needs and present data from professionals who participated in the courses described above.

Keywords: English for the Workplace, Practical Language Skills, Teaching and Learning

Introduction

Employees in Cyprus who use English at the workplace for communication, are not customarily expected to receive and produce language as native speakers but rather to be competent in the use of specific specialized work-related aspects or task types of English. Often though, even after years of studying English formally, during their high school or university education, when employees reach the workplace, experience difficulties in using the target language effectively. Another barrier is that language and language use change over time, leaving employees struggling with skills acquired sometimes over a decade earlier, unable to deal with communicative tasks relating to current needs. Other affective factors, such as the EU enlargement which in turn led to inward migration throughout the area (Nicolaou; 2016; Theophanous and Karyolemou, 2022) or the unprecedented situation caused by the lockdowns imposed to prevent the spread of Covid-19 (Kalogerou, 2022)

have exposed employees weaknesses when using English for work-related purposes.

Research carried out elsewhere suggests that while English has been consistently solidifying its importance as a tool in international business encounters, relatively little attention has been given “to the interface between actual workplace communication and language programs in terms of identifying and meeting learners’ needs” (Kim, 2021:1). With English becoming the European *lingua franca*, the need for improving English was also identified elsewhere. Judge (2012) in a study conducted in Spain, mentions that the use of English in Europe impacts not only the workplace but also international relations, education and research. He maintains that many business tasks including phone calls, e-mails, meetings, and presentations have been conducted in English throughout Europe. Tarnapolsky (2016) in his discussion of the Ukrainian workplace, he identifies that the ever-increasing spread of the English language as the tool of global communication, has led to an ever-increasing necessity for learning it, among those who had not acquired it properly during their formal education but urgently need it to improve their work performance and in turn their life prospects.

Cyprus, on the other hand, has a different history than the aforementioned countries, as it was a former British Colony. Its strong dependence on the service sector which comprise over 80% of the country’s GDP (Kalogerou, 2019) require people in most sectors of the economy to have a good command in the language. Therefore, due to historical and economic reasons, English has gradually assumed the status of the most popular and important second/foreign language (The status of English language on the island is arguable. For more on this see Buschfeld (2013), Fotiou (2015) and Tsiplakou (2009).) on the island, while people at the workplace use it with varying degrees of competence (Andreou and Kalogerou, 2016).

Development of the specific courses

Prior to presenting the Business courses developed and delivered, I provide in this section, some background to explain how the idea emerged. In addition to my academic duties at the University of Nicosia (UNic), I have worked as a consultant for many locally funded projects and provided translation services through my agency “English for the Workplace”. Through these collaborations I have had with the industry, I have often met individuals who had studied English for years, or even obtained degrees from English-speaking universities, but did not have the skills nor the confidence to engage in communicative activities in the target language. When I enquired why they did not attempt to enroll in classes to improve their skills, they came up with a number of excuses ranging from lack of time or poor finances to the limitations of available options. I realized that adults being busy with work and personal engagements may need an option that is targeted towards their needs, easily accessible, certified, affordable and effective.

Therefore, while examining various options to meet the needs identified, I liaised with our Training and Development Unit (TDU) at UNiC, to investigate the possibility of becoming a certified trainer. Such opportunities are available in Cyprus through the Human Resources Development Authority (HRDA) whose mission is “to create the conditions for planned and systematic training and development of the human resources

of Cyprus, at all levels and in all sectors, to meet the needs of the economy within the framework of the social and economic policy of the state". (<https://www.anad.org.cy>). To this end, once participants register to a training seminar series through their organization, they are entitled to having 80% of the associated cost covered and they only have to deposit the remaining 20%, which is often covered by the companies they work for. Unemployed participants, may join any seminar with no cost.

As the mission of the agency seemed to be covering the needs of the target groups I had in mind, I undertook the relevant training and took the exams, in order to gain certification and enable myself to offer business English courses to the industry. This process took about a year and once everything was in place, I started offering the course "English for Assistants" in collaboration with the TDU upon receiving approval through the HRDA. Since March 2022, I have offered the course twice a year. In what follows, I present the participants' evaluation of the course, comparing the results of the first attempt with the last attempt, to describe how the experience gained, has led to making the course more effective.

Method

Participants

Online surveys have become extremely popular as a data collection method, since researchers prefer this type because they yield quick responses (Saleh and Krishna, 2017). A total of 11 individuals (one(1) male and ten (10) female), all native speakers of Greek with one exception who spoke Bulgarian as a mother tongue and moved to Cyprus during her high school years, participated in these two (2) course evaluation surveys, that I include in this paper.

Results

Data collection and procedure

The main research instrument used for this study was a survey compiled using Google forms, which I divided into four sections. The first section was developed for participants to express their views on the course and its contents. The second aimed at collecting data pertaining to the instructor's knowledge of the subject and associated skills; the third was developed for participants to evaluate the premises and the place where the course was delivered while the fourth section aimed at examining the participants' views on the overall organization. Items were followed by a 5-point Likert scale of agreement consisting of the following points: (1) Strongly Disagree; (2) Disagree; (3) Neither Agree nor Disagree; (4) Agree; (5) Strongly Agree. Evaluation forms were sent out using a shortened link to the google forms to the participants via e-mail as it is the fastest, lowest cost method to deliver surveys (Saleh and Krishna, 2017). In what follows, I present indicative data collected from the first time the course was offered (March, 2022) and from the latest round of meetings (March, 2024).

Survey Results

The first question in the first section of the online questionnaire requires participants to indicate their level of agreement in relation to the item “The content of the seminar was useful” to which the first group unanimously agreed that the seminar was not at all useful.

1. Η ενότητα εκπαίδευσης ήταν χρήσιμη.

3 responses

Figure 1. Responses to the question “The content of the seminar was useful” (2022).

Participants asked in May 2024 to respond to the same item, unanimously indicated to strongly agree with the statement:

1. Η ενότητα εκπαίδευσης ήταν χρήσιμη.

8 responses

Figure 2. Responses to the question “The content of the seminar was useful” (2024).

In the same section, item three (3) of the online questionnaire, asks participants to indicate their level of agreement with the statement “the content and the structure were clear”. Two (2) participants strongly disagreed with the statement while one participant disagreed:

3. Η δομή και το περιεχόμενο ήταν σαφής

3 responses

Figure 3. Responses to the question “The content and the structure were clear” (2022).

Participants asked in May 2024 to respond to the same item as above, unanimously indicated that they strongly agreed with the statement:

Figure 4. Responses to the question “The content and the structure were clear” (2024)

In the same section, item five (5), asks participants to indicate their level of agreement with the statement “The way the content was delivered was effective”. Two (2) participants strongly disagreed with the statement while one participant disagreed:

Figure 5. Responses to the question “The way the content was delivered was effective” (2022)

Participants asked in May 2024, unanimously indicated that they strongly agreed with the statement:

Figure 6. Responses to the question “The way the content was delivered was effective” (2024)

Moving on to the second section aimed at collecting participants’ views with regard to the instructor, item one (1) asked participants to indicate the level of agreement with the statement “The instructor knew the subject

well”. Responses here were spread, as one (1) participant indicated to strongly disagree, one (1) participant indicated to disagree and one (1) participant indicated neither to agree nor to disagree with the statement:

1. Είχε τις απαραίτητες γνώσεις σχετικά με το αντικείμενο του προγράμματος.
3 responses

Figure 7. Responses to the question “The instructor knew the subject well” (2022)

Participants in May 2024, asked to respond to the same item, unanimously indicated to strongly agree with the statement:

1. Είχε τις απαραίτητες γνώσεις σχετικά με το αντικείμενο του προγράμματος.
8 responses

Figure 8. Responses to the question “The instructor knew the subject well” (2024)

Item two (2) in the second section of the questionnaire, asks participants to indicate their level of agreement for the statement “She was clear and able to transfer knowledge”. Two (2) participants indicated neither to agree nor to disagree with the statement, while one (1) participant indicated to strongly disagree with the statement:

2. Ήταν σαφής και μεταδοτικός.
3 responses

Figure 9. Responses to the question “She was clear and able to transfer knowledge” (2022)

Participants asked in May 2024 to respond to the same item, unanimously indicated that they strongly agreed with the statement:

Figure 10. Responses to the question “She was clear and able to transfer knowledge” (2024)

Item four (4) in the same section, asked participants to indicate their level of agreement in relation to the statement “She encouraged participants to participate”. Two (2) participants indicated neither to agree nor to disagree with the statement, while one (1) participant indicated to strongly disagree with the statement:

Figure 11. Responses to the question “She encouraged participants to participate” (2022)

Participants asked in May 2024, unanimously indicated to strongly agree with the statement:

Figure 12. Responses to the question “She encouraged participants to participate” (2024)

Item six (6) asked participants to state whether “She created a pleasant learning environment”. Two (2) participants indicated neither to agree nor to disagree with the statement, while one (1) participant indicated to strongly disagree with the statement:

Figure 13. Responses to the question “She created a pleasant learning environment” (2022)

Participants asked in May 2024, unanimously indicated that they strongly agreed with the statement:

Figure 14. Responses to the question “She created a pleasant learning environment” (2024)

Item eight (8) required participants to indicate the level of agreement with the statement “She helped me express myself better when using English”. Responses here spread, as one (1) participant indicated to strongly disagree, one (1) participant indicated to disagree and one (1) participant indicated neither to agree nor to disagree with the statement:

Figure 15. Responses to the question “She helped me express myself better when using English” (2022)

Participants asked in May 2024 to respond to the same item, unanimously indicated that they strongly agreed with the statement:

Figure 16. Responses to the question “She helped me express myself better when using English” (2024)

Moving on to section three (3) of the questionnaire which aimed at collecting participants’ views on the premises where the course was conducted, responses were completely dispersed in May 2022 as one (1) participant indicated to strongly disagree, one (1) participant indicated to strongly agree and one (1) participant indicated neither to agree nor to disagree with the statement:

Figure 17. Responses to the question “The premises where the course was carried out were” (2022)

Seven (7) of the participants asked in May 2024 to respond to the same item as above, indicated that they strongly agreed with the statement, while one (1) opted for the “agree” option:

Figure 18. Responses to the question “The premises where the course was carried out were” (2024)

Moving on to the fourth (4) section of the questionnaire which aimed at collecting responses with regard to the overall organization and administration of the course, item two (2) seeks the level of agreement of the participants in relation to the statement “I am satisfied with the way the seminar was organized”. For this item, one (1) participant indicated to strongly disagree, while one (1) participant indicated to agree and one (1) participant to strongly agree with the statement:

Figure 19. Responses to the question “I am satisfied with the way the seminar was organized” (2022)

Participants asked in May 2024 to respond to the same, unanimously indicated to strongly agree with the statement:

Figure 20. Responses to the question “I am satisfied with the way the seminar was organized” (2024)

Discussion

In the previous section, I present the results of the evaluation carried out in May 2022 and in May 2024, and in this section, I discuss the improvement observed between the first course offered and the latest I have data for.

Starting from the results relating to the content and delivery of the course (figures 1-6), perceptions have significantly improved. One justification can be found in the adjustments gradually made. One of the requirements of the HRDA to approve the course and subsidize participants is to submit a detailed programme prior to the commencement of the course, where all areas taught are described in thorough detail. To abide by the regulations, I included the areas of Business English I intended to cover, namely *intercultural communication skills in the 21st century*, *good-news messages*, *negative messages*, *persuasive messages*, etc. and

stuck to the letter of the submitted document. To this day, I have had mixed ability groups, in spite of what companies require. This meant that some of the participants could not fully follow the materials presented, which included many technical terms, as they presented weaknesses in the areas of grammar and vocabulary. Gradually, I realized that in addition to what participants sign up for, that is technical knowledge, they also need to refresh basic structures in grammar, i.e.: the use of the Present Perfect, so I do some exercises on grammar when the opportunity arises. Hence, while the structure and the contents essentially remained the same, the difference in opinions regarding these areas have significantly improved (see for example figures 3 and 4).

Moving on to the way I am perceived as an instructor, perceptions have significantly improved as well. From the indifferent or negative perceptions in May 2022, my performance, as well as my knowledge in the subject matter, appear to have significantly improved over a period of two years (see figures 7-16). Justification for this may be found in the improvement of confidence in teaching. Following Sadler (2013), as teachers alter their teaching practices, including strategies such as speaking at a slower pace, improving the clarity and organization of the materials and the lessons, their self-confidence appears to improve. Another factor that may potentially impacted in a positive way was that I became less afraid to introduce new ideas or deal with situations that the participants themselves brought to the meetings. Following Shaghaei and Turgay (2014) “Innovation is critical to the continuous improvement of education and the delivery of increased learning outcomes, equity, cost-efficiency and student satisfaction” (p.143). I would take it a step further to say that student satisfaction leads to improved perceptions on teaching practices.

Another factor that presumably may have added to participant satisfaction was that gradually I became better at managing more interactive methods such as role-playing and group discussions. In a study examining students’ perceptions at university level, authors found out that “students appreciated interactive teaching methods such as group discussions, role-playing, and case studies, which helped to keep them engaged and motivated” (Kamran, Afzal and Rafiq, 2023: 13) Further to this, .students acknowledged effective communication as a vital instrument for positive learning experiences and that teachers who they felt to be more approachable and open to feedback were more likely to create a positive learning environment (Kamran et al, 2023). Besides, the teacher is one of “the main actors in the teaching process [and] has an assignment to work continuously on the improvement of [their] personal characteristics and professional competencies in order to improve the quality of teaching” (Maksimović and Zajić, 2018: 172).

Finally, questions in sections three (3) and four (4) of the questionnaire aiming at collecting data on participants’ views in relation to the premises and organization of the seminar. Responses for these items were rather encouraging even for the first seminar organized. One (1) favourable response was collected in relation to the premises in May 2022 (see figure 18). The reality is that UNiC has invested over €100 million in campus infrastructure over the last few years creating a modern, up-to-date campus. Courses subsidized and approved by the HRDA need to be offered in preapproved classrooms, which abide by the regulations and restrictions they set. The TDU administers the allocation of these classrooms to internal or external staff who are HRDA certified trainers and offer courses approved by the agency. The expansive layout of UNiC’s campus allows instructors to

select specialized facilities to support their specific needs. The conference room I have selected for the delivery of these classes is on the first floor of the Research and Development Unit at UNiC, which is situated amid the urban landscape in the bustling suburb of Engomi in the capital of the island, Nicosia and is easily accessible.

Conclusion

This study provides for a comparison and contrast examination of courses developed and offered by the author in March 2022 and in March 2024, through the TDU for English at the Workplace, funded by the HRDA, carried out in May 2022 and May 2024 respectively. The results add to our understanding of the needs of adults who are struggling to improve their skills in English required for the competitive, global marketplace.

As it appears from the overall improvement in the perceptions of participants over the past two years,, continuous course evaluation helps, not only to refine teaching practices and increase participants' satisfaction, but help teachers, the author is a case in point, to polish their skills, reflect on their work, on their advantages and drawbacks and on what needs to be fixed.

One limitation of the survey is that it is limited to the Cypriot audience, including primarily individuals who have Greek as their mother tongue and learnt English through formal education. It appears that there are quite a few similarities with other countries, where English has become the main tool for business communication. Future research can shed light on additional similarities and differences.

Recommendations

This study offers insights on participants' perceptions in relation to Business English courses, offered under the umbrella of TDU by the author. Other HRDA trainers are recommended to follow-up on their participants' views in order to have more statistically significant results and enhance participants' overall experience.

Acknowledgements

I would like to thank Nicolas Kythreotis, George Siekkeris, Angelos Iacovides for their ongoing support in offering these courses. Special thanks to Aigli Mourouzidou for her dedication and support with the administration of these courses.

Abstract: The urgency of instilling a spirit of religious moderation among students has been echoed by the Ministry of Religion of the Republic of Indonesia since 2019. With reference to research results related to the high level of intolerance and radicalism among the young generation, even among elementary school students, through Decree of the Minister of Religion number 93 of 2022, the Government has declared the importance of instilling a spirit of religious moderation among the young generation. Bina Nusantara University as a higher education institution that is committed to contributing to build the good character of Indonesia is called upon to encourage the students in Bina Nusantara University to have a spirit of religious moderation. For this, of course, competency of lecturers are needed, because the Ministry of Education and Culture has announced the need for project-based learning for mandatory curriculum subjects where religion education is included. With this background, this research aims to show that lecturers' competence in delivering project-based learning in religion education has a significant influence in triggering students to uphold the spirit of religious moderation. And from the results of the research data processing, it was found that the influence of lecturer competence in delivering project-based learning was very significant on efforts to trigger students to have a spirit of religious moderation. And the conclusion is that in triggering the spirit of religious moderation among students, the adequate lecturer competence is needed in delivering religious education using a project based learning system.

Keywords: religious moderation, lecturer competence, project based learning, religion education

Introduction

The Indonesian government, through the Ministry of Religion, is concerned regarding the results of research conducted by the Setara Institute (2020) which found facts about widespread attitudes of intolerance and radicalism among students.(Setara Institute, n.d.) Therefore, the government through the Ministry of Religion has declared the importance of religious moderation. Responding to the Government's determination to emphasize the importance of Religious Moderation, the Catholic Community Advisor of DKI Jakarta Regional Office at the end of April 2022 held training for Catholic religion education teachers on the importance of instilling a spirit of religious moderation among students. In the interactions and discussions of religion education teachers at the primary and secondary education levels, a number of questions emerged that were related to the doubts of religion education teachers about instilling the spirit of Religious Moderation for the students.(Yulianti et al., 2018, 2022) The reason is, they argue that for students whose religious beliefs are immature, shouldn't religious militancy be instilled? What will happen if their religious beliefs become gray when the religion education teacher reveals that other religions are also good and can bring salvation too?

Meanwhile, the Indonesian government, through the Ministry of Education and Culture, has also announced the importance of religion education in higher education through project-based learning. Of course, the two spirits and goals of the Indonesian Government through the Ministry of Religion and the Ministry of Education and Culture must be supported by higher education institutions, both public and private. In turn, universities must also provide lecturers who teach religion education who are competent in teaching religion education through project-based learning in order to participate in forming religious moderation among the students.(Kusumajati et al., 2017) For this reason, this research wants to show how significant the contribution of lecturers' competence in delivering religion education through project-based learning is to build the religious moderation among the students.

Religious Moderation

According to Professor Azkal (2019) religious moderation is a perspective, attitude and behavior to always take a position in the middle, always act fairly, balanced and not extreme in religious practice.(Benawa, 2021) Meanwhile, according to the Ministry of Religion (2021), religious moderation is a joint commitment to maintain perfect balance, where every member of society, regardless of race, ethnicity, culture, religion and political preferences, must be willing to listen to each other, and learn to train each other's abilities. managing and resolving differences between them. In more detail, the Ministry of Religion (2019) described it in 3 indicators, namely national commitment, tolerance and non-violence.

It is further explained that in relation to national commitment what is meant is the extent to which a person's worldview, attitudes and religious practices have an impact on loyalty to the basic national consensus, especially in relation to the acceptance of Pancasila as the state ideology, his attitude towards ideological challenges that

are contrary to Pancasila, and nationalism.(Benawa et al., 2022; Fios et al., 2021; Siregar et al., 2019) As for tolerance, it is explained as an attitude of giving space and not interfering with other people's rights to believe, express their beliefs and express opinions, even though these things differ from what we believe, including the willingness to accept religious practices that accommodate local culture and traditions local. What is meant by non-violence in the context of religious moderation is understood as no-radicalism, namely an ideology and understanding that wants to make changes to the social and political system by using violent/extreme methods in the name of religion, including verbal violence, physical and mental.(Fios et al., 2017)

Lecturer Competence

Spencer and Spencer (1993) said that competence is an underlying characteristic of an individual that is casually related to criterion- referenced effective and/or superior performance in a job or situation.(Barman & Das, 2020; Nurahaju & Widanti, 2020; Wong, 2020) Competence according to Spencer-Spencer (1993) has characteristics, such as: 1) Motive, which is something that is consistently thought or desired by people who cause actions. Motivate push, directing, and having behavior towards a particular action or goal. 2) Traits, namely physical characteristics and consistent responses to situations or information. A person's character can affect performance at work, such as the ability to control emotions, attention to details, and so on. 3) self-concept, namely attitudes, values, or one's self-image. Confidence is people's belief that they can be effective in various situations is part of people's self-concept. 4) Knowledge, namely information that is owned by someone in a specific field. Knowledge is a complex competency, because it predicts what a person is capable of doing, not what he will do. Scores on knowledge tests often fail to predict job performance because they fail to measure knowledge and skills in ways that are actually used on the job. 5) Skills, namely the ability to do certain physical or mental tasks. Competence or cognitive skills include analytical and conceptual thinking. (Spencer: 1993, p. 9)

Competence is an ability to carry out a job or task that is based on skills and knowledge and is supported by the work attitude demanded by the job. Thus, competence shows skills or knowledge characterized by professionalism in a particular field as something that is most important, as the superiority of that field.(Wibowo, 2016)

Michael Zwell defined competencies as the enduring traits and characteristics that determine performance. (Zwell, 2000) Example of competencies are initiative, influence, teamwork, innovation, and strategic thinking.(Susilo, 2018; Yoyo Sudarso A., 2018)

Competence is an individual's ability to carry out a job correctly and have advantages based on matters relating to knowledge, skills and attitudes (Emron Edison, 2017, p. 140). Susilo (2018) defined competence as a person's ability to achieve, consisting of nine competency elements: Imagination, Knowledge, Experience, Emotion, Passion, Character, Attitude, Skill and Health. When combined, the initial letters of each word become I KEEP CASH. (Susilo, 2018)

Competence according to Simamora (1997, p. 122) is the skills, knowledge and abilities needed to carry out work actively. Steven and Mary Ann (2008, p. 36) said that competence is skills, knowledge, talents, values, directors and other personal characteristics that encourage superior performance.

From the definition presented by Steven and Mary Ann (2008), it implies that competence consists of several characteristics, namely, (1) Skills, which refers to a person's expertise in carrying out activities, (2) knowledge, refers to information obtained based on experience and types of practical knowledge, other academics, and learning outcomes, (3) Talent is a natural innate talent, as explained by Steven and Mary Ann (2008), is a natural talent that helps employees learn specific tasks quickly and carry them out well. (4) Values that refer to self-attitude (people-pleasing attitude, caring attitude to others, responsible attitude) and one's image. (5) Director, refers to activities to provide guidance, good instructions for students and make improvements to results that have not been achieved, and (6) Personal characteristics, refer to physical characteristics and consistency of situations or information.

Competence is needed to carry out a job or profession in any field. For this reason, work competency standards are needed. Competence is an input in the world of work, and an output for the world of education. That is, for any job and profession requires competence. In the world of work, competency standards are limits on work ability requirements for a certain level of professional work, which must be owned by someone to be able to carry out a job in accordance with the goals and requirements set by the company or company association, by professional associations, institutions. appointed, or by the government. For example, a person is not permitted to hold the nursing profession before having a certificate of passing the nurse competency test. (Susilo, 2018, p. 59). (Susilo, 2018)

Based on the description above, it can be formulated in general that competence is a person's ability to carry out tasks or work based on knowledge, skills and supported by attitudes that are individual characteristics. While lecturer competence is a set of knowledge, skills and behaviors that must be possessed, internalized, mastered and realized by lecturers in carrying out their professional duties. These competencies include pedagogic competence, personal competence, social competence and professional competence. (Ruman et al., 2015) The dimensions of competency are motives, traits, self-concept, knowledge and skills. While the indicators are mastery of teaching learning materials, implementation of evaluation, ability to empathize, sensitivity to the social environment, responsibility, honesty, discipline and objectivity.

Project Base Learning

Project based learning according to Saefudin (2014) is a learning method that uses problems as the first step in collecting and integrating new knowledge based on experience with real activities in life. This is done to help, encourage and guide students to focus on cooperation by involving group work and helping students to focus on their development.

Meanwhile, from the perspective of Goodman and Stivers (2010), project based learning can be interpreted as a teaching approach that is built on learning activities and real tasks that are given challenges to students related to daily needs to be solved in groups.

Project based learning emphasizes student-centered learning when conducting an in-depth investigation of a topic. Constructively, students explore or deepen their learning by taking a research-based approach to problems and questions that are meaningful, real and relevant. This distancing is the definition of project based learning according to Grant (2002).

This learning model can be ap

plied when the facilitator wants to create an active learning environment and asks students to focus on their development. So, the benefits of project base learning are improving problem solving skills, can improve collaboration skills, enable students to engage in active learning, improve students' critical and reflective thinking skills, help students develop more complex problem solving skills, students are more involved and motivated in learning, allowing lecturers to act as facilitators or companions in learning, increasing the reputation of higher education in society, and providing direct benefits to society.(Ruman et al., 2015)

Religion Education

Religion education is education that is expected to become a spirit, an inspiration in forming students' identity in developing their attitudes as stated in the provisions of Law Number 12 of 2012, article 1. The education system in Indonesia must encourage the formation of students' attitudes, faith and piety, so that they become more have noble character and integrity. The implication is that the education system at the basic education level in Indonesia must continue to develop the values of faith and religious morality in various aspects of its policies, so that religion education can be implemented seriously and responsibly, thereby producing students who (1) are devoted to the Almighty God and able to show his religious attitude, (2) upholding human values in carrying out duties based on religion, ethics and morals, (3) acting as a proud citizen, loving his homeland, having nationalism and a sense of responsibility to the state and nation, (4) respect the diversity of cultures, views, religions and beliefs, as well as the opinions of other people, (5) demonstrate a responsible attitude towards work in their field of expertise independently.

Meanwhile, in terms of understanding, students are expected to have knowledge and understanding of religious teachings, so that their faith and devotion to God will grow and develop. The more you know yourself as the Image of God, the more sensitivity and concern for others and your environment will grow and develop. Able to integrate religious values of faith and morals in daily life in the family, school and community. Increasingly aware of oneself as a member of a particular religious institution and actively involved in religious and community life. Increasingly purifying his motivation as a religious community and being able to dialogue and collaborate with friends from different religions.(Ruman et al., 2015) Able to internalize the values of faith and religious morals in building his life as a religious person patterned after the person of the founder of his religion, so that students will become individuals who are one hundred percent loyal as religious people and one hundred

percent loyal as good Indonesian citizens.

Referring to the Decree of the Director General of Higher Education Number 84/E/KPT/2020, the implementation of compulsory curriculum courses, especially in this case, Religion Education, is held to form students who have faith and are devoted to the Almighty God, have noble character and respect differences. It contains actual content and contextual and learning must be interactive, holistic, integrative, scientific, contextual, thematic, effective, collaborative and student-centered.

Method

This research used a simple quantitative method with the aim of examining how significant the contribution of the lecturer competence in delivering project base learning is on the religion education to build religious moderation spirit of the students. The reachable population in this research were 150 students at Bina Nusantara University Jakarta who were research students as the sample frame.

The number of samples taken for this research were 150 students randomly. Furthermore, respondents were asked to fill out a questionnaire regarding variables about lecturer competence as independent variable and religion education to build religious moderation spirit of the students as the dependent variable. The questionnaire was prepared using a Likert scale with the choices (1) Strongly disagree; (2) disagree; (3) Slightly disagree; (4) Agree; (5) Strongly Agree.

The independent variable (X) is lecturer competence consisting of 45 questions which are mastery of teaching materials 5 questions, use of the project base learning method 6 questions, implementation of evaluation 4 questions, ability to empathize 5 questions, sensitivity to the social environment 5 questions, responsibility 5 questions, honesty 5 questions, discipline 5 questions, objective 5 questions; and as dependent variable is religion education consisting of 32 questions which are grouped into 2 large groups regarding learning methods and content. Concerning methods include online 4 questions and onsite learning 4 questions as well as learning methods that are conducive to sustainability of the environment 4 questions. Those related to content include relationships with God 6 questions, relationships with others 7 questions, and relationships with the environment 7 questions. After the data was collected, the data was analyzed using path analysis with the help of the SPSS 22 software program. Path analysis was intentionally used to determine the magnitude of the contribution of lecturer competence (X) on religion education to build religious moderation spirit of the students (Y).

Results

From data processing with the SPSS 2022 program, the following results can be presented descriptive data as seen in Table 1.

Table 1. Descriptive Statistics

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance
VAR00001	150	62,00	154,00	216,00	186,0267	14,16061	200,523
VAR00002	150	34,00	128,00	162,00	145,8533	8,19018	67,079
Valid N (listwise)	150						

To show the validity result of using the parametric statistics such as path analysis requires three things to be fulfilled, namely the data has a normal distribution, linear regression, and significant regression as described follow.

Table 2. Tests of Normality

	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
VAR00001	0.053	150	0.200*	0.989	150	0.313
VAR00002	0.053	150	0.200*	0.986	150	0.133

*. This is a lower bound of the true significance.

a. Lilliefors Significance Correction

From Table 2 the result test of normality, it is known that the two variables are normally distributed, because the significance value in the Kolmogorov-Smirnov column is greater (>) than 0.050, such as X (Lecturer Competence) is 0.200* and Y (Religion Education) is 0.200*.

To strengthen the results of the data distribution normality test, it can be also seen at the histogram below.

Figure 1. Histogram of Lecturer Competence

Figure 2. Histogram of Religion Education

To test linearity, there is information, that if the value of Deviation from Linearity Sig. > 0.05, there is a significance linear relationship between the independent variable and the dependent variable. On the other hand, if the value of Deviation from Linearity Sig. < 0.05, there is no significant linear relationship between the independent variable and the dependent variable.

The results of the linearity test can be seen in Table 3.

Table 3. ANOVA Table

			Sum of		Mean		
			Squares	df	Square	F	Sig.
VAR00002 *	Between	(Combined)	3556.274	56	63.505	0.917	0.633
VAR00001	Groups	Linearity	8.617	1	8.617	0.124	0.725
		Deviation from					
		Linearity	3547.657	55	64.503	0.932	0.607
	Within Groups		6438.499	93	69.231		
	Total		9994.773	149			

From Table 3, the Deviation from Linearity Sig value is obtained. of 0.607 is greater than 0.05. So, it can be concluded that there is a significant linear relationship between independent variable (X) and dependent Variable (Y).

To test the significance, there is information, if the significance value (Sig) is smaller ($<$) than the 0.05 probability, it means that there is an influence of X (independent variable) on Y (dependent variable). On the other hand, if the significance value (Sig) is greater ($>$) than the probability of 0.05, it means that there is no effect of X (independent variable) on Y (dependent variable). The following are the results of the significance test which can be seen at the table 4 in the ANOVA^a table and the significance table in Table 5.

Table 4. ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	9911.524	1	9911.524	17620.616	0.000 ^b
	Residual	83.249	148	0.562		
	Total	9994.773	149			

a. Dependent Variable: VAR00002

b. Predictors: (Constant), VAR00001

From Table 4, it is known that the significance value (Sig) of 0.000 is smaller than the probability of 0.05, so it can be concluded that there is a significant influence of X (independent variable) on Y (dependent variable).

Table 5. Coefficients^a

		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	38.709	0.809		47.819	0.000
	VAR00001	0.576	0.004	0.996	132.743	0.000

a. Dependent Variable: VAR00002

Based on Table 5 above as the result of the data processing, a structural equation can be made as follow:

$$Y = 0.996 X + \epsilon_1$$

The equation showed the magnitude of the direct influence of Lecturer Competence in delivering Problem Base Learning (X) on Religion Education to build religious moderation spirit of the students (Y) with a coefficient of 0.996. It means that Lecturer Competence (independent variable) influenced 99.6% on the Religion Education and only 0.4% was influenced by other variables which were not discussed in this study.

Discussion

From the data processing results, it was found that the contribution of Lecturer Competence in delivering Problem Base Learning on the religion education to build religious moderation spirit of the students is truly significant, as shown by the significant number of 99.6%. The significance contribution of lecturer competence on the religion education to build religious moderation spirit of the students, which reached 99.6%, is understandable because without the competence of lecturers in delivering project-based learning, religious education to build a spirit of religious moderation in students will not happen.(Akhmadi, 2019; Aziz et al., 2019; Ramadhan & Islam, 2022). The results of this research are in line with the findings of B Munthe who stated that there is a significant effect between the professional competency of Christian religious education teachers in strengthening students' affective values in class ix of SMP Negeri 1 Pematangsiantar, North Sumatra, Indonesia.(Munte, 2016).

Likewise, the results of research which conducted by Noh Ibrahim Boiliu et al showed that the personal competence of the teachers of Christian Religion Education affected the motivation to learn in students High school in South Tangerang, Banten, Indonesia.(Boiliu & Stepanus, n.d.) Likewise, the research results of Norma Fitria (2022) also showed that lecturer competence has a big influence on the Accountability of Management of Islamic Religious Higher Education (the pedagogic competence of Islamic religious college lecturers has a positive effect on the accountability of Islamic religious college management).(Fitria, 2023; Hilmy et al., 2022) Research conducted by Yudha Nata Saputra also showed the results that the competence of the PAK teacher has an influence in overcoming problematic student learning behavior by 64.9%, on student learning motivation.(Saputra, 2022). So, even though their research settings are different, the results showed that there are support for the results of this research that there are the significant contribution of lecturers' competence in applying project-based learning to religious education in order to build a spirit of religious moderation for students.

Conclusion

With research results which showed the significance contribution of lecturer competence in delivering project based learning on the religion education to build religious moderation of the students (99.6%), it can be

concluded that the higher the level of lecturer competency in delivering project-based learning, the higher the contribution of lecturers who teach religion education to build the spirit of religious moderation for the students. And vice versa, the lower the level of competence of lecturers in delivering project-based learning, the lower the contribution of lecturers who teach religion education to build the spirit of religious moderation for the students.

Recommendations

Therefore, it is recommended that training on project-based learning be important for lecturers who teach religion education. Apart from that, it is also necessary for lecturers to understand the urgency and relevance of religion education which must be directed to build the spirit of religious moderation for the students.

Acknowledgement

Thank you very much for Bina Nusantara University that has given supporting us to finished this research. This research was made possible thanks to moral and material support through an internal grant from Bina Nusantara University, Jakarta, Indonesia.

Abstract: The aim of this study is to identify and describe the impact of the five longest running/oldest festivals in CALABARZON that contributed to the development of the host communities. The researcher used the social capital theory in studying the festivals as defined by Putnam (1995, 2000) and quoted by Stevenson in 2016. Putnam (1995, 2000) emphasized on networks, norms and social trust, with co-operation and collaboration producing mutual benefits for individuals, including a sense of well-being. This study used a phenomenological approach based on the lived experiences of the participant with the festivals they have attended. A total of 32 participants were selected using the snowball sampling, starting from the tourism officer of each local government that has jurisdiction of the festivals. The researchers used thematic analysis in identifying significant statements into themes and clustering of data. Aside from the obvious economic impact of festivals, the results show that festivals have an on the development of the communities that hold them by developing and preserving the network, norms and trust in each community. All the festivals lead to: (1) community cohesion, (2) sense of belonging/social inclusion, (3) well-being of individuals/Community, (4) education (trainings/seminars), (5) community involvement, (6) civic pride, (7) cultural improvement and preservation, and (8) Self-reliant economic development. Since data gathering procedure was done during the height of the COVID-19 pandemic and lockdowns and no mass gatherings were allowed, it is recommended that a similar study must be done during the festival proper to fully grasp the essence of the festivals. In addition, the results of this study may be used by festival organizers to ensure the success of festivals and for the community development practitioners, that festivals may be used to develop communities.

Keywords: festivals, qualitative research, community development, snowball sampling, social capital

Introduction

One may argue that different communities practice community development for a long time. However, there are various definitions of community development, one definition is that it may be a process: developing and enhancing the ability to act collectively, and an outcome: (1) taking collective action and (2) the result of that action for improvement in a community in any or all realms: physical, environmental, cultural, social, political, and economic (Phillips & Pittman, 2009). There are also studies that established how the idea of community development is related to Economic development as it incorporates creating jobs and aiding in accumulative efforts in sustaining a livelihood for people. Furthermore, community development takes on the idea of creating a more united group of individuals that shares respective social and psychological ties. This means that community development as an educational process enables citizens to address problems by group decision making or they may describe community development as involvement in a process to achieve improvement in some aspect of community life, where normally such action leads to the strengthening of the community's pattern of human and institutional relationships (Phillips & Pittman, 2009).

Festivals are commonly known to people as a day of celebration; throughout the whole world people celebrate various festivals. The idea came from different religious parties and ritual tributes and would usually include sharing of meals, hence the name; feasts, or festivals. But there is a distinction between the two; feasts are usually religious in origin, while most festivals are still in one way or another religious in origin, but they are politically motivated. It is one way of cementing a politician's name in the history of his locality. In present times, the festivities have become festivals that attract visitors from local and international origins.

The pre-colonial/native term for festival is Pandot, which is done in relation to ritual for good harvest, peaceful voyage, favorable outcome in times of war, and recovery from illnesses (de Placencia, 1589). There are a lot of festivals celebrated in the Philippines throughout the year (Zutshi, 2020). "Sinulog" is a dance ritual made to honor of the Santo Nino, a miraculous image in which transcend to religion. It is a Visayan term for the local dance that follows the rhythm of the river flow. The festival is celebrated for nine days which includes a grand parade on its culminating day. A water parade called fluvial procession is done before the parade was celebrated at dawn from Mandaue City to Cebu City. Another Festival is done in Kalibo, Aklan, people celebrate what is considered the wildest among Philippine fiestas; it is known as the "Ati-atihan" and it also honors the Sto. Niño.

There are many festivals in the CALABARZON area (Hephaestus, 2011). The Bañamos Festival of Los Baños is held as part of the foundation celebration of the municipality; Ala eh Festival of Batangas is part of the celebration of the foundation of the province; Pahimis Festival of Amadeo, Cavite features its coffee. Festivals can be manifestations of the experience economy (Pine & Gilmore, 1999) as festivals entertain and educate people who attend about the communities that hold them (Jepson & Clarke, 2015). Furthermore, the success of any festival is reliant on the local community that holds them (Pine & Gilmore, 1999). Other studies (Getz, 1991; Getz, 1997) also imply that festivals can be used to build communities, promote ethnicity within society, and help preserve and celebrate traditions, history and culture. Festivals may also be used as a strategy to extend a destinations lifecycle (Chacko & Schaffer, 1993). Dugas and Schweitzer (1997) concluded that to develop a sense of community is hard work, long term, especially to build levels of connectedness, belonging and support.

Decco & Baloglu (2002) and Ritchie & Smith (1991) believed that festivals have huge impacts on tourism, and these impacts may now be linked with community development. Many studies have documented positive outcomes (Jeong & Faulkner, 1996; Lee, Lee & Lee, 2005). It is highlighted that an international exposure of the local communities can establish both short and long-term opportunity for visitor flow. With respect to the former, considerable attention has been paid to how events can re-shape a city's image, although Boo & Busser (2006) claim that few studies have empirically examined the role of festivals in destination image improvement and call for longitudinal research on this question.

Objectives of the Study

In general, this study aimed to analyze the festivals in the development of the host communities using the social capital theory with a phenomenological approach. In plain sight, a festival may be seen as just short to long term celebrations. However, festivals are yearly events that takes a year-long of planning, creation of committees, and enactment of legislations. Ultimately, Festivals attract tourists to the community that hosts them. This brings additional income to the community during the duration of the celebration. Hence, since festivals are yearly events, the researchers believe that festivals help the development of a community in a year-long basis, not and not just on the days when the festivals are held. This study aimed to analyze the role of festivals in the development of the community using the social capital theory, on a consistent year-long basis which culminates every celebration of the festival itself using a phenomenological approach. In addition, most of the studies done about festivals are foreign and deal mostly on the economic impacts of these festivals and there is little known literature that study their 6 impacts and contribution to the holistic development of the communities using the social capital theory (Quinn & Wilks, 2013).

Specifically, it aimed to:

1. Describe the longest running festivals in CALABARZON, Philippines;
2. Determine and describe the impact of these festivals on the communities that hold them in relation to social capital theory;
3. Identify the feature or characteristics of these festivals that contributed to the development of the host

community.

Scope and Limitation of the Study

All the data were gathered from the months of July to September 2021. Data gathering was heavily affected by the differences in the quarantine restrictions of the provincial government units where the festivals were held. For the Anilag Festival done at municipality of Sta. Cruz, province of Laguna, data gathering was a combination of key informant interviews and focus group discussion via personal and online interviews. For the Coco Festival located in San Pablo City, Laguna, all the data were gathered through online interviews with a combination of key informant interviews and focus group discussions. For the Pahiyas Festival which is located in Municipality of Lucban, province of Quezon, data were gathered via key informant interviews through personal and online interviews using zoom meetings. For the Higantes Festival, which was in the municipality of Angono, province of Rizal, data were gathered via key informant interview both through personal and online interview using zoom meetings. For the Lechon Festival, located in the municipality of Balayan, province of Batangas, data were gathered using the key informant interview via personal and online interview through zoom meetings.

Due to differences in quarantine classifications in the provinces covered by this study, some of the interviews were done online when they were under strict quarantine classifications. The online interview was heavily hampered by internet connectivity, which was frustrating at times. Connections were choppy or dropped while the participants were in the middle of answering questions and you had to ask the participants to repeat what they said. Another limitation of online interviews is you cannot really see the participant's body language and their facial expressions which can help researchers probe into certain topics that the participants were enthusiastic about and which topics they were not comfortable in.

Theoretical Framework of the Study

The researchers used the social capital theory in studying the festivals and its implications on the host community. Social capital can be inclusive for the benefit of everyone within a community. According to Tirmizi (2005), social capital can be considered as a 'tool' in enabling community activities. Social Capital is present in a community which is demonstrated in an planned and collaborative actions initiated by the people in the community, its organizers, and other institutions that worked together. In this study, researcher particularly used the themes: network, norms, and trust with co-operation and collaboration producing mutual benefits for individuals, including a sense of well-being emphasized by Putnam (1995, 2000). The researchers further deduced from the participants several characteristics of the festivals that are related to concepts that lead to the development of the host community such as: (1) community cohesion, (2) sense of belonging, (3) well-being of individuals, (4) education (trainings/seminars), (5) community involvement, (6) civic pride, (7) social inclusion, (8) cultural improvement and preservation.

Method

Research Design

To gain a wide understanding of the selected festivals in Region 4A (CALABARZON), Philippines, a phenomenological approach was used in this study. According to Creswell (2007), phenomenological study describes the meaning for several individuals of their lived experiences of a concept or a phenomenon. Phenomenologists is more focused on narrating what the participants commonly experienced in a given phenomenon. The basic purpose of phenomenology is to lessen experiences by each individual in a specific phenomenon to be able to describe and create an idea, or a "grasp of the very nature of the thing," (van Manen, 1990, p. 177). To this end, qualitative researchers identify a phenomenon (an "object" of human experience; van Manen, 1990, p. 163). This human experience may be phenomena such as insomnia, being left out, anger, grief, or undergoing coronary artery bypass surgery (Moustakas, 1994).

The inquirer then gather data from respondents who have experienced the same phenomenon and create a composite description of the essence of their experience. This description consists of "what" they experienced and "how" they experienced it (Moustakas, 1994). 45 Furthermore, there are two approaches to phenomenology, namely: (1) hermeneutic phenomenology (van Marren, 1990) and (2) empirical, transcendental, or psychological phenomenology (Moustakas, 1994). In particular, this study used Moustakas's (1994) transcendental or phycological phenomenology, which give more emphasis on the experiences of each participant rather than what the researcher concluded. Furthermore, Moustakas also gives emphasis on epoch (also known as bracketing), another Husserl's idea, in which researcher try to put their own experiences aside in order to look at the phenomenon they are studying from a different perspective. Hence, "transcendental" means "in which everything is perceived freshly, as if for the first time" (Moustakas, 1994, p. 34). Moustakas admits that this state is seldom perfectly achieved. However, according to Creswell (2007), he sees researchers who embrace this idea when they begin a project by describing their own experiences with the phenomenon and bracketing out their views before proceeding with the experiences of others. Besides bracketing, empirical, transcendental phenomenology draws on the Duquesne Studies in Phenomenological Psychology (e.g., Giorgi, 1985) and the data analysis procedures of Van Kaam (1966) and Colaizzi (1978). The procedures, illustrated by Moustakas (1994), consist of identifying a phenomenon to study, bracketing out one's experiences, and collecting data from several persons who have experienced the phenomenon.

The researchers analyzed the data by clustering significant and relevant statements or direct quotation and incorporate those statements into codes and merged them into themes. The festivals under study are those that have been organized, supported, acknowledged, or started by the Provincial government of each province in the CALABARZON region for at least 10 years. The festivals covered in this study are: (1) Anilag Festival of Laguna, (2) Parada ng Lechon/Lechon Festival of Batangas, (3) Higantes Festival of Rizal, (4) Pahiyas Festival of Quezon, and (5) the Coco Festival of San Pablo City Laguna. The Oldest City in Laguna.

Locale of Study

The locale of the study is Region IV-A CALABARZON, which composed of five provinces: Cavite, Laguna, Batangas, Rizal, and Quezon. CALABARZON has 123 municipalities, and 19 cities. It has a total number of 4,018 barangays. Furthermore, CALABARZON is home to a lot of festivals that has been celebrated for a long time, most of the festivals in CALABARZON has been celebrated in the mid to late 1990's. Making CALABARZON an ideal locale to conduct the study.

Figure 1. Map of CALABARZON

Source: <https://calabarzon.dennr.gov.ph/index.php/about-us/regional-profile>

Selection of Research Participants

A total of 32 participants were interviewed using key informant interview or focus group discussions which includes 1 organizer and 2 participants. The organizers are the head of the tourism office or their personnel, or personnel part of the organizing committee/working committee for the festivals for as long as they were part of the committee that helped make the festival materialized/happen. The participants, came from the businessmen or local people who participated/attended the festival at least twice, in any of the following: (1) watched a part of the event, (2) people who are involved and who participate any part program of the festival. Furthermore, a snowball sampling technique identified the respondents which includes everyone from the head of the tourism offices or their staff until the data saturation was reached. The tourism head/staff were asked to provide two respondents that they make recommend to be interviewed that is knowledgeable with the festival. These two respondents were then asked to provide to more respondents who are also knowledgeable about the festival with the same qualification as them, this process was continued by the authors until data saturation was reached.

Data Analysis

Thematic analysis was done to determine and describe the impact of festivals in relation to social capital theory. the researcher used the application NVIVO to identify themes and clustering of significant statements, since this

is a qualitative social science study that dealt with a significant amount of data. direct quotations was used and clustered in the NVIVO application and was categorized into codes and eventually in themes such as: network, norms, and trust, then deduced them into several characteristics/codes that are related to community development such as: (1) community cohesion, (2) sense of belonging, (3) well-being of individuals, (4) education (trainings/seminars), (5) community involvement, (6) civic pride, (7) social inclusion, (8) cultural improvement and preservation.

Results and Discussion

Description of the Longest Running Festivals in CALABARZON, Philippines

The Anilag Festival

The *Anilag* festival is celebrated in the town of Sta. Cruz, being the provincial capital of Laguna since 2004. It is a celebration and promotion of products and delicacies like crops, livestock and poultry, bamboo, rattan, and soft hardwood. It is short for “*Ani ng Laguna*” which was originally conceptualized during the time of Governor Joey Lina (1995-2001). This primarily features the farmers and their agricultural products, but it has now evolved into a week-long annual event that also features the top products of each town (six component cities and 24 municipalities), natural wonders, culture, history, and religion. In addition, it promotes the heritage of each town and in relation to the promotion is the preservation of each town’s identity. It is claimed to be the “Mother of All Festivals” by its organizers and features all the 26 festivals of Laguna rolled into one.

For a time, it was renamed La Laguna during the time of the former governor George Estregan (ER) Ejercito. The reason as to why it was being celebrated was also changed, as well as the dates of the celebration. It is what makes the Anilag Festival unique. It is the only festival that went through this process as mentioned by the organizer of the festival:

“The Anilag Festival means the harvest of Laguna. It was conceptualized to feature the different harvests of Laguna. Not only the products but also the services of the province.”-Male, 55 yo

The festival was originally formed to showcase the agricultural products of Laguna. However, nowadays it also serves as a venue to introduce to the tourists the whole province of Laguna. Not just the products but also the history, the natural wonders, the culture, and the talents of the people of each town of Laguna. It is an event that promotes inclusivity, and, in the process, it unites the people of Laguna. According to the festival organizer:

“Actually, it was conceptualized by Governor Joey Lina to promote the agricultural products of the province, then it was turned into a festival not only for agricultural products, but also to promote for example: heritage of a town in the province, to promote preservation as well.”-Male, 55 yo

The Lechon Festival

The *Parada ng Lechon*/Lechon Festival of Batangas, held by the town of Balayan has its roots all the way from the Spanish colonization period in the Philippines; and is dubbed as the ultimate fiesta experience in the Philippines which is done in celebration of the sainthood of Saint John the Baptist (Chongson, 2004). *Parada ng Lechon*, known as the “King of all Batangas Festivals,” is an annual event held on the 24th of June to honor St. John the Baptist, the town’s patron saint. In this festival, hundreds of roasted pigs are adorned in creative dresses and accessories and are showcased around town by a parade. Likewise, water dousing is incorporated in the feast as a centuries-old practice. This is a unique festival because it dates all the way back to the Spanish and American regimes where blessed and fortunate families would parade a lechon in town plaza during the Feast of St. John the Baptist and show it to the poor people of Balayan. This is also done to give thanksgiving and adoration to their patron saint. In addition, the first recorded San Juan fiesta in Balayan that is associated with the lechon was in 1906. This festival is considered as unique since it has been celebrated for more than 100 years now.

The festival was also originally done by the working class from the western district of the población (Kamluran district) to share their blessings and give thanks for the blessings they received during the past year. They would parade lechons in the town plaza (Roman Catholic Church) for the lesser fortunate people from the other districts of the town during the town’s feast (June 24), feast of Saint John the Baptist. The parade is accompanied by water dousing of everyone who is in the vicinity. However, the first ever recorded feast that features a parade of roasted pigs was in 1906. As the years passed by, more and more people from the west district started to join, as they receive more blessings of which they associate with the *Parada ng Lechon* as mentioned by the tourism officer:

“Even before the 1900s, there was already a parade of roasted pigs, but the festival as we know it was only formed in 1959 when the brotherhood of Saint John the Baptist was formed.” -Female, 28 yo

As it grew, the elders of the west district formed the group *Hermanand* for San Juan Bautista to properly organize the festival and ever since, it has been them who oversee the festival. That is the unique characteristic of this festival, it is one of the oldest. However, they have maintained the festival to be controlled by the private group, but in coordination and proper support of the local government of Balayan as the tourism officer stated:

“I researched about other festivals, and I learned that the other festivals are controlled and spearheaded by the LGUs. I asked some of the town councilors if we have laws or ordinances regarding the festival, we do not have one. All we have is a verbal agreement with the hermandad. The total control and program implementation is with the hermandad. The LGU is just here to support them, and we are helping them in almost all of the activities and programs of the festival.”
- Female, 28 yo

The Higantes Festival

The Higantes Festival is a non-religious celebration commenced and celebrated in the Municipality of Angono, Rizal to express the resident's gratitude to its patron Saint Clement. The parade giants is held every Sunday before the town feast on November 23. However, what makes it unique is its origin. Based on Angono folklore, the 'higante' symbolizes the agrarian protest during the later years of the Spanish colonization when Angono was a *hacienda* (large tract of lands). However, Saguinsin, as cited by Marcial (2020), theorized that the higante was inexistent and the locals of Angono actually referred to a tall and towering 'katiwala' or hacienda caretaker named *Karias Tangkad* as the giant whom the residents were exacting and taking revenge, which is 'higanti' in Filipino. The people of Angono used the festival as an opportunity to mock hacienda owners by making papier-mâché caricatures (Tan, 2012).

Among the five festivals chosen in this study, the Higantes Festival is arguably the 2nd oldest when it comes to its origin, however, the festival's origin is a bit hard to decide on, which is also the reason that makes the Higantes festival unique. The aim of the festival is also vague in the beginning, as some sources tell it was a form of protest against the rich landowners of Angono, or a form of revenge (*higanti*) against a tall/giant (*higante*) caretaker of the land of Angono, or a form of morale booster for the people of Angono during the post-World War 2 period. However, one thing is for sure, the festival as we know it today, since Angono is the art capital, it makes sense that the festival is about parading creative giant paper maches to showcase the local artists and their creativity. The contemporary festival started as an event which is part of the town's fiesta with only three giants (a family) being paraded. Then it was proposed by the late Perdigon Vocalan to make more giants, to encourage the local artists to join, and for it to be celebrated on a different day from the fiesta. The main purpose of the festival is to be an event to showcase the creativity and the artistry of the local artists of the town. As mentioned by the son of Mr. Vocalan who also owns a local art gallery/restaurant:

"The Higantes Festival is from the town fiesta of Angono. Before there were only three giants, a family of giants. Then my father proposed a project in the NCCA(National Commission for Culture and Arts) why not multiply it and make it a festival. Back then, it was celebrated together with the town fiesta. My father proposed why not celebrate the Higantes Festival on a separate day. A workshop was held on how to make a giant out of papers, and it was open to all the barangays who wanted to join. A contest was held for the best giant, until it became a tradition and later, the LGU has acquired total control of the festival."

- Male, 52 yo

The Coconut Festival

The Coconut Festival, more popularly known as Coco Festival is celebrated by the City of San Pablo, Laguna. This festival has been celebrated annually since 1996. According to Ladanga, Padrigalan & Muya (2018), it is

held every second week of January in conjunction with the town's fiesta. It is a festival that features not only one of the City's agricultural products (coconuts), but it also aims to boost tourism by promoting art, the rich culture of the town, and other agricultural products as well (Ladanga, Padrigalan, & Muya, 2018). What makes this festival unique is that San Pablo City is one of the oldest cities in Laguna and it is well known for its lakes. Thus, it is called as the City of Seven Lakes, but it has chosen to feature its agriculture products primarily the coconut instead of the lakes in the festival.

What makes the Coconut Festival unique is that it is one of the oldest festivals in Laguna that was fully conceptualized, implemented, and controlled by LGU. It has been celebrated for 25 years prior to the pandemic. It is celebrated in conjunction with the town feast. Resolution No. 96-765 is the ordinance that officially proclaims the Coconut Festival as the official festival of San Pablo City. The aim of the Coconut Festival is to give importance to the coconut industry of San Pablo City. It is very important because it is one of the primary reasons why the city is recognized as a first-class city, the first city to be declared as such in Laguna. According to the tourism officer:

"We conceptualized the Coco Festival in 1996 through Resolution No. 96-765 which recognizes that this will be the official festival of the city of San Pablo. We have reached 25 years last year, unfortunately pandemic so we did not have any activity particularly the highlight of our festival. It was implemented to give importance to the coconut industry because that's why we became the first-class city in the province of Laguna." **-Female, 56 yo**

The Pahiyas Festival

The *Pahiyas* festival is another unique festival if not the most unique of them all, because its origin is believed to date back during the precolonial period, when the first Catholic church was established in Lucban, Quezon, under Captain Lukas Martin in 1630, under the supervision of Fr. Alfonso de San Miguel (1628). During this time, there was an increased emphasis on converting indigenous population towards a more religious side. This initiated those natives and locals to ask the help of their parish priest during their harvest time. They then brought their agricultural products inside the new and much bigger church in which where the parish priest traditionally bless the harvest as a form of thanksgiving to the Lord. As a result, the following year, the farmers experienced another plentiful harvest, thus intensifying beliefs and devotion to Saint Isidore (1595) as the intercessor of God's blessing to them. The *Pahiyas* festival has been observed actually prior to the coming of the Spaniards, but it was absorbed into the feast of town's patron saint (Antohilao, 2004).

When it comes to origin, the *Pahiyas* Festival is the oldest and the most famous among the five festivals of this study. It can also be argued that it is one of the oldest in the Philippines. It is believed that the natives of Lucban, prior to their conversion to Christianity had already been practicing the *Pahiyas*, but when the locals were converted the practice was integrated into the celebration of the feast of San Isidro Labrador. The

implementation of the festival now is headed by the local government in partnership with the church, the church is still involved, however unlike before it was spearheaded by the church together with the town people. There is an official ordinance that institutionalized the celebration of the festival and transferred the control of the festival to the local government of Lucban. According to the tourism officer of Lucban:

“Celebrated during the feast to San Isidro Labrador, it is thanksgiving to the patron saint of the farmers for the bountiful harvest of the year. It has been believed that even before the conversion of the natives to Christianity (1500) they were already giving thanks for their bountiful harvest. When the natives were converted the church found a way to integrate the festival into the feast of San Isidro Labrador, still not losing its main objective, which is to give thanks for the bountiful harvest of the year. The festival has been institutionalized and has been under the supervision of both the local government and the church (catholic). So, the decoration only revolves around the town proper during the festival, sometimes the route changes, just depends on the LGU what streets will be part of the route.)- Female, 45

Effects of the Festival on the Social Capital of the Host Communities

Table 1. Effects of the Festivals on the social capital of the host community

DIRECT QUOTATION/NVIVO	Description/CODES	THEMES
<i>I met a lot of people because of the festival who became my friends</i>		
<i>The team of Kapuso Mo Jessica Soho and they were able to feature my cheesecake.</i>		
<i>People come who are potential long-term customers</i>		
<i>Able to have a project in another province.</i>	<i>Extension of network</i>	<i>Bridging Social Capital</i>
<i>Friends of friends became my friends.</i>		
<i>My art café gained new customers.</i>		
<i>Met a lot of people in participating in the events and as contestant of the events</i>		

Friends and relatives

Family and officemates

We get to be reunited with friends and relatives. The festival is a good bonding event

We bring friends we met from other towns/cities/countries for them to experience the fun and hype.

Renewal of trust

bonding moments with family, former classmates, and quality time with friends.

*Bonding Social
Capital*

Officemates and friends from other provinces

Venue for reunions and family gatherings

Friends from Manila

Family members or relatives

the final decision is with the brotherhood of the Hermandad. We cannot bypass them.

The Municipality of Balayan provides manpower, financial, and/or traffic management assistance

It was institutionalized thru a law.

The festival has been institutionalized and has been under the supervision of both the local government and the Catholic church.

Partnership

Aside from the annual budget, it is heavily sponsored by local businesses, personalities and big companies both from local and national.

*Linking Social
Capital*

Seek the support and participation of the different stakeholders.

Tapping of social media influencers and mainstream media such as Channe1 2 and 7.

Seeks the support of the private and public sectors, small businesses, big corporations, participation of all the members of the community

Bridging Social Capital

The participants affirmed that they met several persons who later became permanent acquaintances. Because of the festival she was able to extend her network and that she was able to convince one co-volunteer to transfer to the school that she is currently enrolled in. They have been very close with one another. A connection that she would have never had if not for the festival.

For the businessmen, it is an event where they were able to gain new customers that are now their regular customers. The festival is a venue where they met someone and that someone gave a big project to that local artist. It is also a venue where they gained new regular customers One of them even mentioned that because of the festival their product was featured in a big-time prime time television show and because of that, her product

is now one of the most famous products of Balayan which extended her network. A network that would not have existed if it was not for the festival:

“Yes, the team of Kapuso Mo Jessica Soho and they were able to feature our cheesecake which became a hit in Balayan and some parts of Batangas and Manila as well.” - Female, 49 yo

“Yes, we do try to make it a point to serve food during the feast, so that when visitors come, we can offer them something and they turn in to a permanent customer.” - Male, 53 yo

According to the local artist who owns a gallery art café and employee, respectively:

“ Yes, because of the festival, my art café gained permanent customers.”-Male, 42 yo

“Yes, my boss met someone who gave him a project in the province because of the festival.”-Female, 28 yo

According to the participants, because of the festival they met people whom they were competing with in an event of the festival, and they became friends, and one mentioned they became family. Because of the festival, they were able to extend their networks. These are the words of the contestants in the events of the festival:

“I learned stories about their personal lives and gained more friends whom I now consider as family.” - Male, 24 yo

“I gained new friends specially the group of dancers from San Pablo City.”-Male, 28 yo

They became friends because of the dance contest, and they now became connected that are giving each other tips when a dance competition in other places is being held, so that their groups may join the competition and compete with one another. For the participants, the festival is a place where they met friends of friends and almost became lovers as mentioned by one of them:

“I gained friends, friends of friends whom I shared drinks with, one almost turned into a relationship.”-Female, 24 yo

Bonding Social Capital

When the researcher asked some of the research participants who attended some of the events of the festival, they negated meeting someone new/permanent because of the festival. However, in watching/attending events of the festival they were usually with their relatives, friends and classmates. This means that the festival is an event where the residents of Laguna can enjoy and bond together. The participants answered they were with their:

“Family, Friends and relatives”-Female, 22 yo

As the respondents mentioned, in watching the events and joining the parade, most often they are with their clubs whose members are now working in a different town, relatives who are now residing outside Balayan, workmates of those who are residents of Balayan but are working outside the town, loved ones, and immediate family members. The Lechon Festival is a place where old acquaintances renew their trust with one another as it serves as the event to do reunions with one another. According to the respondents, if they are watching an event of the festival, they are with their friends, some who are from other places, family and relatives some are within the same household and some are also from other places the festival serves as an event where they renew their trust with one another. As the respondents mentioned:

“Friends from other places, there are also from friends from Angono.”-Female, 28 yo

The festival is also a venue where they spend time with their high school and college friends and reminisce their times when they were still studying and friends from other places as well. An event where they renew their trust with one another as mentioned by the tourism officer. This was confirmed by the participants who were interviewed via focus group discussion:

“The festival is a venue for reunions and family gatherings, we put these events during the festival.”-Female, 56 yo

“When I was in college, of course my friends.”- Female, 24 yo

“We go to the plaza, to the booths to spend quality time with my friends.”- Female, 26 yo

“I am with different people during the different events of the festival, just like one time, I watched the festival with my friend from Batangas.”- Female, 24

The festival is also an event where they attend the different events with their family and relatives, officemates, spend quality time together, be relaxed, and enjoy each other's company and rekindle their friendships. According to the participants:

“One of the family members who married a non-resident, there are also friends from outside the city, it now becomes a chain reaction. There are also cases that the husband of a local is a foreigner, so we do have foreign visitors/tourists.”
- Female, 27 yo

“Friends and family, boyfriend”- Female, 26 yo

“My officemates from Cebu, Batangas, Cavite, Bulacan” – Female, 24 yo

Linking Social Capital.

Based on the interview with the festival organizers, which is also an agency under the provincial government, the festivals are also a linking social capital as the organizers ask for the participation and support of all the local governments from the different towns in the province of Laguna. The festival organizers also tapped the different institutions such as schools, church, public and private sectors for their participation and local and national businesses for sponsorships and participation. One of the festivals is initiated by the Hermandad (private group), however, it is properly coordinated with the local government, in terms of funding and other necessary support needed by the Hermandad. Aside from the LGU, they also seek the support of the business sector in terms of participation and funding. As mentioned by the tourism officer:

“So, that is how we the plan festival but the final decision is with the brotherhood of the Hermandad. We cannot bypass them. The Municipality of Balayan provides manpower, financial, and/or traffic management assistance.”

-Female, 28 yo

Other Characteristics/Features of the Festivals that Contributed to the Development of the Host Communities

Big, national companies for sponsorship (San Miguel Corporation).

To give thanks and share the blessing

Uplifts our feelings as members of the community.

through friendly competitions.

A much-awaited event that Filipinos from all parts of the world are looking forward to be part of.

Civic Pride

Norms

Proud of my hometown

Because of the festival, we are known not only in the Philippines, but also internationally.

Through the festival, Angono is more recognized as the Art Capital of the Philippines all over the world.

Gives an identity to the people of San Pablo

It allows the locals to showcase their creativity, industry, the pride of the locals as being shown in the designing of the houses with kipings. It shows a tradition handed down from generations.

It gives joy, fun and memorable experiences to the community.

Community

trust

Cohesion

It brings the community together.

It unites the people,

More towns people coming back.

A venue where people reunite (family, relatives, friends).

This is the event where we always get to be reunited with our extended family members and relatives.

All the festivals help promote or develop community cohesion, although competitions of some sort are present in the festivals. These competitions are healthy competitions as such they are ways for the people in the community to know one another, to bond with people they are competing with or against. All these festivals have a parade of some sort under their events and these parades let all the people involved in the festival to come and be with one another, it lets them know one another. The festivals also develop the people of the community; holding them a sense of belonging, as these festivals are something they are associated with. When they are meeting someone new and they ask where they are from, the people they meet will then associate the place with the festival, and it makes them easier to have a conversation starter with people whom they just met. The festivals also promote the well-being of those involved and those who watch the events under the festival. They relax the people, make them enjoy what they are watching, and make the people competing or presenting in the events feel good about themselves as they can show their talents and represent their people in competitions. The festivals also allow the locals to share their culture and history to the tourists confirming what Sumbarova (2011) found out, that is, festivals are determinants that cause people to travel to other countries to know the local art, culture and history of the communities that hold them.

The festivals in this study conduct trainings and seminars imbedded in the programs under the festivals. They target certain groups of people every festival. In 2019, the Anilag Festival had a program for making a Longganisa Festival out of the knife fish which is considered a pest in the Laguna Lake. In doing this, they conducted a training for those who will be involved and interested on how to make the knife fish into a longganisa, a form of value-adding to a pest that is a problem of the province. To maximize the involvement of the local community in the celebration of the festivals, ordinances have been passed to make the day of the festival or some of the days of the festival as non-working holidays. The organizers of the festivals make sure that there will be a program for almost everyone in the community to join, attend, or watch.

All the participants, when asked if the festival makes them proud as an individual and as a member of the community, all of them answered yes, which can be related to civic pride. The festivals made them proud of

who they are and where are they from. They are proud even if they are just attendees of the festival, and it makes them prouder if they are part of the organizers and a participant of the events of the festivals. As mentioned in the above results, there are events under each festival that target a specific group of people in the community. There is a program for the businessmen, there is a program for the LGBTQ+, a program for the young ones, the middle-aged, the senior citizens, the agricultural sector, the schools, the sports enthusiasts, the private sector, and the public sector. As such, all the festivals promote social inclusion which is one way of ensuring the success of the festivals, giving the local communities involvement and a sense of ownership of the festivals; just as what Getz (1989) mentioned, festivals provide opportunities to participate in distinctive and collective experiences. As concluded by Raj (2003), festivals add tourism attraction and influence the cultural and economic growth of the place and all the five festivals attract tourists, local or international. With the tourists coming, it adds to the economic growth of the places where they are held.

Conclusion

The object of this study was to (1) Describe the longest running festivals in CALABARZON, Philippines; (2) Determine and describe the impact of these festivals on the communities that hold them in relation to social capital theory; and (3) Identify the feature/characteristics of these festivals that contributed to the development of the host community.

The Anilag Festival of Laguna is festival initiated by the provincial government during the middle to late 1990's. It is done to showcase primarily the agricultural products of the province. The festival is celebrated during the foundation of the province. It is called and known as the "*mother of all festivals*" in Laguna because it features all the cities and municipalities of Laguna.

The Lechon Festival of Batangas is controlled by a private organization and not under the supervision or control of the local government of Balayan; but it is recognized by the LGU and is heavily coordinated with them. The Lechon Festival is the oldest festival in Batangas. It was celebrated as a thanksgiving and share the blessings the townspeople from one part to the town's less fortunate residents.

The Higantes Festival is arguably the second oldest festival covered by this study and the oldest festival in the province of Rizal. The origin of the giant marionettes is bleak. Some stories will tell that the origin dates back to the Spanish colonial period as a form of mockery to Karia, a tall caretaker of the lands of Angono. It was used during the post-World War II period to give confidence to the people of Angono. The current format that is famous right now was introduced during the late 80's. The contemporary festival was initiated by the private sector (local artist of Angono); but is now under the local government of Angono. The was implemented mainly to showcase local artist of Angono, Rizal which is known as "Art Capital of the Philippines".

The Coco Festival of the City of San Pablo, was one of the oldest cities in Laguna. The festival was initiated in

the mid 90's by the local government of San Pablo City, Laguna. It aimed showcase coconuts, the primary agricultural product of the city. According to the tourism office, it is the reason why the city became a first-class component city. The festival is celebrated in conjunction with the town fiesta as well.

The Pahiyas Festival of Lucban, Quezon is arguably the oldest of all the festivals in this study its origin dates back during the Spanish colonial period in the Philippines, it was a done to show the gratitude of the town's people for the bountiful harvest, it was integrated in the town fiesta during the colonial period, led by the church but the festival's control has been transferred to the local government of Lucban.

All the festivals lead to community development in relation to social capital theory as each festival develops network, norms, and social trust. Specifically, the festivals lead to: (1) community cohesion, (2) sense of belonging, (3) well-being of individuals, (4) education (trainings/seminars), (5) community involvement, (6) civic pride, (7) social inclusion, (8) cultural improvement and preservation. All the five festivals help promote or develop community cohesion, since there are competitions of some sort present in the festivals. The festivals also develop in the people of the community holding them a sense of belonging. The festivals also develop or promote the well-being of those involved and those who watch the events under the festival because of their relaxing effect.

Recommendations

For other researchers it is recommended that another study should be done during the actual celebrations of the festivals is highly recommended to fully appreciate/grasp the experiences of the people in the celebration of the festivals and add tourist to get their perspective of the festivals they are attending. In addition, the Pahimis Festival of Cavite should be added to have a full representation of the festivals in CALABARZON, Philippines.

For Community Development Practitioners as shown in this research, festivals may be used as a strategy to develop communities. The results may be used by community development practitioners and festival organizers to ensure the success of festivals.

<https://orcid.org/0000-0002-8323-6400>

Abstract: Herbularyo, a card game teaching about herbal plants (HPs), was created and evaluated as a viable educational card game based on Tuomisto and Aksela's criteria. A quasi-experiment was performed on 81 Grade 8 students from a private high school and 50 Grade 11 from a public high school. Independent t-test revealed that the control group (CG) and experimental group (EG) ($p=0.386$), and EG1 (played ≤ 5) and EG2 (played > 5) ($p=0.681$) are not comparable with each other. Paired t-test showed EG performed better ($p=0.001$) than CG ($p=0.901$) whereas ANCOVA showed that playing Herbularyo improved students' information retention ($p=0.006$). EG1 and EG2 both performed well after playing the game (paired t-test $p=0.000$). However, there was no significant difference in learning based on the quantity of games played (ANCOVA $p=0.188$). Likert scale was used to evaluate 17 statements. Herbulayo (overall = 4.25) was able to capture the student's attention (mechanics and structure = 4.55) and foster interest in HP (feedback = 4.44). Preliminaries (4.05) and pedagogy (3.97) of the game received a lower rating. Nonetheless, Herbularyo proves to be an effective game for promoting knowledge about common herbal medicinal plants in the Philippines.

Keywords: medicinal plants, game-based learning, natural products, educational games

Introduction

The Philippines has a diverse species of plants with thousands endemic to the Philippines. The country is one of the 18 mega-diverse countries with two-thirds of the world's biodiversity (Philippines - Main Details, n.d.). In Philippine history, plants have been used as medicine for oral ingestion and external application. The Manobo Tribe in Agusan del Sur alone was documented to use 122 species of herbal plants (HPs) with different ethnopharmacology (Dapar, Alejandro, Meve, & Liede-Schumann, 2020). In Palanan, Isabela, most residents know the uses of different medical plants that they learned from their ancestors (Baleta, Donato, & Bolanos, 2016).

Apart from traditional usage, the importance of HPs can be seen around the globe. Around 80% of the total population of developing countries depends on these as primary treatments (World Health Organization, 2013). Moreover, HPs are used as an alternative to cope with the symptoms of chronic diseases. With the majority of the top 10 causes of death in the world linked to chronic diseases (World Health Organization, 2020), the need for alternative and preventive medicines should be given importance.

HPs are being utilized in drug preparation. About 25% of medicines prescribed worldwide are derived from plants (Wachtel-Galor & Benzie, 2011). Different studies are being conducted on HPs to scientifically back up their healing effects and ensure they are safe for consumption. With the affordability of HPs, especially in places with expensive health care, knowing the effects of different HPs can be beneficial in helping people afford a healthier life.

In the Philippines, different HPs and their properties were summarized and published. The Encyclopedia of Common Medicinal Plants of the Philippines summarizes the traditional and pharmacological properties of various native plants in the country. It provides vital information such as the appearance and structure of the plant, its molecular composition, and the clinical development study that has been performed. The dissemination of this kind of information is relevant in educating people about these plants, enabling them to make use of their newfound knowledge.

To spread this awareness and knowledge on different health benefits of HP, an alternative approach can be utilized: Educational Board Games have been shown to be an effective tool in improving the learning experience of students. Studies have shown that students show positive responses to classes where games are used to improve their learning experience (Liu & Chen, 2013; Crews, 2011).

Correspondingly, Mariscal, Olivia, and Gil (2015) showed that the games have a positive impact on the students' perception which includes better learning of chemistry than traditional learning, simplified content, higher participation of students, and better appeal to students. Correspondingly, educational board games such as card games show promising results as supplementary materials for learning chemistry by improving attitude, engagement, and inquiry-based learning (Srisawasdi & Panjaburee, 2018; Ndirika, 2013).

Card games are used to simplify information, keep players engaged, and have better appeal to the audience (Mariscal, Olivia, & Gil, 2015). This research aims to create a card game incorporating knowledge about the healing properties of the different common HPs in the Philippines. Herbularyo was designed to appreciate and understand the medicinal properties of common HPs in the Philippines while interactively presenting the information. The effects of playing Herbularyo were assessed by determining how playing can help participants familiarize themselves with different properties of various HPs, and how the quantity of games played could impact the amount of information about HPs the participants can recall.

Method

Conceptual Framework

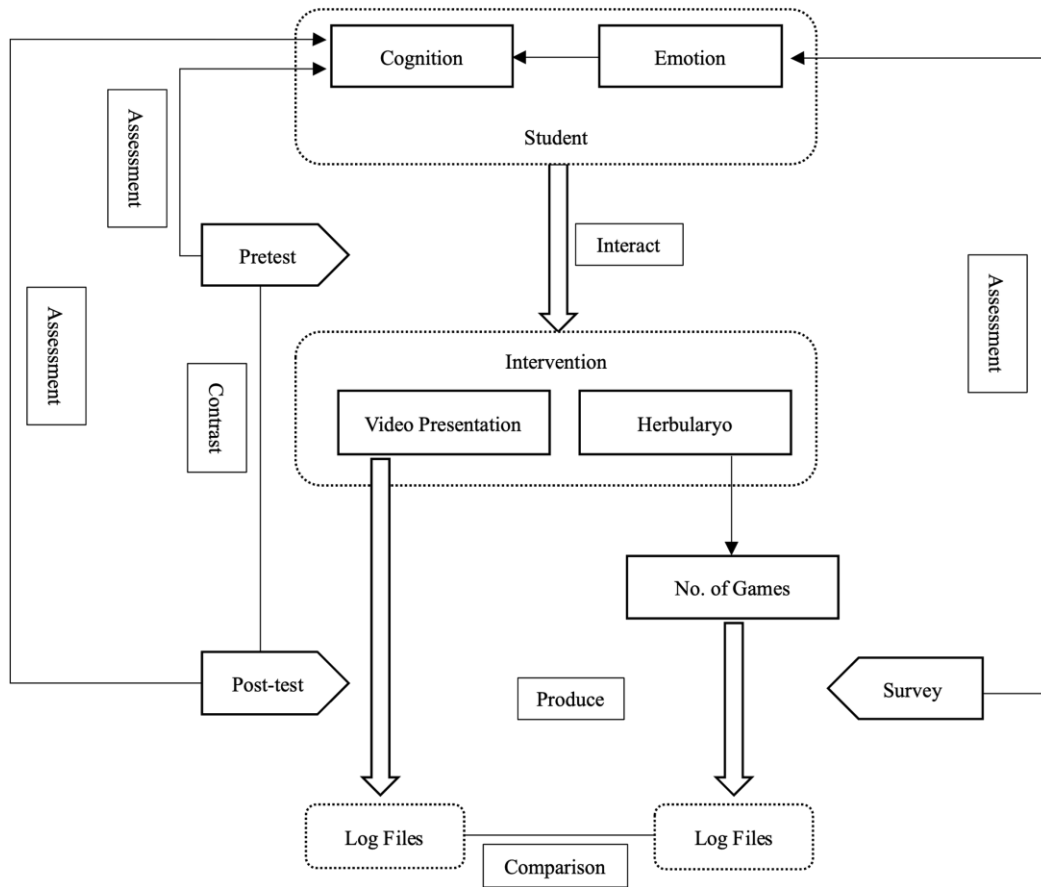

Figure 1. Conceptual Framework for the Assessment Analysis of Herbularyo

Based on the proposed conceptual framework by Zhao, et al. (2021), Figure 1 is the conceptual framework that was used in this study.

Herbularyo aims to teach students about the application of different HPs commonly found in the Philippines. To assess the effectiveness of Herbularyo, cognition and emotion (learning motivation and interest) were assessed. For cognition, pretests and post-tests were given and compared to determine if there was a significant improvement in learning about HPs after the intervention. For the students who played Herbularyo as their intervention, the effect of the number of games on their learning was also assessed. The log files of the data from both the students who underwent video presentation (CG) and Herbularyo (EG) were analyzed and compared to each other to determine which intervention was better at teaching HPs.

Method Summary

The following is the summarized step-by-step process followed when conducting the research.

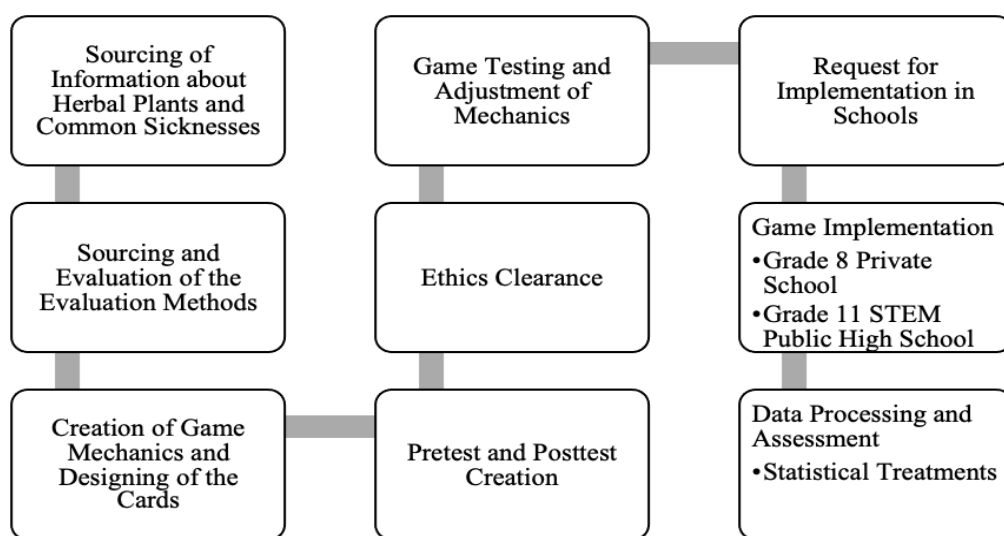

Figure 2. Method Summary of Herbuaryo

Sourcing of Information about Herbal Plants and Common Sicknesses

Herbal medicines from the Encyclopedia of Common Medicinal Plants of the Philippines were listed with the corresponding sicknesses that show healing capability that underwent at least a pre-clinical trial. Specific compounds or molecules responsible for the specific healing property of the HPs were also listed. Afterward, the 11 most common sicknesses that can be healed by different HPs were chosen to be part of the final list of Sickness Cards. A final list of HPs and their healing molecules was made with the corresponding sicknesses they can heal.

Sourcing and Finalizing of the Evaluation Methods

The evaluation questions were derived from the study conducted by da Silva Júnior JN et al. (2021, 2022), supplemented with additional evaluation questionnaire items. Each question was categorized under one of the four general Tuomisto and Aksela (2015) educational card and board game criteria. Their theoretical framework determines which aspects of creating a game must be considered to improve educational games. The summary of the criteria that must be considered are as follows:

1. Mechanics and Structure
 - a. number of players
 - b. length of gameplay
 - c. simplicity of instructions
 - d. mobility of the game (can it be played anywhere)
 - e. game paraphernalia.
2. Pedagogy
 - a. Unpredictability
 - b. Difficulty

3. Preliminaries
 - a. Prerequisite knowledge needed
 - b. The concept of chemistry used
 - c. Application of the concepts
 - d. Representational levels (macro, sub-micro, symbolic)
4. Student feedback
 - a. Interest in playing
 - b. Overall feelings while playing
 - c. A feeling of achieving the goal
 - d. Engagement while playing
 - e. Retained information

The mechanics and structure are the basics of any game that should be present in the first place. Those criteria must be clear and easy to follow to make sure that anyone can proceed with the game. The “game” aspect of educational card games should not be lost. There needs to be a sense of unpredictability and difficulty that each player can utilize to win the game. Chemistry knowledge, on the other hand, must be determined beforehand so there is no confusion as to what concepts must be understood by the students before they can play the game. The chemistry concepts must be clear and applied well in the game. Lastly, the students’ feedback provided a quantitative evaluation of whether the game succeeded in achieving its goals. After playing the game, knowledge should be, at least, gained by the players. In the case of Herbularyo, it aims for the players to be familiar with the different HPs and their healing properties.

A 17-question evaluation form was made. Four questions are under Pedagogy, another four are under Mechanics and Structure, and six questions are under Feedback. The remaining three questions are under Preliminaries.

A Likert Scale derived from a study conducted by Nyutu, et. al. (2021) was adopted in this study. Only the participants from the EG were asked to answer the evaluation. The evaluation for each rating interval is shown.

Table 26. Likert Scale Evaluation

Likert Scale Description	Likert-Scale	Likert-Scale Interval
Strongly disagree	1	1.00 – 1.80
Disagree	2	1.81 – 2.60
Neutral/Uncertain	3	2.61 – 3.40
Agree	4	3.41 – 4.20
Strongly agree	5	4.21 – 5.00

Creation of Game Mechanics and Designing of the Cards

An 89-card deck was created which was divided into two major types of cards. There were 12 sickness cards (11

different illnesses and one patient card which can accept all types of healing cards) which each player needed to heal and 77 action cards to help them win the game. The following is a summary of the different kinds of cards and their usage.

Table 27. Herbularyo Cards and Description

Type of Cards	Description
Sickness Cards	A separate deck composed of 12 cards will be shuffled and distributed equally to players facing up and making sure everyone sees them.
Action Cards	A separate deck of cards where players will get their five held cards. Cannot be seen by other players and the player must use this to their advantage.
Healing Card	A card that contains information about the herbal plant and the molecule responsible for the healing. Shows which sicknesses the card can heal. Should be placed on top of the sickness cards.
Helping Cards	A type of card that has a different use that the player can use to their advantage. A one-time-use card will be thrown to discard a pile of cards after use.
Binat (Relapse) Card	A type of card that has different use per card. Must be used by the player to disadvantage their opponent and prevent them from healing their sicknesses.
Special Card	Can be used by the player whether or not it is their turn to play during each round. Used to counter any action cards used by their opponents. Can be used against itself.

The game mechanics were drafted and underwent a series of revisions. After finalizing the rules, the game was first played by test participants. The following are the general game mechanics of Herbularyo:

1. The game can be played by 2-4 players.
2. Players will shuffle and distribute an equal number of sickness cards. These cards should be placed up front and seen by everyone.
3. Players must shuffle the action cards and distribute five cards to each player. These cards must be hidden by the players from their opponents.
4. The player that has the "Patient card" as one of their sickness cards will be the first player. The rotation of the game is clockwise or to the left of the players.
5. To consider a sickness healed, it needs three healing cards that can heal that specific sickness.
6. The Patient card needs any five healing cards to be considered healed.

7. For each turn, players will have 5 action cards; they only have three moves during their turn, meaning they can use at most 3 action cards before ending their turn.
8. After finishing their turn, the players must draw cards from the deck of action cards to replenish their cards. Drawing a card signifies that they have ended their turn.
9. The first player to heal all his or her sickness will win.

Here are some of the special rules while playing Herbularyo:

1. Players must say the name of the molecule, the name of the herbal plant, and the name of the sickness they are trying to heal when using a healing card.
2. The players must hold five action cards at all times. During their turn, however, the player can only replenish their card after they end their turn.
3. If the player cannot use any of their action cards, the player can discard at most three of their action cards. Discarding cards will be considered a move so if they discarded three cards, they must end their turn.
4. All players share one pile of discarded cards. All the players can see the cards thrown in the discarded pile.
5. If the players run out of action cards before having a winner, they can take the discarded cards, shuffle them, place them down, and use them as the deck of action cards.

As for the card design, two different colors were used for sickness cards and action cards to distinguish the two. Red was used as the cover color for the sickness cards while blue was used for action cards. The action cards are divided further. The healing cards that contain the HP and molecules used light blue as their border color. Each healing card contains one molecule from a specific HP and the sickness that it can heal. Sickness symbols were used so it would be easier for the players to determine which sickness the molecule and plant can heal. The helping card is color green, the Binat (health relapse) card is yellow, and the Special card is color black. Additional cards were added to the deck which contains the different kinds of cards and the summary of the mechanics of the game. These cards were distributed to the players as a game guide but are not part of the game mechanics.

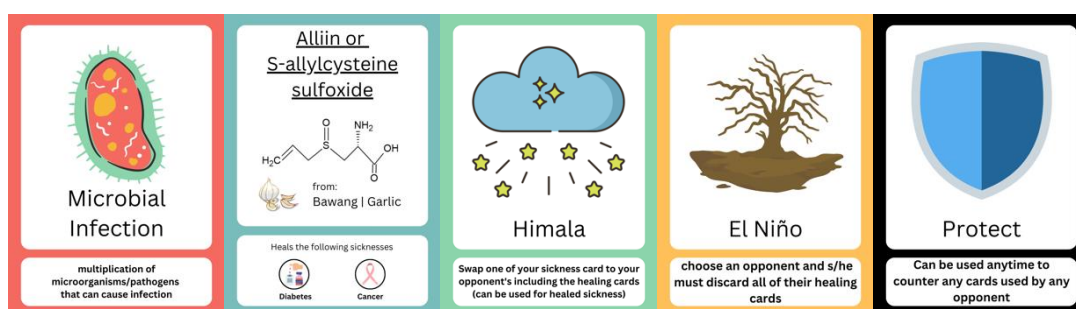

Figure 3. Final Herbularyo Card Designs (left to right): Sickness, Healing, Helping, Binat, and Special Cards.

Pretest and Post-test Creation

A 20-item pre-test was given to each student which is used to determine the prior knowledge of students about HPs. There are two types of questions: one is determining the specific HP and molecule that can heal the specific sickness being asked. The other one is determining the molecule found in a specific HP that is responsible for healing a specific sickness being asked. Similar questions were used for the post-test.

The names of the participants are asked in the questionnaire for recording purposes and to ensure that the pre-test and post-test scores being compared are from the same participants. The researcher individually checked and recorded the answers of each participant in the pretest and post-test to ensure that the data of the participants were protected and only the researcher had access to them.

Game Implementation

Two schools were visited to have the study implemented. In a private school, two sections of Grade 8 students became participants in this study. Two sections of Grade 11 Science, Technology, Engineering, and Mathematics (STEM) strand students from a public high school also took part in this study.

Each group was then given an intervention where CG was given a video presentation about different HPs and their medicinal properties, while the EG played Herbularyo. The CG and EG students were given a 20-item post-test while EG was given an additional evaluation question to determine their overall assessment of the Herbularyo game.

In the private school, there was a total of 81 students took part in this study. About 38 students were part of the CG while the remaining 43 students were part of the EG. A quasi-experiment was performed where the participants were not randomly selected but grouped according to their current section. The reason for this was because of the school facilities' availability, student availability, and teachers' willingness to allow the researcher to borrow their period for the specific class. Overall, a quasi-experiment was the most efficient and convenient method for data gathering given the circumstances of the school.

For the public school, 50 students participated. Seventeen (17) students played five games or less and 33 students played more than five games of Herbularyo. EG1 played five games or less of Herbularyo while EG2 played more than five rounds of Herbularyo. The data gathered from EG1 and EG2 were used to determine if there was a significant difference in learning about Herbularyo depending on the number of games played.

Data Processing and Assessment

A two-sample t-test was used to determine if the pre-test scores of the groups were comparable with each other. The paired t-test was used to determine if there was a significant difference between the scores of the pretest and

post-test scores of the students within the same groups. This is to determine how the intervention (video presentation and playing Herbularyo) affected the learning of the participants. Since a quasi-experiment was performed, it was expected that the two groups for each school (CG and EG for the private school; EG1 and EG2 for the public school) are not comparable with each other. Thus, Analysis of Covariance (ANCOVA) was used to determine if there was a significant difference between the pretest and post-test scores of the two groups. It determined which group had better learning based on the intervention given while also considering the covariance between the groups. The covariance considered is the pretest scores.

EG participants evaluated Herbularyo using the Likert scale. SPSS Statistics was used to automatically calculate the statistical treatment used while Google Sheets was utilized to analyze the evaluation scores of the participants.

Ethical Consideration

Ethics clearance was obtained from the Ateneo de Manila University. Assent forms were given to the participants before asking the participants to play the game. They confirmed their participation in the game and allowed their answers for the evaluation form to be used for analysis. It also contained a short explanation of the objectives with the contact details of the researcher.

Only those students who willingly participated in the study were included. The soft copy of the assent form was given to the contact teacher at the respective schools to be distributed to the participating students. The consent form was then printed and signed by the students and their guardians. Some of the personal information such as name was asked for data processing purposes only. Confidential information of the participants was accessed only by the researchers.

After the research is conducted, the data from the participants will be kept for two years. After two years, the raw data from the participants will be deleted permanently, along with the participants' information. Only the summary of their data will be kept. The participant's information will not be used for anything outside the research.

Results

The following are the results of the two-sample t-test, paired t-test, and ANCOVA testing. The null hypothesis of the statistical treatment used assumes that the mean of the two comparing groups is equal while the alternative hypothesis used is that the means are not equal. A confidence level of 95% was used. To determine if there is a significant difference between the two groups, the calculated p-value must be below 0.05 or 5%. As such, the null hypothesis, where the means of the groups are equal, can be rejected.

Grade 8 Student from a Private School

The following are the results of the statistical treatments used in Grade 8 Students from a private school.

Table 1. Statistical Testing Results for G8 Students from a Private School

	Two-sample t-test	Paired t-test (CG)	Paired t-test (EG)	ANCOVA
H_0	$\mu_1 = \mu_2$	$\mu_1 = \mu_2$	$\mu_1 = \mu_2$	$\mu_1 = \mu_2$
H_a	$\mu_1 \neq \mu_2$	$\mu_1 \neq \mu_2$	$\mu_1 \neq \mu_2$	$\mu_1 \neq \mu_2$
p-value	0.386	CG: 0.901	EG: 0.001	0.006
Interpretation	Do not reject H_0 The two groups are not comparable	Do not reject H_0 There is no significant improvement in learning about HPs in CG	Reject H_0 There is a significant improvement in learning about HPs in EG	Reject H_0 There is a significant difference in learning about HPs in EG than in CG

The p-values for the two-sample t-test and paired t-test of the CG are 0.386 and 0.901, respectively, which are above the 0.05 significance level. On the other hand, the paired t-test for the EG is 0.001 which is below the 0.05 significance level. Similarly, the ANCOVA p-value is below 0.05, which has a value of 0.006.

Grade 11 STEM Student from a Public School

The following are the results of the statistical treatments used in Grade 11 STEM students from a public school.

Table 2. Statistical Testing Results for G11 STEM Students from a Public School

	Two-sample t-test	Paired t-test (EG1)	Paired t-test (EG2)	ANCOVA
H_0	$\mu_1 = \mu_2$	$\mu_1 = \mu_2$	$\mu_1 = \mu_2$	$\mu_1 = \mu_2$
H_a	$\mu_1 \neq \mu_2$	$\mu_1 \neq \mu_2$	$\mu_1 \neq \mu_2$	$\mu_1 \neq \mu_2$
p-value	0.681	EG1: 0.000	EG2: 0.000	0.188
Interpretation	Do not reject H_0 The groups are not comparable with each other	Reject H_0 There is a significant improvement in learning about HPs	Reject H_0 There is a significant improvement in learning about HPs	Do not reject H_0 There is no significant difference in learning about HPs in terms of the number of games played

As for the results of the Grade 11 STEM students from a public high school, the two-sample t-test is 0.681, which is above the 0.05 significance level value. On the other hand, both the EG1 and EG2 have a p-value of 0.000. The ANCOVA result, however, has a value of 0.188.

Game Evaluation

Table 3. Summary Evaluation of the Participants on Herbularyo

Evaluation	Values	Description
Mechanics and Structure	4.55	Strongly Agree
Pedagogy	3.97	Agree
Preliminaries	4.05	Agree
Feedback	4.44	Strongly Agree
Overall	4.25	Strongly Agree

The students who played Herbularyo gave the game an overall rating of 4.25 out of 5. Mechanics and structure have the highest evaluation of 4.55 while pedagogy has the lowest rating of 3.97. It is followed closely by preliminaries, having a 4.05 rating. Lastly, feedback has a rating of 4.44.

Observations and Student Feedback

Some of the additional observations by the researcher, while the participants were playing the game, are as follows:

- Students were enthusiastic while playing the game.
- Students were actively asking questions about the use of different action cards in the game.
- Students asked to have a copy of the cards so they could play it in their leisure time.
- Students scrambled for the limited deck of cards I gave away since a lot of the students were asking for a copy.

Moreover, here is some of the feedback directly obtained from the students after the Herbularyo game was conducted:

- Students verbally expressed that they genuinely enjoyed the game.
- Some students stated that they found the game challenging but enjoyed it nonetheless.
- A student suggested selling the Herbularyo.

Discussion

The results from the two-sample t-test from the grade 8 students from a private high school showed that the pre-test scores from the CG and EG are not equal or comparable ($p=0.386$, see Table 1). This was expected as a

quasi-experiment was conducted and participants in each group were not randomly selected. The grouping was based on their existing section in their school. ANCOVA was performed with their pretest scores as covariates to account for this difference.

For the paired t-test, CG shows no improvement in learning about HPs ($p=0.901$). This means that the video presentation was ineffective in teaching the students about HPs. On the other hand, EG shows great improvement in learning after playing Herbuaryo ($p=0.001$). The p-value for ANCOVA is 0.006, meaning there is a difference in information retention after the intervention. Based on the paired t-test results, EG performed better than CG, indicating that between the two interventions used, playing Herbuaryo improves the learning and familiarity of students with HPs.

As for the Grade 11 STEM students from a public high school, the two-sample t-test results of EG1 and EG2 have a p-value of 0.681 (see Table 2). Like the previous school, the two groups are not comparable since a quasi-experiment was performed. As for the paired t-test, both groups have a p-value of 0.000, which means that the two groups both significantly learned about HPs from playing Herbuaryo. The ANCOVA ($p=0.188$), however, showed insufficient evidence to suggest that the number of games played significantly differs in the amount of information recalled.

As for the evaluation, Herbuaryo gained an overall rating of 4.25 (see Table 3) which corresponds to a “strongly agree” rating. The mechanics and structure (4.55), together with feedback (4.44), are the strong points of the game where Herbuaryo effectively engages the players, promotes learning, and fosters learning about HPs. Pedagogy (3.97) had the lowest rating which can be attributed to the difficulty of completely healing all the Sickness cards given to them and how the game was also based on their luck in getting good cards. Preliminaries (4.05) only had an “agree” rating which may be attributed to the complexity of the structure and pronunciation of the molecules. Although there was a lot of information about HPs that were included in Herbuaryo, the game shows promising results as a viable educational board game.

Conclusion

The statistical treatments showed that Herbuaryo was an effective tool in teaching players about the healing properties of different HPs found in the Philippines. The results of Grade 8 students from a private school showed that the students learned and retained more information about HPs while playing Herbuaryo compared students who had video presentations. In the Grade 11 STEM students from a public school, the results showed that there was no significant difference in learning based on the number of games played. When evaluating the game using the criteria by Tuomisto and Aksela, Herbuaryo got an overall rating of strongly agree indicating that this game is an effective tool in teaching players about HPs and their healing properties, not just in improving the retention of information about the HPs but also in terms of playability, fairness, and enjoyment of the players. Overall, Herbuaryo not only taught the students information about HPs, the molecules found in

them, and the sickness they can heal but also allowed players to learn so much information in an innovative and fun way together with their peers.

Recommendations

Instead of performing a quasi-experiment, randomly selecting the participants for each group can be performed instead. Moreover, having the same background such as year level for the CG, EG1, and EG2 can be performed to have an accurate comparison of how playing Herbularyo, and the number of games played can affect the learning of the participants about HPs. These were assessed on separate occasions from different schools and year levels for this study. Focused group discussions (FGDs) can also be utilized to understand further the players' perception of the game, and how effective it is as an educational car game. As for the mechanics, it can be improved by adding an expansion pack incorporating information on how to use or prepare HPs to treat certain sicknesses.

Abstract: Multitasking which has been reported to occur more frequently in online learning classes compared to traditional face-to-face settings has been found to have negative effects on students' learning. Albeit extensive research has been carried out on the effect of multitasking in education, there is scant research that sheds light on multitasking behaviors and the reasons behind these multitasking behaviors in the context of online learning. Hence, to bridge the gap, the study drawn on the lens of Merleau-Ponty's notion of lived body and the intertwined relationship between the body and objects and others in the context of 27 Vietnamese university students from the Mekong Delta. Data was collected from six focused group interviews. The finding of this paper showed that multitasking is a result of the intertwinements between students as lived bodies and environmental factors, including objects and factors in carrying out non-academic purposes at students' synchronous learning time at their physical learning space. This study adds nuance to the existing literature on students' multitasking in online learning by shedding light on the causes of students' multitasking behaviors through the lens of the Merleau-Ponty's phenomenon. Based on the findings, several implications have been proposed to enhance students' online learning experiences.

Keywords: multitasking, non-academic activities, online learning, physical learning space, learning environment

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 700-711), Antalya, Turkiye. ISTES.

Introduction

One significant aspect of students' engagement in online learning is multitasking, which refers to performing at least two activities with different purposes at the same time (Gazzaley & Rosen, 2016). Lately some studies have confirmed that students in online classes have experienced more multitasking than brick and mortar classes (Aivaz & Teodorescu, 2022; Lepp et al., 2019). Multitasking has been claimed to bring harmful effects for

students learning process since it brings interruption (Aivaz & Teodorescu, 2022) and influences on students' cognitive load (Sweller et al., 1998).

Recognizing the significance of having a framework of influential factors of multitasking, Zhou and Deng (2022) have also established the framework for media multitasking in education. However, online students from their own physical learning space may experience more interruptions from other factors besides media. Hence, there is still a missing piece of research on providing understanding of the underlying reasons of students' multitasking behaviours while participating in online sessions.

To fill this gap, this paper draws on Merleau-Ponty' notion of body and the intertwinements between the body and objects and others to gain insight into students' multitasking behaviours in their own learning space. In his perspective, the lived body understands the environment and with its understanding the lived body can act skilfully with the situation provided by objects or other people to act toward the goals that are important to the body at that moment. The authors of the paper proposed that the participants in the study could conduct non-academic activities with the non-academic objects or tasks required by surrounding people while learning online. Therefore, this research sought to answer the research question: How do the students engage in nonacademic activities while simultaneously fulfilling online learning requirements? This study adds nuance to the existing body of research on students' multitasking in online learning by providing insight into multitasking behaviors and factors that drives students to engage in multitasking from a theoretical framework. By addressing the gap, the findings provide insight into how to support and engage students in online learning.

Literature Review

Definition of Multitasking

Multitasking involves undertaking more than one task simultaneously during the same period of time to reach different goals (Gazzaley & Rosen, 2016). Actually, it is possible to conduct two activities simultaneously without effort such as walking and talking when comes to things that we can do automatically, but normally our "conscious mind" can only fully focus on one action (Bannister & Remenyi, 2009, p. 2). In addition, according to the cognitive load theory, working memory is crucial to the learning process, but it has a finite capacity (Sweller et al., 1998); hence, multitasking can significantly burden the cognitive process of multitaskers. Therefore, it is possible that multitasking is harmful for learning since when multitasking, they experience interruption, according to Aivaz and Teodorescu (2022). In general, student's multitasking can be defined as student's conducting at least one activity which interrupted or distracted the learning activity.

Some interrupting activities in learning

Students' engagement with non-academic activities alongside learning activities has been well-documented through both current non-empirical and empirical research.

Dontre (2021) who also synthesised a significant quantity of prior related literatures concluded that smartphones and social media are the primary technological distractions on learners' online learning. In the same vein, after summarising related studies, Wang, (2022) proposed another type of distractions, including the phrase 'unexpected interruption' which is defined as some events that "immediately catch all of people' attention and raise the level of their excitement, such as someone unexpected visit" (p.7). He also defined 'consistent interference' is a distraction which occurs when "visual information or auditory information, such as background music, web page advertisements, or a smartphone in sigh" consistently attracts all your attention (p.8).

Lepp et al. (2019) had a discussion with group of 17 students and finalised a list including nine activities that students usually do while learning online and offline, including "sending text messages, email, visiting online social networking sites [e.g., Instagram, Twitter], surfing the Internet for purposes unrelated to class, watching videos, playing video games, listening to music, talking with friends, scribbling absentmindedly" (p.4). This list has been used to compare the extent student multitasking between online class and offline class among their college students. Prabawangi et al. (2021) found that 226 undergraduate students from four cities and seven universities in Indonesia multitasked in their synchronous online learning. Their popular activities are doing daily activities, using social media, driving, and watching movies. Likewise, Gonzáles-Gutierrez et al. (2022) have employed the lists of multitasking, such as communicating through social networks, watching TV or videos, reading non-academic topics on the Internet, playing video games, and chatting with friends' to measure how multitasking affects 264 university business major students' self-efficacy for self-regulated learning during the COVID-19 pandemic in Mexico. In the same vein, Aivaz and Teodorescu (2022) found that their Romanian college students engage more with non-academic activities on digital devices in online classes with convenient sampling method. Finally, two surveys conducted in Philippines by Bahian et al. (2020) and Baticulon et al., (2021) reported that performing household chores while studying online are popular students' activities that distracts them from learning online during the covid time.

In general, from these related studies, the popular students' non-academic activities that have happened at the same time with learning online are using the Internet and technological devices for non-academic purposes (e.g., playing games, listening to music, checking email, etc), performing household responsibilities, and other unexpected distractions that cause students full attention (e.g., unexpected visitors).

The conceptual model of multitasking in education

Zhou and Deng (2022) have synthesized nine empirical papers from 2009 to 2020 and proposed three reasons behind media multitasking behavior in education based a framework of Technological-Personal-Environmental Model (TPE) by Jiang et al. (2010), including technological based predictor, personal based predictor and environmental based predictor. According to Zhou and Deng (2022)'s findings, technological factors includes the habit of using technology, personal based determination consists of multitasking preference, self-efficacy, physiological conditions, mood, motivation and engagement, and environmental factor contains course quality

and social norms. With the introduction of the framework, this is the first study which presents a holistic understanding of the reasons for media multitasking.

However, as presented earlier, students have experienced distractions not only from media but also from other things and individuals available at their own physical learning space. In the sphere of education, the physical learning environment has been considered a significant factor. It directly affects student's motivation in active participation in learning activities, personal behavior and school attendance (Asiyai, 2014), learner's learning satisfaction (Zandvliet & Fraser, 2005) and facilitating students' learning and social engagement (Nyabando & Evanshen, 2021). Recently, Khurana (2022) has argued that schools need designed their physical space in accordance with curriculum and enhance the positive relation amongst educators, learners and the learning environment to enhance learning by exploring the school buildings in India, Ireland, and the United States which represent the relationship between physical spaces and curriculum, instruction, materials, and assessments. In this respect, a good learning environment should include elements that support students learning activities.

Therefore, we argued that these understanding of the determinants provided by Zhou and Deng (2022) cannot fully explain all of the factors that lead students' multitasking at theirs physical learning space at their online learning time. Related studies have found several distractions from students' physical learning environment. However, lack of research shed light on the reasons of students multitasking this issue under a theoretical framework and the popular nonacademic activities students have done at their learning time. Therefore, this study employed the embodiment theory of Merleaur-Ponty to holistically get insight into the gaps.

The embodiment theory

The notion of lived body

Merleau-Ponty is probably known as the most famous phenomenologist to have focused his attention to developing a phenomenology of the body (Dall'Alba & Barnacle, 2005). In Merleau-Ponty's philosophy, the body is perceived as the central key, which is explicitly stated by his saying, "I am my body" (Merleau-Ponty, 2005, p. 231). Regarding his perspective, there is the unity of mind and body in conducting intentional purposes (Matthews, 2002), which is impossible to separate between mind and body. Also, there is the harmony relationship between goals and behaviours and this signifies the understanding of the lived body in its world; and one example of the body understanding of the environment is habits and when it comes to habits, the body adjusts to the message intended (Merleau-Ponty, 2005). All in all, our lived body has ability to understand situations that emerge in its space and act in a harmony way with these situations.

The relationship between body and objects and other bodies

In Merleau-Ponty's view, lived body is only in existence in its relationships with objects or subjects in a situation that matters to it (Matthews, 2002). In the interaction between the body and the world, the body

follows the solicit of the world (Merleau-Ponty, 2012). In this sense, human beings might act in harmony with objects and other bodies surrounding within situation(s) that is important to them.

Regarding the incorporation between lived body and objects for its purpose, this relationship is described as a “drawing”, which reveals that the meaning of the objects can be shown through the body’s behaviour and the body’s intention is clear through the harmony action with the objects (Merleau-Ponty, 2005, p. 152). In this regard, the objects have vital roles as “soliciting” our bodies and it is our bodies that adapt the objects intended meaning (Diprose & Reynolds, 2008, p. 186).

Moreover, he also mentioned the interaction between body and others through intercorporate communication. Specifically, the body can make another “speak, think and become what he is but never would have been by himself” (Merleau-Ponty, 1964, p.19). This harmony between bodies in a situation has been repeated one more time in the phenomenology of perception as “my body and the others are one whole, two sides of one and the same phenomenon.” (Merleau-Ponty, 2005, p. 412).

In conclusion, objects or subjects presented in the place situated by lived body might have roles as solicitations which defines what the body is. This has been shared by Gallagher and Zahavi in way that “The environment calls forth a specific body-style so that the body works with the environment and is included in it. The posture that the body adopts in a situation is its way of responding to the environment” (Gallagher & Zahavi, 2008, p.138). In this regard, we argue that online learning students are lived bodies situated in their own physical learning space which comprises situations caused by objects or subjects surrounding, and with the understanding of their environment these lived bodies can act in harmony with objects or people of their purposes. Therefore, we would like to employ this theory to explore the behaviours of our participants at their learning time and space through their reflection.

Research methodology

Research design

This study was shaped by a constructivist worldview which refers to a philosophical belief about the world and the nature of research that researchers integrated into their research (Creswell & Creswell, 2018). According to constructivists, individual’s knowledge of the world is constructed in their contexts where they live and work and via social interactions (Creswell & Poth, 2016; Crotty, 1998). Therefore, it is vital to focus on the participant’s perspective in context to understand their specific context. In this study, we interacted with Vietnamese students to gain insight into the non-academic activities that they encountered while learning online. Therefore, the constructivist paradigm is adopted as a guide because it is aligned with the purpose of the research.

The constructivist’s worldview manifests qualitative research (Creswell & Creswell, 2018; Merriam, 2009),

which enables researchers to understand the way people constructed their insight into their world and experience they have in the world (Merriam, 2009). In addition to this, drawing on Merleau-Ponty's phenomenological lens of intertwined relationship between the lived body and the world, this study aimed to seek an explanation of Vietnamese university students' multitasking while attending their synchronous online classes. Hence, this study applied phenomenological qualitative inquiry.

Participants

The participants were 27 (12 males and 15 females) Vietnamese students majoring in different disciplines from four universities and two colleges in the southwest of Vietnam. Their ages ranged from 19 to 22. They have had experience with synchronous online learning since COVID 19. These participants were selected based on a purposive sampling method because it allows us to select individuals that are the most familiar with the research topic, meaning that they would become good samples for our study (Patton, 1990). First, at the end of the semester, we shared our research with our students and invited them to participate in our study. After selecting our first group of participants, we asked our students to introduce us to their friends who had experienced the same online learning mode from other neighbouring institutions. After having interviews with six groups of 27 participants, we had a sense that we would get the same expected information from other participants. This means that the information became saturated, so we stopped at the total number of 27 informants.

Data collection

The data of this study was collected by conducting semi-structured interviews with six focus groups, including four groups (five participants), one group (four participants) and one group (three participants). The focus group was applied in this study as it is considered as a more productive method of collecting individuals' viewpoints than other ones (Barbour, 2014). This is because group discussion encourages participants' brainstorming that allows them to think and are inspired and challenge each other to express their viewpoints regarding the issue (Dörnyei & Griffee, 2010). The focus group interviews were held online via Google Meet. Each interview lasted approximately 20 minutes and was recorded. The questions for the interview focused on two main themes including participants' demographic information and the non-academic activities that students perform when attending virtual classes at their physical learning environments (e.g., What activities do you do while attending online classes?). The interviews were undertaken comfortably at their own places via Google Meet. We started with easy questions asking about their demographic information to make the participants feel comfortable and confident (Denscombe, 2010). Consequently, the data could be fruitfully generated (Gill et al., 2008). Vietnamese, the participant's mother tongue was used in the interview to make it easy and comfortable for the students to share their experience. Before conducting the interviews, we sent our research statement and consent forms to all participants to thoroughly explain the purposes of the research and sought their participation. Once their consent forms were obtained, we contacted them to schedule the interviews. During the interview, we also reminded the participants that they did not have to answer any questions that they found uncomfortable. Additionally, they could withdraw their participation without any consequences at any stages of the research

process.

Data analysis

The study followed three analysing phases including data preparation for analysis, coding and data representation proposed by (Creswell & Poth, 2016). Additionally, it applied a thematic analysis which is a process that encodes qualitative data (Boyatzis, 1998) by searching across a data set to capture repeated patterns of meaning (themes) associated to the overall research questions (Braun & Clarke, 2006). Firstly, the data from the six focus groups were organized and prepared for analysis. We transcribed the interview recordings in Vietnamese to prevent the meaning from being lost if the data are analysed in a foreign language (O'leary, 2004). In addition to the transcription, key themes and sub-themes related to non-academic activities were created based on the literature review, which also were the answers to the research questions (O'leary, 2004). Secondly, we read the transcripts intensively to obtain a general sense of the data. While reading the transcripts, participants' emergent ideas related to subthemes were captured as a unit of data, a potential answer to the research question (Merriam, 2009). These elements were then manually categorized into the themes. The process of coding theme and subtheme was carried out independently among the two researchers and we cross checked and discussed our coding results together to ensure the credibility of our interpretation of our results. Finally, the findings were translated and presented in English. Our translation was proofread by our colleague who has taught English -Vietnamese translation course for more than five years.

Findings

The harmony interaction between the body and objects which were irrelevant to learning purposes

While virtually joining learning activity, 23 out of 27 students reported their engagement with internet and technological devices for non-academic activities. They mostly emerged in social media. For example,

What I did while joining online class was surf Facebook, Tiktok, and responding messages on Zalo. Even I surfed Facebook when I had no notifications (Lan in group 1)

Besides surfing for information and response to messages, watching movies and listening to music with the electronic devices are popular activities online. For instance, Xuan in group 4 stated that *"I sometimes watched online films (when learning online)"*. Na in group 2 claimed that *"I enjoyed listening to music while working in group with friends."* Besides, they received phone calls from shippers, then went out and skipped a part the lesson as a result. For example, Nhung in group 6 claimed that *"When shippers called, I left the lessons to go out to get the package. So, I missed a part of the lessons, which made me not understand the lessons"*. She also commented that her phone notification sound made it impossible for her to pay attention to learning online. She illustrated that *"while learning, I paid attention to my phone ringing instead of the lecture"*.

10 out of 27 participants reported that they actively partook household chores while they learned online. They reported that they were sometimes doing them while listening to the lecture in the online class or completely leaving their learning devices at their own room to perform household chores. For instance, Hoai in group 3

recalled that “*I couldn’t help doing housework, I felt ashamed of letting my parents do it themselves. These chores needed me. [...] I usually stayed home alone, therefore, I had to do all household chores like cooking while learning online*”. Like Hoai, Thinh in group 3 reported that he had to do the laundry and dried clothes outside, and he had to finish these chores in the morning because he had to do other stuff in the afternoon.

The intercorporeal communication between the body and other bodies who provided them with non- academic tasks.

10 out of 27 participants claimed that they had unexpected visitors. They can invite students to go out for more relaxing tasks. For example,

My friends traveled far away from their home to my house and invited me to hang out with them. I had to accept their invitation, but I still attended the online class with my phone and wore earphones to listen to the lectures. Whenever my teacher called me, I stopped my motorbike to answer my lecturer’s questions. Honestly, I could not learn anything in that case. (Hoai in group 3)

These people might need some help from the students. For example,

My grandparents nearby sometimes called me for some help, I left the room with my online class there. (Thang in group 4).

Once I was taking in my exam. My father entered my room and asked me something. I felt embarrassed. (Hieu in group 6)

Tram in group 5 recalled: “*One day, when I was learning, my mother needed things urgently, but no one else at home with her except me. So, she asked me to go to the convenience store nearby to buy them for her. I went to the store with my phones (with virtual classes) inside pocket. I still listened to (the lecture) [...] after that I asked my classmates what the lecturer was talking [...] Once my house was selling grapefruits. My father displayed them in the front door. When someone asked. I left my laptop [online class] in my room and went out to sell them.*” Furthermore, Hue in group 1 and Dat group 2 shared the similar story when they had to take care of their younger sisters while learning online.

Besides, 10 out of 27 experienced noises from surrounding people.

Once my neighbours’ quarrel was very noisy, which made it impossible for me to listen to my lecturer. (Dat in group 2)

Once I listened to the rhythm and lyrics of my favourite song played by my neighbours, I automatically sang along and forgot my online classes. (Hieu in group 6)

My [next door] neighbour was a welder who worked very noisily [...] the means of transportation went over (my house) was noisy, too. (Nam in group 1)

Discussion

We found that online students were surrounded with objects and people supported for non-academic tasks, which led them to multitasking. Multitasking arises from surrounding object including technological devices

and internet are consistent with previous findings (Dontre, 2021; Gonzáles-Gutierrez et al., 2022; Lepp et al., 2019). In addition, the unexpected access of other people might have influence on students' online learning engagement which confirm the power of the other people appeared at students learning site on the student's behavior by Wang (2022). Last but not least, doing household chores were carried out in students' learning process which concurs with findings by Bahian et al. (2020) and Baticulon et al.(2021). This finding emphasizes the significant roles of physical environment on students' learning which are supported by previous scholars, such as Nyabando and Evanshen (2021) and Khurana (2022). Our finding has added that when these environmental factors are important to students surround them in physical learning environment, these factors can attract students and cause multitasking behaviors.

Based on the findings, it is possible for objects and other people for irrelevant learning purposes at their physical learning might cause interruptions on students' engagement with virtual learning. Since the positive prospect of online learning in the future, it is necessary to pay attention to develop learning environment, especially in students' physical places when they join online classes. We suggest that students should create the physical learning space that supports learning. In this regard, students should build up their own learning space in accordance with the seven criteria: choosing your favourite space, eliminating disturbances, making their places comfortable but not too much, having good lightning, being easy to access to enough necessary supplies, adding decoration or artwork or things that maintain their learning motivation, and keeping this place for only learning purpose (Khan Academy, n.d.). In addition, it is noticeable that one student added that the participants and her/his family considered that learning is important, so they did not do anything to distract his/her learning activities. In this case, this participant successfully engaged in online virtual learning space because learning activities matter to him and to his family members. In this case, students' self-regulated learning strategies are necessary for successfully harmony with online learning activities. Therefore, students should improve their self-regulation learning strategies (Dontre, 2021).

Besides, educators should consider the impact of the environmental factors on students' concentration on online learning tasks to conduct more productive virtual learning engagement by minimizing the side effects caused by multitasking. For example, in teaching reading (Ekuni et al., 2022) suggest utilizing retrieval practice (answering multiterm or fact questions about the texts), which may potentially limit the negative effects of multitasking.

Limitation and Recommendation

Due to the purposive sampling method and the fact that this is a cross sectional study, the findings from our study might be limited in its generalization to other contexts. Future research should be conducted on larger scales to provide more persuasive explanation for students' multitasking at their physical learning space. Another limitation is that the self - reported data. It is necessary for further study to be conducted with more data sources to strengthen the validity and reliability of the findings.

Conclusion

In the current context, the participants engaged in the non-activities with things and people surrounding them at their online learning time, which made them multitask. Through the lens of embodiment theory, multitasking results from the intertwinement between the body and the world, including objects and other bodies to achieve the body's intention purpose. The findings from our study suggested that the physical learning places at students' own homes should be improved and the understanding the causes of such behaviours through the lens of the intertwinement between the body and people and things can benefit students in preparing more suitable learning places to optimize their learning space for online learning. In the same vein, these findings can provide insight into students' behavior which encourages educators to plan their activities more productively in online learning.

Abstract: In most industrial applications, an induction motor is used because of its ruggedness, reliability, and relatively low cost. However, a control scheme is required for the induction motor because it is highly non-linear in dynamic structure and intense in dynamic interaction. Thus, robustness for electrical fault perturbations, load disturbances, speed variation, and parameter uncertainties is needed. The primary focus of this paper is to accomplish the robustness of induction motor drives based on the adaptive sliding mode control (ASMC) algorithm. The ASMC algorithm is based on the conventional robust sliding mode controller with the adaptive switching gain control strategy and discontinuous sigmoid functions to eliminate the undesirable chattering phenomenon. The developed ASMC is utilized for the outer speed and inner current loop, emphasizing two standard PI controllers. Moreover, two control loops of the inner current loop and the outer speed loop in this research are employed from the IFOC structure to drive the three-phase induction motor. The simulation study and numerical design are carried out using PSIM electronics simulation software Version 11. The features of an ASMC are compared with conventional SMC and classical PI controllers. As a result, high-performance control of AC induction motor is achieved by providing effectiveness and robustness regarding overshoot, undershoot, rise time, fall time, and chattering for different operating conditions compared to conventional controllers.

Keywords: adaptive sliding mode control, chattering, induction motor, PSIM simulation, robust control

Introduction

Over recent years, the application of induction motors in the industry cannot be denied. Induction motor applications, such as centrifugal pumps, compressors, elevators, and punching presses, are vast. It is extensively used due to easy maintenance requirements, high reliability, and lower cost for variable-speed operation in broad areas (Wenping Cao; Abid Ali Shah Bukhari; Lassi Aarniovuoro 2019). In addition, industrial applications have become more attractive, especially with advances in microprocessors and power electronics as a modern electrical drive for high-performance characteristics such as robust to parameter variation of the system, inexpensive maintenance with free implementation operation, small overshoot, and steady-state error with the fast transient response (Jahns 2017).

Classical control techniques such as the Proportional-Integral (PI) and Proportional-Integral-Derivative (PID) controllers are commonly used to regulate torque, current, and speed, respectively, in an induction motor. However, these classical control techniques contribute to non-optimal and modest performance in variable speed and position control (Boukhalfa et al. 2019). Therefore, these limitations are solved by using intelligence or adaptive control algorithms such as Fuzzy Logic Controller (FLC), Sliding Mode Controller (SMC), and Artificial Neural Network (ANN). Accordingly, the FLC provides good dynamic performances and robustness to parameter variations, while the ANN accommodates the complicated of arbitrary and nonlinearity (Bouhoune et al. 2017). On the other hand, SMC is excellent for system order rejection and disturbance rejection and is easy to implement (Bagheri et al. 2023).

Generally, SMC has been widely studied and successfully implemented in speed controller applications in AC motor drives (Y. Zhang et al. 2021), (Fereka, Zerikat, and Belaidi 2018), (André and Loro 2020) and other applications such as in power supplies (Fei, Wang, and Fang 2022) and mobile robots (Xie et al. 2021), (Goswami and Padhy 2018). However, conventional SMC algorithms are striving to surmount the chattering phenomenon. Essentially, the associated problems of chattering effects are highly undesirable because of the large switching gain typically applied to handle uncertainties such as external load disturbances and parameter variations (Shao et al. 2021), (Tian et al. 2021).

Chattering problems from the classical SMC method are technically prompted with the integral SMC by modifying the control function. Therefore, the conventional control law is strictly disposed for the operation, and the modified control function is dynamically obtained from the discontinuous control function to the continuous control function, respectively (X. Zhang, Liu, and Zhu 2014). Undoubtedly, the classical SMC is unstable due to control precision for smoothness control performances. Consequently, the control strategy significantly relies upon the proposed adaptive switching gain control strategy.

Therefore, to overcome these inconveniences, this research introduces a new algorithm with a slight modification of classical sliding mode control. For that reason, one variable of gain depends on the system state to reduce the

chattering effect and give robustness for the control performance of induction motor drives.

Sliding Mode Controller

IFOC of Induction Motor Drives

Generally, control features are isolated from two loops, such as the speed controller of the outer loop and the current controller of the inner loop. The speed controller will process the error from the contrasting result of the rotor speed command, ω_r^* , with the rotor speed, ω_r . Subsequently, i_{ds}^* is the nominal value of the flux command for each speed reference, considered the right command of the rotor flux. Where i_{qs}^* is outlined as the current reference of the stator q-axis. Conversely, transformations of Park and Clark from both of the d-q axis current references are technically compared from the current feedback of the motor.

Figure 1 shows the indirect field-oriented control block diagram of the study. The speed controller uses adaptive sliding mode. At the same time, the inner loop of PI current controllers will be processed as the error signal of the voltage command. Then, the switching signal of the Voltage Source Inverter (VSI) will be generated from the Inverse Park Transformation by converting the voltage into two-phase and fed to Space Vector Pulse Width Modulation (SVPWM). Notably, the current model is based on a field-oriented control technique. So, the motor speed is technically controlled by the stator winding current.

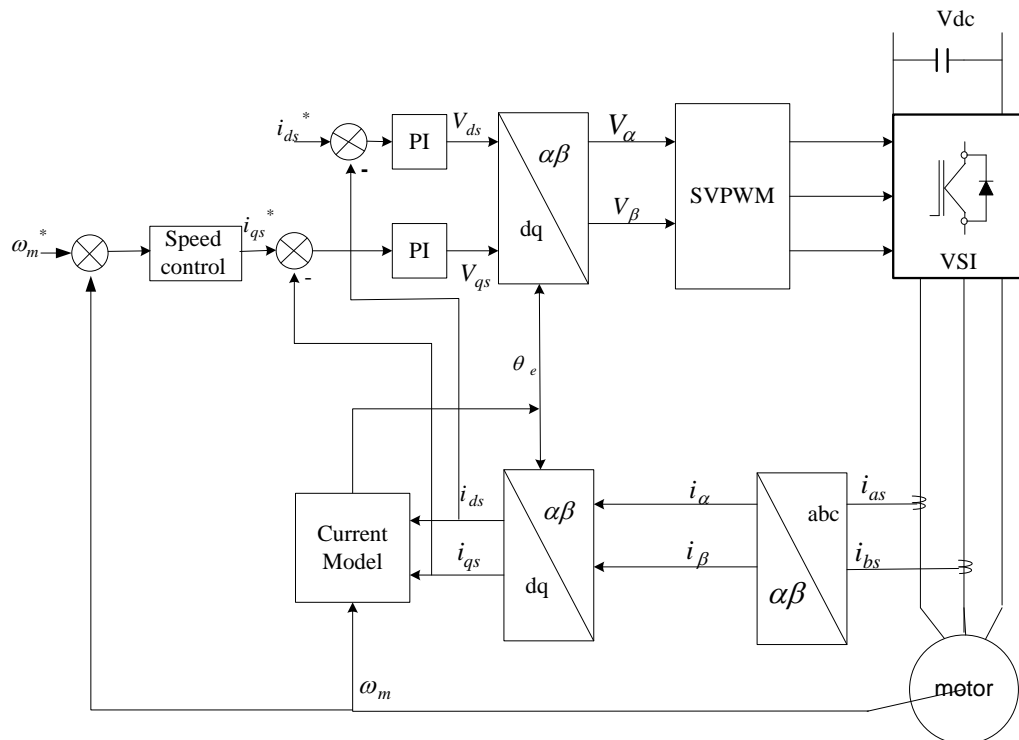

Figure 1. The block diagram of Indirect Field Oriented Control (IFOC)

Adaptive Sliding Mode Controller

The advancement of the sliding mode control strategy for suppression of the chattering phenomenon is clarified in this section. The control law from Equation (1) supplants the signum function in conventional sliding mode to the sigmoid function that considering as:

$$\text{sigm}(\rho', S) = \frac{2}{\pi} \arctan\left(\frac{S}{\rho'}\right) \quad (1)$$

Technically, the control method based on discontinuous function is disposed of the entire operation by implementing with fast sigmoid function. Where ρ' is approximates the boundary layer thickness from a small value with the positive constant. Thus, the modified control algorithm obtains the boundary layer based on the sigmoid function as follows:

$$\rho' = \rho_1 [(1 - |\text{sigm}(\rho', S)|) + \alpha_1] \quad (2)$$

The proposed boundary layer's natural behaviour is adjusted by the system conditions to be progressively proficient when dealing with vulnerabilities. In particular, $S(t)=0$ is the sliding control variable that will be pointed to the origin when vulnerabilities occur in the control system. Then, $S(t)$ is the specific value that will be changed to the origin when the control system is normally stable. On the other hand, ρ' is the constant boundary layer with maximum setting and also pointed to the origin when there are no vulnerabilities in the framework of the sliding variable. Meanwhile, the adaptive switching gain is designed, to be proportional to the absolute sigmoid function as:

$$\beta' = \beta_1 (|\text{sigm}(\rho', S)| + \alpha_2) \quad (3)$$

Where β_1 and α_2 are considered constant and sufficient for operating a sliding mode, occasionally, β' will be expanded prior to vulnerabilities in the frameworks or will remain at the satisfactory value of switching gain when in normal conditions. So, the adaptive switching gain practically relies on vulnerabilities by adequately limiting the boundary layer in the entire operating control framework and diminishing the chattering phenomenon. In. Thus, i_{qs}^* is the stator q -axis of the current reference will be written as:

$$i_{qs}^* = K e(t) - \beta' \cdot \text{sigm}(\rho', S) - \frac{a}{b} \omega_m^* \quad (4)$$

The switching gain and the boundary layer thickness are tuned to nearly approach the zero error of tracking speed performances. Along these lines, the β' shows a varying switching gain that contingently upon vulnerabilities of the framework and ρ' displays the sigmoid function by varying boundary layers to viably wipe out the input of the chattering phenomenon, respectively.

Results and Discussion

The simulation study is carried out by using PSIM 64-bit professional version 11 software. This software contains an embeddable C/C++ that is significant for dynamic system simulation, motor drives, and power electronics which makes it easy for hardware implementation. Fig. 2 shows the main system model of IFOC for three-phase induction motor drives in PSIM software.

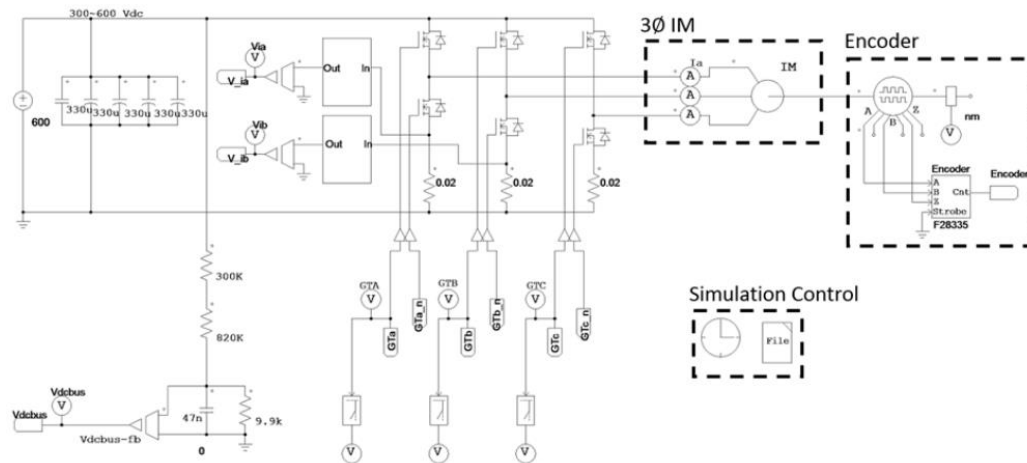

Figure 2. Main system model of IFOC for three-phase induction motor drives

Comparison Performance in Simulation Environment

To shows the effectiveness of this study, two tests were conducted which perform the variety of speed under no-load condition and loaded condition. The motor parameter of the induction motor is tabulated in Table 1. Meanwhile, the simulation cases are observed in term of speed commands as shown in Table 2.

Table 1. Induction Motor Parameters

Parameters	Specifications
R_s (stator)	11.05 Ω
L_s (stator)	6.11 H
R_r (rotor)	0.32 Ω
L_r (rotor)	0.32 H
L_m (magnetizing)	0.029H
No. of Pole	4
Moment of Inertia	0.91 kg.m ²

Table 2. Simulation Cases

Cases	Speed Commands (rpm)
1	Full rated speed =1400
2	Low rated speed =350

The specific test for PI speed controller with no-load and a load of 0.5N at speed command of full rate 1400rpm and low rated speed command at 350rpm when at 2s of triggered time. Technically, the PI speed controller is tuned using Ziegler and Nichols method in closed-loop condition. Therefore, the best parameters of K_p are 0.7 and K_i are 0.9 to achieve superior transient performances respectively. The performance is depicted as Figure 3 for PI controller.

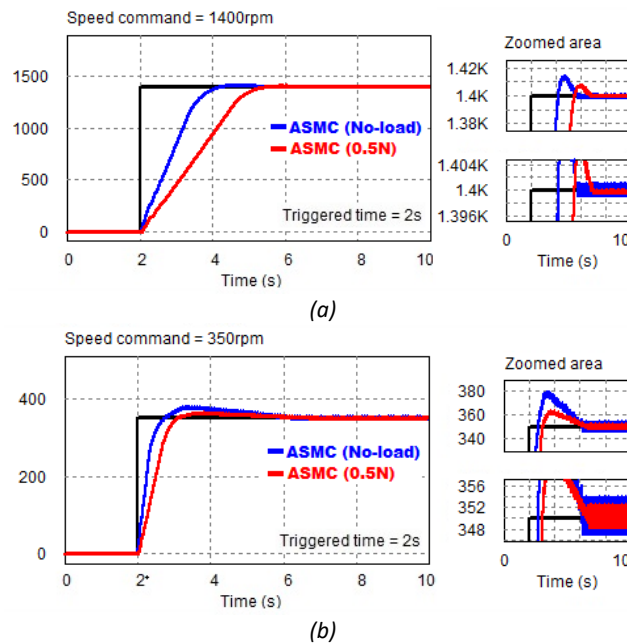

Figure 5. Simulated results for speed response of Adaptive Sliding Mode with no-load and load = 0.5N at (a) 1400rpm; (b) 350rpm

Table 3. Clarifications of simulation cases for comparative performances on different speed controllers with no-load and load=0.5 at 1400rpm when triggered at time=2s

Cases	Speed Controllers	Load (N)	t_d (s)	t_r (s)	t_p (s)	M_p (%)	t_s (s)
1	ASMC	0	2.83	4.18	4.71	14.4	5.78
2		0.5	3.51	5.52	5.98	7.44	6.91
3	SMC	0	2.97	4.33	4.98	24.42	7.18
4		0.5	3.79	5.92	6.62	13.29	8.79
5	PI	0	3.09	4.46	5.21	30.41	7.88
6		0.5	4.15	6.56	7.27	14.94	9.97

Table 3 shows in the summarize of comparative study of three speed controllers operating at 1400 rpm and when initiated at 2 seconds. In particular, the ASMC speed controller is classified in case 1 at the no-load condition and case 2 at 0.5N of loaded condition. Then, the SMC speed controller is classified in case 3 at the no-load condition and case 4 at 0.5N of loaded condition. Lastly, the PI speed controller is classified in case 5 at the no-load condition and case 6 at 0.5N of loaded condition. In particular, the induction motor speed performances are clarified using time domain specifications of delay time (t_d), rise time (t_r), peak time (t_p), maximum % overshoot (M_p) and settling time (t_s).

The Adaptive Sliding Mode Controller (ASMC) demonstrated robust performance with moderate overshoot and relatively short settling times under both no-load and 0.5 N load conditions. However, it's worth noting that the ASMC exhibited slightly longer rise times and peak times as the load increased. On the other hand, the Sliding

Mode Controller (SMC) exhibited faster response times but at the cost of higher overshoot and longer settling times, especially when subjected to a 0.5 N load. While the Proportional-Integral (PI) controller showcased significant overshoot, particularly under no-load conditions, while still achieving acceptable settling times. ASMC speed controller is achieved superior performances for all time domain specifications based on an activated load of 0.5N and no-load condition at speed command of 1400rpm compared with differences speed controllers of SMC and PI respectively. Furthermore, Figure 6 and Figure 7 depict the overlapping results, illustrating the comparative performances of different speed controllers.

Table 4. Clarifications of simulation cases for comparative performances on different speed

controllers with no-load and load=0.5N at 350rpm when triggered at time = 2s

Cases	Speed Controllers	Load (N)	t_d (s)	t_r (s)	t_p (s)	M_p (%)	t_s (s)
1	ASMC	0	2.23	2.73	3.47	8.54	6.14
2		0.5	2.45	3.09	3.71	3.66	6.62
3	SMC	0	2.28	2.81	3.59	15.85	6.96
4		0.5	2.55	3.25	4.05	6.15	7.42
5	PI	0	2.35	2.87	4.05	23.23	7.59
6		0.5	2.66	3.61	4.73	16.57	8.28

Table 4 provides a comprehensive evaluation of Adaptive Sliding Mode Controller (ASMC), Sliding Mode Controller (SMC), and Proportional-Integral (PI) controller, under no-load and 0.5N load conditions at a speed of 350 rpm. For cases with no-load, the ASMC exhibited a rapid rise time (t_r) of 2.73 seconds, modest overshoot (M_p) at 8.54%, and a settling time (t_s) of 6.14 seconds, while the SMC displayed a similar performance profile with a slightly longer rise time (2.81 seconds) and higher overshoot (15.85%).

The PI controller, in contrast, demonstrated a longer rise time (2.87 seconds) and a substantially higher overshoot of 23.23%. When subjected to a 0.5 N load, all controllers exhibited slightly longer rise times, with the ASMC maintaining the lowest overshoot (3.66%) and the shortest settling time (6.62 seconds), followed by the SMC and PI controllers. These findings underscore the influence of load conditions on controller performance, with the ASMC proving to be a favourable choice for rapid and stable control at 350 rpm.

Hardware Performance for Adaptive Sliding Mode Controller

The experimental works are based on high voltage digital motor control (HVDMC), digital signal processing control card TMS320F28335, an incremental encoder and three-phase induction motor. Technically, the HVDMC from Texas Instrument (TI) is used for experimental work with 32-bit floating-point DSP control card to drive the three-phase induction motor through Code Composer Studio (CCS) version 6 and Power Simulation (PSIM) professional version 11.

In particular, the target module of F28335 from PSIM software is generated ready-to-run C code automatically from the control schematic by validated from the control algorithm in PSIM and finally debug the C code in CCS software respectively. Then, the real-time waveforms are monitored from DSP oscilloscope based on PSIM software. The hardware setup is depicted as Figure 8.

Figure 8. Hardware for experimental setup

Figure 9. Experimental results for comparative performances of ASMC speed controller under different conditions at 1400rpm

Figure 10. Experimental results for comparative performances of ASMC speed controller under different conditions at 350rpm

The specific experimental test in Table 5 is clarification cases for ASMC speed under loaded conditions at a speed command of 1400rpm for case 1 and case 2 at 350rpm as depicted in Figure 9 and Figure 10. Hence, the loaded conditions are tested at 0.125N, 0.25N and 0.5N for all cases. Technically, the ASMC speed controller is tuned using the trial-and-error method in the closed-loop condition. Then, the best selected parameters of switching gain based on sigmoid function (β) is 5, constant boundary layer (ρ) is 3 and constant gain (K) is -0.3 to achieve superior performances respectively.

Table 5. Clarifications of experimental cases for ASMC speed controller under loaded condition at 1400rpm and 350rpm.

Cases	Speed (rpm)	Load (N)	t_d (s)	t_r (s)	t_p (s)	M_p (%)	t_s (s)
