CodeRunner (Lobb & Harlow, 2016) is a free and open-source Moodle plugin that allows teachers to assess students' programming abilities by presenting them with coding questions. Compared to traditional written exams, CodeRunner tests provide a more realistic evaluation of students' technical programming skills. CodeRunner can be incorporated into Moodle quizzes alongside other computer-graded question types, such as multiple-choice, numeric, short-answer, or matching questions. Additionally, human-graded essay questions can also be included in the quiz. By integrating CodeRunner into Moodle quizzes, teachers can create a comprehensive assessment that evaluates both programming skills and other relevant course content.

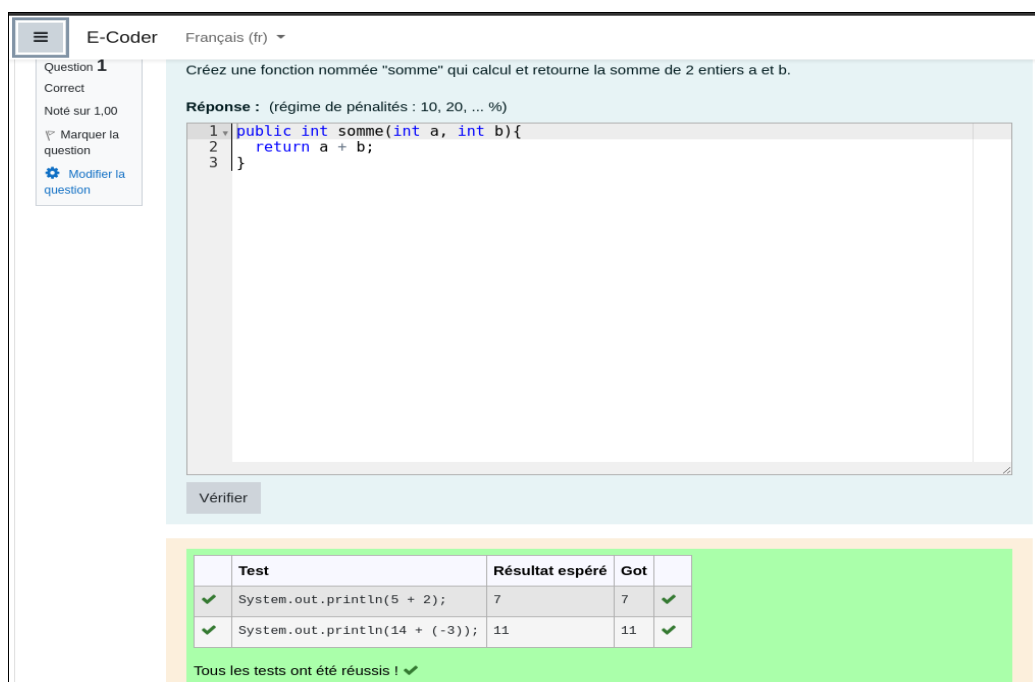

Figure 3. E-coder Platform for Code Testing

By offering web-based questions, CodeRunner allows students to complete assignments from home or after class, freeing up lab time for students who need assistance. The E-coder platform (Figure 3) provides a simulated development environment where students can write and test their code. Students receive immediate feedback on their answers and can resubmit them with a penalty.

CodeRunner: Web Dev & OOP Question Creation

CodeRunner is an excellent tool for assessing programming skills in beginner programming classes, particularly those that cover fundamental concepts like if statements and loops. In our web programming course, we utilized CodeRunner to evaluate students' JavaScript code (Node.js). Although the default setup includes question types for Python and PHP, we focused solely on JavaScript for our course.

To implement CodeRunner, we installed Moodle on a server, added the CodeRunner plugin, and set up the JOBE server to compile student code. To assess JavaScript programming skills, we created a set of questions that concentrated on basic programming concepts.

CodeRunner verifies the correctness of a student's code by executing it and comparing the output to the expected outcome. For JavaScript, console.log() is used to display the output. If the output matches, the test passes, and a green checkmark appears. If the code fails to compile, the student receives feedback on the first error.

Figure 4 displays an example of a JavaScript question where students are required to write a function using Math.random() to generate a number between 1 and 6. If the code compiles successfully, the message "all tests passed" appears, motivating students. If the code is incorrect, the student must scroll down to view the feedback and try again. CodeRunner's ability to provide real-time feedback and automated grading makes it an invaluable tool for assessing programming skills in a beginner programming course.

Test	Expected	Got
<div>✖</div> <pre>var r= randomNom(); if(((r<7) && (r>0))=== true) console.log(true);</pre>	true	<div>***Error***</div> <pre> _tester_ .nodejs:3 return Math.random()*; ^ SyntaxError: Unexpected token ; at createScript (vm.js:80:10) at Object.runInThisContext (vm.js:139:10) at Module.compile (module.js:616:28) at Object.Module._extensions..js (module.js:663:10) at Module.load (module.js:565:32) at tryModuleLoad (module.js:505:12) at Function.Module.load (module.js:497:3) at Function.Module.runMain (module.js:693:10) at startup (bootstrap_node.js:188:16) at bootstrap_node.js:609:3 </pre> <div>✖</div>

Testing was aborted due to error.
Your code must pass all tests to earn any marks. Try again.

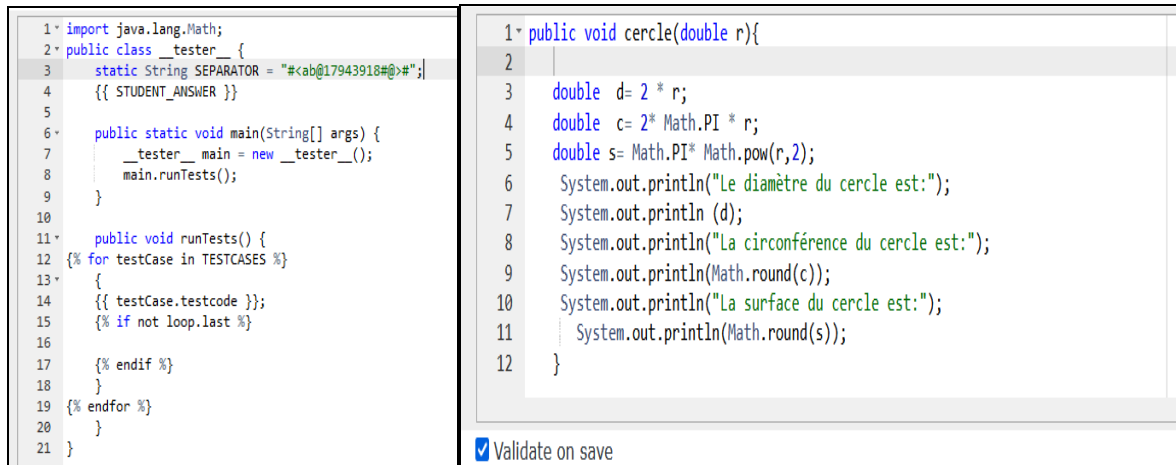

Hide differences

Figure 4. CodeRunner Incorrect Feedback Example

In a Java Object-Oriented Programming (OOP) course within the second-level curriculum, we developed formative assessment questions using java_program and java_method for testing. These question types enable us to test students' understanding of Java programming concepts and object-oriented principles.

The java_method type allows for the inclusion of a method within the Answer class, while java_program enables the use of import statements. To grade the code and access the student's answer code, we utilize template classes and system variables such as STUDENT_ANSWER.

CodeRunner evaluates the student's answer by incorporating it into a template as a method or class. For instance, if we are testing a Math function, we must import it using the "import" statement (see Figure 5, line 1). By using CodeRunner's template classes and system variables, we can provide automated feedback and grading for students, enabling them to identify and correct errors in real-time.

```

1 import java.lang.Math;
2 public class __tester__ {
3     static String SEPARATOR = "#<ab@17943918#@>#";
4     {{ STUDENT_ANSWER }}
5
6     public static void main(String[] args) {
7         __tester__ main = new __tester__();
8         main.runTests();
9     }
10
11     public void runTests() {
12         {% for testCase in TESTCASES %}
13         {
14             {{ testCase.testcode }};
15             {% if not loop.last %}
16
17             {% endif %}
18         }
19         {% endfor %}
20     }
21 }

```

```

1 public void cercle(double r){
2
3     double d= 2 * r;
4     double c= 2* Math.PI * r;
5     double s= Math.PI* Math.pow(r,2);
6     System.out.println("Le diamètre du cercle est:");
7     System.out.println(d);
8     System.out.println("La circonférence du cercle est:");
9     System.out.println(Math.round(c));
10    System.out.println("La surface du cercle est:");
11    System.out.println(Math.round(s));
12 }

```

☒ Validate on save

Figure 5. Java OOP Formative Assessment

CodeRunner employs System.out to determine whether a test has passed or failed. A test passes if the output aligns with the expected output; otherwise, it fails. The Math library includes the "Math.PI()" function for calculating the perimeter and area of a circle. By utilizing a method call, we can execute the test code and define the anticipated output.

Experimental Findings: DevWeb and OOP Courses

In this section, we look at how helpful auto-assessment tools are, especially when students use CodeRunner questions on DevWeb. To prepare for the final test, we set up student accounts a week in advance. This allowed them to practice answering questions and receiving feedback similar to what they would get in the actual test. It also helped them get more comfortable with JavaScript syntax.

After the positive results from DevWeb, we decided to conduct another experiment for the Object-Oriented Programming (OOP) course. We designed a set of Java questions for practice and assessment. Our goal was to see how motivated and engaged students were and whether they found the tool helpful in understanding class concepts.

Evaluating JavaScript Web Dev Skills

The Web Development course is a part of our undergraduate Information Systems program that teaches the basics of front-end web programming. Students learn HTML, CSS, and JavaScript, along with front-end

frameworks like Bootstrap, which is used for creating responsive and progressive user interfaces. Assessment is a vital part of learning, and we provide several tests during the course:

- Two pre-tests were developed to help students prepare for the final exam.
- We conducted four summative quizzes using CodeRunner over four days to give students more chances to improve.

The stats in Table 2 show how many students finished their formative quizzes, including session numbers, completed quiz counts, and percentages compared to the total enrollment (N=176) and participation (N=176). Sessions 1 and 2 had no completed quizzes, so the completion rate is zero. Also, Table 2 gives enrollment and participation numbers for DevWeb course quizzes.

At first, most students tried the quizzes but didn't confirm their answers, leading to a 4% drop in participation on the second attempt. We offered one-hour online quizzes for a week, letting each student try three times (check Table 3). Even though we used the CodeRunner tool, student involvement decreased during the first and second quizzes.

Table 2. Formative Quiz Participation Stats

Number of formative Quizzes done	% of total registered (N =176)	% of total engaged (N =176)
Session 1	≈ 16%	0
Session 2	≈ 12%	0

The table below shows the statistics of summative questionnaires completed by students during four sessions of training. The data is divided into four columns: session, number of completed questionnaires, percentage compared to the total number of registered students (176), and percentage compared to the total number of participants (176).

It should be noted that questionnaires were not used during sessions 1 and 2, as no questionnaire was completed. However, participation rates were significant for sessions 3 and 4, particularly remarkable for session 4, demonstrating the success of using summative questionnaires during these sessions.

These summative questionnaires, more formal and in-depth than formative questionnaires, aim to evaluate the knowledge and skills acquired by students at the end of their training. Their results can be used to evaluate students or identify areas requiring improvements in the training process.

Therefore, it is crucial to encourage the use of summative questionnaires during sessions 1 and 2 to obtain a more precise evaluation of students' achievements and improve the overall quality of the training.

Table 3. Summative Quiz Attempt Statistics

Number of summative Quizzes done	Day	Time (1H)	N = 176
Session 1	09/06/2021	18:05	15
Session 2	10/06/2021	19:05	27
Session 3	11/06/2021	19:05	60
Session 4	15/06/2021	12:45	127

The bar chart illustrates the completion rates of questionnaires for four distinct training sessions, with two sets of data compared: the completion rate relative to the total number of registered students (N=176) and the completion rate relative to the total number of participants (N=176). Notably, for sessions 1 and 2, there were no completed questionnaires, resulting in a 0% participation rate for both data series. However, sessions 3 and 4 exhibit a high participation rate, with session 4 peaking in both series.

Figure 6 displays the participation of students in the quizzes, with blue bars representing students who did not confirm their answers, and red bars representing those who completed the test. Approximately 10% of students took the first quiz, while around 20% to 30% participated in the second and third quizzes. Impressively, over 70% of students confirmed their answers for the fourth quiz.

It is important to note that the series "Percentage of Total Registered Students" is consistently lower than the series "Percentage of Total Participants", which is logical, as the number of participants is necessarily lower than or equal to the number of registered students.

Figure 6. One-Week Summative Assessment

To sum up, the results demonstrate the successful use of questionnaires in sessions 3 and 4, with a high participation rate in the final quiz. However, to enhance the overall participation rate, it is crucial to increase participation in sessions 1 and 2.

Java Formative Assessment

The formative assessment with Java aimed to support students in preparing for their Object-Oriented Programming (OOP) exams through tailored practice quizzes.

Table 4 outlines the quiz participation, with only 26 students attempting it, revealing that 14.77% completed the quiz while 10.22% did not achieve a passing score. Despite some students continuing to use the quizzes post-module, likely due to extended website access, the notably low participation rate suggests the evaluation could be viewed as an added burden, particularly towards the end of the academic year or during periods of overlapping deadlines.

Table 4. Formative assessment attempted by students

Test on OOP language	% of total engaged (N = 26)	% of registered (N = 26)
tentative 1	10.22%	14.77%

After the module concluded, a subset of students persisted in using the quizzes, benefiting from continued access to the website for several months. However, due to the notably low participation rate, the evaluation might be regarded as an extra load, especially during intense periods such as the end of the academic year or when multiple deadlines coincide.

DevWeb Student Success: Assessment Analysis

The graph 7 illustrates the distribution of students' grades in a computer science exam. The horizontal axis represents the grades, ranging from 0 to 20, while the vertical axis indicates the number of students who received each grade.

The grade distribution is bimodal, with two distinct peaks. The first peak is at 10/20, indicating a large number of students who received an average grade. The second peak is at 18/20, indicating a group of students who achieved excellent grades. The curve is symmetrical on both sides of the two peaks, suggesting that there are an equal number of students who received grades below the average as those who received grades above the average.

Additionally, few students received very low grades (between 0 and 5) or very high grades (between 19 and 20).

Figure 7. Analyzing DevWeb's Success Rate

The bimodal distribution suggests that the class can be divided into two groups of students: those who have understood the course content well and those who are struggling. The high number of students who received an average grade indicates that the exam's difficulty level was appropriate for most students. The presence of a group of students who achieved excellent grades shows that some students excelled in the course. The low number of students at the extremes of the distribution indicates that the teaching was effective for most students.

In light of this, we can infer that the implementation of CodeRunner was particularly advantageous for the top-performing students in DevWeb, further validating the saying “excellent students always have excellent tools”.

Conclusion

With the implementation of our innovative online lab teaching method, students are presented with a dynamic learning environment that fosters rapid and effective learning. Beyond traditional course materials, students now have the opportunity to engage with an online lab platform, enabling them to practice and apply their knowledge independently, outside of regular class hours and at their own pace.

Our methodology involved the meticulous configuration of a network architecture featuring two pivotal servers, Moodle and Jobe, where we integrated a range of cutting-edge technologies. The integration of the CodeRunner plugin within Moodle empowers educators to craft code-based assessment questions and provides students with a code debugger offering real-time feedback, enhancing the learning experience significantly.

In our performance evaluation, we scrutinized response times through the orchestration of HTTP requests to the Jobe server for source code compilation. Under stress testing conditions with 100 concurrent users, the server exhibited performance degradation due to increased request loads, highlighting the direct correlation between response times and request volume, as well as network speed.

The practical implications of our study have led to the commencement of the deployment phase on the servers of Oran1 University. The current system architecture includes dedicated access points for administrators and instructors delivering web development modules, aligning with the institution's stringent security protocols. Future plans involve extending remote access to students via UO1's VPN infrastructure, enabling real-world response time testing and broadening the application of CodeRunner across various computer science disciplines.

Looking ahead, the automation of assessment processes by computer science educators will revolutionize practical work completion, offering students the flexibility to engage in hands-on activities anytime, anywhere, independent of physical lab constraints. This advancement signifies a significant leap towards a more accessible and efficient learning ecosystem for computer science students.

Abstract: The National Capital Region (NCR) of the Philippines has long been plagued by traffic congestion that has affected the quality of life experienced by its commuters. Residents within the area have learned to adapt to the case and have created unique ways to cope with the situation. This paper aims to assess factors that influence the productivity of commuters amidst the challenges posed by traffic congestion in the Philippines. Using convenience sampling, a total of 518 employees responded to the online survey. The methods used to gather data were through an online survey. The data gathered was treated using exploratory factor analysis and structural equation modeling. The findings of the study suggest that the factors of traffic congestion such as time wasted, confusing distance, general physical health, stress, and punctuality positively influence traffic congestion; furthermore, traffic congestion positively influences the behavior of commuters. Also, the purchase of a personal vehicle, relocation, use of taxi applications, and leaving home early positively influence the behavior of commuters towards traffic congestion; moreover, the behavior of commuters positively influences the productivity of commuters, and finally, the health and quality of life, financial aspects and increased prospects positively influence the productivity of commuters.

Introduction

Due to the pandemic, transportation activity in many countries was halted. During the pandemic, the workforce and students in the Philippines shifted from a face-to-face setup to an online setup to prevent the spread of the COVID-19 virus (Lim et al., 2022; Chen, 2021; Navarro et al, 2021). Due to this, the traffic in the country decreased dramatically and public transportation was affected severely (Roquel et al., 2021). At this time, economic activities are slowly being reopened by countries, and as a result, the level of traffic congestion is also coming back to pre-COVID levels. According to Wang et al. (2021), in some of the urban areas in the United States of America, traffic congestion is slowly returning.

Moreover, it was also found that the traffic congestion is 25% higher than pre-COVID conditions. Based on the study, the high number of traffic congestion can be attributed to the increase in the use of private vehicles due to the perceived health risks of using public transportation. A study also conducted by Suzara et al. (2021) suggested that the Philippines has a shortage of public transportation systems which worsened when the pandemic hit. Suzara et al. (2021) suggested that the problem arises on how the government solves traffic congestion. The government employs a car-centric approach which puts priority on the creation of infrastructures that will house more vehicles rather than investing in proper public transportation which puts commuters at a disadvantage.

The works of Fattah et al. (2020) suggest that traffic congestion has negative effects on the social and economic aspects of an individual. It was stated that traffic congestion causes stress which also affects the economy with a loss of 2.01 million USD per day in Bangladesh. Also, traffic congestion extends the time spent on travel and can negatively impact productivity. Balabanian (2020) suggested that due to traffic, students spend more time traveling which affects productivity. In the same study, Balabanian also found out that distance traveled also affects the productivity of the students. It was also suggested that the variables of time and distance traveled go hand in hand in terms of tackling the effects of traffic on the productivity of students. Additionally, Ralph et al. (2020) suggested that people who overestimate time will likely also overestimate distance traveled. Due to the long hours spent in traffic, the perceived distance traveled can be overestimated which causes disorientation.

Further, punctuality is also affected by traffic congestion. Alarba et al. (2019) stated that traffic congestion negatively impacts student performance in the Philippines in aspects of punctuality and opportunity loss. Due to the traffic, students induce attendance-related violations in their institutions which also leads to opportunity loss because they have missed the chance to participate in group activities and assessments. Wee et al. (2019) also suggested that overall physical health and sleep quality are also factors that are associated with the punctuality of workers. Kamruzzaman and Rumpa (2019) also stated that traffic congestion is associated with punctuality, productivity, stress, and overall health. Khreis (2020) also suggested that traffic congestion can be linked to cognitive decline, neurodegenerative diseases, and numerous metabolic conditions such as diabetes and obesity which can affect the quality of life and productivity.

The literature suggests that people experience some kinds of productivity loss. Lwesya et al. (2021) stated that in Tanzania, there is a perceived economic loss across the community. Business owners experience low turnovers and bus conductors and operators consume more fuel due to traffic congestion which leads to monetary loss. Ghazali et al. (2019) found out as well that in Seri Kembangan, residents have perceived economic, opportunity loss, and quality of life loss, where respondents suggested that due to traffic congestion, more time is spent on traveling that can be used for doing other meaningful activities. Spending more time in traffic also affects the quality of life workers experience, meaning that traffic congestion has also an effect on leisure time. According to the works of Cui et al. (2019), leisure time is essential to productivity. Moreover, the respondents were also concerned about the cost of fuel that is being consumed due to traffic congestion which leads to monetary loss. The study of Khreis (2020) suggested that traffic can be linked to health loss as well. Health loss pertains to the degradation of health that affects the productivity of an individual.

When people perceive that there is a problem, solutions are conceptualized. In the study of Jiang et al. (2020), it was found that when workers experience perceived economic loss and opportunity loss, people are forced to relocate to an area that would provide better opportunities and monetary incentives. A study conducted by Guanzing et al. (2021) suggested as well that 4th-year medical students in a college in the Philippines consider relocating due to perceived economic loss and opportunity loss. Interestingly, the study highlighted different aspects namely: micro-level which talks about family, education, and socio-demographic status; meso-level which deals with organizational setting and level of income; and macro-level which talks about the political and economic situation of the country. The study found that most of the respondents strongly agree that there are better career opportunities and monetary rewards as an overseas worker, which can be translated as that when there is a better opportunity, people will likely relocate.

Xue et al. (2020) analyzed the relocation behavior of families in Beijing, China, and discovered that the respondents relocated to places that have access to comfortable living accommodations, better public transit, and shorter commutes to work and education. In contrast, Ma and Ye (2019) suggested that workers with short commute times will likely have better productivity. It can be deduced that other than relocating, workers can find jobs that are near their household.

Khreis (2020) suggested that people who experience less traffic congestion will likely have better health. Exposure to Traffic-Related Air Pollution (TRAP) can increase the likelihood of experiencing diseases. If traffic congestion is mitigated, the effects of TRAP will be less severe. Furthermore, Metz (2022) suggested that detouring as suggested by navigation apps is extremely helpful and has a positive impact on the traffic congestion experienced by users. Thereby effectively reducing the perceived effects of factors associated with productivity loss induced by traffic congestion.

According to Hickman et al. (2018) traveling outside of peak hours can be an effective way to combat the effects of traffic congestion. Moreover, Hickman et al. also suggested that in Manila, people often rely on private transportation to avoid the use of unreliable transportation systems and exposure to unpleasant environments when using the public transportation system. Furthermore, booking applications in the Philippines such as Angkas, Grab, and Joyride are extremely popular with commuters. Chalermpong et al. (2023) suggested that due to the traffic congestion being experienced in Southeast Asian countries, motorcycle taxis are becoming popular.

Interestingly, Chang et al. (2021) suggested that population density is linked to traffic congestion in an area. If more people are to move into cities for shorter commute periods, traffic congestion will also increase. According to Chu et al. (2022), there is a strong correlation between urbanization and the intention to purchase new cars. On the other hand, huge increases in the number of cars may have an impact on traffic congestion (Zadobrischi et al., 2020). Interestingly, some responses had a good result in handling traffic congestion and seemed to have a good effect as well on the perceived factors associated with productivity loss, but some can increase the intensity of traffic congestion. Moreover, people cannot also ignore that actions implemented by larger organizations such as the government will have a bigger effect in solving traffic congestion. Suzara et al. (2021) suggested that solving traffic congestion will improve the quality of life of commuters if the government veers away from a car-centric approach and leans towards a more sustainable and people-oriented approach.

This paper aims to evaluate the factors that contribute positively to commuters' productivity in the face of challenges posed by traffic congestion in the National Capital Region of the Philippines. In this study, the research employed both exploratory factor analysis (EFA) and Structural equation modeling (SEM) for a more robust approach. The utilization of EFA was employed in the early stage of this paper to reduce a large set of variables to a smaller number of latent factors, this method helps to explore the structure of the data and identify latent factors that explain the observed patterns of correlations.

Once latent factors are identified through EFA, they can be used for SEM analysis to test and refine theoretical models that specify the relationship between these factors and observed variables. The results from EFA guide the development of the measurement model in SEM on which it defines the latent factors and indicators. Meanwhile, the SEM extends EFA by incorporating both observed and latent variables into a structural model. With these combined approaches, this paper offers a comprehensive approach to assess the factors affecting the productivity loss of employees due to traffic congestion in the National Capital Region of the Philippines.

Hypothetical Research Model

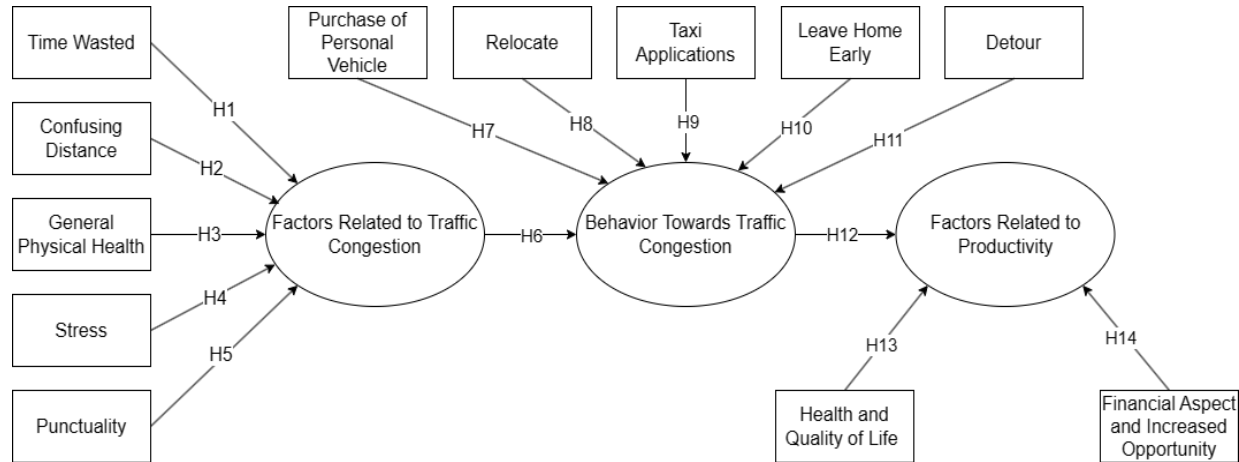

Figure 1. Hypothetical Research Model

Figure 1 illustrates the Hypothetical research model of the study. In measuring endogenous variables in a research, exogenous variables are needed. Endogenous variables are variables that cannot be directly measured but can be measured using exogenous variables. The endogenous variables of this study are factors related to traffic congestion, actions, and factors related to productivity loss. The exogenous variables used to measure factors related to traffic congestion were time wasted, confusing distance, general physical health, stress, and punctuality. Time wasted pertains to the time lost due to traffic congestion (Balabanian, 2020).

Moreover, confusing distance pertains to the distortion of the perceived distance traveled due to the time spent on the traffic (Ralph et al., 2020). According to Kamruzzaman and Rumpa (2019), general physical health refers to the physical condition of a person. Additionally, Kamruzzaman and Rumpa mentioned that stress which pertains to strained mental state, and punctuality which refers to the ability of a person to come on time is another factor related to traffic congestion.

The exogenous variables of the endogenous variable behavior towards traffic congestion were the purchase of a personal vehicle, relocation, taxi applications, leaving home early, and detouring. Hickman et al. (2018) mentioned that people who experience traffic congestion prefer to use private vehicles instead of utilizing public transportation. Additionally, Hickman et al. stated that one method to combat traffic congestion is to leave home early or travel outside rush hour. Xue et al. (2020) and Ma and Ye (2019) mentioned that people tend to relocate to places near workplaces to mitigate the effects of traffic congestion. Chalermpong et al. (2023) stated that taxi applications, specifically motorcycle taxis, are becoming popular nowadays to combat traffic congestion. Moreover, Metz (2020) stated that navigation applications are becoming popular with motorists.

Due to traffic congestion, productivity loss is being experienced by people. The measures used to observe the

endogenous factors related to productivity were health and quality of life, financial aspects, and increased opportunity. Khreis (2020) and Ghazali et al. (2019) mentioned that health and quality of life loss are factors related to productivity loss due to traffic congestion. Health loss refers to the degradation of health status due to external factors that affect a person. Moreover, quality of life loss means that people lose time for leisure activities due to traffic congestion which in turn affects productivity. Ghazali et al. (2019) also mentioned that economic and productivity loss is also associated with productivity loss experienced by people. Economic loss pertains to the monetary loss experienced by people such as more fuel being spent by businesses to transport goods. On the other hand, opportunity loss refers to the loss of chance to improve an individual's quality of life or career due to missing out on opportunities.

Traffic congestion is the accumulation of excess vehicles in a section of the road at a specific time, causing a significantly slower movement of the vehicles which leads to an increase in the travel time from one point to another.

Hypothesis 1: Time wasted will positively influence traffic congestion

Time wasted refers to the amount of unnecessary time that is spent and does not produce any beneficial results. It also pertains to the time lost due to traffic congestion (Balabanian, 2020).

Hypothesis 2: Confusing distance will positively influence traffic congestion

Confusing distance pertains to the distortion of the perceived distance traveled due to the time spent on the traffic (Ralph et al., 2020).

Hypothesis 3: General physical health will positively influence traffic congestion

The overall condition of a person's physical body considers everything from the absence of diseases to fitness level. According to Kamruzzaman and Rumpa (2019), general physical health refers to the physical condition of a person and this is highly affected by traffic congestion.

Hypothesis 4: Stress will positively influence traffic congestion

Stress refers to the body's physiological and psychological reaction to perceived threats or difficulties, which sets off a series of intricate reactions meant to help the body adjust to or deal with the stressor. According to the study of Kamruzzaman and Rumpa (2019), traffic congestion can cause stress among commuters.

Hypothesis 5: Punctuality will positively influence traffic congestion

Punctuality is being regularly on time, following or adhering to schedules, and honoring deadlines are the habits of punctuality (Li et al., 2020).

Hypothesis 6: Traffic Congestion will positively influence action/behavior against traffic congestion

The presence of traffic congestion in an individual's daily life has a significant impact on how a person will react and mitigate the negative effects. Behavior toward traffic congestion is an individual act that may drive patiently, cooperatively, aggressively, and impulsively (Li et al., 2020).

Hypothesis 7: Purchasing of personal vehicles will positively influence action/behavior against traffic congestion

Buying a vehicle increases the mobility of individuals when traveling from place to place, this is because of the exemption from queueing lines and the availability of public transportation. Hickman et al. (2018) mentioned that people who experience traffic congestion prefer to use private vehicles instead of utilizing public transportation.

Hypothesis 8: Relocating will positively influence action/behavior against traffic congestion

Relocation refers to moving from one place to another that is more accessible in terms of distance from the workplace. Xue et al. (2020) and Ma and Ye (2019) mentioned that people tend to relocate to places near workplaces to mitigate the effects of traffic congestion.

Hypothesis 9: Taxi applications will positively influence action/behavior against traffic congestion

Taxi applications are a medium of transportation where people rent motorcycles or cars to go to their designated locations. Chalermpong et al. (2023) stated that taxi applications, specifically motorcycle taxis, are becoming popular nowadays in the Southeast Asia Region to combat traffic congestion.

Hypothesis 10: Leaving home early will positively influence action/behavior against traffic congestion

Leaving home early refers to a person's advanced departure from home to prevent instances that can cause late arrival time (Hickman et al., 2018).

Hypothesis 11: Detouring will positively influence action/behavior against traffic congestion

Detouring refers to the usage of other routes to avoid traffic congestion. According to Metz (2022), the usage of navigation apps in the National Capital Region is becoming popular.

Productivity is the output and efficiency of work as determined by the amount of input to output in multiple tasks or processes. According to Singh and Chaudhary (2022). The organization's work culture now places a high value on productivity. Broadly speaking, productivity is the process of transforming inputs like labor, capital, and time into outputs.

Hypothesis 12: Behavior /Action will positively influence productivity

Actions or behavior are the response of a person when faced with difficulties that aim to achieve a goal, either to mitigate or improve a situation. According to Nazir (2018), action is a response to a stimulus. In the case of the research, the stimulus is traffic congestion which in turn incites employees to take action to combat the adverse effects.

Hypothesis 13: Health and Quality of Life will positively influence productivity

Health is the general state of physical, mental, and social well-being of a person. Quality of life, on the other hand, is a person's perception of their position in life which also includes physical health, psychological well-being, environmental condition, and social welfare. In essence, health and quality of life are closely related concepts that reflect an individual's holistic well-being and fulfillment about their life conditions. Khreis (2020) and Ghazali et al. (2019) mentioned that health and quality of life loss are factors related to productivity loss due to traffic congestion. Health loss refers to the degradation of health status due to external factors that affect a person. Moreover, quality of life loss means that people lose time for leisure activities due to traffic congestion which in turn affects productivity.

Hypothesis 14: Financial Aspect and Increased Prospects will positively influence productivity

The financial aspect refers to the monetary components of various aspects of life, such as personal, social, and professional. It includes income, savings, investments, debts, and financial management. Increased prospects pertain to the number of opportunities present and possibilities for success, improvement, or achievement in life. These prospects can relate to personal development, career growth, financial stability, or any other aspect of life where success is pursued. Ghazali et al. (2019) mentioned that economic and productivity loss is also associated with productivity loss experienced by people. Economic loss pertains to the monetary loss experienced by people such as more fuel being spent by businesses to transport goods. Opportunity loss refers to the loss of chance to improve an individual's quality of life or career due to missing out on opportunities.

Method

Data Collection

The target population for this study consisted of employees in the NCR in the Philippines. The study adopted the convenience sampling method. Data collection occurred from October 2023 to November 2023. A total of 518 responses were gathered. Participation in the survey was voluntary, and respondents' confidentiality and anonymity were ensured. A structured questionnaire with closed-ended questions was designed to collect quantitative data, ensuring clarity and precision.

Table 1. Demographics

Variable	Category	No.	Response information N=518
Gender	Male	323	62.40%
	Female	187	36.10%
	Prefer not to say	8	1.50%
Age	18-20	35	6.80%
	21-29	351	67.80%
	30-39	97	18.70%
	40-49	23	4.40%
	More than 50	10	1.90%
Educational			
Attainment	Primary School	10	1.93%
	High School	104	20.08%
	Vocational	29	5.60%
	Bachelor's Degree	329	63.50%
	Master's Degree	35	6.80%
	Doctorate	11	2.10%
Employment Status	Full-time Employee	392	75.70%
	Part-time Employee	31	6.00%
	Business Owner	20	3.90%
	Unemployed	34	6.60%
	Retired	4	0.80%
	Self-employed	9	1.70%
	Others	28	5.40%
Civil Status	Single	429	82.80%
	Married	86	16.60%
	Widowed	2	0.40%
	Legally Separated	1	0.20%
Monthly Income			
(Php)	Less than 12,082 Php	103	19.90%
	12,082 Php to 24,164 Php	141	27.20%
	24,164 Php to 48,328 Php	187	36.10%
	48,328 Php to 84,574 Php	54	10.40%
	84,574 Php to 144,984 Php	22	4.20%
	144,984 Php to Php 241,640		
	Php	7	1.40%
	More than 241,640 Php	4	0.80%

The demographic profile of the study consists of a total of 518 respondents. It shows a diverse representation of across various categories. In terms of gender, the majority of respondents were identified as male, constituting 62.40% of the data, while females accounted for 36.10%. A small percentage of 1.50% chose not to disclose their gender preference. The age distribution shows a predominantly young and middle-aged population, with 67% falling within the 21-29 age group. Participants aged 30-39 constitute 18.70%, followed by a smaller percentage of 18-20, 40-49, and over 50 age brackets. In Educational attainment, among the participants, a significant majority (63.50%) hold a Bachelor's Degree. High School graduates comprised 20.08% while those with a Masters and Doctorate Degree constituted 6.80% and 2.10% respectively. With regards to employment status, the majority of participants identified as full-time employees (75.70%), with a smaller percentage working part-time (6.00%) or being self-employed (1.70%). In addition, 3.90% were identified as business owners, and 6.60% were unemployed. Retirement status was less common, with 0.80% of participants retired. Civil status shows a predominantly single population, accounting for 82.80% of respondents, while married individuals constituted 16.60%. A small percentage constituted widowed (0.40%) and separated (0.20%). Finally, participants' monthly income distribution shows a diverse final background. The largest portion (36.10%) fell within the 24,164 Php to ₱48,323 Php income range, followed by those earning 12,082 Php to ₱24, 164 Php (27.20%). Lower income brackets (< 12,082 Php) and higher brackets (48,328 Php to 241,640 Php) had respective representations of 19.90% and 10.40%, and lastly with the highest income bracket (> 241, 640 Php) constituting 0.80% of the data.

Data Analysis

Kaiser-Meyer-Olkin Test

The Kaiser-Meyer-Olkin (KMO) test of adequacy is a test used by data analysts to identify the adequacy of data for factor extraction. The KMO gives a score between 0 and 1 where results that are equal to or greater than 0.8 are said to be adequate. This means that when data is tested with KMO and yields a score of 0.8, the data size is said to be sufficient and the correlation between the variables can be explained by a hidden variable (Nkansah, 2018). Moreover, this study utilized an online sample size calculator that computes the required number of respondents to represent the population. The parameters used in computing the number of respondents needed is a 95% confidence interval with a 5% margin of error.

Exploratory Factor Analysis

Multivariate analysis, specifically factor analysis was used to unveil hidden observed variables in the data set. According to Tavakol and Wetzel (2020), this technique allows us to simplify a set of complex variables or items using statistical procedures to explore the underlying dimensions that explain the relationships between the multiple variables/items. The EFA simplifies the complexity of the analysis. It offers the means to construct a model that illustrates the intricate relationships between these latent factors and their corresponding observed variables, providing valuable insights into the factors that contribute to productivity loss.

Table 2. Factor Analysis Results

Corresponding Measure	Factor Loadings
I experience less frustration and annoyance when I spend less time in traffic	0.649
I believe that spending less amount of time stuck in traffic has a positive impact on my overall quality of life	0.625
Reducing my exposure to traffic will affect my health positively	0.611
I think I can enjoy life more if I experience less traffic congestion	0.609
I feel like I have more time to do other things if there is no traffic congestion	0.600
I do not feel tense when there is traffic after acting against it	0.594
I experience less stress and anxiety after doing something to combat traffic	0.580
Less exposure to traffic makes me more energetic and healthier	0.575
I am able to meet deadlines faster because I do not spend too much time in traffic congestion	0.573
I feel more productive because I have more time to do meaningful things instead of being stuck in traffic	0.568
After taking action to combat traffic congestion, I have more spare time	0.567
I noticed that prolonged exposure to traffic congestion leads to a decrease in my overall physical fitness and health	0.538
I try to find ways to reduce monetary losses from traffic, like carpooling or telecommuting (WFH)	0.674
I believe that I will spend less if there is less traffic congestion	0.668
I feel less frustrated when I do not miss important meetings or events due to traffic delays	0.666
I believe that taking action on traffic-related delays can positively	0.642

impact my career or personal opportunities

I believe that if there is less traffic congestion, my expenses will be less 0.639

I believe that taking action against traffic congestion is worth spending my money on 0.609

I experienced less burden about the financial costs induced by traffic congestion when I took action about it 0.582

After taking action to combat traffic, I believe that it positively affects my finances 0.568

I worry less about the potential missed opportunities that could arise from being consistently late due to traffic if there is less traffic congestion 0.518

I think that buying my own vehicle will positively affect my productivity 0.749

I plan to purchase a personal vehicle due to traffic 0.739

I feel the urge to have my own vehicle due to traffic 0.727

I believe that having a vehicle as a service will reduce my travel time 0.702

I feel like having my own vehicle will have a huge impact on my arrival time at work 0.691

I think that having a vehicle will make my everyday commute easy. 0.668

If I move my residence near my office, I think it will be beneficial for me 0.760

I think that the best way to avoid traffic is to relocate nearer to my office 0.742

I like the idea of living near my office so that I can avoid traffic 0.723

I think that living near my work will positively affect my life 0.692

I believe that if I live near my work, I will be more productive 0.685

I want to buy/rent an accommodation that is nearer to my work because 0.652

of the traffic

Instead of riding the bus/jeepney, I book taxi services to get to work on time. (e.g., Grab, Angkas, taxi, habal, etc.)	0.740
---	-------

I feel the urge to switch from mass transportation to taxi services or motor services to prevent being late for work	0.720
--	-------

When the queue in the mass transportation is long, I opt to take other modes of transportation	0.712
--	-------

I believe that using taxi and motorcycle services is an effective way to avoid traffic	0.691
--	-------

When I get stuck in traffic while riding mass transportation, I hail/book taxis to avoid further delays. (e.g. taxi, Grab, Angkas, habal, etc.)	0.677
---	-------

I switch from jeepneys/buses to faster-commuting options just to arrive early at work and avoid getting stuck in traffic	0.648
--	-------

I feel a sense of relief when I leave home early because I will not be late for work	0.734
--	-------

I have noticed that by leaving home early, I can accomplish more tasks and be more productive at work	0.729
---	-------

I believe that leaving home early will save me from being stuck in traffic	0.718
--	-------

I think that leaving home early will positively affect my productivity at work	0.656
--	-------

I believe that leaving early will save me from being late due to traffic	0.640
--	-------

I feel nervous when I do not leave home early because of the traffic	0.557
--	-------

Traffic is consuming a lot of my time	0.758
---------------------------------------	-------

I feel like my time is wasted on traffic	0.754
--	-------

The traffic makes my travel time longer	0.720
---	-------

I feel like I can do better things if I do not spend a lot of time in traffic	0.706
---	-------

I feel like I spent a lot of time in the traffic	0.661
I think detouring positively affects my arrival time	0.679
I feel that detouring has a huge impact on my productivity at work	0.672
I can avoid traffic by taking other roads	0.662
Detouring makes me arrive faster in my destination	0.630
I usually plan ahead of time to detour because of traffic congestion in the area	0.600
I detour usually because of traffic	0.596
I do less work because of the time I spend in traffic	0.701
I am late even when my house is not far away because of the traffic	0.678
I feel like the distance I perceived from my home to my destination is more far because of the traffic	0.650
Traffic makes me perceive the distance between my home and my destination as longer than it actually is	0.644
I do less work because of the time I spend in traffic	0.591
I experience stress and physical discomfort when stuck in traffic, and I think it takes a toll on my physical well-being	0.684
I believe that spending long hours commuting in heavy traffic negatively affects my overall physical health	0.678
I believe that the sedentary nature of long commutes in traffic has a negative impact on my physical fitness and well-being	0.628
I noticed that traffic congestion leads to fatigue and physical strain, impacting my ability to maintain a healthy lifestyle	0.626
I find myself with reduced energy and vitality after spending time in traffic jams	0.569
I feel stressed when I am almost late, and the cars are not moving	0.717

I feel less energized because of the stress caused by traffic	0.633
I feel tense when I am almost late because of the traffic	0.616
I do not like the idea of being in a traffic	0.555
When stuck in traffic, I get irritated	0.528
I find that traffic-related delays have a noticeable impact on the convenience of my daily commute	0.527
Traffic-related delays affect my overall productivity or performance at work or other commitments	0.710
I do less work because I arrive late because of the traffic	0.646
I find myself stressed and frustrated when stuck in traffic on my way to appointments or work	0.621
Traffic is a common reason for my occasional tardiness	0.621

Table 2 shows the treated and final version of the rotated component matrix. The results unveiled 12 observed variables. The resulting variables were: time wasted which refers to the time being wasted in the traffic; a confusing distance which refers to the distortion of the perceived distance; general physical health which refers to the overall health of a person; stress which refers to the mental state being strained; punctuality which refers to the ability of a person to come on time; purchase of personal vehicle which refers to the buying of own vehicle; relocate which refers to moving to a place that is much nearer to the workplace; use of taxi applications; leave home early which refers to traveling outside rush hours; detour which means taking other roads that is less congested to arrive in the same destination; health and quality life of life that pertains to general health and overall outlook in life; financial aspect and increased opportunities which refers to the increase of monetary wealth and that more opportunities are available due to more time to be more productive.

Structural Equation Modeling

Testing theories about the effects of interacting factors is done through the multivariate Structural Equation Modeling (SEM) technique. The SEM is a multivariate approach of testing hypotheses regarding the influences of one variable on another during the interaction between the variables. By doing so, a study can test hypotheses about how variables are related, assess whether their theoretical models fit with the observed data and make predictions about how changes in one variable might affect changes in other variables within a study.

In this paper, the SEM is performed using AMOS 22. The study utilizes the Statistical Package for the Social

Sciences (SPSS) to treat data for Factor Analysis and Reliability Testing. Abuhasel (2023) suggested that SPSS is a great statistical tool to treat data and provide a graphical representation of the results for uncomplicated interpretation. Analysis of Movement Structure (AMOS) will also be used for creating the structural equation modeling. The AMOS is a popular tool that is used in several researches to showcase if the data that is gathered by researchers can be explained by a structural construct (Na et al., 2022; Lee et al., 2023, Ibrahim et al., 2021).

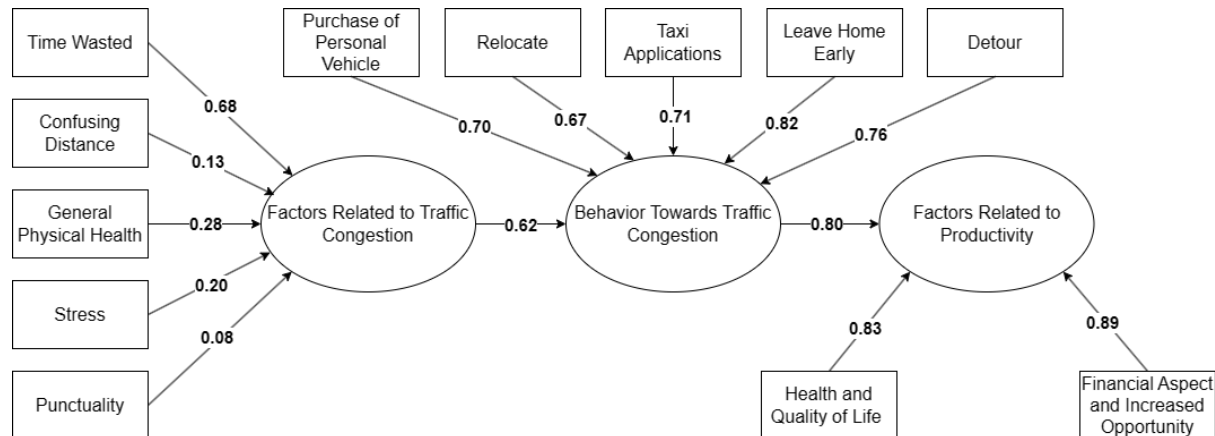

Figure 2. Initial Structural Equation Model for Factors Affecting Productivity Loss due to Traffic Congestion

Figure 2 conveys the initial statistical model of the study.

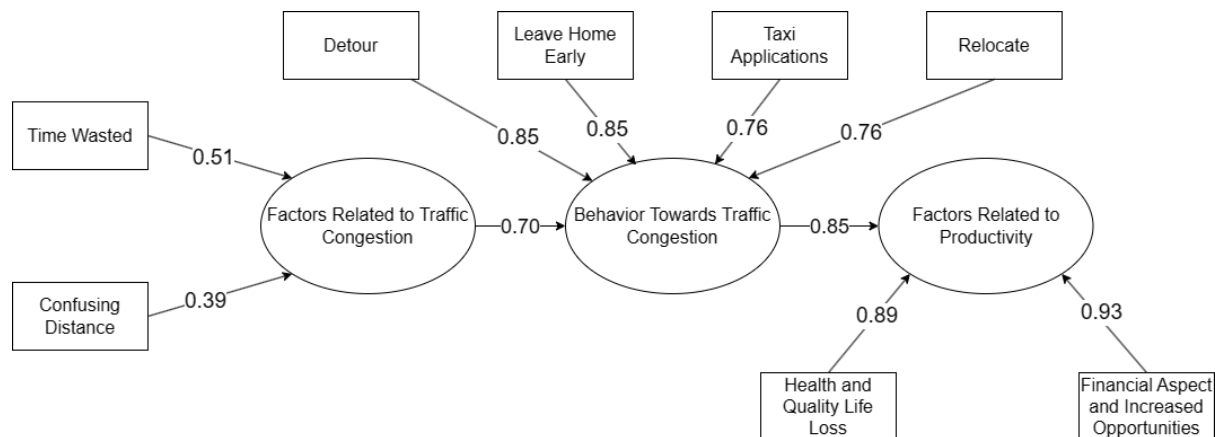

Figure 3. Final Model on Factors Affecting Productivity Loss due to Traffic Congestion

The model should comply with the model fit indices to ensure that the results are acceptable. The initial model does not comply with some of the model fit indices and treatments were required to ensure compliance. The common model fit indices used in studies about SEM according to Kang and Ahn (2021) are the Chi-square/degrees of freedom (df), Goodness of Fit Index (GFI), Adjusted Goodness of Fit Index (AGFI), Chi-square/DF, Comparative Fit Index (CFI), Non-normed Fit Index (NNFI/TLI), Root Mean Square Residuals (RMR), Normed Fit Index (NFI), and Root Mean Square Error of Approximation (RMSEA). The said model fit

indices were suggested by Bhale and Bedi (2023), and Kang and Ahn (2021). A value that is less than five in chi-square/DF is acceptable according to Marsh and Hocevar (1985). Moreover, according to Na et al. (2022), Ibrahim et al. (2021), and Lee et al. (2023) GFI, TLI, NFI, and CFI must have a value greater than 0.90. Moreover, AGFI must have a value greater than 0.80 to be acceptable. Additionally, RMSEA and RMR must have a value of less than 0.10 to be considered acceptable.

The results of the SEM show that two exogenous variables can measure factors related to traffic congestion. An exogenous variable is an independent variable that is not affected by external factors. The exogenous variable is somehow related to an independent variable. The endogenous variables are the items that are being affected by external forces. The two exogenous variables were time wasted and confusing distance. The exogenous variables positively impact the endogenous variable of traffic congestion. On the other hand, the variables that impact behavior towards traffic congestion were relocation, taxi applications, leaving home early, and detours. The results also show that health and quality of life, financial aspects, and increased opportunities are measures of factors related to productivity.

Reliability Testing

In the works of Abdallah et al. (2023), the cut-off value for Cronbach's alpha is 0.7 to be said acceptable. A value that is equal to or greater than 0.7 indicates acceptable reliability. The purpose of reliability testing is to assess the set of measures if they are internally consistent. The meaning of internally consistent is that all measures of a certain variable measure the same item.

Table 3. Cronbach's Alpha

Measure	Cronbach's Alpha	Cut-off	Remarks
Time Wasted	0.801	≥ 0.7	Acceptable
Confusing Distance	0.898	≥ 0.7	Acceptable
Factors Related to Traffic Congestion	0.804	≥ 0.7	Acceptable
Detour	0.910	≥ 0.7	Acceptable
Leave Home Early	0.841	≥ 0.7	Acceptable
Taxi Applications	0.889	≥ 0.7	Acceptable
Relocate	0.873	≥ 0.7	Acceptable
Behavior Towards Traffic Congestion	0.815	≥ 0.7	Acceptable
Health and Quality of Life	0.857	≥ 0.7	Acceptable
Economic and Opportunity	0.890	≥ 0.7	Acceptable
Productivity	0.800	≥ 0.7	Acceptable

Table 3 reflects the results of a reliability analysis using Cronbach's Alpha to assess the internal consistency of factors related to traffic congestion, behavior towards traffic congestion, and factors associated with productivity. Cronbach's Alpha is a measure of reliability, indicating how well the items within a set are correlated.

Model Fit Indices

In SEM, it is important to evaluate if the observed dataset corresponds with the proposed theoretical model. According to Bhale and Bedi (2023), model fit indices show an understanding of the available data that can be explained by the theoretical model. It is important that the requirements of the model fit indices be satisfied to ensure that the dataset can be explained by the model used.

Table 4. Model Fit Indices

Model Fit	Value	Cut-Off	References	Remarks
Chi-Square/df	2.62	< 5	Marsh and Hocevar (1985)	Acceptable
GFI	0.90	≥ 0.90	(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable
AGFI	0.85	> 0.80	(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable
RMR	0.05	≤ 0.1	(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable
TLI (NNFI)	0.93	≥ 0.90	(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable
CFI	0.93	≥ 0.90	(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable
NFI	0.90	≥ 0.90	(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable
RMSEA	0.06	< 0.10	(Na et al., 2022; Ibrahim et al., 2021; Lee et al., 2023)	Acceptable

*Note: GFI = Goodness of Fit Index; AGFI = Adjusted Goodness of Fit Index; RMR = Root Mean Square Residual; TLI = Tucker Lewis Coefficient; NNFI = Non-normed Fit Index; CFI = Comparative Fit Index; NFI = Normed Fit Index; RMSEA = Root Mean Square Error of Approximation; df = degrees of freedom

Table 4 shows the model fit indices of the modified model. Results show that all model fit indices are satisfied. Model fit is an important statistical tool that allows researchers to understand if the dataset can be explained by the proposed hypothetical model.

Results

The results unveiled 12 observed variables. The resulting variables were time wasted, confusing distance, general physical health, stress, punctuality, purchase of personal vehicle, relocating, use of taxi applications, detour, health and quality of life, and lastly, financial aspect and increased opportunities. Initially, there were 16 variables identified from different literature, but factor analysis suggests that there are only 12 variables based on the measures created. Additionally, the resulting KMO score computed is 0.961 and is above the minimum cut-off of 0.7 which means that the data set to be sample adequate. This means that the sample size is already adequate for factor extraction. Moreover, results suggest that the total variance is 72% which means that the research explains 72% of the study and there is still 28% undiscovered.

Proceeding on to the SEM, the final model results revealed that two factors can measure factors related to traffic congestion. The variables were time wasted ($\beta = 0.51$) and confusing distance ($\beta = 0.39$). This means that the two exogenous factors positively impact traffic congestion. Moreover, other exogenous variables of traffic congestion such as general physical health, stress, and punctuality were removed from the statistical model because estimates show low beta values that cause problems in the model. The results of the data analysis showed that the four exogenous variables such as relocation ($\beta = 0.76$), taxi applications ($\beta = 0.76$), leaving home early ($\beta = 0.85$), and detours ($\beta = 0.85$) positively impact the factors related to traffic congestion. Although there were four exogenous variables that positively impacted behavior towards traffic congestion, the result revealed the purchasing of personal vehicles causes problems in the model resulting in its removal. Additionally, the results also present that the health and quality of life, financial aspect and increased opportunities are measures of factors related to productivity with beta values of $\beta = 0.89$ and 0.93 respectively. The result of the statistical modeling revealed that endogenous variables impact each other as well. The factors related to traffic congestion positively impact behavior towards traffic congestion ($\beta = 0.70$). The behavior towards traffic congestion positively impacts factors related to productivity ($\beta = 0.85$).

The Cronbach's Alpha was used to check the reliability of the measures used for each variable. The results of the test showed that the internal consistency of the factors related to traffic congestion, behavior towards traffic congestion, and factors associated with productivity have a Cronbach's Alpha value that ranges from 0.800 to 0.910 and it revealed high internal consistency. Therefore, the values are considered acceptable, indicating a strong correlation among the items within each factor.

The Model Fit Indices results showed remarkable results. All of the suggested model fit indices by Kang and Ahn (2021) were all satisfied. The chi-square/df has a result of 2.62 with an acceptable value of less than 5. The GFI of the model is 0.90 with an acceptable value of greater than or equal to 0.90. The AGFI of the model is 0.85 with a cut-off value that is greater than 0.80. The RMR score is 0.05 with an acceptable value of less than 0.1. The TLI (NNFI) and CFI score of the model is both 0.93 with both measures having an acceptable value that is greater than or equal to 0.90. The NFI score of the model is 0.90 with an acceptable value that is equal or

greater than 0.90. Lastly, the RMSEA score is 0.06 with an acceptable value that is less than 0.1. The results of the model fit indices were all within the cut-off limit.

This study developed several suggestions and recommendations considering the results and conclusions. Results of the study showed that there is a strong possibility that acting can improve how a person experiences traffic congestion. Be it buying a personal vehicle or relocating to a place that is near to work, there is a big chance that current conditions will improve. Although research shows that there is a strong possibility that conditions can be improved, it is still not proper that people will spend more just to combat the effects of traffic congestion. All the activities that the research created are focused on the workers. Results indicate that acting can have a favorable impact on the perceived causes associated with traffic congestion. It is necessary to take action to prevent the issues associated with traffic congestion, which include lost opportunities, health, and quality of life, as well as financial loss.

Discussion

After conducting the factor analysis, the data was then tested to see if the data would fit the hypothetical model. The results revealed that time wasted ($\beta = 0.51$) and confusing distance ($\beta = 0.39$) positively affect traffic congestion. In the study of Balabanian (2020), students spend more time in traffic which results in time wasted, and the perceived distance traveled by students is also distorted. On the other hand, the study results showed employees experience the same factors experienced by students. The study of Kamruzzaman and Rumpa (2019) revealed that employees in Dhaka, Bangladesh also experienced the results of the study. Employees in the region strongly agree that productivity is highly affected by traffic congestion. Variables of time wasted, and confusing distance were observed to be factors of traffic congestion. Results also revealed that factors related to traffic congestion have a significant effect on behaviors toward traffic congestion ($\beta = 0.70$). This means that there is a high chance that employees who experience traffic congestion will have an action or behavior that will combat the effects of traffic congestion. The result of the study validates the literature that emphasizes time wasted and confusing distance are factors related to traffic congestion. The result implies that in the Philippines, there is a lot of time loss and slow-moving traffic that causes productivity loss among employees.

Results also show variables such as relocating ($\beta = 0.76$), taxi applications ($\beta = 0.76$), leaving home early ($\beta = 0.85$), and detouring ($\beta = 0.85$) positively impacts behavior towards traffic congestion. The study by Xue et al. (2020) suggests that people in China will likely relocate to shorten commute time and travel distance. The findings also suggest relocation as an effective option to combat the effects of traffic congestion. The study of Chalermpong et al. (2023) also revealed that booking applications, specifically motorcycle taxis, are becoming more popular in Southeast Asian countries. The study revealed that there is an increase in the usage of motor taxis. The study of Hickman et al. (2018) also suggests that people in Metro Manila in the Philippines travel outside of rush hours to avoid being stuck in traffic and cramped transportation. Participants of the study reported that people traveling in Metro Manila travel outside of rush hours because of the ineffective

transportation system in the area. Gumasing et al. (2023) also revealed that there is a high acceptance of using navigation applications for drivers within Metro Manila. This application allows users to detour on less congested roads. Additionally, SEM results showed that behavior toward traffic congestion has a significant impact on productivity ($\beta = 0.85$). This means that employees who act to mitigate traffic congestion will likely be more productive and will have a better overall outlook in life. Excessive expenses and missed opportunities can be minimized by acting. Other than that, health problems and degradation of quality of life can be avoided. This result effectively adds to the literature about the effect of taking actions to mitigate the effects of traffic congestion.

In terms of the perceived factors related to productivity, results show that it is positively impacted by health and quality of life loss ($\beta = 0.89$), financial aspect, and increased opportunities ($\beta = 0.93$). The study by Ghazali et al. (2019) mentioned that due to traffic congestion, quality of life and health are being experienced by the people in Seri Kembangan, Malaysia. Moreover, economic and opportunity loss was also observed in the area. The residents reported that people in the area are being affected by traffic congestion in terms of economic, opportunity, health, and quality of life loss. The people were spending more on petrol due to the traffic. Moreover, residents reported that they were spending a lot of time in traffic congestion which affects their health, opportunity, and quality of life.

According to the study of Lwesya et al. (2021), the same phenomenon occurs in Tanzania wherein business owners encounter opportunity and monetary losses due to traffic congestion. Business owners were consuming more fuel, which means more money was spent, and were also missing opportunities due to the delay caused by traffic congestion. The result of the study shows that employees in the Philippines are experiencing loss of money and opportunities, and a decline in health and quality of life. This adds to the existing literature about the productivity loss being experienced by employees in the Philippines.

The implication of the research results revealed that traffic congestion acts as a stimulus, in which employees experience productivity loss that affects behavior to mitigate the effects of traffic congestion. The research adheres to the stimulus-response (SR) theory created by Edward Thorndike in the 1900 in which a stimulus activates and triggers a response (Barua et al., 2020). The contribution of the research extended the idea of the SR theory by identifying if the responses positively impact the productivity of employees. The study contributes to existing literature by proving that actions to mitigate traffic congestion alleviates the effect of productivity loss.

The results reveal that the movement of people and the intention to use taxi applications is highly affected by traffic congestion. The work of Lomibao (2023) suggested that the movement of people within the area is highly due to employment. The reason behind the case is to improve the economic position of employees. In contrast, Zadobrischi et al. (2020) mentioned that due to the continual intermigration of people in the area, traffic congestion worsens. Although there are measures that employees take to combat the effect of traffic congestion, there is no certainty as to the duration of the effectivity. Existing actions can be effective right now, but there is

a void that slowly consumes the effectiveness of actions due to the continual intermigration of people.

To minimize the impact of traffic congestion on daily life, the community should give priority to infrastructure improvements in residential areas. This includes improving access to public transportation, involving the community in decision-making processes, and promoting green spaces and walkable neighborhoods. Articles cited in the research showed how the government of the country fails to understand how transportation can be improved. Policies of the country about fighting the effects of traffic congestion are car-centric instead of a people-centric approach. The current policies prioritize the increasing volume of private vehicles within the region instead of giving people better access to public transportation. In addition, it is important to encourage a more environmentally friendly method of reducing traffic congestion as opposed to one that is car centric.

Future works of the study are advised to consider specific demographics to further deepen the understanding of how different types of people are being affected by traffic and how respondents will deal with the subject matter. Factor analysis revealed that the total variance explained by the variables is 72%, and the remaining 28% may be found upon integrating demographics. Additionally, qualitative research can also be used to further understand the subject. Interviews and narratives from subject matter experts can also be helpful in enlightening researchers and readers about the current conditions of how traffic affects an employed individual. The impact of policy making in the Philippines can also be studied to further understand what kind of policies the government must impose to better the situation. Other than that, simulations can also be done to further understand the movement of different demographic groups. This way, researchers can better understand where to place business centers and commercial areas.

Conclusion

Humanity has lived with traffic congestion for years. It is a frustrating fact of life that slows us down and tries people's patience. However, the study has shown a much deeper reality, traffic congestion affects our lives in various ways, making it more than just a minor inconvenience. The study shows the complex relationship between traffic problems, behavior, and commuters' productivity. The study was carefully carried out using SPSS and AMOS software through the application of exploratory factor analysis (EFA) and Structural equation modeling (SEM) for a more robust approach, resulting in a reliable model.

The factor analysis conducted on the dataset identified 12 key factors associated with traffic congestion, such as time wasted, confusing distance, general physical health, stress, punctuality, personal vehicle ownership, relocation, taxi applications, early departure from home, detouring, health and quality of life, and financial aspects with increased opportunities. The hypothetical model shows significant positive effects of factors such as time wasted, confusing distance, general physical health, stress, and punctuality on traffic congestion. However, findings from this study were found to align with prior research such as Balabanian (2020) and Kamruzzaman and Rumpa (2019), indicates that both students and employees experience similar factors

contributing to traffic congestion. The study also emphasizes how traffic congestion affects the perceived travel distance of commuters and how traffic congestion consumes the valuable time that commuters can spend in other meaningful activities as suggested by Ghazali et al. (2019), linking traffic congestion to the deterioration of quality of life, increased expense, and missed opportunities.

Behavioral responses to traffic congestion were found to be positively influenced by variables such as relocating, using taxi applications, leaving home early, and detouring. The study highlights the significant impact of proactive behavior towards traffic congestion on productivity and emphasizes that individuals who take measures to lessen congestion tend to exhibit higher productivity and quality of life. This also reveals that addressing traffic-related challenges can minimize excessive expenses, missed opportunities, health problems, and degradation of quality of life.

With regards to factors influencing productivity, the study identifies health and quality of life loss, and financial aspects with increased opportunities as key determinants. Similar findings were observed in the study conducted in Malaysia (Ghazali et al., 2019) and Tanzania (Lwesya et al., 2021), discussing the broader impact of traffic congestion on individuals, and businesses, leading to health-related issues and economic losses.

In general, the study provides a comprehensive approach to the multiple impacts of traffic congestion, showing its relationship with various factors, behavioral responses, and consequences on productivity, health, and economic aspects. This paper also highlights the importance of proactive measures in mitigating the adverse effects and suggests potential ways to address the challenges posed by traffic congestion.

Theoretical Contribution

The study provides theoretical contributions to the existing literature by identifying and validating 12 distinct factors associated with traffic congestion, behavior, and productivity. The examination of the hypothetical model contributed to the validation of the model in connection with identified factors of traffic congestion. The empirical validation enhances existing models and theories related to transportation studies, which significantly contribute to factors of traffic congestion. This study also established a connection between proactive behavior toward traffic congestion and productivity.

Practical Implication

The study offers practical insights for engineers, managers, policymakers, urban planners, and other stakeholders on the strategies that can be created to address specific factors like confusing distance, stress, and punctuality to enhance the overall traffic management system in the National Capital Region. In addition, it also identifies the positive impact of factors such as purchasing personal vehicles, using taxi applications, and detouring on behavior towards congestion in promoting alternative transportation methods. Organizations can implement practical measures to address health-related consequences of traffic congestion which might involve

employee well-being programs, flexible work arrangements, or support services to help mitigate the stress and health issues associated with commuters. In addition, Businesses can make strategic decisions based on the study's insights. By acknowledging the impact of congestion on productivity, companies may consider flexible working hours, remote work options, or even choosing office locations strategically to minimize the burden of commuters.

Recommendations

Sustainable People-centric Approach

Prioritizing comprehensive infrastructure improvements and improving public transportation that are suited for the NCR is crucial for policymakers to effectively handle the various difficulties presented by traffic congestion. The work of Zadobrischi et al. (2020) suggests that the increase in population density is a major factor of traffic congestion. Additionally, Lomibao et al. (2023) suggests that there is an increase in intermigration in the NCR. The reason behind the event is to improve the financial position of employees. This intermigration worsens the traffic congestion which causes employees to lose productivity. In addition to the intermigration, there is also the car-centric approach employed by the government (Suzara et al., 2021).

Both literature and the result of the study proves that there is something wrong in how policy makers address the problem. The research recommends to policy makers to address the problems in a different way that ensures sustainability of the transport sector. Some ways to approach the problem with traffic congestion is to implement laws that ensure a people-centric approach (Suzara et al., 2021). People-centric approach includes creation of bike lanes, safe and walkable pathways, and improving public transportation. The proposed people-centric approach also allows a decrease in the number of private vehicles on the road. This can be done by improving public transportation, collaborating and giving incentives to transport groups, and increasing the tax for private vehicles. The solution also promotes the decrease of pollution which is in accordance with the Republic Act of 8749 or the Clean Air Act. Not only does it improve the current scenario but also improves pollution control as well.

Decentralization of the Economy

The study of Lomibao (2023) suggests that many people are traveling within the NCR due to its many opportunities to improve a person's financial position, but the implication of it worsens the flow of traffic in the area which leads to productivity loss. The problem is that many business districts and commercial establishment is centralized in the area, resulting to the increase of population density. The work of Zadobrischi et al. (2020) suggests improving the distribution of infrastructure and business centers so that population density among the districts will equalize. This allows a better traffic in districts which lessens the probability of traffic congestion. The government can propose policies that will limit the sale of vacant spaces to developers that will build commercial centers and business districts. Instead of centralizing business and trade in a single area, the industry

must be dispersed strategically and evenly.

Smart Mobility

According to Business Mirror (2022) in the Philippines, that there is a lack in monitoring the traffic. This calls for intervention that allows authorities to properly monitor the daily situation to have a better data driven solutions. Smart mobility allows authorities to interconnect the different infrastructures available to have a better understanding on how the traffic works. This can include the interconnection of traffic lights, transportation vehicles, and smart applications that will help people navigate within the area. Other than that, authorities will be able to real time data that is accurate and reliable that can be used in decision making. Example of existing smart mobility is the attempt of the city of Taipei to connect 160,000 traffic lights to solve traffic congestion. The project includes the use of internet of all things (IoT), traffic lights system, and edge computing to monitor traffic and air pollution. The same can be implemented in the Philippines, especially on severely congested road.

Using English as Medium of Instruction (EMI) in Medical Higher Education in Libya: Teachers & Students' Perspectives

Mohamed Adriosh

Alasmarya Islamic University, Libya,  <https://orcid.org/0000-0001-8389-1811>

Abstract: With a global trend towards adopting English as a Medium of Instruction (EMI) to enhance internationalization and academic competitiveness, many countries, including Libya, have undergone significant reforms in their higher education systems. The present study aims to explore the status quo and challenges associated with the implementation of English as the medium of instruction in medical higher education institutions in Libya by investigating the classroom participants' attitudes and analyzing the overall landscape of English-medium instruction in Libyan medical higher education. The study employs a mixed-methods approach, incorporating surveys and interviews to gather the data. The results revealed that both teachers and students believe in the significance of adopting EMI in medical higher education in the Libyan context. However, they reported some challenges related to the appropriateness of using EMI, the classroom participants' Proficiency in English, and the impact on the content subject comprehension. The findings contribute to the existing literature on implementing EMI in higher education and offer practical recommendations for policymakers, educators, and administrators in Libya and other similar contexts.

Keywords: English as medium of instruction; medical higher education; teachers' perspectives; students' perspectives, Libya.

Citation: Adriosh, M. (2024). Using English as Medium of Instruction (EMI) in Medical Higher Education in Libya: Teachers & Students' Perspectives. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 1505-1518), Antalya, Turkiye. ISTES.

Introduction

In an increasingly interconnected world, English has emerged as a global lingua franca, serving as a medium of communication across cultures, professions, and academic disciplines. As a result, many educational institutions around the globe adopted English as a Medium of Instruction (EMI) to prepare students for success in an internationalized society. However, implementing EMI in higher education effectively requires a nuanced understanding of various theoretical fundamentals that underpin language learning, pedagogy, and educational policy (Macaro, 2018).

Many challenges have been recently observed that were associated with implementing English as the Medium of Instruction (EMI) in Libyan higher education institutions. Therefore, there is a pressing need to understand the

status quo of EMI implementation in Libyan medical higher education institutions in particular. With many countries, including Libya, undergoing significant reforms in their higher education systems to align with this global trend, it becomes imperative to assess the extent to which EMI has been integrated into the educational landscape and the prevailing attitudes towards its adoption among classroom participants, namely teachers and students.

The present study attempts to uncover the challenges faced in implementing EMI in Libyan medical higher education. While there is recognition of the importance of adopting EMI, both teachers and students have reported obstacles such as concerns regarding the appropriateness of using EMI, the proficiency levels of classroom participants in English, and the impact of EMI on subject matter comprehension. These challenges emphasize the complexity of transitioning to EMI and the need for targeted interventions and strategies to address them effectively (Walkinshaw et al., 2017).

Aims of the Study

The primary objectives of the present study are to uncover the status quo and identify the challenges and difficulties associated with EMI, explore the attitudes of teachers and students towards EMI, and analyze the overall landscape of English-medium instruction in Libyan medical higher education. The study employs a mixed-methods approach, utilizing surveys and interviews to gather data. The findings are expected to highlight the perceived significance of EMI adoption while identifying challenges such as appropriateness, English proficiency, and impact on content comprehension. In general, the study aims to contribute to the literature on EMI implementation and provide practical recommendations for policymakers, educators, and administrators in Libya and similar contexts.

Significance of the Study

As countries constantly tend to adopt English as the Medium of Instruction (EMI) to enhance internationalization and academic competitiveness, understanding the status quo and challenges associated with this transition in Libya becomes important. Medical education, in particular, demands precise language comprehension and communication due to its academic and technical nature, making the investigation of attitudes towards EMI and its implementation crucial for ensuring effective learning outcomes. By delving into the perceptions of both teachers and students regarding EMI adoption, this study sheds light on the nuanced dynamics taking place within Libyan medical higher education sector, offering valuable insights that can inform decision-making processes and pedagogical strategies.

Research Questions

Based on its main objectives, the study attempts to answer the following research questions:

- What is the status quo of implementing English as a medium of instruction in Medical Higher

Education in Libyan universities?

- What are the students' attitudes towards the implementation of EMI in Medical Higher Education in Libyan universities?
- What are the teachers' perspectives on challenges and obstacles of implementing EMI in Medical Higher Education in Libyan universities?

Review of Literature

English Medium Instruction (EMI) has emerged as a controversial issue in the field of education, getting considerable attention in scholarly discourse (Arkin, 2013; Macaro, 2017). Despite its controversial nature, EMI has witnessed increasing adoption, particularly in non-native English speaking countries like Libya. As evidenced by existing literature, many studies investigated the implementation of EMI in higher education settings worldwide. Dearden (2014) characterizes EMI as a "growing global phenomenon"(p.2) in education. According to Jiang and Zhang (2017), effective implementation of EMI “can minimize the linguistic barrier to the internationalization of higher education” (p.174)..

Theoretical Background

In today's interconnected world, the adoption of English as a Medium of Instruction (EMI) in educational institutions has become increasingly prevalent, reflecting the global dominance of English as a lingua franca. This phenomenon necessitates a thorough exploration of the theoretical underpinnings that inform effective EMI implementation. Language acquisition theories such as behaviorism, cognitivism, and constructivism provide valuable insights into the cognitive and social processes involved in learning English as a second language (ESL). For instance, behaviorism emphasizes the role of reinforcement and practice in language acquisition, cognitivism focuses on mental processes such as memory and problem-solving, while constructivism highlights the importance of active engagement and social interaction in knowledge construction. By integrating these theories into EMI pedagogy, educators can prepare instructional strategies to accommodate diverse learning styles and facilitate English language proficiency development among students (Mitchell et al., 2019).

According to Sato and Kleinsasser (1999), the communicative language teaching (CLT) approach plays an important role for effective EMI practices, prioritizing meaningful interaction and authentic language use rather than memorization of grammar rules. CLT emphasizes the importance of communication skills in real-world contexts, encouraging students to engage in tasks and conversations that reflect authentic language use. By adopting CLT principles, educators can create dynamic and interactive EMI classrooms where students are empowered to communicate effectively in English, thereby enhancing their language proficiency and communicative competence.

Sociocultural theory, as proposed by Vygotsky, emphasizes the significance of social interaction and cultural

context in language learning. In EMI settings, sociocultural theory emphasizes the creation of a supportive sociocultural environment where students can engage in collaborative learning activities and construct knowledge collectively. By fostering a socioculturally rich learning environment, teachers can promote language development and academic achievement among students from diverse linguistic and cultural backgrounds. Additionally, effective mapping of language policy and planning integration of content and language integrated learning (CLIL) approaches, and adoption of translanguaging practices further contribute to the holistic and inclusive implementation of EMI in educational settings (Lantolf, 2000).

Historical Overview on Teaching English Language in Libya

The history of English language teaching in Libya has been shaped by a complex interplay of historical, political, and educational factors. Initially introduced during the colonial era under Italian and later British rule, English teaching primarily served elite groups for administrative and diplomatic purposes. Following Libya's independence in 1951, English instruction began to expand more broadly within the education system, although its prominence fluctuated over the decades, influenced by political shifts such as Muammar Gaddafi's rise to power in 1969. Gaddafi's regime emphasized Arabization and limited foreign language teaching, including English, in Libyan schools and universities, leading to a decline in the prominence of English language education during this period (Mohsen, 2014).

Aloreibi and Carey (2017) argue that despite challenges, English language teaching persisted, particularly in private language institutes and higher education institutions, where it was taught as a foreign language. Following the fall of the Gaddafi regime in 2011, Libya embarked on educational reforms aimed at revitalizing its education system, including efforts to modernize and internationalize English language instruction. However, challenges such as limited resources, teacher training, and infrastructure have continued to affect the quality and accessibility of English language education in Libya, highlighting the ongoing need for investment and support in this critical area of education.

Previous Studies

Many studies were conducted on different contexts of implementing EMI in higher education in general and medical higher education in particular (Eg.: Ali et al., 2021; Chou, 2018; Macaro et al. 2017; Yang et al., 2019; Yuan, 2019; Zuaro, 2023). The research aspects included: classroom participants' attitudes, challenges and difficulties associated with implementing the EMI in higher education in different geographical and institutional contexts.

Different studies investigated the impact of English Medium Instruction (EMI) on students' English language skills and content acquisition. Macaro et al. (2017) conducted a systematic review of higher education studies on EMI, revealing that teaching academic subjects in English as a second language can foster students' English proficiency without negatively affecting content comprehension. Likewise, Chou (2018) emphasized the

necessity for students to possess adequate English proficiency to pass EMI courses and programs in universities.

Other studies investigated students' perceptions and attitudes towards English Medium Instruction (EMI). Al-Shboul (2022), for instance, examined students' perspectives on Arabic and English as mediums of instruction in Jordan, highlighting EMI's perceived efficacy in enhancing competitiveness and internationalization in education. Similarly, Badiozaman et al. (2019) sought to elucidate the connection between students' perceptions of English and their academic self-efficacy in higher education settings where English serves as the medium of instruction.

Many studies examined the effectiveness of English Medium Instruction (EMI) on teaching processes in the classroom, particularly emphasizing the significance of teachers' proficiency in English. Wang (2021) shed light on the correlation between teachers' English proficiency and their teaching self-efficacy within an EMI context. The study highlighted the crucial significance of English as a medium of classroom instruction in enhancing overall teaching effectiveness, emphasizing the importance of teachers' language competence in facilitating successful EMI implementation. These findings revealed the relationship between teachers' proficiency in English language and their efficacy in delivering instructions effectively in EMI settings, thus emphasizing their need to have adequate language skills enhance EMI practices.

In considering the broader effectiveness of EMI in classroom teaching, it is evident that many factors contribute to its success or challenges. These include students' English language proficiency levels, the efficacy of implementation strategies, and the perceptions and attitudes of both students and teachers towards EMI. Ensuring that both students and teachers possess sufficient English proficiency is essential to adopt successful EMI practices. Moreover, thorough assessments of the impact of EMI on students' English language skills and content learning is substantial to guarantee its effectiveness across diverse educational settings. By carefully evaluating these factors, educators and policymakers can better understand the nuances of EMI implementation and adopt strategies to optimize its outcomes in various educational contexts.

Methodology

The mixed approach is adopted to answer the research questions of the study. Both quantitative and qualitative data collection instruments were used for data collection processes. Questionnaire is used to uncover the students' attitudes towards implementing EMI in the medical undergraduate classrooms in Libyan universities. Likewise, teachers were interviewed to investigate their perspectives on the challenges and issues related to the adoption of EMI.

According to Şahin and Öztürk (2019), mixed-method research advocates for the utilization of both quantitative and qualitative research methodologies when addressing complex research problems. This approach propose that combining these methods offers more comprehensive insights into research inquiries compared to

employing a single method. This innovative paradigm requires new perspectives towards science and scientific knowledge.

The Context of the Study

In Libya, a predominantly monolingual country with Arabic as the national language, Arabic language traditionally served as the Medium of Instruction (MOI) in education. However, English is commonly regarded as a foreign language. In higher education, particularly in the medical field, English serves as the medium of instruction. The growing internationalization of education and students' aspirations to study abroad have contributed to a rising demand for English Medium Instruction (EMI) in medical higher education across the country. Given this evolving educational landscape, the current study was conducted in three Libyan universities to explore the status quo and identify the potential challenges and educational implications in this concern.

Research Design

The present study utilized a mixed approach combining both quantitative and qualitative methodologies to explore the implementation of English as the Medium of Instruction (EMI) in medical higher education institutions in Libya. This approach incorporates surveys and interviews to gather data on classroom participants' attitudes and perceptions towards EMI. In addition, it analyzes the overall landscape of English-medium instruction in Libyan medical higher education. The surveys provide quantitative data, offering insights into the students' attitudes and perceptions on using EMI in the medical undergraduate classrooms. Interviews, on the other hand, offer qualitative analysis, allowing for a deeper exploration of the challenges associated with EMI implementation. This comprehensive approach enables a comprehensive understanding of the status quo and challenges of EMI in Libyan medical higher education

Data Collection

A purposive sampling technique was employed to select 40 medical undergraduate students from three different universities in western region of Libya for data collection purposes. Based on the mixed approach design of the study, a questionnaire served as the primary research instrument to gather data from the students, aligning with the study's objectives. The questionnaire utilized in the study was adapted from previous research works investigating the perceptions of students on the use of EMI in higher education (Aldawsari, 2022; Azhari et al. , 2024). Comprising twenty statements, the questionnaire employed a five-point Likert scale to assess participants' perspectives. Data collection involved distributing the questionnaire to the selected students. Prior to participation, written consent forms were obtained from the participants, providing them with information about the study's purpose and their rights.

For qualitative data collection, eight teachers were purposively selected. The selected teachers had an adequately enough experience in using EMI in teaching medical subjects to the undergraduate medical students in Libyan

context. The semi-instructed interviews were designed to elicit the teachers' perceptions on the actual practices of using EMI in the classroom arising the most common challenges and difficulties associated to the implementation of EMI in medical education context. Semi-instructed interviews allows the the interviewees to elaborate on Their ideas and express their thoughts in more details guided with the interviewer's follow up questions.

According to Talmy and Richards (2010), interviews are used to collect comprehensive ideas on different phenomena in different areas of qualitative research including educational contexts. Talmy and Richards, however, argue that the interview tends to be rather under-theorised. The use of interviews is common in applied linguistics studies due to its effective use for participant investigation. This usage aims to identify participants' identities, experiences, beliefs, and perceptions on different phenomena. Generally speaking, adopting interviews for data collection yeild to a consensus understanding about its role in generating data for the research.

Data Analysis

To achieve the study objectives, data analysis was carried out utilizing the Statistical Package for the Social Sciences (SPSS). Correlation analysis and multiple comparisons were also employed as analytical tools. Additionally, the interviews were analyzed based on Thematic Analysis Approach to sort out different thems concerning the challenges and factors that lead to rise of obstacles in implementing the EMI in medical undergraduate classes. These qualitative insights were sought to derive educational implications aimed at enhancing EMI programs. Overall, the study employs a comprehensive approach to investigate various facets of students' and teachers' perceptions of EMI, employing both quantitative and qualitative methodologies to understand patterns, correlations, and potential areas for improvement in EMI instructional practices.

Results & Discussions

The study sought to explore the students and teachers' attitudes towards the implementation of English as a Medium of Instruction (EMI) within the medical higher education in Libyan context. The following sections report in detail the findings and analyses derived from this investigation along with interrelated discussions .

Findings of Quantitative Analysis

Statistical Procedures

A reliability assessment was carried out by using Cronbach's Alpha equation for students' questionnaire, which comprise 20 items. The Cronbach's Alpha coefficient obtained for the students' questionnaire was 0.94. This indicate a high level of reliability for the questionnaire, suggesting that the instruments consistently measured the intended constructs accurately.

Table 1. Reliability Statistics

Survey	No. of Items	Cronbach's Alpha
Students' Questionnaire	20	0.94

Statistical Results

The statistical analysis shows that the students hold positive beliefs, perspectives, and attitudes regarding the utilization of English Medium Instruction (EMI) within the context of medical higher education in Libya. Table (2) depicts the mean values, standard deviations, and corresponding significance levels pertaining to the 20 items included in the questionnaire, reflecting the students' perceptions towards the implementation of EMI.

Table 2. Students' Perception of EMI

Questionnaire Items	Mean	St. Deviation	Mean Difference	T	Sig. (2- Tailed)	Level
1.	3.98	1.08	0.58	5.28	0.000	High
2.	3.84	1.00	0.44	4.36	0.000	High
3.	3.86	1.06	0.46	4.28	0.000	High
4.	3.65	1.29	0.25	1.87	0.065	High
5.	3.85	1.08	0.45	4.14	0.000	High
6.	3.85	1.02	0.45	4.38	0.000	High
7.	3.73	0.96	0.33	3.37	0.001	High
8.	3.95	1.30	0.55	4.13	0.000	High
9.	3,96	1.38	0.56	3.98	0.000	High
10.	3,84	1.10	-0.56	-4.96	0.000	Moderate
11.	2.97	1.24	-0.04	-3.40	0.001	Moderate
12.	4.02	1.58	0.62	3.86	0.000	High
13.	4.01	1.41	0.61	4.24	0.000	High
14.	4.00	1/48	0.60	3.97	0.000	High
15.	3,91	1.62	0.51	3.06	0.003	High
16.	3.69	1.76	0.29	1.61	0.112	High
17.	3.64	1.84	0.24	1.25	0.213	High
18.	3.86	1.86	0.46	2.45	0.016	High
19.	3.97	1.87	1.57	2.99	0.004	High
20.	4.54	1.74	1.14	6.43	0.000	Very High
Total	3.81	0.73	0.41	5.43	0.000	High

As presented in Table 2 (Students' Perception of EMI), the overall mean score of 3.81 indicates a high level of agreement among students regarding their perceptions of English Medium Instruction (EMI), which is

statistically significant with a p-value of 0.00. This suggests that students generally hold positive views towards EMI implementation in the context of medical higher education in Libya. However, certain inconsistencies emerge within the results of the student survey, with specific items showing varying levels of statistical significance. Notably, items 4, 16, and 17 lack statistical significance, indicating some divergence in students' perceptions on these aspects of EMI.

Additionally, items 10 and 11 exhibit moderate levels of agreement towards EMI use. Conversely, item 20 gets the highest mean score of 4.54 and is statistically significant, followed by item 12 with a mean score of 4.02, indicating strong agreement among students regarding these aspects of EMI. Conversely, items 10 and 11 record the lowest mean scores of 2.84 and 2.97, respectively, suggesting a moderate level of agreement among students on these particular issues.

The findings can be linked with various theoretical frameworks in language acquisition and educational pedagogy, shedding light on the factors influencing students' views and experiences within EMI contexts.

First, the high overall mean score and statistical significance observed in students' perception of EMI align with the principles of communicative language teaching (CLT). The CLT approach prioritizes meaningful interaction and authentic language use, which likely contribute to the positive perceptions students hold towards EMI. Students may appreciate the opportunities for communication and engagement provided by EMI classrooms, reflecting the emphasis on real-world language use advocated by CLT (Sato & Kleinsasser, 1999).

Second, the discrepancies in students' perceptions across different items suggest the influence of various language acquisition theories. For instance, items with lower mean scores, such as items 10 and 11, which indicate moderate agreement, may reflect challenges or inconsistencies in the implementation of EMI practices. This can be understood through the lens of sociocultural theory, which emphasizes the importance of social interaction and cultural context in language learning. In EMI settings, discrepancies in students' perceptions may arise from differences in cultural and linguistic backgrounds, highlighting the need for a supportive sociocultural environment to foster language development and academic achievement (Vygotsky, 1978).

Third, the highest mean scores observed in certain items, such as item 20, could be attributed to effective integration of content and language integrated learning (CLIL) approaches. CLIL encourages the simultaneous learning of subject matter and language skills, promoting deeper understanding and engagement among students. The success of these aspects of EMI aligns with theories such as constructivism, which underscores the importance of active engagement and knowledge construction in learning (Mitchell, Myles, & Marsden, 2019).

To conclude, the findings can be correlated to theoretical frameworks such as communicative language teaching, sociocultural theory, and constructivism. These frameworks provide valuable insights into the cognitive, social, and instructional processes that shape students' experiences in EMI contexts, offering guidance for the effective design and implementation of EMI programs in educational settings.

Findings of Qualitative Analysis

The findings of the interviews conducted with teachers revealed valuable qualitative insights into their perspectives and experiences for implementing English Medium Instruction (EMI) in medical higher education in Libyan context. Generally speaking, teachers expressed a range of perceptions and observations, providing a comprehensive understanding of the challenges and opportunities associated with EMI implementation.

The Role of EMI in Enhancing Students' Proficiency

One recurring theme that emerged from the interviews was the perceived importance of EMI in enhancing students' language proficiency and preparing them for global academic and professional contexts. Teachers highlighted the value of exposing students to English as the medium of instruction, particularly in fields where English is commonly used, such as medical sciences. They emphasized the role of EMI in promoting students' language skills and facilitating their integration into international academic and professional communities.

Some teachers, for instance, expressed strong support for implementing English as the Medium of Instruction (EMI) in medical higher education, emphasizing its role in enhance the students' linguistic competence and academic preparedness for international settings.

T(5): *"Amm...I firmly believe that EMI is essential in medical education, especially considering the global nature of the field. By exposing our students to English as the medium of instruction, we are not only improving their language proficiency but also equipping them with the necessary skills to communicate effectively in diverse medical contexts worldwide."*

T(1): *" Yes, proficiency in English is necessary for medical professionals to collaborate with colleagues, access global research, and provide quality care to patients from diverse linguistic backgrounds. EMI opens doors for our students to pursue international opportunities and contribute to global healthcare advancements."*

The qualitative findings regarding the implementation of English Medium Instruction (EMI) in medical higher education in Libya resonate with existing literature on the subject, which revealed both the importance and challenges associated with EMI adoption in higher education settings.

The importance of EMI in enhancing students' language proficiency and preparing them for global academic and professional contexts, as highlighted by the teachers in the qualitative analysis, aligns with previous research. Many studies have emphasized the role of EMI in promoting students' linguistic competence and facilitating their integration into international academic and professional communities (Macaro, 2018; Lasagabaster & Doiz, 2021). Additionally, the recognition of English proficiency as an essential factor for accessing cutting-edge research, collaborating with colleagues globally, and contributing to advancements in

various fields is consistent with the findings of previous literature (Williams, 2015).

Challenges & Concerns of EMI Implementation

Teachers, however, acknowledged some challenges associated with EMI implementation. One prominent issue cited in the interviews was the disparity in students' English language proficiency levels, which posed difficulties in transmitting knowledge of content subjects effectively and ensuring equal learning opportunities for all students. Additionally, teachers expressed concerns about the adequacy of support and resources available for EMI, including professional development opportunities for teachers and access to instructional materials designed for EMI settings.

T(2) explained: *"Amm...While I see the value of EMI in enhancing students' language skills and preparing them for global medical practice, I foresee several challenges that we may encounter along the way. One major concern is the difference in students' English language proficiency levels"*

T(5): *"But, one challenge we may face is the availability of instructional materials and resources available for EMI. Medical education relies heavily on specialized textbooks, journals, and multimedia materials, and ensuring that these resources are accessible in English may require significant investment and support."*

T(1) : *"faculty members may need training and professional development opportunities to effectively deliver content in English and address the diverse needs of students from varying language proficiency levels."*

The above extracts indicate the teachers' anticipation of challenges such as language proficiency disparities among students and the need for adequate resources and faculty support to facilitate effective EMI implementation in medical higher education. These predictions reflect the complexities inherent in transitioning to EMI and highlight the importance of proactive measures to address potential obstacles and ensure the success of EMI initiatives in medical education.

To sum up, the interviews with teachers provided rich qualitative data illuminating both the perceived benefits and challenges of EMI implementation in medical higher education in Libya. These insights offer valuable considerations for policymakers, educators, and administrators seeking to optimize EMI practices and support the diverse needs of students and faculty members.

The challenges and concerns identified by the teachers in the qualitative analysis also emphasized some aspects that observed in previous literature on EMI implementation. Deficiency in students' English language proficiency levels, cited as a prominent issue by the teachers, have been widely documented in the literature as a challenge for EMI programs (Snow, 2005; De Graaff et al., 2007)). These challenges not only affect the teaching of content matter effectively but also poses concerns regarding equal learning opportunities for all students.

Furthermore, the teachers' concerns about the adequacy of support and resources for EMI implementation align with previous studies highlighting the importance of institutional support and resources in ensuring the success of EMI initiatives (Airey & Linder, 2006; Doiz et al., 2014). Issues such as the availability of instructional materials in English, professional development opportunities for faculty members, and support for addressing the diverse needs of students from varying linguistic backgrounds have been identified as crucial factors influencing the effectiveness of EMI programs.

To conclude, the qualitative findings regarding the importance and challenges of EMI implementation in medical higher education in Libya provide valuable insights that complement and reinforce previous literature on the subject. By acknowledging both the potential benefits and obstacles associated with EMI adoption, policymakers, educators, and administrators can make informed decisions and implement strategies to optimize EMI practices while effectively addressing the diverse needs of students and faculty members.

Conclusion

The comprehensive analysis of the students' perceptions and teachers' perspectives on English Medium Instruction (EMI) in medical higher education in Libya illuminates both the positive aspects and challenges intrinsic in its implementation. Students generally hold favorable views towards EMI, as indicated by the high overall mean score and statistical significance in their perception. The alignment of these perceptions with theoretical frameworks such as Communicative Language Teaching (CLT) ensures the effectiveness of EMI in promoting meaningful interaction and authentic language use. However, discrepancies in students' perceptions across certain items highlight potential areas for improvement, particularly regarding challenges in implementation and the need for a supportive sociocultural environment.

Recommendations & Implications

The findings offer valuable insights for policymakers, educators, and administrators involved in EMI implementation. Recognizing the importance of EMI in enhancing students' language proficiency and preparing them for global academic and professional contexts, stakeholders should prioritize strategies that address challenges such as language proficiency disparities among students. Adequate support and resources, including professional development opportunities for faculty and instructional materials prepared for EMI settings, are essential for the successful implementation of EMI. By proactively addressing these challenges and leveraging the identified benefits of EMI, institutions can optimize EMI practices to meet the diverse needs of students and faculty members, ultimately fostering a conducive learning environment in medical higher education in Libya.

Acknowledgements

I would like to express my sincere gratitude to all the teachers and students who participated in this study. I also

acknowledge the invaluable support provided by the educational institutions and authorities in facilitating the data collection process.

Abstract: In recent years, businesses have continuously sought and developed unique ways to promote products and services by researching various social media marketing strategies. This study is conducted in the National Capital Region of the Philippines, where TikTok is continuously gaining prominence and online shopping is growing. Due to this, the study aims to comprehensively study the correlation between TikTok features and Social Media Marketing Strategies influencing the Purchase Behavior of TikTok Users in the Philippines. This paper provides valuable insights into how businesses can effectively utilize TikTok's unique features to boost their profits by exploring the connections between TikTok features, social media marketing strategies, and purchasing behavior. A mixed-method approach utilizing qualitative and quantitative research methodologies was used in data gathering, with the developed online survey questionnaire. The data was treated using Exploratory Factor Analysis and Structural Equation Modeling (SEM) and carried out using SPSS (Statistical Package for the Social Sciences) and AMOS 22. The study's findings suggest a strong positive

association between TikTok features and the implementation of social media marketing strategies. Furthermore, the study highlights the considerable impact of these strategies on buying mechanism tendencies among TikTok users. Future research directions include replicating the study on different shopping platforms to understand broader factors influencing consumer behavior.

Keywords: Exploratory Factor Analysis, Impulsive Purchasing Behavior, NCR, Social Media Marketing Strategies, Structural Equation Modeling, TikTok features

Introduction

In the modern digital era, there have been continuous changes and transformations in how social media platforms work and interact. One of the most prominent social media platforms is TikTok, also known as Douyin in China, a mobile application created in 2016 by the Chinese tech company ByteDance. According to a study by Zhao and Wagner (2022), this application has been recognized and achieved great success recently, luring millions of users through its captivating challenges, dance clips, and viral trends and reaching a large and diverse audience. This success has significantly impacted online marketing companies, showing them how to promote and attract consumers to purchase products online effectively.

The TikTok application has a user-friendly interface with filters and effects, enabling everyone to make creative and entertaining videos to express themselves uniquely. Anyone with digital gadgets can easily convey their stories and talents by creating short videos. Additionally, the platform offers music integration, allowing users to incorporate music into their video content, enhancing creativity. The application also provides user-friendly editing tools, enabling anyone to customize their content easily. Furthermore, it features a "Discover Page" that helps users personalize feeds based on their interests, interactions, and behavior. The platform also encourages engagement within the community through trends and challenges, inspiring users to create content based on specific themes or trends.

In recent years, businesses have continuously sought and developed unique ways to promote products and services by researching various social media marketing strategies. The results of a study by Guarda et al. (2021) indicate that many companies are adopting digital marketing strategies. This trend has drawn more attention from brands because digital marketing offers a platform for presenting the company, establishing its image, and fostering consumer connections. Digital marketing goes beyond video creation and editing; it also enables

collaboration with other users, which is particularly beneficial for new businesses aiming to develop their products and services.

The paper highlights significant gaps in the knowledge of TikTok users' intent to purchase behaviors in the Philippines. While similar behaviors have been studied on platforms like Instagram, the specific impact of TikTok on spontaneous buying behavior still needs to be explored within the Philippine context. These gaps illustrate a need for more emphasized research on TikTok's impact on the intent buying behaviors of users, which helps the study by using exploratory research rather than confirmatory methods. Existing literature mostly overlooks TikTok, and there is a scarcity of studies that use mixed-methods methodologies. Figure 2 visually outlines these identified gaps, providing a structured overview to guide future research efforts to address these areas effectively. The study does not assume users have actually made purchases; rather, it examines how these platforms influence their perceptions. This approach helps shed light on how digital media shapes consumer behavior beyond direct buying actions.

The study aims to investigate the in-depth exploration of the correlation between the various factors that influence TikTok features and the impulsive purchase behavior of its users. The study uses quantitative and qualitative techniques to understand the consumer's psychology behind their impulsive behavior, with the use of Statistical Package for the Social Sciences (SPSS) to perform multivariate methods such as Factor Analysis and Structural Equation Modeling (SEM). Specifically it aims to describe the profile of TikTok users in the NCR, identify the antecedents of TikTok Features, Social Media Marketing Strategies, and Impulsive Purchases using factor analysis, determine the relationship between TikTok Features, Social Media Marketing Strategies, and Consumer Purchases, determine the relationship of Demographic Profile and TikTok Features, Social Media Marketing Strategies, and Impulsive Purchase Behavior, and determine the effect of TikTok Features on Social Media Marketing Strategies and Intention to Purchase in general.

Moreover, this paper seeks to assess factors that positively influence the Impulsive Purchase behavior of Tiktok users. Employing a robust methodology, the study utilizes both exploratory factor analysis (EFA) and structural Equation Modeling (SEM). In the initial phase of the study, EFA is employed to reduce numerous variables into a more manageable set of latent variables. This approach aids in finding the important structure of the data, which identifies the correlation of the latent variables.

Once identified through EFA, these latent variables become the foundation for SEM analysis, enabling the testing and refinement of theoretical models that express the relationship between factors and observed variables. The results derived from EFA, inform the development of the measurement model in the SEM, describing the latent factors and their respective indicators. Furthermore, SEM goes beyond EFA by incorporating both observed and latent variables into a structural model. Employing this integrated approach, this study offers a comprehensive study of the factors influencing the Impulsive Purchase Behavior of Tiktok User in the Philippines.

Hypothetical Research Model

Figure 1. Hypothetical Research Model

Figure 1 shows the Hypothetical Research Model of the study. Hawkins Stern's impulse buying theory (1962) is the theory considered in this study (Agarwal and Chetty, 2022). The theory provided a fresh perspective on consumer spending habits compared to typical modern buyer behavior. The theory indicates that marketers may influence customers to spend more money than planned. Practitioners can analyze and comprehend the mechanics behind impulsive purchase behavior using Stern's impulse buying theory as a lens. It emphasizes the significance of psychological and environmental influences on customer behavior and illustrates how entrepreneurs can use this information to influence consumer behavior and generate sales.

Hypothesis 1: Tiktok Shop positively influences Tiktok Features

TikTok is a social media platform that provides features for online shopping known as TikTok Shop. Through this feature, business owners may promote and market their goods (Zotara, 2022). The inclusion of TikTok Shop on the platform improves TikTok's overall features, potentially increasing user engagement and involvement with the app's retail industry functionality.

Hypothesis 2: For You Page Feature positively influences TikTok Features

TikTok's For You Page feature uses advanced algorithms to present personalized content, increasing user enjoyment and engagement on the platform through specific recommendations. TikTok's For You Page improves the platform's functionality by offering users with content that matches their areas of interest and preferences, hence maximizing user experience and encouraging additional involvement. One of the most important features on TikTok is the "For You" tab, which uses artificial intelligence to quickly adjust to user preferences and encourage longer usage. Features that further encourage addiction include "Likes," personalized content, and continuous scrolling (Montag, et al. 2021).

Hypothesis 3: Content Format positively influence Tiktok Features

The variety and appeal of TikTok's content formats enhance the platform's capabilities, increasing the overall user experience through multiple media utilization alternatives. Content Format has features such as duet, stitch, picture-in-picture, auto-scroll, and TikTok visual effects. Cheng and Li's (2024) study demonstrates how content format beneficially impacts TikTok features. Previous content analysis has shown that TikTok videos integrate a wide range of visual elements, such as split screens, visual filters, and special effects.

Hypothesis 4: Tiktok Features positively influence Social Media Marketing Strategies

TikTok's features impact social media strategies, potentially increasing reach, engagement, and success rates for companies and marketers that utilize the platform. According to Yang et al. (2022), e-commerce customers exhibit impulse-buying tendencies, influenced by factors like live streaming price discounts and visual appeal.

Hypothesis 5: Celebrity Content Influence positively influence Social Media Marketing Strategies

The availability of celebrity content on TikTok has a favorable impact on social media marketing strategies, potentially enhancing brand awareness, credibility, and engagement with audiences through influencer involvement. A powerful marketing tactic that grabs consumers' attention and raises brand awareness is celebrity endorsement. In this sense, celebrity credibility serves as a reliable source that increases consumers' desire to buy. (Liu, 2022).

Hypothesis 6: Promotion Strategy positively influences Social Media Marketing Strategies

The effectiveness of TikTok promotion strategies has a positive effect on social media marketing strategies, potentially increasing brand exposure, engagement, and sales through intended promotional activities. According to Fernanda (2019), Offering short-term incentives like reduced prices, cash backs, flash sales, and free shipping options combined with sales campaigns can encourage customers to make unexpected purchases or make more purchases overall.

Hypothesis 7: Engaging Content positively influences Social Media Marketing Strategies

According to Thomas (2020), In the modern marketplace, building consumer trust is a persistent objective for firms, and it depends on numerous approaches that go beyond just product quality or price. The way a business communicates with its clients is one of the key components of developing trust. Engaging content on TikTok benefits social media marketing strategies by attracting interest from viewers, developing brand loyalty, and driving user involvement and promotion.

Hypothesis 8: Honest reviews positively influence Social Media Marketing Strategies

The widespread use of honest reviews on TikTok has positive effects on social media marketing strategies, potentially increasing brand trust, credibility, and consumer trust through actual feedback from customers. Consumers are looking for honest reviews and experiences written by customers after availing the products or services from the advertised store (Regina et al., 2021).

Hypothesis 9: Trends positively influence Social Media Marketing Strategies

As demonstrated in the study by Roth et al. (2021), participants' satisfaction and positive emotions throughout challenges or trends can have a big influence on social media marketing strategies. When consumers love participating in these challenges, they are more inclined to share, comment, and connect with related information, resulting in greater exposure and potential reach for companies or marketers who include these trends in their campaigns. Thus, following these trends can help increase brand visibility and interaction on social media platforms.

Hypothesis 10: Advertisements Positively Influence Social Media Marketing Strategies

Improving audience engagement, brand awareness, and more exposure to ads on social media platforms has a favorable impact on social media marketing efforts which results in higher familiarity with the brand and loyalty from consumers. The results of the study conducted by Yousef et al. (2021) concluded that advertisements on social media platforms play a significant role in shaping marketing strategies. With this, the study may provide and create more effective social media advertising campaigns to have better online engagement as well as implement comprehensive marketing strategies, not just to engage but also to achieve the desired behaviors from consumers. Additionally, the majority of businesses employ digital marketing tactics such as social media advertising, and user-generated management to cultivate brand recognition among consumers (Wang and Kim, 2017).

Hypothesis 11: Social Media Marketing strategies positively influence Impulsive Purchase

Utilizing what's trending and popular on social media to connect with and engage your audience is what it means to include trends in your social media marketing strategy. This entails producing content that is relevant to the current issues, problems, or hashtags that are trending. By doing this, you may maintain your prominence, interact with your target market, and increase the social media visibility and relevance of your business (Newberry, 2023). Implementing effective social media marketing strategies has beneficial effects on impulsive purchase behavior, possibly boosting impulsive purchasing decisions among TikTok users who are exposed to engaging marketing campaigns.

Hypothesis 12: Impulsive purchase trigger positively influences Impulsive Purchase

Impulsive purchase triggers that are effectively incorporated into TikTok content have a beneficial impact on impulsive purchase behavior and could even lead to audiences who are drawn in by attractive promotional incentives to make impulsive purchases. Burton et al. (2018) claim that sudden, powerful emotional desires that result from reactive conduct with little cognitive restraint lead to impulse purchases.

Hypothesis 13: Impulsive purchase decisions positively influence Impulsive Purchase

Impulsive purchase triggers that are effectively included in TikTok content have a beneficial impact on impulsive purchase behavior and could even lead to audiences who are drawn in by attractive promotional incentives to make impulsive purchases. This propensity for impulsive and thoughtless purchases can be explained by the buyer's immediate sense of satisfaction (Pradhan et al., 2018).

Method

Research Gap Analysis

Figure 2. Research Gap Analysis

Gap in Research Focus

According to Wylie (2021), prior to beginning any research, it is critical for researchers to identify the gaps. Research gaps are unexplored topics in one's field of study that are not addressed by existing research. Given this, the study aims to conduct research on a topic that has not yet been explored and to focus on aspects different from those examined in previous studies. There are few studies on the impulsive buying habits of TikTok users in the Philippines, particularly in the National Capital Region (NCR). TikTok's effect on impulsive purchasing behavior remains unexplored, notably in the NCR. There are studies regarding this matter in foreign studies, "The Influence of Hedonic Shopping Motivation, Promotion and Product Quality on Impulsive Online Purchase of Fashion Products".

Teo et al. (2023) conducted research in Malaysia to determine how TikTok affects consumers' impulse purchasing behavior. They employed the Stimulus-Organism-Response (S-O-R) model to examine product

appearance, product feasibility, perceived enjoyment, perceived utility, and impulsive purchasing intention. They gathered information from 169 people via online surveys and evaluated it with SPSS and Smart PLS. According to their outcomes, visual attractiveness and product practicality positively affect how much individuals enjoy and find TikTok beneficial for purchasing.

Another study conducted in the United Kingdom by Kristi and Aruan (2023) discovered that factors such as product usefulness, purchase convenience, and product price have a beneficial and essential effect on how individuals perceive the usefulness of purchasing fashion products online via platforms such as Instagram and TikTok. They collected data through online surveys and analyzed it using Structural Equation Modeling (SEM). The research gap here is that no specific study on TikTok's influence on impulsive purchasing behavior has been conducted in the Philippines. To address this gap, extensive research must be conducted on how TikTok, as an online platform, influences impulsive purchasing behavior among its users in the Philippines.

Gap in Research Approach

Most studies on impulsive buying have used a confirmatory research technique, attempting to confirm existing theories and models, but there is a lack of exploratory studies targeting TikTok specifically. The overwhelming usage of confirmatory research in impulsive buying may not be ideal for TikTok due to its specific features and dynamics, necessitating additional exploratory research to discover new insights. This existing study conducted by Lee and Chen (2021) used Confirmatory factor analysis (CFA) where it was used to verify the concept validity and reliability of the measurement model used in this investigation. The importance of the path coefficients was tested using structural model analysis, which also served to support the research hypothesis. This study aims to use an exploratory research approach when examining TikTok's impulsive purchasing patterns. This strategy can assist in finding new patterns, behaviors, and characteristics that confirmatory research approaches may have overlooked.

Gap in TikTok Shop Research

Existing research has primarily concentrated on impulsive purchasing behavior on traditional e-commerce and well-known social media platforms, disregarding the significance of TikTok Shop. Timothy (2017) discovered that 30% of students shop online using social media, while 70% do not, using SPSS software and Microsoft Excel 2010. The most popular social networks for students were Facebook, WhatsApp, Twitter, Instagram, and Google+. Students stated that using social media for purchasing allows them to obtain details about the product quickly, decreases the stress of in-person negotiating, increases customer satisfaction, and promotes interaction between buyers and sellers.

Azizah et al. (2022) studied how the Information System Technology Acceptance Model influences app usage and impulsive purchases on Shopee E-Commerce, a popular platform in Indonesia. Sudden promotions and reduced prices fuel Shopee's impulsive purchases compared to other marketplaces. However, there is an absence

of research on the role of TikTok Shop in impulsive purchasing behavior. TikTok Shop deserves a study due to its distinctive attributes. Studies focusing primarily on TikTok Shop and its influence on impulsive shopping behavior are essential to address this gap and better understand customer behavior in developing social commerce platforms.

Gap in Research Methodology

Few studies have used a mixed-methods approach to investigate TikTok's influence on impulsive purchasing. Many studies focus primarily on quantitative or qualitative methods, ignoring the comprehensive perspective afforded by mixed-methods approaches. There are existing studies that use a quantitative approach. The study conducted by Qin et al. (2022) uses the quantitative diagram for the purposes of gathering and analyzing the data. A thorough analysis of earlier research allowed for the extraction of the measuring scale that was used to create a self-report survey form.

An example of a research paper that focuses on a qualitative approach entitled: “The Phenomenon of Impulsive Buying at TikTok Shop,” conducted by Edwy (2023) states that by conducting open-ended surveys, data is gathered through a qualitative approach. The findings indicated that the majority of respondents had used the TikTok Shop program to make impulsive purchases, and they did so frequently. This study aims to execute a mixed-methods research approach to understand the TikTok online platform thoroughly.

Data Collection

The study will begin with an initial sample of 100 participants, determined using the Raosoft sample calculator, a software tool primarily used to calculate and generate sample sizes. The required number of respondents will also be determined through the Kaiser-Meyer-Olkin (KMO) calculation. The survey to be conducted will include a diverse demographic of both male and females. The age range of participants spans from 18 years old and above, with all of them currently residing in cities within the National Capital Region (NCR). The participants must have an active presence on various social media platforms, with a particular engagement on the TikTok application, and be classified as online consumers.

Given that the study aims to explore the relationship of antecedents of TikTok and social media marketing strategies on impulsive purchasing of consumers, this demographic profile will serve as the foundation of the study. It will support the analysis of the preferences and behaviors of diverse consumers within the TikTok application, specifically in relation to its TikTok Shop.

Table 1. Demographics

<i>Variable</i>	<i>Category</i>	<i>No.</i>	<i>Response information N=262</i>
Gender	Male	105	40.07%

	Female	155	59.16%
	Prefer not to say	2	0.76%
Age	18-20	99	37.80%
	21-25	147	56.10%
	26-30	10	3.80%
	31-35	2	0.80%
	40 and above	3	1.10%
Generation Cohort	Baby Boomer (1946-1964)	2	0.8%
	Generation X (1965-1979)	1	0.4%
	Generation Y (1980-1994)	8	3.1%
	Generation Z (1995-2009)	251	95.8%
Location	Caloocan	19	7.30%
	Las Pinas	1	0.40%
	Makati	8	3.10%
	Malabon	2	0.80%
	Mandaluyong	7	2.70%
	Manila	34	13%
	Marikina	51	19.50%
	Navotas	1	0.40%
	Paranaque	6	2.3%
	Pasay	2	0.8%
	Pasig	28	10.70%
	Pateros	1	0.4%
	Quezon City	91	34.70%
	San Juan	3	1.1%
	Taguig	7	2.7%
Educational			
Attainment	Primary School	0	0%
	High School	36	13.70%
	College	139	53.10%
	Undergraduate (Bachelor's Degree)	82	31.30%
	Postgraduate (Master's Degree)	3	1.10%
	Doctorate	2	0.80%
Employment Status	Full-time Employee	25	9.50%
	Part-time Employee	12	4.60%
	Self-employed	4	1.50%

	Unemployed	6	2.30%
	Student	211	80.50%
	Retired	3	1.10%
	Housewife	1	0.40%
Profession	Not Applicable	116	44.30%
	Architecture and Engineering Field	68	26%
	Medical Field	16	6.10%
	Education Field	8	3.10%
	Entrepreneurial Field	9	3.40%
	Business Process Outsourcing Field	16	6.10%
	Legal Field	4	1.50%
	Information Technology	4	1.50%
	Aviation Field	2	0.80%
	Others		
Civil Status	Single	250	95.40%
	Married	8	3.10%
	Widowed	3	1.10%
	Legally Separated	1	0.40%
Monthly Income			
(Php)	Less than ₱10,957	65	24.80%
	₱10,957 - ₱21,194	52	19.80%
	₱24,165 - ₱43,828	65	24.80%
	₱43,829 - ₱76,669	47	17.90%
	₱76,670 - ₱131,484	19	7.30%
	₱134,485 - ₱219,140	8	3.10%
	More than ₱219,141	6	2.30%

The demographic composition of the study shows a total of 262 respondents, reflecting a diverse representation across various categories. In terms of gender, the majority identified as females, making up 59.16% of the data, while males accounted for 40.07%. A small portion (0.76%) chose not to disclose their gender. The age distribution predominantly comprises young adults, with 56.10% falling within the 21-25 age group. Participants aged 18-30 constitute 37.80%, followed by smaller percentages in the 26-30, 31-35, and over 40 age brackets. Regarding educational attainment, a significant majority (53.10%) held a Bachelor's degree, with 31.30% having completed high school and 13.70% holding a Master's degree.

In terms of employment status, the majority identified as students (80.50%), followed by full-time employees

(9.50%), part-time employees (4.60%), unemployed (2.30%), and self-employed individuals (1.50%). Retirement status was less common, with 1.10% of participants retired. In terms of civil status, the majority were single (95.40%), followed by married individuals (3.10%), widowed (1.10%), and legally separated (0.40%). Lastly, participants' monthly income distribution varied, with the largest portion falling within the Php 24,164 - Php 48,323 income range, followed by those earning less than Php 10,957 and Php 10,957 - Php 21,194. Income brackets ranging from Php 43,829 to Php 219,140 had varying representations, with the highest income bracket (more than Php 219,141) constituting 2.30% of the population.

Measures

An online survey questionnaire, in general, is a digital instrument used to collect data and information about respondents across the Internet. This strategy entails asking people or groups of respondents a series of questions or prompts to obtain particular responses or insights. According to Nayak and Narayan (2019), internet surveys can be conducted at a minimal cost and in a short period, and a survey can be started, put on hold, and reopened at any moment. Furthermore, it can send reminders to the participant if questions are skipped and when the response is finished.

Lastly, it provides numerous benefits such as scalability, convenience of setup, and the capacity to reach a broad range of geographical regions. Hutchinson and Chyung (2023) emphasize the significance of employing a five-point Likert scale (1-Strongly Disagree to 5-Strongly Agree) in research surveys, cautioning against inconsistent efforts to modify it for improved statistical analysis due to a lack of conclusive evidence. In this study, participants were requested to assess their perceived level of agreement regarding the statements formulated in the survey questionnaire using the previously indicated five-point Likert scale.

One of the questions included in the questionnaire primarily focuses on TikTok features: "Have you ever made a purchase directly from TikTok Shop based on a video or recommendation you saw on the platform?" This question highlights how the videos and recommendations from content creators featured on TikTok can influence individuals' purchasing decisions. It suggests that the content users encounter on TikTok has a significant impact on their engagement and purchasing behavior, as they are influenced by what they see on the platform. Another latent variable in this study is the Social Media Marketing Strategies. The questionnaire included questions such as, "I believe that the popularity of a celebrity or content creator impacts their ability to influence my preferences and decisions." This question aims to understand how strategies like celebrity endorsements influence users' preferences and decisions to purchase products. It acknowledges that the popularity of celebrities or content creators can significantly influence users' choices regarding what products to buy. Another question stated, "I find discount codes or coupons used as a type of sales promotion on social media appealing." This question addresses a common social media marketing strategy, which is also prevalent in TikTok Shop. It acknowledges that offering discounts or coupons can attract users to purchase products on the TikTok app, as such promotions serve as incentives for users to make purchases.

The study employs different research approaches to evaluate impulsive purchasing behavior among TikTok users in the Philippines' National Capital Region (NCR). Taderhoost (2022) claims that mixed methods can support each technique through analysis and reinforce the questionnaire data. Combining qualitative and quantitative approaches guarantees that the study is well-rounded. Descriptive analysis of unprocessed social media data sets are best employed with a mixed-method technique (Rodriguez and Storer, 2020). In addition, to confirm the validity and reliability of the study's findings, through the Kaiser-Meyer-Olkin (KMO) Test for Sampling Adequacy, which, according to the research of Harry et al. (2021), the variables' viability and eligibility for subsequent tests demonstrate proof of the authenticity of the KMO of sampling adequacy test result that will be used.

Furthermore, an antecedent's research design model is developed to help discover significant elements driving impulsive purchasing. As a part of the quantitative method, an exploratory factor study is utilized to reveal and explore underlying patterns and connections in the information being studied. This multifaceted technique offers an extensive analysis of impulsive purchasing behavior among TikTok users in the NCR.

Data Gathering

The method used in the data-gathering procedure was online convenience sampling. The limits caused by the size of the population and the lack of a thorough sample frame led Vasiliu et al. (2023) to choose convenience sampling. Based on the study, Convenience sampling is a non-probability sampling technique that was selected to make it easier to select participants based on their availability and ready accessibility. The participants in the research process are frequently ready and willing to participate. The sampling technique aims to obtain a representative sample from the users of TikTok within NCR that are impacted by impulsive buying.

According to Etikan and Babtope (2019), convenience sampling is a straightforward method for choosing samples because they are readily obtainable and easily accessible. It is frequently used as a preliminary study to gather information before proceeding with a more extensive research study. This approach is well-known for its flexibility, ease of use, efficiency, simplicity, and cost-efficiency. Another study by Stratton (2021) confirms convenience sampling's effectiveness because of its low cost, time-efficient nature, and simplicity.

According to a study, proponents employ another sampling method known as snowball sampling, one of the most frequently utilized methods of getting data from difficult-to-reach populations, particularly in circumstances with limited data available. Snowball sampling can enhance connections among possible respondents by using platforms such as Facebook and other social media platforms, which may assist in reducing some of its inherent restrictions by gathering background data on individuals. (Dosek, 2021).

According to Ball (2019), online surveys necessitate an in-depth understanding of how survey research might be adapted to web-based platforms to minimize bias and improve robustness. Online surveys have various advantages over traditional pen-and-paper approaches. According to Chaturvedi et al. (2021), using internet

platforms like Google to distribute survey questions is an ideal solution for providing reliable and statistically valid findings while resolving ethical concerns.

Sample Size

Table 2. Sample parameters and size

Population Size	Confidence Interval	Margin of Error	Result
13,484,462	90%	10%	68

The target respondents of this study are the people residing in the National Capital Region (NCR), which consists of 1 municipality and 16 cities. Raosoft Sample Size Calculator was utilized to determine the required number of respondents. With a population size of 13,484,462 and a confidence interval of 90%, the recommended sample size would be 68. In table 2, the proponents have gathered a total of 262 respondents. According to Bullen et al. (2022), a sample size of at least 100 is required to obtain any significant result. This research, with responses from 262 people, surpasses the range of these recommended measures, strengthening the reliability of the SEM results.

Applications Used for Study

The Statistical Package for the Social Sciences (SPSS) and Analysis of Movement Structure (AMOS) were used to get the necessary information. The SPSS is a program that analyzes scientific data, and it is a fast-visual model. According to Noels (2018), the SPSS is an excellent tool for understanding changes in product demand. The AMOS was used to create the structural equation model. Thakkar (2020) stated that AMOS is known for its unique graphical user interface, and it is also a well-regarded program for solving structural equation modeling problems.

Reliability Testing

Cronbach's alpha is a valuable tool for assessing the reliability of a composite score in fields like psychology, social sciences, health, and education (Zakariya, 2022). It assesses whether a scale effectively measures its intended variable. The resulting alpha coefficient (α) is a crucial indicator. An alpha score of 0.7 or higher signifies good internal consistency. In contrast, a score of 0.5 or below suggests the need to revise or replace questions and, in some cases, redesign the scale (Taber, 2017).

Exploratory Factor Analysis

According to Shrestha (2021), exploratory factor analysis is used to examine complexity and is frequently

employed in the initial stages of studies to identify the connections among a group of variables. The goal of the research is to investigate factor analysis of an online survey to identify important variables when evaluating the relationships between each of these variables. The decision to employ factor analysis for the dataset is evaluated using determinant score limits Kaiser-Meyer-Olkin and Bartlett's test of sphericity. The outcomes of this study imply that factor analysis is an effective method for identifying significant factors that explain the most significant variation within the assessed group.

Structural Equation Modeling (SEM) Analysis

This study utilized path analysis to understand the relationship between antecedents affecting impulsive purchasing behavior on TikTok among users in the National Capital Region (NCR) of the Philippines. Path analysis is an expansion of multiple linear regression analysis, according to Ali and Harahap (2020). Path analysis uses regression analysis to determine causal relationships between variables. Its primary purpose is to ascertain whether a group of independent variables directly or indirectly impacts associated variables. This aims to identify how features on TikTok, marketing strategies on social media, and personal characteristics influence impulsive purchases in industries such as fashion, electronics, beauty, home, food, and health. Using tools such as Structural Equation Modeling (SEM) and factor analysis, this study could quantify how TikTok features directly and indirectly influence marketing strategies and overall buying intentions. With this approach, this study could thoroughly explore the relationships between the antecedents and provide a result of what affects consumer behavior on TikTok.

Model Fit

In this study, the model fit will be assessed using a combination of quantitative approaches, specifically SEM and factor analysis, which will be implemented and utilized through SPSS. SEM will be used to analyze how well the proposed theoretical model aligns with the observed data, considering the relationships between TikTok features, social media marketing strategies, and impulsive purchase behavior. The factor analysis will help to identify and validate the latent variables affecting these variables. The study will analyze thoroughly the fit of the model through statistical measures, such as the Tucker-Lewis Index (TLI), Non-normed Fit Index (NNFI), Comparative Fit Index (CFI), Normed Fit Index (NFI), and Root Mean Square Error of Approximation (RMSEA). According to the paper of Shi et al. (2020), this will ensure the strength and validity of the model. This thorough analysis aims to ensure the reliability and validity of the research model and formulate credible conclusions about the factors influencing impulsive purchase behavior among TikTok users in the National Capital Region, Philippines.

Results

Reliability Testing

Table 3 shows the result of a reliability analysis conducted using Cronbach's Alpha to evaluate the internal

consistency of Celebrity Content Influence, TikTok Shop, Promotion Strategy, "For You Page" Feature, IP Trigger, Content Format, Content Features, Engaging Content, and Honest Reviews. Cronbach's alpha indicates how closely related the survey items are to each other, measuring the extent to which they collectively capture a single underlying concept.

The analysis shows high internal consistency with factors ranging from Honest Reviews to Celebrity Content Influence, with Cronbach's Alpha values ranging from 0.831 to 0.952. These values are indicated as good to excellent, indicating that there is a strong correlation among the items within each item. Meanwhile, IP Decision Impact has a value of 0.707, indicating that the items are moderately well-correlated or acceptable for exploratory research (Olaniyi, 2019).

Table 3. Cronbach's Alpha

Factors	Cronbach's Alpha	Cut-off	Remarks
Celebrity Content Influence	0.952	≥ 0.7	Acceptable
TikTok Shop	0.958	≥ 0.7	Acceptable
Promotion Strategy	0.945	≥ 0.7	Acceptable
"For You Page" Feature	0.940	≥ 0.7	Acceptable
IP Trigger	0.927	≥ 0.7	Acceptable
Content Format	0.929	≥ 0.7	Acceptable
Content Features	0.932	≥ 0.7	Acceptable
Engaging Content	0.912	≥ 0.7	Acceptable
Honest Reviews	0.813	≥ 0.7	Acceptable
IP Decision Impact	0.707	≥ 0.7	Acceptable

To assess the correlation in the study, the formula and corresponding indicators were utilized. The assigned values were as follows: Moderate correlation was defined when the correlation coefficient (r) reached .50, Low correlation was characterized by values below .50, and High correlation was attributed to coefficients equal to or exceeding .80. To quantify the strength of the correlation, the study utilized the formula " $=r^2 \times 100$," emphasizing the squared correlation coefficient multiplied by 100.

Table 4. Correlation

	Age	Generation Cohort	Gender	Civil Status	Location	Educational Attainment	Employment Status	Household Income	Profession	Celebrity Content Influence	TikTok Shop	Promotion Strategy	FYP Feature	Impulsive Purchase Trigger	Content Format	Content Features	Engaging Content	Honest Reviews	Impulsive Purchase Decision Impact

Impulsive Purchase Decision Impact																			

*Note: ** = There is a correlation between the factors

Structural Equation Modeling

Figure 3. Initial Structural Equation Model for Antecedents of TikTok and Social Media Marketing Strategy on Impulsive Purchases

Figure 3 illustrates the initial hypothetical model in the diagram. The three latent variables include factors associated with TikTok features denoted as "TFeatures," social media marketing strategies represented by "SMMSStrat," and factors linked to impulsive purchasing behavior indicated as "IMP." Observed variables are critical for evaluating latent variables that impact impulsive purchasing behavior, which include TikTok features and social media marketing strategies. This approach aligns with findings from a study conducted by Savci et al. (2019), supporting the relevance and purpose of the hypothetical model in understanding the interplay between TFeatures, SMMSStrat, and IMP. Each latent variable was investigated using measurement models before being considered in the structural model.

Exploratory Factor Analysis Results

The factor loadings help analyze a variable's relationship to a factor. The closer the value is to one, the stronger its relationship with the variable. It is essential in interpreting the result of the data. Correlations, also called factor loadings, help in measuring a factor. This step removes the cross-loadings or the factor with two or more values in a row. According to SPSS Factor Analysis, it is ideal that the component should accurately be measured by every input variable because not doing so complicates factor interpretation. Table 5 shows the Treated Factor Loadings that measures a single factor. The factors within each component indicate a high degree of similarity. The proponents ran the SPSS to eliminate the cross-loadings 14 times. It is required to eliminate variables, as only one value in the component per variable should exist. In component 1, the SPSS results indicate that variables SMMS33, SMMS35, SMMS34, SMMS31, SMMS32, SMMS37, SMMS38, SMMS36, SMMS39, SMMS62, SMMS43, SMMS65, SMMS54, and SMMS46 are grouped together. Similarly, the results suggest that variables TF23 up to TF214 in component 2 should be grouped. This grouping pattern should be applied to the remaining variables in each component. Variables that greatly impact a particular aspect of the data should be considered together since they are likely related or similar. Once the new set of components is labeled, it can be used to determine Cronbach's Alpha, which is helpful in testing reliability.

Table 5. Treated Factor Loadings

CODE	1	Questions
SMMS33	.820	I try products or services that has been endorsed or recommended by a celebrity or content creator on social media.
SMMS35	.800	I trust the recommendations made by celebrities and content creators on social media.
SMMS34	.800	I believe that celebrities and content creators genuinely use the products or services they endorse on social media.
SMMS31	.799	I am influenced by celebrities and content creators on my purchasing decisions.

SMMS32	.786	I follow or engage with content posted by celebrities and content creators on social media platforms.
SMMS37	.767	I share products or services recommended by celebrities and content creators with my friends or followers.
SMMS38	.727	I believe that celebrities and content creators prioritize legitimacy in their social media endorsements.
SMMS36	.713	I believe that the popularity of a celebrity or content creator impacts their ability to influence my preferences and decisions.
SMMS39	.534	I believe that the age or gender of a celebrity or content creators matter to trust their recommendations on social media platforms.
SMMS62	.523	I believe that advertisements on social media influence my purchasing decisions.
SMMS43	.501	I purchase a product after seeing an engaging selling content.
SMMS65	.486	I share products or services that I discover through social media advertisements on my own social media platforms.
SMMS54	.486	I think that the use of trends in social media marketing strategies influences my online purchasing decisions.
SMMS46	.477	I often engage with content creators who value their followers and respond to their comments and messages.

CODE 2

TF23	.788	I am satisfied with my overall experience with the TikTok Shop feature.
TF22	.780	I am satisfied with the products available on TikTok Shop.
TF212	.780	I have made a purchase directly from TikTok Shop based on a video or recommendation you saw on the platform.
TF21	.755	I frequently make purchases through the TikTok app.
TF211	.744	I engage with the Yellow Basket in TikTok Videos.

TF24	.732	I buy Fashion and Clothing products on TikTok.
TF210	.703	I trust product recommendations and reviews on TikTok Shop.
TF215	.693	I share or recommend products you discover on TikTok Shop with friends or followers on TikTok or other social media platforms.
TF213	.691	I find the TikTok Shop interface user-friendly.
TF26	.685	I buy Beauty and Cosmetics products on TikTok.
TF214	.649	I compare the pricing of products on TikTok Shop to other online shopping platforms.

CODE 3

SMMS14	.759	I find discount codes or coupons used as a type of sales promotion on social media appealing.
SMMS15	.738	I find 'buy one, get one free' (BOGO) offers as a type of sales promotion on social media appealing.
SMMS16	.729	I find limited-time flash sales offers, as a type of sales promotion on social media, appealing.
SMMS12	.688	I frequently participate in or take advantage of a sales promotion or special offer on social media.
SMMS110	.658	I believe that sales promotions on social media are an effective way for brands to increase sales and engagement.
SMMS13	.639	I agree that social media sales promotions influence my shopping decisions more than traditional advertising strategies (e.g., billboards, tarpaulins, etc.).
SMMS18	.609	I find loyalty rewards program offers as a type of sales promotion on social media appealing.
SMMS17	.601	I find free shipping offers as a type of sales promotion on social media appealing.
SMMS113	.573	I agree that social media sales promotions influence my shopping decisions more than traditional advertising strategies (e.g., billboards, tarpaulins, etc.).
SMMS111	.528	I seek out sales promotions on social media when making purchasing decisions.

SMMS112	.494	I follow or subscribe to brands' or businesses' social media accounts to remain up to date on their sales promos and offers.
SMMS11	.489	I am familiar with the concept of Sales Promotion as a marketing strategy on social media platforms.
SMMS63	.436	I often explore products or services advertised on social media platforms.

CODE 4

TF14	.779	I feel that the content on my 'For You Page' aligns with my interests and preferences.
TF12	.764	I am satisfied with TikTok's recommendations on your 'For You Page'.
TF17	.750	I am satisfied with the overall experience of using the 'For You Page' on TikTok.
TF16	.724	I believe that the 'For You Page' algorithm contributes to the variety of content I see on TikTok.
TF13	.722	I frequently find new and engaging content on your 'For You Page'.
TF15	.638	I actively engage with the content on my 'For You Page'.
TF11	.623	I understand TikTok's "For You Page" algorithm.
SocMed1	.568	I often use TikTok.

CODE 5

PP111	.795	Boredom or idle time tend to trigger my impulsive purchases.
PP110	.757	Stress or emotional tendencies trigger my impulsive purchases.
PP114	.737	Happiness tend to trigger my impulsive purchases.
PP115	.735	Excitement tend to trigger my impulsive purchases.
PP113	.706	Retail therapy tend to trigger my impulsive purchases.
PP19	.630	The recommendations from friends and family tend to trigger my impulsive purchases.
PP112	.625	Peer pressure tend to trigger my impulsive purchases.

PP116 .550 Cravings tend to trigger my impulsive purchases.

PP11 .505 I find myself making impulsive purchases.

CODE 6

TF32 .829 I am aware of the "Stitch" TikTok Content Format.

TF31 .760 I am aware of the "Duet" TikTok Content Format.

TF33 .712 I am aware of the "Auto-Scroll" TikTok Content Format.

TF34 .708 I am aware of the "Picture-in-Picture" TikTok Content Format.

TF35 .670 I am aware of the "TikTok Visual Effects (TikTok Filters and Effects)" TikTok Content Format.

TF315 .572 I think that the Stitch feature on TikTok improves collaboration between users.

TF314 .530 I think that the Duet feature on TikTok improves collaboration between users.

TF316 .506 I think that the Auto-Scroll feature will improve my entire TikTok viewing user experience.

TF317 .498 I think that the Picture-in-Picture feature will improve my entire TikTok viewing user experience.

CODE 7

TF39 .814 I frequently use the "Picture-in-Picture" TikTok Content Format.

TF38 .781 I frequently use the "Auto-Scroll" TikTok Content Format.

TF37 .776 I frequently use the "Stitch" TikTok Content Format.

TF36 .771 I frequently use the "Duet" TikTok Content Format.

CODE 8

SMMS41 .601 I find social media content to be visually appealing and engaging.

SMMS61 .595 I often notice advertisements on social media platforms.

SMMS66	.571	I believe that advertisements on social media platforms are effective in influencing consumer behavior.
SMMS42	.564	I think that short videos on social media platforms is an effective strategy for content to be engaging.
SMMS45	.556	I find content that delivers its message briefly, engaging.
SMMS52	.509	I believe that brands effectively utilize trends in their social media marketing strategies to capture my attention.

CODE

SMMS24	.662	I purchase a product after seeing an honest review.
SMMS23	.656	I do trust honest reviews when deciding to buy something.
SMMS21	.527	I agree that the algorithm of various social medias suggests genuine reviews that align with my preferences.
SMMS26	.484	I believe content creators are motivated by personal enthusiasm and genuine interest when creating honest review content.

CODE 10

PP13	.676	It takes time for me to decide before proceeding with my purchase on the app.
PP14	.671	The products I purchase through the app fall into the category of necessities or needs.
PP16	.614	I spend small amount of money in purchasing when using the app's online shopping feature.
PP18	.464	I feel that impulsive purchases have a negative impact on my overall financial well-being.

Kaiser-Meyer-Olkin

Table 5. KMO Test of Adequacy

KMO Test of Adequacy	
Kaiser-Meyer-Olkin Measure of Sampling Adequacy	.948

Kaiser-Meyer-Olkin (KMO) is a statistical test that measures the correlation between two variables. It helps to determine the reliability of data analysis by evaluating the significance of each variable and removing the variables that are not significant. According to Stephanie (2021), the KMO value would be closer to one if more variables are associated. A KMO value more relative to one indicates that the model is more reliable and acceptable, validating the data the proponents collected. Table 1 shows that the adequacy of the KMO test is acceptable since the result is 0.948, which is close to one.

Table 6. Hypothetical Model- Loadings of Measurement

Latent Variables	Observed Variables	Code	Standardized Regression Estimates	P-Value
TikTok Features	TikTok Shop	TF1	0.758	***
	"For You Page" Feature	TF2	0.844	-
	Content Format	TF3	0.804	***
	Content Features	TF4	0.588	***
Social Media Marketing Strategies	Celebrity Content Influence	SMMS1	0.788	***
	Promotion Strategy	SMMS2	0.885	***
	Engaging Content	SMMS3	0.847	***
	Honest Reviews	SMMS4	0.763	-
Impulsive Purchase	Impulsive Purchase Trigger	IMP1	0.659	-
	Impulsive Purchase Decision Impact	IMP2	0.535	***

*Note: *** = Significant

The results in Table 6 illustrate that all the observable variables correlate strongly and positively with their respective latent variables. Additionally, the derived p-values, which represent the relationships' statistically significant aspect, support these connections' significance.

Table 7. Estimates of Structural Model- Hypothetical Model

Endogenous Variable	Exploratory Variables	Unstandardized Estimate	Standardized Regression Estimates	P-Value
---------------------	-----------------------	-------------------------	-----------------------------------	---------

Social Media	TikTok	0.557	0.831	***
Marketing Strategies	Features		(83.1%)	
Impulsive Purchase	Social Media	1.216	1.068	***
	Marketing Strategies			

*Note: *** = Significant

Table 7 displays standard regression estimates between latent variables. According to the findings, when participants experience TikTok Features, there is an 83.1% chance that they will utilize social media marketing strategies. Subsequently, if social media marketing strategies are implemented, there is a 106.8% chance that impulsive purchase factors will be augmented.

Based on the results, it interprets a robust positive correlation between TikTok Features and the implementation of social media marketing strategies and, further, an impact of social media marketing strategies on increasing impulsive purchase factors. These results emphasize the potential influence of TikTok Features on marketing strategies and the impact on consumer behavior, providing valuable considerations for marketing and business strategies.

Table 8. Model Fit Indices - Hypothetical Model

Model Fit	Value	Cut-Off	Remarks
TLI (NNFI)	0.901	≥ 0.90	Acceptable
CFI	0.930	≥ 0.90	Acceptable
NFI	0.912	≥ 0.90	Acceptable
RMSEA	0.115	≤ 0.10	Failed

*Note: TLI = Tucker Lewis Coefficient; NNFI = Non-normed Fit Index; CFI = Comparative Fit Index; NFI = Normed Fit Index; RMSEA = Root Mean Square Error of Approximation

Table 8 displays the model fit indices of the hypothetical model. The Tucker-Lewis Index (TLI or NNFI) has a score value of 0.901, which almost meets the acceptable cut-off of greater than or equal to 0.90, which is a reasonably good fit. The Comparative Fit Index (CFI) has a total value of 0.930, which also exceeds the required cut-off of greater than or equal to 0.90, which is also considered acceptable. However, the Root Mean Square Error of Approximation (RMSEA) exceeds the recommended 0.10 cut-off, registering a value of 0.115, indicating a failure to meet the standard. The cutoff values correspond with Shi and Maydeu-Olivares's criteria

(2020). Although the model accurately depicts latent variable relationships, multiple fit indices emphasize the importance of thorough analysis, averting against relying entirely on a single indicator.

Structural Equation Modeling Results

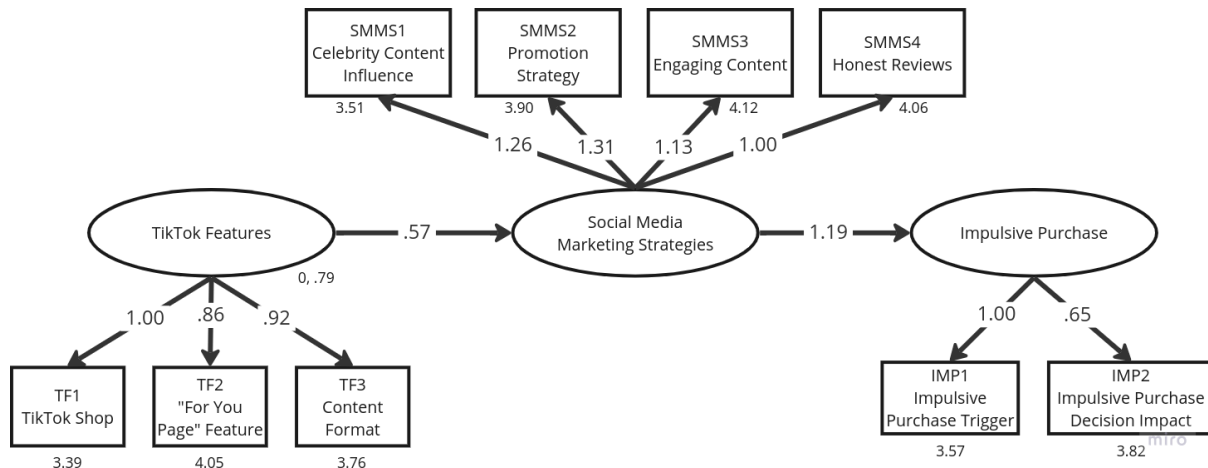

Figure 4. Final Model on Antecedents of TikTok and Social Media Marketing Strategy on Impulsive Purchases

Figure 4 depicts the modified model after modifying the hypothetical model. When the changes to the indices were reviewed, it was discovered that the Content Features variable (TF4) was removed. This conclusion was driven by Content Features failing to adhere to the rule of thumb, which states that most standardized residuals in the correct model should be less than two in absolute value. Shi and Maydeu-Olivares (2020) emphasize that the population values of cross-loadings or residual correlations should preferably be in the range of .20 or .40. A higher score suggests the model is misspecified more substantially.

This modification is supported by the findings of Hasanah et al. (2022), who underline that particular social media persona and content generate higher engagement, resulting in many followers. Cuevas et al. (2020) observe that some business contents display minimal interaction and engagement between the organization and users, justifying the elimination of Content Features from the model. Furthermore, the lack of a correlation is noticeable in the hypothetical and modified models, where only e2 and e4 had previously correlated. However, under the modified model, e4 lacks value in engaging material, strengthening the justification for its removal.

Table 9. Modified Model - Loadings of Measurement

Latent Variables	Observed Variables	Code	Standardized Regression Estimates	P-Value
TikTok Features	TikTok Shop	TF1	0.766	-
	"For You Page"	TF2	0.840	***

Feature				
Social Media Marketing Strategies	Content Format	TF3	0.781	***
	Celebrity Content Influence	SMMS1	0.779	***
	Promotion Strategy	SMMS2	0.889	***
	Engaging Content	SMMS3	0.854	***
	Honest Reviews	SMMS4	0.765	***
Impulsive Purchase	Impulsive Purchase Trigger	IMP1	0.657	-
	Impulsive Purchase Decision Impact	IMP2	0.537	***

*Note: *** = Significant

Compared to the hypothetical model, the two versions present a consistent positive connection between the observable and latent variables. Furthermore, the latest model in Table 9 maintains the significance of these correlations. Moreover, the statistical significance of the relationships between the observable variables and their associated latent variables remains the same, strengthening the reliability and relevance of these relations in the modified model.

Table 10. Estimates of Structural Model - Modified Model

Endogenous Variable	Exploratory Variables	Unstandardized Estimate	Standardized Regression Estimates	P-Value
Social Media Marketing Strategies	TikTok Features	0.566	0.851	***
Impulsive Purchase	Social Media Marketing Strategies	1.195	1.057	***

The re-evaluated estimations for the modified structural model are shown in Table 10. The differences identified in the modified model are minimal compared to the hypothetical model. Notably, the standardized regression estimates for the hypothetical and modified models remain consistent, demonstrating that the associations

between each latent variable are still significant. As stated in the table, The improved model complies with an additional detailed set of model fit indices that correspond to this alignment in estimates. The findings, specifically the Estimates of the Structural Model for the Modified Model table, highlight the strength of the correlations between latent variables, confirmed by the model's fulfillment of a broader range of fit indices.

According to the recomputed results, users who experience TikTok Features are 85.1% more likely to use social media for advertising. As a result, there is a 105.7% possibility that impulsive purchase characteristics will be a good fit if social media marketing methods are applied. According to the outcomes, there is a substantial positive association between TikTok features and the application of social media marketing strategies and the effect of social media advertising strategies on improving impulsive buying characteristics. The results of this study highlight the possible impact of TikTok features on marketing techniques and customer habits, providing significant considerations for marketing and business actions.

Table 11. Model Fit Indices - Modified Model

Model Fit	Value	Cut-Off	Remarks
TLI (NNFI)	0.933	≥ 0.90	Acceptable
CFI	0.954	≥ 0.90	Acceptable
NFI	0.938	≥ 0.90	Acceptable
RMSEA	0.101	≤ 0.10	Acceptable

*Note: TLI = Tucker Lewis Coefficient; NNFI = Non-normed Fit Index; CFI = Comparative Fit Index; NFI = Normed Fit Index; RMSEA = Root Mean Square Error of Approximation

The model fit indices of the recalculated modified model are shown in Table 11, displaying positive findings across multiple metrics. The TLI achieves a value of 0.933, exceeding the suggested cutoff of 0.90 and showing a good fit. Similarly, the CFI displays a value of 0.954, exceeding the minimum threshold of 0.90 and satisfying the acceptance criteria. Furthermore, the RMSEA is 0.101, within the accepted range of 0.10.

The results indicate the modified model's ability to accurately depict the underlying relationships between latent variables. Furthermore, the comprehensive assessment of various fit indices highlights the structural equation model's reliability, highlighting the value of multiple criteria for assessing the model instead of depending on just one metric. The following cutoffs were based on Shi and Maydeu-Olivares's (2020) study.

Discussion

The study's findings on the relationship between TikTok features, social media marketing strategies, and their

impact on purchasing power provide insights into existing customer behavior and marketing strategies. To begin with, the strong correlation between TikTok feature engagement and the probability of using social media for marketing highlights the expanding relevance of platforms like TikTok in digital marketing. With a large user base and innovative features like TikTok Shop and the "For You Page," companies can successfully attain and engage with potential customers. This demonstrates the changing environment of social media as an effective platform for advertising, company promotion, and communication. Secondly, the study's findings on the correlation of impulsive purchase characteristics with social media marketing techniques indicate a dynamic relationship between consumer behavior and marketing strategies on platforms such as TikTok. Celebrity content influence, promotion strategies, captivating content, and honest reviews effectively appeal to customers' impulsive purchasing behaviors, which could lead to more significant sales and brand loyalty.

Since the study focuses on TikTok users specifically in the Philippines, this study was able to fill the gap in the lack of studies on the impulsive purchasing intention of TikTok users in the country, particularly in the National Capital Region (NCR). By carrying out research with this demographic group, this gap was filled. Given that the previous studies commonly employed confirmatory research techniques, this study was able to explore and examine the application's distinct characteristics and dynamics of the impact on the impulsive buying intention of the users with the utilization of an exploratory research method. This method was able to uncover new perspectives and trends that are more conventional compared to the confirmatory research which unfortunately has been missed. Jacobucci (2022) asserts that in essence, psychology research is increasingly integrating aspects that could be labeled exploratory. After identifying the previous studies that have mostly focused on impulsive purchasing intention on well-known social media platforms and other traditional e-commerce platforms, the study was able to fill the gap in conducting in favor of the significance of TikTok Shop. With this, the study was able to close this knowledge gap, comprehend consumer behavior on new social commerce platforms, and prove the essential importance of its impact on the impulsive shopping intention of the consumers.

Lastly, this paper was conducted with a new approach by utilizing mixed methods to provide a broad perspective, which previous researchers have not been able to achieve as they primarily concentrated either on quantitative or qualitative methods. Schoonenboom and Johnson (2017) state that the fundamental purpose of mixing both quantitative and qualitative components in mixed-methods studies is to strengthen and enhance study findings. They believe that research problems should always be answered using a combination of approaches, which increases validity and knowledge. Through the integration of qualitative and quantitative data analysis, the study has gained a deeper understanding of TikTok's impact on impulsive purchasing intention.

Furthermore, the significant positive correlation between TikTok features and the application of social media marketing strategies highlights the importance of businesses adjusting to and efficiently utilizing developing digital platforms. As customer preferences change and attention spans shorten, marketers must constantly innovate and use platforms like TikTok to remain relevant and competitive. Notably, the study's focus on the impact of these strategies on increasing impulsive purchasing preferences emphasizes social media marketing's

potential influence on customer behavior. This shows businesses should purposefully apply TikTok features and specialized marketing strategies to generate engagement and encourage viewers to make purchases.

Overall, the findings demonstrate the dynamic interplay between TikTok features, social media marketing strategies, and consumer behavior, providing valuable insights for businesses and entrepreneurs seeking to control and benefit from the ever-changing digital landscape. Companies can improve their marketing in an increasingly competitive market by effectively identifying and utilizing these relationships.

Individuals who engage with TikTok features (TikTok Shop, "For You Page" Feature, and Content Format) are significantly more likely (85.1%) to use social media as a platform for advertising. Additionally, there is a substantial possibility (105.7%) that impulsive purchase characteristics align well with the application of social media marketing methods (Celebrity Content Influence, Promotion Strategy, Engaging Content, and Honest Reviews). The study's outcomes suggest a strong positive association between TikTok features and the implementation of social media marketing strategies. Furthermore, the study highlights these strategies' considerable impact on enhancing users' impulsive buying tendencies. Overall, these results provide valuable insights for businesses and marketers, emphasizing the potential influence of TikTok features on marketing techniques and consumer behavior.

Ten factors are included in the dataset, according to the findings of the factor analysis. These criteria were discovered to be present after looking over the collection of questions. Tiktok Shop, "For You Page" Features, Content Format, Content Features, Celebrity Content Influence, Promotion Strategy, Engaging Content, Honest Review, Impulsive Purchase Trigger, Impulsive Purchase Decision Impact.

After factor analysis had concluded, the dataset was verified to determine whether or not it worked the hypothesis model. The results revealed that TikTok Shop ($\beta = 1.00$), "For You Page" Features ($\beta = 0.86$), Content Format ($\beta = 0.92$), positively affect TikTok Features. Results also show variables such as Celebrity Content influence ($\beta = 1.26$), Promotion Strategy ($\beta = 1.31$), Engaging Content ($\beta = 1.13$), Honest Review ($\beta = 1.00$). In terms of Impulsive Purchase, result shows that Impulse Purchase Trigger ($\beta = 1.00$), Impulsive Purchase Decision Impact ($\beta = 0.65$) According to Sharabati et al. (2022) Customers are impacted in many different ways by TikTok's varied features, which include the captivating For You Page algorithm, influencer marketing, user-generated content, and e-commerce integration. These effects include entertainment, buying decisions, brand perceptions, and cultural trends. The findings show that TikTok features present chances for effective control and advantages, as well as useful insights for companies and entrepreneurs dealing with the ever-changing digital landscape. By effectively identifying and utilizing these connections, businesses can improve their marketing strategies in a market that is becoming more and more competitive.

According to Kusumawati et al. (2021), Understanding the elements influencing impulsive buying is critical for brands and businesses, especially in the quickly expanding industry, as TikTok continues to shape consumer behavior. This study offers insightful information that can improve marketing plans and the success of TikTok

social media campaigns. Furthermore, the strong correlation that exists between TikTok features and the application of social media marketing strategies highlights how important it is for companies to adjust to and effectively use new digital platforms. To stay relevant and competitive, marketers must constantly innovate and make use of platforms like TikTok in response to shifting consumer preferences and shorter attention spans. The study's focus on how these tactics can increase the likelihood that consumers will make impulsive purchases highlights the potential influence of social media marketing on consumer behavior. It also highlights the necessity for businesses to intentionally use TikTok features along with customized marketing tactics to increase viewer engagement and encourage purchases.

The study's findings were derived using SPSS factor analysis, a method employed to refine the questionnaire by eliminating irrelevant variables and overlapping factors. The resulting components, Celebrity Content Influence, TikTok Shop, Promotion Strategy, "For You Page" Feature, IP Trigger, Content Format, Content Features, Engaging Content, Honest Reviews, and IP Decision Impact, underwent reliability testing. Cronbach's alpha was utilized to assess how closely these components were related, measuring the extent to which they collectively captured a single underlying concept. Notably, the results indicated correlations of 0.707 to 0.952 ranging from acceptable to excellent, underscoring the reliability of the refined questionnaire in capturing the interconnectedness of the surveyed variables.

The correlations between the Demographics profile and various factors in the context of TikTok, social media marketing strategies, and consumer purchasing behavior have also been assessed. A significant positive low correlation of .202 (4.08%) exists between Household Income and Engaging Content, indicating that as household income increases, engagement with content considered engaging also tends to rise. The study considers a customer persona, which is Alex, Taylor, John, and Sarah, to represent demographic profiles on different income statuses. For instance, comparing Alex, with a higher income falling between Php 131,485 to Php 219,140, and Taylor, whose income is less than Php 10,957, the positive correlation implies that Alex may, on average, exhibit a slightly higher level of engagement with engaging content compared to Taylor. Conversely, there is a significant negative low correlation of -.163 (2.66%) between Employment Status and TikTok Shop, revealing that engagement with TikTok Shop tends to decrease as employment status increases. Moreover, the analysis suggests that, on average, John, who is employed part-time, may demonstrate slightly lower engagement with TikTok Shop than Sarah, a student.

The hypothetical model examined the relationships between latent variables—TikTok features ("TFeatures"), social media marketing strategies ("SMMStrat"), and impulsive purchasing behavior ("IMP"). The model is supported by a study conducted by Savci et al. (2019), and before testing, measurement models were applied to assess the suitability of latent variables using observed variables. Satisfactory index values were obtained for all scales. The fit of the proposed model was then evaluated using the Root Mean Square Error of Approximation (RMSEA), Confirmatory Fit Index (CFI), and Tucker-Lewis Index (TLI), with accepted fit indices and their respective limits detailed in an unspecified table.

The modified model resulted from adjustments to the original hypothetical model, removing the Content Features variable (TF4). This decision was based on examining indices, revealing that Content Features did not adhere to the standardized residuals' rule of thumb, and its residual covariance with Engaging Content lacked significance. The elimination of Content Features was justified by its apparent lack of importance in making TikTok videos engaging. Additionally, observations that some business contents display minimal interaction justified this removal. The lack of correlation, particularly with e4 regarding engaging material, further supported the modification, aligning with insights from both the hypothetical and modified models.

The model's relationship to the actual result from SPSS and Structural Equation Modeling (SEM) depicts the research design model, which intends to investigate the relationship between TikTok features and Social Media Marketing Strategies (SMMS) regarding their influence on Purchase Power. The method involves transferring computed findings from SPSS to SEM and assessing the study's findings' closeness to reality. The study seeks to determine whether the results are closely related to actuality, meaning that most of the data are relevant in assessing the interconnection of these three variables and their impact on customers' purchasing behavior or purchasing power.

Theoretical Contribution

The study focuses on identifying and validating factors associated with social media marketing strategies, impulsive buying, and TikTok features. It contributes to the existing literature by investigating the theoretical model and improving current theories and models about the TikTok platform and other social media platform studies. This has a major impact on the factors that precede impulsive purchases on TikTok. The study also establishes a connection between positive behavior toward the TikTok platform's antecedents and the tendency of customers to make purchases, which is affected by the value they believe the platform provides.

Practical Implication

This study has practical implications for stakeholders, such as for business owners as it provides a valuable reference for identifying marketing strategies appropriate for their business needs. By understanding the approaches outlined in this study, business owners can boost their marketing strategies and enhance the overall status of their business. Additionally, this study can inform business owners about the latest marketing trends and best practices, empowering them to make knowledgeable decisions that can positively impact their business growth.

Recommendations

For Future Researchers

The proponents recommend that future researchers conduct the same methodology and utilize SPSS to identify the correlation between a different shopping platform and another. By replicating this study with various

shopping platforms, researchers could also explore the factors influencing consumer behavior and preferences regarding online shopping. Such insights could help businesses tailor their online shopping experiences to meet the needs and expectations of their target audience, leading to increased customer satisfaction and sales.

Comparison Across the Age Groups

In order to gain a better understanding of how TikTok's features and marketing strategies influence impulsive buying behavior, it is recommended that future researchers expand their studies beyond the age range of Gen Z and Gen Y. By broadening the scope of the study, the researchers can better comprehend the platform's impact on the purchasing decisions of individuals of all age groups and identify any potential differences or similarities in behavior across different age ranges. Such information is invaluable to businesses and marketers to target and connect with their audience on TikTok efficiently. It could also help develop more effective and customized marketing strategies for different age groups.

Cross-Cultural Analysis

The proponents recommend conducting a comparative study across different cultures or countries to examine if the factors influencing TikTok features and impulsive purchase behavior vary across diverse cultural contexts. Exploring the factors influencing impulsive purchase behavior and TikTok features in different cultural contexts can help companies tailor their marketing efforts to specific target audiences. Furthermore, this study can contribute to a better understanding of the impact of social media on consumer behavior and give an idea of how different cultures interact with technology and social media platforms.

Longitudinal Study

The proponents recommend conducting a longitudinal study to observe changes in TikTok usage patterns and impulsive purchasing behavior over an extended period. This will provide insights into trends and potential shifts. By tracking these trends over time, researchers can gain a deeper understanding of what drives consumers to make impulsive purchases and how social media platforms like TikTok play a role in this behavior.

Qualitative Exploration of User Experiences

Conducting qualitative research, such as interviews or focus groups, can be incredibly valuable. By engaging with users directly, future researchers can gather detailed information about the factors that drive impulsive purchases on the platform, as well as the emotional and psychological impact of these purchases.

Exploration of Privacy Concerns

The proponents suggest to examine the role of privacy concerns in TikTok usage and impulsive purchasing

behavior, considering how users' perceptions of data security may influence their online shopping decisions. Privacy concerns play a significant role in TikTok usage and online shopping behavior. As such, companies and app developers need to take data security seriously and ensure that users' personal information is protected. Doing so can help build trust with their users and encourage more confident and secure online shopping behavior.

Study on Trust and Credibility

The proponents recommend conducting a study on the trustworthiness and credibility of information presented on TikTok, exploring how these factors influence consumer trust and subsequent impulsive purchasing decisions. Such a study would examine the factors influencing consumer trust in the information being presented and how this trust ultimately impacts impulsive purchasing decisions.

Comparison with Other Social Media Platforms

Expanding the study by comparing the impact of TikTok's features and marketing strategies on impulsive buying behavior with other leading social media platforms would be beneficial. Researchers can conduct a thorough analysis of these variables to gain a better understanding of the influence of various social media platforms on impulsive buying behavior. This study can help identify potential strategies for marketers to leverage these trends. Furthermore, examining the differences between TikTok and other platforms could provide valuable insights into the unique features that set TikTok apart from other social media platforms and why it has become such a hit among younger generations.

Analysis of User Engagement Metrics

The proponents recommend exploring the correlation between user engagement metrics on TikTok (likes, comments, shares) and impulsive purchasing behavior, examining how these interactions contribute to consumer decision-making.

Comparative Analysis with Traditional Marketing

The proponents recommend exploring how TikTok features and social media marketing strategies compare to traditional marketing channels in influencing consumer behavior and impulsive purchases.

For Business Owners

This study is recommended for business owners as they can use this study as it provides a useful reference for identifying marketing strategies that are appropriate for their business needs. By implementing the approaches outlined in this study, business owners can improve their marketing strategies and enhance the overall status of

their business. Additionally, this study can keep business owners informed about the latest marketing trends and best practices, empowering them to make informed decisions that can positively impact their business growth.

Effect of Influencers

The proponents suggest investigating the impact of influencers on TikTok in shaping user behavior, particularly in terms of impulsive purchases, and comparing the effectiveness of various influencer marketing strategies. Analyzing this impact can help businesses make informed decisions about their influencer marketing strategies and improve their effectiveness.

Impact on Brand Loyalty

It is important to investigate the long-term impact of TikTok features and social media marketing strategies on brand loyalty. Specifically, the proponents recommend assessing whether impulsive purchases lead to sustained customer loyalty. One area of interest is understanding how different features and social media marketing strategies impact brand loyalty over time.

Abstract: Integrating programming into education is perceived to provide students with a distinct perspective on learning. In addition to enhancing the appeal of studying, it provides students to delve into many educational subjects. Therefore, this research aims to examine the perceptions among mathematics educators at the elementary level regarding the incorporation of programming into mathematics instruction. A comprehensive questionnaire had been used incorporating survey methodologies. The UTAUT2 questionnaire underwent translation, validation, and reliability testing. This survey involved the participation of 101 teachers from national schools, national type schools (Chinese), and national type schools (Tamil). The outcome of the research revealed that performance expectations, effort expectations, social influence, facility conditions, hedonic motivation, and behavioural intention significantly impacted the inclination of primary school mathematics teachers in Malaysia to incorporate programming into their mathematics instruction. The survey indicates that 79.2 per cent of mathematics teachers possess proficient and satisfactory abilities in using technology. Approximately 89.1 per cent of individuals possess the capability to incorporate STEM principles into the process of learning mathematics at a moderate to high competency level. Therefore, math educators in academic establishments possess grown technological skills and maintain a positive perspective regarding programming for mathematics education implementation.

Keywords: mathematics education, programming, primary school, UTAUT2 questionnaire.

Introduction

UNESCO's Sustainable Development Goal 4.4 is to enhance the skills of young people and adults in areas that pertain to employment, decent work, and entrepreneurship by 2030 (UNESCO Statistics, 2021). Today's young generation must possess skills and competence in various sectors through ICT skills or computer-related

activities. One of the ICT skills assessed is proficiency in writing programming languages to create a programme. The UNESCO report is concerned about the rapid advancement of technology, which brings both benefits and challenges. Several developing nations, particularly those in sub-Saharan Africa, are lacking fundamental infrastructure and amenities necessary for a good learning environment, such as internet connectivity, computers, and electrical access. Thus, that situation leads to the standard of learning instruction not evolving at the same rate as technology. On the same bargain, the percentage of Malaysian youth and adults who possess information and communication technology (ICT) proficiency between 2017 and 2019 is notably low in the areas of writing and utilising programming languages compared to other ICT skills (Department of Statistics Malaysia, 2020). In contrast to their proficiency in operating and configuring software, which stands at 47.4 per cent, a mere 12.4 per cent of Malaysian youth and adults possess the ability to construct programming code. This indicates that programming code creation proficiency among Malaysians is extremely poor. Indeed, it would not be an exaggeration to say that Malaysian youth and adults are predominantly consumers of software and programming, as opposed to inventors. This circumstance necessitates an immediate action plan to improve the current state of affairs to nurture more inventors while accomplishing the SDGs' target.

Theoretical Background

Programming as Educational Tools

Programming is considered a versatile educational tool. Programming has been incorporated into the curriculum of numerous academic disciplines, including music (Gazzano, 2023), science (Metcalf et al., 2019), English (Kazahaya, 2021), and mathematics (Ahmed et al., 2020). The incorporation occurs not just in higher education institutions but also in secondary, primary, and preschools. These integration endeavours are conducted to demonstrate the value of programming in empowering students' learning comprehension (Sáez-López et al., 2019), cognitive development, bolstering motivation (Minamide & Takemata, 2019), and enhancing students' self-efficacy (Coskunserce, 2023). Cognitive growth involves student problem-solving (Shinkai & Hayase, 2019), meta-cognitive (Daher et al., 2020), computational thinking (Minamide et al., 2020), logical thinking, and creative thinking (Bae & Jun, 2018). Programming-based learning teaches students to solve problems by decomposing complex issues into more manageable components (Scherer et al., 2019). Students must also examine the problem, and the pattern of possible solutions, and select the most practicable planning to solve the issue. Indirectly, this process of profound thought teaches students to reason and think critically. These opportunities foster students' imagination and enable them to generate innovative thoughts. Students who possess digital skills will result from the continuous development of these abilities, which will also foster a level of cognitive thinking maturity that can be leveraged as a career asset. Sjoberg et al. (2020) suggest that students' comprehension of a given concept can also be enhanced when cognitive development is evaluated through the lens of analytical thinking. By utilising programming as an educational instrument, one can effectively illustrate a concept. For instance, students can manipulate robots by applying precise mathematical equations. The coding creation will influence the robot's movement and provide a unique learning experience for students to investigate the cause and effect of certain configurations based on the problem.

Besides, students who participate in programming-based learning are perceived as being more engaged and actively involved (Pinto-Llorente et al., 2017). They gain opportunities to engage with learning materials in a tangible, visual, and conceptual sense through programming-based learning activities. Students could comprehend, retain, and develop a new concept through this opportunity. An in-depth comprehension of a particular concept will inspire and pique one's interest in further investigating related concepts. Programming-based learning is positively received by both high achievers and ordinary learners (Kong & Lin, 2022; Topali & Mikropoulos, 2023). Students consider learning through programming to be not only beneficial and easy but also spark an interest in learning. In addition, collaborative strategies for activity implementation are frequently combined with programming-based learning (Papavlasopoulou et al., 2019; Wei et al., 2021; Zakaria et al., 2022). Discussion can be facilitated among students through collaborative activities to either analyse the project or propose a feasible work plan. Both modes of discourse have the potential to enhance student engagement and facilitate a deeper understanding. Unplugged programming, visual programming, and textual programming have the potential to enhance kids' self-potential in learning, depending on the student's needs and the school's context. Unplugged programming is considered a favourable choice for educators and learners who face limitations in terms of infrastructure resources and technology (Humble et al., 2019). Visual programming serves as an effective tool for bridging the gap between theoretical concepts and practical application of programming languages, particularly for novice students in the field of programming (Panskyi et al., 2019). While textual programming may provide a challenge for young learners, mastering it provides an enhanced educational advantage (Rastovac et al., 2021).

Programming in Mathematical Learning

The potential for youth and adults to cultivate programming skills is viewed as extremely promising. This is due to the diligent efforts of the Malaysian Ministry of Education to ensure that every primary and secondary education possesses access to electricity, the internet, and computers. Moreover, computer facilities intended for educational objectives have been supplied to 88.8% of educational institutions (Department of Statistics Malaysia, 2020). The ministry is making every effort to equip primary and secondary school students with programming skills. Indeed, this endeavour commenced with the revision of primary and secondary school curricula. The curriculum of Design and Technology (RBT) in primary schools in Malaysia has been amended to include programming in Basic Computer Science (ASK) for secondary students beginning in 2020. The inclusion of the programming module in the primary school curriculum enables students to develop new programmes through the utilisation of programming features (DSKP RBT Year 5, 2019). Like Malaysia, several developing nations like England, Finland, and Hong Kong have opted to include programming in specific disciplines. However, Sweden decided to incorporate programming into mathematics lessons in basic and secondary schools (Skolverkat, 2022). In level one, the basics of programming are indirectly applied through well-structured and sequentially followed lessons on algebra. Then, in level 2, the construction of programming algorithms using visual programming was introduced. This integration intends to enhance mathematics understanding concepts by developing skills in using digital tools and programming. Programming not only enhances programming proficiency but also facilitates the application of fundamental mathematical

principles in dealing with problems (Kaufmann & Stenseth, 2021). Students who learn mathematics through programming activities demonstrate an apparent boost in their mathematical abilities when compared to those who engage in alternative learning activities (García-Perales & Palomares-Ruiz, 2020). Organising educational activities via programming, nevertheless, requires greater caution since this does not transpire automatically. The inability of educators to effectively address technical challenges, inadequate guidance, excessive focus on programming language exploration rather than mathematical concepts and working memory limitations will all hinder the potential of programming as an educational tool that promotes mathematical learning (Laurent et al., 2022).

Problem Statement

The OECD Programme for International Student Assessment (PISA) is a worldwide assessment that examines educational achievements across participating countries. Recently OECD report (2023) found that 41% of 15-year-old pupils in Malaysia demonstrated a minimum competency level of 2 in mathematics. To gain level 2, students must possess a proficient problem-solving approach for simple scenarios, the ability to extract basic information from data management or two-dimensional representation, and comprehension of functional relationships. Hence, the findings of this evaluation indirectly indicate that 59% of Malaysian students struggle to mathematically analyse and recognise a basic problematic situation without any guidance. This discovery proposes that Malaysian students struggle with complex daily problems, lack imaginative thinking and creativity, and have not mastered fundamental arithmetic skills. Meanwhile, the research conducted by Ling & Mahmud (2023) encompasses several limitations that students strive to solve mathematical problems involving sentences. These constraints emphasised inadequate language proficiency, which hinders students from comprehending the situation and failing to fully interpret the question's intent, as well as mathematical ignorance, which causes errors in selecting the appropriate strategy. Thus, critical thinking and problem-solving fundamentals are vital and must be developed in children from an early age (Ismail et al., 2023). Failure to adequately acquire this skill during schooling will impede the student's ability to realise his complete potential in life.

Additionally, students' fundamental knowledge, attitude, interest, and the instruction provided by their teachers are all contributing elements to the problem of low mathematics achievement (Abu & Leong, 2017; Jamian & Taha, 2020). A study conducted by Abd Karim et al. (2023) reveals that 35.5% of upper secondary school pupils in Malaysia experience mathematics insecurity. Other studies conducted by Kashefi et al. (2022) and Alias et al. (2023) demonstrated a correlation between students' problem-solving abilities and mathematics anxiety. Mathematics anxiety also hinders the development of students' problem-solving abilities. Ultimately, it is necessary to assist students in overcoming student anxiety and developing problem-solving abilities to prevent its recurrence. It is recommended that this initiative be initiated in primary schools. It is believed that the investigation of programming in mathematics education can enhance rational thought, problem-solving, and mathematical reasoning (Husain et al., 2017).

Research Objectives

Examining the practicality of incorporating programming into mathematics classrooms to foster CT and student motivation is the focus of this research. This will be accomplished by Scratch programming, which is one of the most user-friendly block-based language platforms available. The objective of the study is as follows.

- i. To measure the level of technology used among primary school mathematics teachers in their instruction.
- ii. To assess primary school teachers' level of programming knowledge and skills.
- iii. To evaluate primary school teachers' level of acceptability of using programming in mathematics instruction.

The research questions are conducted to answer the research objectives based on the three phases. Therefore, the study will answer the following research questions.

- i. How frequent is technology utilisation among primary school mathematics teachers in their instruction?
- ii. What level of programming expertise do primary school mathematics teachers have?
- iii. How do primary school mathematics teachers embrace the integration of programming in mathematics instruction?

Method

A needs analysis is the objective of this study. The objective of this need analysis is to determine the significance of developing instructional modules that incorporate programming to facilitate effective change. Using this constructive intervention, challenges will be identified, and initiatives can be coordinated to construct modules that cater to the requirements of the target audience. Identifying challenges or issues in every situation and validating the proposed solution is an essential procedure (McKillip, 2011). Therefore, after ascertaining the core needs, a suitable evaluation must assess the substantial concerns and select the most effective improvement. This study adopted McArdle (1991) needs analysis model, which outlines surveillance, investigation, analysis, and reporting as the main procedure. This method of analysis is appropriate for identifying the training requirements of teachers in schools. A comprehensive assessment of the teachers' instructional practices can be obtained from the final report of the need analysis. This report provides an overview of the current situation and identifies the specific training requirements. It also includes recommendations for intervention training and a well-structured plan for implementing and evaluating the training programme. The process of needs analysis commenced with surveillance of relevant papers to assess the key challenges in the acquisition of mathematical knowledge among primary school students. Subsequently, the optimal instruments have been determined for gathering data on teachers' acceptance to incorporating programming into mathematics instruction. Once the UTAUT2 questionnaire is chosen, it is subjected to a validation process conducted by field experts. Once authorised by the authorities, the questionnaire was disseminated to all research participants via their local district education offices. The acquired data was subjected to descriptive analysis and subsequently reported. Figure 1 illustrated the study procedure.

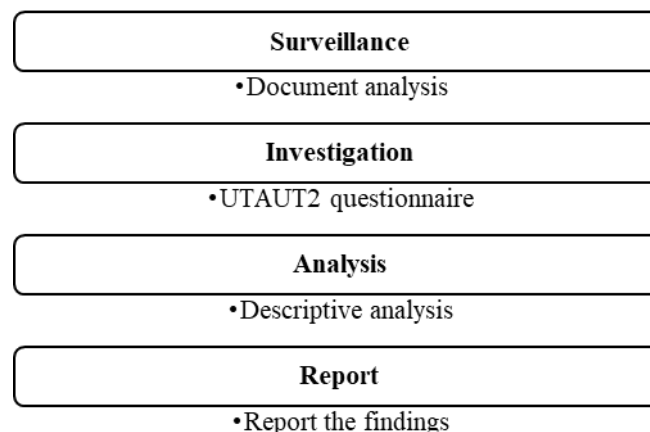

Figure 1. The Procedure of the Study

For the pilot test, this study utilised 30 mathematics primary school teachers to answer the questionnaire as Hertzog indicated that the sample size for the pilot study is between 10 and 40 individuals, which is enough to give a reliable estimation of the pilot study's objectives (Hertzog, 2008). Meanwhile, more than 100 mathematics primary school teachers needed to answer the questionnaire as proposed by Borg & Gall in survey research requires no fewer than 100 cases of sample size in each major sub-group and twenty to fifty in each minor sub-group (Borg & Gall, 1996). This study employed cluster sampling as a sampling technique. This technique is deemed more practical for obtaining a sample of mathematics primary school teachers because teachers throughout Malaysia have similar characteristics. They have received training in mathematics education at the Teacher Education Institute (IPG) or the Public Institute of Higher Education and underwent the requirements established by the Malaysian Ministry of Education. Therefore, generalisations can be made even though the study sample was drawn solely from mathematics teachers in primary schools in the northern zone.

Data Collection Tools

The UTAUT2 Questionnaire was employed in this study to assess the degree of acceptability of the research sample towards a specific technology (Venkatesh et al., 2012). This questionnaire utilises the UTAUT2 questionnaire, which has been translated into Malay by Md Zuber & Mansor (2023). This question consists of two components: part A, which pertains to demographic information, and part B, which pertains to the UTAUT2 questionnaire. The demographic question includes eight inquiries about gender, age, teaching experience in mathematics, frequency of technology use in mathematics instruction, confidence level in using technology for mathematics instruction, proficiency and knowledge in programming, ability to integrate STEM in mathematics instruction, and challenges encountered by teachers when utilising technology in the classroom. Performance expectations (4 items), effort expectations (4 items), social influence (3 items), facility conditions (4 items), hedonic motivation (2 items), and behavioural intention (2 items) are the six constructs assessed by the UTAUT2 questionnaire. The 7-point Likert scale had been used to measure items with a rating scale ranging from 'strongly agree' to 'strongly disagree'. To ensure that samples have the same knowledge of the terms,

definitions were provided for each term used. This questionnaire employed the term programming, which refers exclusively to unplugged programming and visual programming. The questionnaire was subsequently subjected to a process of validation and reliability.

Analysis

Demographic

The questionnaire was commenced by collecting demographic data, including gender, age, educational background, school category, and teaching experience. A total of 101 primary school mathematics teachers responded to this questionnaire, with 16.8 per cent being male teachers and 83.2 per cent being female teachers. Regarding age distribution, 45.5 per cent of teachers fall within the age range of 36-45 years, 38.6 per cent are 46 years old or over, 13.9 per cent are aged between 31-35 years, and a mere 2 per cent are below the age of 30. Most teachers, specifically 73.3 per cent, are from national schools, while 21.8 per cent are from Chinese national-type schools (SJKC), and only 5 per cent are from Tamil national-type schools (SJKT). Regarding teaching experience, 42.6 per cent of teachers have a tenure of over 20 years, 37.6 per cent have 11 to 20 years of experience, and 19.3 per cent have less than 10 years of experience.

Frequency in using technology.

Most teachers (31.7%) utilise technology in their teaching 2 or 3 times a week. This is followed by 22.8% who use it once a week, 16.8% who use it every day, 11.9% who use it once a month, 8.9% who use it 2 or 3 times a month, and just 7.9% who have never included technology into their educational activities.

Confidence in using technology.

Approximately 64.4% of the participants in the survey reported having a moderate to high level of confidence in using technology. Only 29.7% of individuals hold a moderate level of confidence in using technology, while an additional 6% possess low confidence.

Ability to integrate STEM in mathematics instruction.

42% of teachers are capable of effective STEM integration in the classroom. Even though 10% of the study sample lacks confidence or demonstrates a low level of ability in integrating STEM into learning, nearly half are at a moderate level.

Skill and knowledge in programming.

Regarding technological proficiency, a mere 2 percent acknowledged possessing highly proficient skills. Most of the study sample reported possessing moderate technological proficiency (42.6%), followed by good

proficiency at 36.6%. A minority of participants showed low or very low proficiency at 15.9%, while only 3% lacked confidence in utilising programming.

Challenges encountered by teachers when utilising technology in the classroom.

A significant proportion of teachers (64.8%) concurred that the primary limitations they faced were time management concerns about teacher functions and the distribution of instructional time for mathematical subjects. The subsequent factors cited include inadequate facilities, technicians, and training, which affects 57.7%, inadequate personal ICT tools for teachers (45.1%), students lacking basic computer proficiency (39.4%), teachers' inadequate knowledge of technology (31%), students being easily distracted while using technological tools (23.9%), and a lack of interest in technology usage among only 2.8% of students.

UTAUT2 Questionnaire

As part of the validation procedure, eight experts have endorsed each item in this questionnaire. During the reliability procedure, an internal consistency test was conducted on this questionnaire.

Performance expectancy.

The Cronbach's alpha value for performance expectancy is 0.975. This demonstrates a high reliability rate exceeding 0.90 as reported by Hopkins (1998), Konting (2005), Pallant (2010), and Sekaran & Bougle (2016). Table 1 exhibits a descriptive analysis of this construct.

Table 1. Descriptive Analysis of Performance Expectancy

Item	Mean	Standard Deviation	Skewness	Kurtosis
PE1	4.51	1.246	0.76	-.685
PE2	4.52	1.316	.133	-.583
PE3	4.47	1.331	-.054	.155
PE4	4.53	1.246	-.033	.169

Typically, this means near scale 5, which represents "moderately agree". The analytical results indicate that the mean values for PE1, PE2, PE3, and PE4 are 4.51, 4.52, 4.47, and 4.53, respectively. Typically, this refers to a rating of around 5 on the scale, which indicates a "moderately agree" response. Further, distribution kurtosis and skewness are approximately normal when they fall within the range of -1 to +1 (Mishra et al., 2019). Consequently, this data can be characterised as having a normal distribution.

Effort expectancy.

A Cronbach's alpha coefficient of 0.863 was calculated for the four effort expectation items. The items

comprising this construct are deemed satisfactory and acceptable, as indicated by this value (Ahmann & Glock, 1980; Sekaran & Bougle, 2016). The descriptive analysis for the effort expectancy construct is presented in Table 2.

Table 2. Descriptive Analysis of Effort Expectancy

Item	Mean	Standard Deviation	Skewness	Kurtosis
EE1	4.26	1.383	-.083	-.412
EE2	4.27	1.288	-.172	.044
EE3	4.27	1.370	.049	-.224
EE4	4.27	1.252	.064	.240

Usually, this indicates roughly on the fourth scale, indicating a "neutral" stance. The skewness and kurtosis values of the data fall within the range of -1 to +1, indicating that the data follows a normal distribution.

Social influence.

The obtained Cronbach's alpha value for social influence is 0.921. A descriptive analysis for each social influence item is presented in Table 3.

Table 3. Descriptive Analysis of Social Influence

Item	Mean	Standard Deviation	Skewness	Kurtosis
SI1	4.07	1.336	-.309	.073
SI2	4.28	1.350	-.198	-.015
SI3	4.35	1.389	-.464	.040

This generally signifies a value close to scale 4, which signifies "neutral". The data exhibit skewness and kurtosis values between -1 and +1, indicating that they follow a normal distribution.

Facilitating conditions.

The Cronbach's alpha value for the facilitating conditions is 0.913. Table 4 displays a descriptive analysis of all facilitating condition items.

Table 4. Descriptive Analysis of Facilitating Conditions

Item	Mean	Standard Deviation	Skewness	Kurtosis
FC1	4.08	1.419	.029	-.264
FC2	4.11	1.333	-.100	-.242
FC3	4.21	1.306	-.093	.203

FC4	4.47	1.375	-.350	.169
-----	------	-------	-------	------

This tends to indicate a value in proximity to scale 4, which is associated with the term "neutral". Despite FC1 and FC2 exhibiting a leptokurtic kurtosis graph and FC3 and FC4 displaying a platykurtic kurtosis graph, the data remains within the range of a normally distributed dataset.

Hedonic motivation.

A hedonic motivation Cronbach's alpha value of 0.883 was obtained. All facility condition items are described in detail in Table 5.

Table 5. Descriptive Analysis of Hedonic Motivation

Item	Mean	Standard Deviation	Skewness	Kurtosis
HM1	4.59	1.343	-.003	-.184
HM2	4.76	1.350	-.119	-.897

Usually, this refers to roughly level 5 on the scale, which signifies "moderately agree". Both the HM1 and HM2 data exhibit a minor left skewness in their distribution. Whilst the kurtosis graph indicates a slightly platykurtic distribution. However, it is important to note that the dataset still follows a normal distribution.

Behavioural intention.

A behavioural intention value of 0.956 for Cronbach's alpha was achieved. Each item pertaining to behavioural intention is elaborately described in Table 6.

Table 5. Descriptive Analysis of Behavioral Intention

Item	Mean	Standard Deviation	Skewness	Kurtosis
BI1	4.62	1.363	.109	-.515
BI2	4.63	1.347	.022	-.244

This typically corresponds to an impression of "moderately agree" at almost level 5. The skewness and kurtosis of BI1 and BI2 data generally shown normally distribution.

The Spearman Rho correlation coefficient is employed to define the association between the behavioural intention variable and all ordinal-scaled variables (Chua, 2022) in the UTAUT2 questionnaire. The correlation between each construct and the behavioural intention construct is presented in Table 6.

Table 6. Spearman Rho correlation coefficient

Construct

Performance Expectancy	Correlation Coefficient	.864**
	Sig. (2-tailed)	.000
Effort Expectancy	Correlation Coefficient	.759**
	Sig. (2-tailed)	.000
Social Influence	Correlation Coefficient	.722**
	Sig. (2-tailed)	.000
Facilitating Condition	Correlation Coefficient	.700**
	Sig. (2-tailed)	.000
Hedonic Motivation	Correlation Coefficient	.617**
	Sig. (2-tailed)	.000

** Correlation is significant at the 0.01 level (2-tailed)

In general, the correlation coefficient, denoted as r , exhibits a positive sign in the association between all variables and the behavioural intention variable. According to the results of the intercorrelation analysis, behavioural intention is strongly correlated with effort expectancy ($r = .759$), performance expectancy ($r = .864$), and social influence ($r = .722$). The strength of the correlation between hedonic motivation ($r = .617$) and facilitating condition ($r = .700$) is moderate.

Discussion

ICT was introduced into the curriculum in Malaysia, leading to the widespread use of technology in teaching among primary school mathematics teachers. 92.1 per cent of the survey sample have utilised technology in teaching in the classroom, while only 7.9 per cent have not used it at all. Indeed, 71.3 per cent utilise it often, both daily and weekly. Yao & Zhao (2022) demonstrated a comparable trend where 70% of Chinese mathematics teachers in Tianjia utilised technology for class preparation. This development is positive, and there are increased attempts to promote the adoption of this technology among mathematics teachers. Mathematics teachers have included technology in their lessons. Additionally, a notable correlation has been observed between the proficiency of teachers in technology and their implementation of technological tools in mathematics instruction (Bahador et al., 2017). Seven identified factors promote the utilisation of technology in the classroom. Perceived utility, perceived effect on student motivation, anxiety, enjoyment, self-efficacy, context dependence, and subjective nomenclature were enumerated by Wijnen et al. (2023) as elements that promote the implementation of technology in the classroom. In conjunction with the intrinsic motivation to utilise technology in the classroom, administration support significantly influences the attitude of primary school mathematics teachers towards technology integration in the classroom ($r = .0995$) (Ravendran & Daud, 2019).

Regarding their level of confidence in utilising technology in the classroom, 64.4% of the study participants reported feeling confident in doing so. An additional benefit amid adversity is that the COVID-19 pandemic has

significantly increased the number of mathematics teachers who are positive about incorporating technology into their lessons. Slightly lower in the mean confidence level when it comes to utilising technology in instruction compared to secondary school mathematics teachers, primary school mathematics teachers still exhibit a commendable level of confidence in this regard (Marpa, 2020). Erkin (2023) also discovered that mathematics teachers in Turkey possess a satisfactory level of confidence regarding the proficient utilisation of technology in the classroom and are capable of handling challenges of moderate intricacy. The findings demonstrate with high confidence teachers ought to remain diligent in addressing any challenges encountered.

Technology use is frequently linked with STEM. Aligned with the Malaysian curriculum's focus on enhancing Science, Technology, Engineering, and Mathematics (STEM) education for students at all levels of schooling, teachers in Malaysia have started incorporating STEM into their teaching practices. 42% of the study participants demonstrated proficiency in incorporating STEM concepts effectively into their mathematics classes. The study by Lau & Rosli (2020) revealed that while some mathematics teachers demonstrate moderate knowledge of using STEM in mathematics instruction, some of them still lack sufficient knowledge of mathematics software and other related software. In the same manner, findings of twenty empirical studies compiled by Abd Ghani et al. (2023) stated teachers have insufficient expertise in STEM education and require training programmes to enhance their skills and understanding of STEM.

Using technology for teaching in the classroom presents its obstacles. Participants identified time management, insufficient facilities, technicians, training, and personal technological devices as the primary problems they faced when using technology in the classroom. Perienen (2020b) found similar results. The highest average accuracy was achieved in the areas of technical support requirements, preloading learning software on computers, and providing a school timetable for integrating technology. Both findings indicate that teachers require specific time to organise learning activities and need technical support to incorporate technology in mathematics education. Besides, the research shows that even though teachers have a strong understanding of the subject matter and good ways of teaching, they still have challenges when it comes to utilising and integrating technology tools in the classroom (Patalinghug & Arnado, 2022).

Teachers serve as the primary cornerstone in the execution of an educational programme. Thus, gratifying and empowering the teacher to employ an instructional strategy will promote learning effectiveness. The overall proficiency of teachers in programming is deemed satisfactory, as indicated by the fact that 38.6% of teachers acknowledge possessing excellent or very good programming skills and knowledge. In contrast to the degree of teacher receptiveness regarding the implementation of programming in mathematics instruction, the average level of agreement among the study participants was moderate regarding behavioural intention, hedonic motivation, and performance expectation. Nevertheless, when considering effort expectation, social influence, and facilitating conditions, the data indicates a neutral stance regarding the implementation of programming in mathematics education.

This study has the potential to make a valuable contribution to the existing body of research on the adoption of

programming in primary school mathematics instructional materials. According to the findings of this research, performance expectation is the most influential factor in determining behavioural intention regarding the use of programming in mathematics education. Participants in the study opt to incorporate programming into mathematics instruction if doing so can enhance and optimise the learning process. Subsequently, social influence and effort expectancy all serve as catalysts for behavioural intention when programming is implemented in mathematics education. Likewise, the study by Russo et al. (2020) demonstrated that there is a positive correlation between teacher enjoyment with the teacher's attitude towards any challenge and willingness to devote additional time to the subject. In the face of any difficulties, teachers who possess an abundance of enthusiasm will exhibit a more optimistic manner. Even without successful fulfilment of a need or support from the administration, teachers will be motivated to persist in their pursuit of self-directed professional development (Koay, 2023). This illustrates that if programming in mathematics education is easily accessible, has significant benefits for enhancing teaching quality, and receives adequate emotional support, teachers are willing to incorporate programming into their mathematics instruction.

Nevertheless, the impact of facility condition and hedonic motivation on the research sample's tendency to utilise programming is very slight. Meanwhile, both construct it is not the primary barrier to learning through this programming. This is because every school is now furnished with computers. This computer is functional and comes with suitable programming applications like mBlock and Scratch. Plus, students can utilise this programme at home as it is provided free of charge. Hence, the primary obstacle encountered by these educators pertains to their proficiency in programming for mathematics instruction. To aid them in this endeavour, a comprehensive manual is required, supplemented by practical exercises and technical assistance (Szabo et al., 2019).

Conclusion

It is believed that incorporating programming into mathematics lessons helps students master the subject. Still, it is undeniable that mathematics education necessitates exceptional skills in lesson planning. Further, teachers are finding it more and more challenging to incorporate programming into mathematics lessons. Not only mathematical content knowledge is essential, but good programming abilities are also required of teachers for the implementation. Thus, teachers are more likely to be enthusiastic about incorporating programming into mathematics lessons when they find that it is assessable, effective in boosting productivity, has positive reinforcement from the community, has sufficient facilities, and is enjoyable to explore. Consequently, there is an immediate demand for optimal support that enables mathematics teachers to proficiently incorporate programming into their pedagogy.

These findings also suggest that even teachers are moderate level of programming expertise, they are prepared to include programming into their teaching. Hence, a mechanism must be established to facilitate these teachers with programming within the framework of mathematics education. This is because the programming typically

implemented in Malaysia is more focused on extracurricular education, engineering, Design and Technology subject for primary school, and Computer Science for secondary school. As a result, the application of programming in mathematics education necessitates a comprehensive module that serves as both an instructional aid for the instructor and an exploration platform for the students.

Recommendations

The present research was administered via an online platform to mathematics educators employed in urban public schools. Even though the teaching participants in this study were situated in a remarkably comparable environment, it was unfeasible to control for every variable associated with various schools or districts. Even certain educators may experience increased visibility because of adopting a more constructivist pedagogical approach in their classrooms. The perspectives of these educators may not be representative of educators in rural regions, where access to programming, facilities, and collaboration with technological distributors may be limited. One potential improvement for the study is to increase the number of participants and ensure that they are representative of a wider range of settings, including suburban and rural elementary school mathematics teachers. This is because students in diverse settings are better served by the holistic impact that is produced by the perspectives of educators who are diverse in nature. Teachers should also be provided with an extensive programming training module that can be tailored to cover a variety of topics. Assessing programming necessitates an extensive investment of time and considerable technical expertise. These teachers' enthusiasm to incorporate programming into the mathematics curriculum at the elementary school level must be rewarded with ongoing and extensive professional development. In addition to offering ongoing training, it is imperative to furnish teachers with a sharing platform and technical assistance resources to guarantee they consistently receive the support required to maintain this aspiration. All of this will encourage these elementary school mathematics teachers to explore and experiment as they attempt to develop an outstanding lesson.

Abstract: In recent decades, contaminants of emerging concern (CECs) have attracted significant attention worldwide. The CECs include fertilizers, medical substances, personal care products, and others that negatively

affect living organisms. Our recent research revealed that pharmaceuticals cannot be fully removed by municipal wastewater treatment plants. This leads to the release of the pharmaceuticals into the environment and its contamination. Since water shortage is a current global issue, finding efficient technologies for water reclamation is of high importance. Hence, membrane separation processes are known as the most efficient treatment methods, this work was dedicated to investigation of Aspirin (ASP), Carbamazepine (CBZ), and Sulfamethoxazole (SMX) removal by polymeric membranes. Individual and complex (two- and three-component) feed solutions were filtered through porous material, and removal capabilities were studied. The initial concentration of contaminants used in this study was equal to 3 mg/L, and HPLC was utilized to determine the concentration of the pharmaceuticals before and after filtration. The data obtained showed that interactions between the pharmaceuticals, i.e. synergistic effect, influence their retention by the membranes, and the efficiency of the treatment may reach 100%.

Keywords: Aspirin, Carbamazepine, Sulfamethoxazole, Membrane filtration, Synergistic effect

Introduction

The increasing presence of harmful contaminants of emerging concern (CECs) in water resources and the limitations of conventional wastewater treatment plants in removing them have become a global environmental concern (Carrera et al., 2019). The CECs are different toxic compounds and chemicals including personal care products, plasticizers, fertilizers, medical substances, different nanomaterials, and others that negatively affect living organisms (García-Fernández et al., 2021). The CECs have adverse health and environmental effects even at very small concentrations and could enter and accumulate inside the living organisms (Ahmad et al., 2018; García-Fernández et al., 2021).

Such materials or chemical compounds that are not regulated by law and could pose harm to the environment and human health; therefore, a technology used for water reclamation should be efficient and reliable while at the same time preventing the release of CECs into the environment. Pharmaceuticals are constantly consumed by humans and animals and can enter the environment via different pathways. For example, the improper disposal of pharmaceutical waste by households and hospitals leads to the release of the medical compounds into the water or soil systems (Kadam et al., 2016; Bound and Voulvoulis, 2005). Moreover, veterinary pharmaceuticals or supplements could enter the soil medium or surface waters through the excretion of animal urine and/or feces (Delgado et al., 2023). Environmental pollution with pharmaceuticals is a challenging concern as they have persistent characteristics and are not easily degraded naturally (Miarov, Tal, and Avisar,

2020).

Our recent research discovered that many of the medical substances cannot be completely removed by municipal wastewater treatment plants (WWTP) (Kamal et al., 2024). As a result, pharmaceuticals escape in WWTP effluents consequently entering the receiving environmental systems through different pathways and contaminating the environment. Many research investigations have indicated that medical drugs, their byproducts, and/or metabolites are detected in various water bodies globally including surface water, groundwater, tap water, and drinking water (Madikizela, Ncube, and Chimuka, 2020; Niemi et al., 2020; Pater et al., 2020; Perin et al., 2021). The persistent nature and small particle size of CECs discombobulate the efficiency of current treatment methods and higher contaminant retention is achieved by high pressure membrane treatment systems. Currently, the membrane separation techniques (MSTs) are recognized as one of the most efficient treatment technologies. Conventional polymeric membranes are widely utilized in MSTs and are a powerful tool for desalination, water treatment, reclamation of municipal and industrial wastewaters, etc. According to the literature, Aspirin (ASP), Carbamazepine (CBZ), and Sulfamethoxazole (SMX) are considered top-priority medical substances in many different countries based on ecotoxicological risk-based research investigation of their occurrence in influents and effluents of WWTPs and surface waters (Aubakirova, Beisenova, and Boxall, 2017). SMX is an antibiotic which is generally prescribed to treatment or prevention of infections and falls under the classification of drugs that are either non-biodegradable or challenging to break down and has high persistence in the environment (Xia et al., 2022). CBZ is categorized as an anticonvulsant medication and is also classified as a persistent compound with low water solubility (Hai et al., 2018). ASP, on the contrary, is a water soluble and biodegradable compound which is mainly used as analgesic and anti-inflammatory medication (Lotfy and Eiseb, 2010; Feng et al., 2013). ASP is commonly detected in water bodies and WWTPs in many countries (Agunbiade and Moodley, 2016; Satayeva et al., 2022).

This work focuses on the application of the different polymeric membranes - polycarbonate track etch (PCTE) and polyethersulfone (PES) membranes in removal of target pharmaceuticals via MST process. Individual and mixture of ASP, CBZ, and SMX solutions were selected as target pollutants.

Materials and Methods

Chemicals and materials

ASP standard ($MW=180.16 \text{ g mol}^{-1}$, analytical grade) was purchased from Merck, USA. CBZ ($MW=236.27 \text{ g mol}^{-1}$, $\geq 98\%$ purity) and SMX ($MW=253.28 \text{ g mol}^{-1}$, $\geq 98\%$ purity) of analytical grades were supplied by Sigma-Aldrich, USA. Acetonitrile (ACN) (high-performance liquid chromatography (HPLC) grade) was supplied by Fisher Scientific, USA. Aqueous solutions of target pollutants were prepared by using ultrapure water (UPW) from Millipore MilliQ Integral 5 purification system, USA.

Flat sheet PCTE with 10 nm pore size and PES with 200 kDa molecular weight cut-off (MWCO) membranes

were obtained from Sterlitech, USA.

Equipment

The Dionex UHPLC System (Thermo Scientific, USA) with an RS diode array detector (DAD) was utilized for the determination of pharmaceuticals in solutions. Chromatographic separations were performed on a Hypersil Gold C8 column with 150×2.1 mm dimensions. UPW was used in a mobile phase A and ACN was used in a mobile phase B. The column temperature was set to 25 °C on both left and right sides and the injection volume was set to 1 µL. All samples were filtered with Chromatofil cellulose acetate (CA) syringe filters with 0.2 µm pore size prior to the analysis.

SurPASS electrokinetic analyser (Anton Paar GmbH, Austria) was used to assess membranes' zeta potential.

The membranes' contact angle was measured using OCA 25 (DataPhysics Instruments GmbH, Germany) by standard sessile drop protocol.

Membrane filtration experiments were conducted using CF016 stainless steel cell with an active filtration area of 4 × 4 cm² supplied by Sterlitech, USA.

Filtration experiments

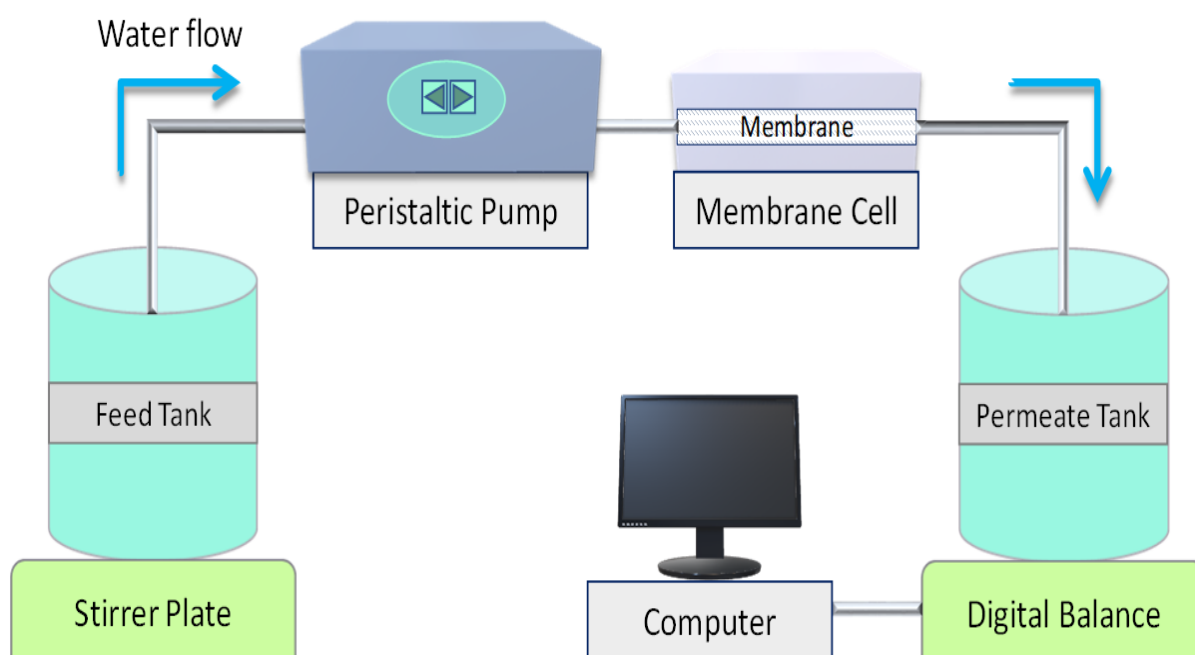

Figure 1. The lab-scale filtration set-up.

The feed solutions of ASP, CBZ and SMX were prepared by adding 3 mg of the individual medication to 1 L of UPW. Also, following combination of pharmaceuticals was prepared with 3 ppm of each drug concentration in 1L of UPW: ASP+CBZ; ASP+SMX; CBZ+SMX; and ASP+CBZ+SMX. The prepared feed solution was set on the stirrer plate allowing the continuous mixing and homogeneous solution throughout the process. The permeate tank was placed on the digital scale (OHAUS, USA) and data of the filtrate volume was collected every minute. The feed solution was pumped into the membrane cell with MasterFlex pump (Cole-Parmer L/S, USA). The lab-scale filtration set-up is illustrated in Figure 1.

Duration of the membrane filtration was 6 hours in all experiments and filtration was conducted with dead-end mode. The samples from feed and permeate solutions were collected for further analysis.

The removal of the pharmaceuticals was calculated with Equation [1]:

$$\text{Removal (in \%)} = (C_{\text{feed}} / C_{\text{perm}}) / C_{\text{feed}} \times 100\% \quad \text{Eq. [1]}$$

where C_{perm} is the drug concentration in permeate (ppm or mg/L) and C_{feed} is the pharmaceutical concentration in feed solution (ppm or mg/L).

Results and Discussion

The collected samples of permeate were analysed with the HPLC equipment for presence of the studied pharmaceuticals. The detailed results of ASP removal are presented in Figure 2.

Figure 2. Removal of ASP by PCTE and PES polymeric membranes.

The results analysis shows that PCTE membranes overall demonstrate higher removal values of pharmaceutical substances compared to PES membranes. The absolute elimination of ASP drug was achieved in ASP+SMX combination for both polymeric membranes. Also, filtration of individual ASP in UPW demonstrated excellent results with 97.15% and 89.98% drug removal values for PCTE and PES membranes, respectively. While the lowest ASP removal was in ASP+CBZ drugs combination for PES membrane filtration with only 3.23% drug removal result. The average removal values of ASP with PCTE membrane were 75.12% and with PES membrane removal value dropped to 50.31%.

The results of CBZ removal are presented in Figure 3.

Figure 3. Removal of CBZ by PCTE and PES polymeric membranes.

For CBZ individual pharmaceutical removal, the results were 61.08% and 17.01% for PCTE and PES membranes, respectively. The highest CBZ removal of 87.97% was acquired with PCTE membrane in ASP+CBZ drug combination and the lowest removal – 8.51% was obtained in the mixture of all three drugs by PES membrane. The average removal values of CBZ with PCTE membrane were 62.63% and with removal by PES was 18.96%.

SMX removal results are demonstrated in Figure 4. The SMX removal in combination with ASP showed very contrasted results, with 100% removal with PCTE membrane and no removal with PES membrane. Moreover, PES membrane demonstrated very poor removal of SMX in all individual and drug combinations within 0–32.51% range. The lowest SMX removal with PCTE membrane was individual drug in UPW with 39.06%

removal. The average removal values of SMX with PES and PCTE membranes were 13.28% and 55.71%, respectively.

Figure 4. Removal of SMX by PCTE and PES polymeric membranes.

Hydrophobicity/philicity of the membranes was assessed via the contact angle tests. For instance, contact angle measured for PCTE and PES membranes consisted 75 ° and 90 °, respectively. Membranes' charge as function of pH was studied for both membranes. The zeta potential experiments showed that at neutral pH (pH of the feed solutions) the membranes are possessing the similar zeta potential values, i.e. around – 20 - (– 30) mV.

From Figure 2-4 it can be seen that the average observed for ASP (by both membranes) and SMX (by PCTE) when the feed contained ASP+SMX. In comparison to ASP and SMX, 100% removal of CBZ was not achieved in all the experiments. Zero retention was observed for SMX by PES membrane. The rejection lower than 10% was found for ASP (ASP+CBZ, ASP+SMX+CBZ), SMX (CBZ+SMX) and CBZ (ASP+SMX+CBZ).retention values of ASP and CBZ were higher than for SMX. For example, the average removal for ASP by PCTE and PES membranes was 75.12% and 50.31%, respectively. The average retention of CBZ consisted 62.63% and 18.96% (by PCTE and PES filter). On the other hand, the capability of both polymeric membranes in SMX removal was the lowest based on the average values of the pharmaceutical removal (55.71% by PCTE and 13.28% by PES membranes). 100% rejection was

Each experiment performed demonstrated its unique rejection value, which indicates that the removal of the drugs was affected by the presence of second and/or third pharmaceutical in the feed. PCTE demonstrated

higher removal values than PES membrane for all three pharmaceuticals. Also, average retention values observed for ASP and CBZ were higher than for SMX. To understand removal mechanisms of the pharmaceuticals, the size exclusion, charge and hydrophilic interactions were considered.

All pollutants used in this study have a molecular weight lower than the pore size of both membranes, i.e. 10 nm and 200 kDa. Assuming interactions between the drugs and simply summing their molecular weights, we can see the calculated values do not exceed 10 nm and 200 kDa. Also, it should be indicated that the membrane with the smaller pore size (PCTE) exhibited better retention for all three drugs.

The zeta potential experiments illustrated that both filters have similar negative charge (around -25 mV at neutral pH). According to Levakov et al., ASP and SMX are negatively charged at neutral pH, while CBZ is neutral (2022). Keeping it in mind, it can be speculated that negative drug/s are possibly interacting with the neutral one and this influences the rejection.

The contact angle measured for PCTE and PES membranes (75° vs 90°) indicated higher hydrophobic nature of PES filter. On the other hand, Das et al., reported the following hydrophobic order for the studied medicines: CBZ (most hydrophobic), ASP, SMX (2017). Comparing hydrophobicity/phility results with the data presented in Figures 2-4 it can be seen that the hydrophilic filter demonstrated improved retentions. Along with that, presence of most hydrophilic drug, SMX, led to reduced removal values in majority of experiments. These findings can be explained by the stronger attraction of hydrophobic drugs to the porous materials made of polymer (Verliefde et al., 2009).

Conclusion

The experiments performed in the frame of this study showed synergistic removal (equal to 100%) of ASP and SMX when both pharmaceuticals are present in the feed (ASP+SMX). Better CBZ removal was observed for ASP+CBZ (88%) in comparison to the feed that contained CBZ only (61%). In all other cases the rejection of the individual pharmaceutical was higher or equal to rejection of the complex feed solution. From the data obtained it is also obvious that the presence of the second and/or third medicine in the feed may improve or reduce retention capability of the membranes. Based on the explanations provided in this paper, it is believed that all three mechanisms (size exclusion, charge and hydrophobic interactions) are involved while the complex feed solutions are applied to PES and PCTE membranes. Possible interactions between membrane and drugs, and between pharmaceuticals require further investigation, while PES and PCTE membranes demonstrated a potential in the removal of medicinal substances.

Abstract: The aim of this paper, through a literature review, is to discuss the heuristic potential of the concept of *authentizotic* organisation as a healthy organisation that balances personal and professional life, which provides a positive meaning for the actors involved in organisations, enabling the fostering of trust in the psychological contract. This results in a motivating organisational climate for the members of the organisation due to this positive sense of belonging and, consequently, the tendency for their performance to improve. To achieve this goal, the leadership must design its trust action in a decisive way, considering the internal and external characteristics of the organisation in question. However, the ideal authentic organisation does not exist at any given time and/or space. It is a process in constant (re)construction, whose dynamic cannot be the pure happiness of the organisation's members without considering the need to constantly adapt to the internal and external context, thus enabling its sustainable development.

Keywords: Authentic organisation, Trust, Organisation, Authentic climates, Sense of belonging

Introduction

The social object organisation, at first glance, refers to formalised and hierarchical human groups aiming to

ensure the cooperation and coordination of its members in the fulfilment of certain goals (Friedberg, 1992). We can understand the organisation as being

[...] a complex collective unit with a formal dimension and an informal dimension in which there is interaction between (individual and collective) actors with at least a minimum of coordination and reciprocal expectations that employ more or less different roles in the pursuit of goals set internally (not necessary with the same degree of internal sharing) and generally recognised externally (which are not necessarily the internal goals) influencing and being influenced by the environment, producing for it, over time, characteristics that are both specific and dynamic (Serpa, 2016, p. 3258).

Therefore, an organisation/company is not just an economically rational organisation, a legal entity that creates products and services with the aim of making a profit; it also includes the social, political and cultural aspects related to its activity. In addition to its capacity for action, a company also has the capacity to create its own identity. The company cannot just be seen as a place for producing goods and services but can also be seen as a place for social and cultural production, identity and the integration of individuals and groups (Sainsaulieu, 1987). The worker is no longer seen merely as an instrument of production but as an actor, in other words, an active being with the capacity to intervene (Sainsaulieu, 1987). This perspective focuses on analysing the relationship between companies and society as a whole, defining them simultaneously as a place of production, an organisation and an institution, respectively in three dimensions: the economic, the social and the symbolic (Thuderoz, 1997). These dimensions cannot be dissociated or hierarchised (Parente, 2005).

Given the high relevance of organisations/companies in modern societies, Kets de Vries (2001) wonders which are the best companies to work for. The author believes that these companies are those in which employees trust the people they work for, take pride in what they do and enjoy working with others. Kets de Vries (2001) classifies these types of companies as authentic organisations. *Authenticizotic* is a neologism resulting from the combination of two Greek terms: *authentikos* and *zotikos*. The first means that the organisation is authentic and trustworthy. The second means that it is “vital to people’s lives”, giving them a sense of balance, personal fulfilment, competence, autonomy and initiative, providing meaning to their lives (Kets de Vries, 2001). The author bases authentic organisations as healthy organisations on the following assumption: “Work, however, does not necessarily need to be stressful. On the contrary, work can be an anchor of psychological well-being, a way of establishing identity and maintaining self-esteem” (Kets de Vries, 2001, p. 101), in a certain comparison and even reconciliation between the health of the healthy individual and this type of organisation (Nenev  et al., 2018) (Table 1).

Table 1. Healthier people characteristics

1.	Stable sense of identity
2.	Good at reality testing
3.	Take responsibility for own actions
4.	Strong sense of self-efficacy

-
5. Motivated to self-reflect
 6. Creative, with a sense of playfulness
 7. Positive outlook
 8. Passionate about what they do
 9. Manage anxiety well
 10. Able to deal with dependency & separation issues
 11. Can cope with setbacks & disappointments
 12. See people in a balanced way
 13. Sense of belonging & community
 14. Keen to establish & cultivate relationships
-

The aim of this paper, through a literature review, is to discuss the heuristic potential of the *authentizotic* organisation construct, as a model of a healthy coordinated collective unit that balances personal and professional life, which provides a positive meaning for the actors involved in organisations, making it possible to foster trust in the psychological contract. This results in a motivating organisational climate for the members of the organisation due to this positive feeling of belonging and, consequently, the tendency for their performance to improve.

Methods

The methodology followed seeks to understand authentic organisations as a model of coordinated collective unity. To this end, a bibliographic search was carried out in the following databases: the B-ON of the Foundation for Science and Technology (FCT) in Portugal, an electronic resources library that includes electronic scientific information databases such as Web of Knowledge, DOAJ, SCIELO, and institutional repositories (<https://www.b-on.pt/>) and Scilit, which collates information referenced in CrossRef and PubMed (<https://www.scilit.net/>). A search was carried out between 26 and 27 January 2024, by searching the following expression in the title, abstract or as a keyword: “Authentizotic”. This online bibliographic search was supplemented by the collection of complementary bibliographic material directly related to this topic.

Authentizotic organisations

What are they?

“The ‘Authentizotic Organisation’ refers to the best place to work. It is the most favorite and attractive organisation for employees compared to its peers” (Abdelkawi et al., 2023, p. 53). *Authentizotic* organisations are, thus, “organisations in which people feel truly alive” (Kets de Vries, 2004, p. 183) This concept was coined in 2001 by Kets de Vries, who later sustained that

Organisations that cultivate and honour the above meta-values are what I like to call ‘authentizotic’, a

label that melds the Greek words *authentikos* (authentic) and *zotikos* (vital to life). In its broadest sense, that first part of the label, authentic, describes something that conforms to fact and is therefore worthy of trust and reliance. As a workplace label, authenticity implies that an organisation has a compelling connective quality for its employees in its vision, mission, culture, and structure. [...] The *zotikos* (vital to life) element of the authentic organisation refers to those aspects of the workplace that give people the sense of flow mentioned earlier and help build a sense of personal wholeness, making people feel complete and alive (Kets de Vries, 2004, p. 199).

These *authentic* organisations would then allow for a confident balance between personal, family and professional life in the organisation (Rego & Cunha, 2004, 2006; Rego & Souto, 2004; Rego et al., 2012; Kets de Vries, 2001, 2011a, 2018; Cunha et al., 2005; Seco & Lopes, 2013; Nenevė et al., 2018), fostering organisational commitment as “[...] the psychological bond that characterises the individual’s attachment to the organisation” (Rego & Souto, 2004, p. 33), and ultimately increasing their performance in the organisation (Seco & Lopes, 2013; Rego & Cunha, 2006, 2008; Cunha et al., 2007) (Table 2).

Table 2. Underlying features the distinguish authentic organisations

1. They have a compelling mission	Everyone understands and signs up to. A values-based mission statement makes employees feel like they're part of something bigger, beyond the daily routine. Each understands the role he or she plays in achieving that mission.
2. The organisation’s culture and practices are aligned with the values they espouse	These values are embraced at all levels-they are part of the ‘organisation’s DNA’.
3. Employees trust the people they work with and for	The culture of trust goes both ways: employees implicitly trust their leaders to make the right decisions, while leaders trust employees to put the organisation’s needs first as they interact with various stakeholders.
4. Leadership is not a solo act but a team sport	People help and support each other. Politics are inevitable in any organisation, but political dynamics are minimal in authentic ones. Internal competition and individualistic thinking are sidelined in favour of collaboration, thereby creating an enriching place to work.
5. The work environment emphasises high-quality day-to-day relationships	Employees enjoy working together and have fun. From a mental health perspective, it is obvious that if people get along with those they work with-they like and respect them-they derive a sense of belonging.
6. Fair process – the perception of a level playing-field for all	Fair pay and benefits are fundamental components of this, but equally important is the feeling that the leadership cares and is interested in employees’ well-being.

7. People feel that they are listened to	Employees feel that they have a voice, and that their input is valued. The leadership creates a culture that is participatory-one where people can speak up and criticise without fear of reprisals, and where top management shares information with employees.
8. A culture of recognition	Efforts never go unappreciated and praise flows generously. Conversely, recognising employees for their personal or team achievements creates a more meaningful experience. When people feel appreciated, higher levels of engagement and retention result.
9. Ongoing opportunities and incentives to develop and grow	Leaders recognise that people inherently want to be challenged so they can acquire new skills and go out of their way to provide opportunities to accelerate their personal growth. Management makes a concerted effort to figure out ways to unlock each employee's potential, knowing that it will benefit both the individual and the organisation.
10. Leaders really make a difference	Top management walks the talk- they embrace and exemplify its values and goals, setting the direction in a way that can be described as 'true north'. They ensure that everyone in the organisation is treated with respect and care.
11. Information is shared	Leadership ensures that communication and transparency are engendered at every level: communication flows upward, downward, and laterally. Putting transparent information systems in place helps employees to make more informed decisions.
12. Leadership realises that people have a life outside of work	Taking a holistic, long-term perspective, they acknowledge the importance of work/life balance. They go to great lengths to avoid employee burnout. This positively impacts organisational loyalty and commitment, making for a sustainable psychological contract between employer and employee.

Source: Based on Kets de Vries, 2018.

Leadership and the psychological contract

These types of organisations make it possible to maintain the psychological contract (Kets de Vries & Balazs, 1999a, 1999b; Kets de Vries, 2001), which "[...] implies mutual obligations and commitments (explicit and implicit) between the employees and the organisation" (Kets de Vries & Balazs, 1999a, p. 656), which is crucial for the establishment and maintenance of the organisation's climate (Kets de Vries, 2011a). Table 3 details the features of *authentizotic* climates within organisations.

Table 3. *Authentizotic* climates

1. Spirit of camaraderie is the degree to which interpersonal relationships in the organisation are characterised by friendship, team spirit, and mutual concern.

2. Trust and credibility of the leaders represents the degree to which leaders are trustful, fulfil their promises, and are honest.
3. Open and frank communication with the leaders is the degree to which employees feel free to communicate openly with the leaders and to show disagreement with them.
4. Opportunities for learning and personal development are the degree to which employees feel that they can learn continuously and perform tasks that contribute towards developing their potential.
5. Fairness/justice is the degree to which people feel that favouritism, discrimination, and inequity in distributing outcomes does not exist.
6. Work-family conciliation is the degree to which the organisation creates conditions for employees to reconcile their work and family lives.

Source: Table produced according to Rego, and Pina e Cunha, 2012, with reference to Rego and Cunha (2008).

In multiple publications, Kets de Vries stresses the crucial importance of organisational leadership in collaborating towards the emergence and development of authentic qualities (Kets de Vries, 2001, 2004, 2011a, 2011b, 2017, 2018; Kets de Vries & Balazs, 1999a, 1999b). However, these processes are not easy or simple to substantiate (Ketz de Vries & Balazs, 1999a, 1999b; Seco & Lopes, 2013; Rego & Cunha, 2006; Rego & Pina e Cunha, 2012; Barbosa et al., 2021; Serpa et al., 2020).

To build authentic psychological climates and healthy organisations, managers must care about how employees perceive the organisation, paying attention to a number of aspects: (a) a respectful and trustful way of acting; (b) opportunities for employee learning and personal development; (c) the degree to which they treat employees as people in search of meaningful work; (d) the honesty and frankness they place in relating to subordinates; (e) strategies they develop to facilitate work-family balance; (f) ways they promote spirit of camaraderie and teamwork and (g) the fairness in their decisions involving promotions and rewards (Rego, & Cunha, 2008, p. 749).

Trust is crucial in this process of moving towards a more sustainable organisational development (Serpa & Sá, 2022; Ketz de Vries, 2001, 2017, 2018), inasmuch that

The main ingredient that makes for an authentic organisation is trust. When trust is part of the organisational culture, people are more confident and more productive and the organisation becomes a vibrant, networked web, connecting people up and down the hierarchy. If there is such a thing as a magic recipe for trust, it may simply be that each individual treats other people as they would like to be treated Ketz de Vries, 2018, p. 9).

Table 4. Realities translated by the different meanings that work environments provide to its members in multiple dimensions

1. A sense of purpose created by leaders for people by designing a future perspective and a culture for the organisation to contribute to a group identity.

2. Sense of self-determination, meaning that employees perceive themselves as masters of their destiny, in control of their lives, not just passive or considered as mere characters without their own identity in the organisation.
3. Psychological climate in which affective well-being prevails.
4. Sense of impact, favouring the members of the organisation having the feeling that their actions effectively influence the life of the organisation.
5. Sense of competence, on the assumption that there is a sense of possibility among individuals for growth and personal development through the organisation. The organisation fosters continuous learning that enhances individual creativity and eliminates feelings of frustration over career stagnation.
6. Sense of belonging, in the sense that people feel inserted in the organisational community. This bond forms the basis of trust and mutual respect.
7. Sense of pleasure and joy, on the assumption that organisational life is run by people who promote and encourage a happy environment, as an influx to the mental health of individuals, from which imagination, innovation and their assertiveness emerge.
8. Sense of meaning, on the assumption that people feel motivated to put their creativity at the service of work, perceiving themselves as involved, focused on the work they do in the organisation.

Analysis and implications

Several authors highlight three very important aspects to consider: 1. There is no ideal authentic organisation, in any context or at any time, and the local conditions and concrete constraints must be addressed on a case-by-case basis (Cunha et al., 2005); 2. As a corollary to the previous point, there is no magic recipe for developing authentic organisations (Cunha et al., 2005; Kets de Vries, 2018); and 3., as Pina e Cunha et al. (2014) point out, “The relevance granted to positivity also does not mean that negative phenomena (e.g., pessimism, negative emotions) are necessarily dysfunctional. Above a certain level, the effect of the positivity ratio can be perverse” (p. 323).

Also, other issues and shortcomings could be raised about the concept, the model, and its broader use. Some sort of glass ceilings are present on Kets de Vries’ concept that need to be shattered without refusing the importance of what the author addresses and the real need for authentic organisations. First, the concept and dimensions of the human motivation for work implied in the Kets de Vries’ model need further discussion. Second, a more developed and problematised discussion about the specifics of the work, job and tasks performed by individuals and their role in their motivations needs a deeper analysis. Third, all the macro perspective on the understanding of life, meaning and structure of work organisations also needs attention. Finally, there is the need for some reflection on the nemesis of authenticity and alienation, both from a psychological and a societal perspective and

addressing their manifestations on individuals and in given societies' logics. These issues need more discussion in the conclusions.

Even the scope of authenticity in work should address issues that go beyond the present *authentizotic* organisation concept, discussing what could be authentic but also what should be addressed to discuss authenticity. So, we proposed four ways of enhancing the discussion and the feasibility of an authentic work experience and organisations that actively contribute to it.

Firstly, a contextualisation and relativisation of the weight and importance that the factors identified as essential for an *authentizotic* organisation – and linked to organisational relationships and practices and human motivations – have on the choices and lives of everyone, marked by individual and social differences. For example, a less generalised and decontextualised reflection should be carried out on the meaning and importance that the tasks to perform, the significance of work for identity construction and self-esteem, and interpersonal relationships have for each person and/or social or socio-professional group. The dimensions equated by Kets de Vries strongly refer to the psychosocial dimensions of Herzberg's two-factor theories – hygiene and motivational (Cunha et al., 2007; Herzberg, 1968) and McGregor's Theory X and Y (McGregor, 1960). However, as is the case with these authors, the proposed dimensions need to be relativised and, above all, need to consider how different individuals and socio-cultural and socio-economic factors shape the different weight and divergent reading that each person or group will normally make of these dimensions or needs. They also fail to consider the sociological and social normality of the divergence of interests and diversity of positions and perspectives and the resulting conflict between people and groups in the context of work, and how this divergence and multiplicity are structuring factors in and for organisational life and its social configuration (see, for example, what Sainsaulieu (1977, 1997) says about identity, subcultures and conflicts).

Secondly, it is important to reflect more deeply on the meaning of work and its existential dimension in building an authentic life. There is the need to equate what Dejours (2012) advocates about living work, ethical suffering, the relationship between work and the construction of a social bond, and the power to constitute a profoundly subjective experience beyond utility in the field of reflection, on the relationship between work, moral subjectivity, identity, individuality and culture and civilisation. Dejours (2012) warns us of the need to understand the complex relationship between suffering, violence, alienation at work and the existing or predominant culture. In other words, what the author calls the relationship between the psychodynamics of work and mental health and suffering (Dejours, 2012). Therefore, the centrality of living labour, which is "[...] what the subject must add to the prescriptions in order to achieve their objectives", requires an in-depth analysis of what "[...] subjective commitment to the task" consists of (Dejours, 2012, p. 365). As the author sustains,

At the end of the day, each new configuration of the real found in work calls for the formation of new skills that the worker did not have until then. In this way, work, understood as production work – *poiesis* – in order to be of quality, summons subjectivity to its most intimate foundations, namely the

body, the place of subjective experience [...]. To work is not only to produce, it is also to transform oneself (Dejours, 2012, p. 366).

Thus, “[...] work is not reduced to an activity, it implies dimensions that have to do more properly with action in the sense that Aristotle (1992) gives to the concept of praxis: morally just action” (Dejours, 2012, p. 368).

Similarly, the proposals of Hackman and Oldham’s (1974) model of Job Characteristics and Herzberg’s Job Enrichment (Cunha et al., 2007; Herzberg, 1968) can be used here to emphasise the importance of the specific nature of the work done and the skills that can be mobilised, increased and enhanced, and how this contributes to a more authentic experience. In other words, increased meaning, autonomy, responsibility, control and information at work, which tends to produce positive psychological states and greater commitment, performance and internal motivation. However, the same authors recognise the need to relativise the linear application of their models by acknowledging the existence of moderating factors related to individual and contextual differences.

Next, there is the need to discuss the macro dimension of looking at organisations and their members, which is practically absent in Kets de Vries. In fact, one cannot discuss the typologies of organisations without this perspective, analysing the organisations themselves, their structures and their environment (Miner, 2002). Likewise, the individuals involved cannot be viewed atomistically and only from a psychological angle; they are social actors with varied collective identities and their discourses and practices reflect this (Ferraz, 2018). That means understanding the human behaviour of employees and managers within contemporary organisations, understood as social constructions (Ferraz, 2018).

This implies analysing the organisational structure in terms of functions, hierarchy and communication, the type of good or service they produce and how they do it, the different internal and external social actors and their identity logics and interests, the subcultures present, the logics of power and authority, the specific nature of existing discourses, ideologies and mentalities, and the way of dealing with conflict and diversity. Similarly, this macro view implies analysing the environment and its complex relationship with the organisation, such as defining and identifying the different *stakeholders* and their interests and perspectives, the economic and technological context, the ideological discourses on economic models and the logic of how organisations operate, and the power relationships between organisational players, sanctioned and legitimised by societal logics and legal determinations.

Another important element in understanding the meaning and authenticity of people’s actions involves understanding that organisations are characterised by a game that takes place between different subcultures – professional, functional, hierarchical and others – and which is crossed by internal and external power relationships and negotiation (Sainsaulieu, 1977, 1997). Such a game can produce a peculiar form of socialisation and organisational continuity that is not aligned with the need to impose a homogeneous and tension-free corporate culture, as sometimes seems to follow from one of the dimensions proposed by Kets de

Vries (2018). In other words, the organisation builds its identity in this multiplicity of processes and actors with different conceptualisations of identity (personal, social and organisational) that do not always coincide, a dynamic plurality that is reconfigured and in tension due to organisational fluidity (Tavares, 2001).

This congruence of values between the individual and the organisation is based on the dynamic and not tension-free combination of the three aforementioned identities, giving it a plural configuration (Tavares, 2001). In this way, the alignment of values envisaged by Kets de Vries (2018) for an authentic organisation cannot ignore its possible plurality or its frequent and normal negotiated tension.

Finally, a more complex reflection on alienation (the ever-present brother-enemy of authenticity) and the complementarity, overlap or difference between alienation from a sociological perspective and alienation from a psychological or even psychosocial perspective would be pertinent. In other words, to also discuss what authenticity is as it is associated with issues of human autonomy, control, dignity, critical capacity and self-reflexivity and its relationship with the societal configuration, its ideologies and existing power structures. And this cannot be considered a secondary issue, not least because one of the central social institutions in our world is private enterprise, along with a hegemonic tendency for the discourse of corporatisation to invade all spheres of human life, even intimacy and physical and mental well-being. A world in which we have become hyperactive individuals, disconnected from social ties, obsessed with income, productivity and the quantifiable usefulness of our actions in all dimensions of our lives (Byung-Chul, 2014, 2019).

Conclusion

As has been shown, *authentizotic* organisations seek to foster a balance between the individual and the organisation by giving meaning to work (Rego & Souto, 2004; Rego & Pina e Cunha, 2012; Potocan, 2021; Polowczyk, 2017; Kets de Vries, 2001). This results in a motivating organisational climate for the members of the organisation due to this positive feeling of belonging, increasing the psychological contract and improving the organisational climate, consequently improving their respective performance. To achieve this goal, leadership needs to foster and demonstrate trustworthiness, bearing in mind the need to consider the internal and external characteristics of the context of the organisation in question, and there is no such thing as an authentically perfect organisation at any given time and/or space.

In short, there is no ideal *authentizotic* organisation at any given time and/or space. This is a process in permanent (re)construction. There will always be conflicts in organisations, which can sometimes be essential for their progress. *Authentizotic* organisations and the discourses about what matters and why also reflect and participate in the societal environment and their logics. This whole framework needs to be considered if organisations are to be minimally prepared to develop their capacity to respond in an increasingly digitalised society that also fosters balanced social, economic and environmental development (Serpa et al., 2022; Medne & Lapina, 2019). This is a process in permanent (re)construction whose dynamic cannot be the pure happiness

of the organisation's members without considering the need to constantly adapt to the internal and external context and thus enable its sustainable development.

Abstract: This paper aims to critically analyse the relationship between Sociology and Social Work, helping to demonstrate the need for a fruitful and enriching dialogue between these two scientific areas. To attain this goal, a documentary analysis was carried out and the authors' experience as sociologists was mobilised, putting forth, as an example, some potential contributions of the *sociological imagination* as a significant heuristic tool for both Sociology and Social Work. Interdisciplinarity between Social Work and Sociology, in which each scientific discipline maintains its specific identity, is one of the paths to be promoted that could also contribute to the scientific and professional legitimisation of each of these scientific areas. It is suggested that *sociological portraits* be mobilised in the analysis of the configurations of the scientific areas of Sociology and Social Work in Portugal, favouring the interdependent articulation of the science, training and profession components and thus collaborating in the definition, implementation and evaluation of better-informed social interventions, which, consequently, have higher potential to be successful and increasingly efficient in promoting social justice and equity.

Keywords: Interdisciplinarity, Social Work, Sociological imagination, Sociological portraits, Sociology

Introduction

In various discursive records produced by multiple actors within the Social Sciences, the tense, sometimes oppositional relationship between Sociology and Social Work is highlighted. Sociology is presented as being focused on science and theorising the frameworks and constraints of Social Work, while Social Work is

presented as being focused on the application of knowledge and the practice of the Social Work profession (Kelly & Stanley, 2012). In this type of argument, Sociology is deemed the best example of Social Sciences, inasmuch that it would be in a better position to understand and analyse the multidimensionality of social reality in an integrated way, making it possible to overcome the individualistic or naturalistic limitations of professional common sense in explaining social phenomena (Caria et al., 2013). Social Work would be the best example of the application of Social Sciences because it would be able to overcome the existing artificial and abstract disciplinary divisions, and social workers would have the best training to integrate different scientific and disciplinary knowledge from Social Sciences and to know how to operationalise them in the field (Caria et al., 2013).

In a very pertinent summary of the relationship between Social Work and other Social Sciences, López Rodríguez, and Torralba Roselló (2020) sustain that Social Work is based on various theoretical corpuses from different Social Sciences disciplines, namely Anthropology, Psychology, Sociology, and Economics, among others. These influences had a greater or lesser impact depending on the place, historical moment and country in which Social Work developed. Paradoxically, the relationship between Social Work and Sociology, despite the fact that in both scientific areas inequalities and diversity take centre stage and focus on social action to understand the human condition in context (Kelly & Stanley, 2012; Davies, 2023), this relationship has often been distant and flexible (Ahmed-Mohamed, 2011; Charron, 2014; Levin et al., 2015; Shaw, 2020). Sociology has often assumed a supposed scientific superiority that materialises in Sociology questioning Social Work, while Social Work is not perceived as questioning Sociology (Davies, 2023; Shaw, 2020).

Sociology, as a science that takes a specific stance of social reality, producing plural theoretical topics, formulating research problems in the context of these topics, and developing methodological strategies that guide empirical research (Ferreira & Serpa, 2017), has always been multi-paradigmatic and methodologically eclectic (Babalola & Nwanzu, 2021; Sebele-Mpofu, 2020; Serpa & Ferreira, 2020). Sociology is considered to have focused on broad epistemological frameworks that cut across the Social Sciences, while Social Work has specialised in social intervention (Ahmed-Mohamed, 2011). However, this position does not imply a clear separation between these two disciplinary areas, articulated around the binomial of know-how. However, in general terms, it could be considered that, for Sociology, the theoretical component is more relevant than applying that theory to solve specific social problems (Ahmed-Mohamed, 2011).

This accentuated separation between these two scientific and professional areas can also be seen as a lack of consensus in Portugal. There are more and more sociologists who work together with social workers, carrying out social work in non-academic activities; and, at the same time, there are more and more social workers who carry out activities with academic purposes when they combine their teaching activity in Social Work training with research activity not directly linked to the effectiveness of professional intervention. As a result of this progressive coexistence, these two scientific and professional areas seem to be increasingly in direct competition in the labour market (Caria et al., 2013). It is in this context that this paper aims to critically analyse the relationship between Sociology and Social Work, aim at contributing to a fruitful and enriching dialogue

between these two scientific disciplines.

Method

This paper seeks to contribute to the discussion of the relationship between Sociology and Social Work. It favours a reasoned reflection based on the authors' experience of teaching in higher education and participating in academic management activities (carried out by one of the authors) in Bachelor's and Master's degree programmes within these two scientific areas under analysis in the Portuguese context. The method used in this paper has an intensive nature. The aim is to understand the many components that characterise this process of dialogue between Sociology and Social Work.

This investigation favoured the document analysis technique, developed from different types of documental sources produced for some purpose. They can be understood as a way of contextualising information and are analysed as methodologically developed communicative devices for producing versions of events (Flick, 2005). To do this, documents found in two large bibliographic databases were selected and analysed: *B-ON* (The Online Knowledge Library, which is widely used in teaching and research institutions in Portugal and provides access to scholarly texts, such as published papers, but also access to repositories of Master's dissertations, doctoral theses and research reports) and *SCILIT* (a platform that aggregates all scholarly publications with a DOI [Digital Object Identifier]).

Sociology and Social Work

A possible definition of Social Work as a profession from 2014 by the *International Federation of Social Workers* emphasises that "Social work is a practice-based profession and an academic discipline that promotes social change and development, social cohesion, and the empowerment and liberation of people". Social workplaces its theoretical and methodological foundations within the framework of the Social and Human Sciences, ultimately seeking to promote social cohesion and the empowerment of people through social justice (Mareková, 2021), implying a critical reflection of its action (Wu & Greig, 2022). Social Work, therefore, develops empirical studies in various areas (Table 1).

Table 1. Areas into which Empirical Studies of Social Work can be Hypothetically Divided

1. Emotional experiences and resilience	Studies the reality of human existential suffering: how a shared sense of fragility/vulnerability can be understood and represented. It studies how the associated suffering becomes energy, the capacity for resistance, seriousness and responsibility for one's own lives (care).
---	--

2. Coping and recovery	Studies the dynamics of coping actions that start from the aforementioned internal suffering: how the care of individual subjects engages the care of others and structures the caring associated.
3. Development of experiential competences	Studies how the experience of a deep shared (relational) confrontation develops in common people significant existential capabilities (human ability to help) also of a para-professional nature (natural helpers or experts by experience).
4. Validation / standardisation of professional methods	Concerns the scientific corroboration of professional methods used by social operators, without reference (or with weak reference) to this or that context of use.
5. Evaluation of professional interventions	Studies the empirical evaluation of interventions carried out and already implemented professional practices or projects (including Social Work Education), with particular reference to the satisfaction of the recipient/involved subjects.
6. Analysis of best practices and effectiveness factors	Studies the optimal ingredients and the particular organisation or the master idea that has guided the realisation of practices that are unquestionably considered (or following a scientific evaluation of which point e) are successful (good practices) or even the best ones (best practices).
7. Wellbeing and competences of the practitioners	Studies social professions within existing welfare systems (developed or emerging): how professional social workers or welfare managers live and organise their daily work within services (workloads, training, experiences and stress borne, acquired or missing skills, relations with the management, etc.).

For its part, Sociology aims to advance a reliable and verifiable corpus of scientific knowledge based on research and contribute to improving the global human condition (International Sociological Association, 2001). Sociology, like all the other Social Sciences, is a multi-paradigmatic science crossed by distinct theoretical configurations that are partly overlapping and partly contradictory. Empirical research is based on different paradigms that retain areas of specificity and can produce rival results and explanations of the reality they analyse. Sociology seeks to bridge the gap between macro-social dynamics and local processes. This allows for the linking of subjective meanings with social practices and promotes a focus on the interaction between systems and actors, structures and practices, and the material conditions of existence and social construction of reality, and, by collaborating in this demystification of the established social order, Sociology serves as both a scientific representation and a critical practice in the social domain (Serpa & Ferreira, 2019).

We believe that there are no radical differences between Sociology and Social Work as scientific areas, as “Sociology and Social Work [are] born in the same cradle” (Dunk-West & Verity, 2016, p. 6), provided that we do not exaggerate the division of labour dichotomy, for example, in a radical distinction between “science v art;

theory v practice; research v theory” (Kelly & Stanley, 2012, p. 337), which could potentially harm these Social Sciences (Armstrong, 2014). Thus, it is important to reconfigure the theory/practice dichotomy, acknowledging and conceptualising the existence of a duality between the symbolic-deductive processes and knowledge that guide the analysis of reality and the practical-intuitive processes and knowledge that guide social intervention, both of which contain theory and practice simultaneously (Caria et al., 2013).

Within the symbolic-deductive domain of Social Work, it would be possible to create conditions to overcome the dualisms between Sociology-science and Social Work-profession (Caria et al., 2013). To this end, it would be necessary to consider that, in both professional activities, there are different ways of using theory. In research, the processes of interaction with people are determined by the production of knowledge on a more general scale; in Social Work, the processes of intervention with people, on a micro-scale, shape the general knowledge that can be used (Caria et al., 2013). This equation of the relationship between scientific theory and professional practice would have two consequences. On the one hand, it would allow us to move away from a conceptualisation of professional work that reduces it to the activity of the symbolic analyst and expert by considering that social interaction with service users is an integral part of the professionalisation of Sociology and Social Sciences in general (Caria, 2011; Caria et al., 2013). On the other hand, the skills that can be learnt through the use of theory in research do not function decontextualised from scientific knowledge when they are used in a professional situation, as there are no skills without knowledge (Caria et al., 2013; Perrenoud, 2001). To summarise, social theory can have a dual use, professional and/or academic, which is not equivalent in either case. In academia, theory aims to produce and validate new knowledge about the reality of Social Work, with activity in the field being ancillary and auxiliary. In the profession, social theory favours knowing how to act in the field, with the ancillary and auxiliary activity of knowing how to apply the knowledge already produced (Caria et al., 2013).

When analysing social reality, these Social Sciences can mobilise different levels or scales of analysis: macro, meso and micro. Sociological analysis focuses on three types of social relationships – relationships of interaction (micro); relationships of group constitution (meso); and relationships of systemic interdependence (macro) – which can be defined as, respectively, intersubjective relationships and relationships between individual acts (micro); relationships of coordination and, possibly, stabilisation of interactively combined acts, and relations between collective actors and collective acts (meso); and relationships between properties of relationships between people and between groups (macro) (Pires, 2014). Social Work, at the micro level, focuses on service users, namely individuals, families or small groups; at the meso level, it focuses on strategies involving particular groups of actors at the agency and community levels; at the macro level, it focuses on the formulation of general policies and the development of intervention programmes (Conrad-Amlicke, 2024; Wu & Greig, 2022).

In this process of analysing social reality, interdisciplinarity – implying more intense collaboration, involving the dissolution of disciplinary boundaries from the definition of the problem to methodological options – is crucial (Ahmed-Mohamed, 2011; Sá & Serpa, 2022) and even necessary for Sociology and Social Work,

although this process is not easy given that the oppositional relationships between these Social Sciences continue to shape the cognitive evaluations of these academics and professionals (Frost, 2015; Stanley & Kelly, 2010). Emphasising the relationship between theory and practice in Social Work training can be seen as an epistemic act, i.e., a way of rethinking the construction of knowledge in this scientific area and addressing otherness. Debating the role of the diversity of theoretical perspectives, to which Sociology has contributed and which have been more present in teaching, is an opportunity for the discipline of Social Work to rethink its analyses and interventions (López Rodríguez & Torralba Roselló, 2020).

Social problems and the sociological imagination

Social Sciences, in particular Sociology and Social work, enhance the understanding of social situations, providing self-knowledge and subsequently enabling groups and individuals to change the conditions of their lives and to address and manage social problems in a given historical and social context. A social problem usually refers to something that affects a group or a category of people and raises questions in a wider circle, beyond the individual (Santos, 1999; Serpa & Miguel Ferreira, 2018). The process of producing any problem should be analysed as a social phenomenon because it involves a set of actors and social relationships that the process implies, and as a discursive and conceptual phenomenon because questions of the form of discourses and concepts are relevant (Santos, 1999). Analysing the genesis of a social problem refers to the Social Work carried out around what has become a specific social problem. This work includes political pressure, the progressive formalisation of discourses and the legitimisation of the problem itself as a social issue accepted as existing and relevant and as the starting point for legitimate political and social action programmes (Santos, 1999).

A social problem is not just the result of society's malfunctioning but presupposes real work carried out in and by society or at least by some of its components, which includes two essential stages: acknowledging and legitimising the problem as such. On the one hand, its recognition: making a particular situation visible, making it *worthy of attention*, presupposes the action of socially interested groups to produce a new category of perception of the social world to act on it. On the other hand, its legitimisation: this is not necessarily induced by the simple public recognition of the problem but presupposes a real promotional operation to insert it into the field of social concerns of the moment. In short, in addition to these objective transformations, without which the problem would not be considered, there is the specific work of public enunciation and formulation, i.e., a mobilisation operation (Lenoir, 1989).

One of the essential stages in the constitution of a problem as a social problem is precisely its recognition as such by State bodies. Thus, State recognition makes it possible for certain problems with a more individual dimension to be transformed into social problems that require collective solutions. These solutions are almost always devised by *experts*. As this is a challenge with multiple dimensions, above all economic but also professional and moral, analysing the official recognition of social problems reveals at least two forms of legitimisation that combine and reinforce each other: recognition by senior public administration officials and

recognition by *experts* (Larson, 1977; Rodrigues, 1997).

But for a problem to take the form of a social problem, it is not enough for it to find agents who are socially recognised as competent to examine its nature and propose acceptable solutions; it will be necessary to impose this problem on the stage of public debates, and its publicisation in a public sphere. A public sphere emerges when certain social forces, who want to influence the decisions of the authorities, form a public that uses its reason to legitimise some of its demands in this forum (Mozzicafreddo, 1985). Therefore, the theoretical foundation for informed action is crucial if it is to be successful and not fragmented in solving complex social problems (Mareková, 2021; Armstrong, 2014; Ahmed-Mohamed, 2011; Farmer, 2014; Kelly & Stanley, 2012; Dunk-West & Verity, 2016) (Table 2).

Table 2. Demonstrations of the History of Applied Social Research

- (1) Almost any question as regards the relationship between theory, research and practice has been raised and discussed within different contexts throughout history.
- (2) The relationship between social research and political decisions is complicated. You may never expect political decisions to follow recommendations unambiguously.
- (3) Over time, social research will contribute to the change of political frames of reference and their conception of social phenomenon and political philosophy, partly as a support to current social movements. However, it will end up integrating results from social research in an unpredictable and sometimes astonishing way.
- (4) Throughout its history, Applied Social Theory has been influenced by political mainstream discourses in its scope, its basic understanding of its role and its choice of methods and designs. One has to acknowledge and be aware of this influence.
- (5) Recent discussions on evidence-based practice and practice research include elements that may be traced back to former discussions within applied social research. It is urgent to consider the strands of these discussions if we do not want to “do it all over again”.

Source: Table designed according to Høgsbro, 2015, S67.

Power relationships (Schmitz & Hamann, 2022) tend to shape ideological discourses that are always present in the definition of so-called social problems and which also tend to have a collective and not purely individual dimension (Kelly & Stanley, 2012) in the constitution of the object of intervention (Serpa & Miguel Ferreira, 2018; Ferreira & Serpa, 2021). Therefore, social structures and forms of social interaction that shape contemporary societies can only be explained by considering the coordinates of time and place in their historicity and the socio-historical contexts into which they are integrated, contrary to the naturalisation of certain structures, actions and meanings (Serpa & Ferreira, 2019).

Although ideologies and practical knowledge are ways of rationalising the world and classifying it, i.e., instruments of social cohesion and tension, all scientific disciplines are subject to the influence of symbolic-ideological elements (Silva, 1986). Ideology is a concept with multiple meanings, which Ferrarotti (2021)

summarises as detailed in Table 3.

Table 3. Ideology

- | |
|---|
| <p>(a) ideology as a relatively coherent body of beliefs about the various aspects of society, that is, as a cultural system and a guide for policy;</p> <p>(b) as lore or pre-scientific knowledge, imbued with ethical common-sense implications for behaviour;</p> <p>(c) as an activist aspiration offering a sense of direction for group-behaviour;</p> <p>(d) as a “false” or “mystified” consciousness related to practical economic interests;</p> <p>(e) as a non-scientific theory;</p> <p>(f) as a rationalisation of the <i>status quo</i>;</p> <p>(g) as a doctrinaire dogmatic design to change the existing social and political situation.</p> |
|---|

Source: Table drawn up according to Ferrarotti, 2021, p. 17.

Ideology can be seen as a system of representations, the central core of which is composed of a system of legitimisation, guiding the actions of a given group and justifying its historical insertion (Javeau, 1998). This demonstrates the need to mobilise the *sociological imagination* (Mills, 2000) to see beyond the obvious (Ferreira & Serpa, 2017), focusing on the interdependent relationships between the micro, meso and macro analytical levels (Farmer, 2014; Nissen, 2013; Stanley & Kelly, 2010; Kelly & Stanley, 2012), articulating Anthropology, History and Sociology and promoting the analysis of probable futures when aiming to understand and manage social problems. This is due to the fact that the *sociological imagination* allows “its possessor to understand the larger historical scene in terms of its meaning for the inner life and the external career of a variety of individuals. It enables him to take into account how individuals, in the welter of their daily experience, often become falsely conscious of their social positions” (Mills, 2000, p. 5).

Sociology and Social Work focus on social problems, social structure, social integration and how individuals think and act, simultaneously moulded by cultural and structural possibilities and constraints. The static-dynamic, structure-action, and diachronic-synchronic dichotomies could be equated, and their effects limited, if the heuristic and conceptual potential of the process were favoured. The process can be seen as the imbrication between action and structure, characterised by openness, sequentiality and cumulativeness, given that the past informs the present and the present shapes the future, considering the conditions and possibilities created by previous events (Ferreira & Serpa, 2021).

Components of Sociology and Social Work – Science, Training, Profession: Sociological Portraits

This point suggests a procedure for analysing the configurations of the scientific areas of Sociology and Social Work in Portugal, favouring the interdependent articulation of the science, training and profession components. In the science component, Sociology and Social Work (whether in their introductory or general dimension or their specialised dimension) are recognised, to a greater or lesser extent, as scientific disciplines that take a

specific view of social reality by elaborating plural theoretical problems, formulating research problems in the context of these problems and constructing sets of principles, theories, methodical strategies and crucial results that serve as models or guidelines for research (Costa, 2004). This component can be considered the main basis from which the Sociology/Social Work as training and Sociology/Social Work as profession components develop. In the training component, in the training models and practices that are articulated with the science and profession components, various elements are relevant and can be analysed, such as the structure of the courses and curricular units, the programmes of the curricular units, the qualifications and skills of the teachers, and the teaching/learning activities developed (Costa, 2004). The profession component emphasises the diversity of professional roles and practices, the processes of constitution of the actors who carry out activities in an academic and/or business context as a professional group, their forms of professional association, and the models of professional culture (Costa, 2004).

The analysis of this process favours *sociological portraits*, an original proposal by Bernard Lahire. Lahire's proposal is shaped by a view of "multi-socialised and multi-determined actors" (Amândio, 2014, p. 47), with necessarily plural dispositions (to act and to believe) resulting from great heterogeneity, variety and multiplicity of socialisation processes and inter-individual and intra-individual variations in behaviour. Lahire highlights the increasingly heterogeneous complexity resulting from multiple, early and potentially varied socialisation processes (Lahire, 2001b, 2005, 2007, 2019; Lima Junior & Massi, 2015; Rodrigues, 2018).

This sociological framework shapes *sociological portraits* as unique sociologically constructed configurations comparing different portraits (Lahire, 1994, 2002b), thus valuing the internal dynamics of situations in contextualised interdependent relationships, identifying the multiple interactions of causes and effects (Lahire, 1995). This methodological device of *sociological portraits* (Davet & Venera, 2021; Lima Junior & Massi, 2015; Nunes et al., 2016; Lopes, 2012; Lopes et al., 2016) aims to rescue a double plurality in individual trajectories: on the one hand, the plurality of internal dispositions, considering their genesis, unequal strength and systematicity; on the other hand, the contextual, external plurality associated with the multiplicity of processes, agencies and contexts of socialisation or ways of life (Lopes et al., 2015). Of the potential of sociological portraits (Atkinson, 2020; Amândio, 2014; Alves, 2016; Meier, 2003; Lopes et al., 2018; Gomes et al., 2014), it should be emphasised that

Sociological portraits arise as a methodological device capable of capturing a double plurality in individual trajectories: on the one hand, the plurality of internal dispositions, considering their origin, unequal "strength" and systematicity; and, on the other hand, the plurality of contexts, as an external factor, associated with the multiplicity of processes, agencies and socialisation contexts or ways of life (Gomes et al., 2015, p. 1).

But how are *sociological portraits* drawn up? The methodological device of the sociological portrait requires complexity in its elaboration and analysis. In drawing up sociological portraits, the accounts of the individuals themselves through in-depth interviews are central (Nunes et al., 2016; Lahire, 2002b), in the form of a semi-directive biographical interview (Lopes, 2012; Machado, 2019) through a vertical and a horizontal reading

(Maia, 2021), with the aim of objectifying subjectivity (Lima Junior & Massi, 2015).

Lopes (2012), in an attempt to update Lahire's proposal for drawing up sociological portraits, indicates six stages in the composition of the sociological portrait device: 1. Designing a semi-directive interview guide of a biographical nature, suited to the objectives of the research and covering various spheres of life deemed relevant; 2. Conducting two to three interviews, preferably a few days or a week apart, encouraging reflexivity; 3. Transcribing the interviews; 4. Editing the interviews, transforming them into a fluid discourse in the interviewee's first-person; 5. In a back and forth between theoretical resources and empirical material, the portrait is constructed by interpreting the information; and 6. Indicating an interpretative title for each portrait, a summary and a main body (Lopes, 2012, Lopes, et al, 2018; Gomes et al, 2014; Costa & Lopes, 2009) (Table 4).

Conclusion

This paper aimed to critically analyse the relationship between Sociology and Social Work to foster a fruitful and enriching dialogue between these two scientific areas. One of the dimensions of this dialogue is the relevant role that these Social Sciences can play in understanding social situations, providing self-knowledge and enabling the various actors to change the conditions of their lives and participate in the equation and

management of social problems in a given social-historical context.

Interdisciplinarity between Social Work and Sociology, in which each maintains its specific identity, is one of the paths to be promoted that could contribute to legitimising the scientific and professional position of each of these Social Sciences. Kelly and Stanley (2012) sustain that “Bridging this gap may be critical to the longevity of both disciplines and finding ways to come together to do so it seems would be productive” (p. 335), as well as developing holistic interventions in an informed way and consequently with a greater chance of success, with effectiveness but also efficiency, in old and new inequalities (Sá & Serpa, 2022) in the promotion of social justice and equity (Wu & Greig, 2022).

Various reflections on the importance of interdisciplinarity in higher education training (cf. Shandas & Brown, 2016) highlight a framework based on three dimensions: *pedagogical* (implying the learning of an investigative logic centred on the study of a problem from various perspectives; *programmatic* (involving the implementation of a curriculum that focuses on problem-solving to promote an interdisciplinary perspective); and *institutional* (organisational and stakeholder support in promoting this logic, functioning as an interdisciplinary community with high heuristic capacity) (Shandas & Brown, 2016).

Abstract: Social differences and social inequalities are often confused concepts. However, it is important to understand the difference between these two concepts, as it has relevant implications for how we think about society and the social relationships produced and reproduced in a societal context. This paper seeks to help clarify the distinction between social differences and inequalities. To this end, a methodology of collecting, selecting and analysing various documents related to this subject was applied. The results of the analysis allow to conclude that social inequalities are differences (natural or constructed characteristics or variations that distinguish individuals from each other) that have negative consequences for individuals and social groups. The distinction between social differences and inequalities is important because it helps to understand the causes and consequences of inequalities. Social differences are inherent to the human condition, but social inequalities are created by society. In conclusion, differences become inequalities with the socially constructed and reconstructed reading that associates these characteristics with negative aspects. This understanding of the distinction between social differences and inequalities in the causes and consequences of social inequalities is essential for promoting social justice.

Keywords: Social differences, Social inequalities, Social justice, Inequalities, Inequities

Introduction

Social differences and social inequalities are concepts that are often confused. However, it is important to understand the distinction between these two concepts, as it has relevant implications for how we think about society and the social relationships produced and reproduced in a societal context. Social differences cannot be directly and linearly associated with social inequalities (Lahire, 2008; Costa, 2019), insofar that inequalities are a socially constructed classification. It is therefore essential to make an explicit distinction between differences and inequalities (Zhang et al., 2022; Hofbauer, 2011; Barros, 2018). This is the starting point of this paper.

In analysing this distinction, Rousseau's (2021) position on the origin and foundations of inequality, conceiving two forms of inequality, one natural and the other moral or political, can be considered a relevant contribution. Natural inequality, which can currently be understood as a dimension of difference, expresses differences in age, health, strength of body and qualities of spirit. Another dimension, absent in this reflection by the author, would regard the types of cultural differences characteristic of certain societies. Moral or political inequality, which depends on a kind of convention established or authorised by the consent of men, would be at the origin of the unequal distribution of privileges, namely wealth and power (Rousseau, 2021).

Human beings are different from each other and live in societies that are themselves unequal and differentiated (Barros, 2018). However, it must be realised that "[...] not all differences can be interpreted in terms of social inequality, nor do they systematically produce a feeling of injustice" (Lahire, 2008, p. 1). Inequalities can be seen as differences that are perceived as unfair (Serpa, 2020; Zhang et al., 2022) in the legitimacy of the desirability of objects of various kinds (Lahire, 2008), which is a central element. So, to a certain extent, inequalities do not respect the proposal of Rawls (1971) of social justice as an equitable distribution of rights, duties, opportunities and social conditions by social institutions that guarantee "justice as fairness".

Social inequalities do not simply express social differences between groups or populations with different lifestyles or specific cultures. The different behaviours of various social groups and cultural differences are not in themselves social inequalities, insofar as these differences are not expressed in terms of more or less resources, goods or opportunities, in terms of advantages and disadvantages, or in the form of social hierarchies (Machado, 2015), nor are social inequalities differences in individual talents, abilities and performances. If individual talents, abilities and performances are socially rewarded differently according to their rarity or merit, we will be dealing with individuals with different amounts of resources. But these are not social inequalities, given that this difference in resources is not the result of any unequal social mechanism independent of individual actions (Machado, 2015).

Social inequalities are systematic and persistent differences in access to goods, resources and opportunities between individuals, social groups or even entire populations (Machado, 2015). To this first element of definition can be added a second element that stipulates differences in access to goods, resources and

opportunities as evidence that exist independently of individuals' talents, abilities and performances. There are individuals and groups with outstanding talents, abilities and performances who will have little access to these goods, resources and opportunities, and other individuals and groups who "[...] have wide access to them without having outstanding talents or abilities or without having particularly meritorious performances" (Machado, 2015, p. 2).

A difference can be horizontal, without anyone being above or below, better or worse; an inequality is always vertical and involves hierarchy. Differences are a categorisation. An inequality is not just a categorisation, it is something that violates a moral norm of equality between human beings, although it does not presuppose any norm of complete equality; it indicates a difference that is too great and/or takes an unjust direction. For a difference to become an inequality, it must also be extinguishable. Inequalities are hierarchical, avoidable and morally unjustified differences (Therborn, 2006).

Methods

The method used in this article is of an intensive nature. The aim is to understand the various implications inherent in the distinction between social differences and social inequalities. Documentary analysis was the technique favoured in this investigation, developed from different types of documentary sources. In a documentary study, documents can be understood as "means of communication", produced with some purpose and for some end. They can be understood as a way of contextualising information, being analysed as methodologically developed communicative devices for producing versions of events (Flick, 2005).

Documents found in two large bibliographic databases were selected and analysed: B-ON (The Online Knowledge Library, which is widely used in teaching and research institutions in Portugal and provides access to scholarly texts, such as published papers, but also access to repositories of master's dissertations, doctoral theses and research reports) and SCILIT (a centralised platform that aggregates scholarly publications with DOI [Digital Object Identifier]). In these two bibliographic databases, the document collection focussed on the results of advanced searches, in which the keywords "social differences" and "social inequalities" were combined, namely in reference databases and full-text bibliographic databases.

Social differences and inequalities

When trying to analyse the various societies and social relationships that are produced and reproduced in a societal context, it becomes clear that they are characterised by different types of differences and inequalities. Various types of differences can be listed, such as ethnicity, sex, gender, age, nationality, behaviour, occupation, beliefs, forms of religiosity, bodily specificities, culture, and tastes, among others. Differences are inherent in the human world and the natural world. In general, the existence of differences of all kinds cannot be avoided through human action. The presence of differences in the social world is associated with the very diversity that

makes up human beings as a whole, whether in terms of personal or so-called natural characteristics, or external characteristics (Barros, 2018).

Hence the importance of locating differences suggested by Bottero and Irwin (2003), who sustain that

A productive direction here is to engage with its variability across diverse contexts, both contemporary contexts and changing historical contexts. To do so adequately requires that we move outside the terms of difference and work with a more general perspective. With such a perspective we can analyse difference partly in terms of overt values and commitments: as claims. However, such a focus also needs to be matched by the analysis of implicit assumptions and norms, as they are embedded in social interaction and in practical engagements with the social world (p. 466).

The study of a different society and the various types of differences cannot be carried out without conceptualising the difference as a relationship. This requires establishing a field of differences (Rowland, 1987). Each culture is defined by the differential deviation (Lévi-Strauss, 1952) vis-à-vis others, and the conceptualisation of difference as a system of differences in space and time makes it possible to establish the terms of comparison between different societies or cultures (Rowland, 1987).

The analysis of the types of cultural differences that characterise contemporary societies can be done on the basis of a guiding principle composed of two logics. The first logic is that cultural difference is “first”; it has a certain historical thickness, and its members seek to maintain, reproduce and defend it. The starting point for analysing cultural difference is based on its existence at a given moment, as embodied by actors who claim to have a past, a memory. In the second logic, difference is constructed, new or renewed, “second”, and therefore of the order of invention (Wieviorka, 2002, p.131).

But not all differences can be interpreted in terms of social inequality, nor do they systematically produce a feeling of injustice. Multiple cases can be mentioned, and differences in objects, practices and competences can be considered of little value, or even devalued, from the point of view of the most commonly shared collective beliefs (Lahire, 2008). The socially differentiated distribution of technical competences in a given field does not produce injustice or social inequality, inasmuch that “[...] our institutions and our collective beliefs have not made these specific competences primary attributes, nor have they made the lack/absence of these competences an intolerable flaw or an unbearable ‘socio-cultural handicap’” (Lahire, 2008, p. 2).

Furthermore, if differences are inevitable and desirable, one can imagine that they are perceived and valued socially and are less and less marked by inequalities. For this reason, social struggles are generally not aimed at abolishing differences but at trying to suppress or minimise inequalities (Barros, 2018).

Social Inequalities: Socially Constructed Differences

The social construction of differences can contribute to the production and reproduction of inequalities. Let us consider two examples: the first centres on the process of interethnic classification developed by the inhabitants of Yaxcabá (Iacutan State, Mexico), who, based on a supposed cultural difference, produce social, economic and symbolic inequalities. These inhabitants differentiate themselves ethnically by using surnames associated with their Mayan or Spanish ancestry. This system of interethnic categorisation is used to explain and justify discriminatory practices on the part of the inhabitants of Yaxcabá who claim to have Spanish origin, as opposed to other members of the community who are identified as having indigenous origin. These discriminatory practices express a complex social organisation between family groups, which links and opposes different collective identities, “essentialised” and stigmatised that establish unequal social positions and prestige among the inhabitants of Yaxcabá (Pérez Ruiz, 2021, p. 283). Difference is used in two ways:

[...] first, to construct the borders between one identity and another; second, to hide social, economic, and political inequalities within the population. This reveals one of the characteristics, or perversions, of identitarian strategies or politics: constructing and manipulating difference to justify itself (Pérez Ruiz, 2021, p. 299).

Another example relates to the categorisation of tuberculosis as a contagious disease and its implications for the configuration of socially differentiated and unequal valuations of the social condition of being ill, the disease and its inherent medical and political management (Ferreira, 2008).

These values oscillate between two poles, expressed in the notions of phthisis and tuberculosis. Phthisis, especially acclaimed in the literary field by various writers and poets who produced a romantic aesthetic, was seen as a hereditary disease or associated with fate that affected the sensitive souls of the romantic elites, namely young people, women and fragile beings who were consumed by “sad passions”. Being “phthisic” was also a way of life of luxury and idleness that marked the experiences of the sanatorium by the wealthy classes until the end of the 19th century, which continued into the 20th century. From the end of the 19th century onwards, the symbolic representations of phthisis gave way to representations associated with tuberculosis, the “white plague”, a disease of misery that affected the poor and working classes. A double discourse emerged in the public arena. On the one hand, a celebration of tuberculosis, and on the other, fear of the “social scourge”, tuberculosis and the stigmatisation of the “dangerous” classes, the sowers of the bacillus. The “tubercular”, both proletarian and poor, embodied absolute evil in the eyes of the propertied classes – they were identified as dangerous revolutionaries who sowed germs and were a source of contagion – which became urgent to control and isolate in hospitals and sanatoriums aimed at the working classes (Ferreira, 2008).

Inequalities are always circumstantial and historical (Barros, 2018). Differences can be understood as historical and social constructions. On the one hand, there is an external social construction of differences. In a given society, it is decided which differences are considered relevant within the broader framework of socially perceived and valued differences. On the other hand, there is an internal social construction of these differences. Each difference is also constructed internally from different perspectives, and this construction is constantly

being updated (Barros, 2018). For a difference to produce inequalities, it is necessary for everyone (or at least the majority of the “privileged” and the “aggrieved”) to consider that the deprivation of an activity, knowledge, the access to a certain cultural good or a given service is a flaw, a handicap or an injustice deemed unacceptable (Lahire, 2008).

The issue of inequality is, therefore, clearly inseparable from the issue of the belief in the legitimacy of a good, knowledge or practice, in other words, inseparable from what we could call its degree of collective desirability (Lahire, 2008). What distinguishes social difference from social inequality in terms of access to a wide range of goods, practices, knowledge, institutions, and other resources is the fact that, in the latter situation, we are talking about objects that are collectively and widely defined as highly desirable. Thus, one can only talk about inequality when there is a strong collectively defined desirability (Lahire, 2008). The “desirability” cultivated within sub-groups or small communities never constitutes the conditions of possibility for social inequalities. For this to happen, the desire to access a series of specific goods or practices must animate and motivate a much larger population (Lahire, 2008).

Growing social differentiation – the social division of labour, the process of urbanisation and industrialisation, and the consolidation of functional and professional hierarchies – although having required the creation of new forms of functional regulation and coordination between social structures and individuals, and a greater need for institutional organisation to ensure the integration and interdependence of individuals, has fostered the creation and recreation of perspectives on differences, as well as the materialisation of these difference(s) into inequality(ies). As Barlösius (2023) claims,

[...] the differentiation between above and below applies to the way that individual and/or social groups are assigned to social positions. The positioning usually follows from better or inferior living conditions, which are captured mainly by available objective and subjective resources, usually income, education, paid work, and leisure time (p. 5).

The plurality of social inequalities

Social inequalities are multiple and complex. They are always in a process of change, with some becoming extinct or fading away, others emerging or becoming more pronounced, some persisting for a long time, albeit under new circumstances, and most of them transforming in terms of intensity, scale and social significance. Social inequalities are not only interconnected with each other in varying ways but are also interconnected with many other social phenomena of different types, levels, breadths and temporalities (Costa, 2012a, 2012b; Therborn, 2006; Machado, 2015; Carmo & Costa, 2015).

Inequalities can be seen as a multidimensional phenomenon of a systemic nature. This concept implies favouring a relational perspective when analysing inequalities, which not only encompasses various concepts and variables but also combines different methodologies and tools for analysis. Moreover, the systemic nature of inequalities results from interdependent processes that cumulatively affect the most vulnerable groups and social

categories (Costa & Carmo, 2015). The dynamics of interception tend to form systems (Bhir & Pfefferkorn, 2008) or inequality regimes (Piketty, 2020) that reproduce and perpetuate themselves in the social space (Bourdieu, 1979).

Addressing social inequalities requires the use of the plural, as they take multiple forms and have different generating mechanisms. This plurality expresses the multidimensional configurations of social inequalities that manifest in various societal spheres (Cantante, 2015). Following the approach proposed by Göran Therborn (2009), we can recognise three main types of social inequality: vital inequalities, existential inequalities and resource inequalities. The various types of inequality can interact and influence each other (Tilly, 2005; Bhir & Pfefferkorn, 2008; Therborn, 2006).

Types of inequality

Resource inequalities

Resource inequalities, which express the unequal distribution of social, economic and cultural resources, are the type of inequalities with the highest social visibility and are present both in the common and ideological discourse and in scientific discourse produced by the various social sciences. They include dimensions such as inequalities in income and wealth, education and professional qualifications, cognitive and cultural skills, hierarchical position in organisations and access to social networks (Therborn, 2006; Costa, 2012a, 2012b). These types of inequalities directly influence the establishment of vital inequalities and existential inequalities.

These unequal distributions of capital structure the social space (Bourdieu, 1979). Social space is markedly unequal in that it is constituted and reshaped based on the dynamics of conflict and social struggle over access to, possession of and strategic mobilisation of various resources. It is, thus, a space of relationships structured based on dominant and subordinate social positions depending on the type and extent of capital appropriated and utilised. Economic capital encompasses the different factors of production (land, factories, labour) and all economic goods (income, assets, material goods).

Cultural capital regards the totality of intellectual qualifications, whether produced by the school system or passed down through the family. This capital can exist in three forms: incorporated (social status inscribed on the body), objectified (differentiated possession of cultural goods), and institutionalised (diplomas). Social capital concerns a network of interpersonal relationships, involving the work of sociability: reciprocal invitations and shared leisure time. Symbolic capital consists of a set of rituals (such as etiquette or protocol) linked to recognising the power of an agent with greater possession of the other three forms of capital.

Existential Inequalities

This sort of inequalities refers to the unequal recognition of human individuals as persons (Therborn, 2006). They highlight inequalities in freedom, rights, recognition and respect that individuals and groups can enjoy in

society. It means oppression and restriction of freedom, discrimination, stigmatisation and humiliation. Patriarchy, slavery and racism are some of the best-known manifestations of existential inequalities in the history of societies. Today, there are multiple versions of these and other existential inequalities, some more institutionalised, others more socially diffuse (Costa, 2012a).

Unequal recognition and respect, different degrees of freedom to act and the effects of hierarchies of self-respect and self-confidence mean that social status hierarchies generate persistent inequalities in health and life expectancy. Social hierarchies produce existential inequality, with serious psychosomatic consequences. A study of 18,000 English civil servants found that heart disease killed 50 per cent more people from the lower strata than those from the higher strata (Marmot, 2004; Therborn, 2006).

Vital Inequalities

It covers inequalities in life, death and health. Inequalities relating to the prevalence of certain diseases and vulnerability to them, the health resources available to prevent and deal with them, inequalities relating to the occurrence of certain disabilities and the social responses to them, indicators of life expectancy at birth and child mortality rate are some of the most commonly used to comparatively analyse inequalities between populations and analyse changes over time (Therborn, 2006). These dimensions of human life in society, which are directly linked to the biological constitution of human beings, are neither socially homogeneous nor static. They show considerable variability between individuals, groups and societies and are frequent dimensions of social inequality (Costa, 2012a).

Long historical persistence or rapid social change can occur. A huge increase in life expectancy over the last century; on average, worldwide, it has risen from between 30 and 40 years to between 60 and 70 years. On the other hand, there are inequalities in life expectancy between different populations in the world today. The average life expectancy at birth in sub-Saharan African countries is 53 years, whereas in OECD countries, it is 80 years (UNDP, 2010; Costa, 2012a).

The comparison between OECD countries and US states reveals that the more unequal the distribution of income, the lower life expectancy tends to be and the higher the child mortality rate (Wilkinson & Pickett, 2009). The manifestation of vital inequalities in the United Kingdom (life expectancy, prevalence of chronic diseases, prevalence of disabilities and self-perception of health status) is intertwined with social classes, income levels and poverty situations (Shaw et al., 2008). Analysing hospital records in Portugal, research into the ages at death, causes of death and social attributes shows that the longevity of members of social classes with greater economic and cultural resources is significantly higher (Antunes, 2010).

It is possible to speak of the crystallisation of inequalities, be they vital, existential or of resources, to refer to the fact that the lines separating positions of social advantage and disadvantage remain the same over time and that individuals, families, groups and entire populations who are in these positions also tend to be the same

(Machado, 2015).

Social inequalities and social categories

Consisting social inequalities of systematic and persistent differences in access to goods, resources and opportunities, generated independently of individual talents, abilities and performance, they tend to crystallise and form lasting social categories, which can be class, gender, ethnic-racial, status, age or other categories (Machado, 2015). Analysing categorical inequalities involves examining the distribution of certain attributes (income, wealth, education, and longevity, among others) by social category. It allows us to see to what extent those attributes are equally or unequally distributed among the social categories considered.

According to Tilly (2005), the establishment of categorical inequalities is associated with processes, as depicted in Table 1.

Table 1. Establishment of Categorical Inequalities

Meeting	Between previously separate social groups who, when they come into contact, develop symbolic forms of reciprocal categorisation
Imposition	Discriminatory categorisation of groups of individuals by other social groups;
Negotiation	Of borders, designations, practices and interpretations between individuals and groups in interaction;
Transfer	From these categories, boundaries and relationships, from certain contexts and groups to others.

Source: Tilly, 2005; Costa, 2012b

The relationship between types of social inequality and social categories is one of interdependence. On the one hand, the various types of social inequalities can lead, through their persistence, to the establishment of crystallised and lasting social categories. On the other hand, since these categories were initially established based on the unequal distribution of a certain resource or certain vital or existential inequalities, their persistence will contribute not only to maintaining these inequalities but also to creating or accentuating inequalities that were not initially present in the establishment of these specific categories (Machado, 2015) (Table 2).

Table 2. Matrix Types of Social Inequalities X Social Categories

		Social Categories			
		Class categories	Gender categories	Age categories	Categories ethnic-racial
Types of Social	Income	Income inequality is felt at multiple levels in the conditions and			

	lifestyles of the different classes.		
Power		Women tend to occupy less dominant positions than men in institutional hierarchies of all kinds, in governments, parliaments, companies and universities.	
Prestige			Ageism: e.g. when people over 40 or 50 lose their job and try to find a new one, many of them cannot because of their age and become long-term unemployed, too young to retire and “too old” to work.
Recognition			Racism and ethnic discrimination mean that people are not recognised and are disrespected because of this attribute of their identity.
Health	The longevity of members of social classes with greater economic and cultural resources is higher (Antunes, 2010).	Women adopt more positive health beliefs and behaviours than men and have healthier lifestyles, which may explain why they suffer fewer severe conditions and have greater longevity	Inequalities in the interaction between health professionals and patients; Inequalities in the management of the care provided; Reproduction of inequalities

(Courtenay, 2000;
Augusto, 2013).

Therborn (2006) identifies a set of social processes that generate significant inequalities and which have been analysed from various multi-paradigmatic disciplinary spaces. A theoretically and analytically enlightening analysis of social inequalities in today's world requires characterising the main mechanisms and factors at play (Costa, 2012a) (Tables 3 and 4).

Table 3. Mechanisms of Inequality

Exploitation	The generation of inequalities due to the asymmetrical appropriation by some of the goods and values produced by others. Monopoly of resources; unfair or non-existent remuneration of the wealth produced.
Distancing	Generation of inequalities as a result of processes of competition or competition in systems of interdependence (vital and income distances have increased).
Exclusion	The generation of inequalities due to the selective restrictions that certain groups place on others' access to resources and opportunities.
Hierarchisation	Generation of inequalities due to the institutionalisation of positions of superiority or inferiority in formal organisations. Unequal recognition and respect generates existential inequality.

Table 4. Mechanisms of Equality

Catching-up	Covering processes of systemic change, equalisation of opportunities, compensatory policies and affirmative action.
Inclusion	Rule of law, citizenship, public services, migration possibilities, human rights.
Compression	Shortening institutional and organisational hierarchies, involving training processes.
Empowerment	Organisational democratisation, associations.
Redistribution	Welfare state, progressive taxation, social policies, mutualism

Source: Therborn, 2006; Costa, 2012a; Costa, 2012b.

With regard to the social bases of inequality, Tilly (2005) highlights the historical importance of unequal distribution of resources or unequal control of means of action, such as labour (skilled and organised labour), animals (used for food and production), land (including the natural resources located on it) and machines (used in the conversion of raw materials, the production of goods and services, and transport), but also the means of coercion (weapons, specialists in violence) and social bonding institutions (from kinship networks to religious

sects, trade diasporas and so on) (Tilly, 2005; Costa, 2012b). In addition to these social bases of inequality, it is important to emphasise the crucial importance today of unequal ownership, access and control of financial capital, information, the media and scientific and technological knowledge. These factors, which have been decisive as the social bases of inequalities in the contemporary world on a global scale, will probably become increasingly important in the immediate future (Tilly, 2005; Costa, 2012b).

As for the social mechanisms that explain inequalities, Tilly (2005) focuses, above all, on “exploitation mechanisms” (a relationship of interconnection between social agents, with an asymmetrical appropriation of the results of productive endeavours), “opportunity closure mechanisms” (with the exclusion of more or less vast groups of people by others, and the consequent reproduction of social barriers) and “selection-distribution mechanisms” (Tilly, 2005; Costa, 2012b). Various explanatory factors can be mobilised to analyse the current situations and dynamics of inequality on a global scale: global history (international interactions and the sedimentation, institutionalisation and knock-on effects they bequeath), global imbrications (between states and nations, on the one hand, and transnational movements and organisations, on the other) and global flows (of people, capital, goods and information) (Therborn, 2006; Costa, 2012a).

Social inequalities and social (in)justice

When social inequalities are analysed, not only are situations described, but valuations are also called for. This observation raises several questions that can be approached from two complementary levels. One has to do with the value orientations of those who undertake analyses of social inequalities from different points of view intrinsic to the various social sciences; the other has to do with the value systems of the societies in which inequalities are analysed (Costa, 2012b). Analyses of social inequalities are crossed by this relationship between cognitive and evaluative parameters. The issue of which social differences can or should be considered social inequalities has often been answered in terms of social justice (Rawls, 1971; Therborn, 2006; Lahire, 2008; Fraser, 2008; Sen, 2009; Dubet, 2010; Costa, 2012b).

We can consider whether social inequalities are differences deemed to be unfair (Therborn, 2006). Several meanings are generally associated with the notion of social injustice: the violation of a norm of equity; excessive inequality, severely limiting the life chances of the most disadvantaged; and something socially perceived as undeserved (Therborn, 2006; Costa, 2012b). However, from a liberal perspective, social and economic inequalities can be admitted and accepted subject to positions being open to all, in conditions of equal opportunities, and greater benefit for the most disadvantaged members of society. As Rawls (1971) sustains, “[...] all primary social goods – freedoms and opportunities, income and wealth, and the foundations of self-respect – should be distributed equally, unless an unequal distribution of any or all of these goods is to the advantage of the least favoured” (p. 303). However, for Amartya Sen (2009), there are, on the one hand, a multitude of dimensions and situations in which inequalities in capabilities have relevant consequences of social injustice and, on the other hand, efforts to reduce inequalities in capabilities meet a fundamental objective of social justice (Sen, 2009; Costa, 2012b). For Sen (2009), rather than trying to abstractly design the ideal

institutions of a just society, it is important to understand the multiple situations of concrete social injustice, associated with various specific forms of inequality, and to try to mitigate, correct or even eliminate them (Sen, 2009; Costa, 2012b).

Three central types of injustice coexist in contemporary societies: economic, cultural and political. Various strategies have been developed to address and combat these social injustices (Fraser, 2008). In the face of socio-economic injustices, which cause distributive injustices, redistribution policies have been advocated and developed, such as progressive taxes, labour legislation, social security, public education and public health services (Fraser, 2008). To address sociocultural injustices – injustices of recognition, namely deficient, stigmatising recognition of status or identity – policies have been developed to acknowledge difference, or the right to difference, involving processes of changing cultural sensibilities, social movements, changes to the legislative framework and public policies of “affirmative action” (Fraser, 2008). In the face of new socio-political injustices, injustices of representation – which include the unfair political representation of certain social categories (e.g. gender and region) in the various instances of nation-states – focus on limitations to the framework of people, groups, categories and populations (e.g. foreigners, migrants and refugees) in the various instances of nation-states, in national or global spheres of belonging and in instances of defining rules of relationship on a global scale – the politics of representation, which refer to defining spheres of inclusion for social actors, taking these social actors into account in national and supranational decision-making bodies, access to redistribution policies and recognition policies – have been favoured by non-governmental organisations of a transnational nature, globalised social movements and global regulatory or governance institutions (Fraser, 2008; Costa, 2012b).

Conclusion

Differences are transformed into inequalities through the socially constructed reading of these characteristics, which potentially contributes to the structuring of existing and new inequalities (Costa, 2019). As Cunha and Durand (2016) state, “What is at stake is not the naturalness of differences, but almost always the naturalisation of social inequalities as a way of legitimising and perpetuating them (p. 185). Instead of unreflectively measuring the distance between social groups, social classes or social categories, automatically converting all differences into inequalities, social scientists should, first and foremost, look at the genesis of these collective beliefs, the processes of legitimisation, de-legitimation or re-legitimation of different types of goods, activities or knowledge, and, in essence, the struggles over the social definition of “what matters”, “what has value”, in short, what is a “capital” (p. 3) in the eyes of the majority (Lahire, 2008).

The distinction between social differences and social inequalities is fundamental to understanding, in an interdisciplinary logic (Serpa et al., 2017), on the one hand, the social mechanisms that create and perpetuate inequalities and, on the other hand, the public policies that need to be implemented to mitigate inequalities and maximise the value of difference in harmony with the value of equality. The concept of social justice as equality

of conditions refers directly to the “[...] places that organise the social structure” (Dubet, 2010, p. 9). In this conception, what is contested are not the inequalities of situations, structural asymmetries or functional hierarchies, but rather the privileges of some and the discrimination against many others (Costa, 2012b, pp.102-103).

It is important to encourage an increase in social justice in contemporary societies, combining policies inspired by both the concept of equality of place and equality of opportunity, seeking to minimise the undesirable effects of both. However, given the seriousness of the problems of social injustice linked to structural inequalities, it is pivotal to prioritise policies more directly focused on promoting equal situations (Dubet, 2010).

Radityo Widiatmojo

Binus University, Indonesia,  <https://orcid.org/0000-0003-3888-2056>

Abstract: This research discusses the close relationship between visual literacy, the ability to read, understand, and create visual texts - and elementary school books, particularly children's picture books. It aims to explore the visual literacy parameters in English elementary textbooks published by the Indonesian Ministry of Education and Culture. In comprehension and retention, visual content embedded in school textbooks serves as a powerful tool to enhance student understanding. This research uses the descriptive qualitative method and visual literacy paradigm by Maria Avgerinou. The research object of this study is English digital schoolbooks for an elementary level which can be accessed through <https://buku.kemdikbud.go.id/> by the Indonesian Ministry of Education and Culture. The results of this study found that visual perception affects the learning process, concept formation, and problem-solving ability, thus contributing to critical thinking skills. Thus, the combination of illustrations and images in English learning books for elementary students develops students' visual literacy. The findings will contribute valuable insights to inform educators, curriculum developers, and policymakers about the current state of visual content in education materials.

Keywords: English Textbooks; Indonesian; Visual Literacy

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1631-1641), Antalya, Turkiye. ISTES.

Introduction

Gaining proficiency in visual literacy is essential in the information-saturated era, where visual communication is becoming more important. This is especially true for those studying English as a foreign language (EFL), since images can help explain concepts and words that they are unfamiliar with. This move toward the visual is evident in many sectors. While written words on paper used to be our primary form of communication, text combined with still or moving visuals seen on progressively smaller screens is rapidly taking its place (Goldstein, 2016). Visual literacy training ensures that elementary students can engage with visual information

successfully, and it enhances recall, comprehension, and inferential understanding (Golding & Verrier, 2021). Visual literacy has been a prominent aspect in language teaching.

Visual literacy is defined as the learned ability to interpret visual messages accurately and to create such messages, paralleling reading and writing in print literacy (Avgerinou & Pettersson, 2011). Visual literacy has been always regarded as an important literacy ability for 21st century students in the digital age. The current generation, who were born in the “bain d’images” (Avgerinou, 2009), is familiar with visual culture but lacks sophisticated visual literacy abilities, like how listening to an iPod does not teach critical analysis or music creation. Because of that matter, students should be taught and developed in visual literacy abilities (Wang, 2021). It marks the time to stop relying solely on verbal literacy for teaching and assessment in schools.

Visual literacy is integrated into English Curricula in several countries such as Australia, Sweden, Canada, Singapore, and New Zealand (Callow, 2020). The Indonesian curriculum for learning English makes no formal mention of visual literacy as separate topic. In contrast, the Indonesian English curriculum focuses on communicative development of the four language abilities (speaking, listening, reading, and writing) (Sulistyaningrum & Sumarni, 2023). In other words, visual literacy is emphasized as a part of a broader educational framework (Prameswari et al., 2023). Visuals can be effective aids for this, offering context and assisting comprehension, particularly for young learners in learning EFL.

The combination of visual and text helps students increase their visual literacy skills by providing a multi-dimensional approach to learning. The combination of visual and text interplay is important in visual literacy as learners are most able to build connections between verbal and visual representations when text and illustrations are actively held in memory at the same time (Avgerinou & Pettersson, 2011). Visual representations can stimulate students’ cognitive processes to be able to analyze visuals and catch students’ attention (Prameswari et al., 2023). Thus, it will make them understand the idea easier. Effective usage of the visual work will communicate the message, especially in the learning process of EFL.

The combination of visual and text interplay in visual literacy as learners are most able to build connections between verbal and visual representations when text and illustrations are actively held in memory at the same time (Avgerinou, 2009). This can enhance the interpretation and understanding of visual messages and aid in effective visual communication in education. Martinec and Salway (2005) have studied the relationship between images and text in various media. The combination of images and text allows for the integration of visual and verbal elements, enhancing the overall communication experience and making the content more engaging and impactful (Martinec & Salway, 2005). Different levels of image-text relations have been explored and it provides a system for analyzing these relations in different genres and media types.

To develop visual literacy in elementary students, they are expected to study textbooks' images that interact with texts in diverse ways to build visual literacy. An examination of image-text relation is consequently required since it is unclear how texts and images interact to produce meaning in the English textbooks in Indonesia.

However, not many studies follow this approach. In Indonesian senior high school of English textbooks, visual images show no significant power discrepancy between images and texts, indicating that visual images could enhance students' engagement (Elmiana, 2019). The aim of visual literacy is to increase people's ability to think and analyze (Widiatmojo, 2020). Other studies examined the second language acquisition aspect of English textbooks (Syairofi et al., 2022). Few academic articles from Indonesia have been published on visual literacy topic examine the visual images in EFL textbooks. None provides a thorough examination of the relationships between images and text, and the visual literacy parameters on the EFL elementary textbooks. Therefore, this paper aims to explore the visual literacy parameters in English elementary textbooks published by the Indonesian Ministry of Education and Culture.

Method

The study employs a qualitative research methodology using the visual literacy paradigm by Maria Avgerinou and Martinec and Salway's model of image-text relation. The data collection was conducted from the official website of the Indonesian Ministry of Education and Culture (<https://buku.kemdikbud.go.id/>). As a sample, the English textbooks were chosen from Grades 1, 2, and 3 because they were considered as early level of elementary schools and early level of acquiring English. The series of English textbooks is entitled "Student's Book: My Next Word". All the images in combination with language are selected from the sections of vocabulary, conversation, and exercise in elementary English textbooks.

After the textbooks were collected, the pictures within the book were categorized into several models of image-text relation by Martinec & Salway (2005). The models are divided into two categories, relative status relation (image and text independent, image and text dependent, image subordinate to text, text subordinate to image) and logico-semantic relations (elaboration, extension, enhancement, locution, and idea). Data analysis includes both descriptive tables of frequency and percentage and text analysis of image-text relations.

Results

In Elementary English Textbooks the image-text relation is found more equal (70.97%) than unequal (29.03%) in status. The equal relation is shown from the dependency degree of image and text, while the unequal relation is shown from the subordination degree of image and text. From Table 1, it is shown that of 186 cases of image and text combinations, a majority (59.68%) shows image and text dependent, and image and text independent is found the least frequent (11.29%). In addition, the higher the grade, the more image subordinate to text.

Table 1. Image-Text Relative Status Relation in Elementary English Textbooks

Grade	Image & Text Independent	Image & Text Dependent	Image Subordinate to Text	Text Subordinate to Image	Total
-------	-----------------------------	------------------------------	------------------------------	------------------------------	-------

1	11	34	19	5	69
2	3	39	9	1	52
3	7	38	4	16	65
Total	21	111	32	22	186
Percentage (%)	11.29	59.68	17.20	11.83	100

Most images are related to only a part of the text. It indicates that images are applied to support the text and help the students to illustrate ideas or concepts. Figure 1 shows an example from image and text complementary. It shows an image of explaining a giraffe's body parts with a text pointing to the body part. It shows how the text forms a meaningful exercise for the students to match the text and the image. Figure 2 shows an example of image and text independent. It shows pictures of caterpillars which their body length symbolizes the word length of days' names. The text is not solely conveyed through the picture nor the colors. In this way, it illustrates how the text and images co-contribute to an understanding of the days' names.

Figure 1. Image & text complementary

Figure 2. Image & Text Independent

Figure 3 shows how text is subordinate to images. It shows a picture of students' activity in a school. Students are expected to know the context by the richness of visual aspects in the picture. The text only encourages the students to look at the picture and describe it with their understanding. Thus, the use of text subordinate to images is to encourage students to be more engaged in EFL learning process, such as speaking or writing. Figure 4 shows how images are subordinate to text. It is an evaluation sheet which the students are asked to fill out. The images are emojis to explain their feelings on the learning process, while the text describes the aspects of assessment's evaluation.

Figure 3. Text subordinate to image

Refleksi Peserta Didik:

Saya senang		☹️	😐	😊
1.	Mengenal likes dan doesn't like.			
2.	Mengetahui apa yang disukai dan yang tidak disukai teman.			
3.	Mengetahui apa yang disukai dan yang tidak disukai orang tua.			

Saya bisa		☹️	😐	😊
1.	Menyebutkan likes dan doesn't like.			
2.	Merespons teks tulis menggunakan likes dan doesn't like.			

Figure 4. Image subordinate to text

The image and text logico-semantic relations in elementary English textbooks is shown in Table 2. From 186 cases found in the textbooks, it shows elaboration relation (38.71%) as the most frequent, followed by extension relation (23.65%), locution projection (22.58%), enhancement relation (14.52%), and idea projection (0.54%).

Table 2. Image-Text Logico-Semantics Relations in Elementary English Textbooks

Grade	Elaboration	Extension	Enhancement	Locution	Idea	Total
1	23	14	6	26	0	69
2	24	14	9	5	0	52
3	25	16	12	11	1	65
Total	72	44	27	42	1	186
Percentage (%)	38.71	23.65	14.52	22.58	0.54	100

Elaboration refers to the image and text relation which either one of them adds more detailed but not always new information to the other. Figure 5 shows the example of it, and it illustrates the use of English verbs where visual images explain the action. Students are asked to complete the sentence in which it has gained detailed information from the image. Extension refers to the image and text relation which either one of them provides new information for the other.

Figure 6 shows an example of it, and it displays new vocabularies for students in EFL learning process. The images represent the new vocabulary.

Figure 7 shows an example of enhancement. Enhancement happens when one word or image benefits the other in a contextual way due to a difference in time, location, purpose, or cause. In the English elementary textbooks,

enhancement occurs when there are series of description of images in the context of the name and adjective that usually follow. In this way, students are expected to be able to describe an animal the way it is illustrated in the books.

Figure 5. Elaboration

Figure 6. Extension

Figure 7. Enhancement

Figure 8. Locution

Figure 8 shows an example of one of projection types, locution. Locution refers to the exact wording quoted. In the books, Figure 8 illustrates how a picture of students greet in English and it is expected to be followed by the students. Another type of projection, idea, is shown in Figure 9. It illustrates the wording projection that appears in the speech bubble. The meaning of projected wording is illustrated in the right bubble. The bubbles serve as a model for understanding the context of the illustrated conversation.

Figure 9. Idea

Discussion

As pointed out by Avgerinou (2009) today's children live in visual culture which influences enormously our perception of self and the surrounding world, attitudes, beliefs, values, and general lifestyle. Visual message has established a visual vocabulary before a verbal one, and it has learnt to deal with the complexity and subtlety of visual communication. Viewing is more than just seeing with eyes; it is a sensory perception. Viewing is a cognitive skill to decode and encode visual components that can be cultivated and improved via training (Wang, 2021). The Indonesian curriculum in teaching EFL identifies viewing as a component of linguistic competence, one of four basic competencies to cultivate (along with cultural awareness, reasoning capacity, and learning ability). The analysis uses Avgerinou's visual literacy aspects such as visual language, visual learning, and visual perception.

Visual language is a system of communication that uses visual elements including images, symbols, and gestures to transmit meaning and information (Avgerinou & Pettersson, 2011). Visual images are powerful tools for building students' knowledge of the real world, which cannot be produced through classroom activities alone (Elmiana, 2019). Visual images in EFL textbooks depict places, situations, and personalities that help students to learn about the actual world and provide chances for students to develop their grasp of the target language, culture, and worldview. In the context of Indonesian EFL textbooks, the students can understand the new vocabularies through provided images.

Furthermore, the series of images construct a mini scenario that reflects the real world. Thus, the images help the students understand how to practice in a certain social context. Specific gestures, such as a smiling face, serve as a nonverbal communication bridge to teach children to smile habitually. Smiles also reflect cheerfulness, happiness and harmony. Other visual languages such as skin color and hair type also reflect the

Ministry of Education and Culture's efforts to teach diversity to elementary school children. Differences in skin color and hair types appear to be united by smiles and eye gaze that imply enthusiasm and cheerfulness.

Although diversity is taught and implied in visual language, the Ministry of Education and Culture should also take the opportunity to educate elementary school children about colleagues with disabilities. The visualization of disabled friends living in harmony with other friends, will be a trigger to do good and not be picky in making friends. At some point, this could potentially raise awareness not to bully friends. This is an implementation of visual learning.

Through the use of visual stimuli like pictures, characters, diagrams, and films, students can acquire, process, and retain information more efficiently through the cognitive process of visual learning (Avgerinou & Pettersson, 2011). Understanding difficult concepts and comprehension and memory retention can be improved through visual learning. Visual learning can be incorporated by teachers into real-world learning situations (Guo et al., 2018). It is important to emphasize to students that visual aids frequently convey information that is not found in text and are not redundant. Less proficient readers will probably benefit differently from modeling and training in these areas because they frequently do not come up with complex methods on their own.

Visual perception is the process by which the brain interprets and organizes visual information acquired from the eyes (Avgerinou & Pettersson, 2011). It requires the capacity to detect, evaluate, and comprehend visual inputs such as shapes, colors, patterns, and spatial relationships. Previous research has highlighted the importance of initial education as a period in which an individual's intellectual characteristics are developed and as the first step in preparing for primary education, in which the child is provided with knowledge and the formation of capacities, abilities, and personality qualities (Baldeón et al., 2022).

On the other hand, visual compositions that present social functions such as helping, reading, cleaning and so on, should be emphasized more in each theme. Indeed, the complexity in digesting meaning occurs when an image presentation has various purposes. But with the strength that visual language is a universal language, there is nothing wrong with the Ministry of Education and Culture being more sensitive in embedding visuals with a positive tone, so that at the end of class all students have the potential to digest perceptions that are at least uniform, although not the same. This can be the basis for students who have critical thinking skills.

The study integrates Martinec and Salway's (2005) concept of image-text relation, which offers a framework delineating the status and logico-semantic connections between images and text. Avgerinou and Pettersson's (2011) examination of verbal and verbal-visual logico-semantic relations in images within the textbooks extend this framework to analyze the nuanced interactions between images and text within students' English textbooks. Textbooks should incorporate sound, print, and image elements in unique ways. Various aspects in communication should be used as teaching tools for visual literacy, and students should have access to many resources for skill development. These resources should include time for in-depth analysis of visual and verbal texts and discussions on how various modes interact to co-create meaning.

Through visual learning and visual perception, students are encouraged to directly think critically in processing all the information in the picture. Why on page 6, the picture presented is a curly-haired boy with a slightly dark skin color, why many students are together doing one activity, why the teacher presented is more Mrs. Teacher than Mr. Teacher, or why the giraffe is smiling. Of course, this kind of stimulation will liven up the learning atmosphere in the classroom. And it is just expected that there will be questions from students about small aspects of the picture, but they can potentially have a big impact on the discussion in class. On the one hand, the variety of images is expected to provoke students' curiosity to ask questions. On the other hand, it is expected to arouse the courage of students to answer the curiosity of other students, resulting in an exchange of perceptions. Critical thinking can start from small things like this.

The Ministry of Education and Culture's efforts to make textbooks more "alive" certainly need to be appreciated. The challenge is not only in the quality of the visuals presented, but also the teachers must be more proactive in deciphering the message in a picture. The role of the teacher in honing students' critical skills is crucial, considering that the conditions on the ground in Indonesia with its unique demographics will never have the same standards. Therefore, the presence of picture textbooks requires teachers to learn to explore all possible meanings that will emerge as a form of visual literacy, regardless of whether the teacher teaches in private or public schools.

Conclusion

This study investigated the image-text relations in Indonesian elementary English textbooks. The parameters used in the analysis cover visual language, visual learning, and visual perception. The findings reveal that visuals are primarily used to complement and support the text (elaboration relation, 38.71%), often by illustrating vocabulary or concepts. However, visuals can also present new information (extension relation, 23.65%) and enhance the understanding of the written text (enhancement relation, 14.52%) by providing context. Importantly, the analysis demonstrates a clear trend towards a more equal image-text relationship (image and text complementary, 59.68%) in lower grades, with visuals becoming increasingly subordinate to text (image subordinate to text, 17.2%) in higher grades.

These findings highlight the crucial role visuals play in EFL learning for young learners. Students' visual literacy skills and support the development of new language skills by bridging the gap between unfamiliar vocabulary and concepts. The textbook design, with a dominance of equal and complementary image-text relations, aligns well with the emphasis on viewing as a component of EFL learning in the Indonesian curriculum. This approach fosters visual learning, visual perception, and ultimately, a deeper understanding of the target language and the world it represents. In other words, visual literacy can help students to increase their ability to think and analyze critically.

The study emphasizes the importance of teachers effectively utilizing the interplay between visuals and text. By

engaging students in analyzing visuals and discussing how they co-create meaning with the written text, educators can further enhance the effectiveness of EFL textbooks and promote the development of both visual literacy and language skills in their students.

Recommendations

Further research should concern on the guided classroom activity and interactivity that help students in visual learning process. It should be the concern on how the teacher's guide the students in visual learning process. Another concern should be in other subjects' textbooks. As in science studies or social studies, other visual aspects like diagrams and graphs are applied to elementary textbooks.

Acknowledgement

We would like to express our gratitude to Binus University and the Indonesian Ministry of Education and Culture for helping us in conducting this study.

Abstract: Securing employment is a fundamental aspect of individuals' economic well-being. Those involved in the workforce invariably navigate a work environment that can exert distinct impacts on each individual. One potential issue in the workplace is the occurrence of workplace bullying, which can affect the psychological well-being of its victims. Individuals thriving in a positive work environment typically exhibit job satisfaction and a lack of psychological distress. This research aims to investigate the influence of workplace bullying on job satisfaction and psychological distress among Bank X employees in Denpasar City. Employing a quantitative approach with a cross-sectional design, the study involved a sample of 93 individuals selected through simple random sampling. Data were collected using The Negative Acts Questionnaire-Revised (NAQ-R), the Job Satisfaction Survey (JSS), and the Kessler Psychological Distress Scale (K-10). Data analysis utilized the stepwise linear regression technique. Results indicate that workplace bullying (sig. = 0.021, $p < 0.05$) and tenure (0.017, $p < 0.05$) significantly impact job satisfaction. Furthermore, workplace bullying (sig. = 0.000, $p < 0.05$) and gender (sig. = 0.003, $p < 0.05$) have a significant influence on psychological distress.

Introduction

Work can be considered one of the primary necessities for most individuals. In today's egalitarian era, the meaning of work has undergone a significant shift. Traditionally associated with men, work is now equally pursued by women. Work represents an individual's endeavor to fulfill their life's needs, encompassing both physical and social dimensions. The ability to meet these needs through work contributes to a positive psychological impact on the individual.

As individuals engage in their professional activities, they inevitably encounter various challenges within their work environments. One persistent organizational problem that continues to plague workplaces today is workplace bullying. Workplace violence or "bullying" has become a significant organizational phenomenon that has garnered widespread attention from diverse groups, including researchers, educators, protective organizations, and community leaders (Rudi, 2010).

Namie (2003) defines workplace bullying as the perpetrators' need to control others and engage in deliberate, repeated, and harmful interpersonal hostility that can jeopardize the health and economic status of the targeted individual. Workplace bullying is described as recurrent and systematic behavior and activities by superiors or colleagues that can have a negative impact on the victim (Stale, et al., 2018). Workplace bullying can happen to anyone. Workplace bullying is classified into three categories: 1) downwards bullying (bullying by managers to subordinates); 2) horizontal bullying (bullying by one or more colleagues to those in the same position or job); and 3) upward bullying (subordinates bullying individuals in higher managerial positions) (Branch, Ramsay, & Barker, 2013).

As illustrated in Figure 1, 19% of Americans have experienced workplace bullying, another 19% have witnessed workplace bullying, and 63% are aware of workplace bullying (Workplace Bullying Institute, 2017). The phenomenon of bullying is not limited to developed countries but also occurs in developing countries like Indonesia. According to a study conducted by Gunawan, Prihanto, & Yuwanto (2009) on workers in Surabaya,

workplace bullying has a negative impact on both psychological conditions and behavior. Psychological effects include feelings of anger, hurt, sadness, disappointment, loss of self-confidence, self-anger, feeling isolated, frustration at work, and fear of facing others, while behavioral effects include defensiveness, loss of work commitment, and the urge to quit one's job.

Findings from a systematic review conducted by Akter (2019) indicate a positive correlation between workplace bullying and psychological distress. One of the psychological impacts experienced by victims of workplace bullying is stress. Stress can undoubtedly lead to decreased employee productivity and even cause employees to leave their jobs. According to León & Leon (2021), 4% of workers worldwide leave their jobs due to stress.

Undoubtedly, workplace bullying can foster a sense of discomfort in the work environment and negatively impact employee job satisfaction. Employee job satisfaction is heavily influenced by the work environment. According to O'Driscoll et al. (2011), victims of workplace bullying experience higher levels of stress, lower emotional well-being, frequent absenteeism, decreased job satisfaction, and diminished work motivation.

The repercussions of workplace bullying extend beyond individuals and permeate groups and organizations as well. For groups, workplace bullying can disrupt team effectiveness and erode established group norms. At the organizational level, workplace bullying can negatively impact organizational performance and undermine the prevailing organizational culture (Samnani & Singh, 2012).

Workplace bullying is reportedly highly prevalent in the banking sector. The banking industry is claimed to have a high prevalence of workplace bullying, which negatively impacts both individuals and organizations (Xiao, et al., 2022). This can occur due to the hierarchical structure, performance-based evaluations, and intense competition within the banking industry, which can foster a climate where workplace intimidation can flourish (Gupta, et al., 2020). Based on the previously described issues, the researcher is interested in conducting a study to examine the role of workplace bullying in job satisfaction and psychological distress among employees of Bank X in Denpasar City.

Method

The research employed a quantitative approach using a cross-sectional study design. The dependent variables in this study were job satisfaction and psychological distress, while the independent variable was workplace bullying. The research was conducted at Bank X in Denpasar City in February 2023. The population of this study was all employees of Bank X in Denpasar City. The research sample was selected using simple random sampling, resulting in 93 respondents.

The research instrument for this study uses a questionnaire adapted from the research of Erwandi, Kadir, and Lestari (2021). Workplace bullying is measured using the Negative Acts Questionnaire-Revised (NAQ-R). The

NAQ-R consists of 22 items that assess bullying incidents experienced by the subject during the past 6 months at work. NAQ-R consists of 5 answer choices, namely "never", "sometimes", "every month", "every week", and "every day". The validity test shows results of 0.721 to 0.897. Meanwhile, to measure psychological distress using the Kessler Psychological Distress Scale (K-10) questionnaire. K-10 consists of 10 questions about the feelings the subject has felt during the last month. Measuring job satisfaction was carried out using the Job Satisfaction Survey (JSS) questionnaire (Spector, 1997) and was adapted by Rindyantika and Safitri (2014). The JSS scale consists of a score of 1 to 6 with categories ranging from "strongly disagree", "disagree", "somewhat disagree", "somewhat agree", "agree", and "strongly agree". The statistical test to analyze the effect of workplace bullying on job satisfaction and psychological distress uses a simple linear regression test with a significance value of $\alpha < 0.05$.

Results

Linearity Test

Correlation	Indicator	F	Sig.
Job Satisfaction *	<i>Linearity</i>	4.753	.032
Workplace Bullying	<i>Deviation from Linearity</i>	1.538	.109
Psychological Distress *	<i>Linearity</i>	27.264	.000
Workplace Bullying	<i>Deviation from Linearity</i>	1.817	.044

Figure 1. Linearity Test Results

The linearity test is a test carried out to determine whether the relationship is linear or not between the independent variable and the dependent variable. The decision making method for the linearity test is with a significance < 0.05 , then the relationship between the two variables is linear and vice versa, if the significance is > 0.05 , then the relationship between the two variables is not linear (Priyatno, 2010). Based on table 1, it can be seen that job satisfaction with bullying in the workplace has a significance value of 0.032 and psychological pressure with bullying in the workplace has a significance value of 0.000. Based on the data above which shows (sig. < 0.05), it can be assumed that job satisfaction with workplace bullying and psychological pressure with workplace bullying have a linear relationship.

Regression Test

Dependent Variable	Model	Unstandardized Coefficient	Standardized Coefficients	t	Sig.
		B	Beta		
Job Satisfaction	<i>Constant</i>	135.173		20.457	.000
	<i>Workplace Bullying</i>	.521	.213	2.084	.040

Psychological	<i>Constant</i>	1.764		.512	.610
Distress	<i>Workplace Bullying</i>	.636	.456	4.882	.000

Figure 2. Regression Test Results

Based on table 2, it shows that the sig value is $0.004 < 0.05$ and $0.000 < 0.05$. Based on the basis for decision making, it can be concluded that the hypothesis in this research is that H_0 is rejected and H_a is accepted. This means that there is a significant influence of workplace bullying on job satisfaction and psychological distress.

Stepwise Test

<i>Dependent Variable</i>	<i>Model</i>	<i>Unstandardized Coefficient</i>	<i>Standardized Coefficients</i>	t	Sig.
		B	Beta		
Job Satisfaction	<i>Workplace Bullying</i>	.576	.236	2.356	.000
	<i>Tenure</i>	.354	.244	2.438	.017
Distress Psikologis	<i>Workplace Bullying</i>	.606	.434	4.840	.000
	<i>Sex</i>	-3.490	-.271	-3.018	.003

Figure 3. Stepwise Test Results

Based on table 3, it is known that $Sig < 0.05$. This means that workplace bullying and work experience have a significant influence on job satisfaction. Workplace bullying will certainly affect employee job satisfaction.

Discussion

Workplace bullying has a detrimental impact on employee job satisfaction. Based on the results of research conducted by Cakirpaloglu, Cech, & Kvintová (2018), workplace bullying causes a decrease in job satisfaction, frequent absences from work, fluctuations, decreased performance, and decreased work motivation. Apart from that, the latest research conducted by Develi and Turak (2023) shows that workplace bullying in the public sector contributes negatively to job satisfaction, which means that the higher the workplace bullying, the lower the level of job satisfaction. If we look at the work period, it can be seen that the work period plays a role in job satisfaction.

Workplace bullying can certainly affect the psychological condition of employees. Employees who experience bullying at work tend to have an impact on their mental condition. Samsudin, Isahak, & Rampal (2018) conducted a systematic review which stated that bullying behavior can cause individuals to experience burnout, mental strain, and undesirable psychosomatic effects. Workplace bullying also has a positive effect on employee emotional exhaustion, which means that the higher the workplace bullying

experienced, the higher the employee's emotional exhaustion (Anasori, Bayighomong, & Tanova, 2019). Individuals who experience bullying will usually experience psychological distress which will certainly cause them to become emotionally tired. This is in line with research results which say workplace bullying damages morale, increases stress, and encourages some individuals to resign from their jobs (Georgakopoulos & Kelly, 2017).

Apart from that, in table 3 it is also known that workplace bullying and gender have a significant influence on psychological distress. Women are said to experience psychological distress more often than men. Based on the results of research conducted by Bilodeau, Marchand, and Demers (2020), it is known that the level of psychological stress is higher among working women compared to working men. This is caused by women having greater exposure to stress triggers and their access to fewer resources than men (Milner et al., 2019). If it is related to workplace bullying, women are said to experience more harassment in the workplace than men (Tonini, et al., 2011), so it can be one of the causes of psychological distress.

Conclusion

Workplace bullying is a prevalent concern in the professional environment that demands attention due to its detrimental impact on both organizations and their employees. This pervasive issue can lead to a decline in job satisfaction and significantly affect an individual's psychological well-being. Research findings have consistently demonstrated that workplace bullying exerts a substantial influence on job satisfaction and psychological distress among employees of Bank X in Denpasar City.

Abstract: Mark–Release–Recapture (MRR) techniques are widely used today and are specialized techniques to study organisms in the entire field of biology using Artline 999 XF (water-resistant marking marker) without harming individuals, which are released and recaptured again. We applied the MRR method for the Order Lepidoptera (Insecta) in the area of Drenova to estimate the population size, distribution, habitat, behavior, etc., for the species *Pseudochazara tisiphone* Brown 1980, during 2023. During this year, we catch 43 species of this type, of which 33 were women (76.7%) and 10 were men (23.2%). The captured species were marked and re-released, according to the rules of the MRR method, and out of the total number of captured individuals, eight *P. tisiphone*, species or 18 %, were re-encountered, considered to be a low frequency. We conducted sampling in 2 time intervals, where the first interval took place from July 15 to August 8, while the second interval took place from August 25 to September 12, 2023. The first time we recaptured 5 individuals and the second time we recaptured 3 individuals. From the analysis of the days and months, when we met and re-met more often individuals of *P. tisiphone*, it turns out that the frequency of meeting this type results more in Spring – Summer, than in Autumn. Based on these preliminary data, we think that in the future, we should increase the number of days in the field, to increase the chances of re-encountering individuals, and have a clearer picture to design conservation models for Lepidoptera species.

Keywords: Lepidoptera, Mark – Release-Recapture, Insect, Albania

Introduction

Mark-Release-Recapture (MRR) is a method for obtaining demographic information about animals, including insects (Gall 1984; Pollock et al. 1990; Sandercock 2006). Marking of animals with different marking methods dates back to 218 BC, when ornithologists first marked birds with tape (Fisher 1964). Marking insects for scientific studies began around 1920, when researchers used dyes, and stains in insect population studies (Dudley 1923). MRR studies of butterflies were first initiated in Britain and Europe in the 1930s (Brett 1936; Dowdeswell *et al.* 1940), and later in America (Whrlich 1960), or Western Australia Williams (2002). During studies using the MRR method, marking does not affect the subsequent survival of the animal (Manly 1971; Pollock *et al.* 1990; Pollock 2005). Information derived from the number of Lepidoptera captured and recaptured provides important variables such as: population size, reproduction rate, threat level, etc. Among the positive sides of the MRR method is that marking does not affect the subsequent survival of the animal (Manly 1971; Pollock *et al.* 1990; Pollock 2005).

The study of Lepidoptera in Albania has continued for several decades, with various researchers and entomologists who have contributed and continue to contribute in the discovery of butterfly species in the country. The first publications about Lepidoptera in Albania were made at the beginning of the 20th century, by foreign authors, who explored the Albanian territories of those years, continued afterwards, by foreign and local authors (Bershov, *et.al.*1993).

In June 2018, a review article was published (Cuvelier, *et.al.* 2018) with new distribution maps of the butterflies of Albania, which recorded 3 new species of butterflies in Albania also confirmed 2 species, for which there was not enough information (Verovnik R, *et.al.*2013). These study contributed in updating the status of 6 butterfly species in Albania, for which, little was known before.

These researches represent collection efforts throughout Albania, contributing to the discovery and documentation of numerous butterfly species. Today, 205 species of butterflies have been confirmed in Albania, but there are still potentially more to be found, and it is estimated that about 10 – 15 potential species can to be found, which have not yet been identified (Cuvelier *et.al.* 2023).

The study with the MRR method was carried out for the species *Pseudochazara tisiphone*. This species was discovered in the ophiolite zone of northern Pindos (Greece) by Brown (1976), and since then, has declined due to human activity (Brown, 1976). In 2017, an isolated population was found near Bulqiza (Diber), (Cuvelier et al. 2018), and in 2022, 30 km north of Bulqiza, another population was found in Lurë-Dejë National Park (Cuvelier *et al.* 2023). It is worth noting that at least 4 *Pseudochazara tisiphone* mutations are reported between Dibër district and Korça district. *Pseudochazara tisiphone* is found on stony plateaus and rocky slopes, on ophiolite substrates, with patches of loose gravel and scattered grasses from 1000 to 1700 m a.s.l (Figure 1).

Albania has a decisive role in the conservation of these butterfly populations with significant interspecific genetic variations or with their world center of gravity in this country. This also goes hand in hand with the protection of these special habitats that are prone to serious human threats (Cuvelier *et al.* 2023).

Method

Our study was conducted throughout 2023 in the Korça Region, in the area of Drenova – National Park “Bredhi i Drenova” (DCM No. 96 dated 21.11.1966). It is a protected area of the second category (according to the classification of protected areas by the International Union for Conservation of Nature, IUCN), with a surface of 1380 Ha (Figure 1). The monitoring of this species was carried out in 2 transects of this area with a surface of 5 Ha each, according to Williams (Williams *et.al* 2018). Was also done on a daily basis in each transect between 09:30 and 12:30, starting later on cooler days (i.e. if temperatures were below 24°C), throughout the months of July – September.

Monitoring was based on days with suitable weather conditions depending on precipitation and temperature, aiming at random assessments of species (Pollock *et al.* 1990). Collection and marking of species was carried out during this period, which also coincides with the flight time of the Order Lepidoptera (Pollock 2005).

Figure 1. Map of the study area

Each transect was observed for almost 2 hours at a slow and steady pace. Unmarked individuals, as well as any previously marked individuals, were noted during monitoring (Manly 1971). In using the MRR technique, butterflies in the field were collected by aerial entomological netting. Individuals are then removed from the web (Figure 2), holding the butterfly by the flaps between the thumb and forefinger of the right hand (Morton 1982).

Individuals are passed in the left hand (the right hand is free for marking), and it is held on the thorax at the base of the lower flaps which are raised in this position, and at the base of these flaps a symbol (number /line/ dot) with gold metallic ink tip pen (Figure 2), to be recognizable (Williams *et.al.* 2002).

Figure 2. Marking of individuals of the species *P. tisiphone* (photo by © Xh. Qirinxhi)

Marked insects are released back into the same field/site. Then we return to these same stations, and aim to meet again these same individuals marked by us. In each case, utmost care was taken not to damage the flats and disturb the marked individual (Gall 1984). Recaptured butterflies were then checked for the presence of the marker to differentiate from unmarked butterflies. In some cases prior to tagging, individuals were kept on ice to reduce the stress that the tagging procedure may cause (Kemp 1999).

Butterflies, which hold their wings (flats) in the closed position straight above the body, are again not disturbed by this procedure. In this case, the marking symbol from our side is visible to the naked eye, and therefore they are registered as marked individuals without the need to be recaptured. However, most of the butterflies did not hold their wings straight, so marking the underside of the hind wing requires recapturing and distinguishing any marked individual (Gall 1984).

Results and Discussions

To test the marking procedure on Lepidoptera survival, 43 individuals were captured using the MRR (Mark–Release–Recapture) method.

The survival rate was evaluated with two parameters: one for the first day after marking and the other for the following days. This is the standard way of testing for a temporal effect of marking on subsequent survival (Gall 1984; Sandercock 2006). The butterfly species studied was *Pseudochazara tisiphone* Brown, 1980, family Nymphalidae Rafinesque, 1815, subfamily Satyrinae Boisduval, 1833.

Tabel 1. Number of individuals according to transects and sex

	Transect 1	Transect 2	Total
Individuals caught	18 individuals	25 i individuals	43 individuals
Males	6 individuals	4 individuals	10 individuals
Females	12 individuals	21 individuals	33 individuals

The first interval was between: July 15 and- August 8, while the second interval was for 18 days, in the period: August 25 – September 12. During the fieldwork process, 43 *P. tisiphone* species were caught with an entomological net, of which 33 females (76.7%) and 10 males (23.2%). In the period July 15 – August 8, we caught 27 individuals, of which 21 were female and 6 were male. Of the 27 that were caught the first time, there were also some recaptures. In the second period, August 25 – September 12, we caught 16 individuals, of which 12 were female and 4 were male, and here we also had some recaptures. 8 individuals were recaptured, so the recapture rate was 18%. The first time we recaptured 5 individuals and the second time we recaptured 3 individuals. Out of the 27 individuals who met for the first time, 5 of them were recaptured, 3 of whom were female and 2 were male, resulting in 18%. Out of the 16 individuals caught the second time, 3 of them were recaptured again, 2 of whom were female and 1 was male, resulting in 18%. (Williams *et al.* 2018).

The transects where the monitoring was carried out, were observed for almost 2 hours with slow and steady walking. In the first transect, 18 individuals were caught, of which 12 were females and 6 males, and in the second transect, 25 individuals were caught, of which 21 were females and 4 were males (Table 1, Figure 3). After the capturing, the species were marked with an identification mark on the lower part of the front wing of the hind wings. During the marking process, we also had 2 dead individuals.

Figure 3. Number of individuals according to transects and sex

Conclusion

The analysis of our data aims to design a conservation model for Lepidoptera species, starting from the study with the MRR method of the *P. tisiphone* species, which is used to estimate the size of a population where it would be impractical to count each individual.

This study focuses on the use of the Mark-Release-Recapture method, increasing the number of studies, although there are biases with this method, it is one of the most acceptable methods, comparing it to other commercial methods.

Our results provide information on the diversity of the Order Lepidoptera, present in the area of Korca, (“Bredhi i Drenova” National Park), during the year 2023. In this study, the MRR method was used, where the total number of captured individuals is 43 type *P. tisiphone* of which 33 females (76.7%) and 10 males (23.2%). The highest ratio results for females of the *P. tisiphone* species. The lower number for males is thought to be a result of the effect of the emasculation of male individuals during the time interval between our meeting and re-encountering the species.

From the analysis of *P. tisiphone* individuals that we met and re-met more often, we conclude that the frequency of this species results more in Spring – Summer than in Autumn.

P. tisiphone marked and released, can be easily identified – as the identifying metallic paint markings are on the upper surface of the exposed hindwings, they are visible when the butterfly is in a normal perched position and in many cases this avoids the need to recapture the individual.

Abstract: Various factors affect labour mobility. It not only benefits the employees, but it also helps employers who need more local workers. Therefore, in addition to earning a wage by working in a foreign country, they also need a place to live. According to the International Covenant on Economic, Social and Cultural Rights (ICESCR), every individual is entitled to adequate housing, including foreign workers. However, inadequate housing for migrant workers has been a feature of the global housing crisis for years, including in Malaysia. Many reports and media coverage mention the issue of neglect of workers' rights and the issue of non-compliance with the act created when employers provide accommodation for their workers. The issue of adequate housing involves numerous parties, including workers, recruiting agents, employers, and government authorities. This study employs descriptive qualitative research methodology, utilising interview and focus group discussion techniques to collect data pertaining to the concept of "awareness of adequate accommodation". The findings of this study lead to an insufficient level of awareness about the rights of each individual, including foreign workers, to ensure that the house and accommodation they live in are comfortable and appropriate. This study will contribute ideas to all parties so that appropriate action can be taken to increase awareness about safeguarding workers' rights and complying with the act related to the provision of housing and worker facilities in Malaysia.

Keywords: Descriptive, qualitative, awareness, accommodation, foreign workers

Citation: Suhaida M.A., (2024). Descriptive qualitative research on awareness of adequate accommodation for foreign workers in Malaysia. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1657-1667), Antalya, Turkiye. ISTES.

Introduction

In 2019, there were 169 million international migrant workers worldwide, and they constituted 4.9 per cent of the global labour force in the destination countries. Males comprised 58.5% and women 41.5% of all foreign migrants. Conversely, the majority of migrants moved from low—and middle-income to high-income countries. Approximately 10% of them were between 15 and 24 years old, and the services sector was the main employer (Migration Data Portal, 2024).

The ability of workers to shift between various jobs, occupations, industries, or geographical areas in pursuit of

employment opportunities is referred to as labour mobility (McConnell et al., 2021). International mobility and migration have become a vital feature of globalization and an important source of economic growth. Migrants are known to have participated in creating prosperity and wealth in their host countries, as well as assisting development and poverty reduction efforts in their countries of origin through remittances. Migrants have the option to work where they find satisfying and think it is worthwhile in order to support their families and themselves. Employers who are facing a labour shortage might also benefit from the labour movement in order to increase the quantity of labour required to ensure a smooth production process (Borjas, 1989). This concept of labour mobility is a fundamental aspect of a dynamic and adaptable labour market.

Workers who live distant from their families require a place or accommodation to rest and meet their necessities. Because they work outside of their home countries or regions, firms may be required to make specific arrangements for migrant workers. Concerning the right to adequate housing, Article 25 Universal Declaration of Human Rights states that "Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including foods, clothing, housing and medical care and necessary social services" (United Nations General Assembly, 1948).

The Malaysian law that regulates the accommodation of workers has been passed as early as the 60s is the Workers' Minimum Standards of Housing and Amenities Act 1966. The Act was amended in 1990 and is known as the Employees' Minimum Standards of Housing and Amenities Act 1990 (Act 446). This act sets out minimum standards for housing and amenities that employers must comply with for their employees who are provided with accommodation as part of their employment (Department of Labour Peninsular Malaysia, 2024). The purpose of Act 446 is to safeguard the welfare of employees and promote decent living standards. It helps to prevent exploitation and ensures that employees are provided with necessities for a comfortable living environment.

However, many non-compliances with Act 446 have been recorded. Among the cases related to the accommodation of foreign workers are related to the placement of too many people in one residence, exceeding the required number (Suratman et al., 2019; Low, 2021; ILO, 2022a). In addition to overcrowding, the cleanliness of living quarters is also a problem, and this exposes migrant workers to infectious diseases that can spread to others (Wahab, 2020; The Star, 2022). In addition, the media also reported many cases related to the non-compliance of employers who provide accommodation for foreign workers (The Star, 2020, 2021; Sinar Harian, 2021; Bernama, 2022, 2023; Malay Mail, 2022).

The point is, with regulations and guidelines at the global and national levels, why is it still feasible to ignore the right of foreign workers to have an adequate living condition? Why are there parties who do not see these foreign workers as other human beings who need a comfortable place to live and emphasize the aspect of health care? Thus, this study aims to qualitatively review the awareness related to the right to have accommodation that is appropriate, comfortable, safe and healthy for foreign workers. The concept of awareness that will be discussed covers awareness among workers, recruiting agents, employers and the government related to the

management of foreign workers in Malaysia.

Literature Review

Adequate housing

Adequate housing is a crucial component of the United Nations' Sustainable Development Goals (SDGs). Specifically, it is addressed under Goal 11: "Sustainable Cities and Communities" (United Nations, 2024). Under Goal 11, Target 11.1 explicitly focuses on ensuring access for all to adequate, safe, and affordable housing and basic services, as well as upgrading slums by 2030. The SDGs recognize the importance of ensuring access to safe, affordable, and adequate housing for all, as it is essential for people's well-being, dignity, and overall quality of life.

Adequate housing was recognized as part of the right to an adequate standard of living in the 1948 Universal Declaration of Human Rights and the 1966 International Covenant on Economic, Social and Cultural Rights. This means that the International human rights law recognizes everyone's right to an adequate standard of living, including adequate housing (OHCHR, 2009). For that reason, the concept of adequate housing is often used in discussions about human rights, social justice, and sustainable development.

The characteristics of the right to adequate housing are clarified mainly in the Committee's general comments No. 4 (1991) on the right to adequate housing and No. 7 (1997) on forced evictions. The right to adequate housing contains freedoms (OHCHR, 2009). These freedoms include (i) protection against forced evictions and the arbitrary destruction and demolition of one's home, (ii) the right to be free from arbitrary interference with one's home, privacy and family, and (iii) the right to choose one's residence, to determine where to live and to freedom of movement.

Besides, the right to adequate housing contains a few entitlements. These entitlements include security of tenure, housing, land and property restitution, equal and non-discriminatory access to adequate housing and also participation in housing-related decision-making at the national and community levels (OHCHR, 2009).

The right to adequate housing can be affected by the extent to which other human rights are guaranteed. Access to housing is most at risk for those denied the right to education, work or social security. Improving housing conditions and protecting against forced evictions are often dependent on claims made by those affected. Where the rights to freedom of expression, assembly or association are not respected, the possibility for individuals and communities to advocate better living conditions is significantly reduced (OHCHR, 2009).

Accountability mechanisms are essential to guarantee that all parties fulfil their responsibilities concerning the right to adequate housing (OHCHR, 2009). Many different players at the national, regional, and global levels are involved in monitoring the human right to adequate housing. The role of the private sector and NGOs also

helps the monitoring process.

Accommodation for foreign workers

International Labour Organization (ILO) Convention No. 97 concerning Migration for Employment requires that migrant workers are not discriminated against in the provision of housing (C097 -Migration for Employment Convention (Revised), 1949, 1952). The convention aims to protect the rights of migrant workers by ensuring fair and ethical recruitment practices, promoting equal treatment with local workers in terms of working conditions and social security, and facilitating their return to their home countries. Thus, for countries where migrant workers are a large proportion of the workforce, they may have specific laws governing worker housing.

Accordingly, ILO Recommendation No. 115 concerning Workers' Housing gives guidance on policy, legislation and practice to the national authorities in charge of housing. It offers useful guidance on what is expected from employers who provide housing to their employees, specifying a number of housing standards. This Recommendation applies to the housing of manual and non-manual workers, including those who are self-employed and aged, retired or physically disabled persons (ILO, 1961). It also aims to ensure that workers have access to safe, healthy, and adequate housing.

Nevertheless, a press release and report by the ILO highlights that migrant worker living standards in Singapore, Thailand and Malaysia, still needed more improvements to ensure decent and adequate accommodation (ILO, 2022b). Before the COVID-19 outbreak, many migrant workers in Malaysia, Singapore and Thailand were living in substandard accommodation with deficits across the criteria for adequate and decent housing. With the advent of the COVID-19 pandemic, low-wage migrant workers were at increased risk of COVID-19 exposure and transmission due to structural factors such as their economic status, working conditions, and overcrowded and poor standard accommodations that are often in deprived areas that are at higher risk of repeated outbreaks (Wahab, 2020; ILO, 2022a). These socioeconomic inequalities see migrant workers in housing and workplaces that do not permit adequate safe physical distancing.

Malaysia has had legislation on minimum standards for accommodation for workers and their families, including migrant workers, for over 50 years. The Ministry of Human Resources first introduced the Workers' Minimum Standards of Housing and Amenities Act in 1966. The 1966 Act aimed to compel employers to provide minimum standards of housing and amenities to foreign employees and local estate workers in agriculture, plantations and mining industries (Nasir et al., 2023). In 1990, the Workers' Minimum Standards of Housing and Amenities Act 1966 was amended to streamline the existing law as well as consolidate various other workers' accommodation provisions contained in several different laws. In July 2019, the Act amended by Parliament further extended the sectors for which it is mandatory to provide decent accommodation for migrant workers. The 2019 amendment has expanded the coverage of Act 446 to cover migrant and local workers in all sectors including the construction sector.

Awareness of adequate accommodation

Awareness can be defined as knowledge that something exists or understanding of a situation or subject at the present time based on information or experience (Cambridge University Press, 2024). It can also be explained as knowing something, knowing that something exists and is important (Oxford University Press, 2024).

Awareness is often described as the first step in the change process and the first step in self-management (Agosti et al., 2019). Developing an adequate co-creative capability to allow for socially responsible action is of critical importance in the current climate of swift changes. Besides, within the context of globalisation, communication opportunities and challenges presented by information technologies, having awareness is very important. (Vyas et al., 2012). Besides, awareness development practices are recognised to affect not just individuals but also groups, teams and society

The concept of awareness to be explored in this study is related to the awareness of adequate accommodation for foreign workers. What awareness should be given to migrants about their rights? What awareness needs to be applied by recruiting agents and employers to ensure the provision of accommodation for employees? How is the awareness of the government and authorities to ensure that laws and regulations are obeyed?

Research Methodology

This study is based on descriptive qualitative research, which aims to explore the characteristics of a phenomenon, rather than explaining the underlying causes or mechanisms. The most frequently proposed rationale for the use of descriptive approach is to provide straightforward descriptions of experiences and perceptions, particularly in areas where little is known about the topic under investigation (Doyle et al., 2020). A qualitative descriptive design is most appropriate as it recognises the subjective nature of the problem the different experiences participants have and will present the findings in a way that directly reflects or closely resembles the terminology used in the initial research question.

Qualitative descriptive studies (also known as 'exploratory studies' and 'qualitative description approaches') are relatively new in the qualitative research landscape. The design of qualitative descriptive studies evolved as a means to define aspects of qualitative research that did not resemble qualitative research designs to date despite including elements of those other study designs (Ayton, 2024). A qualitative descriptive study is an important and appropriate design for research questions that are focused on gaining insights about a poorly understood research area rather than on a specific phenomenon.

Given that this research examines the management of foreign worker housing in Malaysia, the study population comprised policymakers, employers engaged in foreign worker employment, non-governmental organisations (NGOs) involved in foreign worker arrangements, researchers, and labour-related institutions. According to

Lawrence A. Palinkas et al. (2015), descriptive research generally uses purposive sampling as it focuses on the specific characteristics or target participants that align with research objectives and possess certain knowledge. For that reason, to identify the appropriate participants during the data collection process, the purposive sampling technique will be used.

The data collection process for this study began with three focus group discussions (FGD) and continued with a series of interviews. Two FGDs are among those involved with the provision of accommodation for foreign workers by sector: FGD group 1 for the manufacturing, servicing, and construction sectors and FGD group 2 for the plantation and agriculture sectors. FGD group 3 is among government agency officials and monitors who are responsible for the acts and regulations provided.

For each FGD, 8-10 institutions were involved in the discussion. The interviews were recorded and transcribed verbatim, and the data were analysed using inductive qualitative content analysis in accordance with Burnard et al. (2008). Content analysis is a research tool to identify the simplest form of word count, theme or concept. It will discover the pattern of ideas through this analysis. Each participant was given interview questions beforehand and filled out personal information and a consent form. The session is started by each moderator in the FGD group and the opportunity to speak is given to all participants.

Finding

The question asked during FGD is, "What are the concerns and challenges encountered in meeting the guidelines for the provision of housing and accommodation for foreign workers?". Several themes emerged when these questions were answered by the participants. However, for this research paper, only the theme of "awareness" will be discussed.

Migrant worker

As an employee, it is appropriate for each individual to know their rights in obtaining comfortable and safe accommodation. It is also appropriate for the individual to know the rules provided by each country so that their welfare is not neglected. Before migrating, in addition to employment and salary factors, they should also be aware of their needs and rights to get accommodation that meets the needs of survival. As the opinion expressed by Mr RZ, representative of the NGO "don't just think about work, they need to care about the place to live, which is also their right as an employee". The representative of employer-A also thinks that "it is necessary to give awareness to foreign workers, so that they know what is happening".

Recruitment agent

According to a representative from the Malaysian Trades Union Congress (MTUC), Malaysia has a system to

manage the employment of foreign workers. Applications for the employment of foreign workers are made online through the Ministry of Human Resources through the Foreign Workers Centralized Management System (FWCMS). This is an online platform developed by the Malaysian government to facilitate the registration, monitoring, and management of foreign workers in the country. The system helps to streamline the process of hiring foreign workers and ensures compliance with relevant regulations and laws.

Various information and guides are available on the website, including related to employee rights and employer responsibilities related to employee accommodation. Applications for foreign workers also can be made through a recruitment agent. As employment agents, they should have information about workers' rights in general and specifically according to the country to which foreign workers are to be supplied. Since these foreign workers come from various countries and have different educational backgrounds, it is appropriate for these foreign workers' recruitment agents to share information about adequate accommodation rights with their clients. "But most of the agents only accept money without informing the right of the workers. As a result, the welfare of workers is neglected" – Mr F., representative from MTUC.

Employer

Under Malaysian law, specifically under Act 446 (the Workers' Minimum Standards of Housing and Amenities Act 1990), employers are responsible for providing adequate housing and amenities for their foreign workers. Under Act 446, employers are required to provide suitable housing that meets certain standards, such as adequate ventilation, lighting, and sanitation facilities. Employers are also required to ensure that the housing provided is clean, safe, and in good condition. Failure to comply with the provisions of Act 446 can result in penalties, including fines and imprisonment.

However, according to a representative from Mrs. N from the Local Authority, procedures do exist and are clear, but they do not care or pretend not to know". This attitude of not being concerned about other people's rights and lack of awareness brings a bad image to the country.

Mr RZ, a representative of the NGO is of the opinion that all employers are aware and know about Act 446, which they need to comply with. But some who deliberately take it for granted are willing to be fined. "Some have money and are willing to pay fines and compounds repeatedly". However, he added, "when asked, they say they don't know the rules, because they exchange employees who manage them, while they actually take advantage. In developed countries where the laws are clear and strict, employers can obey. But non-compliance in Malaysia is high". He emphasized that there is a high level of ignorance of human rights and welfare, including foreign workers.

Miss R, a representative of a labour-related institution, also shared her experience handling cases she went through. According to her, some foreign workers are not covered by insurance and workers' compensation. In the event of an accident or injury at work, only authorized and registered workers are compensated. "This

situation occurs because the employer's attitude of responsibility is weak, and there is no awareness of the consequences if something happens".

Government agencies

On the government's side, Act 446 has been introduced since 1990. Several amendments have been made to adapt the act to current changes and needs. Department of Labour Peninsular Malaysia (DoLPM) is a government agency who responsible for enforcing various labour laws and regulations in Malaysia, including Act 446 the Workers' Minimum Standards of Housing and Amenities Act 1990. According to Mrs N, a representative from DoLPM, this department plays a crucial role in ensuring that employers comply with Act 446 by providing suitable housing and amenities for their workers, including foreign workers. They conduct inspections and enforce penalties against employers who fail to meet the minimum standards set out in the act.

DoLPM plays a crucial role in ensuring that employers comply with Act 446 by providing suitable housing and amenities for their workers, including foreign workers. The department conducts inspections and enforces penalties against employers who fail to meet the minimum standards set out in the act. Mrs N, a representative from DoLPM, said, "We not only have many new cases of non-compliance, but there are employers who have been repeatedly fined for the same offence... their sense of responsibility and awareness is indeed low."

In addition to the role of a recruitment agent, Mr. RZ, a representative from an NGO, suggested that the government could also share information and raise awareness among foreign workers about their right to obtain adequate and habitable accommodation. He mentioned that "the government or agents need to explain about workers' rights before arriving or after arriving in Malaysia."

Conclusion and Recommendation

Access to adequate housing is recognized as a fundamental human right and as an element of the adequate standard of living. The right to adequate housing is understood as central to economic justice, recognized in the ILO's Declaration of Philadelphia in 1944 (ILO, 2022a).

Accountability concerning the poor standards of migrant worker housing requires effective enforcement. New standards have little meaning if they are not comprehensively enforced with deterrent punishment against employers, property owners/agents, and dormitory operators for breaches. Evidence suggests that problems related to housing and accommodation of foreign workers occur due to the parties involved' lack of awareness.

Awareness of an issue sometimes does not come by itself and requires a campaign to create and increase it. Research about the role of public awareness campaigns in sustainable development shows that the results of effectiveness studies generally allow one to evaluate the usefulness of public awareness campaigns in promoting

sustainable development, especially when it comes to increasing awareness and changing behaviour (Borawska, 2017).

Abstract: Education serves as a cornerstone in advancing civilization and fostering the development of a prosperous human capital. Aligned with the National Education Philosophy's goal of fostering a balanced and harmonious society, the pivotal role of educators becomes increasingly significant in the era of 21st-century globalization. This study endeavors to elucidate the methodologies of Islamic education in contemporary times. Furthermore, it seeks to delve into the multifaceted roles of teachers as *Murabbi* (mentors), *Mudarris* (instructors), *Muallim* (educators), *Muaddib* (nurturers), and *Mursyid* (guides) in instilling moral values within students, following the objectives of the National Education Philosophy. Employing a qualitative approach, this study undertakes a literature review and document analysis to discern trends and insights. Despite the evolving landscape of 21st-century education, which accentuates student-centered learning, the indispensable presence of teachers remains paramount. Teachers, operating under the paradigm of the 5M concept, continue to play a pivotal role in orchestrating the learning journey, ensuring holistic development and moral upbringing of learners. In essence, this study underscores the enduring significance of educators in navigating the complexities of contemporary education, particularly within the realm of Islamic pedagogy, while also highlighting their instrumental role in shaping the ethical fabric of society following the overarching aspirations of educational philosophy.

Introduction

Education is an important tool in shaping human civilization. Islamic history has proven the significance of education in the series of civilization development through the covert propagation movement in delivering knowledge to society, as well as the emphasis on education through the condition of releasing prisoners of the Battle of Badr, which required them to teach 10 children of Medina to read and write until they were proficient. The importance of education also forms the basis in the history of the existence of various human civilizations in terms of forms and patterns of life in line with changes in time, place, and customs of a society. The educational process begins from birth and continues throughout life to enable humans to gather experiences and knowledge, subsequently passing on such matters to the next generation.

Therefore, education forms the basis for reflecting attitudes and tendencies that exist within a society, where it is an essential element in the development of individuals to shape a useful and morally upright generation. This goal can be realized through the practice and application of pure values that form the core of the development of a society and nation. Neglecting education will lead to setbacks and moral decay (Ahmad Munawar & Noranizah, 2012)

Research Methodology

This is a qualitative study, and the research design is descriptive analysis. The study is conducted to collect and obtain data to assist the researcher in making a comprehensive review of the literature related to the topic under investigation. The researcher has gathered data from initial writings on the concepts of *mudarris*, *muaddib*, *murabbi*, *mursyid*, and *mu'allim* in the context of education, as well as teaching practices around the 21st century. These data were obtained through reading and researching various sources, including working papers, journals, thesis reports, scholarly books, proceedings, and articles. Based on the data obtained, the researcher then conducted data analysis to address the research questions.

Islamic Education in the 21st Century

Education from Islamic perspectives

Education in Islam is not merely aligned with contemporary trends; rather, Islamic education has a mission to transform the minds and behaviors of society to be in harmony with the demands and requirements of Islamic teachings. Islamic education does not sideline all elements or aspects of societal development; instead, it should

be based on the al-Quran and al-Sunnah, rooted in the belief in the Oneness of Allah (*tauhid*), and submission to Allah SWT. Failure to place these primary sources at the forefront of life results in the failure to shape committed Muslim individuals who adhere to the demands of religion (Ahmad Munawar & Noranizah, 2012).

Aji Luqman et al. (2023) outline that Islamic education aims to instill awareness in individuals as servants of Allah and in community members to have a sense of responsibility towards community building in matters of administration, environmental conservation, and worship to Allah SWT. This direction is achieved through education that emphasizes balance and harmony between worldly and hereafter life. These fundamental Islamic values can safeguard human life from engaging solely in matters driven by desires and even serve to meet the demands of social and individual change.

Al-Faruqi believes that the success of the Muslim community depends on efforts to improve the educational aspect, where there should be unity and complementarity between Islamic education and the secular system. This integration will create an education system based on the spirit of Islam or the Islamization of knowledge and become an integral ideology within society. To achieve this goal, several objectives have been set as guidelines (Zuraidah, 2012):

- (i) mastery of modern disciplines,
- (ii) mastery of the heritage of Islamic knowledge,
- (iii) determining the adaptation of Islam to modern knowledge fields,
- (iv) seeking a creative synthesis between the Islamic heritage and modern knowledge, and
- (v) directing Islamic thought towards achieving Allah's SWT planning pattern.

The main goal of the Islamic education system is to provide skills, knowledge, and the development of individuals who are mindful of Allah SWT. Schools and teachers play a crucial and significant role in the world of education towards educating the younger generation. Schools, as formal institutions, not only play a role in imparting knowledge to students but also emphasize the development of social and moral skills, which are fundamentally the responsibility of parents. Therefore, the role of teachers is crucial in developing the society of a country (Ab. Halim, 2021).

Education in the 21st Century (PAK-21) in Malaysia

The current developments have an impact on the educational aspect. Therefore, Islamic education in the 21st century is also experiencing a phase of change in the learning curriculum. Learning in the form of teacher-centered tradition has shifted towards education that stimulates social development to face the industrial era, which influences society to become more modern. The use of technology such as smartphones and the internet is a necessity in achieving life goals more effectively and efficiently. However, it can still have negative effects if it is not based on morals. Therefore, education in the 21st century still needs to uphold a balance and moral values in line with current developments (Mohd. Faizin et al., 2023).

In Malaysia, education is one of the foundations of civilization development in strengthening the formation of a prosperous human capital. In line with the National Education Philosophy (FPK) towards achieving the formation of a balanced and harmonious society, the role of teachers is crucial in the era of globalization around the 21st century. 21st-century education (PAK21) refers to approaches and educational strategies tailored to the demands of the modern era, where technology and globalization play crucial roles. PAK21 aims to prepare students with relevant skills and knowledge to succeed in the information age and promote the development of PAK21 such as the four Cs, namely critical thinking, creativity, communication, and collaboration (YM Raja Abdullah & Daud, 2018).

Furthermore, PAK21 emphasizes a student-centered approach, based on collaboration and problem-solving orientation. The use of technology in the learning process is also a crucial component of 21st-century education because technology can enhance access to information and develop digital skills. According to Abd Rahman & Ramli (2021), due to the global outbreak of COVID-19 at the end of 2019, the government announced the closure of all educational institutions, including government and private schools, at the primary, secondary, and tertiary levels.

Pedagogy forms the foundation of the quality of teaching and learning for teachers that encompasses principles, techniques, and teaching processes. A systematic, engaging, and relevant teaching and learning process can ensure that students are actively engaged and motivated throughout the learning process.

There are several challenges to new norm pedagogy, especially during the COVID-19 pandemic. According to Abd Rahman & Ramli (2021), face-to-face teaching and learning methods have been completely transformed into remote learning methods to control the movement of teachers and students. This is to ensure their safety from COVID-19 infections. As a result of the implementation of the new norm pedagogy, some challenges faced by students and teachers include unsatisfactory internet access, a non-conducive learning environment, as well as a lack of electronic devices (Mohamad, 2021).

However, the Ministry of Communications and Multimedia Malaysia (KOMM), in collaboration with the Ministry of Finance (MOF) and the Ministry of Higher Education (MoHE), has initiated efforts to assist the learning process of students from the Bottom 40 (B40) group in Higher Education Institutions (HEI) by providing them with a device. Additionally, in a study by Norazlin & Siti Rahaimah (2013), it is stated that time constraints, insufficient knowledge, and limited information and communication technology facilities are challenges in implementing 21st-century learning.

Teachers' Role Based on The Understanding of the 5m in 21st-Century Learning

5M concepts in education

The concept of the Five *mim* (5M) refers to the combination of five concepts of Islamic education teachers,

namely: *mudarris*, *muaddib*, *murabbi*, *mursyid*, and *mu'allim* (Muhamad & Jaafar, 2021). Mohammad Ali & Abang Muis (2021) have listed five terms synonymous with Islamic education teachers, namely *murabbi*, *muallim*, *mudarris*, *mursyid*, and *muaddib* or *ulama*. Meanwhile, Ab Halim Tamuri's study discusses in detail the characteristics of the domain of the roles of Islamic Education teachers, including responsibilities as *mudarris*, *mu'allim*, *murabbi*, *muaddib*, and *mursyid* (Mamat & Wan Abdullah, 2014). Essentially, this concept is specifically designed for Islamic education teachers. However, it can also be applied to teachers of other subjects with some modifications. This concept constitutes important characteristics that should be possessed by a teacher, especially an Islamic education teacher. According to Jaafar et al., (2019), among the 5M, the following statements can be correlated:

The teacher (murabbi) plays a role in developing morals, not only as a knowledge disseminator (mu'allim). In short, teachers should also strive to instill etiquette (discipline in thinking, physical, and spiritual aspects) by being a muaddib and shaping effective teaching characteristics within themselves (mudarris) as well as being capable of leading by providing guidance (mursyid).

Mudarris

The term "mudarris" originates from Arabic, literally meaning a teacher or educator. Although the term "mudarris" is not directly mentioned in the Quran, it is closely related in meaning to its root word, which is "د ر س" (Mamat & Wan Abdullah, 2014). "Mudarris" is the active participle form of "tadris", and it is also a derivative of the words "darrasa" and "darasa". These two words differ in meaning, where "darrasa" means to teach, while "darasa" means to learn.

Lubis (2020) stated in his study that a teacher who plays the role of "mudarris" is so special that Allah SWT mentioned it in several verses of the Quran. Three verses in the Quran use the root word "darasa", namely Surah Ali-Imran verse 79, Surah Al-An'am verse 105, and Surah Al-A'raf verse 169 (Muhamad & Jaafar, 2021). Mamat & Wan Abdullah (2014) listed several other verses, including Surah Al-An'am verse 156, Surah Saba' verse 44, and Surah Al-Qalam verse 37.

A "mudarris" is an Islamic education teacher who has successfully demonstrated himself as an excellent educator based on five important characteristics: personality, effective teaching methods, the ability to create a conducive classroom environment, and proficiency in making professional decisions (Abdul Hakim Ramli, 2020; Mamat & Wan Abdullah, 2014).

According to Muhamad & Jaafar (2021), a "mudarris" plays a role as an excellent teacher in classroom management from the beginning to the end of the learning session. Norliza Nor Hashim et al., (2019) also define a "mudarris" as an effective teacher encompassing aspects of teaching and learning preparation, teaching processes, and self-assessment.

Mu'allim

The teaching process is also associated with the term "*ta'lim*". "*Ta'lim*" encompasses three important terms in education, namely *tarbiah*, *ta'lim*, and *ta'dib*, which are directly related to individuals, society, the environment, and the relationship with Allah SWT. *Ta'lim* is also understood as the process of transferring knowledge from the teacher to the students who do not possess that knowledge. The person who transfers this knowledge is called a "*mu'allim*" (Tamuri & Ajuhary, 2010).

The study by Muhamad & Jaafar (2021) states that *ta'lim* is a process of imparting knowledge from a teacher to his students. Therefore, a *mu'allim* can be defined as a disseminator of knowledge to students based on authoritative sources without denying the right of intellect to acquire knowledge. The wisdom of the *mu'allim* in fulfilling the responsibilities as a guide and leader to the students will complete themselves as professional and authoritative *mu'allims*.

Therefore, *mu'allim* is the actor associated with the derivative term '*ta'lim*', which means teaching. The verb for *Mu'allim* is '*allama*' in the Quran. Allah SWT says:

And He taught Adam the names of all things; then He presented them to the angels, and said: 'Tell Me the names of these if you are truthful.'

(Surah al-Baqarah, 2:31)

This verse narrates that Allah SWT taught Prophet Adam the names of all creatures that can be perceived by humans, whether through sensory perception or intellect (Mohamad Azizi bin Md Mukhtar et al., 2020).

According to Mohamad Azizi bin Md Mukhtar et al., (2020), *mu'allim* refers to the explanation of knowledge so that students can have a deeper understanding of the knowledge conveyed, using various teaching methods. *Mu'allim* is also a teacher who imparts knowledge and skills because it forms the foundation that students will practice in their daily lives, aligning with their responsibilities as servants of Allah on earth (Norliza Nor Hashim et al., 2019).

The success of the *ta'lim* process depends on the harmony between teaching processes and the Quran and Sunnah. As the *mu'allim*, the teacher must implement the educational process based on the principle of harmony between theory and practice, determine the direction and goals of *ta'lim* before accepting and understanding any information, and be attentive to and nurturing students' abilities. Additionally, teachers need to be proficient and creative in delivering lessons, master knowledge, and act as planners, managers, facilitators, and mentors, always staying motivated, and possessing a positive personality as a role model for students to emulate (Tamuri & Ajuhary, 2010).

In summary, the role of the teacher as a *mu'allim* encompasses responsibilities in the classroom to inform, teach, transfer, and convey various types of information, discipline, and knowledge to students, whether through

training, instructions, or any form of teaching. Thus, this process aligns with the requirements of Islam in accordance with the Quran and Sunnah, where students are required to consider these sources as the primary reference for evaluating and understanding any knowledge or information. This is the educational approach in Islam that emphasizes the importance of knowledge and understanding based on the first verse revealed to Prophet Muhammad SAW (Tamuri & Ajuhary, 2010).

Murabbi

Murabbi originates from the verb "*rabba*," which means to educate, nurture, and raise. *Murabbi* is derived from the word "*tarbiyah*," which means education, nurturing, upbringing, and caring (Muhamad & Jaafar, 2021). According to Lubis (2020), *tarbiyah*, in terms of terminology, is the process of realizing human development, shaping a society that is aligned with the philosophy of life, having high personalities, and fostering the qualities and talents of students to develop according to their maturity level. Mohamad Azizi bin Md Mukhtar et al., (2020) define a *murabbi* as a teacher who serves as a role model for students in addition to teaching. As a good role model, a teacher must possess commendable characteristics such as honesty, compassion, sincerity, and others.

The role of a *murabbi* involves engaging in the realization of the formation and development of students in terms of physical, spiritual, emotional, intellectual, and social aspects to produce individuals who are virtuous, righteous, and obedient according to Islamic views (Norliza Nor Hashim et al., 2019). A *murabbi* is also responsible for showering affection, educating, nurturing the innate nature of students, and developing their inherent abilities.

In their writing, Mohammad Ali & Abang Muis (2021) elucidate that teachers with the characteristics of a *murabbi* emphasize efforts to nurture and develop human potential, which includes the physical, spiritual, and intellectual development of students. Four elements of the *tarbiyah* process include nurturing and caring for children, developing talents and potentials, guiding potentials towards perfection, and this process occurs gradually.

Sidek Baba elaborates on the role of teachers as *murabbis* in seven roles, which include preparing oneself with knowledge, skills, and specialization; setting an example for others, delivering the curriculum with appropriate methodologies, instilling moral values in students, being creative and proactive in handling teaching and learning, understanding the challenges of the times and the whims of the environment, and creating a conducive atmosphere during the teaching and learning process (Jaafar & Rashed, 2015).

Among the characteristics of a Rabbani teacher highlighted by al-Ghazali is a teacher who plays the role of a parent or guardian to the students in school, fostering a sincere relationship full of compassion to establish trust between them. Furthermore, the teacher also needs to strive to instill Rabbani traits in the thoughts and actions of the students so that the formation of excellent individuals in this world and the Hereafter can be realized

through the *tarbiyyah* process conducted by teachers with *murabbi* characteristics. The role of the *murabbi* teacher is also encompassed in the role of the teacher as a *muaddib* (Muhamad & Jaafar, 2021).

Therefore, teachers characterized as murabbis need to embody four elements of teacher quality, such as Rabbani thinking, mastery of religious knowledge, practice and cultivation, teaching skills, and moral excellence (Jaafar & Rashed, 2015).

Muaddib

Muaddib refers to the word "*addaba-yuaddibu-ta'diban*" which means to instill good manners or cultivate good character, in other words, to cleanse someone from bad manners (*suul adab*) or impurities (Lubis, 2020). According to Lubis, *ta'dib*, in terms of terminology, is the process of educating for noble character. Therefore, an individual needs to be educated with good manners to shape their identity following the laws of Allah. A study by Norliza Nor Hashim et al., (2019) states that a *muaddib* must educate students to be cultured, and possess noble character, and integrity. While Mohamad Azizi bin Md Mukhtar et al., (2020) define *muaddib* as an educator who guides students in terms of manners by fostering commendable qualities.

The role of a *muaddib* is to shape his students by instilling behavioral, effective, and cognitive values. According to Abdul Hakim Ramli (2020), a *muaddib* plays the role of a teacher to educate, guide, and cultivate noble character in the development of students' personalities within the classroom. Muhamad & Jaafar (2021) also state in their study that the process of *ta'dib* involves moral aspects to produce students with noble characters.

Mursyid

Mursyid, on the other hand, means a guide or a giver of guidance, derived from the verb "*arsyada*" or "*irsyad*". The Quran mentions "*Mursyid*" several times, and the term "*Irsyad*" in the Quran encompasses meanings that indicate the right path and true guidance. Allah SWT says:

It is a Book which guides to the right path; we have believed in it, and we will never associate anyone with our Lord.

(Surah Al-Jin, 72:2)

Abdul Hakim Ramli (2020) stated that *Mursyid* refers to the leadership aspect of a teacher in the classroom to nurture, advises, and guide students to become righteous individuals. However, Mohamad Azizi bin Md Mukhtar et al., (2020) explained that *mursyid* means someone who helps their students differentiate between right and wrong, and lives a high standard of life in line with the situation and educational level of their students, or provides guidance towards the truth. According to Lubis (2020), the process of *Irsyad* in teacher's leadership while teaching students involves showing the right way, advising, accompanying, guiding students,

giving directions, and also providing guidance. The characteristics of a *mursyid* teacher are considered experts in their field, leaders in pedagogy, striving to make decisions and solve problems that arise in the field of education, and also assisting their colleagues.

Teachers as Murabbi, Mudarris, Muallim, Muaddib, and Mursyid in 21st Century Learning

From the Islamic perspective, teachers bear significant responsibility in shaping morals and individuals, functioning not only to impart knowledge but also as preachers. This responsibility is associated with the role of a preacher or *da'i* in raising awareness among communities about the Islamic religion and its implementation in daily life, especially targeting its primary audience, the students. Da'wah (preaching) and education are two inseparable elements because their goal is to develop knowledge, attitudes, skills, and practices among students (Ab. Halim, 2021).

The four patterns of goals that teachers aim to achieve in teaching and learning Islamic Education are:

- (i) transferring knowledge,
- (ii) behavioral change,
- (iii) excellence in students, and
- (iv) success for students in this world and the hereafter.

Therefore, in achieving the curriculum goals of Islamic Education, teachers play a crucial role in facilitating the teaching and learning process by implementing, providing materials, planning teaching and learning activities, modifying the curriculum, improving it, and being directly involved in the introduced curriculum.

The relationship between students and teachers in the learning process can be observed through the qualities and feelings of care given, frequent advice, guidance, assistance provided to students, and guidance to follow what is advised. This situation provides motivation and encouragement for the ideas and positive thinking of students, in addition to enhancing mastery of knowledge and understanding among students. The application and approach of the 5M represent a paradigm shift in the role of teachers in the context of Islam, where this practice has a relationship with Allah SWT.

The study by Ab Halim Tamuri entitled "The Practice of Islamic Education Teachers in Developing the Hadhari Islamic Society" outlines 25 main domains that Islamic Education teachers need to master to become effective educators, as stated by Mamat & Wan Abdullah (2014):

1. Capturing students' attention during teaching and learning.
2. Structuring teaching content.
3. Linking with students' existing knowledge.
4. Introducing teaching topics during instruction.
5. Delivering information easily, accurately, and clearly.
6. Using blackboard or whiteboard effectively.

7. Adapting teaching strategies to the time, interests, and abilities or levels of students.
8. Adapting teaching strategies to available resources.
9. Managing the classroom well (creating a conducive learning environment).
10. Using appropriate and effective teaching aids (OHP, flip chart, pictures, ICT, computer, and others).
11. Having a sense of humor.
12. Having good interpersonal skills (body language, gestures, eye contact).
13. Diversifying effective teaching methodologies.
14. Diversifying questioning techniques during teaching.
15. Answering students' questions wisely.
16. Identifying student learning problems.
17. Adjusting teaching pace (slow or fast).
18. Teaching according to the sequence of teaching content.
19. Providing reinforcement to students during teaching.
20. Teaching actively or energetically inside and outside the classroom.
21. Using Jawi script effectively.
22. Conducting formative assessment of student learning.
23. Making teaching summaries.
24. Giving follow-up assignments or homework.
25. Reflecting on teaching from an Islamic perspective.

Conclusion

Teachers of Islamic education serve as icons and are categorized as role models in leading a religious and moral life by students and the entire community. The teaching methods of teachers can have a significant impact on students in receiving the knowledge imparted because of their compassionate nature and wise guidance. The desired learning outcomes in the implementation of Islamic education are the mastery of knowledge and the internalization of values in life.

Acknowledgement

The researchers would like to thank UiTM Cawangan Melaka for funding this study through the Fundamental Research Grant Scheme (FRGS/1/2022/SS10/UITM/03/7) channeled by the Ministry of Higher Education Malaysia. We would also like to extend our gratitude and appreciation to everyone who was part in this work, whether directly or indirectly.

Woman's Representation in Music Video

Frederik Masri Gasa

Bina Nusantara University, Indonesia,  <https://orcid.org/0000-0003-0181-325X>

Felisianus Novandri Rahmat

MNC University, Indonesia

Abstract: "Beautiful We Are" is the title song by Alffy Rev which in the music video chronicles the beauty of Indonesian culture and the sacred love story of two lovebirds depicting scenes of female domination and male subordination. Combining EDM music, gamelan and national songs, Alffy Rev admits his goal is to make Indonesia more loved among young people and to make Indonesia known to the world. This study aims to determine the representation of woman in the clip "Beautiful We Are". Culture is a representation of the identity of a community. From culture also stored the character, symbolism, philosophy and way of life of the people. This study uses descriptive qualitative research methods. The data analysis technique uses semiotic analysis by Roland Barthes which analyzes video sequences with markers of denotation, connotation and myth. The results of this study indicating the representation of women in the clip "Beautiful We Are" is presented through female domination and male subordination, the role of women in social and cultural life. The content of the video shows the beauty of Indonesian culture.

Keywords: Culture, Music video, Representations, Domination, Woman

Introduction

Mass communication is a form of interaction that influences itself intentionally or not but is not limited only to verbal forms of communication, but also in terms of facial expressions, writing, painting and music. Music communicates through the presentation of lyrics. Meanwhile, the lyrics written by the lyricist are part of the intentionally created verbal symbols.

The music video is known as a 1-5 minutes audio and visual spectacle that displays the storyline of the message in the song lyrics content. In fact, many of the actors in the production (musicians) use music videos as a promotional event to showcase their work. Thus, in music video works, the emphasis is on the visualized stories in order to create false views and aim to gain the attention of the audience. In this case, to support the power of

visualization and audio stories, it is certainly important to place the talent for portraying the characters in the clip.

The positioning of the representation of the character in the music video generally places the figure of the genre as the main figure in the music video. In addition, the positioning of talent in music videos often contrasts with the promotional goals of the music video itself. Like Rihanna's music video titled Work, in the video Rihanna is scantily clad and sexy. Rihanna's sexuality and the accompanying dancers are heavily featured in her music videos. With this, because we know that the form of exploitation of women's sexuality that occurs in the media is an unfair form that is contrary to the legal protection of human rights, both in international and national instruments. As mentioned in *Undang-undang nomor 39 tahun 1999, Pasal 2*, “*Negara Republik Indonesia mengakui dan menjunjung tinggi hak asasi manusia dan kebebasan dasar manusia sebagai hak yang secara kodrati melekat pada dan tidak terpisahkan dari manusia, yang harus dilindungi, dihormati dan ditegakkan demi peningkatan martabat manusia, kesejahteraan, kebahagiaan dan kecerdasan serta keadilan*” (Tajna Jasmine, 2021).

Based on this social phenomenon, there are several music videos that raise related issues. One of them is Alffy Rev's music video called Beautiful We Are which raises the issue of gender equality. The clip, titled Beautiful We Are, has a call for further study, as in this clip it chronicles the adventures of two lovebirds struggling to find secrets in prehistoric times, and how to portray the value of the genre. equality in the nuances of Balinese culture.

Alffy Rev's EDM genre music released their 7th single on YouTube in July 2020. The clip, which was played for 3,198,023 in December 2020, chronicles the adventures of a couple to uncover the secrets of prehistoric times. Bali. The story of the video goes backwards and makes the female character here told as a brave, hardworking and friendly character. Not only that, the role of the other packed characters also shows a group of tribes, the traditional Balinese dances in this scene are more female-oriented. Here, traditional art is also included as a means of communication as it also contains messages which are passed on to other people (Media Mahasiswa Publishing, 2015).

Therefore, Alffy Rev's Beautiful We Are clip is worth discussing in more depth. If you look at previous researchers, there haven't been any studies on women to instill the value of gender equality in Balinese culture. Previous research results with the title Representation of Radical Feminism in the "God is a Woman - Ariana Grande" music video yielded the results of female domination and male subordination, descriptions of monoandrogynous women, female body power and the role of women in social and legal life. The second study titled "Representation of Women's Stereotypes and Patriarchal Culture in Meghan Trainor's Video Clip - All About That Bass" gave the results that female stereotypes are still attached to public opinion, namely the use of skirts and the pink color which is always identified with women. And a patriarchal culture that sees women as the sex objects of men and women must serve men.

Based on the data contained in previous studies, this research is worth exploring to see how the form of representation of women in the value of gender equality in Balinese culture. This research is also expected to provide educational value on gender equality and Balinese cultural arts in the digital age for millennials and video maker communities.

Methods

This research is qualitative research. Qualitative research is conducted to acquire knowledge through understanding and discovery. In qualitative research, the researcher is the key. This study emphasizes the boundaries of meaning and linked by value. (Lexi, 2010). The research method used to conduct this research is the semiotic method. Semiotics is a method used to study various science, it is possible because there is a tendency to see various social discourses as phenomena of language (Kurniawan, 2020). The main source of this research is the clip titled "Beautiful We Are" which is the 7th single created by Alffy Rev which was released on his personal YouTube social network (Alffy Rev) in July 2020 with a video duration of 4:03 minutes.

To obtain the results of the research, the researcher will analyze the Alffy Rev video clip "Beautiful We Are" using the semiotic theory of Roland Barthes. Barthes' theory focuses on the idea of meaning in two stages, namely denotation and connotation or commonly referred to as the Order of Significations. First order of meaning (denotation) and second order of meaning (connotation). The denotation refers to what we believe in common sense, the observable meaning of a sign, which explains the relationship between the signifier and the signified, or between the sign and its reference to reality which produces a direct meaning / explicit. Connotations in Barthes' framework are called myths because they are the same as ideological dissections that function as revelations and justify the dominant values that apply to a certain period.

In qualitative research, researchers must test the validity of the data to obtain the validity of the data found. According to Moleong, to determine the validity of the data, an examination technique is necessary. The examination technique is based on a number of certain criteria. Four criteria are used to check the validity of qualitative data, namely: a) credibility, b) transferability, c) dependability, d) confirmability (Abdullah, 2009).

Results

Various ways can be done to foster a sense of homeland love, at least by not making speeches or spreading hatred towards the public. One of them was successfully implemented by a young man from East Java, Awwalur Rizqi Al-firori. With his positive works, he is able to cultivate a sense of love for the homeland by introducing or elevating local culture in his works.

Known as a composer who defends nationalism and regional culture in his works, Alffy Rev published a work titled "Beautiful We Are" on his YouTube account on July 22, 2020 in collaboration with a young Indonesian singer, Hanin Dhiya. His work is now steeped in nuances of Balinese art and culture. In the description column

of his YouTube channel, Alfyy Rev describes that his song with the title "Beautiful We Are" is his seventh work. This special song was eventually born into a new story form for Alfyy. The reason is that his song is tightly nuanced with Balinese culture with lyrics full of romantic values. According to Alfyy Rev, the song "Beautiful We Are" tells the secret of prehistoric Bali which shows that Indonesia was once a land of extraordinary civilizations in its time. The hidden civilization was finally discovered, and how beautiful this country was. For example, the correct way to wear kamen (Diantari Putri, 2020).

In the clip "Beautiful We Are", there is no longer any subordination of the role of gender inequality, when it is said that women are less important, for example in the development of household policies, or that there is a double burden when a woman is considered capable of doing all the housework, because women are considered to have a nurturing nature, and women are in charge of labor because they are in a precarious family situation.

This is shown in the second scene, a woman is depicted as a modern woman who becomes an educated person as seen in the photo frame which shows the moment when she is wearing a paskibra uniform, and several stacks of books and computers laptops that open a map site of Indonesia showing that she is a researcher. Not only that, the scene which shows that women also play an important role in decision-making is depicted in the fifth scene, where a woman becomes the leader.

Figure 1. Scene 2

Figure 2. Scene 5

On an adventure with his lover, he is invited by his lover to walk first to find a place to go. With a brownish yellow image display, this clip looks warm, besides telling the audience that women are the givers of life. Where the yellow color associated with brown gives the meaning of prosperity and the foundation of life (Epsikologi, 2020).

Figure 3. Scene 7

Figure 4. Scene 1

The role of the female character who transforms into a Balinese goddess in the seventh scene has the connotation of a special female figure where a goddess is known to have divine power, which can be a creator, destroyer or impart beauty. In this case, the producer seems to want to tell the audience that women are valued and compared to a goddess who has strength and beauty, because an adult woman can give life to offspring and become a mother and a wife. who deserve to be loved and respected.

Not only that, the first scene, when the woman has just woken up in black pajamas, portrays a female character who is genuinely respected for not exploiting the character's body shape so that she gets trapped by a blanket. Plus, with the male lover versus female character masculinity scene at the start of the adventure journey played by Alffy Rev and Linka Angelia, namely the scene where Alffy extends her hand to help Linka, and Linka responds to the scene of Alffy's hand holding arm as if to show the audience that the two lovebirds are a complementary couple, supporting each other without limiting their gender roles, both male and female.

Overall, this clip succeeds in expressing the issue of unequal gender roles regarding women, which manifests as unimportant women, or simply as *konco wingking*. This music video also provides education to the public about the history and culture of Bali, where in the eighth to tenth stage, female dancers are shown wearing traditional Balinese clothing, as well as Balinese dances such as the Pendet dance and Kecak dance. This clip can also be a small satire on the value of the spirit of nationalism and love for the homeland for young people, which begins with the scene of the introduction of self-identity in a photo frame of a female character wearing a paskibra uniform, for the persistent struggle of a loving couple even with limited tools to find a place they want to live. In order to achieve their goal, they keep trying to do so by exhibiting a high sense of love, respect and concern in order to find the place they are looking for, namely to see the beauty of Indonesia. , both in culture, music, dance and makeup. The role of the producer in creating the script for this music video comes down to showing that the nation of Indonesia is no less beautiful and no less interesting than the incoming global works and culture.

Discussion: Culture from the perspective of millennials

Culture is a representation of the identity of a community. From culture also stored the character, symbolism, philosophy and way of life of the people. Culture has three forms, the *artefak* is the name of the visible culture, while the *sosiofak* is an image of the social order of society and the *mantifak* is a representation of ideas or thoughts (Erza, 2013).

The typology of the company can be arranged according to technological adaptation, hence the emergence of the term millennial or generation Z, which is a name tag for people born in the 1990s and 2000s. There is a difference between this generation and the previous generation in the vision of culture. Generation Z seems to be an exclusive generation that breaks the chain of cultural relays and prefers to develop its own culture.

Their culture, which now follows the current of globalization, makes popular with some Indonesians anything that smells of foreign culture like Korea. The spread of Korean cultures in East Asia and some countries in Southeast Asia is commonly referred to as *Korean Wave*, who is able to present South Korean culture well to Indonesian people, even to be able to influence the lifestyle of Indonesian youth. From musical tastes, dress styles, food, manners, beauty products, etc. As recently, the phenomenon of the abundance of McDonald's (McD) fast food restaurants due to their partnership with the famous k-Pop, Bangtan Boys (BTS) providing a new menu innovation namely *BTS Meal*. The success of the *BTS meal* marketing strategy certainly cannot be separated from the *BTS fans* who are all over the country, especially in Indonesia. In fact, the Indonesian government has temporarily closed 13 McD outlets (Putri, 2021). However, in this context, BTS is mentioned as the most successful producer of Korean pop culture and contributes greatly to the national economy of South Korea. The Hyundai Research Institute (HRI) said in 2018 that BTS contributes 4 trillion won (US \$ 3.54 million) annually to the South Korean economy (Setowara, 2021).

The spillover of BTS meals in various countries is reminiscent of Indonesia in 2020, and the work of young Jakarta musicians, *Weird Genius*, which consists of Reza Oktovian, Eka Gustiwarna and Gerald Liu. It all started with his song *Lathi*. *Lathi*, which was released in February 2020, is unique as the lyrics combine two languages, namely English and Javanese. Not only that, the combination of a touch of traditional music and electronic music, often referred to as EDM or Electronic Dance Music, may surprise Asian listeners. Until *Lathi* managed to go viral and achieve many accomplishments. Even the faces of *Weird Genius* members were plastered on Billboard Times Square, New York.

Not only that, the combination of the concept of EDM music with a touch of traditional music was also sung by musicians from Mojokerto, East Java, Alffy Rev. It also managed to innovate by organizing national songs and Indonesian folk songs with electronic music. In fact, in 2017 he had the opportunity to appear at the Embassy of the Republic of Indonesia in the UK, and in 2018 he received an award *The Olympic Council of Asia (OCA)* as *YouTuber* cover song *Asian Games 2018* (Damanik, 2018).

Combining EDM music, gamelan and national songs, Alffy Rev admits his goal is to make Indonesia more loved among young people and to make Indonesia known to the world. He said this during a BBC interview in 2019 "I want the Indonesian national anthem to be included in youth playlists because of its extraordinary national values, I want the national anthem to be in line with western music "(BBC News Indonesia, 2019). He also said that he wanted to make Indonesia global with his work, that he would try to make Indonesia seen as elegant in the eyes of the world. One of them, in his original work titled "How Beautiful We Are", although the clip tells the love story of two lovebirds, Alffy Rev still wraps it with elements of Indonesian culture, à la both dance, history and myth, as well as Balinese music.

The positive reviews in Alffy Rev's music video prove once again that his work can be easily accepted by millennials. Additionally, the storyline of the original music videos is still full of adventure, mystery, and

shows the richness of Indonesian culture. Not only that, behind the clip, full of adventure, mystery and beauty of Indonesian culture, there is always the theme of the love story of two lovebirds. One of them in the clip entitled "Beautiful We Are", tells the adventure of the love story of two lovebirds who can not separate. In fact, according to the results of a survey on rumahmillennials.com, the romantic genre is the favorite among millennials. This can be read from data on seven film genres, there are three genres most favored by millennials, namely; romance, action, comedy. The action genre is in first position with 63.8% and romance is in second position with 60.9% and comedy is in third position with 58% (PRATOMO, 2019). This is related to mass communication, where mass communication is a process of communication carried out to people in large numbers so that it requires data which becomes the raw material for messages which will then be disseminated to the public (Triputra, 2018).

Conclusion

There is a portrayal of a woman who is strong, respected and becomes a supportive figure for her partner, to which scenes from the video such as the main character stand. transforming into a goddess filled with wings, clothes and a golden crown which represents strength, luxury and a polite and elegant woman, the main female character wakes up in black pajamas, represents a female character who is truly respected as not harness the character's body shapes to be fooled by a blanket, and a scene where the female character returns help from her partner. The man holding her arm gives a message that women are supporters, men and women complement each other. Not only that, unconsciously, the messages contained in this clip are intended to influence the audience through ideologies such as the myth of the existence of a city thought to be lost, namely Atlantis.

And in another case, it is used for campaigns on gender equality where previously many thought that being a Balinese woman was a difficult life, as she had to bear three burdens, namely economic burden, family burden and the religious charge. Even if it is about culture, this music video is still packaged according to the millennial eyes which are packaged in a modern form, for example in terms of arrangement and images using CGI, so that while the video is aired, it looks very luxurious and real. Not only that, this clip also provides values for the spirit of nationalism and love of the motherland, as well as education in Balinese culture, both in terms of the correct use of traditional clothing, dancing, history and language.

Recommendations

Future research would be better if it was seen from a different perspective regarding how cultural commodification is carried out through art and other entertainment.

Profiling Digital and Collaborative Competencies in International Online Learning (COIL) in Higher Education

María del Pilar García-Chitiva

Tecnologico de Monterrey, México,  <https://orcid.org/0000-0001-6776-3422>

Abstract: Collaborative international learning (COIL) is one of the most recently adopted higher education activities, especially after the pandemic. In COIL, students from two countries come together through digital communication tools to participate in academic activities coordinated by professors from both countries. Despite frequent academic and innovative activities, studies analyzing these activities still need rigorous exploration. Although the COIL strategy proposes collaboration as one of the central cores, few studies examine the competencies students require for optimal team performance. This work aimed to characterize the collaborative and digital competencies of students who learned in a COIL experience. The results showed that the student's personal experiences are at the forefront of how they develop and perceive their digital and collaborative competencies when learning with others and that the educational modality to which students are continuously exposed impacts the competencies they develop and how they collaborate.

Keywords: COIL, Digital competencies, Higher education, Educational innovation, Collaborative competencies

Citation: García-Chitiva, MdP. (2024). Profiling Digital and Collaborative Competencies in International Online Learning (COIL) in Higher Education. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1688-1698), Antalya, Turkiye. ISTES.

Introduction

Collaborating involves working together to achieve common goals (Guitert & Pérez-Mateo, 2013). It also requires coordinated, continuous, flexible, and symmetrical efforts and distribution of assignments according to each one's expertise and the nature of the task (Iinuma et al., 2016; Roschelle & Teasley, 1995). In addition, it demands dialogue, collective construction, negotiation of meanings, management within the group, and awareness of each group member about each one's strengths.

Lewis (2003) proposed a cognitive measure called Transactive Memory System (TMS), which allows understanding of the cognitive functioning of a collaborating team based on three dimensions: specialization, Coordination, and Credibility. Specialization reflects the differentiated knowledge of group members; Credibility, the members' beliefs about the reliability of other members' knowledge; and Coordination, the efficient and coherent processing of the group's knowledge (Garcia-Chitiva, 2020). These dimensions are

shaped by trainees' increasingly detailed knowledge about what their teammates know and can do. They also comprise coordination systems deployed to establish effective channels and moments to communicate, work, and meet expected objectives. This deployment contributes to Credibility, constituted by the time spent working together and the positive or negative experiences of working with peers (García-Chitiva, 2021b).

How collaboration is developed also adds value to learning with others. For example, if it is face-to-face, the possibility of having immediate feedback from peers and teachers is direct and more significant (Peñarrubia-Lozano et al., 2021), while doing it in an online environment 'can extend the response time, requires the support of tools to communicate (e.g., email, mobile applications, etc.), and even require teaching and learning to be balanced between flexibility and teacher guidance (Lin, 2020).

The Collaborative Online International Learning (COIL) strategy is among the ways to teach and learn online. COIL has as its primary purpose the development of academic and intercultural knowledge exchanges between teachers-teachers, students-students, and teachers-students from different national and geographical contexts (San Martín et al., 2022), *i.e.*, its primary purpose is the internationalization of the curriculum and the development of intercultural skills. Being grounded in the collaborative structure, COIL could be said to be a learning activity in which "peers work together towards a common goal, with a certain degree of symmetry in their actions and knowledge" (Dillenbourg, 1999, p. 8). Therefore, it favors the dynamics of interaction, collaborative negotiation, and exchange of meanings in group work (Stahl et al., 2006) and joint knowledge construction while learning.

Given its nature, COIL has provided opportunities for cross-cultural contact among groups of students, especially those with fewer resources who cannot finance international travel (de Castro et al., 2019; (Gutiérrez-González et al., 2023). Studies on COIL have been predominantly exploratory. De Castro et al. (2019) analyzed the characteristics of experience ratings perceived by university students after participating in COIL learning experiences. In another study, Gutiérrez-González et al. (2023) determined the effect of the COIL experience on the communicative competencies and educational achievement of Architecture students, while Simões & Sangiamchit (2023) and Loyo Rosales & Gutiérrez (2022) examined the incidence of the COIL experience on developing intercultural, digital, and communicative competencies in English, adaptability, and research competencies in university students. Participants' perceptions and learning outcomes have been favorable in all cases.

However, other variables relevant to the learning processes with others and online have yet to be systematically addressed; for example, differential aspects of the collaborators concerning their digital competencies to perform online when working in teams. Nor do we anticipate studies that examine in detail aspects that shape the activity of collaborating, such as the levels of expertise of the group members and the use that the group makes of this knowledge, as well as the levels of Coordination and communication that they achieve for joint performance. These relationships become essential due to the development of the COIL experience in different cultural contexts, in which students' different dispositions for working with different ways of accessing and

processing information may be present, as well as the impact of their digital competencies. It is a space where collaboration is possible because it takes place online.

This study examines whether there is a relationship between the experience of learning collaboratively online when the colleagues in the group have different digital competencies.

Learning collaboratively online involves the knowledge of one's digital competencies and those of peers to perform in a virtual or online environment (Colás-Bravo et al., 2017). This is essential in online learning environments, considering that low digital competencies can affect individual performance and group achievement and thus generate demotivation and conflicts in teams (Huachara-Martinez et al., 2023; Lin, 2020). Recent studies analyze the relationship between digital competencies, the optimal development of collaborative learning, and success in educational achievement (Huachara-Martinez et al., 2023).

Others have examined how digital competencies facilitate or hinder student participation and outcomes in online learning environments (Kwiatkowska & Wiśniewska-Nogaj, 2022). In addition, the relationship between digital competencies and how computer-mediated instruction and online systems favor learning and collaboration has been reviewed (García-Chitiva, 2021b).

In this context, digital competencies play a crucial role in online collaborative learning, and some teammates may be more advantageous than others in this aspect. Therefore, from perspectives such as those of Conde Jiménez, (2017), multidimensional scales have been proposed to examine them and identify strengths and gaps to be covered to increase student learning opportunities.

Although the COIL strategy proposes collaboration as one of the central cores in this scenario, only some studies examine the competencies students require for optimal team performance.

Therefore, this work aimed to characterize the collaborative and digital competencies of students who learned collaboratively in a COIL experience. This is to identify patterns, areas of strength, and opportunities for improvement that provide evidence for similar subsequent ones. This is critical, as possessing digital and collaborative competencies can be critical to student learning. It is also valuable for the teacher to understand which competencies require further development. In this way, he/she can design and develop pedagogical actions that strengthen them.

Given the above, this paper conducted a statistical profiling of the 21 groups formed by students from two Latin American universities who worked together in the COIL experience documented here. This is to identify the relevant collaborative and digital competencies in the groups and those that require further development.

Lewis's (2003) proposal, which examines the cognitive functioning of team members working together, was used to examine the collaborative process. This has three dimensions that were addressed by García-Chitiva

(2021) to examine team collaboration: Specialization (expertise and knowledge of each member), Credibility (knowing who knows what and trusting the contribution they make to the work), and Coordination (agreeing on attitudes towards the work and developing effective communication). To analyze digital competencies, the dimensions proposed by Conde Jiménez (2017) were taken in his three-dimensional scale: instrumental (includes basic technical skills for the use of information and communication technologies -ICT); strategic (involves the creative use of ICT to build and create with social impact) and expansive (refers to the appropriation and reinsertion of ICT tools in different cultural and social contexts).

In the following, the methodological approach of this work is presented. The results and their subsequent discussion follow this. The paper concludes with conclusions and recommendations.

Method

The cluster analysis methodological approach, in which the non-hierarchical K-means method was used, was used. This method facilitates the identification of variations in groups by establishing similarity and clustering (Chen & Witten, 2023).

Data pre-processing

Data processing was carried out with the R libraries tidy and dplyr (R Core Team, 2023), rows with missing data were removed, missing values were imputed, and the scores of the scales used were normalized (mutate() and scale()).

Data analysis

Subsequently, the factoextra and cluster libraries were used to perform K-means clustering. The Euclidean method was used to calculate the distance matrix between the groups to cluster the groups. This made it possible to determine the students' similarities and dissimilarities (Rquer, 2020) based on their responses to the scales. The k-means method was then applied to divide the data into clusters.

Instruments

Two types of instruments were used. Lewis's (2003) TMS test, adapted to Spanish by García-Chitiva (2021), consists of 15 items to examine the perception of collaborative work, or collaborative competencies per se (within groups), in terms of expertise, Coordination, and Credibility. The second, developed by Conde-Jiménez (2017), has 22 items and examines digital competencies in the Instrumental, Strategic, and Expansive dimensions. A five-point Likert scale ranging from strongly disagree to agree strongly was used in both cases.

Sample

The sample comprised 65 students from two private universities in Ecuador and Colombia. Table 1 presents details of January, courses, and programs of study. The Ecuadorian students were enrolled in face-to-face health and architecture programs, and the Colombian students were enrolled in virtual education programs.

Table 1. Participants

Characteristics	Nominal Distribution
Gender	
Female	35 (53%)
Male	30 (47%)
Age (years)	
18-26	43 (66%)
27-35	16 (24%)
36-43	6 (9%)
University	
Ecuador	33 (50,7%)
Colombia	32 (49,2%)

Características de la actividad colaborativa en la experiencia de aprendizaje COIL desarrollada

The experience occurred over six weeks and was structured in three specific moments (see Figure 1). The students worked in freely formed groups. As conditions for the formation of the groups, the students were told that each group could contain a maximum of 4 people and that in each of these groups, there had to be students from the two universities, University 1 Ecuador, and University 2 Colombia. In the introductory stage, the students got to know each other, formed groups, and learned about the expertise of their classmates.

In the second stage, they developed collaborative work each week, under the agreements of times and communication channels to meet in each group. In this stage, there was continuous asynchronous accompaniment by the teachers (1 Ecuador and 1 Colombia) every week and a weekly synchronous meeting. In the third stage, the groups of students used the data and/or information collected, analyzed it, and, through counseling with the teachers, specified the appropriate type of methodological orientation according to the type of topic addressed and the information collected.

In addition, they generated the writing of the research report in which the conventional structure of a research article was considered (title, abstract, keywords, introduction, method, results, conclusions, recommendations, and references). During the closing session, each group presented their proposal.

Figure 1. Flow chart COIL educative experience.

The task of the collaborative activity consisted of developing a research report from the generation of the topic of interest and formulation of the problem to the generation of a working paper (WP) research report. The activities' contents and development were arranged in the Google Classroom platform and distributed in four units (see Figure 1).

Results

We begin our analyses by examining the participants' aggrupation from the Euclidean distance of their average response to all questionnaire items. A cluster analysis of the Euclidean distance matrix revealed the presence of six clusters with an unequal number of subjects per cluster (see Figure 2).

Figure 2. Group members clustered by their responses in the questionnaires.

This analysis detected two interesting data patterns when examining the total collaborative and digital competencies scores in the resulting clusters (see Figure 3). On the one hand, total scores for collaborative competencies (e.g., specialization, credibility, and coordination) were higher than for digital competencies in clusters 1, 3, and 4. On the other hand, the total scores for digital competencies (instrumental, privilege, appropriation, and expansive) were higher than those for collaborative competencies in clusters 2, 5, and 6.

Figure 3. Differences in collaborative and digital skills by cluster

In this case, Colombian students outperformed their Ecuadorian peers in all three dimensions of digital competencies. Given that the Colombian and Ecuadorian students only met after these coil sessions and came together in small groups of three members, we examined whether their educational backgrounds played a role in obtaining these total scores. We observed statistical differences between Colombian and Ecuadorian students on three dimensions of the collaboration scale, such that Ecuadorians outperformed their Colombian peers. In the competence scale, significant differences were observed in the high scores of Colombian and Ecuadorian students, mainly in the instrumental dimension (see Table 2).

Discussion

This work aimed to characterize the collaborative and digital competencies of students who learned in a COIL experience. To meet this objective, a statistical profile was developed from which six clusters were derived, which were diverse regarding the members of the groups formed to collaborate. The clusters' agglutination variety is estimated to have at least three origins. The first concerns people's differences (e.g., cognitive styles, learning styles). This particular trait implies people's preferences for learning and relating to others (Aggarwal et al., 2023), and even a preference for specific communication channels and times.

Secondly, it is also part of another culture because of the novelty of working with strangers. This aspect has been documented in the teamwork literature, where it is mentioned that extended working time is vital to strengthen the interaction and performance of collaborative teams (García-Chitiva, 2021a, p. 48). While in the COIL educational experiences, one cannot expect extended learning time beyond a few weeks (usually six), it is crucial that educators can generate an introduction among students to each other's cultural issues, experiences, and tastes of their peers from another country. For example, do introductory activities using different formats or synchronous introductory activities in which students talk about their tastes, work preferences (e.g., types of homework, schedules, etc.), and other aspects that allow them to get to know each other.

Thirdly, the statistically significant differences in collaborative competencies in favor of the Ecuadorian students have to do with the fact that they were part of a face-to-face program and knew each other previously. Since the groups were freely formed, students from this country were placed with peers of the same nationality in 11 of the 21 groups.

As for the advantage of Colombian students in digital competencies, it is assumed that this high perception is because these students are enrolled in a virtual mode. Therefore, using ICT and the Internet is part of their daily routine.

Considering the abovementioned, the present work contributes to the visibility of the strengths to guide collaborative learning processes in a COIL Experience. Also, it finds a way to include orientations and guidelines to collaborate, which allows all students to strengthen their credibility, coordination, and expertise. Similar support is also required for the development of digital competencies. Teachers can perform diagnostics to identify which aspects of the competency need to be strengthened. On the other hand, the possibility of incorporating other personal and contextual variables in future studies is also becoming visible. In addition,

there is a need to configure symmetrical collaborative teams (Isohätälä et al., 2020), to encourage effective collaboration among participants.

Conclusion

Considering the above, this paper contributes to the visibility of the strengths to guide collaborative learning processes in a COIL Experience. It is recommended that future studies consider the possible inculcation of orientations and guidelines to collaborate in the curriculum. This will enable students to authentically, in practice, strengthen their credibility, coordination, and expertise.

Guidance for developing digital competencies is also required. Teachers can perform diagnostics to identify which aspects of competence need to be strengthened. Finally, the possibilities of incorporating other personal and contextual variables in future studies are visible. In addition, it is necessary to set up symmetrical collaborative teams to foster effective collaboration among participants.

Recommendations

It is recommended that future studies seek symmetry in the groups of students participating in the COIL experience, i.e., that they are students with the same modality (virtual or face-to-face) and that they are from similar educational backgrounds, to determine the characteristics of collaborative and digital competencies without the pre-existence of these marked differences.

Jointly analyzing collaborative and digital competencies in samples of students participating in COIL educational experiences in educational and cultural contexts other than Latin America may generate interesting results.

Representation of Father's Interpersonal Relationship with Fatherless Children in the Film Series HBO Euphoria Season 1

Tania Bellayah Sugiantoro

Bina Nusantara University, Indonesia

Frederik Masri Gasa

Bina Nusantara University, Indonesia,  <https://orcid.org/0000-0003-0181-325X>

Abstract: This research is based on the incident of the father's minimal role in the family. In Indonesia, the percentage of children who do not live with their parents in 2021 is 3.8%. This research focuses on "Representation of Interpersonal Relations between Fathers and Fatherless Children in the HBO Euphoria Season 1 Movie Series". This descriptive qualitative research uses Roland Barthes's semiotic analysis method. There are two characters whose representations are examined, with the aim of understanding how these two characters represent the results of interpersonal relationships with their fathers. The researcher analyzed descriptively the signs that existed in the two characters when they interacted with their father. Based on the research results, the signs appear and have a lasting effect on both characters. Cassie's character is shown as a teenager who finds it difficult to say no when she is a teenager. at the same time, Nate is shown as a teenager who has an anger issue. The things that influence their character from children to young adults are The role of technology in children's development, the language of love used, sex education during puberty, and the culture of promiscuity in the United States.

Keywords: Representation, Semiotics, Interpersonal Communication, Roland Barthes

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1699-1708), Antalya, Turkiye. ISTES.

Introduction

Communication activities can be found anywhere and anytime. In general, communication is done between two people or is referred to as interpersonal communication. The result of interpersonal communication is the creation of interpersonal relationships which are connections that are owned at least between two people who are interdependent on one another. Communication can also be done face-to-face or through mass media (Nurudin, 2007). Mass communication is addressed to an enormous audience. It can be interpreted that the

intended audience is all people who read and watch television. Mass communication is also communication transmitted by audio and visual transmitters.

According to Wibowo (verywellhealth.com, 2022), film is a tool for conveying various messages to audiences through a media story. Being a form of mass communication, the film contains signs, symbols, and semiotics, which can be interpreted by audiences who enjoy them. Films are also made to channel the expressions of the creators which are presented to the public. Several types of films include entertainment, education, informative, inspirational, and documentaries.

A family is a social group characterized by shared residence, economic cooperation, and reproduction united by marriage or socially approved adoption, which interacts following its social roles.

Patriarchal culture teaches Indonesian society that the father's job is to earn a living and the mother's role is to take care of the household and children. The result of this Patriarchal Culture is the absence of a father figure from family life, especially children.

Figure 1. Parent's duty

Based on the data found (Figure 1), it can be seen that children in Indonesia spend more time with their biological mothers than with their fathers. The percentage of children who do not live with their parents as of 2021 is 3.8%. The negative character that children have can arise as a result of childhood events involving parents that are not good or arguably traumatic for the child. The absence of one of these roles can shape a child's character and the way the child responds to things.

Based on the fatherless phenomenon, data on the number of children in conflict with the law as perpetrators of both physical and psychological violence from the 2016-2020 period amounted to 655 cases (Katadata.co.id, 2022). With details of 506 children being perpetrators of physical violence and 149 children being perpetrators of psychological violence.

Figure 2. Child Physical and Psychological Abusers

The data from figure 2 can be concluded that the number of these cases is certainly related to the role of the family in the growth and development of children because in this case, the family is the primary social group owned by children. The impact of the vacant role of parents in a child's life can also influence children to become abusers or victims.

Figure 3. Cases of Violence by Place

Based on the data above, it was found that the highest rank in the perpetrators of violence was the husband-wife relationship with 4,893 perpetrators, then the boyfriend-friend relationship with 4,588 perpetrators, and parents against children with 3,075 perpetrators throughout 2022.

Research by Gurning, F.P, et al (Gurning et al., 2022) discusses *"Analysis of Audience Reception of Family Communication in the Ngeri-Ngeri Sedap Film"*. The results of this study reveal that parenting has a very close relationship with the child's personality. Amalia, A. & Natsir, M. H. D. in 2017 published the results of research on *"The Relationship Between Interpersonal Communication in the Family with Adolescent Identity"*. The results of this study indicate that there is a significant influence between family communication and juvenile delinquency.

Based on the results of the two studies, this study will examine the representation of the relationship between the role of the father to the child so that the fatherless phenomenon occurs in the HBO series film *"Euphoria"* by

Sam Levinson Season 1. This study aims to determine the representation of the relationship between the characters Nate and Cassie towards their father so that they experience the Fatherless phenomenon from the HBO series film "Euphoria" Season 1.

Method

This research uses a descriptive qualitative approach because it will analyze the representation of the father's relationship with characters who experience the Fatherless phenomenon from the HBO series "Euphoria". Qualitative research is research that aims to understand the phenomena experienced by research subjects. This approach is used to examine matters related to behavioral research, attitudes, motivations, perceptions, and actions of the subject. According to Creswell, J. W qualitative research is research used to examine human and social problems. This research will report on the results and analysis of data obtained in the field, then be described in a detailed research report.

This research uses the Semiotics analysis method according to Roland Barthes, which is a science used to interpret a sign, where language is also an arrangement of signs that have certain messages from society. Signs here can be in the form of songs, dialog, music notes, logos, pictures, facial expressions, and gestures. Roland Barthes divided the semiotic analysis into two, namely denotation and connotation.

1. Denotation: This is the relationship between the signifier and the signified in real form or denotation.
2. Connotation: there is a connotation that describes the relationship when the sign is mixed with feelings or emotions.
3. Myth: this is a way of giving meaning as a result of traditional stories.

The initial stage of data collection in this research uses observation and documentation methods. The second stage is the results of observation and documentation will be analyzed by Roland Barthes's semiotics. The last stage of the research conducts a documentation study, namely studying the literature relevant to the research and the results of the analysis that has been done to get the results of the research.

This research is semiotic, therefore the data validity technique used is the nine-formula technique (Purwasito, 2006). Here are the nine validity formulas:

1. Who is the communicator
Communicators play an important role in communication semiology. The background of the communicator needs to be known to understand the sign to be interpreted. Communicators need to be known so that the signs conveyed either directly or indirectly can be conveyed to communicants.
2. Motivation of the communicator

In communication semiology, there is an interpretation of signs related to the communicator. here the communicator builds a message to be conveyed to the communicator.

3. Physical and Social Context

Communication semiology interprets signs based on the social and cultural context, time, and location of the sign. Communicators build messages by considering rules or norms and then giving them to communicators.

4. Sign structure and other signs

Signs in communication semiology can be interpreted by looking at signs related to close signs functionally and their relevance.

5. Sign Function, History and Mythology

Giving meaning to signs can also be seen by how people see signs or their functions. This is related to the communicator's intention to the communicator.

6. Intertextuality

Communication semiology strengthens interpretation and argumentation by comparing sign functions with other texts. Intertext is an effort to deepen interpretation by using similar sources.

7. Intersubjectivity

Communication semiology presents interpretation with signs obtained from the interpretation of other signs that have relevant relationships. The researcher takes his experience as a reference, books, and other supporting data.

8. Common sense

Retrieval of meaning in communication semiology by using common meaning in society. Usually used for social signs.

9. Scientific Explorer Researcher

It is an intuitive interpretation carried out by researchers in communication semiology. Using intellectual experience, subjective beliefs, and scientific searches conducted by researchers. This concerns the credibility of the researcher.

To measure the validity of this study, researchers only used five formulas from the nine formulas described. The formulas that researchers used in this study are: 1. Who is the Communicator, 2. Motivation of the Communicator, 3. Physical and Social Context, 4. Sign Function, History and Mythology, and 5. Common sense.

Results

The Euphoria season 1 series consists of 8 episodes, and each of the episodes has a duration of 48-62 minutes. The series tells the story of a group of teenagers with the main character Rue as the narrator of the series. Rue tells how the system that exists in the environment and life of teenagers is now broken. Starting from the use of drugs that are easily accessible to teenagers, free sex, fraud, and relationships that lead to violence.

The delinquencies in this series are shown explicitly and categorized as movies rated 21 years and above. Based on the research results, 4 episodes were found that showed interpersonal relationships between fathers and children related to the fatherless phenomenon. The following are the results of this research:

Technology and Child Development

In this series, the role of technology is mostly shown as a tool that hurts child development. The negative impact that affects the characters of Nate Jacobs and Cassie Howards depicted in the Euphoria Season 1 series is pornography (Ratnaya, 2011).

Figure 4. Cal Jacobs Sex Tape

Based on the scene above, Nate Jacobs' character is a technology user who is not supervised by his parents. This allowed him to have access to his father's adult content when he was a child. Nate even remembers how the video collection was arranged in such a way by Cal Jacobs so that his father would not notice the change in the arrangement of his porn collection.

Figure 5. Cassie's Revenge Porn

In the snippet above, the character Cassie Howards experiences revenge porn. The definition of revenge porn is images or movies with sexual content that are published, posted on the internet, or circulated without the consent of one or more participants, usually with malicious intent and revenge followed by separation (Dictionary Collins English, 2023). Cassie Howard is asked to make a sex tape with every man she is currently with, despite refusing the invitation, Cassie still complies due to her fear of being alone and unloved.

Love Language that Appears in the Relationship between Father and Son in the Euphoria Season 1 Series

Love language according to researchers is a way that a person uses to show his love for others. Reviewed by Dr.

Fadhli Rizal M (halodoc.com, 2022), humans have 5 love languages that are often used to show love for the intended person, namely: word of affirmation; physical touch; quality time; receiving a gift; and act of service. In the Euphoria Season 1 series, the most common love languages are physical touch, quality time, and words of affirmation.

Figure 6. *Physical touch* Cal Jacobs

For Nate's character, Cal gives a word of affirmation in scene 2. Cal says that he believes Nate will grow up to be successful and a strong child. While giving the word of affirmation Cal Jacobs also touches his hand to Nate's cheek, this is a form of physical touch love language.

Figure 7. *Physical touch* Gus Howard

Cassie Howard felt her father's intense affection during her childhood. The snippet above shows Gus Howard hugging Cassie Howard warmly when giving her a birthday present. This changed during Cassie's transition to adolescence, as Cassie's parents often fought and ended up separating.

Sex Education in Childhood Puberty

Puberty is a transitional phase or growth of children reaching reproductive maturity. Children at puberty experience rapid brain development. Therefore, this transition is also a process of identity formation so that children experience emotional and physical changes.

Figure 8. Nate Jacob's *Emotional Outburst*

Cal Jacobs and Nate's relationship also fluctuates when Nate has experienced puberty, marked by a snippet of image 8. In this scene, Nate experiences an emotional outburst or emotional outburst, according to Rebecca Valdez, MS, RDN (verywellhealth.com, 2022), emotional outbursts are characterized by sudden and uncontrolled and extreme anger. Cal's role in Nate's puberty is not optimal, coupled with the big secret that Cal has, namely the collection of pornographic videos he made with many people has been watched by Nate secretly during Nate's childhood.

Figure 9. Cassie's uncomfortable hugs

The puberty experienced by Cassie was enough to make people overlook because Cassie's body underwent quite drastic changes. Her body, especially her breasts, grew larger than other teenagers who were also going through puberty. This can be seen from the snippet of picture 9 when she hugged a man her body was hugged too tightly so that her breasts stuck out for too long and made her uncomfortable. The discomfort is shown by Cassie's expression which gives a fake smile.

The Culture of Promiscuity among American Teenagers

The Euphoria Season 1 series is set in the United States, of course, the cultural role of the country plays an important role in the storyline of the series. The United States is one of the countries that has the nickname of a free country. Set in East Highland High School, the characters in this series are teenagers who have experienced puberty. Lisa Wade from the book American Hookup: The New Culture of Sex on Campus (Wade, 2017), discusses the culture of dating and sexual activity on American campuses. The shows presented by this series also show similar things, namely promiscuity ranging from free sex, drug abuse, and violence.

Nate Jacobs' character, in this series Nate is exposed to promiscuity from his childhood. His father, Cal Jacobs has a collection of videos of him having casual sex with younger men, young women, and even transgenders. Nate was exposed to these things at a very young age, when children of Nate's age were not allowed to consume pornography.

Figure 5 shows Cassie Howard about to have sex with her partner or with men who have been her lovers. Although Cassie rejected her partner's invitation to make a sex video, she still did it because she didn't want to feel alone. She wants to have someone she loves with her. This could be due to Gus' minimal role in Cassie's life. Not only that, Cassie was also exposed to Gus' life of drug abuse.

Conclusion

In the Euphoria Season 1 series, researchers found 5 markers that represent the relationship between father and fatherless child. These five signs have a domino effect on life and shape the characteristics of Nate and Cassie. The domino effect is a chain reaction that occurs when one event triggers a series of similar, related, or connected events (study.com, 2022).

A. Nate Jacobs:

- Has uncontrollable anger, especially on LGBT matters
- Exposed to sex at a young age
- Lives in the same house with his father but hardly ever speaks
- Cold expression when dealing with matters concerning his father
- Resents his father for trying to cover up his sexuality.

B. Cassie Howard:

- Shy with new people, shown with an uncomfortable expression
- Has a sex tape with her partner despite her refusal to be loved
- Expresses sadness when dealing with matters concerning her father
- Received a lot of physical touch in childhood
- Looks forward to her father's presence.

Recommendations

It is hoped that further research can present a more in-depth communication semiology because in this study researchers still have limited knowledge and time to work on it. For research that uses the Roland Barthes semiotic analysis model, it is expected to learn how to analyze it, the purpose of the analysis, and test its validity. From the Euphoria Season 1 series, it can be interpreted that the role of parents, especially fathers, in the growth and development of children has an important impact if it is not fulfilled. Based on the fatherless phenomenon that is rampant in Indonesia, it would be nice if the role of fathers in the family and child development is improved. Because this can have a negative impact and cause a domino effect when children grow up. Small things that are traumatic for children can be the basis for the formation of deviant characteristics in adulthood.

Notes

This article is an output from Tania Bellayah Sugiaturo's thesis entitled Representation of Father Interpersonal Relationships with Fatherless Children in Hbo Serial Film Euphoria Season 1.

Instagram as a Media to Strengthen Generation Z's Long Distance Relationship in Indonesia

Ananda Ranggabarani

Bina Nusantara University, Indonesia

Frederik Masri Gasa

Bina Nusantara University, Indonesia,  <https://orcid.org/0000-0003-0181-325X>

Abstract: Currently, there are a lot of Generation Z's especially students, who are in long-distance relationships. To conduct a long-distance relationship, it requires commitment from the partners to maintain communication, this is based from research that shows many long-distance relationships fail due to lack of communication. With the availability of new media such as social media, long-distance communication can be easily done. Instagram is Generation Z's favorite social media application. The view of social interaction related to this research is that long-distance relationship couples use Instagram accounts to communicate with each other, exchange opinions, publicize couples by uploading photos or videos through Feeds or Instastories, and a place to find inspiration for activities that can be done during long-distance relationships or when meeting. This study aims to describe the role of Instagram social media as a facilitator and strengthener of long-distance relationships owned by student couples. By using qualitative research methods with New Media Theory, the results of this study show that Instagram social media has a role in students' long-distance relationships and can be used as a media facilitator of Generation Z's long-distance relationships.

Keywords: Generation Z, Instagram, Long Distance Relationship, Social Media

Citation: Ranggabarani, A. & Gasa, F.M. (2024). Instagram as a Media to Strengthen Generation Z's Long Distance Relationship in Indonesia. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024--International Conference on Research in Education and Science* (pp. 1709-1718), Antalya, Turkiye. ISTES.

Introduction

Interpersonal communication is a process where humans and other individuals communicate by exchanging information, opinions and expressing feelings verbally or non-verbally, face-to-face or digitally. As social beings, humans need other individuals' presence in their lives. This mutual need occurs through relationships between individuals. Needing information, understanding, opinions, and affection from others is why individuals form relationships with others.

One form of relationship between individuals is a romantic relationship, dating. Dating is a relationship where two individuals meet and do a series of activities together in order to get to know each other (DeGenova & Rice, 2005). There is a change in understanding of the concept of togetherness in a relationship, where individuals can have a relationship with a partner without physical closeness, namely a long-distance relationship (Freitas, 2004).

In Indonesia, independent research conducted by tirto.id shows that around 63.4% of 183 respondents stated they were in a long-distance relationship. The number of married couples in long-distance relationships is as much as 28.4%, while dating couples in long-distance relationships is 71.6%. It was also mentioned that some couples have to undergo long-distance relationships due to the need to continue their studies in other areas (Wibisono, 2016). From the reasons given by the research respondents, there are many student couples in Indonesia who are in long-distance relationships. Generally, university students are entering adulthood in the age range of 18-25 years. Based on the division of generations by Graeme Codrington & Sue Grant-Marshall, Generation Z is the generation born from 1995 to 2010 (Codrington & Grant-Marshall, 2004). Therefore, individuals who are currently students in 2023 can be categorized as part of Generation Z.

In order to keep a relationship, particularly a long-distance one, strong and healthy, it is important for partners to maintain good communication with one another; this is shown by research conducted in the United States, showing that there are 90% of couples break up their relationship due to lack and poor communication between the two parties. Meanwhile, in Indonesia, 7.4% of cases of ending a dating relationship were caused due to lack of communication (Amato & Previti, 2003).

The importance of communication in a relationship, especially long-distance relationships, is also shown by a 2012 research survey in Indonesia conducted by Wolipop involving 123 long-distance dating respondents. 49% of respondents successfully underwent long-distance dating, 38% of respondents were unsuccessful in long-distance dating due to an affair, 5% of respondents who underwent long-distance dating were hit by doubt or uncertainty and despair towards their partner, in this case, it could affect the decrease in the level of trust. In comparison, the other 10% hoped that their long-distance relationship would succeed (Rema, 2014). In addition, Coleman in 2000 states in his research that the thoughts and feelings present in long-distance relationships require an effective communication tool to create a harmonious relationship (Nisa & Sedjo, 2010). In today's world, communication technology has rapidly advanced, leading to the emergence of new forms of media like the internet and social media.

Social media is a digital platform allowing users to carry out social activities whenever and wherever needed. Research by Firda Abraham in 2014 found several benefits in social media, including making a meeting place for individuals with the same interests, increasing knowledge, and adding relationships. In addition, social interactions on social media include adding friends or relationships, seeking information, communicating, and buying and selling activities (Abraham, 2014). With the ability to use social media anytime and anywhere, it can help long-distance relationship couples to communicate effectively.

Citing from Katadata, the We Are Social survey results show that Instagram was Generation Z's most favorite social media platform globally in April 2021 (Azkiya, 2021). The result even far exceeds other social media platforms like Whatsapp and Facebook. In Indonesia alone, according to We Are Social, Instagram users in Indonesia reached 89.15 million users as of January 2023 (Mutia Annur, 2023). That number is the fourth largest in the world after India, the United States, and Brazil. As one of Generation Z's favorite media, Instagram can be used as a medium of communication by Gen Z long-distance relationship couples with a variety of features so that communication between couples is not limited to exchanging messages and voices.

Previous research by Lexie Gutzmann in 2018 proved that long-distance relationship couples use social media to strengthen their long-distance relationships. These couples feel that social media helps maintain their communication and relationships. Although long-distance relationships require various sacrifices, couples feel the benefits of long-distance relationships outweigh the sacrifices required.

Furthermore, a study by Maulidia Mulyani in 2019 revealed that when both spouses work to support their family, it often leads to one being away from home. As a result, many households adopt a long-distance relationship model. Long-distance relationships must still be carried out by utilizing social media so that the commitment of both is maintained. As a tool to communicate quickly without waiting a long time, social media is considered very helpful for communication practices in married couples who are separated by distance. Maintaining communication makes family life harmonious and maintained even in long-distance relationships. Also, fulfilling the rights and obligations of husband and wife can still be done even though it cannot be as optimal as it is not directly related.

The difference with previous research is that this study focuses on knowing how Instagram, which is Generation Z's favorite social media application, can be used as a facilitator for Gen Z long-distance couples to maintain their long-distance relationship. Moreover, Instagram offers distinctive features that set it apart from other social media platforms. As a result, it can serve as a valuable tool for providing numerous interaction options to Gen Z individuals in long-distance relationships.

Method

The method used in this research is a qualitative approach. Qualitative research is a research and understanding process based on a methodology that investigates social phenomena and human problems (Masrukhin, 2014).

The data sources used in this study are primary data and secondary data. Primary data is a data source that directly provides data to researchers (Sugiyono, 2018). In this study, the writers obtained primary data through in-depth interviews, which is the process of obtaining information for research purposes through question and answer while meeting face-to-face between the interviewer and the respondent or interviewee, with or without

using interview guidelines where the interviewer and informant are involved in a relatively long social life (Sutopo, 2006).

This research interviewed five Generation Z couples with long-distance relationships, where the information was determined using purposive sampling. Purposive sampling is a data collection technique based on specific considerations related to the case study under study and the researcher's objectives (Sugiyono, 2018).

The selection of five pairs of informants is based on criteria that have been made by the researcher, which are:

1. Informants born in 1995-2010 (Generation Z)
2. Informants are students who have been in a dating relationship for more than one month
3. The informant has been in a long-distance relationship for more than one month
4. Informants are active users of Instagram social media for more than one month in 2023.

In addition, in this study, primary data were obtained through observation of five informant couples' activities on Instagram. The observation method is a data collection method carried out by observing and recording the things that are being investigated (Supardi, 2006).

The data analysis technique carried out in this study uses the Miles and Huberman Interactive Analysis Model, which analyzes data with three streams starting from reducing data which means summarizing. In this study, the writer carried out the reduction stage by selecting the main things from the results of in-depth interviews with five informant couples, observing the activities of five informants on Instagram social media, and studying the theoretical literature in the conceptual foundation section. Then carry out the data presentation stage by describing the descriptions in the form of descriptive narratives from the results of interviews that have been conducted with five informant couples in long-distance relationships. After all the data is collected based on the results of interviews and observations, the step taken by the researcher is to read and analyze the data obtained. The results can explain how Instagram plays a role in the long-distance relationship of Generation Z couples.

To test the validity of the data in this study, researchers used triangulation techniques so that the data obtained could be recognized for credibility. To ensure the validity of the research findings, researchers tested the validity of the data in several stages. Source triangulation is done to test the credibility of one data with other data. In this study, researchers triangulated sources by comparing data obtained by interviewing five informant couples, observing the activities of five informant couples on Instagram social media, and studying theoretical literature studies. Then triangulation of techniques to test data credibility is done by collecting data through the same source but using several different techniques. In this study, researchers triangulated techniques by conducting in-depth interviews and observing activities on Instagram media with five pairs of informants who were not different. The last stage is time triangulation, which is collecting data at different times. In this study, the writers chose to conduct interviews when the five informant couples were not busy doing activities or when there was no conflict in the informant couples. Also, observations were made when the five informant couples were doing activities on Instagram social media.

Results

Instagram as a medium to strengthen long-distance relationships

Every couple has routine activities to maintain and strengthen their relationship, either by meeting in person or through social media. However, for couples in a long-distance relationship, activities through social media are the only option, one of which is Instagram. The role of Instagram as a medium of communication and interaction is very helpful for them to maintain communication and strengthen the relationship despite being separated by distance. Therefore, the long-distance relationship couples in this study stated that they actively use Instagram to communicate with their partners.

With the availability of various features on Instagram, of course, these features are well used by long-distance relationship couples to interact with each other frequently. As stated by all informants in this study, the Direct Message, Reels, and Explore Feed features on Instagram are very helpful for their daily communication. Apart from using the Direct Message feature to communicate daily or sharing various Reels content or content found through Feeds or Explore Feeds, some also casually share photos or videos of their partner in Instastories.

Challenges Faced on Instagram and Solutions

In a long-distance dating relationship, various efforts have been made to maintain communication and the closeness of the relationship between each other. However, in interpersonal communication, there will still be noise or challenges. The problems in this long-distance relationship interaction are considered higher than in face-to-face communication. With these obstacles, it can cause conflict in a relationship. Challenges that occur in long-distance relationship communication through Instagram can be technical problems and problems from individuals who use it.

Instagram as Generation Z's long-distance relationships facilitator

According to Miles, Rice, and Barr in *Media: an introduction* 3rd edition, new media is a media that is the result of the integration or combination of several aspects of technology combined, including computer and information technology, communication networks and digital information media and messages (Flew, 2008).

Based on the characteristics of new media by McQuail, there are six characteristics, namely: (1) Interactivity, (2) Social Presence, (3) Autonomy, (4) Playfulness, (5) Privacy, and (6) Personalization (McQuail, 2010). Based on the above characteristics, the elements mentioned in this study are as follows:

1. Interactivity

All couples can respond to posts sent by other couples or respond to posts on Instagram.

2. Social Presence

Long-distance relationships certainly prevent couples from being able to meet physically to make personal contact. However, as a new media, Instagram allows couples to be present virtually.

3. Autonomy

Instagram, as a new media, gives couples the power to choose what posts they want to see and share with other users.

4. Playfulness

with the availability of a wide variety of content on Instagram, ranging from serious to funny content, Instagram can be used as a source of entertainment and fun by couples.

5. Privacy

couples can manage who can see their account and manage who can see their uploads either by creating a second private account or uploading through the Close Friends feature.

6. Personalization

every couple certainly has different preferences. Therefore, on Instagram, couples can organize and choose what content they want to use or need.

In this study, researchers used the New Media Theory. New Media Theory is a theory developed by Pierre Levy. This theory explains the development of media. New Media is online media that is technology-based, flexible & interactive, and functioning publicly and privately using the internet (Mondry, 2008). Pierre Levy says there are two views on new media theory, the view of social interaction and social integration.

The view of social interaction related to this research is that long-distance relationship couples use Instagram accounts to communicate with each other, exchange opinions, publicize couples by uploading photos or videos through Feeds or Instastories, and a place to find inspiration for activities that can be done during long-distance relationships or when meeting. Through Instagram, long-distance relationship couples can easily communicate and interact without meeting face-to-face.

This study's view of social integration is that the media is ritualized because it becomes a habit. Instagram makes long-distance relationship couples informants habitually sending each other uploads found on Instagram's Explore Feed or Reels via Direct Messages without switching to another social media application. In addition, informant couples habitually upload photos or videos of their partners through feeds or Instastories, publicly and privately, on a second account or Close Friends. Some informant couples also have a habit of seeing Direct Messages received by their partners, and there are also informant couples who decide to share accounts. Instagram creates a community with such habits by presenting related features.

Discussion

Please use 10-point font size. Please margin the text to the justified. Manuscripts should be 1.5 times spaced. Footnotes and endnotes are not accepted. All relevant information should be included in main text. Do not

indent paragraphs; leave a 1.5 times space of one line between consecutive paragraphs. Do not underline words for emphasis. Use italics instead. Both numbered lists and bulleted lists can be used if necessary. Before submitting your manuscript, please ensure that every in-text citation has a corresponding reference in the reference list. Conversely, ensure that every entry in the reference list has a corresponding in-text citation.

Based on the study's results, long-distance couples rely heavily on social media technology to support their communication needs. This is proven by the five couples using Instagram and other social media as their communication and interaction media while running a long-distance relationship. The couples feel that social media helps maintain their communication activities and relationships because it is the only media that helps them communicate and interact with each other while carrying out long-distance relationships. As the times evolve and people's lifestyles change, Instagram currently provides various features. These features are Direct Messages (DM), Instastories, Reels, IGTV, Explore Feed, Bookmark/Save Post, and others. The availability of these features is beneficial for long-distance relationship couples to have various interaction options that can be done when communicating with their partners.

All informants in this study make Direct Messages the feature they use most often when communicating via Instagram. Interactions in Direct Messages range from exchanging regular messages to exchanging Instagram posts found on the main homepage, Explore Feed, to Reels that can help them generate a topic that can be discussed through Direct Messages. The five informants also like to use the Instastories feature, which informants usually use to upload photos or videos of their partners or upload photos or videos of daily activities that can be news for their partners without exchanging a direct message.

There are some unique interactions that can only be done on Instagram. Every long-distance relationship couple in this study uses the Collaborative Bookmark feature, which allows couples to collaborate to save uploads on Instagram. The reasons for each couple to use this feature are different, such as saving uploads together to collect references for dating places when meeting, saving video uploads or funny Reels, and items they want to buy together.

In this study, the informants conveyed a variety of challenges and problems that occur during interaction on Instagram, such as partners forgetting or being slow in replying to messages sent via Direct Messages, misunderstandings when a partner sends a relatively sensitive post such as news of a public figure's cheating, not commenting on a partner's photo or video uploads on Feeds or Instastories with compliments or others, to misunderstandings due to liking posts or exchanging DM messages with the opposite sex that one of the parties in the couple does not know. In addition, Internet connection interruptions and problems on the devices used for activities on Instagram can interfere with the communication process of each long-distance relationship partner on Instagram.

A solution is certainly needed with the emergence of conflict caused by obstacles. In this study, each couple conveyed a variety of solutions to the problems experienced while interacting on Instagram. Several couples

choose to share Instagram accounts or allow their partners to access their Instagram accounts as a solution. These couples think that being transparent can prevent problems such as lying to each other.

Another solution undertaken by all couples in this study is to be open about their feelings, for example, expressing their feelings when they see or know their partner likes posts or interacts with other people of the opposite sex. Each couple thinks that being open about their feelings can end a conflict and help each partner know what can and cannot be done when doing activities on Instagram to respect each other.

As a new media, Instagram has different characteristics from conventional media. Based on the characteristics of new media by McQuail, there are six characteristics, namely: (1) Interactivity, (2) Social Presence, (3) Autonomy, (4) Playfulness, (5) Privacy, and (6) Personalization (McQuail, 2010).

Interactivity, the Instagram application allows interaction between users, in this research, long-distance relationship couples by sending or responding to the content provided. Social Presence, Instagram as a new media helps present users virtually, which helps long-distance relationship couples feel close even though they do not meet in person. As a new media, Instagram gives couples autonomy to regulate what uploads they want to see or share with other users.

Then Instagram also has playfulness characteristics, with the availability of various kinds of content on Instagram ranging from serious to funny content. Instagram can be used as a source of entertainment and fun for couples. For privacy, Instagram provides options for couples to control who can see their account and regulate who can see their uploads by creating a private account or uploading uploads through the Close Friends feature. Couples can also apply personalization on Instagram by controlling and choosing what content they want to see, use, or need.

In this study, researchers used the New Media theory by Pierre Levy. In New Media theory, according to Pierre Levy, there are two views, the view of social interaction and social integration (Mondry, 2008).

The view of social interaction related to this research is that long-distance relationship couples use Instagram accounts to communicate with each other, exchange opinions, publicize couples by uploading photos or videos through Feeds or Instastories, and a place to find inspiration for activities that can be done during long-distance relationships or when meeting. Through Instagram, long-distance relationship couples can easily communicate and interact without meeting face-to-face.

This study's view of social integration is that the media is ritualized because it becomes a habit. Instagram social media makes long-distance relationship couples informants have a habit of sending each other uploads found on Instagram's Explore Feed or Reels via Direct Messages without switching to another social media application. In addition, informant couples habitually upload photos or videos of their partners through feeds or Instastories, publicly and privately, on second accounts or Close Friends. Some informant couples also have a habit of seeing

Direct Messages received by their partners, and there are also informant couples who decide to share accounts. Instagram creates a community with such habits by presenting related features that the couples have used in this study.

Conclusion

The conclusion based on the results of the research and discussion above regarding the use of Instagram social media as a medium for strengthening long-distance relationship couples' relationships is:

1. As a new media, Instagram can help maintain and facilitate communication between long-distance relationship couples. In addition, Instagram strengthens the relationship that long-distance relationship couples have. Interaction that occurs on Instagram is not only limited to exchanging messages. Thanks to other features such as Explore Feed, Instastories, and others, each partner also publishes each other, exchanges opinions, and so on.
2. Each partner uses and feels helped by the features on Instagram. Therefore, long-distance relationship couples can use Instagram as one of the communication facilitators.
3. Interaction on Instagram does not always run smoothly. There are technical problems, such as connection problems, and individual problems, such as misunderstandings between couples.

Recommendations

Academic advice for future researchers is to discuss the role of Instagram as a facilitator of long-distance relationships in more depth. Future researchers should examine the interactions carried out by long-distance relationship couples through Instagram.

Notes

This article is an output from Ananda Ranggabarani's thesis entitled Instagram as A Media to Strengthen Long Distance Relationships for Generation Z In Indonesia.

Abstract: Developing relevant competencies for optimal job performance ensures graduates' professional inclusion and success in the labor market. Competency research is examined from the business contexts of higher education and with the actors involved: faculty, students, graduates, and companies. This paper reviews the research on competency-based training of the last decade. Bibliometric analysis methodologies were approached with 539 documents. As a selection criterion, only articles and conference papers were considered, and 75 were selected for a detailed examination of their content through stratified sampling. The results indicate that empirical studies predominated over theoretical ones; self-reporting and interviews were the preferred techniques; the areas with the highest number of studies were Arts and Engineering, the Exact Sciences, and the Social and Legal Sciences. It is concluded that more studies examining competencies at the graduate level in higher education are needed. From these findings, we derived a taxonomy of competencies identified by areas of knowledge, which is presented in the results.

Keywords: Competency-based education, Competency-based learning, Educational Innovation, Higher education, Labor market

Introduction

Developing skills for the 21st century is part of the global education agenda. Higher Education faces a challenge to identify ways to empower students to succeed in work and life (Mursid et al., 2023), among which collaborative, digital, and citizenship skills are among the main ones (OECD/Fundación Santillana, 2019; O.E.I., 2019) as pointed out in reports generated by global organizations.

There are several approaches to understanding and defining the concept of competency. For example, for Spencer & Spencer (1993), competencies are essential, habitual, and persistent characteristics of individuals

causally related to favorable performance at work. From a broader perspective, Le Boterf (2005) defines them as a set of knowledge built from experience and learning, in which the teacher is a facilitator for developing competencies, and the individual is the protagonist of his or her learning. Other perspectives define competencies as the results of complex processes derived from interaction. According to UNESCO (2007), competencies are complex skills that individuals develop through interactions in the social context of their immersion, which favor their performance in different scenarios through interactions in the social context of their immersion. Tardif (2008) refers to competencies as the interaction of complex processes involving different types of knowledge (knowing how to be, knowing how to do, knowing how to know, and knowing how to live together), which allow people to develop in a critical and creative sense, contributing to the construction of the social fabric. Finally, the OECD (2012) states that competencies are a set of knowledge, skills, and abilities that can be learned, extended, and strengthened over time and that facilitate people's performance in different domains involving cognitive, technical, and social-emotional competencies. However, for several years now, some researchers have warned about the dissonance of the term and the potential confusion that can arise between different epistemological bases and interpretations of the subject (Gervais, 2016; Khan & Ramachandran, 2012). The problem of polysemy affects more than just the definition. The existence of a deeper problem is noted, related to the lack of commitment or decision-making when it comes to positioning oneself concerning competencies: what they are, how they are defined, how they are operationalized, and how they are evaluated from the educational perspective (Díaz-Barriga Arceo, 2012).

On the other hand, precise knowledge of the challenges faced by professionals preparing to enter the labor market still needs to be developed. Labor and employability regulatory agencies, for example, Singapore (Skills Frameworks, n.d.) and the United States (U.S. Department of Labor, n.d.), have put forward options to build bridges between the professional competence seen in higher education and what the labor market wants in jobs, the profiles requested and the evaluations for the preparation of potential collaborators.

This dialogue between the university and the labor market has allowed an exchange of perceptions on the importance of competency training for the professional future of graduates. For example, (Succi & Canova, 2019) and soft (Marin-Zapata et al., 2021), the relationship between the development of transversal competencies in the university and the needs seen from the perspective of employers, under the idea of counting on the development of the competencies required in the labor supply, allows graduates to face an increasingly competitive and changing world. Other disciplines discuss the development of transversal competencies from the perspective of students and teachers, including scientific, computational, creative, information management, innovative thinking, communication enhancement, and digital competencies, the latter due to the massification of online learning (Wannapiroon et al., 2022). In addition, other approaches address learners' personal competencies (e.g., self-knowledge, self-management, self-learning), as addressed by (Tsvetkova et al., 2021). More generally, other approaches examine the type of privileged soft competencies and their emphasis on professional training, mainly in graduate programs (Garcia-Chitiva & Correa, 2023).

Due to the broad and varied framework from which competencies are explained, this paper addresses the

perspective of Belchior-Rocha et al. (2022). These authors explain competencies as an integration derived from the mix of skills, knowledge, and attitudes that people require for their effective performance. These competencies are instrumental (*e.g.*, retrieving information, analytical thinking), soft competencies (*e.g.*, cooperation, leadership), systemic (*e.g.*, system orientation, methodological), and specific or technical (*e.g.*, research, business skills).

In the above works, the intention to analyze the relevance of developing competencies from different areas, actors, and levels is evident. However, the variety of conceptual and methodological approaches presents a dispersed panorama that makes it difficult for policymakers, university leaders, professors, and researchers to identify taxonomies, implementations, successful educational practices that can be replicated, and lessons learned. Therefore, this paper contributes to responding to and analyzing this gap. We propose three questions to analyze this inattention: What are the characteristics of the research on competencies (productivity, relevance per citation, region, and disciplinary area), and the main conceptualizations used in the studies? How are competencies evaluated? What competencies are most frequently analyzed in higher education studies and industry, and to what type are those?

Given the above, this study had three objectives: (1) present the state of research on the competency approach through global indexes to characterize the competencies stipulated in higher education and job training and identify the conceptual approaches used; (2) understand the different research and assessment methodologies employed to provide new knowledge on the subject; and (3) identify the different types of competencies used in higher education and job training, in the areas of health sciences, social and legal sciences, architecture, engineering, arts and humanities, and multidisciplinary approaches in the trends found in the last decade.

Method and materials

To identify scientific publications on competencies from the last ten years, we used the search terms "competency" OR "competence" AND "higher education" AND "labor market" in the SCOPUS database, searching the title, abstract, and keywords of the documents published from 2013 to 2023. We downloaded the data in January 2024 in .bib format and we obtained 536 documents, distributed as follows:

Table 1. Characteristics of the sample of documents analyzed with the Bibliometric methodology.

Type of document	Quantity
Article	399
Book	2
Book chapter	32
Conference papers	14
Revisions	17
Total	514

We analyzed the data using two strategies to answer the three questions guiding the present work. The first was a bibliometric analysis (Salas et al., 2018) of the metadata of the 536 documents. This process employed the Bibliometrix library (Aria & Cuccurullo, 2017) and bibliometric techniques (Serafin et al., 2018) using the total number of documents to answer the bibliometric part of the first question: What are the characteristics of the research on competencies (productivity, relevance per citation, region, and disciplinary area), and the main conceptualizations used in the studies? In this first step, we examined the papers for the number of publications per year, most relevant documents by the number of citations, The volume of documents published per area of knowledge, most cited documents per area of knowledge, Countries with the highest number of publications and the thematic trend of publications in the overall sample and by disciplinary areas.

Subsequently, we identified the documents' areas of knowledge: Medicine and Health Sciences (M-HS), Social and Legal Sciences (SS-LS), Architecture and Engineering (A-E), Arts and Humanities (A- H), Sciences (S) and Multidisciplinary (M).

For the second analytical strategy, we defined two inclusion/exclusion criteria. The first criterion focused on identifying the most relevant documents by number of citations in each area by year. Documents without citations were excluded. Only four documents were selected for each year from 2013 to 2023 when there was a sufficient number of annual publications; otherwise, we selected only those with at least one citation from those available in each area.

The second criterion concerned the relevance of the studies to answer the research questions and the objective that guided this work. Documents whose title and abstract were unrelated to the three questions and the objective were excluded. After this selection, the sub-sample of documents consisted of 75 documents.

Finally, to answer the following research questions, we defined categories to analyze the content of the documents as follows:

Table 2. Research questions and content analysis categories.

Questions	Categories of analysis
What are the characteristics of the research on competencies (productivity, relevance per citation, region, and disciplinary area), and the main conceptualizations used in the studies?	<ul style="list-style-type: none"> • Definitions of competency • Primary theoretical and/or normative references for defining the concept of competency
How to evaluate competencies?	<ul style="list-style-type: none"> • Characteristics of the studies that analyzed competencies empirically

	<ul style="list-style-type: none"> Mechanisms employed to assess student performance in competency-based programs
What characteristics do the competencies have, and which ones are analyzed in higher education and training for work settings?	<ul style="list-style-type: none"> Characteristics of the competencies analyzed in higher education training processes. Characteristics of the competencies analyzed in the training processes for jobs

Results

First strategy: results of bibliometric analysis

The bibliometric analysis examined the overall scientific production by years, knowledge areas, and the trend and thematic evolution of publications between 2017 and 2023. Figure 1, panel A, shows that publications on the subject, in general, increased annually. The highest points reflect that 79% of the publications appeared since 2017 and the remaining 21% in the previous four years. This is relevant considering the growth of research on the topic in that time span; panel B shows the ten most cited articles (Jackson & Wilton, 2017; Jerrim & Macmillan 2015; Morley et al., 2018; José Sá & Serpa 2018; Shopova, 2014; Börner et al., 2018; Hernández-de-Menéndez, 2020; Roulin & Bangerter, 2013; Figueredo, Biscala & Teixeira, 2017; Vila, 2014).

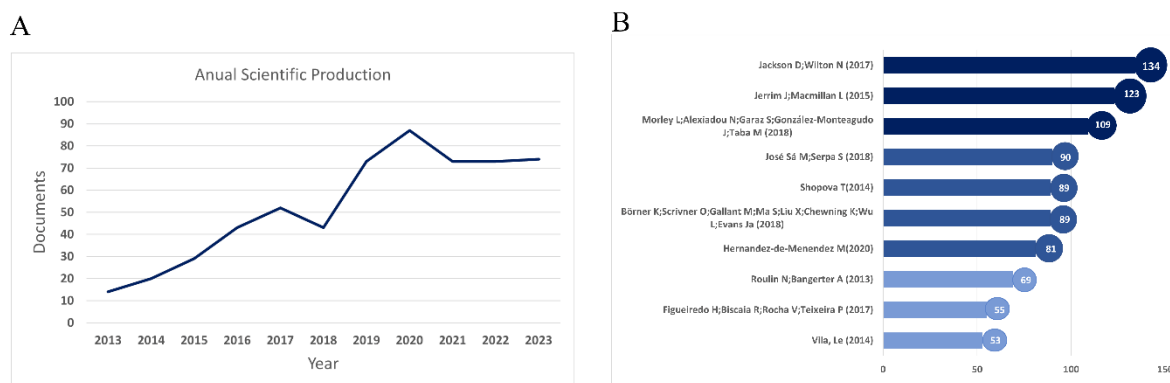

Figure 1. Scientific production by year (panel A) and the ten most relevant documents by number of citations (panel B).

In panel C of Figure 2, area A-E stands out for the number of publications and the sustainability of the study on the topic over the decade compared to SC, SS-LS, A-H, M-HS, and M. SS-LS peaked in 2016, fluctuated in the other years, and grew exponentially in publications on the topic from 2022. The scientific production of SC showed significant growth between 2018 and 2022.

Panel D shows that SS-LS papers had higher citation frequencies than the others, with citations reaching triple digits. In the other disciplines, A-H papers had outstanding citation activity, peaking in 2015. On the other hand,

there was a visible decline in citations for papers in all areas from 2020 onwards.

Finally, Panel E shows that Spain had a more significant number of publications than other countries. The level of production in this country increased throughout the decade analyzed. Countries such as Ukraine, Portugal, and Poland also stand out. Science has evolved collaboratively; Panel E reflects this dynamic of joint work and publication, identifying Spain with a high level of collaboration in scientific publication with countries from different continents.

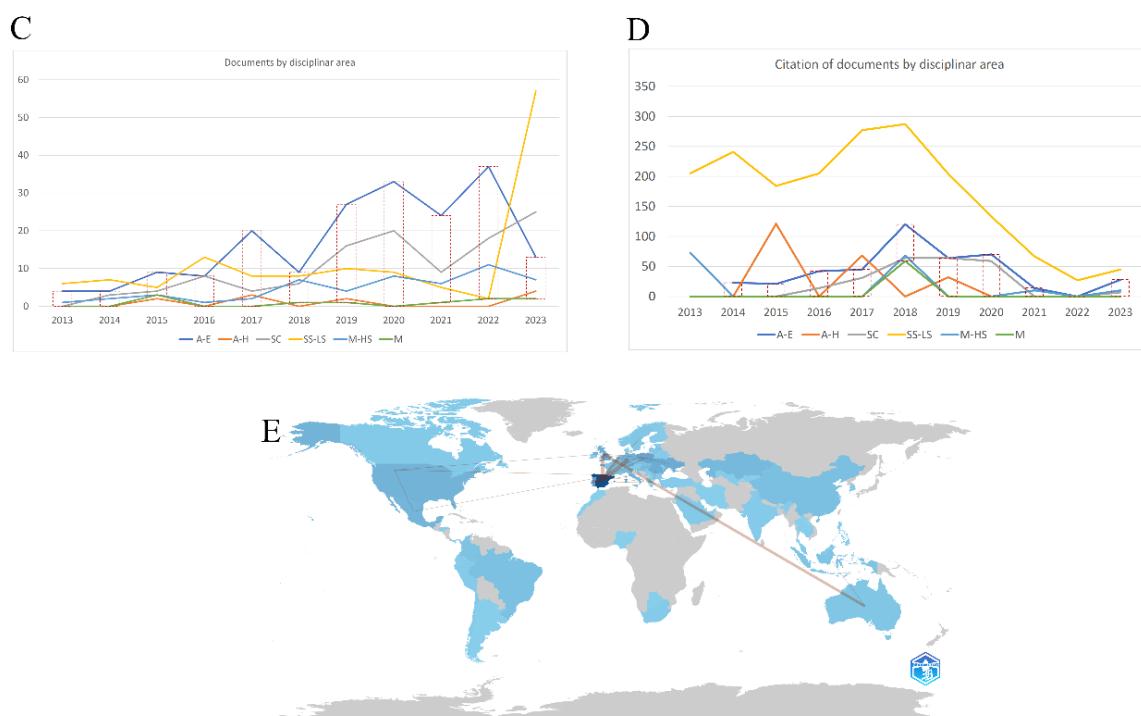

Figure 2. The number of papers published between 2013 and 2023 by area (panel C), citations obtained in the papers by area (panel D), and countries with the highest scientific production and an indication of their collaborative relationships (panel E).

Figure 3 shows the evolution of the most relevant thematic trends, defined by the frequency of keywords used by the authors. From 2013 to 2020, there were 14 topics related to the competency-based approach. The studies were mainly focused on Higher Education. Studies on active learning, emotional intelligence development, key competencies, human capital, graduate employability, and engineering education were less frequent.

From 2020 to 2023, the study topics were reduced to 12. However, studies on competencies, e-learning, professional development, and curriculum, among others, came to be analyzed in conjunction with the labor market. In this sense, the study of competencies went from focusing only on theoretical disciplinary development to a more practical understanding of the workplace.

Figure 3. Trends and thematic evolution of the publications analyzed per the keywords in English defined by the authors.

Second strategy- content analysis: results according to categories of analysis

This section presents the content analysis results of the 75 documents selected. The results are presented according to the research questions to make this report more dynamic.

Question 1: What are the characteristics of the research on competencies (productivity, relevance per citation, region, and disciplinary area), and the main conceptualizations used in the studies?

Table 3 summarizes the studies that explicitly mention the definition of competencies in three ways: in the sense of a general explanation of the concept, as a definition of specific or disciplinary competencies, or as transversal, generic, or soft competencies. It was found that 48% of the documents in the sample explicitly referenced a definition of competency. The remaining studies addressed the subject, identifying relevant competencies for vocational work training and employability and defining the relevance of some competencies in a specific disciplinary area (e.g., problem-solving competencies in engineering, innovation competencies, etc.). Some analyzed competencies from results previously obtained in international projects. In this case, such research used data from applied scales and perception questionnaires in projects exploring competencies for employability in previous years (e.g., REFLEX, HEGESCO). Most definitions of competencies appeared and discussed theoretical developments.

In addition, we could identify the recurrent sources used to define or conceptualize the term "competencies" in the studies analyzed. Tables 3 and 4 present the primary references describing the concept of competency at a general level and its specific expressions in disciplinary and cross-cutting aspects.

Table 3. Common definitions of competence in the analyzed studies

Typologies of	Common definitions of competence	Studies

definitions of competence

About the concept of competency in general	Capacity to apply knowledge, skills, and attitudes to use in concrete and complex situations to solve problems and make decisions effectively.	(Fragoso- Luzuriaga, 2015); (Gil-Galván et al., 2021); (Monteiro et al., 2021); (Quendler & Lamb, 2016); (Jackson & Wilton, 2017); (Teo, 2023); (Qu, 2023); (Castro Pais et al., 2023)
	The set of capabilities, knowledge, skills, attitudes, and values enabling individuals to perform tasks and solve problems effectively. Effective in specific work situations.	(Figueiredo et al., 2017); (Ornellas et al., 2019); (Prikshtat et al., 2020); (Almeida de Camargo Pereira & Felicetti, 2023); (Michavila et al., 2018); (Munkácsi & Krisztina, 2023); (Colombo & Marcato, 2023); (Mayombe, 2024); (Kuznetsova et al., 2023); (Pažur Aničić et al., 2023); (Bakhmat, 2023); (Tominc & Rožman, 2023).
	The set of skills and knowledge that people acquire or learn through education and training enabling them to perform effectively in the labor market and society in general.	Jerim & Macmillan, 2015); (Gora et al., 2019); (Martínez-Argüelles et al., 2023); (McGowan et al., 2023); (Herrmann et al., 2023); (Thorne et al., 2023)
On the concept of specific competency or discipline	Knowledge and technical skills required to develop a professional activity.	(Stuss et al., 2019); (Bartual Figueras & Turmo Garuz, 2016); (Valencia-Arias et al., 2023)
On the concept of cross-cutting, transversal or generic	Digital competencies as essential transversal knowledge in all disciplinary areas.	(Shopova, 2014); (Torres- Coronas & Vidal-Blasco,

competency, or soft skills	2015; (Konovalova et al., 2023); (Kulikova et al., 2023)
Combination of transversal competencies that provide a solid foundation for further learning	(Stuss et al., 2019); (Li & Valerievna, 2023); (Niyazova & Niyazov, 2023)
Ability to perceive opportunities for change, generate new ideas for the work environment, and compare the potential value of new ideas vs. adopting existing ideas	(Vila et al., 2014)

Within the organized authors and projects was a high level of activity by European bodies such as the Organization for Economic Cooperation and Development and the European Commission, as well as projects such as Tunning and HEGESCO. Undeniably, the work of the different interest groups residing in this continent to advance solidly in this issue is for the development of the citizens of the 21st century. Mexico is also involved with its projects, although to a lesser extent.

Table 4. Primary reference sources used to define the concept of competence in the documents analyzed between 2013 and 2023.

	Organizations, entities, and projects	Studies
Organizations	OECD (2005, 2006, 2019) Definitions and selection of competencies and executive reports on skills and employability.	(Figueiredo et al., 2017); (Priksht et al., 2020); (Almeida de Camargo Pereira & Felicetti, 2022); (Tominc & Rožman, 2023)
	Unesco (2002, 2005) Model of Competencies	(Gil-Galván et al., 2021); (Almeida de Camargo Pereira & Felicetti, 2022); (Thorne et al., 2023)
	European Commission (2002; 2006; 2008; 2010a; 2010b; 2013; 2014; 2018; 2020) Adult literacy guidelines and reports on crucial competencies for lifelong and life-wide learning, improving living and working conditions, and strategies for smart growth, sustainability, and inclusion	(Quendler & Lamb, 2016); (Ornellas et al., 2019); (Priksht et al., 2020); (Gil-Galván et al., 2021); (Goulart et al., 2022); (Martínez-Argüelles et al., 2023); (Munkácsi & Krisztina, 2023) ;

(Castro Pais et al., 2023)

	World Economic Forum (2016; 2018) Papers on the future of jobs.	(Monteiro et al., 2021); (Almeida de Camargo Pereira & Felicetti, 2022); (Goulart et al., 2022); (Castro Pais et al., 2023)
	International Labour Organization (ILO). Gap in skills enabling individuals to become employed	(Mayombe, 2024)
Entities	National Agency for Quality Assessment and Accreditation (ANECA) Occupational Information Network (O*NET)	(Martín Del Peso et al., 2013); (Almeida de Camargo Pereira & Felicetti, 2022); (Colombo & Marcato, 2023)

In addition to identifying the sources from which the definitions emerge, we also distinguished the typologies referred to when addressing the subject of competencies. These appear in only three of the articles reviewed.

Table 5. Types of competencies mentioned in the studies.

Competencies typologies	Studies
Scientific, practical, cross-cutting, and career (Allen, 2009)	(Monteiro et al., 2021)
Instrumental, interpersonal, and professional competencies (Tuning Educational Structures in Europe. González, J., & Wagenaar, R., 2003)	(Pujol-Jover et al., 2022)
Key competencies in education for sustainable development (Wals, A.E.J., 2012). Employability skills (Suleman, L., 2016). Skills for a Digital World (Organization for Economic Cooperation and Development (OECD). (2016). Skills for a Digital World). Digital competencies (Popova, S., Koroleva, E., Efremova, M.; 2023).	(Raitskaya & Tikhonova, 2019); (Konovalova et al., 2023)
Competencies for lifelong learning (Lifelong et al., 2007). Key competencies for lifelong learning: European reference	

framework. Office for Official Publications of the European Communities)

Knowledge-skills-attitude (KSA)(Myers et al., 2004) (Munkácsi & Krisztina, 2023)

Knowledge, Skills, Work activities, Work styles (O*NET, 2023) (Colombo & Marcato, 2023)

Data Literacy (Ridsdale et al. 2015; Heidrich et al. 2018; Etsiwah, 2021), Future Skills (Ehlers, 2020; Binkley et al. 2012; Freise 2018) (Herrmann et al., 2023)

Intercultural competencies (Thomas et al., 2008) (Li & Valerievna, 2023)

Question 2. How are competencies evaluated?

To answer this question, we analyzed the content of the methodological detail of the 76 selected studies. The results led to identifying two measurement trends in the documents. On the one hand, we found studies that measured or developed some intervention to assess competencies; on the other hand, we identified studies that examined the characteristics and progress of competencies from a theoretic perspective.

Concerning the studies that developed some intervention or measurement, we found 32 studies reporting measurement instruments in the defined research methodology. These studies' samples included students, graduates, professors, and business people. Among the characteristics of these studies, eleven collected purely qualitative data through interviews and focus groups. On the other hand, 14 of these works were quantitative, with a tendency to conduct mainly descriptive and correlational studies. There were also three quantitative studies using different methodological approaches: an S.E.M. model, a repeated-measures model, and a case study. Finally, four mixed studies involved quantitative analyses predominating over qualitative ones. Table 6 shows details.

Table 6. Types of studies and characteristics of competencies measurement.

Type of Study	Instruments or techniques used	Sample/ Participants	Studies
Qualitative/ Descriptive	Interviews	Entrepreneurs	(Roulin & Bangerter, 2013);
		Teachers	(Bartual Figueras & Turmo Garuz, 2016);
		Students	(Priksht et al., 2020); (Gil-Galván et al., 2021);

Twenty studies did not use measurement processes. For this study, we decided to characterize and analyze the studies that did not involve measurement to understand their methodologies and purposes. The findings led to identifying two types of studies that did not include the measurement of competencies: Theoretical-critical analytical, and Methodological proposal for the development of a conceptual model.

First, we found that the theoretical-analytical studies focused on the following topics:

- Importance of developing transversal competencies: socioemotional competencies and emotional intelligence (Fragoso-Luzuriaga, 2015).
- Relevance of digital skills and critical thinking in college students (Kozorez et al., 2020).
- Developing a model that integrates transversal and disciplinary competencies (Goulart et al., 2022).
- Proposal for a framework for lifelong learning competencies for work demanded by the labor sector and professional updating (Quendler & Lamb, 2016).
- Understanding the challenges of European higher education in disciplinary and cross-disciplinary training and work certifications (Pavlin & Svetlik, 2014).
- Analysis of the connection between translation and interpreting skills development and the labor market (Rodríguez de Céspedes, 2017).
- Analysis of the use of technological tools for teaching and evaluating transversal competencies in Higher Education (José Sá & Serpa, 2018).
- Relationship between labor market introduction and vocational training of competencies in the framework of knowledge, skills, and attitudes (Grossman et al., 2017).
- Development of competencies and skills in digitalization and the knowledge economy of the labor market (Raitskaya & Tikhonova, 2019).

Studies that were critical-analytical and theoretical reviews.

- Development of professional disciplinary competencies in engineering, design, and use of technological tools (Ivanov et al., 2018).
- Soft and job skills training in Higher Education (Zighan & EL-Qasem, 2021).
- Model designs for training competencies starting with labor sector needs (Medina et al., 2020).
- Relationship between employability and perceived transversal skills training in graduates (Belchior-Rocha et al., 2022).
- Industry 4.0 Context Analysis and training of specific and transversal competencies (Hernandez-de-Menendez et al., 2020).
- Analysis on European research on the labor market, STEAM skills development, and lifelong learning in the contemporary context of the technological revolution and companies' digitalization (Piatkowski, 2020).
- Propose a new Unified Credential Framework (UCF) and competencies training for the model to ensure that all post-secondary education is practical and straightforward (Thorne et al., 2023).
- Generate a reference guide with recommendations on the best educational methods to develop ethical, communicative, self-monitoring, and evaluation competencies in healthcare professionals (Niyazova & Niyazov, 2023).
- Development of proposed solutions to improve digital skills among forestry personnel (Konovalova et al., 2023)

Finally, Achcaoucaou et al. (2014) proposed a model to develop transversal and occupational competencies in university students. Heymann et al. (2022) proposed a method based on competency framework documents and reports such as DeSeCo (2002), European Commission (2006), OECD (2012), and theorists such as Le Boterf (1994), Spencer and Spencer (1993), among others.

Question 3. What competencies are most frequently analyzed in higher education studies and industry, and to what type are those?

Figure 4. Taxonomy of Competencies analyzed in six disciplinary areas.

In the 75 studies examined in the contain, we identified that instrumental competencies such as communication, technological, and cognitive were mainly developed in SS-LS, A-H, and SC. In addition, the development of

soft skills, such as problem-solving, leadership, critical thinking, and teamwork, were the most evaluated competencies in the 75 studies. The areas of M-HS and A-H were the ones that most developed soft competencies. Instrumental competencies (e.g., use of information, technological), and specific competencies (e.g., mathematical, strategic action) are analyzed more intensely in the SS-LS and A-E areas. Something similar happened with systemic competencies (e.g., transitory learning, systemic thinking, practical), which are developed to a greater extent in the SS-LS area. Figure 4 presents the distribution of competencies by discipline area.

Discussion

We highlight four points based on the analysis and its conclusions. The first refers to the role of organizations such as UNESCO, the OECD, the World Bank, and the I.B.E., among the main ones, and the influence of their definitions of competencies on research on the subject. Adopting these guidelines as confirmation of the descriptions and operationalizations of competencies corresponds to the worldwide incidence of these organizations' educational and economic systems studies. This is precisely where competency-based education is located, at the intersection of training and job placement.

The second refers to the relevance of developing and training competencies to respond to global challenges because it does not refer to particular regional or national situations. In this work, we have identified a marked trend towards the training of soft and instrumental competencies. This allows us to establish this growing tendency to examine soft competencies, as previous works have done in postgraduate programs (García-Chitiva & Correa, 2023). This indicates that higher education institutions and the labor market need global references to orient their perspectives and strategies (McKeown, 2020).

A third point that emerges from the results is the significance of training in professional and labor competencies in the last decade. The growing and increasingly focused orientation towards strengthening human capital is evident, even surpassing the analysis on the development of disciplinary competencies addressed in previous decades (Malinowski, 1993). Training critical and decisive individuals with competencies that enable them to innovate, work in teams, communicate assertively and effectively, self-manage, and lead groups, to mention some of the competencies desired in the labor market, is a challenge discussed in global agendas.

In addition, this review allowed us to identify a taxonomy that considered six areas of knowledge with four specific emphases of competency analysis (instrumental competencies, soft competencies, specific competencies, and systemic competencies), where soft and instrumental competencies predominated. This finding shows a clear shift in research on competencies in higher education towards the formation of human capital, professionals with sufficient competencies to interact in their environment and effectively use the disciplinary knowledge they develop in university education. Likewise, the advent of artificial intelligence with tools such as ChatGPT and other emerging technologies further anticipates this trend in the future (García-

Peñalvo, 2023).

A fourth and final point refers to the current conceptualization of competition, which has become polysemic. The concept does not have a single definition because its meaning varies according to the disciplinary approach from which it is analyzed and operationalized. However, it is pertinent to note a reflection derived from the study: the polysemy of the concept of competence is necessary to strengthen the curricular, instructional, and functional characteristics and needs of each area of knowledge. Innovating from this particularity could enhance the work using the competency-based approach. This innovation accepts the plurality of definitions and taxonomies based on the needs of each field of study and the continuous improvement for a measurement that goes beyond the participants' perceptions.

Among the data collection techniques, self-reports, standardized surveys such as REFLEX and HEGESCO, interviews, and focus groups received priority in the studies analyzed. These mechanisms inquired about the opinions of students, graduates, faculty, and employers about the competencies trained, required, and needed. However, this approach reveals a methodological gap. We suggest using instruments such as rubrics, portfolios, observations, and qualitative approaches for a comprehensive understanding of the development of competencies in students and graduates.

Likewise, we identified unexplored gaps in the study on the subject. These may reveal themes in future studies on competencies in vocational education. For example, it would be opportune to investigate the development of competencies with individual factors, such as cognitive styles, learning styles, and self-regulation, and the incidence of this relationship with teaching methods and the performance of graduates in the labor field. Following this idea, (Salas, 2014) concluded with the need to analyze how universities can add value to the training of their students by ensuring that teaching, learning, and assessment methods can improve the development of competencies relevant to the labor market.

Another aspect to highlight concerns the context in which competencies are researched. The involvement of employers in the analyses is evident. The studies analyzed reflect the need to take advantage of employees' diverse skills at a personal and individual level, reinforcing the importance of improving companies' organizational cultures through continuous training (Hora, 2020).

The studies were conducted in the university professional setting and focused on examining the possible elements associated with developing competencies and success in employability through analyzing behavior and personal and intrapersonal factors. They also reviewed the competencies that lead to efficient teamwork (Herrera et al., 2017), a valuable indicator. Previous works have shown the benefits of collaborative learning in professional training (García Chitiva, 2020; García-Chitiva, 2021), reflected in the competence developed by professionals about to enter the labor market. This is useful for further work to be carried out in baccalaureate and postgraduate programs. It is worth highlighting this last aspect since most of the works were developed in the context of higher education in bachelor's degree programs; it is worth examining in more detail the

development of competencies in graduate programs, as suggested by (Garcia-Chitiva & Correa, 2023).

Conclusion

This study has focused on the last decade, showing significant changes in forming professional and labor competencies. These changes are oriented to the demands of the business world of the 21st century. Companies seek professionals with specialized knowledge and consolidated interdisciplinary and soft skills. Thus, one of the challenges for higher education and the labor market is to reconfigure the curricula formulated from the perspective of training for and throughout life, which includes solid disciplinary training that is situated and coherent with the needs of the context at all educational levels, and that strengthens the development of competencies for self-management, collaborative work, critical thinking, and positive leadership, among others. It is clear that, although there are references that allow analyzing and operationalizing competencies, it is necessary to understand them from their contextual nature. The tasks associated with professional and job training within the various disciplinary areas demand different competencies from individuals. Therefore, it is relevant to recognize the type of competencies that characterize such contextual frameworks in each case to identify appropriate ways to enhance, evaluate, and measure their level of development.

Research on competencies needs to be more widely developed at the technical and graduate levels. It is necessary to address this need in these populations, considering that the emphasis on competencies is dynamic and aligned to the needs of the social context and that the learning and development of competencies should be sustainable and guaranteed throughout life.

The results and discussion allow us to understand that the linkage process required to strengthen the transition from higher education to the labor market based on competencies is in its early stages. If the trend shows that the topic of employability is currently of interest for educational research at a higher level, with 26% of the articles reviewed related to the academic field and the labor market, an increase in scientific production is expected in the coming years, which will clarify and contextualize efforts on both sides.

The work presented here also allowed us to understand the different practices used to measure the level of performance of educational institutions and the labor sector. Undoubtedly, much remains to be done in terms of metrics. At present, it is still complex to advance in the use of instruments and evidence to strengthen evaluation systems that allow us to issue more precise results on the level of performance beyond perception. We hope to see more solid proposals in the coming years.

This study also derives from a suggestion emanating from the tendency to generate spaces for permanent updating on different topics. In this specific case, it would be important that organizations and institutions dedicated to research and the generation of models or principles on competencies could generate observatories from which to document and review progress on the subject by area of knowledge. Some observatories, such as

the one dedicated to the engineering discipline in Mexico (Mexico, n.d.), could be a reference for future initiatives that favor a better understanding of training demands and the labor market.

Recommendations

In this study, only articles from one database (Scopus) were analyzed due to researchers' ease of access to this information source. It is recommended that subsequent studies interested in replicating this study extend the observations with studies obtained from other databases.

Acknowledgments

The authors acknowledge the financial and technical support of Writing Lab, Institute for the Future of Education, Tecnologico de Monterrey, Mexico, in the production of this work.

Inside-Outside: A Local Theory for Strengthening Deprived Schools' Ecosystems and Enhancing Teacher Practices

Mirna Isabel Rivera García

Universidad Tecnológica Centroamericana, Honduras,  <https://orcid.org/0000-0003-0750-022X>

Abstract: This study proposes a local theory called "Inside-Outside" to strengthen a deprived school microsystem. The theory aims to reduce the cycle of ignorance in schools with poor infrastructure facilities, large groups of students, located in high-crime areas, children from low-income families with low levels of schooling, and families unable to support students with school tasks at home, thereby leaving the learning process entirely to teachers, who must bridge the technological and pedagogical institutional gaps. This qualitative study was based on empirical findings and followed the educational design research methodology. Fieldwork was conducted with third- and fourth-grade students and teachers in an urban school in an impoverished area in Honduras. The theory contributes to improving teachers' practices by considering students' socioeconomic contexts, limited access to digital tools, and engagement with non-profit organizations to compensate for insufficient family and government support. Inside-Outside theory serves as a comprehensive framework for transformative educational practices that empower educators and uplift students in resource-constrained settings.

Keywords: deprived schools, local theory, low-income families, impoverished areas, digital tools

Citation: Rivera García, M.I. (2024). Inside-Outside: A local theory for strengthening deprived schools' ecosystems and enhancing teacher practices. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024—International Conference on Research in Education and Science* (pp. 1746–1769), Antalya, Türkiye. ISTES.

Introduction

This study was conducted in San Pedro Sula, Honduras, in a school situated in Rivera Hernandez, a socioeconomically challenged neighborhood that is under gang control. Many children in this neighborhood are forced to abandon their education due to poverty and limited opportunities. In fact, the mean number of years of schooling in Honduras from 2013 to 2023 (no data reported in 2020) was 8.9 (Instituto Nacional de Estadística, 2023). According to the World Bank's Human Capital Index (2023), "A child born in Honduras today will be 48 percent as productive when she grows up as she could be if she enjoyed complete education and full health." These data are a faithful reflection of what happens in the school and neighborhood where we conducted this study.

Educational design research (McKenney & Reeves, 2019) has been instrumental in the researcher's efforts to develop a comprehensive theory derived from classroom experiences with students and teachers. By analyzing data collected between 2015 and 2019, during the researcher's doctoral studies at Aalborg University in Denmark (Rivera, 2019), the researcher refined a local theory which goes beyond technology and pedagogy considerations. It accounts for the challenging contexts that children face in socioeconomically deprived educational settings. With support from a non-profit organization, Zamora Terán Foundation, providing technology, traditional pedagogy was transformed into an active approach that employed problem- and project-based learning (PBL) approaches. Teachers were integral to this process, receiving training in the new pedagogical model and contributing to the lesson prototype development.

Since pedagogy and technology do not independently address the issues faced by students, the need to integrate external elements to strengthen the microsystem arises. The proposal for a local theory emerges from this premise. This study introduces a local theory termed "Inside-Outside" that was designed to fortify an underserved school's microsystem. Originating in a disadvantaged area in a public school characterized by violence and poverty, this theory bolsters education in high-poverty contexts by establishing a secure school environment for students and teachers. Developed by synthesizing the theoretical frameworks, with insights from educators and students, and input from school administrators, this theory was crafted via meticulous observation of processes and the application of various methodologies to comprehend challenges and opportunities (Rivera, 2018a).

The researcher's motivation to present this theory stems from a desire to meaningfully contribute to the educational experiences of children in similar circumstances to children in Rivera Hernández. Following educational design research (EDR), the researcher shaped this theory and addressed the complex needs of students in educational settings (Rivera, 2019).

Theories Underpinning Inside-Outside Local Theory

Student-centered learning has emerged as a pivotal approach in the education landscape, placing learners at the forefront of the educational process. This paradigm shift is underpinned by the contributions of pioneering educators who championed the ideals of experiential learning, cognitive development, and the importance of social interactions in the learning process (Rivera, 2018b).

Table 1. Educational theories to sustain the Inside-Outside components of the local theory

Authors	Main Student-Centered Characteristics	Key Concepts
John Dewey (1916)	Learning by doing	- Experiential learning
		- Teaching to live in society
	Experiential learning	-Real-life experiences

	Teaching to live in society	"'To learn from experience' is to make a backward and forward connection between what we do to things and what we enjoy or suffer from things in consequence" (Dewey, 1916/2007, p. 117)
Maria Montessori (1914)	Importance of the environment	<ul style="list-style-type: none"> - Learning about the materials and tools used in the classroom - Importance of teacher observation in understanding children's needs <p>"My method is scientific, both in its substance and in its aim. It makes for the attainment of a more advanced stage of progress, in directions no longer only material and physiological" (Montessori, 1914/1964, p. 8)</p>
Jean Piaget (1929)	Stages of cognitive development	<ul style="list-style-type: none"> - Children discover knowledge <p>"The child's convictions are the product of a reaction influenced but not dictated by the adult" (Piaget, 1929, p.28)</p>
Lev Vygotsky (1978)	Zone of proximal development	<ul style="list-style-type: none"> - Scaffolding: children learning with the assistance of adults or other peers - Learning as a social process <p>"That children's learning begins long before they attend school is the starting point of this discussion. Any learning a child encounters in school always has a previous history"(Vygotsky, 1978, p. 84)</p>

The local Inside-Outside theory draws on the foundational principles and insights of prominent figures in student-centered learning, as elucidated in the Table 1. Each educator—Dewey (1916), Montessori (1914), Piaget (1929), and Vygotsky (1978)—has contributed unique perspectives and concepts that inform the Inside-Outside framework. From Dewey's emphasis on experiential learning and societal engagement to Montessori's focus on the role of environment and observation, these key characteristics are woven into the fabric of the Inside-Outside approach. Likewise, Piaget's stages of cognitive development and Vygotsky's zone of proximal development and scaffolding principles serve as guiding pillars for understanding the dynamic interactions between learners, educators, and the learning environment in the Inside-Outside framework. The Inside-Outside theory integrates these insights to create a holistic and adaptive learning ecosystem that empowers students to thrive in diverse educational settings.

The theory endeavors to break the cycle of ignorance manifests when children from impoverished backgrounds

face limited access to quality schooling due to factors such as poverty and poor infrastructure. This lack of access perpetuates a cycle wherein these children are unable to acquire the necessary knowledge and skills to overcome their circumstances. Schools confronted with various challenges, such as having inadequate infrastructure, overcrowding in classrooms, being located in high-crime areas, and serving students from economically disadvantaged backgrounds who have limited access to educational resources and parental support. In addition to addressing pedagogical aspects, this theory draws on the insights of educators who seek to not only transform teaching methods but also impact the broader environment hindering student learning. Therefore, Inside-Outside theory, it is grounded in the principles of prominent theorists who advocate for systemic changes to uplift educational practices and mitigate the barriers faced by students.

Table 2. Educational theories that influence the outside components of Inside-Outside the local theory

Theory	Key Concepts
Ecological Systems Theory (Bronfenbrenner, 1979)	<ul style="list-style-type: none"> - Emphasizes the multiple layers of influence on human development - Considers internal and external factors impacting education - Addresses the interconnectedness of individuals with their social and physical environments
Pedagogy of the Oppressed (Freire, 1970)	<ul style="list-style-type: none"> - Advocates for education as a tool for liberation and social transformation - Emphasizes participatory, student-centered learning - Critiques oppressive educational structures
Activity Theory (Engeström, 1986)	<ul style="list-style-type: none"> - Emphasizes the role of social interactions and cultural context in shaping cognitive development - Leverages peer support networks and community involvement to scaffold students' learning experiences - Recognizes the importance of social interaction and collaborative learning in educational settings

By integrating perspectives from scholars such as Bronfenbrenner, Freire, and Engeström, the Inside-Outside theory aims to create an inclusive and supportive educational ecosystem, bridging the gap between technological advancements and pedagogical approaches. This holistic approach acknowledges the interplay between socioeconomic factors and educational outcomes and strives to empower both students and educators as they navigate complex social contexts.

This article aims to develop a local theory called Inside-Outside that draws from insights gained from a specific school experience situated in a deprived area, Rivera Hernández neighborhood in San Pedro Sula, Honduras. The objective of this proposal is to use this theory to strengthen the educational microsystem in disadvantaged settings.

Method

This study used EDR as its methodology (McKenney & Reeves, 2019), since it integrates theory and practice. It allows the researcher to achieve two goals: providing theoretical insights into the challenges faced by underprivileged schools in impoverished areas and implementing practical solutions to improve the quality of education at the micro level.

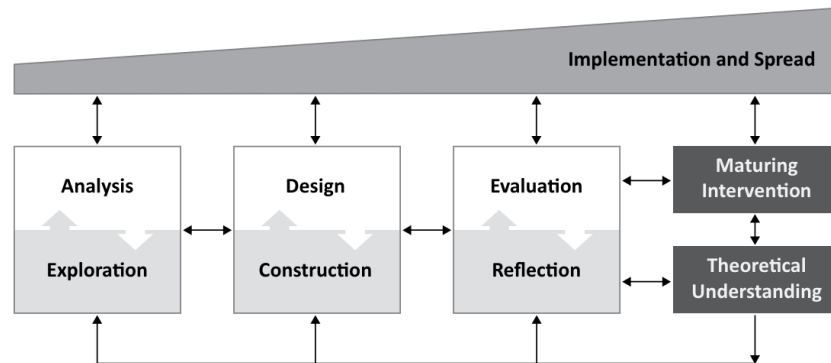

Figure 1. Generic model for conducting design research in education

The flexibility EDR of enables researchers to pursue their goals in real-world contexts by collaborating with key stakeholders, such as teachers, school authorities, students, and technology providers. The generic model EDR provides helps organize, manage, and classify collected data. This generic model allows for the creation of local theories (see Figure 1), with the empirical evidence collected and literature review (Gyamfi, 2014; Mckenney & Reeves, 2019).

Table 3. Main aspects for conducting educational design research (EDR)

Phase	Approach	Key Methods
Analysis and Exploration	Conduct literature review and problem orientation	- Literature review - Visual anthropology (Collier & Collier, 1986)
	Collaborate on artifact production	- Informal meetings
	Select research methods	- Participant observation
	Understand context through fieldwork	- In-depth interviews
Data Gathering and Analysis	Utilize qualitative methods for data collection and analysis	- Classroom observation
	Identify intangible factors influencing research issue	- Survey of students
	Identify decision-makers	- In-depth interviews of principal and authorities
Design and	Reflect on inputs from previous phase	- Future workshop (Jungk &

Construction		Müllert, 1987)
	Generate ideas for design	Brainstorming
	Identify needs for prototype design	-Team work
	Develop prototype	-Classroom design
Evaluation and	Test prototype through evaluation	- Implementation in class
Reflection		
	Reflect on implementation	- Interviews teachers and students

As McKenney and Reeves explain, "in educational design research, local theory is produced when limited manifestations of a certain phenomenon are studied (e.g. several iterations of one basic intervention are studied in just a few classrooms)" (p. 40). This approach allows researchers to gain a deeper understanding of the barriers and constraints within a specific ecological context. Local theories are described as "relatively humble," using a quote from Cobb et al. (2003, p. 9).

Unit of analysis

In this study, the unit of analysis comprises a school environment situated in an underprivileged area that is controlled by various criminal gangs and characterized by a high crime rate. The daily routines for both students and teachers involve commuting under risky conditions. The researcher sought to comprehend the external context, particularly the challenges encountered by individuals in the vicinity of the school during their daily commutes.

The researcher also delved into the internal dynamics of the school environment, focusing on teachers and students interacting in their typical setting, examining school infrastructure, and assessing technology use in the classroom. To obtain comprehensive insights, the researcher listened to students and teacher experiences and perspectives. engaged with teachers and students, listening to their perspectives and experiences.

The data collection methods included visual anthropology, participant observation, surveys, interviews, and future workshops, a technique to find solutions in a collaborative way (Vidal, 2006). These diverse approaches facilitated a thorough exploration of external and internal contexts, allowing for a nuanced understanding of the challenges and opportunities present.

To analyze the collected data, the researcher utilized the Theory of Constraints (TOC) framework (Goldratt, 1990), activity theory (Engestrom, 1989), and the Pedagogy of the Oppressed (Freire, 1970). Using this analytical approach the researcher identify the primary constraints hindering the implementation of PBL using information and communication technology (ICT) in a public school operating in an impoverished area. Through this analysis, this study uncovered key barriers and proposed strategies to overcome them, ultimately enhancing educational practices in the school environment.

Results

Through observation using a semi-structured questioner, the researcher observed third-grade, and found that 6 out of 10 of Freire's contradictions were employed. The study identified several problems with the teacher–student dynamics, as articulated using Freire's Pedagogy of the Oppressed (1970).

This study identified several key issues with the traditional teaching approach: a one-way flow of information from teacher to student, leading to passivity among students; an imbalance in knowledge distribution, with the teacher as the sole authority; a lack of active student participation, hindering critical thinking development; deficient dialogue and collaboration opportunities in the classroom; an overreliance on teacher discipline and control, limiting student autonomy; and a troubling imbalance in the learning process, where students are treated as passive recipients rather than active participants.

Table 4. Main contradictions studied based on Freire (1970)

Teacher–Student Contradictions (Freire, 1970)	Identified Problems
The teacher teaches and the student is taught	Traditional teaching approach and student passivity
The teacher knows everything, and the student knows nothing	Excessive dependence on the teacher to transmit knowledge
The teacher thinks and the student is thought	Lack of active student participation
The teacher talks and the student listens docilely	Lack of dialogue and collaboration in the classroom
The teacher disciplines and the student is disciplined	Excessive dependence on teacher discipline and control
The teacher is the subject of the learning process, and the students are mere objects	Students viewed as passive recipients, expected to absorb and memorize the information the teacher provides without active engagement or critical thinking

The findings highlighted significant problems inherent in traditional teaching methods, as elucidated by Freire's Pedagogy of the Oppressed. These issues include a one-way flow of information from teacher to student, resulting in student passivity; an overemphasis on the teacher as the sole authority of knowledge; a lack of active student participation, hindering critical thinking development; lack of dialogue and collaboration opportunities in the classroom; an excessive reliance on teacher discipline and control; and a troubling imbalance in the learning process, where students are relegated to passive recipients rather than active participants.

Table 4 shows the identified contradictions and their associated problems, which highlights the need for transformative pedagogical approaches that prioritize student engagement, critical thinking, and collaborative learning.

External environment

The external environment's impact on school performance becomes evident, highlighting traditional disciplinary approaches' insufficiency in the classroom. There was a recognized necessity for children to develop self-discipline by fostering intrinsic motivation toward integration into society, rather than through punitive measures. The emphasis lies in enabling students to comprehend their reality, cultivate self-confidence, and nurture a positive self-image, empowering them to effect transformative changes in their circumstances.

Beyond the provision of technology, there arises an urgent call to aid children in emancipating themselves from the shackles of poverty and insecurity. Drawing inspiration from Freire (1970, p. 66), liberation is perceived as praxis—an amalgamation of action and reflection aimed at transforming the world. Thus, a genuine commitment to liberation rejects both the mechanistic view of consciousness as an empty vessel and the imposition of banking methods of domination in the guise of liberation.

The researcher selected TOC as their analysis methodology because it offers thinking process tools specifically designed to tackle constraints unearthed during the research process. TOC revolves around three pivotal questions geared toward overcoming system constraints. First, "What to change?" demands a comprehensive grasp of the process areas in need of improvement and the identification of core issues. Second, "To what to change to?" entails considering feasible and easy-to-implement solutions. Third, "How to cause the change?" entails actively engaging participants in the quest for solutions.

The constraints were identified and delineated by a comprehensive analysis of data collected via future workshops with teachers, observations using Freire's contradictions, and the examination of two cases utilizing activity theory. These constraints fall into two main categories: technological and pedagogical. Technological constraints encompass issues such as weak Internet connections, inadequate equipment maintenance, and insufficient hardware and software protection.

Pedagogical constraints include limited teacher training, reliance on traditional teaching methods, and large class sizes with inadequate support. These challenges significantly impact instructional delivery and student engagement, preventing obstacles to the implementation of innovative teaching approaches. Additionally, factors related to student children's well-being, such as nutrition and school–community relationships, further compound these challenges. Addressing these constraints is imperative for fostering an environment conducive to quality education and the successful integration of ICT and pedagogy in the classroom.

According to Goldratt (1990), a system constraint is "nothing more than what we all feel to be expressed by

these words: anything that limits a system from achieving higher performance versus its goal." TOC is a "management philosophy, which emerged in the early 1980s. The development of TOC is credited in the main to Goldratt, an Israeli physicist who has had a remarkable impact on the business world, especially in the U.S." (Mabin & Balderstone, 2000, p. 1).

Table 5. Main constraints identified by following the Theory of Constraints (TOC) (Goldratt, 1990)

Constraint Type	Description
Technological	Weak Internet connection provided by a private company, inadequate equipment maintenance, lack of protection for hardware and software, and insufficient power connectors
Pedagogical	Limited pedagogical training for teachers, persistent use of traditional teaching methods, and large class sizes without assistants
Children's Well-being	Lack of emphasis on children's nutrition, limited school–community relationships, and an inability for students to take XO computers home due to safety concerns

These constraints are categorized into two main types: physical and non-physical. Physical constraints encompass issues such as inadequate equipment maintenance, a lack of appropriate furniture, insufficient power connectors, limited access to quality Internet connections, and a lack of maintenance resources. Non-physical constraints include limited pedagogical training for teachers, persistent use of traditional teaching methods, large class sizes without assistants, and a lack of emphasis on children's nutrition. Addressing these constraints is crucial for creating an environment that is conducive to effective teaching practices and ensuring equitable access to quality education for all students.

Table 6. Types of constraints identified based on Goldratt (1990)

Constraint Type (TOC)	Description
Physical	Inadequate equipment maintenance, a lack of appropriate furniture, insufficient power connectors, limited access to quality Internet connections, and a lack of resources for maintenance
Non-Physical	Limited pedagogical training for teachers, persistent use of traditional teaching methods, large class sizes without assistants, and a lack of emphasis on children's nutrition

Using evaporating cloud representation to summarize the answer to what to change in the classroom during this research (TOC).

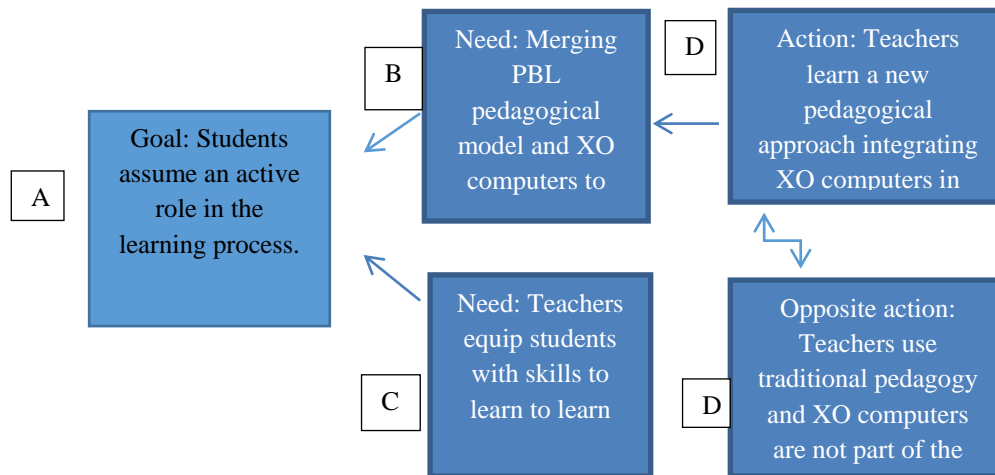

Figure 2. Using evaporating cloud to respond: "What to change in the classroom?"

As Figure 2 illustrates, the essence of the change can be synthesized as follows: The aim is to enable students to become active participants in the learning process by integrating the PBL approach with the use of XO computers, thus promoting student-centered learning. Furthermore, the objective involves equipping teachers with the training necessary to impart students with the essential skills required to confront the challenges of the 21st century while also resolving the tension between traditional and nontraditional teaching methods (Rivera, 2020).

Future workshop

A future workshop is a participative approach that empowers the participants and promotes critical thinking, teamwork, and democratic principles (Vidal, 2006). A future workshop is appropriate for developing countries in which democracy is weak and freedom of speech is risky, so participants might be afraid to speak about their views. Future workshops were created with the intent of democratizing participation and seeking joint solutions to problems (Jungk & Müllert, 1987).

In this case, the participants were 25 elementary school teachers who had XO computers available for teaching in the classroom. The researcher facilitated the workshop, guiding the participants through the different phases and working with staff from the Zamora Terán Foundation (ZTF), the school's main provider of XO computers and technical support. I followed the steps for the future workshop method (see Table 7).

Table 7. Future workshop developed with schoolteachers (Jungk & Müllert, 1987)

Phase	Teacher Role	Main Outcome
-------	--------------	--------------

Preparation	Collaborator and contributor	Identification of opportunities and constraints related to introducing problem/project-based learning (PBL) using computers in suburban schools
Critique	Participant and discussant	Identification and discussion of limitations of utilizing XO computers and teacher-oriented pedagogy, highlighting challenges related to technology, pedagogy, infrastructure, and student performance
Fantasy	Visionary and creative contributor	Creative expression of aspirations and dreams for an ideal educational environment through drawings and discussions, envisioning improvements in infrastructure, teaching methods, technological resources, and student well-being
Implementation	Decision-maker and evaluator	Selection of implementable solutions to address identified constraints, active participation in evaluating proposed ideas, considering factors such as feasibility, practicality, and potential impact

Pedagogical model developed with practitioners

The pedagogical model depicted in Figure 3 emerged from the empirical testing of prototypes in the classroom, which were shaped collaboratively by students, teachers, and researchers. The primary objective is to cultivate 21st-century skills through student-centered learning and empowering children in impoverished areas to break the cycle of generational ignorance by acquiring essential soft skills to thrive in a digital society. Constraints were identified during this process.

Key Steps for Designing a Pedagogical Model for Economically Challenged areas:

1. Construct prototypes to bridge the techno-pedagogical gap
2. Test prototype lessons in the classroom
3. Design a student-centered pedagogical model that considers the Inside-Outside microsystem
- 4.

In this pedagogical design, the teacher–student relationship is horizontal, and teachers employ scaffolding strategies to support learners. Teachers honor individual learning styles and serve as facilitators who provide in-classroom coaching and feedback. Students are integral members of a learning community who engage in active, collaborative relationships characterized by mutual support, respect, and assertive communication.

This methodology promotes experiential learning, with students solving real-world problems relevant to their disadvantaged contexts. Initially students develop projects using the scientific method, leveraging ICT for self-directed learning and honing 21st-century skills to fortify the Inside-Outside microsystem they inhabit. Assessments are formative, with teachers and peers offering feedback, and learners engaging in self-assessment to reflect on their learning journeys, achievements, and challenges.

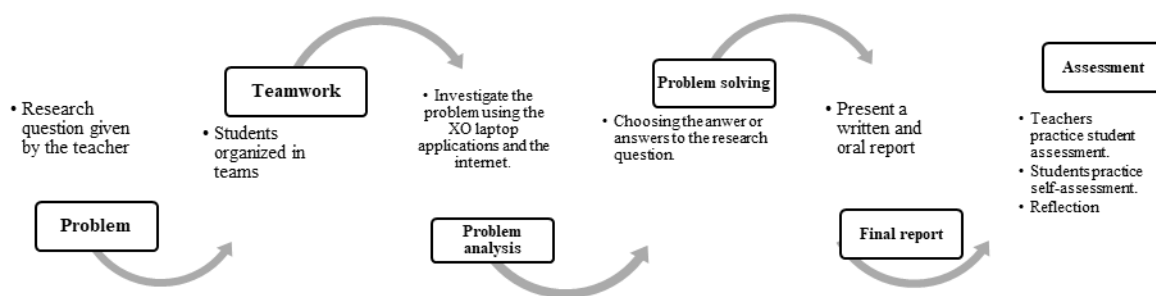

Figure 3. Pedagogical design model resulting from empirical testing in the classroom

Unfolding the intervention

The pedagogical model proposed by teachers who underwent PBL training and utilized XO computers was implemented in the classroom and analyzed using activity theory as part of its development.

Two cases were developed, with one involving third graders and the other involving fifth graders. The study participants were teachers who received five days of training in PBL principles and XO computers during an earlier research phase. During this training, the teachers designed a prototype lesson to test. The classroom implementation of the prototype lesson spanned five days, although it was originally planned to cover three days. The lesson plan required more time than anticipated, this led to adjustments in the implementation timeline.

Case 1—Third graders

The morning session teacher for third graders, who worked from 7 a.m. to noon, Monday through Friday, served a large class (48 students) and taught all subjects. She chose her Spanish class to participate in the present study, intending to improve the students' reading skills. This teacher volunteered to implement a lesson design integrating PBL principles and XO laptops.

The teacher asked the students to take the computers out of the lockers. The students could not take the computers home because the school was in a dangerous area, and the students might be robbed of their computers if they travel with them. The teacher waited until all students had their computers ready to work, which took about 20 minutes, because some students needed to charge their computers' batteries, and there were not enough electrical outlets (see Figure 4).

The teacher organized the students into groups of six to nine, wrote the names of the members of each group on the whiteboard, and asked the student groups to arrange their desks in a circle. Then, the teacher asked the students to create a story and use the XO laptops to search for images and information, read information, and write their stories. The students used Tux Paint to draw, and they used the XO cameras to record interviews (see

Figure 5). Each group's final product was a story they read aloud in front of the class (see Figure 6).

Figure 4. Children charging laptop batteries

Figure 5. Students using Tux paint and recording interviews

Figure 6. Students giving oral presentations

According to activity theory, the object in this context would be the improvement of third-grade children's reading skills in the Spanish class. The outcome would be the strengthening of 21st-century skills, such as teamwork, public speaking, creativity, and problem-solving. The division of labor involves students organizing for teamwork, working peer-to-peer, building knowledge, and teachers acting as facilitators.

The community includes XO providers (such as the ZTF), teachers, students, and administrative staff. The rules establish that students are active learners at the center of knowledge, teachers motivate students to research, and XO is incorporated into the lesson plan. This follows a student-centered approach, where active participation, peer collaboration, and the use of technology to enhance learning are encouraged. This analysis can help

strengthen the Inside-Outside local theory by providing a deeper understanding of how the pedagogical model is implemented and how it contributes to the development of key skills in students.

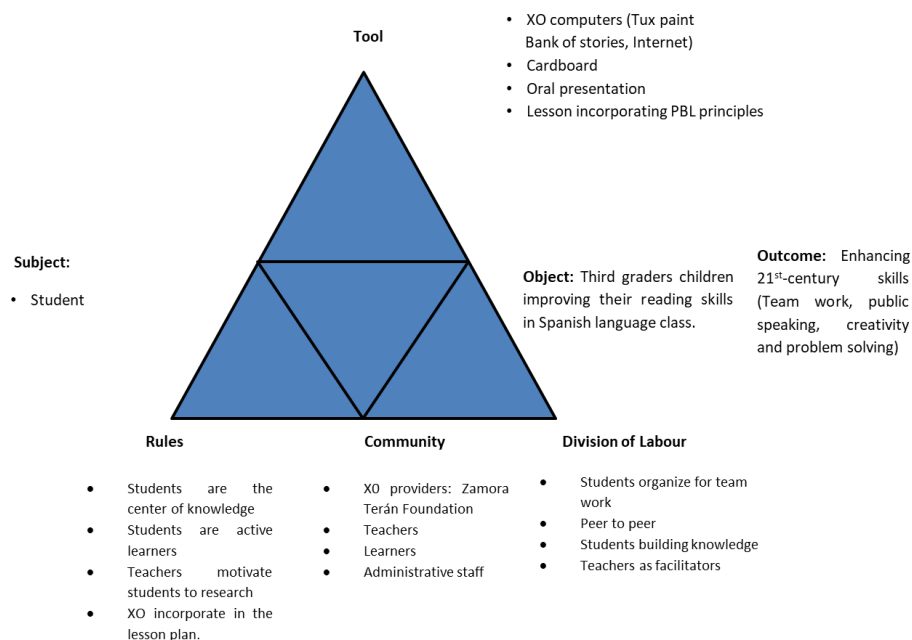

Figure 7. Activity system for student-centered learning for third graders

Case 2—Fifth graders

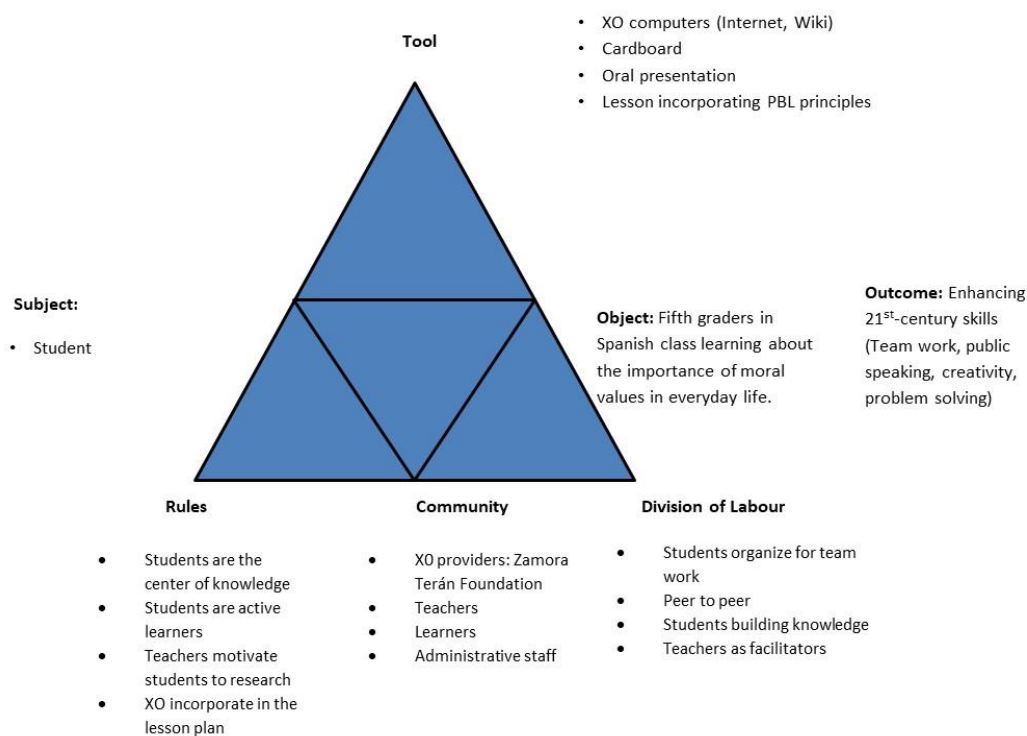

Figure 8. Activity system for student-centered learning for fifth graders

The next implementation experience was with fifth graders. The fifth-grade teacher taught all subjects to 40 children in the morning session, Monday through Friday. She volunteered to participate in the implementation after taking the introductory PBL workshop during an earlier research phase. She chose to develop a Spanish-class lesson using PBL principles and to integrate XO computers as a tool to mediate the process of learning by researching and working in teams.

According to activity theory, the use of various tools—including XO computers (with Internet and Wikipedia access), cardboard, oral presentations, and a lesson incorporating PBL principles—intends to achieve the object of fifth graders in a Spanish class learning about the importance of moral values in everyday life.

Figure 9. Students working on mental maps and exploring the application independently

Figure 10. Students preparing for an oral presentation

The outcome of this activity is the enhancement of 21st-century skills, such as teamwork, public speaking, creativity, and problem-solving. In terms of the division of labor, students organize themselves for teamwork, collaborate peer-to-peer, and collectively build knowledge. Teachers play a facilitator role, guiding and supporting students in their learning process. The community involved in this activity includes XO providers (such as the ZTF), teachers, students, and administrative staff. Each member of the community plays a vital role in supporting and facilitating the learning process.

The rules established for this activity emphasize that students are at the center of knowledge, encouraging active participation and learning. Teachers are tasked with motivating students to engage in research, and XO computers are incorporated into lesson plans to facilitate learning activities. The subject of this activity is the students themselves, who are actively engaged in the learning process while utilizing various tools and resources to develop important skills and knowledge related to moral values and 21st-century competencies.

From classroom prototype lessons to a local theory

A class pedagogical prototype may be insufficient for addressing all the challenges and limitations identified in the research context for the following reasons:

Challenge Complexity: The challenges faced in the classroom environment often extend beyond purely pedagogical concerns. They may involve external factors, such as community dynamics, infrastructure limitations, or socio-economic disparities, that cannot be adequately addressed solely within the classroom.

System Interconnectedness: The issues affecting education are often interconnected with broader societal, cultural, and economic systems. Attempting to address these challenges solely in the classroom may overlook critical factors that influence pedagogical interventions' effectiveness.

Resource Limitations: Classroom-based interventions may be constrained by limited resources, both in terms of physical infrastructure and human capacity. Relying solely on internal resources may not provide the breadth and depth of support necessary to effect meaningful change.

Need for Holistic Solutions: Effective solutions to complex educational challenges often require a holistic approach involving multiple stakeholders and resources. A class pedagogical prototype may represent only one aspect of a larger solution, necessitating the involvement of external actors and resources to achieve comprehensive outcomes.

This pedagogical design's methodology asserts that children learn by doing—solving real problems aligned with the demands of their underprivileged contexts. From an early stage, children can develop projects using the scientific method and the appropriate use of ICT for self-directed learning and developing 21st-century skills to strengthen the Inside-Outside microsystem in which they live and study. The assessment process is formative, teachers and peers provide feedback, the learner also practices self-assessment, reflecting on their own learning achievements and struggles.

The pedagogical design in Figure 11 puts students at the center of learning—as most generic PBL models do. However, what distinguishes this model from others are the requirements to be aligned with the Inside-Outside microsystem to consider the student children's underprivileged context when designing and implementing classroom lessons, and to keep in mind ways to contribute to breaking the circle of ignorance.

Figure 11. Pedagogical design aligned with the Inside-Outside microsystem

Process for building the Inside-Outside microsystem local theory

First, begin by thoroughly examining the external and internal contexts to understand the challenges students face in their neighborhood and family environments. Assess the infrastructure, technology, and teaching practices in the school.

Second, identify the constraints that hinder the application of PBL in this specific landscape. Recognize the prevalence of traditional, top-down teaching methods and the impact of external factors, such as gang-controlled neighborhoods, on student safety and attendance.

Third, develop the Inside-Outside microsystem concept to address the absence of support from the national government and limited family involvement in education. Inside the classroom, rely on NGO and peer support to fill the gaps left by the government and families. Outside the classroom, encourage children to share their newfound knowledge with their families and communities and positively impact their surroundings.

Fourth, develop a comprehensive implementation strategy for the Inside-Outside microsystem. Collaborate with NGOs to obtain iclassroom resources and support, foster peer support networks, and implement initiatives to encourage knowledge sharing beyond the school environment.

Fifth, continuously monitor and evaluate the effectiveness of the Inside-Outside microsystem. Assess changes in student engagement, academic performance, and community involvement over time. Adjustments should be made as necessary to ensure the continued success and sustainability of the microsystem.

Finally, consider the Inside-Outside microsystem's long-term impacts on student empowerment and community development. By liberating students from systemic barriers and fostering a culture of knowledge sharing and empowerment, the microsystem has the potential to create lasting, positive change in both individual lives and communities.

By integrating the activity theory framework with the Inside-Outside microsystem theory, a robust theoretical foundation is established for understanding and promoting educational innovation within diverse sociocultural contexts.

Table 8. Aligning Inside-Outside theory with activity theory to validate how it works in the field

Element	Description
Subject (Inside)	Refers to the students and teachers actively participating in the implementation phase. They engage in classroom activities and act as agents of change within the community.
Tools (Inside)	Encompasses physical resources (such as XO computers), pedagogical approaches, and support systems. These tools empower students and teachers to effectively navigate the educational landscape.
Object (Inside)	Aligns with the goal of testing prototype lessons in two classes. It extends beyond classroom boundaries to include empowering students with skills and knowledge that transcend traditional academic domains.
Rules (Inside)	Encompasses guidelines for classroom conduct and principles of equity, inclusivity, and collaboration. These rules promote a student-centered approach to education and foster senses of belonging and mutual respect.
Division of labor (Inside-Outside)	Delineates the roles and responsibilities of students, teachers, and community stakeholders in advancing educational goals. Emphasizes collaborative partnerships and shared accountability for achieving positive outcomes.
Community (Outside)	Represents the broader community beyond institutional boundaries, including the school, foundations, neighborhoods, and families.
Outcomes (Outside)	Encompasses the desired goals of enhancing students' 21st-century skills and fostering positive social change. These outcomes transcend academic achievement and include empowerment, resilience, and community engagement.

Activity theory provides an analytical framework that helps the practioners to understand how educational activities and practices interrelate with internal and external systems in a learning environment. By aligning the Inside-Outside microsystem theory with activity theory, people can examine how internal (within the classroom) and external (outside the classroom) factors interact to influence the educational process and student development. This alignment seeks to validate the Inside-Outside microsystem theory by demonstrating how it integrates with a broad, established theoretical framework in the field of educational research. By providing empirical evidence of the Inside-Outside microsystem theory's validity and relevance, its credibility and utility in understanding and improving educational practices in specific contexts are reinforced by seeking validation from the scientific community.

Figure 12. Inside-Outside microsystem to support children's education

The process begins in the classroom, where the assistance of NGOs compensates for the absence of support from the national government, and the involvement of teachers and peers substitutes for the lack of family support. A supportive classroom environment serves as a foundation for further growth and development. This supportive ecosystem also extends beyond the confines of the classroom, as students share their newfound knowledge, positively impacting not only their families but also the communities in which they reside.

Table 9. Description of each component of the Inside-Outside local theory

Component	Description
Inside (Classroom)	<p>Students work collaboratively in a supportive peer-to-peer environment.</p> <p>Teachers act as facilitators, guiding students through problem-solving activities and providing support as needed.</p> <p>Use of XO computers and educational software provided by NGOs supplements classroom learning.</p> <p>Integration of traditional school supplies for self-learning and discovery among peers.</p>
Outside (Community)	<p>NGOs provide external support, resources, and expertise to enhance educational opportunities.</p> <p>Engagement with community dynamics, including local organizations, businesses, and social networks, fosters meaningful connections between classroom learning and real-world contexts.</p> <p>Collaboration with families to empower parents as partners in education and leverage family support systems supports students' academic journeys.</p> <p>Addressing neighborhood challenges, such as safety concerns and socioeconomic disparities, create supportive learning environments that meet students' needs and foster positive outcomes.</p>
Student in the Center	<p>Students are placed at the center of the learning process, actively engaging in collaborative problem-solving and hands-on activities.</p> <p>Emphasis on student agency, allowing learners to become part of the education process.</p>

Discussion

When delving into the intricacies of the Inside-Outside microsystem local theory, it becomes apparent that the theory embraces both the internal and external facets of the educational landscape. This comprehensive perspective acknowledges the interconnectedness of factors in the classroom environment and those beyond its physical boundaries.

Internally, the Inside-Outside theory focuses on classroom dynamics, emphasizing the importance of supportive teacher–student relationships and the use of innovative pedagogical approaches. According to Ryberg et. al (2010), PBL development can vary in terms of who has more control in the classroom. This control, akin to a sound control panel, is used to modulate or regulate situations as needed. In some cases, such as in primary education settings, teachers may exert greater intervention, as students require more support from teaching staff and their families or community environments.

Externally, the Inside-Outside extends beyond the classroom to encompass broad community and societal contexts. This includes understanding neighborhood dynamics, familial challenges, and institutional infrastructure, as Luckin (2010) highlighted. By considering these external factors, the theory seeks to address the systemic inequalities and structural barriers that hinder educational progress for marginalized communities.

By integrating activity theory into the Inside-Outside microsystem local theory analysis, it was acknowledged how these internal factors interact with broad societal, cultural, and economic systems and shape students' learning experiences inside and outside the classroom. The ZTF is a prominent example of a contribution from an external dimension (Outside) supporting an internal dimension (Inside), as the Inside-Outside theory proposes. By providing free technology and training for the school educational center, the foundation addresses the material and technological needs of the students and strengthens the entire educational environment.

This external collaboration facilitates the implementation of innovative educational practices and the development of additional resources, ultimately enriching the internal educational process. The ZTF exemplifies how external partnerships can strengthen and enrich the internal educational microsystem, which supports the fundamental premise of the Inside-Outside theory. Overall, the Inside-Outside microsystem local theory represents a holistic approach to educational intervention that recognizes the interconnectedness of internal and external factors and seeks to create meaningful change at both levels.

Conclusion

The Inside-Outside theory is a comprehensive framework for transformative educational practices that empower educators and uplift students in resource-constrained settings. The theory improves teachers' practices by considering students' socioeconomic context, limited access to digital tools, and engagement with non-profit

organizations to compensate for the lack of family and government support.

The pedagogical design and microsystem in which the Inside-Outside theory aligns and works, respectively, are interdependent. Inside the classroom, students develop a strong sense of belonging, work in teams for peer-to-peer supportive interactions, try to solve real-life problems affecting their context (with guidance from their teachers, who act as facilitators), and develop problem-solving skills. They can use computers or other technological devices provided by NGOs (in the absence of government support), the Internet and offline educational software, and traditional school supplies (e.g., notebooks, cardboard, etc.) for independent and peer-supported learning.

The pedagogical model also has impacts outside the school; for example, students develop projects related to issues affecting their communities, and they bring home new knowledge and experiences to share with their families and communities. In most cases in this particular setting, expecting that children will receive academic support at home from their illiterate relatives is unrealistic; most children cannot complete their homework independently if they do not understand the assignment, and no one at home can help them. One way to narrow this gap is to allow children to take computers home and use them as a pedagogical resource. However, this strategy is currently impossible, because students' neighborhoods are dangerous and their lives could be jeopardized if someone wanted to steal a computer.

Recommendations

Prioritizing the cultivation of supportive teacher–student relationships and implementation of innovative pedagogical approaches within the classroom is imperative. Educators should focus on creating inclusive and engaging learning environments in which students feel empowered to explore and learn, fostering a sense of belonging and collaboration among all members of the educational community.

Recognizing the significance of students' socioeconomic contexts, particularly in resource-constrained settings, is crucial. Additional support and resources should be provided to students facing poverty-related challenges, limited access to digital tools, and a lack of familial support for academic tasks. Efforts should be made to ensure that every student has equitable access to educational opportunities and resources.

Collaboration with external stakeholders, including non-profit organizations—private companies committed to social responsibility, and community foundations—should be encouraged to supplement internal support structures within schools. Partnerships should be forged to address systemic inequalities and provide resources to marginalized communities. Through collaboration, educators and external organizations can create comprehensive support systems for students and communities.

Advocating for PBL approaches is essential for enabling students to tackle real-world issues affecting their

communities. Educators should guide students in problem-solving activities that integrate technology, traditional learning tools, and collaboration with peers. This approach enhances academic learning and fosters critical thinking and practical skills that are essential for real-world success.

Strategies should be explored to provide safe access to educational resources (such as computers and digital tools), especially for students from dangerous neighborhoods. Initiatives that allow students to take resources home or provide secure access within the community should be considered. Ensuring safe access to resources is vital for promoting equitable educational opportunities for all students.

Implementing systems for ongoing monitoring and evaluation is essential to assess interventions' effectiveness and identify areas for improvement. Data-driven insights should be used to refine strategies and ensure that educational practices align with the goals of the Inside-Outside microsystem local theory. Continuous monitoring and evaluation are critical for maintaining the effectiveness and relevance of educational interventions over time.

Acknowledgments

I extend my appreciation to the teachers, students, and administrators of Centro Básico Padre Claret for their invaluable cooperation and participation. Their dedication to educational innovation and commitment to improving outcomes for students in disadvantaged settings have been instrumental to this study's success. I am deeply grateful to ZTF for their generous support and collaboration throughout this endeavor. Their commitment to providing technology and training to educational centers in impoverished areas has significantly impacted the lives of students and educators alike.

I also want to thank Dr. Thomas Ryberg and Marianne Lykke, as well as Dr. Lone Dirckinck-Holmfeld and Dr. Ellen Christiansen from Aalborg University, Denmark, for their kind support and encouragement of my ideas. Finally, I would like to express my gratitude to Universidad Tecnológica Centroamericana (UNITEC) in Honduras, and particularly to Dean Ana Rettally, Postgraduate Faculty, for providing the essential resources that facilitated the completion of this study.

Blockchain Education in Honduras: Assessing Cryptocurrency Understanding in Universities

Mirna Isabel Rivera García

Universidad Tecnológica Centroamericana, Honduras,  <https://orcid.org/0000-0003-0750-022X>

Ingrid Margoth Vásquez Flores

Universidad Nacional Autónoma de Honduras, Honduras,  <https://orcid.org/0009-0005-7644-1448>

Abstract: The study focused on analyzing the knowledge and application of cryptocurrencies in undergraduate programs across public and private universities in Honduras. Given the increasing relevance of cryptocurrencies in the global financial landscape. The primary objective was to assess the level of knowledge and application of cryptocurrencies among students in administrative programs, distinguishing between universities and specific courses. The research followed a documentary and field methodology with a mixed approach. Surveys and semi-structured questionnaires targeted students, faculty, and departmental authorities. The questionnaires covered demographic aspects, levels of knowledge, information sources, work experience, real investments, and participation in practical laboratories. The results unveiled a detailed overview of cryptocurrency knowledge and application in the university setting, identifying significant differences between universities and courses, and offering a contextualized understanding. Furthermore, the experiences and perceptions of faculty and departmental authorities regarding integrating cryptocurrencies into education were analyzed. It was concluded that over 50% of the student population in administrative careers was familiar with and utilized cryptocurrencies. Recommendations included the imperative need to integrate cryptocurrency content into academic programs and provide continuous training for faculty and administrative staff. This study provided a robust foundation for comprehending the then-current state of cryptocurrencies in the university environment.

Keywords: blockchain education, cryptocurrency, financial education, undergraduates

Introduction

Technological advances drive innovation in business. 150 years ago, the telegraph spurred a revolution in the financial world, as it was used by businessmen to transmit stock prices in the United States, having a more

commercial use, unlike in Europe, where it was primarily used as a social medium.(Du Boff, 1980). In the mid-20th century, bankers introduced credit cards and ATMs, which transformed the world of money from paper to plastic. (Bartolomé & Lindín, 2019).

The combination of technology and finance is known as financial technology or Fintech. (Budiarti et al., 2021). In an interconnected world, with rapidly developing companies investing in providing customers with immediacy and confidence in their transactions, the use of the Internet is the most common, contrary to the last decade of the 20th century, which witnessed the foundations that disruptively merged the way things were done in the financial world. Pioneers bet on disruptive technologies; in 1995, Wells Fargo saw the great potential of the Internet. (Anderson & Guo, 2020) It's important to understand that “every time consumers use PayPal, Apple Pay, or Google Wallet, they are using a Fintech” (p.9 Carballo et al., 2021).

Fintech in the Latin American region

Together in Latin America, there are approximately 2,482 companies considered fintech, and worldwide there are around 11,000. The leading countries in Latin America are: Brazil, with 771 companies, representing 31% of the market, followed by Mexico with 512 companies, 21%; Colombia with 279 and Argentina with 276, accounting for 11% each, and Chile with 179 companies representing 7% of the market. These five countries concentrate the largest fintech investment (Findexable, 2021).

The Central American region presents significant challenges: Honduras has 25 companies, Guatemala has 31, Panama has 16, Nicaragua has barely 3, and El Salvador has 14. These country-specific data represent only 5% of the market, with Costa Rica slightly ahead of the other countries in the region with 44 companies, which is equivalent to 2% (Banco Interamericano de Desarrollo et al., 2022).

The Chinese made a great leap by turning e-commerce into something natural in 1999, laying the groundwork for companies like Alibaba that set the stage for what is now known as e-commerce. (Schmuck & Benke, 2020). The traditionally conservative banking sector took an unexpected turn in England, where in 2005, the first branchless bank emerged. What economic liberals have long awaited is decentralized banking. In 2009, the decentralized cryptocurrency Bitcoin emerged in the financial market, which is still in use today. (Wright, 2008).

Fintech and cryptocurrencies are closely intertwined in various aspects. On one hand, fintech have emerged as cryptocurrency exchange platforms, offering users the ability to buy, sell, and store digital assets more conveniently and easily. Additionally, some fintech have integrated cryptocurrencies into their international payment and remittance systems, facilitating faster and more economical transfers on a global scale. Furthermore, the use of cryptocurrencies in crowdfunding and collective financing has enabled projects to efficiently obtain funds from a global audience with lower costs. On the other hand, fintech are actively exploring how to utilize blockchain technology and cryptocurrencies in areas such as decentralized lending

(DeFi) and the tokenization of traditional assets like real estate or stocks, opening up new investment opportunities and democratizing access to financial markets. This convergence between fintech and cryptocurrencies is rapidly transforming the financial landscape, offering innovative solutions and promoting financial inclusion on a global scale. Ever since the Chinese made a significant leap by making e-commerce a natural phenomenon in 1999, with companies like Alibaba, e-commerce has become a permanent fixture. (Schmuck & Benke, 2020). On the other hand, what has long been yearned for by the most economically liberal is starting to become a reality as the transition to decentralized banking begins, with the emergence of the cryptocurrency Bitcoin in the financial market in 2009, which is still in use (Wright, 2008).

The first country in the world to recognize Bitcoin as a legal tender is El Salvador, in 2021. Decree-Law 057 of 2021, known as the Bitcoin Law, establishes: "Bitcoin as legal tender, without restrictions and with unlimited liberating power in any transaction and under any title that natural or legal persons, public or private, need to carry out." (BBC, 2021). On the other hand, in Honduras, a statement was issued by the National Banking and Insurance Commission (CNBS) warning the general population about the use of cryptocurrencies as legal tender: "Any individual problems arising from the use of transactional platforms and traders of 'virtual currencies', such as Bitcoin, outside the financial system, are solely the financial user's risk, as they are not regulated by Honduras' legal framework" (CNBS, 2024).

The types of digital payments in Latin America and the Caribbean (Carballo et al., 2021) 42% through mobile payment and electronic wallets, 33% through payment gateways, which "transmit encrypted information to the acquiring bank processors of the merchant," and payment aggregators or payment facilitators, 9% through mobile point of sale (mPOS), 7% through international remittance and transfer platforms, 5% through cryptocurrency payment platforms, and 4% through other methods.

Rise of Blockchain and Cryptocurrencies

Cryptocurrency relies on blockchain technology for its operation, and blockchain provides a secure and decentralized method for conducting and recording digital transactions. It was proposed by Satoshi Nakamoto in 2008. Cryptocurrencies use blockchain to ensure security, transparency, and decentralization of transactions. Blockchain eliminates the need for intermediaries such as banks or financial institutions, as all transactions are verified and recorded by a decentralized network of nodes. (Nakamoto, 2008)

The relationship between fintech and blockchain is marked by a mixture of benefits and risks. On one hand, blockchain technology offers a revolutionary opportunity to streamline and democratize financial services, with faster, safer, and more economical transactions at an international level, as well as the automation of processes through smart contracts. Decentralized identity management and asset tokenization promise greater security and liquidity in financial markets (El Koshiry et al., 2023).

However, these advancements also bring considerable challenges. Technical complexity and lack of regulation

may hinder widespread adoption, while security gaps could expose users' sensitive data to risks of hacking and theft. The volatility of certain cryptocurrencies raises concerns about financial stability and consumer protection (Faturahman et al., 2021). Therefore, addressing these challenges effectively is essential to fully harness the transformative potential of the relationship between fintech and blockchain.

Teaching cryptocurrency and blockchain in university

The presence of cryptocurrencies in the world's major economies has created a significant opportunity for various startups in the industry, leading to a massive demand for digital assets. This new market has contributed to the development of more job and educational opportunities, among other things. (European Commission. Joint Research Centre, 2017).

"For universities with appropriate blockchain facilities, professors, students, and budget, it is feasible to readjust the entire curriculum system to cultivate comprehensive talent in blockchain. For example, University College London (UCL), one of the main partners of UBRI, has developed several blockchain and FinTech curriculum plans and has proposed some master's programs based on these " (Feng et al., 2022).

Renowned universities and educational institutions worldwide have incorporated aspects of emerging technologies such as blockchain and cryptocurrencies into their curricula. Below are some examples in Table 1.

Table 1. American and European Universities Teaching about Cryptocurrencies and Blockchain

University	Course	Description
Massachusetts Institute of Technology (MIT)	Blockchain and Money	It covers the fundamentals of blockchain technology, the economics of cryptocurrencies, and the potential applications of blockchain in the financial industry.
	MIT Blockchain Strategy Program	Certification program designed for business leaders who wish to understand the potential impact of blockchain technology on their industries and learn how to implement blockchain solutions in their businesses.
Stanford University	Bitcoin and Cryptocurrencies	It covers the technical aspects of cryptocurrencies and blockchain, as well as the economic and legal implications of these technologies.
	"Crypto Currencies: Bitcoin and Friends"	Designed for professionals in the financial and technological industries who wish to gain a deeper understanding of cryptocurrencies and blockchain technology.

New York University (NYU)	Blockchain and cryptocurrencies	It provides a comprehensive overview of the essential concepts of blockchain, the technology used to enable fast, secure, and transparent transactions, and discusses smart contracts, consensus mining, and the key advantages of blockchain technology.
University of California, Berkeley	Berkeley Center for Law and Business	It is a business and law program that covers various topics, but emphasizes the technical and economic aspects of blockchain technology, as well as the legal implications of these technologies.
	"Blockchain Fundamentals Professional Certificate"	Certification program designed to help students gain a basic understanding of blockchain technology and its potential applications in various industries.
University of Oxford	"Blockchain Strategy Programme"	It covers the business implications of blockchain technology and its potential impact on various industries.
	The Economics of Cryptocurrencies	It covers the legal and regulatory aspects of cryptocurrencies and blockchain technology, as well as their potential impact on global economic policy. (https://www.conted.ox.ac.uk/courses/the-economics-of-cryptocurrencies)

Table 1 was compiled using information gathered from the official websites of various consulted academic institutions. (Berkeley University, 2024; MIT University (a), 2024.; MIT University (b), 2024; New York University, 2024; Oxford, 2024.; Stanford University, 2024.)

The teaching of cryptocurrencies and blockchain at the university level has become a topic of great relevance in the educational sphere, driven by the growth and importance of these digital assets in the world's major economies. Various renowned educational institutions, such as the Massachusetts Institute of Technology (MIT), Stanford University, New York University (NYU), University of California, Berkeley, and University of Oxford, have integrated aspects of these emerging technologies into their curricula.

First steps in Latin American universities

In Latin American universities, formal education on cryptocurrencies and blockchain is led by one of the most prestigious universities in Latin America, the Universidad Autónoma de México (UNAM), which in 2021 launched a postgraduate program in Financial Engineering that incorporates topics such as cryptocurrencies and blockchain (UNAM, 2024). However, prestigious universities in South America have also introduced these topics into their curricula and have even created master's programs that directly address these topics, such as the

case of Fundação Getulio Vargas, a university with a strong reputation (UNAM, 2024).

In Argentina, the University of Palermo offers two courses related to Blockchain and cryptocurrencies. The first is an online study program called "Blockchain Development," which prepares developers and programmers to build decentralized applications on the Ethereum platform. The second course, titled "New Technologies: FinTech and Crypto Assets," provides an updated overview of FinTech and cryptocurrencies, aimed at entrepreneurs and professionals interested in understanding the fundamentals of the crypto asset world. On the other hand, the University of CEMA (UCEMA) offers a diploma in Blockchain and cryptocurrencies aimed at students from various backgrounds with no previous knowledge in the field, with the aim of analyzing the characteristics and potential of blockchain technology.

In the Central American region, Honduras was the first country where a higher education institution committed to implementing and educating on cryptocurrencies and blockchain. The National Pedagogical University Francisco Morazán (UPNFM) signed an agreement with the founder of Blockchain in Honduras (UPNFM, 2022).

Given the relevance of this topic, this study focused on analyzing the knowledge and application of cryptocurrencies and blockchain technology in undergraduate programs offered by two private universities and one public university located in San Pedro Sula, Honduras. The main objective was to assess the level of knowledge and application of cryptocurrencies and blockchain among students enrolled in the programs.

The research questions:

1. What is the overall level of knowledge of students about cryptocurrencies, differentiated by university?
2. What is the proportion of cryptocurrency application on test platforms, both globally and by university, and how does this percentage vary by major?
3. What is the proportion of cryptocurrency investment globally and by university, considering variables such as gender, age, major, and work experience?

Methods

This research was framed within the scope of basic, documentary, and field research, adopting a mixed approach that integrates both qualitative and quantitative components to obtain a comprehensive and contextualized understanding of the subject under study. The main instruments used were a survey directed at students and a semi-structured questionnaire designed to interview teachers and responsible individuals in the area. The research design was non-experimental, observing phenomena in their natural environment. With a descriptive approach, it aims to provide a detailed and systematic view of the level of knowledge and application of decentralized finance in the context of undergraduate administrative careers.

Hypothesis

Regarding the hypotheses, it was proposed that more than 50% of the population in administrative careers have knowledge about cryptocurrencies and apply them in their financial activities, while the null hypothesis suggests the opposite. The variables considered include the level of knowledge and application of cryptocurrencies, the university, the career, the department, the city, work experience, investment rate, gender, and age.

Null Hypothesis (H0): Less than or equal to 50% of the population in administrative careers have knowledge about cryptocurrencies and apply them in their financial activities.

Alternative Hypothesis (H1): More than 50% of the population in administrative careers have knowledge about cryptocurrencies and apply them in their financial activities.

Unit of Analysis

The population under study consisted of a total of 441 individuals. Sample selection was based on convenience criteria and did not follow a probabilistic approach. A total of 91 responses were obtained from students who were in the final semester of their respective careers. Thirteen professors participated in the survey.

Table 2. Unit of Analysis

University	Programs	Public or Private
UNAH-VS	Bachelor's in Business Administration and Management	Public
UNAH-VS	Bachelor's in Public Accounting and Finance	Public
UNITEC	Bachelor's in Finance and Economics	Private
UNITEC	Bachelor's in Industrial Management	Private
CEUTEC	Bachelor's in Business Administration	Private
CEUTEC	Bachelor's in Public Accounting and Finance	Private

Results

Data analysis and findings

In this section, the obtained results, both quantitative and qualitative, are presented and analyzed in detail. A comprehensive review and understanding of the findings are provided, covering both numerical data and qualitative aspects to offer a complete insight into the study.

The results regarding the knowledge variable, as illustrated in Figures 1 revealed that 60.0% of students and 76.9% of professors claimed to have basic knowledge about cryptocurrencies. The professors participating in this study have more than ten years of experience in teaching at the higher education level.

Figure 1. Global Knowledge: Student and Teachers

Figure 2. Knowledge by universities

On the contrary, 34.3% of students reported "not having knowledge," compared to 7.7% of teachers who shared a similar viewpoint. The remaining 5.7% of students and 15.4% of teachers claimed to have a good understanding. The Figure 2 shown students with basic knowledge, 67.4% are from UNITEC, 62.5% from CEUTEC, and 50.0% from UNAH-VS. This indicates that each university moves at its own pace.

According to the data shown in Figure 3, a lower percentage of students (36.7%) have used test platforms compared to those who have not used them (63.3%).

Figure 3. Practice platform usage

The students who have used test platforms are 84.8% from UNITEC, 15.2% from CEUTEC, and 0.0% from UNAH-VS because it is not included in the curriculum due to the lack of regulation on cryptocurrencies within the country, stated the Head of the Department of Business Administration and Public Accounting and Finance at said university. Students have not been as actively involved in using these tools in their academic units.

Tabla 3. Test platform usage

University	Test Platform Usage (%)	Observations
UNITEC	84.8	Highest usage among students for test platforms
CEUTEC	15.2	Lower usage compared to UNITEC
UNAH-VS	0.0	No recorded usage due to absence of cryptocurrency regulation.

The Finance and Economics program has utilized test platforms the most (57.6%), followed by Industrial Management (27.3%), both of which belong to Unitec and Public Accounting and Finance (15.2%) is a program offered by Ceutec.

As shown in Figure 4, a significant proportion of both students (66.7%) have not invested money in cryptocurrencies, while 22.2% are considering it, and 11.1% have already done so. It is worth noting that among the students who have invested, they stated that they have done so with values of less than \$500 dollars in 80.0% of cases, and the remaining in the ranges of \$501 to \$1,000.

Figure 4. Global investment

The data presented in Table 4 provide a detailed insight into the involvement of students who have invested in the cryptocurrency market and reveal significant patterns that may influence the adoption and understanding of these emerging technologies in the university setting.

Table 4. Investment Profile and Demographic Factors in University Students

Demographic variable	Percentage of the sample
Investment by university	
Unitec	80%
Ceutech	20%
Program	
Finance and Economics	60%
Industrial Management	30%
Public Accounting and Finance	10%
Gender	
Female	60%
Male	40%
Age	
21 to 25 years	60%
26 to 30 years	20%
Over 35 years	20%
Investments in dollars	
Less than \$500	80%
More \$500 a \$1,000	20%
Work experience	
No experience	20%
Less than 5 years	40%
Between 5 and 10 years	20%
More than 20 years"	20%

As shown in Figure 5, students expressed mixed feelings regarding the use of cryptocurrencies, as they believe that the negative perception of the topic, lack of regulation in Honduras, and market volatility are the main challenges they face. There is widespread uncertainty among students because cryptocurrencies are a relatively new topic in Honduras. Despite their concerns, there is also a clear desire among students to learn more about cryptocurrencies and blockchain to maximize their potential in both academic knowledge and investment endeavors.

On the other hand, Figure 6 shows that the majority of professors have expressed that they have taught about cryptocurrencies briefly, while a minority have addressed the topic in more depth. Additionally, more than a third of professors have not included anything about cryptocurrencies in their curriculum, but they are

considering doing so.

Discussion

The study highlights the different levels of knowledge, usage patterns, attitudes, and perceptions of students and teachers towards the use and application of cryptocurrencies in administrative career settings in San Pedro Sula. Overall, there is a growing trend towards long-term adoption, driven by motivations related to experimentation with these assets, where confidentiality, transaction traceability, and blockchain security are predominant features.

Universities are slowly entering into education and training through the use of test platforms that allow for simulations or practices without risking real money. According to the study, teachers feel responsible for including the topic in some of their classes with a critical focus, highlighting both the risks and benefits (Faturahman et al., 2021).

En Honduras, unlike El Salvador (Alonso et al., 2024), the government is not actively promoting the use of cryptocurrencies. This lack of promotion creates uncertainty, particularly regarding the inclusion of cryptocurrencies in university curricula.

Conclusions

There is a growing interest among both students and teachers in understanding more about cryptocurrencies and their applicability in educational and financial contexts. In an increasingly digitized world, cryptocurrencies have emerged as a relevant study topic for understanding their underlying technology and exploring their implications in the global economy and personal finances.

However, in Honduras, the lack of regulation represents a significant challenge for the widespread adoption of cryptocurrencies in the university environment. This regulatory uncertainty can create uncertainty among educational institutions and students, making it difficult to integrate these topics into curricula and research activities.

Despite these concerns and obstacles, there is an evident desire among students to deepen their knowledge of cryptocurrencies and blockchain technology. They recognize the disruptive potential of these innovations in various fields, from banking to supply chain management, and are eager to explore how these technologies can offer new opportunities both in academic settings and in personal investment strategies. The pursuit of this knowledge not only enhances their understanding of the modern financial world but also prepares them to adapt to a constantly changing economic landscape and capitalize on emerging opportunities.

It was concluded that more than 50% of the students and teachers who participated in the study were familiar with the basic concepts of cryptocurrencies and used practice platforms. In the case of teachers, it was inferred

that they also knew about it since they used them in their classes.

Based on the data, it can be inferred that the alternative hypothesis (H1) is accepted, indicating that more than 50% of the population in administrative careers have knowledge about cryptocurrencies and apply them in their financial activities.

Recommendations

Comprehensive training programs are essential for seamlessly integrating cryptocurrency education into teaching and learning practices. Both teachers and students must be equipped with the necessary knowledge and skills to navigate the evolving landscape of digital finance. Fortunately, there's a strong interest among educators and learners alike in exploring the use and application of cryptocurrencies.

Investing in ongoing education and training initiatives is paramount. Regular workshops, seminars, and professional development opportunities will keep educators updated on the latest trends and best practices in cryptocurrency usage and regulation. Collaboration with industry experts and organizations can provide valuable insights and real-world examples.

Moreover, educational institutions should actively support the integration of cryptocurrency-related topics into existing curricula. This includes developing standardized course materials, case studies, and interactive learning modules. By fostering collaboration across disciplines such as finance, economics, computer science, and law, students can gain a holistic understanding of cryptocurrencies.

Furthermore, ethical considerations should be emphasized throughout the educational process. Encouraging discussions on topics like financial literacy, risk management, and social impact will promote responsible cryptocurrency usage. By instilling ethical decision-making skills, students will be better equipped to engage in cryptocurrency-related activities with integrity.

In summary, by providing comprehensive training programs, investing in ongoing education initiatives, and fostering interdisciplinary collaboration, educational institutions can empower students to navigate the complexities of the digital finance landscape responsibly and ethically.

Study limitations

While insightful, the findings of this study are not conclusive. To achieve a more comprehensive understanding, it is imperative to increase the sample size and ensure representation from a wider spectrum of professors and students.

Expanding the sample size will facilitate a more robust exploration of perspectives and experiences related to the use and application of cryptocurrencies in university settings, encompassing diverse academic contexts and viewpoints.

Additionally, the absence of regulatory frameworks in Honduras regarding these crypto assets poses a significant limitation. Cryptocurrencies are viewed as non-traditional investments within decentralized finance, and the lack of regulation adds complexity to their integration into educational settings.

Acknowledgments

We would like to express our gratitude to the directors and professors of the National Autonomous University of Honduras (Valle de Sula), with special recognition to Dr. Carlos David Coca Singh and Master Juan Carlos Reyes Reyes, who lead the Administration and Business Generation, and Public Accounting and Finance programs, respectively. We also extend our thanks to the Universidad Tecnológica Centroamericana (UNITEC), to Master Leonidas Abel Guevara, director of the Finance and Economics program, and to Dr. Renata Bulnes, director of the Industrial Administration program. Also, we appreciate Centro Universitario Tecnológico (CEUTEC), to Master Josue Roberto Álvarez Tejada, Head of Public Accounting and Finance, and to Master Kelly Alexandra Rodríguez Gallardo, Head of the Administration program. Additionally, we acknowledge the support of the dean of the Postgraduate Faculty of Unitec, Master Ana Rettally, for providing the necessary resources to conduct this study.

Abstract: Around 25% of India's population requires universal accessibility for independent and dignified living, highlighting the urgency of prioritizing "accessibility and inclusion" for sustainable development. In urban areas, equitable resource distribution, aligning with the Right to the City, is crucial, with education being central. Ensuring education rights promotes social justice and inclusion, striving for equitable access to quality education as per UN's Sustainable Development Goal 4 and India's National Educational Plan 2020. This study examines fundamental indicators for effective inclusive education (IEIE) in Delhi's primary schools, focusing on inclusion of children with disabilities (CwDs) into mainstream education and determining their ranking. Conducted in 51 primary schools, a survey involved stakeholders rating indicators on a five-point Likert-type scale. Statistical analyses using the weighted product model (WPM), a prevalent multi-criterion decision-making method, highlighted the importance of IEIE indicators and identified barriers like inadequate infrastructure hindering access to education, particularly for CwDs. The results consistently highlight stakeholders prioritizing qualitative aspects of inclusive education, challenging the notion that financial support is paramount, especially in countries like India. The findings advocate for better inclusive education facilities, enhanced integration of CwDs, and increased awareness among school stakeholders, necessitating collaborative efforts for creating inclusive urban educational environments.

Keywords: Inclusive Education, Indicators ranking, Primary schools, Children with disabilities, WPM analysis

Shelley & O. T. Ozturk (Eds.), Proceedings of ICRES 2024-- International Conference on Research in Education and Science (pp. 1787-1800), Antalya, Turkiye. ISTES.

Introduction

India, renowned as the largest democracy, faces numerous hurdles in providing educational opportunities for over 200 million children aged six to 13 (Social & Rural Research Institute, 2014). According to the 'Education

at a Glance, 2018' report by the Ministry of Human Resource Development, dropout rates in India average 4.13% for primary, 4.03% for upper primary, and 17.06% for secondary students. Among the critical challenges is the dropout rate of approximately 47 million children with disabilities (CwDs) out of the 301.4 million unenrolled or dropout children. The Census of India 2011 indicates that 1.05% of school-age children (2.13 million) have disabilities, with 28% (588,000) not attending school, notably with 44% of CwDs facing complex activity limitations and functional challenges. Despite the implementation of inclusive education policies like Education for All (Sarva Shiksha Abhiyan- SSA, 2001), Right of Children to Free and Compulsory Education (RTE) Act 2009, The Rights of Persons with Disabilities (RPWD) Act 2016, and National Education Plan (NEP) 2020 over the last two decades, a comprehensive, practical approach to implementing inclusive education principles remains challenging. As emphasized by Jomon Mathew (2017), factors such as poverty, limited accessibility, and the scarcity of inclusive schools significantly contribute to school dropout rates in India. Promoting inclusive education is vital for enhancing the involvement of individuals with disabilities in society, starting from the primary level.

The efficacy of inclusive education for children with disabilities (CwDs), relies not only on factors like school size, location, and amenities but also on indicators of effective inclusive education (IEIE) within the school setting. Various scholars have emphasized the importance of IEIE in facilitating the integration of CwDs into mainstream schools. These studies encompass works such as "Measuring Concerns about Integrating Education in India" (Sharma & Desai, 2002), "Measuring Indicators of Inclusive Education" (Loreman et al., 2014), "The Concerns about Inclusive Education Scale" (Lozano et al., 2022), "Development of a Set of Indicators for Inclusive Education in Europe" (Kyriazopoulou & Weber, 2009), and "Enabling Inclusive Education in Hong Kong" (Forlin & Rose, 2010). Essential elements of inclusive schooling encompass adequate funding, comprehensive teacher training, public awareness, and cultivating a positive mindset (Aziz, 2018). Belappurkar et al., (2013) highlight the significance of comprehending laws and policies related to CwDs' inclusion, while the Harmonized Guidelines 2021 emphasize the importance of establishing an accessible built environment in India.

Various research endeavors have utilized diverse Multi-Criteria Decision Making (MCDM) methodologies to evaluate rating data and prioritize attributes, including the Weighted Product Model (Goswami et al., 2020; Ahsan, & Indawati, 2019; Chourabi et al., 2019), Ranking of Attributes (Sahoo et al., 2022; Şahin, 2020), the RIDIT method applied to Likert scale surveys used for the selection of quality attributes (Pradhan, 2009), RIDIT method to Likert scale surveys used for a review on teacher training programs in Turkey (ŞENER, & Taner, 2020), application of RIDIT analysis to Likert scale surveys' (Biswal et al., 2011; Wu, 2007), best project selection by using TOPSIS analysis (Dodangeh et al., 2009), ranking efficient units in data envelopment analysis (DEA) by using TOPSIS method (Lotfi et al., 2011), application of TOPSIS to determine the ranking order of the private universities (Wang et al., 2022), and priority on qualitative attributes of transfer facility (Sadhukhan et al., 2015). However, the impact of these analytical techniques on the prioritization of inclusive education has not been extensively examined.

Regrettably, the execution of effective inclusive education in urban Indian mainstream schools faces notable shortcomings. There's a paucity in efforts to gauge the current status of these schools regarding the perceived importance of diverse aspects of inclusive education by all stakeholders (including; teachers, principals, special educators, staff, parents, and students), not just teachers as in prior studies (Sharma, & Desai, 2002; Lozano et al., 2022) also neglecting the aspects of accessibility of building and infrastructure. This study aims to bridge this gap by evaluating the significance of various dimensions of inclusive education in regular schools, particularly in integrating children with disabilities (CwDs), while considering inputs from all stakeholders. In countries like India, where financial constraints are prevalent (Aziz, 2018; Sanjeev & Kumar, 2007; Mathew, 2017), prioritizing essential inclusive education resources is vital for narrowing the gap effectively. The prioritization of domains and indicators would provide valuable insights for government officials and school administrators to make informed decisions and implement impactful measures to enhance accessibility and inclusion for individuals with disabilities in schools. These prioritized criteria also hold significance for policymaking, strategic planning, and budget allocations aimed at fostering the development and management of inclusive schools across India. Hence, this study also aims to rank indicators for effective inclusive education (IEIE) based on their perceived importance by all stakeholders in primary schools in Delhi.

Method

Variables (Indicators Selection)

Globally, researchers emphasize the significance of various indicators in effective inclusive education (IEIE). These metrics include 'academic teaching and learning,' covering class size, teaching methods, and curriculum (Aziz, 2018; Scruggs & Mastropieri, 1996; Mutisya, 2011). Additionally, the 'availability of appropriate support' involves administrative assistance, the prevalence of disabilities among students (Gupta, 2016), financial support (Aziz, 2018), policies, and student-teacher ratios (Belappurkar et al., 2013). Furthermore, 'availability of appropriate facilities' encompasses services like therapeutic care centers, paraprofessional staff (Mutisya, 2011), resources for accessible features, specialized training (United Nations, 2006), and vocational training (Lozano et al., 2022). 'Teacher's education and training' includes their background, teaching experience, training for children with special needs (CWSN), equipment proficiency, and awareness of universal design of learning (Bhatnagar, & Das, 2013; Scruggs & Mastropieri, 1996).

'Teacher's attitude' involves their demeanor and awareness/sensitization to disabilities (Forlin & Chambers, 2011; Hemmings & Woodcock, 2011; Mutisya, 2011). 'Socio-cultural aspects' encompass parental/community involvement and mutual respect among students with/without disabilities and teachers (Mutisya, 2011). Lastly, 'infrastructure and built environment accessibility' covers entry, movement, washroom access, way-finding, academic space, extracurricular activities, and digital infrastructure (Harmonized Guidelines of 2021; RPWD ACT 2016; Belappurkar et al., 2013; UNESCO, 2004; Mutisya, 2011). Additional indicators were derived from literature and expert opinions, refined through a pilot survey and Fuzzy Delphi analysis.

Questionnaire Development Process

A paper-based survey questionnaire was developed to gather insights from primary school's stakeholders in Delhi. The process involved selecting indicators of effective Inclusive Education (IEIE) from literature, refining them through a Focus Group Discussion with experts, validating indicators via fuzzy Delphi method and Wilcoxon signed rank test, and constructing the questionnaire. The survey sought opinions on the importance of 33 IEIE identified through Fuzzy Delphi analysis, rated on a five-point Likert-type ordinal scale (Likert, 1932) from Very High Importance [5] to Very Low Importance [1]. An excerpt of the survey questionnaire is presented below (see Figure 1).

Indicator 1: Class - Size

Description: The total number of students in a class.

How important do you thing is indicator -1, in enabling effective inclusive education considering the inclusion of children with Locomotor disabilities in mainstream regular school.

This survey is designed to collect school stakeholder's responses in terms of the importance of various indicators of effective inclusive education on a five-point Likert-type ordinal scale (Likert 1932). The scale consists of a five-point Likert-type classification with responses labeled as - Very High Importance (5), Important (4), Relatively Important (3), Low Importance (2), and Very low Importance (1).

Data Collection

The study focuses on major Indian cities, primarily tier 1 and above, with Delhi as the primary area of interests (Tier 1 cities in India are major urban centers that drive economic and social development and has a population

of 1 lakh and more). Data gathering took place in Delhi's primary schools (only public schools) spread across its 12 zones, with the "central" zone chosen randomly to ensure unbiased representation. Stakeholders from 51 primary schools participated in interviews and surveys from March to May 2022 to explore effective inclusive education models. Participants were briefed on the survey's objectives, and their completion signaled informed consent. The study involved various stakeholders, including teachers, principals, special educators, staff, and students with or without disabilities, ranging from nursery to fifth grade. Utilizing the Yamane's formula, the study determined the appropriate sample size for survey research based on a known population size ($N = 19848$) and a finite population.

$$n = \frac{N}{1 + N(e)^2}, \quad \text{where, } n = \text{sample size, } N = \text{population size, and } e = \text{margin of error,}$$

In Delhi's primary schools, there are 939 teachers in total for nursery and KG classes. For grades first through fifth, there are 17,374 teachers. The number of principals is 1,535, (Chettri & Ghosh, 2022). The total count of teachers and principals (i.e., population size - N) is as follows:

$$\text{Population size (N)} = 939 + 17374 + 1478 + 57$$

$$\text{Population size (N)} = 19848$$

$$\text{so, sample size (n)} = 19848 / 1 + 19848 \times (0.05)^2$$

$$\text{sample size (n)} = 392.09$$

Out of the planned 492 participants from 51 primary schools (consisting of 421 regular teachers, 20 special educators, and 51 principals), 481 individuals (97.7%) actively engaged in the survey. Collected data underwent digitization and coding. During processing, respondents assessed all aspects of IEIE, resulting in 481 complete responses after excluding incomplete observations. With a sample size of 392 school stakeholders, statistically deemed acceptable, the study accounts for the diverse stakeholders currently engaged in primary schools (Chettri & Ghosh, 2022).

Assessment of Response Reliability of the Data

To evaluate the reliability of data responses, a statistical analysis employing Cronbach's alpha coefficient was conducted on the importance of indicators of Inclusive Education (IEIE). Cronbach's alpha (α), a measure denoted by the Greek letter α , assesses the internal consistency of summed rating scales (Cronbach, 1951). Widely accepted, it gauges item consistency within a scale by evaluating the correlation among responses to survey questions (Cronbach, 1951; Cronbach & Shavelson, 2004). The resulting Cronbach Alpha value for the overall data was 0.895 (see Table 1), categorized as 'Good' ($0.80 \geq \alpha \geq 0.89$), surpassing the 0.70 threshold (see Table 2). This outcome validates the reliability and validity of the survey data (see Table 1), affirming the questionnaire's effectiveness in capturing these indicators.

Table 1. Cronbach's alpha coefficient test to assess response reliability of data.

VARIABLES	VALUES	Internal Consistency
-----------	--------	----------------------

Number of Items (K)	33	Formula (α) = $K/K-1 * [1-(\sum s^2y/\sum s^2x)]$
Sum of the item variance ($\sum s^2y$)	45.8266	
Variance of total score ($\sum s^2x$)	347.8369	$\alpha= 0.895$
Cronbach's Alpha (α)	0.8953	
Reliability Level	Good as ($0.80 \geq \alpha \geq 0.89$)	

Table 2. Range of Cronbach's alpha coefficient with corresponding reliability levels.

Range of Coefficient of Cronbach's Alpha	Reliability Level
' α ' > 0.90	Excellent
0.80-0.89	Good
0.70-0.79	Acceptable
0.60-0.69	Questionable
' α ' < 0.59	Unacceptable

Data Analysis

Considering the central goal of this study to prioritize indicators of effective inclusive education (IEIE) based on the perspectives of school stakeholders, it is crucial to apply methods suitable for managing comprehensive rating data. While a conventional user ranking based on mean scores is prevalent, it lacks efficacy for Likert-type data due to mean limitations as a measure of central tendency. Therefore, the study recommends the use of Multi-Criteria Decision-Making (MCDM) techniques designed for such data to ensure a more accurate analysis. Multi-Criteria Decision-Making (MCDM) methods are increasingly recognized as valuable tools for analyzing intricate real-world problems because they can assess various alternatives based on different criteria, aiding in selecting the most suitable option (Chung & Ng, 2016). These methods may involve identifying the best alternative, ranking alternatives to determine critical factors, assessing deviations from accurate alternatives, establishing relationships among alternatives, or determining criteria weights for optimal solutions. MCDM techniques not only identify optimal alternatives but also highlight less important ones, aiding decision-makers in selecting the best solution. Methods like the Weighted Sum Model (WSM) and Weighted Product Model (WPM) are utilized to assign weights to criteria for decision-making assistance (Sahoo et al., 2022). The WPM was chosen due to its compatibility with Likert-type scale ordinal data, extensive previous use in attribute ranking, and greater efficiency in problem-solving compared to other methods, particularly in subjective contexts (Atmojo et al., 2014; Adriyendi, 2019). This approach facilitates estimating the relative importance of IEIE and their subsequent prioritization.

Weighted product model (WPM)

The Weighted Product Model (WPM), an extension of the Weighted Sum Model (WSM) (Bridgman, 1922; Miller & Starr, 1969; Triantaphyllou & Mann, 1989), functions similarly to the WSM but employs

multiplication instead of addition. Each alternative is assessed against others by multiplying ratios, one per criterion, raised to the power of its weight (Bridgman, 1922; Miller & Starr, 1969; Triantaphyllou & Mann, 1989; Triantaphyllou, 2000; Tofallis, 2014). Known as dimensionless analysis, the WPM's structure removes units of measure, enabling its use in both single and multi-dimensional Multi-Criteria Decision Making (MCDM). It benefits from utilizing relative values rather than absolute ones (Atmojo et al., 2014). To employ the WPM method, certain steps need to be followed (Adriyendi, 2019):

Step 1: Construct weighted normalized decision matrix R''

$$R'' = \begin{bmatrix} r_{11}^{w_1} & r_{12}^{w_2} & \dots & r_{1n}^{w_n} \\ r_{21}^{w_1} & r_{22}^{w_2} & \dots & r_{2n}^{w_n} \\ \vdots & \vdots & \ddots & \vdots \\ r_{m1}^{w_1} & r_{m2}^{w_2} & \dots & r_{mn}^{w_n} \end{bmatrix}; \sum_{j=1}^n W_j = 1 \quad (1)$$

Step 2: Calculate the score S_i^{WPM} of each Indicator

$$S_i^{WPM} = \prod_{j=1}^n r_{ij}^{w_j}; \text{ where } i=1,2,3, \dots, m \quad (2)$$

Step 3: Select the Best Indicator BI^{WPM}

$$BI^{WPM} = \max S_i^{WPM}; \text{ where } i=1,2,3, \dots, m \quad (3)$$

Results

Within the WPM approach, the weight is integrated into the performance rating as an exponent. The rankings of indicators are derived from WPM scores (see Table 3). WPM scores, denoted by 1, serve as an index, where a value closer to 1 signifies greater indicator importance. The indicators of effective inclusive education (IEIE) ranking outcomes from WPM analysis are outlined below (see Table 3).

Table 3. Score S^{WPM} and priority ranking of each indicator..

Indicators	S^{WPM}	Ranking
1 Class-Size	0.727	10
2 Teaching Strategies	0.684	17
3 Curriculum w.r.t. CWSN	0.724	11
4 Student-Teachers Ratio	0.831	4

5	Administrative support	0.671	20
6	Participation in Co-curricular activities	0.623	28
7	Enrolment of Children with Special Needs	0.808	6
8	Are you a differently-abled /special child	0.870	1
9	Type of disability- you belong	0.815	5
10	Severity of disability	0.865	2
11	Inadequate financial support	0.659	23
12	Policies_ implementation of inclusive education	0.669	21
13	Availability of Therapeutic care center	0.722	12
14	Availability of Paraprofessional Staff	0.674	19
15	Availability of Resources	0.629	27
16	Availability of Special training for Teachers	0.692	16
17	Availability of Vocational training facilities	0.721	13
18	Educational Qualification	0.644	25
19	Teaching Experience	0.644	26
20	Trained /Untrained w.r.t. CWSN	0.838	3
21	Proficient in operating Special Devices	0.620	30
22	Awareness about UDL	0.709	15
23	Teacher's Attitude (Negative/ Positive)	0.599	31

28	Accessibility to Vertical and Horizontal Movement	0.769	7
29	Accessibility to Wash and Other Facilities	0.729	9
30	Accessibility to Exit, Way-Finding and Communication	0.666	22
31	Accessibility to Academic Spaces	0.732	8
32	Accessibility to Extra-Curricular Activities	0.677	18
33	Accessibility to Digital Infrastructure	0.653	24

Note: Here, ' S^{WPM} ' represent the WPM score of a respective indicator, Ranking: rank of the indicator with the closer the ' S^{WPM} ' score value to 1, the higher the rank.

Discussion

According to the results of the WPM analysis (see Table 3), specific qualitative indicators are notably prioritized by stakeholders in schools. These indicators mainly center on student characteristics, highlighting the importance of identifying students and their disabilities. These include factors such as whether they are differently-abled/special children ($s = 0.870$), the severity of their disability ($s = 0.865$), the type of disability

they have ($s = 0.815$), and the enrolment of children with special needs ($s = 0.808$). Additionally, attributes concerning teachers are considered vital, including the training status of educators regarding children with special needs ($s = 0.838$), the student-teacher ratio ($s = 0.831$), class size ($s = 0.727$), and curriculum concerning CWSN ($s = 0.724$). Furthermore, indicators related to accessibility, such as vertical and horizontal movement ($s = 0.769$), access to academic spaces ($s = 0.732$), and access to water, sanitation and hygiene (WASH) and other facilities ($s = 0.729$), are also deemed significant. Therefore, the WPM analysis indicates that the most crucial IEIE encompass factors associated with students with disabilities, teacher-related attributes, and accessibility-related indicators targeted at overcoming barriers within school premises and structures.

According to the WPM analysis, indicators of moderate importance encompass various aspects such as the presence of a therapeutic care center ($s = 0.722$), availability of vocational training courses and facilities within the school ($s = 0.721$), accessibility to site entry and school premises ($s = 0.717$), awareness about universal design for learning (UDL) ($s = 0.709$), availability of special training for regular teachers and staff ($s = 0.692$), teaching strategies ($s = 0.684$), accessibility to extracurricular activities ($s = 0.677$), availability of paraprofessional staff ($s = 0.674$), administrative support ($s = 0.671$), policies regarding the implementation of inclusive education ($s = 0.669$), and accessibility to exit, way-finding, and communication ($s = 0.666$). This suggests that indicators related to facilities, support services, resources, infrastructure, the accessible built environment, and policies regarding inclusive education implementation are considered moderately important based on their relative significance in the analysis.

According to the WPM analysis, it is noteworthy that stakeholders assign lower importance to various indicators, including inadequate financial support ($s = 0.659$), accessibility to digital infrastructure ($s = 0.653$), teacher's educational qualifications ($s = 0.6443$), teaching experience ($s = 0.6436$), availability of resources to implement accessible features into the school ($s = 0.629$), participation of CWSN in co-curricular activities ($s = 0.623$), acceptability & mutual respect between students and teachers ($s = 0.622$), proficiency in operating special devices & equipment used by CWSN ($s = 0.620$), teacher's attitude (negative/positive) ($s = 0.599$), awareness & sensitization regarding disability ($s = 0.575$), and parents/community involvement awareness ($s = 0.565$). This finding contradicts the common assumption that financial support, teacher's education, teacher's experience, awareness & sensitization regarding disability, and parent's/community involvement are pivotal factors for the inclusion of CwDs in inclusive education, particularly in developing nations like India. Notably, many primary schools (only public schools) only have one special educator per school to aid CWSN, and the enrolment of these students is relatively low in existing schools. This could explain why stakeholders do not prioritize these indicators as highly important compared to the aforementioned ones. The reduced significance attributed to financial support, teacher's education, teacher's experience, awareness & sensitization regarding disability, and parent's/community involvement, especially considering the significantly low enrolment of CwDs in primary schools, likely indicates a lack of enthusiasm among stakeholders (teachers, principals, special educators, etc.) in actively advocating for the inclusion of CwDs in these schools, as these indicators necessitate their direct involvement and commitment.

Conclusions

This research provides valuable insights into the importance of IEIE for promoting the inclusion of CwDs in primary schools in Delhi, India. The results indicate that stakeholders prioritize qualitative indicators concerning students, teachers, resources, and accessibility, while allocating less emphasis on financial support (see Table 3). Typically, in developing countries like India, there tends to be a focus primarily on the financial and administrative aspects of inclusive education, sometimes overlooking the qualitative dimension crucial for CwDs' inclusion. The findings emphasize the need to enhance accessibility around schools and give due consideration to qualitative aspects.

The outcomes highlight the current lack of attention to certain indicators such as awareness and sensitization regarding disability, parental/community involvement, teacher's attitude (positive/negative), mutual respect between students and teachers, participation of CWSN in co-curricular activities, proficiency in operating special devices & equipment used by CWSN, teacher's educational qualifications, and teaching experience. Conversely, indicators such as student characteristics (including whether they are differently-abled/special children, their type of disability, severity of disability, and enrolment of children with special needs), student-teacher ratio, trained/untrained educators regarding CWSN, awareness about UDL, class size, curriculum, accessibility to academic spaces, accessibility to water, sanitation and hygiene (WASH) and other facilities, availability of therapeutic care centers, and availability of vocational training courses and facilities in school hold greater significance in the context of CwDs inclusion. This discrepancy may arise from the various types of disabilities encompassed within CwDs, including locomotor disability, visual impairment, hearing impairment, and speech and language disability as per the RPWD ACT 2016 India, necessitating heightened attention and care compared to typically abled children. Consequently, there is a justified need to enhance the awareness of school stakeholders regarding the needs and requirements of CwDs in the context of their inclusion in regular schools. The rankings of IEIE obtained through the WPM method underscore the importance of IEIE and advocate for additional research in this domain.

Limitation and Future Research Scope

Specifically, there is a necessity to create an evaluation framework for assessing the present condition of these indicators within mainstream schools, aiming to enhance the enrolment of CwDs. This study provides a scientifically validated foundation for the deliberate choice of indicators of effective inclusive education (IEIE) concerning the integration of CwDs into regular primary schools (public schools). This research focusing solely on primary schools.

Mahmoud Abouraia

Modern College of Business and Science, Oman

Hesham Magd

Modern College of Business and Science, Oman

Abstract: The paper investigates the intellectual traditions that underscore the assumptions of academic and career advising, toward an understanding of what it means to advise college students and the pedagogical ramifications of this understanding. The discussion articulates the driving forces that stand behind a university model that goes beyond course registration and degree explanation. The intention is to inspire new thoughts on the applications of a flipped Academic and Career Advising model that centralizes a desired understanding and exploration of the needs of the 21st. century labor market and the expectations of college graduates. The paper explores the success factors of an advising model that is integral to the university academic programs and consistent with a student-centered teaching paradigm, while exploring the potential it holds for several audiences such as students, faculty, theorists, and policy makers. The discussion ends with a consideration for adding an online advising component to enhance the existing model.

Keywords: Academic advising, Constructivist advising, Institutional improvement

Introduction

Over the last 20 years or so, the discourse of academic and career advising (A&CA) in Higher Education Institutions (HEIs) has been narrated many times by various stakeholders such as educators, advisors, students, researchers, and decision makers. Each narrative highlights some points while vailing others. Considerably, all the narratives congregate that the story is worth discussing and reflecting upon. Yet the available literature on academic and career advising reflects a myriad of perspectives and deals with both types of advising (academic

and career advising) as discrete entities and divisions. Also, different researchers and stakeholders contextually define A&CA differently. Rarely, do you find a university that combines both types of advising in one division. This conceptual paper calls for perceiving both types of advising (academic and career advising) as one entity. The assumption taken in this paper is that both types of advising are interrelated and interdependent so much so that you cannot separate one from the other (Schoeman & Bezuidenhoud, 2021)

There is much literature around academic advising that relates its assumptions to epistemology with its focus on how we know what we know and what knowing is (Antoney, 2020). Epistemologically, academic and career advisors focus on the what and the how of the advising process. In other words, the focal point on how we should advise and what advising is all about. Perceived as such, academic advising is no more than registration advising with a focus on an in-depth understanding of advisees' exploration of their degree and study plans. The truth of the matter is that this is an oversimplification of the advising process.

The understanding that this paper is promoting perceives academic and career advising from an ontological perspective with a focus on what it means to advise and the ramifications of this understanding. Also, ontologically speaking, we cannot separate the way we advise from the way we teach, and the way students learn. In other words, we cannot operationally define the advising process without reflecting on the teaching, learning, and assessment model that is adopted in a certain context.

This paper is premised on the assumption that teaching, learning, and assessment that are grounded on a constructivist philosophy contributes to college students' academic and professional success (Friedensen, et.al. 2024). Our teaching methodology values a flipped learning process. We do not perceive ourselves as the only trusted source of knowledge. We believe that students are not empty vessels waiting for us to be filled with information (Amini, et al. 2018). We perceive students as an integral part of the teaching, learning and assessment process. Accordingly, there should be consistency between the way we teach and the way we advise. In other words, since we flipped the teaching and learning process, we must flip the advising process too. Advisees are active participants. Before they come to the advising session, they should explore what concerns their academic and professional career.

Ontologically, academic and career advising is a collaborative, give and take process, where both the advisor and the advisee co-explore and co-develop a glocalized understanding of what it means to grow at the academic and professional levels. Glocalization as a concept and practice allows advisors and advisees to promote global perspectives related to academic and career development issues with local insights. The following section explores further the intellectual traditions of a proposed model that merges academic and career advising. The proposed model centralizes the core principles of glocalization and a flipped learning and advising process.

Glocalization is a concept that integrates global best practices in the field of advising with a local understanding of the socio-cultural context in which the advising process takes place. The proposed Glocalized Academic and Career Advising Model (GA&CAM) draws upon several intellectual traditions such as Vygotsky's social

constructivism, narrativism, connectivism, Bakhtin's dialogism and complexity theory that inform its practice.

Vygotsky's Social Constructivism and the Intellectual Traditions of the proposed GA&CAM

The GA&CAM draws upon Vygotsky's social constructivism and Zone of Proximal Development (ZPD) (Vygotsky, 1962). According to Vygotsky's ZPD, for effective advising to take place, both the advisor and the advisee should be dynamically engaged in goal-oriented social interactions of growing difficulties, which contribute to the cognitive development of both parties. "Development in thinking is not from the individual to the socialized, but from the social to the individual" (Vygotsky, 1962, p. 20). According to this line of thinking, academic and career advising represent a unified framework that underscores the nature of the advising practice as a developmental, cognitive and learning process. This type of understanding inspires advisors to instill higher thinking skills in their advisees. The advising, from this perspective, puts a premium on exploring learners' prior knowledge, experience, and future goals. It emphasizes advisees' autonomy, and self-actualization in learning and career development within a well-thought out ZPD process. By incorporating this strategy, Vygotsky (1978) indicates: For learning to take place, social interactions should be within the Zone of Proximal Development (known as ZPD), the distance between the actual development level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers (p. 86).

Narrativism and the Intellectual Traditions of the proposed GA&CAM

Another philosophical approach that underpins the intellectual discourse of the GA&CA proposed model is narrativism. The GA&CA process concerns a story that needs to be explored and learned about. Narrative theorists would say in this regard that storytelling has the aptitude to use relatable examples that shape advisees' identities and career trajectories. According to this type of understanding, advising is an impactful process that allows student advisees to construct and reconstruct coherent narratives while reflecting on past experiences, and developing future horizons (Bryson, et al. 2023).

Connectivism and the Intellectual Traditions of the proposed GA&CAM

Connectivism is another school of thought that underscores the intellectual traditions of the proposed Globalized Academic and Career Advising Model. Connectivism as a philosophy suggests that human understanding is built on connecting what we need to know to what we already know. The proposed GA&CA model facilitates this process. It allows both the advisor and the advisees to collaboratively develop a global understanding of the academic and professional environment with a local insight. Connecting the global with the local allows student advisees to develop a new horizon of understanding their needs in relation to the demands of the global and local labor markets and other intellectually different stakeholders.

Complexity Theory and the Intellectual Traditions of the Proposed GA&CAM

The dynamic nature of academic and career advising can further be understood through the lens of complexity theory, which emphasizes the intersection and interdependence of factors impacting learning and career paths. Complexity theory implies that there is an interconnectedness among the parts of structured systems to the extent that the component of one system can impact the components of the other (Nayager & de Klerk, 2024). According to this theoretical discourse, both types of advising are closely interconnected so much so that you cannot uproot one from the other. There is always a dynamic interaction between the components of the two systems. Knowledge of one type necessitates knowledge of the other and the vice-versa. Embracing the principles of complexity theory allow student-advisees to develop adaptability, flexibility, self-authorship, and development (Iatrellis, et al.2023).

Bakhtin's Dialogism and the Intellectual Traditions of the Proposed GA&CAM

The glocalized academic and career advising discourse also centralizes Bakhtin's dialogic theory (1990), where the advising process is grounded on dialogue within a safe and engaging advising environment. Bakhtin's principles of dialogism contributes to an understanding that it is through dynamic, goal-oriented dialogic interactions that a shared, diverse, intercultural, glocalized and negotiated meaning between the advisor and the advisees can be constructed and reconstructed.

All in all, taken together, social constructivism, narrative theory, connectivism, complexity theory, and Bakhtin's dialogism provide a solid theoretical framework for a glocalized, academic and career advising approach. These theories embrace principles such as autonomy, social interactions, narrative construction, and a differential and referential understanding of the self in relation to the different intellectual Other.

Taken together, incorporating insights from these theories represent the knowledge of the glocalized flipped academic and career advising model, which centralizes an understanding and exploration of the skills needs of today's labor market and the expectations of university students. The proposed GA&CA model puts an emphasis on engaging both the advisor and the advisees in co-developing an understanding of industry-specific competencies that meet the evolving needs of the labor market. The proposed GA&CA model enables advisees to: develop a lifelong learning mindset that is adaptable to the ever-changing demands of the labor market, experience data-driven decision making, take charge of their educational and professional journeys, and self-assess their strengths, weaknesses, opportunities for improvement and career readiness. Glocalization, as a concept and practice, makes the advising process a public, interpretive and situated learning experience through which both the advisor and the advisee co-explore effective strategies that prepare student advisees for their academic and professional career in global and local settings. The following section explains further the discourse of the proposed A&CA model.

The Publicity, Interpretivism, and Situatedness of the GA&CA Discourse

The discourse of the GA&CA is public, interpretive, and situated. As a public act, the discourse of the GA&CA indicates that it presupposes the existence of other stakeholders who are dynamically engaged directly and indirectly in the advising process. Advising, as such, is a communicative public act. When advisors communicate with their advisees, the meaning that is socially constructed is an outcome of dialogic and communicative interactions according to Bakhtin (1986) theory. A glocalized advising act values Bakhtin's dialogism, where the focus is on advancing communicative interactions between advisors and advisees. In other words, the GA&CA is not a monolithic, or static act, but an engaging, dynamic, and public dialogue between student advisees and other stakeholders. According to this line of thinking, the advising act requires three types of knowledge: knowledge of our minds (advisors), knowledge of advisees' minds, and knowledge of the shared world. The following figure depicts the triangulated relationship of the three knowledge entities.

Figure 1. Public Nature of the GA&CA

This means that our interaction with our advisees in relation to objects and experiences in the world is what generates meaning. That said, the concept of the GA&CA, as a public act, centralizes the integration of Bakhtin's dialogic communicative interactions. Advising would fail if advisors have no idea about the minds of the advisees and the world they share with them. The act of advising (academic and career advising) is a dialogic enterprise of communicative interactions among three types of knowledge : knowledge of the self-knowledge of the other and knowledge of the world. The proposed glocalized academic and career advising model embraces three types of knowledge, which constitute a robust foundation for both the advisor and his/her advisees to explore their roles in academic and career decision making. Glocalized advising practices, per se, provide access to diverse experiences and knowledge related to career exploration and social learning.

On the other hand, the discourse of the GA&CA requires continuous interpretation on the part of the advisor and the advisee of what surround them in the world. The third principle of the proposed GA&CA indicates that both the advisor and the advisee are situated. Both depend on their situated conventions, values, and beliefs in understanding each other. Being situated implies that we always already lean on our socially constructed beliefs in making sense of other people's values. When the advisor and the advisees communicate, each draws on his/her previously constructed beliefs to interpret and understand the other. When they communicate, their prior constructed values and beliefs come into play.

Communicative interactions between them open up the likelihood of understanding each other's constructed

inner world in relation to the outside world. The GA&CA process, by itself, is an act of interpreting the word and the world within a certain context at a certain point in time. In other words, the act of interpretation is place and time bound.

In much the same way of Bakhtin, Vygotsky's social constructivism informs the principles of the GA&CA approach. According to Vygotsky's (1978), the advising act is first social and then personal. The social view of the GA&CA requires both the advisor and the advisees to dynamically get engaged in life-contextualized communicative interactions and enterprises of growing difficulties. In so doing, students' knowledge of their academic and professional career can't be created autonomously, but through social interactions. This line of thought speaks of the advising act as a contextualized social practice and a dynamic outcome of social interactions. The advising process, through the lens of Bakhtin and Vygotsky's concepts, as such, is a dynamic and developmental social act that is shaped and determined by the socio-cultural beliefs and values that profile each individual entity.

Accordingly, the proposed GA&CA model, while enacting the principles of dialogism and social constructivism, it perceives the advising process as a developmental social act that goes beyond the time-honored boundaries of separating the local from the global. A glocalized approach to academic and career advising motivates advisees to explore and interpret the boundaries of their constructed knowledge in relation to the boundaries of their advisor's worldviews. This type of academic and career advising discourse opens new other horizons that make student advisees make sense of their world and the world of the different intellectual Other. Advising, therefore, is a process of meaning making and an outcome of a triadic association among the world of the advisor, the world of the advisees and the events and experiences in the world.

The discourse of the GA&CA promotes an understanding that to advise is to enable advisees reflect on their past to improve their present and forecast a rewording professional future. The principles of the GA&CA perceive both the advisor and the advisee are always already in an on-going interpretive mode of being-in-the world with others who are by necessity different. Therefore, to advise is to intelligibly interpret one's world in relation to the world of the different other. The Other in an advising context can be future employers, decision makers or any other stakeholders. It is the advisees' intelligibility that provides meaning to their academic and professional understanding. As an intelligible act, advising requires the presence of two communicants (advisor and advisee), and an object or experience in the world. The interpretations that both the advisor and the advisee have of the external experiences are generative, situational, provisional and can change overtime. So, it cannot be codified or schematized.

In conclusion, the proposed flipped glocalized academic and career advising model speaks of :
relating glocalization principles to advisees' career goals,
exploring global opportunities with a local insight,
and facilitating advisees' access to global communities to discuss global challenges with a local insight.

Significantly, the GA&CA proposed model is consistent with a flipped constructivist teaching, learning and assessment approach which emphasizes:

learning-by-doing,

inquiry-based learning,

project-based learning,

and competency-based performance and assessment.

Figure 2 depicts the flipped act of both learning and advising.

A Proposed Flipped Teaching – Learning –& Advising Model

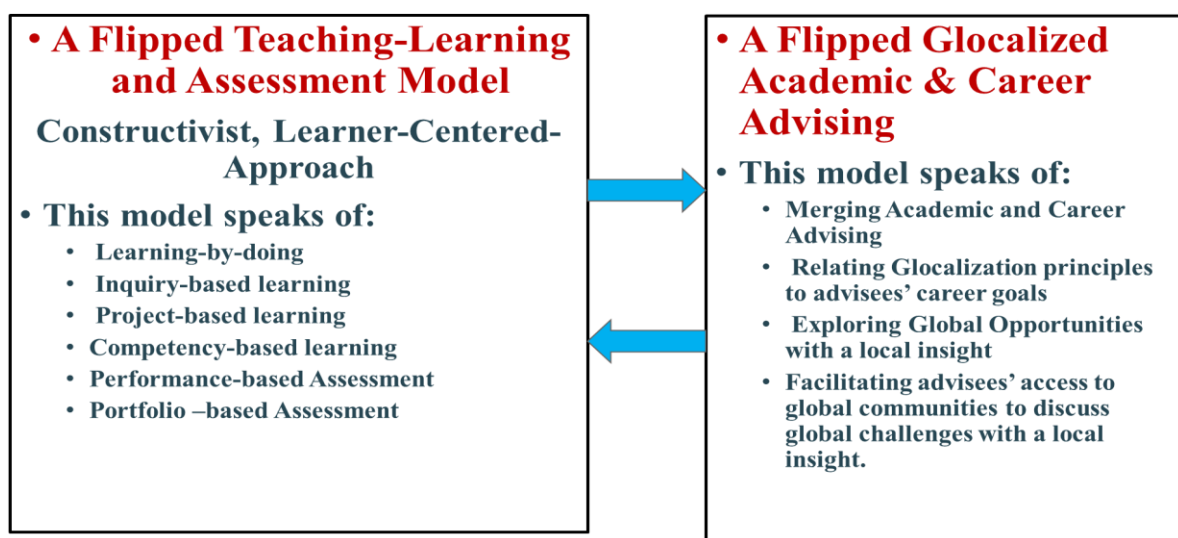

Figure 2. Flipped Act of both Learning and Advising

All in all, the proposed globalized academic and career advising model is deeply rooted in the intellectual traditions of Bakhtin and Vygotsky which emphasize the social and collaborative nature of learning and advising. Also, theoretical concepts from the narrative theory indicate that storytelling plays a role in shaping advisees' identities and career paths. The advising practices that value these theories put high priority on advancing knowledge of the self, knowledge of the other and knowledge of the world. This type of understanding has the potential to achieve institutional improvement in this domain through the development of an online version of the proposed GA&CA model.

An Online GA&CA for Institutional Improvement

The model goes beyond course registration and degree explanation. The intention is to inspire new thoughts on the applications of a flipped online Academic and Career Advising model that centralizes an understanding and exploration of the needs of the 21st. century job market and the expectations of college graduates. The model demonstrates the importance of establishing a pedagogical consistency between the advising model and the learner -centered teaching-learning paradigm of the university. The flipped online academic advising model

should be an effective and easy tool to use and a helpful consulting instrument that eases students' access to academic advisors where they can discuss their academic works and professional career goals (Thottoli, et al. 2024). A virtual academic and career advising system (VACAS) would allow both the advisor and advisee to interact synchronously or asynchronously through videoconferencing or chatting facilities.

Abstract: Based on an exhaustive study from 2001–2003 involving 14 high schools in the EU, a definition of the educational content and the aligned methodology for high school levels was developed for two areas—cyber safety and cybersecurity—with the aim of improving the knowledge and skills of students and their teachers. Available sources, including video platforms, quizzes, presentations, educational games and hands-on sources for practical exercises, were evaluated and included in the developed fiches with educational content. The paper describes the results of the study based on the evaluation of the acceptance of the method and the content by the students and with an assessment of the achieved learning outcomes.

Keywords: cybersecurity, cyber safety, high schools, Europe, game-based learning, Capture the Flag contest.

Introduction

Today's young population is changing its internet habits very quickly in response to considerable societal, market and technological innovation. They are frequently engaged with online videos, music, gaming, and messaging. In general, their internet use is broadly positive, contributing to the building of digital skills. When enjoying the benefits of the internet, it is important to be aware of the potential risks and to apply safety precautions, as young people now have internet access at a very early age. Studies claim that cybersecurity education should be applied in schools because there are many benefits if a school is able to offer cybersecurity education (ENISA, 2020) since the adult participants in seminars organized on the market are reluctant to spend time and money. Schools should provide programs on cybersecurity topics to larger communities, as cybersecurity education is changing the minds of individuals and contributing to a safer digital environment. According to Amankwa (Amankwa 2021), schools in the USA are provided with grants and financial allocations from the federal government to ensure support for implementing cybersecurity education. In addition, camps dedicated to cybersecurity topics are regularly organized for high school students each year

(Chen and He, 2021). One example is the GenCyber (GenCyber, 2015) summer camp, which is organized for teachers and students within an NSA/NSF support program. However, a study based on a systematic literature review of more than 20 very relevant papers reported that a well-designed curriculum in cybersecurity education at the K-12 level could successfully motivate students at this level to pursue cybersecurity pathways and careers, but today, such a curriculum is still missing (Jerman Blažič B. and Jerman Blažič A., 2022). Recommendations for addressing cybersecurity topics or curricula examples in the educational programs of European high schools are lacking, as was proven by a survey involving high school management in 14 European countries in 2021 (Caulkins et al., 2022). Digital skills, including the cybersecurity skills built through cybersecurity programmes, are understood to represent a combination of abilities, knowledge and experience that enables an individual to successfully complete a task when working in a digital environment and using digital services as well as being safe. The lack of sufficient attention given to acquiring cybersecurity knowledge by European children and young people has a negative impact on the capacity of a modern, digitized society and young people has a negative impact on the capacity of a modern, digitized society capable of efficiently reacting to the increasing number of cybercrimes (Adams and Makramalia, 2017). The problem addressed in this paper is twofold: a lack of appropriate educational content for EU high school students and a lack of teachers with knowledge and understanding of cybersecurity topics, content and skills. In this paper, both problems are addressed with teaching materials and delivery methods in line with the modern pedagogical approach. Acquiring cybersecurity skills requires an ICT background and knowledge that must be regularly updated to ensure the adoption of technological advances. The demands for new learning methods are now more pressing than ever, especially regarding the need to introduce and upgrade educational methodology at the high school level. Several studies have shown (Angafor et al., 2020; Dragon et al.) that even education and training in universities in several areas, including ICT, dedicated to preparing high school teachers are still very technocratic, and the educational approach is not promoted in line with the requirements for sustainable education and modern teaching (Burns et al., 2013; Cybersecurity4Europe, 2022). The paper is organized as follows. Section 2 provides a short overview of related previous work on the subject by summarizing the results of an online survey among European high school students and teachers that provided information about the missing content in cybersecurity education, the desired educational methods for material delivery, and the methods that supported the preparation of the classes. Section 3 describes the implementation of the developed curriculum and the selected learning sources. In the same section, the organization and the course for the contest of Capture the Flag are briefly described. The last section discusses the approach applied and the experiences collected. The last section introduces the recommendations and the concluding remarks.

Related works and identified needs

In this paper, **cyber safety** is understood as the means of protecting users from harmful online content. It concerns the emotional and psychological impact of what is seen, read and heard online. Being cyber safe means meeting appropriate standards of behavior in the content the users put on the internet, knowing how to avoid harmful interactions online, and being equipped to seek help in the case that an unexpected result occurs.

Examples of cybersafety incidents include cyberbullying, sexual harassment, exposure to hate speech/inappropriate content (violent, sexual, etc.), leakage of sensitive information, personal abuse, etc.

Cybersecurity is understood as the means of protecting data, systems and assets on the internet. It refers to the physical and software operation of the networks and computers over which the internet is delivered. Cybersecurity is described as well as the process, state, or activity in which communication systems and information are protected from modification, unauthorized access or exploitation.

Examples of cybersecurity incidents include the following: the entry of viruses into the system, the denial of service by connected systems, hacked and abused accounts/profiles, man-in-the-middle attacks (in which an attacker has access to the communication channel and can see and modify the information exchange), misuse social engineering (in which a person tries to acquire user or company credentials by asking simple questions), phishing (receiving access to a user's or company's credentials in a financial institution and stealing money, encrypting data and requesting payment to unencrypt data and other important information). Issue received additional attention when the problem of a labor force lacking cybersecurity skills was detected almost everywhere. The number of missing labour force with cybersecurity skills was estimated to be approximately 3 million workers globally, according to cybersecurity workforce studies carried out in 2018 and 2019 (Jerman Blažič, 2022). High schools in EU were found to not offer cybersecurity education in their computer science programs. The study of the issue provided the information that gamification of the cybersecurity topics can help in the education of the European youth. Training solutions, including games in the area of cybersecurity, have proven their capacity to raise awareness, defense and affective strategies based on an exhaustive analysis of more than 100 cybersecurity games available on the market (Coentrad et al., 2020, Jerman Blažič, A., 2021).

These findings triggered the members of the Concordia Competence Center (Concordia, 2021) to dedicate part of the project work to remedy the situation of missing skills among the EU population by preparing a modular body of knowledge of cybersecurity, first for workers in the industry, and launching courses where the interested organization could shape an appropriate education process according to needs by selecting modules from the offered set. Later, the team worked on the cybersecurity curriculum development dedicated to enable cybersecurity education among the younger population in the EU. Study was launched to help the selection of KAs that could become part of EU high schools' regular education. At that time, the UK National Cybersecurity Centre launched the Knowledge Base of Key Areas (KAs) in cybersecurity dedicated to training for postgraduate degrees in higher education (Attwood and Williams, 2023). The CyBok knowledge base identifies the KAs in all the relevant topics of cybersecurity and the aligned areas, such as human, organizational and regulatory aspects (Adams and Makramala, 2017). The base is licensed under the Open Government License v3.0. However, the KAs and the educational levels appropriate for schools are not yet provided by the CyBok database. The curriculum development and the education method were developed with help from the information collected with an on-line survey and with the talks carried out with the high school students, their parents, the teachers and school managers of 14 EU high schools. The on line survey with questions about desired topics and knowledge as well the desired of the material delivery helped as well. Before starting work

on the particular topics e-sources that address education in cybersecurity for 14- to 18-year-old students were inspected. Most of them are focused on spreading awareness about cybersafety, while cybersecurity topics that contribute to the adoption of cybersecurity skills were not addressed. Similar findings were recently reported by researchers who described different initiatives for enhancing the safety behavior of young people when using online services (Lin et al, 2018; Pencheva et al., 2020). Some studies addressing the relevance of cybersecurity education in high schools have identified only a few topics that should become part of high school education for cybersecurity (Passy, 2017; Chindrus and Caruntu, 2023). It was found as well that Most of the material provided on the internet is available only in written electronic form (brochures, posters or presentations, typically in pdf format). No recommendations were found on platforms about how to apply the available educational tools, such as serious games and videos, in cybersecurity educational programs at the high school level. The game-based learning tools available on the internet cover very different topics, including spam, malware, cyber-attacks, and SQL injection XSS scripting, but they are intended to be used by very large and mixed audiences. Curriculum and fiches development requires tremendous teamwork in analyzing the offers and selecting the best solutions that match the training content in the fiches, together with the selected e-sources. The team was composed of cybersecurity experts and university teachers, some of whom were contributors or editors of the developed methodology and fiches' content. To extend the applicability of the programme to the level of knowledge in a particular school, three difficulty levels were prepared for each topic, i.e., beginner, intermediate and advanced. It was decided that the developed curriculum be composed of two major fields, i.e., cyber safety and cybersecurity, as these areas have different approaches to delivering content and learning.

The Method and The Curriculum Design

The methodology for lesson delivery and KAs content were developed in parallel with the selection of the e-sources, which were evaluated for their appropriateness in providing active learning in the classes. The collaboration between the high school teachers, the participating experts and the university professors engaged in teaching cybersecurity and education was continuous, and as a result, a set of 12 fiches were prepared for each of the two areas, i.e., cybersafety and cybersecurity, all of which were equipped with information about the difficulty level and the requested students' prerequisite knowledge. They are presented on Table 1. The desired topics identified by the students were included in the selection of online tools, platforms, games and videos. Flexibility in the application of the education process was assured. The idea was that the education would follow the school's selection of the module's content, as the survey results revealed that the participating schools differ greatly in their programmes and attitudes toward teaching. The flexibility of the approach enables different needs to be met by a particular school participating in the education exercise and the accommodation of the teaching content to be in line with the student's knowledge level in that school. The fiche's content and the e-sources were prepared for the teachers who were teaching informatics and who had a medium level of competence in informatics and computer science. The advanced knowledge modules in the fiche collection were prepared to enable the teachers to improve their knowledge, and in the case of interest among the students, they could elaborate that content by offering additional training hours. Class preparation and the selection of a fiche

with the appropriate difficulty level were considered teachers' tasks. The students enrolled in cybersecurity education were expected to have basic digital skills, but for the cybersafety modules, no precourse knowledge was needed. All the fiches contained a number of existing and already validated e-resources, systems and tools in both the addressed areas.

Table 1. Overview of the 12 modules and in each of the addressed knowledge area: cybersafety

A. Cybersafe topics			B. Cybersecurity topics		
A0. Why discussing cybersafe	A.TEST Testing the group level		B0. Why studying cybersecurity	B.TEST Testing the group level	
A1. Personal/Sensitive Data and Privacy	A2. Cyberbullying and Sexual Harassment	A3. Inappropriate Content	B1. OSI Model	B2. Operating systems (OS), Computer Hardware, and how does a computer work	B3. Protection of Data: concerns
A4. Hate speech	A5. Fake profiles, Fraud, and Phishing	A6. The importance of Strong Passwords	B4. Network Standards and Protocols	B5. Cybersecurity essentials (CIA triad)	B6. Attacks, Threats, Vulnerabilities
A7. Addiction	A8. Keep my online account safe	A9. Stay safe in Online Social Networks	B7. Defense against Cyber threats (Cyber hygiene)	B8. Cryptography	B9. Individual Incident Management
A10. Online Games	A11. Fake News	A12. Transparency of Recommendation Algorithms	B10. Capture the Flag	B11. Penetration testing/trainings	B12. Roles in Cybersecurity and Top10 certifications

The selection of games to be included in fiches was not an easy task, as the number of appropriate serious games with proven learnability (Jerman Blažič, A., et al., 2017) for high school-level education in cybersecurity is not large (Jerman Blažič, A., 2021; Miguel et al., 2014). It seems that the cybersecurity area for a less-demanding level of knowledge is somehow neglected by game designers. The reason for this difference comes from the games' origins, as most of the cybersecurity games were developed within military institutions and are not suitable for a nonmilitary environment, for general education such as the one to be implemented in most high schools. However, the inclusion of games was based on an analysis of previous studies.

Each fiche listed in Table 3 is equipped with the following information that helps the teachers prepare for the class:

- The level of knowledge addressed by the module
- The level of knowledge required by the students before they attend the class with that module;
- The learning objectives (LOs) of each fiche
- The type of knowledge to be conveyed to the students
- Examples of questions to be discussed with the students during class
- Practical examples to be used by the teacher, such as games, hands-on exercises and quizzes

- List of links to e-resources to be used when preparing the class and later by the students during the class, such as games, quizzes and videos.

Each fiche is accompanied by a list of URLs for the proposed practical examples and suggested e-resources. A total of 434 URLs are included in the teaching material, 195 of which address cybersafety and 239 of which address cybersecurity. They are provided at the end of each module. Although all of them were tested before inclusion, regular updating is recommended. The list of serious games and quizzes in the safety module is modest and is located in fiche A11. The list of included games includes “Identify and Challenge the Information” (topic: Fake News), developed by the University of Portland, “IN ocular science and Harmony Square”. An example of a recommended quiz is “The All New NewsWise Headline”. Examples from the game list in the cybersecurity modules are “The Matching Games”, “Map OSI and TCP/IP Layers”, “Cisco Learning – Binary Game”, “Print Matching game”, “Education Arcade”, “Cybersecurity NOVA Labs”, “PBS and Band Runner”, “Solve the Cryptoquote”, “RSA Encryption and Decryption”, “NCSC – the Cyber Sprinter”, and “Capture the Flag.” Most of these examples are available without charge. Capture the Flag is offered as a specific module composed of three fiches, Foundation, Intermediate and Advanced. It is recommended that students and teachers interested in the advanced learning of cybersecurity topics. Appendix B presents the CTF fiche at an intermediate level.

Implementation of the Developed Method

The applicability of the developed educational model for both audiences, high school teachers and students in 9 European schools, was demonstrated for the 2022–2023 school year. The call for participation was sent to the high school management who participated in the survey. The endorsement of the school’s participation after they had previously expressed a willingness to participate in the educational process according to the offered educational model required several conditions to be fulfilled by them. The school management agreed to the teaching of the selected curriculum topics becoming part of the ICT classes. Background knowledge in ICT was requested from the high school teachers who applied to take the preliminary courses dedicated to upgrading their knowledge in cybersecurity. The enrollment of the students in the cyber safety and cybersecurity classes was voluntary, and they were allocated by the school management in groups according to the presented knowledge in the tests, which was performed before the beginning of the classes. The tests were planned to be anonymous, as their purpose was to offer information about the students’ knowledge that helps the fiches with the difficulty level that best matches the students’ knowledge for selection. The test was recommended to last a maximum of 30 minutes. The teachers learned during the organized, online courses before the education in the schools started, how the proposed methodology works and how it should be applied in the classes. They were asked to test and become familiar with the e-sources and the tools presented in the fiches. One month later, they were given to prepare for their first classes before starting their education. For students who showed advanced knowledge of cybersecurity, the Capture the Flag module was prepared to be delivered to them, together with additional training hours for those interested in the subject who were planning to participate in the contest by the

end of the educational process. The participating school's management was asked to ensure that the classes had equal participation from male and female students. The teacher's education started early in October 2022 with a set of online lectures. The engaged instructors who led the courses for the teachers were university professors who contributed to the curriculum's development. The high school teachers were familiarized with the fiches' content, how to apply the educational material for the classes and which fiches were dedicated to improving their knowledge of cybersecurity. The teaching methodology presented to the teachers followed the dynamic teaching model (Concordia, 2021) by providing an active learning approach. Due to the volatility of some e-resources and their rapid changes, the teachers were asked to check them before the class and, if they changed or showed a lack of a sufficient and clear explanation of the presented material, ask the team for a replacement. Guidelines for class preparation discussed with the teachers during the teachers' courses provided opinions and advice that were recommended for use. Special attention was given to the way the fiches were selected when preparing a particular topic for the classes, as the topic material was expected to meet the identified knowledge level of the students. Open and lively discussions with students can provide enough information about how much the students are aware of threats when using online services and how much they know about the subject. This method is more suitable for cyber safety topics because they are generally more familiar with everyday activities on the internet. In teaching cybersecurity topics, the assess For most of the lessons, the fiches provide practical examples. In presenting them, they can be complemented with local news relevant to the class topic or with inspirational talks from experts. Such examples are expected to engage students in the learning process. The Bring-your-own-example (BYOE) tactic is also considered to help with a better interchange of opinions between the students and the teacher and to enable more lively discussions in class. To make the class topic more familiar, the students may be invited to check in advance the lesson to be covered in the next class and to look for cases they would like to share and discuss with the teacher and their peers that fit the class topics. Presenting their own examples was suggested to be introduced at the beginning of class or later, depending on the class topic. The fiches provide information about the learning objectives of each of the presented topics, and when the teacher feels that they have achieved their completion, a test may be included by the end of the class in the last 10 minutes. Questions for this type of test are also provided in the fiches, with the exception of fiches B12, B14 and B15 (capturing the Flag fiches). The teaching process with the developed curriculum in the schools started in the last week of November 2023. The classes were held in laboratories that were equipped with computers connected to the internet. The classes started with an introduction about "what a career in cybersecurity means". Some schools managed to invite experts from the industry that delivered a short speech about that topic by presenting cybersecurity role models and their career experiences, which was concluded with an invitation to the students to consider a career in cybersecurity. In two cases, the speakers were school parents working in the cyber domain, such as police, cybersecurity centers and CERTect. The students were allowed to bring and use their own devices (BYOD) during class. The classes usually started with information about one or two cybersecurity incidents in the area of the fiche topic, presented as a story. The results from the beginning of the class were presented to the students and discussed with the teacher. The purpose of the discussion was to stress the topic's priority within the curriculum. Most of the modules offer multiple-choice test questions with different levels of difficulty, which the teacher can select according to the needs of a particular class. Story telling prepared by the teacher at the beginning of the class is intended to launch the discussion for an easier

understanding of the game scenarios to be played during and after the class. The order of presenting different topics was selected by the individual teacher after the evaluation of the students' knowledge, but alternating the cybersafety topics with the cybersecurity topics was recommended as a method based on the findings that cybersafety topics positively impact teaching due to the greater amount of emotional/psychological content addressed in these topics. The alternation made the learning more relaxed. The topics selected by the teachers differed; however, the most frequently selected fiches for teaching were "Data protection (Foundation, Intermediate level)", "Essentials of cybersecurity (Foundation, Intermediate and Advanced level)", "Attacks, Threats and Vulnerability (Intermediate level)", "Defense against Cyber threats (Foundation level)" and "Capture the Flag (Intermediate and Advanced level)". The classes in all the participating high schools were very well attended. For example, in Slovenia, 365 students from five different high schools attended classes provided by five computer science teachers. In addition, training hours were applied for the five teams that decided to participate in the contest. The class portfolios in these schools were rich and contained both foundation fiches and fiches with advanced topics; for example, "Fake news" was one of the most frequently taught topics. Support was provided by the teachers involved, who helped the students understand the mechanics of the Capture the Flag game. The additional hours were well attended as they enabled the students to work on the Capture the Flag platforms at their own speed.

Results and Testing the Aquired Knowledge

After the classes ended at the beginning of March 2023, a survey was carried out in the majority of the participating schools to evaluate the students' adopted knowledge and their satisfaction with the learning. The questions were designed following the ACM education recommendation, which defines three types of learning outcomes to be assessed in their Computer Science Curricula (Leune et al., 2017). They are the following: Familiarity, meaning that a student has understood the concept at the theoretical level, is achieved mainly through lectures. Usage: A student understands the concept and can apply it correctly when the situation requires it. Assessment: A student understands the concept and can recognize the given concept in practice (Švabenski et al., 2022). Several questions were prepared to address the suggested learning outcomes, and additional questions addressed satisfaction with the applied education. The answers were very positive, most of them gave very positive numbers. The interviews with the teachers provided additional insights. The total number of teachers who participated in conversations about their experience with teaching was 14. They were carried out in the schools of the three countries that applied to participate in the Capture the Flag contest. Most of the teachers were glad to be part of the educational experiment, but most of the benefits they found came from the content of the fiches and the possibility of learning and preparing classes with material provided on the shelves. The fiches were assessed to be very helpful as a good way of bringing their knowledge up to date. According to a teacher's statement, the fiche's content was found to be very well structured and clearly presented, and there was a good red line for implementing the content in a class. The prepared questions to be asked during the classes and those included in the tests were found to be useful and contributed to the discussion with the students. The provided sources for teaching helped them, with less time spent on class preparation, and

provided useful guidance in testing the students' preknowledge before the class started. The prepared recommendation for how to use the provided material was assessed to be very useful and beneficial. The e-resources, i.e., the available videos and the game playing, introduced more amusement and enjoyment in the classes and made communication between the students and the teacher easier. The applied active learning enabled better content understanding and easier learning. The teachers' extra work, in attending the education prepared for them, and the obvious success of the implemented classes were recognized and awarded. To verify the results of the applied methodology in more real circumstances, an international contest was organized with the game Capture the Flag, which is a game designed to test the cybersecurity ability of the participants. Evidence from other Capture the Flag contests with beginners shows that the students who had typically never worked with a Linux OS or common network and security utilities before with the Capture the Flag concepts were capable of solving the challenges of the Capture the Flag contest (Švabensky et al., 2018). In March 2023, the classes ended, and an evaluation of the acquired knowledge by the students who attended the Capture the Flag classes with the three difficulty levels and the training hours was performed. It was prepared to participate in the international Capture the Flag contest. The idea for the development of the Capture the Flag game comes from the battle strategy. The participating teams in the Capture the Flag "Battle" are supposed to protect their "base" and their "flag". The other objective of the participating team(s) is to capture the flag from the other competing team(s) without being caught (Akintrotimi, 2023). The adaptation of the battle strategy to cybersecurity allows different scenarios to be prepared, and as a consequence, the results of the contests with different tasks are not the same. This is enabled by the nature of the game, which allows it to be played in many different forms (Cole, 2022). The most frequently played form is the "defensive" scheme, where each team attacks an established network and connected servers. Due to the international dimension of the action for teaching teachers and students from EU high schools, the Capture the Flag contest was run remotely on the internet, which is usually the most frequently applied model for knowledge evaluation. Each team worked in its own computer at their school. The participation in the contest was limited to a maximum of five high school students on each of the participating teams, but the final number of team members was set to 4. The Capture the Flag challenge was implemented by applying the defensive scheme and was designed according to the modules that were applied during the educational program. This applied game format was played with several teams that were trying to reach the same objective or the "flag" located in the network server. In the simplest form, the "flags" are usually simple text files placed in a specific location that should be discovered. The playing time was defined by the moderator to be 3 hours; this timing is considered the best time for beginners in a Capture the Flag contest. After the game was completed, the moderator reported the results and presented the correct solutions to the challenges. The times to solve the challenges were recorded, and the team that collected all the flags or obtained the highest score after the playing time was considered the winner of the game. The challenges that were given in the contest required the competing teams from three different countries to discover the server's vulnerabilities (flags) in the established network, to exploit this vulnerability (e.g., enabling remote connecting), to identify the IP number of the attacker and to determine whether a remote shell of the server is working correctly. Appropriate tools were available for scanning the server ports, identifying which ports of the server are open, and determining the type of protocols running behind these ports. The score engine continuously received the solved challenges and confirmed the correctness of the solutions during the allocated

playing time. The competing teams did not solve all the presented challenges, so the winner was the team that collected the highest number scores. Nineteen teams of students who attended the classes with the Capture the Flag module participated in the contest. The participants were from Croatia, Romania and Slovenia. The points acquired during the contest ranged from 5 points (the team with the lowest scores) to 87 points from a possible 100, obtained by the best team, coming from Romania. The rankings of the 19 teams that participated in the contest, each with 4 members, are presented in Table 2 with their names and country codes.

Discussion and Concluding Remarks

Considering the results, the applied methodology was shown to be applicable and useful. The originality of the approach, which has its origin in up-to-date educational methods and material, made the classes attractive. The efforts to promote active student participation improved teaching and student learning. The use of competitive computer games, videos from involved e-platforms, storylines and other tools are elements that made the classes enjoyable with the interactive participation of the students. The advanced testing of the students' knowledge before the lessons for accommodating the difficulty level of the delivered material, the provision of the teacher's active involvement in presenting the content, selected according to the students' interest and needs, and the

additional components applied in the education process made the proposed methodology applicable and attractive. One of the main components that contributed to this process was the offered guidance to teachers for preparing the classes with ready-to-use content, additional learning tools and available e-sources. The methodology was designed to encourage the teachers to apply specific additional measures for making the classes attractive for the participating students and ensuring their participation. The introduction of the BYOE tactic in the area of cybersecurity is another component that makes the proposed methodology innovative and acceptable for all involved people. The novelty of the developed methodology and its applicability were confirmed by the answers collected during the surveys and the expressed personal interviews of the teachers, the school managers that scouted the participants' needs in terms of teaching cybersecurity and cybersafety subjects at a level mostly adopted for the high school students. However, the main innovative component of the applied methodology is its flexibility, which provides the best match between the different knowledge levels of high school students and their interest in specific cybersecurity topics. Cybersecurity education at all levels is still an area that needs further support as well as the application of innovative methods and flexible teaching approaches. Cybersecurity is an area with rapid and dynamic development that needs to be followed.

Recommendations

The new and modern use of tools, videos, and e-platforms prepared for teaching cybersecurity skills at the high school level enables the transfer of the necessary knowledge. It should start early in the educational process, as young people are faced with internet threats every day in their private and later in their business lives. The integration of cybersecurity and cyber safety in secondary school education will have multiple benefits; among them, it will enable more young people to pursue professional cybersecurity careers, which will reduce cyber-skill shortages among the world population and a lack of skilled labor forces. However, it should also be recognized that the introduction of cybersecurity program in the EU high schools despite of the current initiatives will require additional significant time and effort.

Abstract: In recent times, the landscape of supply chain management has undergone a profound transformation through the integration of artificial intelligence (AI). The incorporation of AI into operations aims to bolster efficiency, optimize processes, and elevate decision-making within the realm of supply chain management. A myriad of AI tools has been deployed to drive this evolution. This paper endeavors to address specific objectives, including the identification of AI technologies utilized in supply chain management, an evaluation of the revolutionary impact of AI on supply chains, an exploration of challenges associated with adopting AI technologies in supply chains, and an examination of both current and future trends in AI technologies within supply chain management. To achieve these objectives, a systematic literature review was conducted, serving as the foundation for the study framework. Journal articles and reputable search engines such as Science Direct, Google Scholar, and Masader were utilized to source previous studies on AI technologies in supply chain management. To maintain linguistic consistency, only articles written in English were considered. The anticipated results of this study aim to contribute new insights, unveil potential gaps for future research, and foster a comprehensive understanding of the role of AI in supply chain management. Subsequently, the findings will fuel a robust discussion on the transformative impact of AI on supply chain operations.

Keywords: Artificial intelligence, Supply chain management, AI and supply chain management, AI technologies.

Introduction

Artificial Intelligence (AI), as defined by [Delke et al., 2023] refers to the capacity of computers to autonomously tackle problems for which they haven't been explicitly programmed. Reference [Poumader et al., 2021] assert that AI represents a computer field where machines exhibit the ability to perform tasks traditionally

requiring human intelligence. Within supply chain management, AI contributes significantly to smart delivery and retailing [Sharma and Dash, 2022], enhancing the efficiency of information, product, and funds flows [Pulles et al., 2016]. Marketers utilize AI to gather insights into customer behavior and preferences, employing cameras in supermarkets to analyze purchasing patterns and predict future choices [Wang and Chen, 2019]. Real-time and precise forecasting in manufacturing and retailing are notably advanced through AI applications, impacting the entire supply chain system [Sharma and Dash, 2022]. Proponents of AI in supply chain management contend that it facilitates setting product/service prices, designing effective communication channels, promoting products, and providing users with memorable experiences [Sharma and Dash, 2022].

Literature Review

The Concept of AI: AI is a term broadly employed to characterize the use of diverse computer technologies capable of solving scientific and engineering problems [Helo and Hao, 2022]. Soleimani (2018) suggests that the scientific perspective on AI revolves around designing and comprehending operational environments to enable intelligent actions, akin to human intelligence. In contrast, the engineering approach to AI spans computer science and data science, requiring substantial data processing and advanced statistical methods for technical application [helo and Hao, 2022]. Davenport (2018) emphasizes the necessity for extensive data processing and cutting-edge statistical techniques for the practical implementation of AI, especially considering the dynamic technological landscape, unpredictable customer demand, globalization, and digitalization in companies.

AI Technologies: Various AI technologies find application in supply chains. Machine learning, a pivotal AI application, extends beyond data processing to handle unstructured knowledge by identifying patterns and providing feedback [Brynjolfsson and McAfee, 2017]. Artificial Neural Networks (ANN), inspired by the nervous system, leverage interconnected computer networks for learning from examples, recognizing patterns, and processing ambiguous information [Brynjolfsson and McAfee, 2017]. Robotics, an interdisciplinary field, integrates mechanical, information, and electronic engineering [8]. Evolutionary Computation (EC) employs diverse algorithms to solve problems at different levels [Helo and Hao, 2022]. Speech Processing (SP) converts speech into digital signals using digital signal processing techniques [Fu and Sun, 2018]. Expert Systems (ES) employ calculated reasoning and extensive data to solve problems, offering viable alternatives [Jarrahi, 2018]. Machine Vision (MV) recognizes objects and interprets content from images, while Natural Language Processing (NLP) extracts meaning from speech text based on semantic analysis [Davenport, 2018].

The Impact of AI on Supply Chain Management: AI's influence on supply chain management is profound, particularly in demand pattern projection and forecasting [Delke et al., 2023]. Accurate predictions enable enterprises to optimize sourcing agreements and order processing, reducing costs related to transportation, warehousing, and administration. Notable examples include the UK's National Grid using Google's 'DeepMind' to predict supply and demand variations, and the German online retailer Otto reducing inventory by 90%

through AI-driven reliable forecasting [Dash et al., 2019; Yao, 2018]. In production processes, AI optimizes assets, designs teams, and enhances system reliability [Delke et al., 2023]. Robotics, as an AI application, is extensively employed in production tasks, such as product transportation to delivery vans (Bughin et al., 2017). In marketing, AI generates content across social media channels, enabling the observation and prediction of customer buying patterns [Sharma and Dash, 2022].

Challenges in the Application of Artificial Intelligence in Supply Chain Management: [Nozari et al., 2022] acknowledge that despite the transformative impact of technology in various sectors, the realm of supply chain management faces significant hurdles. These challenges encompass cybersecurity concerns, a lack of trust in both artificial intelligence (AI) and the Internet of Things (IoT), connectivity issues, environmental risks, energy management challenges, a dearth of traceability in efficiency across different supply chain levels, insufficient digitalization, inadequate integration at all operational levels, a lack of end-to-end visibility, and the complexities associated with handling and maintaining legal contracts [Davis and deif, 2021; Fogru and Keskin, 2020; Haddouch et al., 2019; Nozari et al., 2022; Sanders et al., 2019, Sulistyowati and Purnomo, 2020].

Method

This study utilized a systematic literature review with a preference for a cross-sectional survey approach, drawing from literature published in high-impact academic journals and peer-reviewed articles. The stringent criteria of back-to-back peer reviews conducted in esteemed academic journals deemed these selected articles as the gold standard [Osobajo et al., 2022]. Employing a systematic literature review enhances the review process's quality and enables the synthesis of large datasets into manageable, informative pieces. It is recognized as a reliable and valid method for synthesizing research findings in a specific field [Kitchenham, 2007]. Initially, 55 journal articles were identified, with 20 eliminated based on abstracts. Subsequently, 16 were excluded due to dates exceeding a 10-year threshold, resulting in an initial database of 19 articles. After careful examination of abstracts, an additional 3 articles were omitted, ultimately leaving 16 articles that were less than a decade old.

Results and Discussion

Unleashing Opportunities through AI and IoT Adoption in Supply Chains

The literature analysis underscores the substantial potential for opportunities arising from the integration of AI applications and IoT in supply chains, despite the inherent challenges. Notably, in sectors such as agriculture, the advantages derived from AI applications in supply chains far outweigh the challenges encountered. There is a visionary perspective that places data and technology at the forefront of future supply chain productivity and customer satisfaction. The strategic utilization of IoT, including robotics, and AI applications proves to be exceptionally effective in capturing, storing, and distributing massive volumes of data. While it is undeniable that supply chain operations grapple with multifaceted challenges, the presence of these advanced technologies offers a promising avenue for improvement. The symbiotic integration of IoT and AI into supply chains emerges

as a transformative force that enhances overall business operations. Despite the existing hurdles, the adoption of these technologies is poised to optimize efficiency and contribute to the evolution of supply chain management into a more streamlined and resilient system. This strategic amalgamation reflects a forward-looking approach, positioning data-driven technologies as pivotal drivers for the continued success and evolution of supply chain processes.

Conclusion and Recommendations

In conclusion, the paper underscores the transformative influence of Artificial Intelligence (AI) in revolutionizing supply chain management. From enhancing demand forecasting to optimizing production processes and improving marketing strategies, AI applications demonstrate substantial benefits. The diverse array of AI technologies, ranging from machine learning to robotics, plays a pivotal role in reshaping traditional supply chain paradigms. However, the implementation of AI in supply chain management is not without its challenges, such as cybersecurity concerns, trust issues, connectivity problems, and environmental risks which pose significant hurdles. Despite these challenges, the potential for cost reduction, operational efficiency, and improved decision-making remains compelling.

The systematic literature review presented provides a comprehensive overview of the current landscape of AI in supply chain management, and continuous adaptation to the evolving technological landscape is imperative. It's imperative to offer some recommendations for the way forward:

- R1 - Addressing Ethical Implications: Companies should proactively address the ethical implications of AI in supply chain management. This involves developing responsible AI practices, ensuring transparency in decision-making algorithms, and considering the social and economic impact of AI-driven automation on the workforce.
- R2 - Continuous Monitoring of Industry Trends: Given the dynamic nature of technology, companies should engage in continuous monitoring of industry trends. Staying abreast of emerging AI technologies and their applications in supply chain management enables organizations to maintain a competitive edge and adapt to evolving challenges.
- R3 - Collaboration and Information Sharing: Industry stakeholders, including companies, researchers, and policymakers, should foster collaboration and information sharing. This can help address challenges such as cybersecurity concerns and connectivity issues that require collective efforts and shared insights to find effective solutions.
- R4 - Investment in Employee Training: As AI becomes more integrated into supply chain processes, investing in employee training becomes crucial. Ensuring that the workforce is equipped with the necessary and required skills to collaborate with AI technologies fosters a harmonious integration and helps mitigate concerns related to job displacement.

On a final note, while AI presents immense opportunities for innovation and efficiency in supply chain management, a balanced and thoughtful approach is essential. By addressing challenges, staying informed about technological advancements, and prioritizing ethical considerations, organizations can harness the full potential of AI to create resilient, adaptive, and ethically sound supply chains.

Abstract: In the post-COVID-19 and amidst the Ukraine-Russia conflict era, this article delves into the trajectory of smart energy systems, specifically focusing on the United Kingdom (UK) and Europe. The global response to the pandemic has precipitated a surge in technological integration, reshaping societal dynamics and prompting inquiries into the consequences of energy behaviour. Simultaneously, geopolitical events, notably the Ukraine-Russia conflict, have introduced new complexities to the global energy landscape. This research examines the consequences of this dual environment on the development of intelligent energy systems, investigating the possibility of a fundamental change towards enhanced surveillance, regulation, and punishment of energy consumption in the United Kingdom and Europe. Drawing on insights from Michel Foucault's theoretical framework, the research explores the nuanced interplay between technological advancements, surveillance mechanisms, and the regulatory landscape. The article examines how smart energy systems, including the widespread use of smart meters, may contribute to establishing a new order in energy governance. It investigates the extent to which such technologies may be leveraged to monitor energy practices, discipline consumption patterns, and implement sanctions as control mechanisms. Furthermore, the research considers the socio-political implications of these developments, contemplating their impact on democratic principles and community engagement in energy decision-making processes. This article enhances our understanding of the changing dynamics in energy governance after global challenges and geopolitical shifts by combining empirical research on smart energy systems and analyzing current energy policy trends in the UK and Europe.

Keywords: Smart energy systems, Privacy concerns, Technology design, Energy transition, Inclusive decision-making.

Introduction

The Russia-Ukraine conflict has significantly impacted the UK and EU energy sector, leading to a reevaluation of energy strategies. The reliance on Russian natural gas supplies and the geopolitical tensions have highlighted vulnerabilities in the energy infrastructure, necessitating a shift towards more resilient and sustainable solutions (Vivoda, 2010). Energy security has become a central concern, prompting calls for diversifying and decentralising energy sources (Selvakkumaran & Limmeechokchai, 2016). The potential disruptions in gas supplies due to the conflict have emphasized the need for smart technologies in the energy sector (Saeed et al., 2023). Smart energy systems, which integrate digital technologies and intelligent devices, offer real-time monitoring, control, and optimization of energy consumption, enhancing efficiency and mitigating vulnerabilities (Khan et al., 2020). The transition towards smart energy is a response to immediate challenges and a strategic move towards creating adaptive and sustainable energy ecosystems (Zhuang et al., 2020). The urgency for cleaner and more sustainable energy sources has accelerated efforts to integrate digital technologies and intelligent systems (Han et al., 2020). The Russia-Ukraine conflict has redirected attention to the role of smart energy as a strategic response to geopolitical uncertainties (Shen & Hong, 2023).

Integrating smart energy systems is crucial for building resilience, ensuring energy security, and mitigating the potential impacts of geopolitical disruptions (Matt et al., 2015). This transition represents a transformative moment in the energy sector, where technological innovation converges with geopolitical realities, shaping the trajectory towards a more sustainable and digitally-enabled energy future (Bican & Brem, 2020). The shift towards smart energy has the potential to reshape the energy sector's trajectory (Ma et al., 2018). It aligns with the global trend of embracing the Fourth Industrial Revolution, which emphasizes digitalization and intelligence (Bican & Brem, 2020). However, this trajectory is not without challenges. The increased demand for electrical energy, driven by digitalization, puts additional pressure on an industry already transitioning towards sustainable sources (Ma et al., 2018). The widespread adoption of smart energy systems becomes crucial to meet this demand (Sanguinetti et al., 2018). The societal dynamics and divisions exposed by the Russia-Ukraine conflict have implications for the energy transition (Lyu et al., 2022). The willingness to embrace sustainability strategies and collective measures may be challenged (Lyu et al., 2022). Understanding the motivations of individuals who resist collective actions provides insights into the complex interplay of power and knowledge (Lyu et al., 2022). The social implications of smart energy adoption require a deeper understanding of societal conditions and the compatibility of innovations with existing norms (Sanguinetti et al., 2018). As the UK and the EU navigate the post-conflict period, smart energy adoption's social and cultural dimensions come to the forefront (Prakasa et al., 2022). Digitalization experiences during the pandemic have cultivated new attitudes, values, behaviours, and routines (Matt et al., 2015). These modifications facilitate the broader dissemination of smart energy systems (Matt et al., 2015). The public's awareness of digital tools and digitalized workflows has been heightened by the pandemic (Matt et al., 2015). Individuals and communities have acquired essential digital skills and literacies, establishing the foundation for the widespread utilization of smart energy

technologies (Matt et al., 2015). The increasing availability of smart tools has resulted in a technological ecosystem corresponding to individuals' changing digital behaviours (Matt et al., 2015).

The global transition towards smart energy systems is gaining momentum, particularly in significant emitters such as Europe and the United States. The European Union's Green New Deal and the Clean Energy Package showcase a dedication to sustainable energy sources. In contrast, the United States promotes a future focused on digitalized energy and mobility. However, it is crucial to recognize the disparities in technological infrastructure and capabilities across countries. The ongoing energy transition presents an opportunity to fortify energy security and cultivate a more sustainable and socially informed energy landscape for the future. The societal divisions exposed by the pandemic underscore the challenges in achieving collective goals, emphasizing the need for a nuanced understanding of the social implications of smart energy technologies (Ma et al., 2018; Zhang et al., 2022; Parks & Wallsten, 2019). The interplay of power and knowledge in smart energy adoption raises potential risks and challenges. Understanding the motivations and behaviours of individuals who resist collective actions is essential in shaping the ongoing energy transition. Researchers must engage with these complexities and uncertainties, drawing insights from social theories and understanding societal dynamics. It is imperative to establish a structured framework of social viewpoints regarding the diffusion of smart energy systems, considering the various factors that shape the future of smart energy. This highlights the importance of engaging with social theories and understanding societal dynamics to navigate the multifaceted nature of the transition towards smart energy systems (Ma et al., 2018; Sanguinetti et al., 2018; Noppers et al., 2019; Parks & Wallsten, 2019). The Russia-Ukraine conflict has accelerated the shift towards smart energy systems in the UK and the EU, emphasizing the need for resilience and sustainability. Integrating digital technologies and intelligent systems is crucial for addressing energy security concerns.

Moreover, the future design of energy, internet, and privacy policies should be informed by a nuanced understanding of the social implications of these technologies. This underscores the significance of considering the societal implications of smart energy technologies in shaping future policies and systems (Zhang et al., 2022; Throndsen & Ryghaug, 2015). In conclusion, the transition towards smart energy systems presents opportunities and challenges. Researchers must grapple with the multifaceted nature of this transition, engaging with social theories and understanding societal dynamics. By doing so, they can contribute to fortifying energy security and cultivating a more sustainable and socially informed energy landscape for the future (Ma et al., 2018; Zhang et al., 2022; Parks & Wallsten, 2019; Throndsen & Ryghaug, 2015).

The shift toward intelligent energy systems requires thoroughly examining the social consequences, particularly concerning power and knowledge dynamics. Foucault's power/knowledge concept offers valuable insights into an energy regime that self-regulates and disciplines without explicit state control, relying on constant mutual observation to influence individuals. While this regime holds the potential to support sustainability, concerns arise regarding its influences, highlighting the necessity for critical discourse and thorough research (Heizmann & Olsson, 2015). The significance of comprehending power and knowledge dynamics and their effects on the energy transition is emphasized by the influences shaping smart energy's future after the pandemic, particularly

in light of the Russia-Ukraine conflict. This underscores the need for a structured social framework to examine various power constellations operating on multiple levels, providing a comprehensive understanding of the social dynamics involved and emphasizing the call for nuanced research and analysis (Lopes et al., 2016; Silvast et al., 2018; Kojonsaari & Palm, 2023).

Moreover, examining energy behaviours in a smart grid and the evolving representations of users in layered infrastructures shed light on policy implications and social impacts. This underscores the significance of empirical social research for the successful co-evolution of technology and behaviours, enabling smart grids to encourage active engagement by end-users (Lopes et al., 2016; Silvast et al., 2018). In conclusion, delving into the interplay of power, knowledge, and the adoption of smart energy mandates a multidisciplinary approach encompassing social implications, policy considerations, and user representations. By integrating social science research and applying Foucault's power/knowledge perspective, researchers can contribute to a nuanced comprehension of the intricate dynamics involved in the transition toward a sustainable energy future (Heizmann & Olsson, 2015; Kojonsaari & Palm, 2023). This compilation of chosen sources thoroughly comprehends the societal consequences of smart energy and the energy transition, highlighting the necessity for critical discussion, extensive investigation, and a well-organized framework of social viewpoints.

The foundation of Foucauldian perception

The COVID-19 pandemic has led to the implementation of stringent quarantine measures by various governments, particularly in the EU and the UK. These measures, reminiscent of historical instances of state-imposed quarantine, reflect the exercise of disciplinary power in society (Cohen, 2019). Foucault's analysis of the evolution of modern societies aligns with the expansion of disciplinary power, which has transitioned from overt governmental control to individuals' internalization of rules, leading to self-discipline (Peters, 2017). The exercise of authority is demonstrated in the handling of the pandemic. It is anticipated to substantially impact the future of intelligent energy, particularly within the European Union and the United Kingdom. As exemplified by Bentham's panopticon, Foucault's concept of disciplinary power has been influential in understanding modern society's power dynamics (Manley et al., 2012). The spatial intricacies of modern disciplinary power, as described by Foucault, are now commonplace within carceral studies and geographies, reflecting the enduring relevance of his work (Schliehe et al., 2022).

Furthermore, Foucault's conceptualization of surveillance within elite sports academies has been questioned using alternative surveillance networks, indicating the ongoing scholarly engagement with his ideas (Manley et al., 2012). The influence of disciplinary power extends beyond the pandemic, as evidenced by its application in analyzing the discipline suffered by women in the context of patriarchy (Liao et al., 2022). Additionally, Foucault's work has been seminal in understanding the rationality of disciplinary power, emphasizing its enduring significance in sociological discourse (Welsh, 2016). The power dynamics at play are set to significantly impact the future of smart energy in both the EU and the UK. As smart urbanism takes hold and data collected by sensors and devices shape our understanding of spaces, it becomes evident that disciplinary

power is increasingly shaping urban environments (Dalton et al., 2019). Moreover, the focus on citizen engagement in co-creating low-carbon smart cities underscores the intersection of power dynamics and sustainability efforts, highlighting the relevance of Foucault's analysis in contemporary urban development (Preston et al., 2020). In conclusion, Foucault's examination of disciplinary power provides a framework for understanding the power dynamics evident in the pandemic response and their potential impact on the future of smart energy, particularly in the EU and the UK.

The application of Foucault's concepts to the context of the EU, the UK, and the ongoing conflict between Ukraine and Russia reveals the relevance of pastoral power to the smart energy transition. As societies transition towards decentralized models, disciplinary power, embodied in governmental bodies, dictates acceptable and unacceptable behaviours. In contrast, pastoral power, governing thoughts and feelings crucial to the energy transition, gains significance (Martin & Waring, 2018). The metaphor of the panopticon, adapted from Bentham, resonates within the smart energy landscape, representing individualized-subjectivized biopolitics, where state agencies in the EU and the UK serve as overt shepherds (Waring & Latif, 2017). Nevertheless, within the realm of smart energy, the shepherd's role becomes veiled as it navigates through the collective efforts of the regime's constituents. As this process unfolds, a power vacuum emerges, filled by the "technologies of the self," leading to internal governance by individuals in the EU and the UK as central control and self-regulation converge (Waring & Latif, 2017). This evolution introduces challenges, including heightened individual pressure due to digital omnipresence and difficulties in creating regulated data protection and privacy structures. Foucault's emphasis on self-governance implies that individuals in the EU and the UK remain interconnected within broader societal governance structures despite wielding greater autonomy through smart energy technologies (Martin & Waring, 2018). The ongoing conflict between Ukraine and Russia adds complexity to the geopolitical context within which these technological and societal shifts unfold. Foucault's concepts of disciplinary power can be extended to the international realm, where states exercise influence over each other through various means, influencing the geopolitical dynamics of the conflict (Cohen, 2019). The EU and UK lessons underscore the importance of a nuanced and culturally sensitive approach to smart energy transitions within the broader international landscape. Applying a Foucauldian perspective to the conflict between Ukraine and Russia, particularly from the standpoint of the UK and the EU, allows for drawing parallels between Foucault's concepts of disciplinary power and contemporary geopolitical dynamics, extending his ideas to the international arena (Cohen, 2019).

Foucault and the Challenges of Transitioning in Energy

The Ukraine-Russia conflict has prompted the UK and the EU to employ disciplinary power at the international level through economic sanctions, diplomatic pressures, and military deployments to influence Russia's behaviour (Jabri, 2007). Jabri (2007) argues that Foucault's notion of political power reflects how governmental institutions and laws influence behaviours deemed acceptable or unacceptable globally. Additionally, the information warfare and propaganda efforts accompanying geopolitical conflicts can be viewed through the lens of pastoral power, as governments, including those of the UK and the EU, seek to shape narratives and influence

public opinion to gain international support (Tilli, 2019). The metaphor of Jeremy Bentham's panopticon for internalized surveillance extends to the surveillance and intelligence-gathering activities of states in response to geopolitical tensions (Jabri, 2007). Governments monitor foreign entities' actions and communications to ensure compliance with established norms and detect potential threats, using the panoptic gaze to enforce compliance and deter undesirable behaviours in the international arena (Jabri, 2007).

Moreover, the concept of technologies of the self, as described by Foucault, can be applied to the strategies states employ to regulate their behaviour in response to conflict (Cadman, 2010). Governments self-regulate by formulating foreign policies, alliances, and strategies aligned with their national interests, contributing to the complex web of international power relations (Cadman, 2010). In conclusion, a Foucauldian perspective sheds light on the intricate power dynamics in the Ukraine-Russia conflict from the perspective of the UK and the EU. By analyzing the deployment of disciplinary, pastoral, and automated mechanisms, one can understand how states exert influence, shape narratives, and navigate the complexities of international relations in geopolitical turmoil. The conflict between Ukraine and Russia and the crucial need for intelligent energy usage presents a complex perspective when analyzed in light of Michel Foucault's concepts of knowledge, power, and governmentality. Despite overwhelming scientific evidence and the tangible impact of climate change on global communities, a wave of scepticism still challenges established knowledge (Legg, 2018). This scepticism disregards the effects on coastal areas and ridicules policies aimed at climate protection (Bucher, 2012). The scepticism draws support from conspiracy theorists, particularly in virtual spaces, shaping discourse around topics such as gated communities (Bucher, 2012). The suggestion of compromising data privacy to optimize energy efficiency in local and wide-area energy networks will likely face opposition from those inclined toward conspiracy theories (Bucher, 2012).

Applying a Foucauldian perspective to the interplay between individual agency and smart energy technologies reveals the centrality of knowledge, power, and governmentality (Cadman, 2010). Foucault's concepts regarding knowledge, space, control, and power find relevance in understanding smart energy systems (Cadman, 2010). According to Foucault, knowledge is intrinsically linked to power, and power is manifested through technological "spaces" like smart energy systems, which have entry requirements in the form of knowledge (Cadman, 2010). This sets the stage for the development of power relations (Cadman, 2010). Foucault views knowledge as a transformative process that shapes both the subject and the object (Legg, 2018). The exercise of definitional power, determining how something is defined and by whom, becomes crucial (Legg, 2018). The pandemic has underscored the significance of controlling narratives as a primary means of exercising power and resisting such control through counter-narratives (Portschy, 2020). The reciprocity between knowledge and power is emphasized by Foucault, stating that power relations and fields of knowledge are interdependent (Legg, 2018). Discourse, serving specific interests, uses established knowledge to create norms, exemplified by the peer review process (Legg, 2018). However, in domains like climate change or public health, societal actions can evoke counter-discourses challenging mainstream knowledge (Legg, 2018). Foucault's understanding of knowledge societies as control societies, producing norms and standards through disciplinary technologies, finds resonance in the smart energy movement (Cadman, 2010). Governmentality, encompassing

various strategies of normalization flexibly applied, involves the microphysics of power (Cooper, 2019). It incorporates the relationship between power and subjectivity, linking governance techniques with self-practices, such as self-adjusting energy behavior, and political governance, with techniques of self-governance, such as activating self-motivation (Cooper, 2019). While governmentality entails constant monitoring and supervision, it paradoxically upholds individual freedom within the framework of liberalism, which organizes conditions for individual freedom with a focus on security (Cooper, 2019). In the realm of smart energy regimes, the promise of user control encounters limits when non-rational behaviour or deviations from norms occur, emphasizing the delicate balance between individual freedom and the broader societal interest (Cooper, 2019).

Foucault and the Concept of the Smart City in the Context of the Ukrainian-Russian War

The integration of networked technologies in smart cities has led to an increased focus on surveillance, control, and the politics of urban data. This has given rise to a nuanced interplay of power dynamics and the emergence of what has been termed "spatialized intelligence" (Kitchin, 2013). Existing critical urban studies research has highlighted the unequal power relationships created or reinforced through objectivist understandings of data, the troubling new form of capital that urban data extraction represents, and the obstruction of citizens' ability to participate in the city and exercise their democratic rights (Hoop et al., 2022). Furthermore, the smart city has been identified as a disciplinary strategy, re-subjectifying citizens as active participants required to achieve specific goals (Vanolo, 2013). The recognition of the importance of individual citizens' rights in the smart city, which is centred around the needs of its citizens, as well as the significance of equity, participation, and democratic principles, has been acknowledged as essential elements (Cardullo & Kitchin, 2018). Additionally, the value of adopting a Foucauldian 'archaeology of knowledge' approach has been suggested to explicate understandings and misunderstandings surrounding the idea of the 'smart city' (Wang, 2017).

Understanding the dynamics of smart cities also involves exploring knowledge management perspectives, as knowledge management is crucial for building competitive advantage and creating value propositions in this context (Israilidis et al., 2021). Moreover, enhancing citizens' sense of gain in smart cities has been studied using a SWOT-AHP-TOWS approach, which identified the essential criteria for enhancing citizens' sense of gain and the top-ranked strategy for achieving this (Li et al., 2022). Moreover, there has been a strong emphasis on the importance of provincializing smart urbanism by shifting the focus away from technology as the central point of analysis and instead prioritizing power relationships. This approach draws inspiration from post-colonial theories (Chang et al., 2020). Additionally, the shift from a human-centric to a multi-service digital (non-human) city council in smart cities has been recognized, necessitating a new business process for managing smart city (non-human) customers (Saragih et al., 2021). Finally, evaluating and applying public management service quality in smart cities based on intelligent computing has been explored, emphasizing the significance of public satisfaction with public information services in smart cities (Lu, 2023).

- In smart city studies, Foucauldian perspectives posit a "production of techno-centric rhetoric and narrative" where technological solutions subdue urban and societal problems. Three vital theoretical

concepts have been applied for concrete analyses (Trunova, O., Khodachek, I., & Khodachek, A. M. 2022).

- A reinterpretation of the panopticon: Smart technologies can implement surveillance reminiscent of the panopticon model, as they operate without the need for a guardian or overseeing authority to guarantee compliance; potential consequences are proactively expected (Sun, J., Makosa, L., Yang, J., Darlington, M., Yin, F., & Jachi, M. 2022).
- The intentional manipulation of public space, mainly through security architecture, has led to the rise of pastoral power. This power aims to influence individuals' behaviours by aligning them with digitally contextualized conditions (Lu, 2023).
- Analyzing the governance of daily life, this study explores the power dynamics revealed by automated and anticipatory governmentality. It delves into the role of smart information technologies in shaping these dynamics, particularly in the context of smart energy systems. Drawing on Foucault's differentiation between discipline and security apparatuses, the study examines the concepts of referentiality, normativity, and spatiality (Saragih et al., 2021).

The social science research extensively delves into the impact of smart energy on socio-technical environments. Scholars have scrutinized the smart city as a disciplinary strategy, focusing on the power/knowledge implications within contemporary urban spaces (Vanolo, 2013). Moreover, studies have explored smart grids in social science research, emphasizing visions, professionals, users, and smart technologies, with a geographic emphasis on Europe and the USA (Kojonsaari & Palm, 2023). Additionally, the social science literature widely discusses the potential role of households as 'co-managers' of energy in smart grids, emphasizing the collaborative aspect of energy management (Smale et al., 2018). The institutional logic approach has been applied to examine citizen participation in smart city development, providing a deeper understanding of the social construction of the smart city in specific contexts (Pansera et al., 2022). Investigation into the intersection of social practices and smart grids, particularly in the Netherlands, has focused on flexibility, grid management, and domestic consumption, shedding light on the practical implications of smart grid technologies (Smale et al., 2017). Critiques of smart city research have been presented, addressing current shortcomings and advocating for a more comprehensive interdisciplinary research agenda (Kitchin, 2014).

Furthermore, ethical dimensions of smart cities and urban science have been scrutinized, centring on instrumental rationality, privacy, datafication, dataveillance, geosurveillance, and anticipatory governance. This underscores the importance of ethical considerations in implementing innovative city technologies (Kitchin, 2016). Additionally, societal implications of cybernetic urbanism and the smart city as a specific modality of entrepreneurial urban governance have been critically analyzed, highlighting the complexities of power dynamics within smart city initiatives (Krivý, 2016). These comprehensive investigations give rise to apprehensions regarding data- and future-oriented urban methodologies, resulting in unfavourable perceptions of the smart city notion and suggestions for a more extensive interdisciplinary research plan. Nevertheless, they

also acknowledge the advantages of smart energy technologies, specifically regarding their socially advantageous implications and digital advancements for urban sustainability.

Intelligent energy systems and the impending revolution in energy

The ongoing conflict between Ukraine and Russia has led to a sense of helplessness among local communities as geopolitical forces dictate decisions (Arias et al., 2022). This sentiment is reminiscent of resistance observed in anti-war movements and is compounded by apprehensions about a surveillance society (Arias et al., 2022). The proliferation of sensors in smart devices has led to pervasive 24/7 monitoring technologies, which are ingrained in contemporary society and align with state interests (Aman et al., 2021). This has given rise to a Smart Machine Age, partly catalyzed by the ongoing conflict dynamics in Ukraine and Russia (Aman et al., 2021). The trajectory towards a Smart Machine Age is also influenced by the second energy revolution, which focuses on digitally transforming energy systems and ushering in a modern digitalization regime (Aman et al., 2021). This digitalization renders energy practices more transparent and amenable to optimization, fostering awareness that guides choices favouring climate support and energy conservation (Aman et al., 2021). Smart energy applications facilitate the connection and synchronization of diverse, decentralized energy generation, consumption, and storage systems, optimizing them for efficiency through big data management applications (Aman et al., 2021).

The logic of smart energy, viewed through the lens of Foucault, rests on a system of individualized-subjectivized disciplinary power akin to Bentham's panopticon (Arias et al., 2022). Constant energy transparency engenders mutual surveillance, rendering a central supervisory authority redundant, as individuals observe and adapt to each other's behaviour, forming a mainstream without a discernible leader or framing (Arias et al., 2022). Although smart energy systems have the potential to reduce energy costs by improving efficiency and implementing cost-reduction initiatives, they also present a privacy challenge due to the requirement to access personal data (Aman et al., 2021). Efforts to introduce smart meter infrastructures in the European Union have slowly diffused across member states. Scandinavian countries and Germany are at the forefront of pushing for a digitalized energy system (Aman et al., 2021).

In conclusion, the ongoing conflict between Ukraine and Russia has contributed to the emergence of the Smart Machine Age, characterized by the integration of sensors in smart devices and the digital transformation of energy systems. This has implications for surveillance, privacy, individualized-subjectivized disciplinary power, and the need for transparency and optimization in energy practices. Smart meters, seemingly innocuous, wield the potential to influence energy consumption in novel ways. The "energy community" concept envisions connected energy infrastructures with embedded digital applications, linking electric vehicles and appliances. This network shares real-time usage statistics across a national or international network, creating a social energy network reminiscent of a smart city, where control is maintained through continuous monitoring, comparison, and evaluation, reflecting the complex geopolitical dynamics at play in the Ukraine-Russian conflict.

Cultural Perspectives on Smart Energy Amidst the Russia-Ukraine War

The cultural differences in smart energy behaviours across European nations have significant implications, particularly in the ongoing conflict between Russia and Ukraine. The digitalization of daily life and work routines, as well as attitudes towards smart energy adoption, are shaped by cultural nuances. Scandinavian countries, known for their high levels of digitalization and transparency in energy usage, offer valuable insights into these dynamics (Nadolu & Nadolu, 2020). However, concerns about surveillance capitalism and ethical questions regarding significant data practices have been raised in these societies (Alladi et al., 2019). Often considered a pioneer in implementing smart energy technologies, Norway faces challenges where imagined experiences diverge significantly from real ones (Lunde et al., 2015). Unlike Germany, where cooperation and commitment are expected from all actor groups, Norway takes a more exclusive approach, prioritizing "greening," grid optimization, and user flexibility (Lunde et al., 2015). Even in environmentally conscious cultures, organizational conflicts can lead to scepticism and resistance among smart energy prosumers (Lunde et al., 2015).

In Finland, the proliferation of smart energy encounters active resistance stemming from disinterest and disillusionment. At the same time, Denmark witnessed criticism of implementing the National Smart Grid Strategy, with smart systems fostering a passive consumer attitude that discourages proactive prosumer behaviour (Lunde et al., 2015). Comparable challenges are evident in the Netherlands, where autonomy and privacy concerns hinder participation in emerging cooperative models (Lunde et al., 2015). Adopting smart energy solutions is further complicated by infrastructure complexities, scepticism from critical actors, and a lack of clarity regarding long-term strategies (Lunde et al., 2015). Geopolitical events, such as the Russia-Ukraine conflict, have the potential to influence the acceptance and adoption of smart energy technologies, underscoring the necessity for resilient and adaptable smart energy systems that account for the distinct cultural contexts in which they operate (Lunde et al., 2015). The emphasis on cultural differences underscores the importance of tailoring technology implementation to the diverse needs of specific communities (Lunde et al., 2015).

Balancing Act of Smart Energy Systems in Homes: Examining the Techno-Economic Advantages versus Pessimistic Perceptions

Integrating smart energy systems into households is a complex procedure shaped by factors beyond economic considerations. Unlike Germany, where cooperation and commitment are expected from all actor groups, Norway takes a more exclusive approach, prioritizing "greening," grid optimization, and user flexibility (Lunde et al., 2015). Individual characteristics such as age, openness to experience, and perceived benefits of demand flexibility further contribute to shaping attitudes towards these technologies (Dwivedi et al., 2017). The development of attitudes, from knowledge acquisition to persuasion and decision-making, is highly personalized, with acceptance contingent on various factors (Dwivedi et al., 2017). In residential contexts, individuals tend to exhibit more conservative tendencies, less impulsivity and shared responsibility. Deeply ingrained objections, personal values, identity perceptions, and situational factors all shape attitudes towards

smart energy systems (Dwivedi et al., 2017). The study of smart home energy management systems encompasses the operation of home electricity consumption devices, distributed generation systems, energy storage devices, and the charging and discharging of electric vehicles (Ma et al., 2021).

Additionally, energy-saving behaviour involving home retrofitting and financial investment in new energy efficiency technologies, such as installing home energy management systems and purchasing energy-labelled appliances, is critical in influencing the adoption of smart home energy technology (Ji & Chan, 2019). Moreover, the most influential contextual factors affecting the implementation of climate-smart technologies in agriculture include human capital, physical capital, financial capital, and social capital (Nchanji et al., 2022). Adopting climate-smart agricultural practices, such as irrigation, has been demonstrated to increase household income for farmers (Agbenyo et al., 2022). This has prompted the seed sector to introduce various varieties of climate-smart maize into the market, impacting household income among smallholder farmers (Wanjira et al., 2022). Adopting intelligent energy systems in households is a nuanced process shaped by many factors, including economic considerations, individual characteristics, contextual factors, and the perceived benefits of the technologies. A comprehensive understanding of these diverse influences is essential for successfully adopting and integrating smart energy technologies in residential settings.

Smart energy technology, notably smart meters, can revolutionize energy management by providing enhanced comfort, reduced operating costs, diminished environmental impact, and significant demand response (Chawla & Kowalska-Pyzalska, 2019). However, the societal embrace of smart meters is impacted by various psychological and structural elements, including concerns about privacy, technological characteristics, and societal expectations (Chawla & Kowalska-Pyzalska, 2019). Initiatives at augmenting acceptance through data visualization and user-friendly technologies face challenges, as adopting sustainable innovations is intricately affected by a blend of economic, environmental, and symbolic characteristics (Chawla & Kowalska-Pyzalska, 2019). Furthermore, intelligent systems can instigate household conflicts due to discrepancies in energy preferences among household members, potentially involving individuals in novel surveillance, automation, and data markets (Chawla & Kowalska-Pyzalska, 2019). Public perceptions of demand-side management and a more intelligent energy future emphasize the cost and operational benefits of innovative energy systems, particularly in automated meter readings, diminished customer inquiries, and societal gains through the reduction of carbon emissions (Spence et al., 2015). Additionally, an analysis of smart metering information systems supports the frequent issuance of improved electricity bills reporting actual consumption, which can influence consumer acceptance and interaction with smart meters (Nachreiner et al., 2015).

Exploring Gender Dynamics, Age Factors, and Smart Energy Neighborhoods in the UK, EU, Ukraine, and Russia amidst the War

The attitudes, knowledge, and preferences related to sustainability, trust, risk tolerance, and comfort in the context of the ongoing Ukraine and Russia conflict are influenced by various factors, among which gender and age are prominent. Gender, in particular, plays a significant role in shaping perceptions and behaviours towards smart energy systems (Nesti, 2019). Studies have revealed marked differences in gendered perceptions of smart

home technology preferences in the United Kingdom, indicating the need to recognize women's and men's distinct economic, social, and cultural capital (Nesti, 2019). This highlights the importance of fostering inclusive practices to create a more sustainable and equitable low-carbon energy system (Nesti, 2019). Moreover, the prospect of incorporating gender into the economy, especially in developing regions, holds significance for industries such as intelligent agriculture.

Furthermore, matters concerning bias, safeguarding personal information, and the lack of energy security in households of minority communities in the United States also have a substantial impact (Uteng & Turner, 2019). Furthermore, age is a crucial aspect influencing perceptions of smart energy systems. Younger generations, despite being digital natives, tend to critically assess smart technologies, influenced by their upbringing in a digital society with social media (Iqbal et al., 2018). Conversely, older individuals may express reservations regarding relying more on external professionals but may exhibit a heightened interest, particularly in health monitoring (Iqbal et al., 2018). The disparities associated with age become even more evident when comparing homeowners and those residing in social housing, as homeowners tend to be more sceptical about increased dependence on external experts and potential exposure of their data, reflecting a stronger sense of control over the technologies (Iqbal et al., 2018). To bridge the gaps between generations and cultivate a sense of community, smart energy neighbourhoods and communities have been developed to leverage social connections within a community to enhance collaboration towards shared goals (Iqbal et al., 2018). In conclusion, gender and age are pivotal factors that significantly impact perceptions and behaviours towards smart energy systems. Recognizing the influence of gender and age is essential for developing inclusive policies and technologies that cater to diverse preferences and contribute to a more sustainable and equitable energy system.

Envisioning Smart Communities in the UK and EU Amidst the Ukraine and Russia War: The Role of Community Energy

The conflict between Ukraine and Russia has brought to the forefront the relevance of community energy systems, particularly from the perspectives of the UK and the EU. The EU actively supports community energy systems, recognizing their potential to address high electricity costs in certain European regions (Wang et al., 2020). Smart energy systems, a key component of community energy, aim to leverage digital dynamics but face challenges in making individual energy profiles public and shareable, raising concerns about privacy and personal rights (Fang et al., 2012). The shift towards sustainable energy sources necessitates comprehensive approaches encompassing all industries and demographics. However, this transition also gives rise to apprehensions regarding privacy, cybersecurity vulnerabilities, and the welfare of users (Apanavičienė et al., 2020). Smart energy communities are envisioned as integral components of more extensive smart city networks, aiming to achieve a more participatory, fair, and democratic energy transformation. However, challenges such as the "centrality dilemma" and uncertainties about the impact of smart technologies on community cohesion exist (Saeed et al., 2023). The shift towards sustainable energy sources necessitates comprehensive approaches encompassing all industries and demographics. However, this transition also gives rise to apprehensions regarding privacy, cybersecurity vulnerabilities, and the welfare of users (Apanavičienė et al., 2020). They are

integrating smart grids and IoT results in highly dynamic and efficient energy distribution and consumption, offering potential solutions to the challenges faced by smart energy systems (Z et al., 2021).

Additionally, community energy management systems (CEMS) are crucial in providing ancillary services to energy consumers in a community, facilitating inter-community energy trade (Murakami et al., 2018). Furthermore, the development of predictive and prescriptive digital twin models, simulating future scenarios, is identified as a future tendency in the operational stage of smart building integration into smart cities (Khan et al., 2020). Advancing and implementing community energy systems and intelligent energy technologies offer the potential for a more inclusive, equitable, and democratic energy revolution. Nevertheless, tackling obstacles concerning privacy, cybersecurity, and user approval is crucial to fully unlocking these systems' benefits.

Discussing Smart Advantages and Self-Monitoring Drawbacks in the UK and EU Amidst the Ukraine and Russia War

Incorporating intelligent energy systems initiates a transformative process in behaviour through shared observation and monitoring, heightening individual pressures to adjust (Lund et al., 2017). This shift results in greater individualization and subjectivation within the evolving energy landscape as personal behaviours, practices, and lifestyles become public (Lund et al., 2017). As smart energy systems advance, traditional pastoral power structures may evolve into mutually controlling self-technologies, resembling a new manifestation of "AI power" where individuals remain gatekeepers, shaping and managing systems toward desired outcomes (Lund et al., 2017). Smart devices are widely used in all aspects of life, so it is difficult to disconnect from the grid or separate from a centralized power system. Despite the advantages of smart energy systems in promoting energy-efficient climate protection, there are lingering concerns about covert control, both by suppliers and through collective surveillance (Lund et al., 2017). It is crucial to proactively design smart systems and implement higher-level state regulations to address these challenges, highlighting the continued importance of a regulatory role akin to that of a pastor (Lund et al., 2017). The COVID-19 pandemic has impacted technology anxiety, cybersecurity, and trust in utilities, with the concept of a "smart" quarantine contributing to increased openness to smart technologies (Lund et al., 2017). However, heightened reliance on intelligent technologies raises privacy concerns within the home as a private space (Lund et al., 2017). The transition from energy feedback and dynamic pricing to a broader and more integrated approach to smart strategies, which incorporates artificial intelligence, the Internet of Things, and automation, poses specific difficulties (Yan et al., 2013). The cost of privacy control is expected to rise with increased surveillance and novel panopticon systems, particularly in vehicle automation (Yan et al., 2013).

As smart systems advance, they face various challenges due to their complex nested logic. These logics become intertwined with energy policy, resulting in materialism focused on objects. This contradiction between complexity and simplicity creates difficulties, mainly when services are marketed as being simple but end up causing complications and overload. These issues have a direct impact on resource efficiency and waste reduction. (Yan et al., 2013) Moreover, addressing significant issues associated with smart energy technologies,

such as establishing a moral programming roadmap, remains challenging (Yan et al., 2013). The future advancement of smart energy deployment raises concerns regarding energy justice as the focus on energy poverty intensifies alongside technological advancements (Sovacool et al., 2017).

A comprehensive framework is introduced to tackle social questions of power at micro, meso, and macro levels, encompassing dimensions of smart energy diffusion, modes of action, power constellations, and community solutions (Sovacool et al., 2017).

I am presenting a framework that introduces social inquiries into power dynamics within smart energy systems.

The emergence of intelligent energy systems has triggered a significant change in how personal decisions are publicly perceived, underscoring the significance of individualization and subjectivization in the future energy landscape (Tusova et al., 2019). With the increasing prominence of smart technologies, behavioural change is set in motion within the transition, leading to mutual observation and monitoring. Consequently, individuals face pressures to adapt, giving rise to the establishment of control mechanisms, discipline, and power (Renukappa et al., 2022). This transformative process prompts inquiries into the evolution of traditional control systems, potentially transforming pastoral power into a complex network of mutually controlling self-technologies (Tusova et al., 2019). The proliferation of intelligent energy systems also entails surrendering personal control, as individuals become crucial gatekeepers who can shape and oversee these systems (Tusova et al., 2019). Nevertheless, finding a harmonious equilibrium between the economic significance of data and the democratic importance of privacy continues to pose a challenge in liberal democracies.

Moreover, the interconnectivity of smart energy systems could lead to a unique manifestation of power dynamics. In this scenario, traditional power relations become indistinguishable as they blend into the dynamic nature of digital interactions among individuals (Tusova et al., 2019). This connectedness poses challenges regarding resource efficiency, waste reduction, and establishing pandemic-resilient livelihoods (Alahakoon & Yu, 2016). The impact of the COVID-19 pandemic has further influenced aspects such as technology anxiety, cybersecurity, and trust in utilities, leading to a redefinition of the home as a private space with privacy implications (Vitak et al., 2021). Users are developing practices and strategies to counteract surveillance, reflecting the spirit of counter-movements as described by Foucault (Vitak et al., 2021). The advent of intelligent energy communities brings forth the potential for novel, eco-friendly energy networks. Within these communities, individuals may find themselves subject to a higher level of collective or systemic control compared to those who are not part of such communities (Tusova et al., 2019). Smart community energy systems can foster a stronger sense of community and encourage active participation, thereby creating fresh prospects, particularly for underprivileged rural regions, to foster collaborative lifestyles and work environments (Tusova et al., 2019).

Nevertheless, addressing the significant challenges associated with smart energy technologies, including concerns about data privacy and energy justice, necessitates innovation and the development of a moral

programming roadmap (Alahakoon & Yu, 2016). The implications of smart energy systems on individual attitudes and behaviours are diverse, covering issues of control, privacy, community engagement, and resource efficiency. As the progression of smart technologies persists, it becomes increasingly crucial to proactively design smart systems and implement higher-level state regulation. This is necessary to guarantee that the advantages of technology are accessible and equitable for all individuals.

Table 1. illustrated the Modes of Action, Behavior, Interaction, Power Dynamics.

Level	Intelligent Technologies Operational Functions	Modes of Action, Behavior, Interaction, Power Dynamics	Types of Power Structures	System-Power Logic, Drivers, Motivations	Community Solutions
Level	Intelligent Systems	Ways of Operating, Conduct, Interaction, Power Relationships	Categories of Power Configurations	Logic of System-Power, Motivators, Drivers	Solutions for the Community
Micro	Intelligent Energy/Home/Mobility Technologies, such as Applications, Intelligent Meters, Intelligent Storage	Mutual Observation and Monitoring, Self-control, Anticipation of Behavior, Compliance	Technologies that Regulate Individuals: Personalized Disciplinary Power	Comparison of Data, Self-sufficiency, Self-improvement, Incentives through Benefits, IT Capabilities, Core Values	Intelligent Micro Networks, Social Applications/Media, Collaborative Solutions
Meso	Intelligent District Management, Intelligent Micro Grids, Urban or Rural Intelligent Mobility Systems	Specific System Monitoring and Control, Interaction: Feedback at the Micro Level, System Adjustments, Optimization, Feedback Control, Customer Support	Self-governance, Logic of Coordination and Configuration, Internal Iterative and Dynamic IT Processes	Connectivity, Availability, Development, Integration of Sectors, Efficiency, Optimization, User Acceptance, Simplification of Complexity, Technological Dependencies	Community Energy Systems: Intelligent Energy Neighborhoods, Community Grids, and Community Mobility Systems
Macro	Essential System Control of Energy, Mobility and Living Devices by Government or E-Commerce/IT	Development of System Design (based on Analysis of Large-scale Data), Interaction: Feedback at the	Power through Authority, Central Control, Incentive Systems, Utilization of	Standardization, Rationalization, System Efficiency, System Effectiveness, Efforts, Rebound	Collaborative Solutions through Hybrid Joint Ventures (involving Private Companies, Public Enterprises,

Level	Intelligent Technologies Operational Functions	Modes of Action, Behavior, Interaction, Power Dynamics	Types of Power Structures	System-Power Logic, Drivers, Motivations	Community Solutions
	Companies or Energy Providers	Micro/Meso Level, Reception of Information, Adaptation of System Design, Top-down Rule-making, Overall System Monitoring and Control	User Control Logic and Capabilities	Effects, Costs, Benefits, Technological Dependencies	Civil Society Associations)

Central Theme: Microscopic Dynamics

Sub-Theme: Personalized Technologies and Conduct

• **Description:** This central theme explores technologies and behaviours on a microscopic scale, concentrating on individual-centred smart energy systems. Technologies related to smart energy, home, and mobility, including applications (Apps), smart meters, and smart storage systems, are reshaping how we manage energy, optimize home functions, and revolutionize transportation. It delves into how these technologies impact individual actions and responses.

Sub-Theme: Micro-Level Power Dynamics

• **Description:** Investigating power dynamics, this sub-theme underscores mutual surveillance, self-discipline, the anticipation of behaviour, and conformity as prevalent features at the microscopic level. It discusses how individuals navigate power relationships within smart energy systems.

Sub-Theme: Self-Technologies

• **Description:** This sub-theme introduces the idea of "Technologies of the self," emphasizing the personalized and subjectivized aspects of disciplinary power. It investigates how individuals use these technologies to govern and influence their behaviours within the smart energy framework.

Sub-Theme: Data-Driven Incentives

• **Description:** This sub-theme delves into motivations and examines data-driven aspects such as comparing

data, enhancing self-efficiency, optimizing oneself, providing incentives through benefits, leveraging IT capabilities, and considering meta-values. It illuminates the underlying factors that influence individual actions in smart energy systems.

Sub-Theme: Community-Centric Resolutions

• **Description:** This sub-theme promotes the importance of community involvement and proposes solutions beyond individual efforts. It delves into the concept of Smart Micro Networks, Social Apps/Media, and Crowd Solutions as community-focused approaches at a microscopic level.

Main Theme: Mesoscopic Dynamics

Sub-Theme: Local Technologies and Interactions

• **Description:** Shifting focus to more localized technologies, this sub-theme highlights Smart District Management, Smart Micro Grids, and Urban/Rural Smart Mobility Systems. It explores how these technologies interact within specific community settings.

Sub-Theme: System Monitoring and Control

• **Description:** Examining modes of interaction, this sub-theme emphasizes specific system monitoring and control at the mesoscopic level. It explores feedback mechanisms at the microscopic level, system adaptations, optimization, and customer care within localized smart energy systems.

Sub-Theme: Governance and Coordination

• **Description:** Dieses Unterthema befasst sich mit Dynamiken der Macht, Selbstverwaltung, Organisationsstrategien und den sich ständig ändernden IT-Prozessen innerhalb von Organisationen. At mesoscopic level, it studies how these elements shape smart energy systems.

Sub-Theme: Broader Considerations and Motivations

• **Description:** This sub-theme broadens considerations to connectivity, availability, development, sector coupling, efficiency, user acceptance, complexity reduction, and technological path dependencies. It examines overarching motivations shaping the mesoscopic dynamics of smart energy systems.

Sub-Theme: Community-Centric Solutions

• **Description:** Proposing solutions at the mesoscopic level, this sub-theme advocates for Community Energy Systems, Smart Energy Neighborhoods, Community Grids, and Community Mobility Systems. It explores how localized communities can actively participate in shaping smart energy outcomes.

Main Theme: Macroscopic Dynamics

Sub-Theme: Key System Control and Management

- **Description:** Dieser Teil des Themas konzentriert sich auf wichtige Systemsteuerungen, die von Organisationen wie der Bundesregierung, E-Commerce- und IT-Unternehmen oder Energieversorgern verwaltet werden. Es untersucht, wie hochrangige Organisationen Smart Energy Systems beeinflussen und verwalten.

Sub-Theme: Top-Down Rule-Making and Design

- **Description:** Examining modes of action, this sub-theme involves creating system design through big data analysis, top-down rule-making, and overall system monitoring and control. It explores the macro-level actions that shape the entire smart energy landscape.

Sub-Theme: Overarching Power Dynamics

- **Description:** This subtopic explores fundamental dynamics of power, including pastoral power, central control, incentivization regimes, and the utilization of user control logic and opportunities. It examines the ways in which power is employed and distributed on a macro level.

Sub-Theme: System Efficiency and Optimization

- **Description:** Dieser Abschnitt konzentriert sich auf Systemlogik, Treiber und Antriebe. In addition, it addresses standardization, rationalization, system efficiency, system effectiveness, efforts, rebound effects, costs, benefits, and macro-level technological path dependencies.

Sub-Theme: Collaborative Hybrid Ventures

- **Description:** Dieses Unterthema stellt Hybrid-Joint-Venture-Projektlösungen vor, die die Zusammenarbeit zwischen privaten Unternehmen, staatlichen Unternehmen und sozialen Organisationen fördern. It explores collaborative approaches to address macro-level challenges in smart energy systems. This thematic analysis furnishes a detailed understanding of the primary themes, sub-themes, and their explanations across microscopic, mesoscopic, and macroscopic levels within smart energy systems.

Conclusion

In conclusion, navigating the intricate landscape of intelligent energy systems demands a comprehensive evaluation of their potential benefits and drawbacks. While these systems promise increased efficiency through transparency and control, they simultaneously introduce vulnerabilities akin to those observed in social networks. While providers tout enhanced freedom and self-determination, it is crucial not to overlook the

looming threats of potential data misuse and the rise of monopolistic entities. The concept of collaborative solutions involving citizens, stakeholders, and users is a positive stride toward developing user-friendly, grassroots approaches. However, inclusivity challenges emerge, with evidence indicating that more affluent individuals often dominate engagements in the energy transition. To uphold principles of just transitions and energy democracy, a paradigm shift toward inclusive decision-making processes is imperative. Failure to engage diverse segments of the population risks exacerbating inequalities, fostering resistance, breeding mistrust, and fueling movements rooted in science denial and conspiracy theories.

To foster widespread engagement, moving away from top-down policy dictation is essential. Intelligent energy policies should embrace negotiation and discourse with individuals and communities traditionally excluded from formal policymaking. Neglecting these stakeholders' interests, preferences, and concerns may provoke defiant reactions. Using platforms like citizens' councils can mitigate such risks by incorporating citizen perspectives into legislative and executive processes.

Es ist wichtig, innovative Forschungsmodelle zu verwenden, um die Vorteile, Ungleichheiten und Auswirkungen des Rückkaufs in intelligenten Energiesystemen zu bewerten. A user-centric approach to designing technology and increased citizen participation emerges as a critical strategy for navigating the complexities within integrated systems. The post-pandemic landscape introduces new challenges for energy social research, necessitating reevaluating surveillance power and including gender considerations.

The detailed framework presented in this contribution establishes a robust foundation for future research, providing insights into the unfolding power dynamics within social networks across various levels. Given the multifaceted nature of smart energy, a comprehensive exploration with detailed descriptions and analyses becomes essential. The framework highlights power dynamics as level-dependent but predominantly top-down. To understand how knowledge flows and privacy concerns are safeguarded, it is essential to understand nexus structures the interfaces between levels, systems, and actors. Despite the seamless nature of digital processes, a paradox of complexity, chaos, and data overload persists. The role of artificial intelligence in navigating this landscape and its implications for emerging pastoral power instances warrant further investigation.

A broader and deeper debate involving technology developers, policymakers, civil society, scientists, and future users is imperative. Enabling an integrative process that customizes smart energy systems according to user preferences and privacy concerns is the key to realizing the advantages of energy-efficient climate protection without compromising individual freedom to government-imposed control. This pursuit is comparable to discovering a rare chameleon in the continually changing terrain of smart energy.

Acknowledgement

The researcher would like to thank prince Muhammad bin Fahad University and the College of Business

Administration for allowing me to work on this research.

Doctors' Careers Intention and Retention: Studying the Underlying Factors in Johns Hopkins Aramco Healthcare Hospital in The Eastern Province of Saudi Arabia

Fajer Mohammed Abuflassa

Prince Muhammad bin Fahd University, Saudi Arabia

Nadia Adnan

Prince Mohammad Bin Fahad University, College of Business Administration

Abstract: Doctors' retention and career intention are consistent problems that healthcare institutions globally face. It increased during and after the COVID-19 pandemic as it caused many doctors to leave their organizations or reduce their working hours. Several studies have investigated this issue. However, there is still a lack of exploring all the related factors impacting doctors' career intention and retention within a healthcare organization, utilizing the Social Exchange Theory to study further the correlation between job satisfaction and doctors' intention & retention. This paper explored six influencing factors to determine this relationship. Results from survey data collected from doctors working in a private healthcare institution in Saudi Arabia were conducted to support the hypothesized relations. The results contributed to a deeper understanding of how and when a doctor decides on a career change or remaining in a specific organization.

Keywords: Doctors Career Intention, Doctors' Retention, Job Satisfaction, Private Healthcare Sector, Social Exchange theory

Introduction

As per the WHO Health report in 2016, a close correlation has been found between the accumulation of a qualified healthcare practitioners such as (doctors, nurses, and midwives) and significant healthcare outcomes such as immunization coverage, and maternal survival. This is because healthcare practitioners act as gatekeepers for the community and its individuals. Furthermore, in order for a healthcare organization to overcome the global shortage of healthcare practitioners' issue and develop an efficient and effective system to meet the goal demand management of healthcare organization should pay great deal of attention to the human

resources for health (HRH) practices in term of the number of the healthcare practitioners in each area and the skill mix with optimum competency and motivation.

Throughout the COVID-19 pandemic, the global faced an evident shortage of doctors; where doctors in Italy were working 100 hours per week and covering multiple areas and duties with the hospital, and that became worse when many of them got infected while taking care of their patients (J. Am. Coll Surg 2020). That severe shortage had an unfortunate effect on the population of rural areas. In addition, the Associate of American Medical Colleges (AAMC) projected that the U.S. will face a shortage of physicians between 37,800 in 2019 vs. 124,000 in 2023. On the other hand, the World Health Organization (WHO) estimated a shortage of physicians and nurses to reach up to 4.3 million, and that caused an outmatch of supply vs. the growing demand. According to Chopra, Atkins, Ranson, Bennett and Dal-Poz (2010) study, approximately 70% of healthcare resources are human. Enormous implications can result from inadequate training, recruiting or distribution of management within the healthcare organization. These concerns primarily affect the healthcare workers in rural and urban areas and between the public and private healthcare sectors. One suggestion was presented by Canavan, M., Alpern, R., E., Thompson and others in a (2013) study, where they discussed a method to reduce the shortages in the healthcare system in a medium and long-term periods through the promotion of R&D. On the other hand, both Schweitzer and Synowiec (2012) presented another solution where the role of new health informatics is essential to overcome the traditional obstacles to delivering care to all populations. An example is telemedicine technology, which helps provide more care to remote and rural areas. This also helps to resolve the shortage of coverage staff. Technology can also increase the demand for new medical specialties, enhancing the deficiency level. Further studies by Zurn, Mariio, Dal Poz, Stilwell, and Orvill in a (2004) study where they discussed the economic theory, stating that an imbalance in a skill occurs when an adequate supply of a skill is given. The workforce and the amount demanded to diverge at the existing market conditions. Another common issue between the public and private healthcare sectors is a need for more planning and management, which leads to unbalanced staffing of doctors.

This study aims to investigate and comprehend the factors impacting doctors' careers intention and retention in the private healthcare sector by examining the current state in Saudi Arabia concerning doctors' job satisfaction in private hospitals. The objectives of this thesis are:

To analyze the current literature review and examine the elements influencing doctors' careers intention and retention in the private healthcare sector in Saudi Arabia

To explore the intention of leaving an organization or changing career path

To investigate the influencing factors linked to doctors' retention and job satisfaction in an organization

Further in this thesis, the shortage of doctors in Saudi Arabia's private healthcare sector will be further investigated, while most hospitals are concerned about recruiting new physicians. Therefore, they should focus on the different strategies to retain doctors for as long as possible. The thesis will further investigate the underlying factors for doctors' intention to either leave or remain at an organization. As for the second and third objectives, a research model and survey were utilized to explore and address specific factors influencing doctors

in the Saudi private healthcare sector. Studying the factors influencing doctors' career intentions and retention in a specific healthcare institution, such as the Johns Hopkins Aramco Healthcare Hospital in the Eastern Province of Saudi Arabia, can provide valuable insights into the challenges and opportunities faced by healthcare professionals in that setting. By understanding these factors, hospitals and healthcare organizations can develop strategies to improve doctors' career satisfaction, intention to stay, and overall retention rates. Aman-Ullah, A., Aziz, A., Ibrahim, H., Mehmood, W., & Aman-Ullah, A. (2023) investigated the workload and job demands placed on doctors can help identify if excessive work hours, high patient volumes, or other factors contribute to career dissatisfaction and intention to leave. This could involve analyzing the number of hours worked, on-call duties, patient-to-doctor ratios, and the impact of these factors on work-life balance. de Guzman, A., Carver-Roberts, T., Leake, R., & Rienks, S. (2020) assessing the competitiveness of compensation packages, including salary, bonuses, benefits, and opportunities for professional development and advancement, can help determine if doctors feel adequately rewarded for their work. Comparing compensation packages with other healthcare institutions in the region could provide useful benchmarks. Younas, M., & Waseem Bari, M. (2020) explored the hospital's culture, leadership styles, and management practices can shed light on how these factors influence doctors' job satisfaction and intention to stay. Factors such as communication, autonomy, support from superiors, and opportunities for professional growth and recognition can significantly impact doctors' career decisions. Van den Borre, L., Spruyt, B., & Van Droogenbroeck, F. (2021) investigated the balance between work and personal life is crucial to understanding the factors that influence doctors' intention to continue working in a specific healthcare institution. Factors such as flexible working hours, availability of family support programs, and access to recreational facilities can affect doctors' overall satisfaction with their quality of life. Pierse, T., Morris, R., OToole, L., Kinirons, B., & Staddon, E. (2023) assessed the availability of continuing medical education programs, research opportunities, and career advancement prospects can reveal how these factors contribute to doctors' career intentions and their decision to stay or leave. The presence of mentorship programs, academic collaborations, and research infrastructure can influence doctors' professional growth and commitment to an institution. Mesha, M. D. (2023). conducting surveys or interviews to gauge doctors' overall satisfaction, engagement levels, and job motivation can provide valuable data on the factors that drive or hinder their commitment to their careers in a particular healthcare institution. Factors such as job autonomy, recognition, teamwork, and a supportive work environment can impact doctors' career intentions. Schweitzer and Synowiec (2012) stated doctors' perceptions of the hospital's work environment, including the availability of resources, quality of patient care, clinical governance, and patient safety protocols, can shed light on how these factors influence their career intentions and retention. Factors such as professional fulfillment, patient outcomes, and perceived impact on society can influence doctors' commitment to their careers. Pierse, T., Morris, R., OToole, L., Kinirons, B., & Staddon, E. (2023) explained the availability of opportunities for personal and professional growth, including specialized training, leadership development programs, and participation in conferences and workshops, can help determine if doctors feel supported and encouraged to enhance their skills and knowledge....By studying these underlying factors and their impact on doctors' career intentions and retention in the Johns Hopkins Aramco Healthcare Hospital in the Eastern Province of Saudi Arabia, healthcare administrators and policymakers can identify areas for improvement and develop strategies to enhance doctors' job satisfaction, well-being, and commitment to their careers in the institution.

Theoretical Background and Hypotheses - Doctors' Intention and Retention

Doctors' Retention

The process in which an employee is encouraged to stay in an institution for extended period of time is called *Retention* (Hom & Griffeth 1995). As stated by Dixit and Singh (2011), the different practices and strategies which cause the employee to remain in an institution for a an extended period of time can refer to as the retention process. Various theses discuss the psychological factors that might be linked to the employees' level of interest in their jobs (Rowland & Ferris, 1982). Authors Namusonge, Ng'ethe and Iravo in a (2012) study, stated that employees' retation in their job is vital, as they are the engine which can make the organization work in an immensely improved manner, achieving competitive advantage in the identified industry. On the other hand, studies showed that losing vital employees is costly to organizations in term of capital and time. In a (2009) study by Chipunza and Samuel, it was discussed the that when a high performer departure from an organization, the capacity to gain competitive advantage and gaining productive talent are lost.

Previous studies such as (Bojke, Sibbald, and Gravelle) in 2003 and (Heponiemi et al., and Kuusio et al) in 2013 reported that the intention to depart from the private healthcare sector increase with age; there are several causes for the increase in the turnover rate for doctors in the private healthcare sector in Saudi Arabia; for instance, the role of workload (Chambers, Colthart and Mckinstry (2004)), balancing work and life responsibilities, attractive compensation (Martochio, 2013), career development, and an appropriate performance appraisal system (Kuvaas, 2006). A 2011 research by Kumar and Sandhya, has categorized the strategy of retention into three stages, bottom, middle, and top stages. Starting with the bottom stage strategy which consist of the offering workplace conveniences, performance appraisal, recognizing professionalism, and provide perks and recreation. On the other hand, the middle stage consists of options for personal growth, recognition, and training and development. Finally, the top stage which is more about encouraging work & life balancing, considering employees' needs, offering a trusting environment, and lastly assigning the right person at the right role.

Doctors' Careers Intention

According to Griffeth, Hom, R. W., P. W. & Gartner, S (2000) study, they described turnover intention as the individual's willingness to voluntarily departing from an organization, which Khatri et al. (2001) linked in his research to job satisfaction and organizational commitment as the main elements that affect employees' intention to resign from an organization. According to Meyer and Tett (1993), a psychological factor is one of the leading factors to depart from the organization, which was proven during and after the COVID-19 pandemic. The increase in the turnover rate among healthcare practitioners directly affected the quality of healthcare and facility management. Several organizations are still working on surviving the impact of the COVID-19 pandemic on the healthcare industry, including patients' dissatisfaction due to managing new doctors and the departure of their long-term treating doctors.

Another side of this issue also understands what influences career choices for doctors, as the healthcare industry is consistently changing and is one of the most complicated industries across the market. Previous studies found that doctors tend to change their career choices after five years after their graduation, as the increasing demand, working hours, and changes in the work nature of the case influence them to make a career change intention. For example, a study by de Vries H, Hertogh CM et al., and Meilboom AA (2015) focused on joiner doctors in the UK and found that joiner doctors choose medical specialties with good working conditions and opportunities for better geographical location and career advancements. In Saudi Arabia in particular, a study conducted by King Abdulaziz Medical City in Riyadh focused on Saudi female doctors and the difficulty of balancing work and life, which resulted in an increased desire for Saudi female doctors to select specific specialties life (Primary Care, Internal Medicine, and Pediatric) verses decreased desire in a specialty like (Surgery and Emergency Medicine) given the long working hours and nature of work which cause difficulty to balance between life and work.

Therefore, focusing on influencing factors that impact the resignation rather than addressing the underlying reasons of the turnover rate would be more efficient. However, discovering and addressing these underlying factors and reasons take much work. In 1982 Michaels et al. created a scale for the turnover intention, later in 2014 Li et al. altered that scale in order to employ it in China to study the turnover intention of nurses. Li et al. new scale consisted of six items, stating that an employee's intention to depart an organization depend on his or her intention to explore the market for a new job or the possibility of locating a new job with better opportunities. Other studies stated that job satisfaction with its dimensions, such as work environment, compensation, training and development, and organizational support, determined turnover intention.

The Social Exchange Theory

Kelley and Thibaut developed the Social Exchange Theory (SET) 1959. The theory has been used as a conceptual base of the retention and turnover study to determine the relationship between the employee and the employer (Conway & Coyle-Shapiro 2005). This theory states that an individual receives benefits they feel required to compensate or repay by demonstrating a positive efforts or behaviors (Mossholder & Settoon & Henagan 2005). In this thesis's context, it means that depending on how the organization treat its employees, that will be directly reflected on their performance. This is also defied as the reciprocation of benefits between employee and the employer. This can refer to tangible exchange like salary and awards or intangible exchange like support and appreciation. As a result, commitment and loyalty toward the organization will increase, which will decrease the turnover rate and increase the retention rate. As per the Social Exchange Theory by Blau in 1964, adequate practices of Human Resources Management such as performance appraisal, compensation, training and development, work environment, and instrumental support should improve job satisfaction which in return enhances employee retention, in this case, an individual and organization enter into a trade of relationship in which shared benefits result in obligations to replicate to one another (Raihan, 2012). As per Jaworski's (1988), the effectiveness of several control choices may depend upon external and internal factors. This suggests the need for a moderate variable, such as job satisfaction, as suggested in this thesis. The research

model has also included the work environment variable because, as stated earlier, having a positive work environment affects career success and job satisfaction (Ng & Feldman, 2014). According to (Cai et al., Buchtel, E. E., Zhu, F., Z., & Guan, Y 2019), the more support the individual recourses from the surrounding environment, the better focus they will have on their career goals. From the previous literature review and related doctors' retention factors of training and development, performance appraisal and compensation the below research framework and model have been identified: Figure 1 identified as research model.

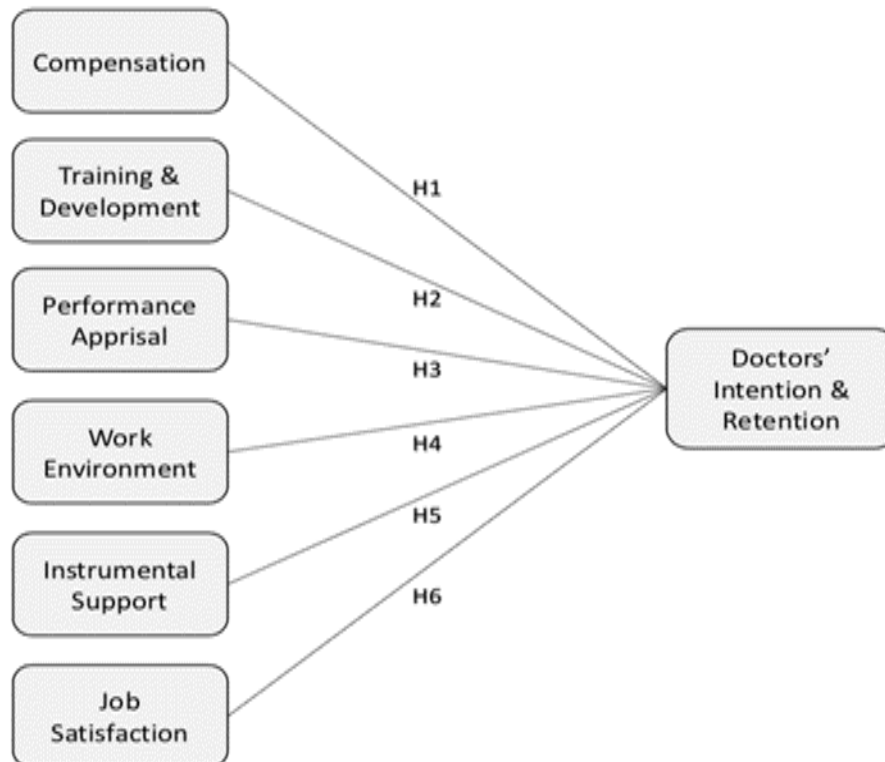

Figure 1. Research Model

Compensation

Dessler, 2005 defined compensation a system of financial payment going to employees as a result of their work toward the organization; this component is one of the main factors effecting workers' retention. According to (Bibi, Ahmad, and Majid 2016; Kumar, Mathimaran 2017; Dreher & Williams 1992), the financial payment is the crucial aspect of compensation that influence employee's attraction and retention, and it helps to decrease absenteeism. Every employee desires a compensation system that is fair and equivalent with their qualifications, experiences, and skills (Perumal, Ajgbe & Long 2012). According to Willis, Kelton, Saywell & Kiovsky (2004), direct compensation is the most critical issue in recruiting and retaining talents. It is also used as a strategy to motivate workers to enhance organizational commitment, performance, and, eventually job satisfaction. Because doctors work in the service sector, unlike the manufacturing sector, focusing on their behavior and attitude is a vital part of the organization's outcome; this means providing attractive compensation benefits to

ensure doctors' job satisfaction which leads to better service quality and eventually, patients' satisfaction. Previous studies like Kosoe (2011) investigated the influence of compensation on workers' retentions and found an important relationship between those two components. In a related study Afridi & Irshad (2007) explored the affect of compensation on workers' retentions. The results revealed a positive correlation between workers' retentions and compensation. Following the above literature review, the below hypothesis was developed:

Hypothesis 1: There is a significant correlation between compensation and doctors' retention

Training and Development

Training can be described as an activity that is organized and directed to improve workers' performance by guiding them reach level of skill or understanding by sharing information (Forgacs, 2009). Through Chipunza & Samuel 2009 study, they discovered that employees' level of organizational commitment and therefore their stay at the organization was through training and development, and that decreases the turnover rate and enhances the retention rate. Many studies showed that the more opportunities of training and development are presented to employees that will increase their satisfaction. The Social Exchange Theory (SET) also supports these results. According to Rosser (2004), Khalsa and Grace (2003) studies, training and development influence workers' job satisfaction levels, which, in return, might influence their decision to stay with the organization. Given the ever-changing medical sector, organizations must pay attention to their doctors' continued medical education, encourage it and provide as many opportunities for their learning and enhancing their skills. This can be done by offering doctors training programs within and outside the organization exposing the doctors to new cases and populations to learn from; according to Chew (2004), study in order for employees to conquer career challenges, organizations should provide training opportunities as it provide employees with the needed abilities and tools to improve their performance. Besides the fact that training and development improve employees' competency and skills (Martin, 2011), this can also affect the retention rate within the organization. According to Long and Bashir (2015) and Chung and Cave (2013, a positive relationship was found between employee retention and training as a factor.

Furthermore, Winterton (2004) study suggested that workers' retention might be negatively affected if an organization fail to provide training and development opportunities. In the contrary, Janette, Larose and Haines (2010) study discussed that providing training and development opportunities may lower workers' retentions by improving their skills, making it more appealing to continue with the organization. However, several studies still had opposing conclusions regarding the correlation between employee retention and training and development . Therefore, future investigation is needed to better identify the nature of the relationship between the two factors. Therefore, the following hypothesis was identified:

Hypothesis 2: Training and development will positively affect doctors' retention

Performance Appraisal:

Performance appraisal is the process of evaluating workers' performance on a regular basis with the purpose of improving the productivity within the organization (Raihan, 2012); implementing this system can improve and measure the performance of employees, according to Waldman, Bass, and Einstein (1987). Furthermore, organizations use this system to develop, retain, and motivate employees (Kuvaas, 2006). Moreover, from the Social Exchange Theory SET perspective, when employees understand and know that decisions are made based on a fair and structured system, this increases the desire to stay at the organization. However, developing a performance appraisal system for the doctor should be tailored to their job nature; as hospitals contain both clinical and non-clinical employees, organizations should take into consideration the doctors' working hours, shifts, patients' satisfaction rates, and the doctors' willingness to update his/her knowledge to improve their skills and keep up with the changes in the medical sector.

Jehad and Farzana (2011) stated that the development of performance appraisal process improve workers' sense of being appreciated and valued by the organization, which results in increasing the employee's retention rate and loyalty to the organization. However, Ayaz, Riaz, Sajid and Wain (2012) study stated that performance appraisal as a component did not impact workers' retentions. Similarly, Yean, Johari, Ahmed, and Adnan Yahya (2012) study discovered no remarkable correlation between performance appraisal and worker intention to remain in an organization. Given all of the above conflicts, it is still necessary to explore further and analyze the relationship between those two factors; hence, the below hypothesis was identified:

Hypothesis 3: Performance appraisal is positively associated with doctors' retention

Work Environment

The work environment is the elements which provide the surroundings for individual's jobs (Chao, 2013). It is considered one factor that impact an employee's intention to continue with an organization (Zeytinglue & Denton, 2005). According to Gunaseelan and Ollukkaran (2012), the work environment tends to positively or negatively affect specific job outcomes. Several studies by Lata and Kundu (2017), Soomro, Mangi, Abidi, Ghumro, and Jalbani (2011) studies discussed that a positive working environment, such as clean and appealing environment, motivate individuals to accomplish their tasks efficiently and effectively, that is assumed to have a significant influence on workers' retentions and organizational commitment. Similarly, Farooq et al., Akhtar, A., Naheed, K. & Akhtar (2018) found that the lack of suitable housing in rural areas contributed to the emigration of doctors from that area to more industrialized cities. Also, Shemodoe et al. (2006) study documented that settling in the community was associated with the retention of employees in that area and affected the employees' intention to leave a particular organization. The above literature review found that the working environment can be both the organization environment itself and the community surrounding the organization also has the same effect; this includes housing, schools, and other recreation facilities. Given the job nature of a doctor, and since they are very professional and experienced individuals, they will have different

expectations about the job and the working environment. Therefore, working conditions and living situations are vital factors influencing their retention and intention to leave the organization. For example, doctors working in rural areas have different relationships between them and their patients due to the limited social networking in rural areas. Following the above literature, the below hypothesis has been identified:

Hypothesis 4: A significant correlation exists between the working environment and doctors' retention

The Instrumental Support

The previous study has discussed that instrumental support experienced at the workplace positively and significantly affects employees' career success and job satisfaction (Karatepe & Olugbade, 2017). Therefore, instrumental support is considered part of social support, an essential resource for individual's personal development and growth (Kerksieck et al., 2019). Furthermore, it can be defined as the individuals' beliefs of how much their well-being is valued by their supervisors, coworkers, and the overall the organization in which they work (Eisenberger et al. (2002)). On the other hand, according to (Kahn, 2007), instrumental support relates to the tangible support from the employees' surrounding working environment. Although several studies have focused on instrumental support and its correlation on Objective Career Support (OCS), this section will focus on the correlation between Subjective Career Support (SCS) (e.g., career satisfaction, job satisfaction) and instrumental support.

According to (Florian et al., 1995) study, forming relationship in the working space supplies individuals with vital social support resources in times of stress or need, which result in increasing job satisfaction and the intention to stay within an organization. Furthermore, the more the employee feels connected, attached, and close to their working environment, the higher their contribution will be to the organization, leading to their retention (Kahn, 2007). Similarly, healthcare institutes should pay great attention to doctors' engagement within the organization. This thesis examines how instrumental support fosters doctors' retention and the influencing role of job satisfaction between the two factors. In addition, responding to arguments by (Kundi et al., 2021) states that when employees establish connections with others at the organization, the long-term results are likely to be increasing job satisfaction. Following the above literature, the below hypothesis has been identified:

Hypothesis 5: There is a positive correlation between instrumental support and doctors' retention

Job Satisfaction

Smith et al. (1969) described job satisfaction as individual feeling toward their job. On the other hand, Locke (1969) suggested that any pleasurable or positive attitude toward a job is a result of increasing job satisfaction and sense of achievement. Job satisfaction is a complicated element of various factors, as doctors can be happy about one acceptance of their job and unhappy about another aspect of the same job. For example, a doctor can be happy about his work location but not his income. A doctor's satisfaction with the job considerably enhances

the service operations and vice versa; it also affects the level of patients' satisfaction with delivering the care with quality. This is also reflected in the doctor's behavior toward their peers and the rest of the clinical and non-clinical team members, eventually increasing patient satisfaction. Therefore, any organization's success and improvement relate directly to the workers' relationship between them, as it plays a vital role that benefits the organizations and their individuals on the long run.

A significant gap is addressed in this study regarding the intention of retention literature review by exploring the role of job satisfaction, instrumental support, training & development, compensation, and performance appraisal and their effect on doctors' intention and retention in an organization. Lastly, this thesis may play a role in developing the social exchange theory by testing and framing the correlation between the abovementioned elements and SET.

Hypothesis 6: There is a positive correlation between job satisfaction and doctors' retention

Method

Sample and Procedure

The thesis data were collected over one month, starting July 1 – July 31, 2022, by utilizing a survey that was emailed to 200 doctors using Google Forms; these doctors are working in a private healthcare organization in the Eastern Province of Saudi Arabia, approval from the private healthcare organization management was taken before distributing the survey. The participants understood the purpose of the survey along with the components involved in selecting the questions; they were advised to answer the question as honestly as possible. Therefore, the two open-ended questions were kept optional to answer.

The questionnaire comprised 27 questions addressing six components: training & development, compensation, work environment, performance appraisal, instrumental support, and job satisfaction. The survey response rate was 69%, a result of 133 responses out of 200, representing a response rate of 69 %. Data were entered and processed with SPSS and Mplus software. Most of the responders were male (81% male vs. 18% female), 39% aged 50 – 60 years old vs. 34% aged between 40 – 50 years old. Most of the participants worked in the organization for 20 – 30 years; most of them are Saudis nationals working in the Eastern Province in Dhahran city. Most of the doctors in this thesis work in Surgery, Primary Care, and Internal Medicine services.

Measure:

Due to the small sample size (less than 300), Velicer and Guadagnoli (1988) theory was adopted, stating that a sample size of 100 is stable if the component pattern contains at least four variable loadings > 0.6 . All answers were rated on a 5-point Likert scale ranging from 5, "strongly agree." To 1, "strongly disagree," to (Appendix A for thesis questioner, questions from 1-22).

Compensation and Doctors' Goals

To measure compensation factor and its effect on the doctors' careers, a three-item scale was adopted. A sample item is "My work is duly awarded". Items were rated on a scale of 5-point ranging from 1 "strongly disagree" to 5 "strongly agree". The Cronbach's alpha for this scale was 0.780.

Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items

Inter-Item Correlation Matrix

	COM1	COM2	COM3
COM1	1.000	.494	.642
COM2	.494	1.000	.491
COM3	.642	.491	1.000

Training & Development

Training & development factor and its effect on the doctors' careers was measured using, a five-item scale. A sample item is "The training program at my organization help me to achieve my career goals". Items were rated on a scale of 5-point ranging from 1 "strongly disagree" to 5 "strongly agree". The Cronbach's alpha for this scale was 0.639.

Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.634	.642	5

TRN5	.132	.5551	.174	.498	1.000

Working Environment

Working environment factor and its effect on the doctors' careers was measured using, a four-item scale. A sample item is "I feel proud and engaged in the work that I do". Items were rated on a scale of 5-point ranging from 1 "strongly disagree" to 5 "strongly agree". The Cronbach's alpha for this scale was 0.825.

Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items

Analytical Strategy:

The Structural equation model (SEM) was conducted in Mplus software (version 8.8; Muthen & Muthen, 2017) in order to measure the identified hypotheses. In accordance with the previously discussed studies (e.g., Raihan, 2012), the test models were first tested prior to measuring the identified structural model. Next, the models were evaluated using the confirmatory factor analysis (CFA) and exploratory factor analysis (EFA).

Following Bentler and Hu theory developed in (1999), CFA, SEM, and EFA models were evaluated using three fit indices: minimum covariance coverage, comparative fit index, and STDYX values. In addition, values like (compensation and work environment) as predictor and values like (job satisfaction) as moderator

Results

Confirmatory Factor and Exploratory Factor Analysis

In this thesis, various testing were performed to test the discriminant reliability of the study variables. First, CFA was performed to measure the fit of the identified model. Results of the identified model indicated that the seven-factor model was as follows: minimum covariance coverage value of 0.100, STDYX values are 0.514, 0.499, 0.514, 0.519, 0.536, and 0.521 representing COM, TRN, WE, PA, IS and JS respectively. Second, exploratory factor analyses (EFA) were conducted for an array of substitute models to compare the fit of the identified model to that of competing models. Chi-squared test of model fit for the baseline mode value was 208.694, and the CFI/TLE scores were 1.000 and 1.000, respectively, indicating a good fit model. Likewise, the Standardize Root Mean Square Residual value was 0.000, which indicates a good fit model.

Estimated Sample Means

COM1	TRN1	WE1	PA1	IS1	JS1
3.252	3.481	3.519	4.053	3.707	4.001

Hypotheses Testing

Results of the identified hypotheses were demonstrated using the structural equation model. As seen in the structural equation model below, the model results are 1.00, 5.190, 1.995, 0.809, -2.343, and 32.119, representing COM, TRN, WE, PA, IS, and JS, respectively. In Hypothesis 1, it was proposed that there is a positive correlation between doctors' retention and compensation. The values were 0.0000 and 0.000, representing the Chi-Square P-value and the RMSEA value, respectively, indicating a good fit model. In Hypothesis 2, it was proposed that training and development will positively affect doctors' retention. The values were 0.0163 and 0.059, representing the Chi-Square P-value and the RMSEA value, respectively, indicating a close fit model. Providing initial support for Hypothesis 2. In Hypothesis 3, It was assumed that Performance appraisal is positively associated with doctors' retention and intention. The values were 0.4385 and 0.546, representing the Chi-Square P-value and the RMSEA value, respectively, indicating a close fit model.

In Hypothesis 4, it was stated that a positive correlation exists between the working environment and doctors' retention. From the analysis, the values were 0.0000 and 0.000, representing the Chi-Square P-value and the RMSEA value, respectively, indicating a good fit model. As for Hypothesis 5, it was proposed that There is a significant correlation between instrumental support and doctors' retention. The results show that values were 0.0000 and 0.000, representing the Chi-Square P-value and the RMSEA value, respectively, indicating a good

fit model. Finally, for Hypothesis 6, it was stated that job satisfaction positively affected doctors' retention and intention. The results demonstrated values were 0.0000 and 0.000, representing the Chi-Square P-value and the RMSEA value, respectively, indicating a good fit model.

DIR: doctors' career intention & retention COM: compensation TRN: training
WE: work environment PA: performance appraisal IS: instrumental support JS: job satisfaction

Open Ended Questions:

In this questionnaire, doctors were given two open-ended questions regarding their career intentions (Appendix A for thesis questionnaire, questions 25 & 26). A total of 74 doctors answered the open-ended questions out of 133 who responded to the questionnaire. These qualitative items were created under the final dimension of this thesis (Doctors' Careers Intentions) and analyzed using a 5-point Likert coding scheme provided in Appendix B. Each comment was then rated on scale (1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = agree, and 5 = strongly agree).

Change workplace:

Some responders expressed their plans to change their healthcare institution to either work in their private clinic or move out of the country to pursue working in a different environment with new opportunities.

Financial reward:

Some responders expressed their feeling toward the change in their contracts, including their allowances and financial rewards, to which they feel their work are not being duly rewarded. Therefore, they choose to move to another job with a better financial offer, especially with the increased workload and administrative demand.

Working environment:

Other participants expressed their feeling toward the stressful working environment, unfair treatment from their supervisor, receiving other discrimination practices, or not feeling valued overall.

Positive working environment:

Most responders have established themselves in the current healthcare institution and prefer to remain for the next three years.

Negative working environment:

On the other hand, some responders plan to leave the healthcare institution and pursue their careers either at a different organization or in a different career path.

Discussion

The thesis utilized the Social Exchange Theory while developing and testing the hypothesis by selecting six factors (performance appraisal, working environment, compensation, instrumental support, training, development, and job satisfaction) in a private healthcare sector in the Eastern Province of Saudi Arabia. Through the hypotheses, we assumed that each factor had either a significant or a positive relationship with doctors' careers intention and retention. A cross-study selected sample, the strong impact, and the correlation between the abovementioned elements and doctors' career intention and retention in the healthcare institution. In particular, compensation and work environment had the most positive feedback and responses percentage toward encouraging doctors to remain at a specific organization. On the other hand, both performance appraisal and instrumental support factors had the highest reliability score toward doctors' careers intention and retention. This supports the Social Exchange Theory (SET), referring to the benefits a person receives from someone and how they will make the person feel committed to repay and compensate through positive efforts and behaviors (Henagan, Mossholder & Settoon 2005). In this thesis's context, doctors' obligation and loyalty toward an organization depend on how their employer treats them. On the other hand, we found that performance appraisal and training & development had a moderate relationship with job satisfaction and, therefore, doctors' career intention and retention in an organization. As per the above findings, it is clear that healthcare institutions should also offer training, career development, or vocal support for healthcare institutions to retain doctors. However, they should be associated with tangible returns such as rewards, satisfactory evaluation ratings, and work-related support from materials and other resources (Montoya-Weiss et al., 2001). As well as creating a positive working climate and environment by asking for continuous feedback from doctors by utilizing employees' engagement surveys and face-to-face corresponding with the management. This will lower the

turnover rates and reduce the associated cost of hiring new employees according to J E., Colbert et al., A. E., Bono & Purvanova, R. K. in 2016 research.

As for the role of job satisfaction, this was explicitly selected because, as social beings, everyone craves the quality of relationships and environment, and the wanting to belong, (Lim, 2008). A study by (Hom and others in 2007; suggests that reducing the turnover rate could be possible by regularly observing employees' work balance and their communication with their supervisors.

Conclusion

In view of the above results, the following are several implications and recommendations for the managers leading private healthcare organizations in Saudi Arabia. In theory, several evidence has been provided in this MBA thesis of the correlation between doctors' retention and the six selected thesis components (compensation, performance appraisal, training and development, instrumental support, job satisfaction and work environment). One of the main theoretical contributions of this thesis is the introduction of job satisfaction as a moderating role with the Social Exchange Theory to explain the relationship between the selected moderating role and doctors' retention.

A 2019 paper by the Saudi Health Council focusing on the physician workforce in Saudi Arabia discussed some recommendations to increase Saudi doctors' engagement and encourage them to face the new challenges and opportunities facing the Saudi healthcare system by creating a Society of entrepreneurship centers in medicine schools and professionals' societies offering continuing medical education (CME) and establishing investments space. Similar to the American Medical Association (AMA)'s Physician Innovation Network and AngelMD (a platform for physicians to invest in health sector start-ups). Moreover, HR Department and the private healthcare organization should understand the need to provide tangible and intangible solutions and recourses to the doctors to increase their organizational commitment. Some of these practical recommendations could be; Create rewards programs to engage doctors and showcase appreciation for their achievements; managers should ensure a fair and balanced distribution of the working hours and workload between the team; HR Department should conduct regular sessions with the doctors to address their concerns and questions to make them feel involved and heard. As well as investing in the medical residents trained in the hospital and recruiting them for permanent hiring. This will provide a comprehensive supply for the hospital for a workforce resource pool and assets to build its reputation as a teaching and training hospital. On the other hand, hospital management should offer training programs abroad to improve the doctors' skills and increase their experience and innovation opportunities in several fields related to the new aspects of medicine, such as telemedicine and artificial intelligence-assisted medicine.

Furthermore, adding recreational facilities and arranged out-of-work activities and events for the doctors and their families. Also, an essential aspect of the working environment is improving the current mental healthcare

spaces and resources for doctors, especially post-COVID-19 pandemic, given the increasing demand and consistent changes in the healthcare system. In addition, hospital management should ensure that policies are established to protect doctors' rights and avoid patient abuse.

Recommendations

The thesis contains a few limitations will provide opportunities for future research. First, the result relied on only doctors' feedback to assess the factors and their relation and effect on intention and retention. It would be more beneficial in for future researchers to gather the results from multiple recourses, as this study collected the data from doctors' responses only. Second, this thesis measured the SET with job satisfaction and careers' intention. Therefore, researchers in the future should take into consideration testing the theory with other factors such as personal growth and work-life balance (Spurk et al., 2020; Kundi et al., 2014). Third, this study chose job satisfaction as a moderating role between the influencing factors and intention & retention. Hence, it would be interesting to explore other moderating factors like leadership role and organizational climate. Finally, the time frame given to distribute and review responses to the questionnaire was only one month, which affected the sample size and, accordingly, the results.

Twenty-First-Century Librarianship and The Need for Infopreneurial Content in The Library and Information Science Curriculum of a Developing Nation

Habiba Mohammed Barau

College Library Complex, Federal University of Education Kontagora, Niger State- Nigeria.

Kamaluddeen Isa El-Kalash

College Library Complex, Federal University of Education Kontagora, Niger State- Nigeria.

Abstract: We are in a rapidly evolving landscape where knowledge and information are catalysts for innovation and economic growth. However, the current Library and Information Science (LIS) curriculum has failed to equip graduates with the requisite 21st-century skills needed for innovation and self-reliance, thereby exacerbating unemployment challenges, especially in a developing nation like Nigeria. Hence, this paper highlights the critical need to instil infopreneurial content into the LIS curriculum of Nigeria, to foster creativity among the LIS students by making them identify and capitalize on information-based opportunities. In the process, an overview of 21st-century librarianship was made, Nigeria as a developing nation was discussed, the meaning and areas of infopreneurship practice were highlighted, obstacles to infopreneurial practice in developing nations were explained, and the need for increased involvement of LIS professionals in infopreneurial endeavours to enhance national development are explored. However, the paper proposed curriculum development in the LIS field, to drive innovation and concludes by emphasizing the imperative of embedding infopreneurship content into the LIS curricula as a means of advancing the employment avenues of LIS graduates in emerging nations.

Keywords: Twenty-first-century, Infopreneurship, Library and Information Science Curriculum, Developing Nations.

Introduction

In the dynamic landscape of the twenty-first century, where information ecosystems evolve rapidly, libraries stand as vital hubs for community engagement, lifelong learning, and the acquisition, organization, and transfer of knowledge for individual and economic gains. This, may not be unconnected to the fact that libraries form the

bedrock of our social and economic progress. However, the advent of the internet, which led to the proliferation of digital technologies has fundamentally transformed how information is accessed, consumed, and shared, resulting in information abundance. The development has propelled librarians and allied information professionals, especially in developed nations, to embrace the new paradigms that are evolving into the library and information science (LIS) terrain, beyond mere custodians of knowledge, to navigators of complex information landscapes.

With the nature of the changing times, one of those skill sets that are required by LIS professionals in the 21st century is that of infopreneurship. However, while a handful of developed nations have increasingly integrated infopreneurial concepts into their LIS education frameworks, developing nations like Nigeria often lag in this regard. The disparity is concerning, given the pivotal role that libraries play in facilitating access to information, promoting literacy, supporting education, and fostering socio-economic development. By implication, the failure to equip LIS professionals with the requisite infopreneurial skills risks relegating their roles to contemporary society as mere custodians of print materials and overlooking their potential as catalysts for innovation and social change. More so, graduates of the LIS profession are likely to add up to the already existing chunk of unemployed youths without entrepreneurship skills especially since the established gap within the public and private sectors cannot in any way absorb the constant stream of the products of our institutions of higher learning.

While it is common knowledge that the digital revolution has ushered in unprecedented opportunities for information access and exchange, it has also exacerbated existing disparities between developed nations and developing ones. In Nigeria for example, librarianship is facing a series of challenges that include outdated educational models, and infrastructural challenges that hinder the ability of her LIS programs to adequately prepare her graduates for the realities of the twenty-first-century markets. Against this backdrop, this paper advocates for the integration of infopreneurial content into the LIS curriculum as a means of fostering innovation, infopreneurship, and sustainable development of the country. In other words, the paper underscores the need for educational reform, to equip aspiring librarians with the skills and the necessary mindset to thrive in an increasingly digital and infopreneurial environment.

Nature of the Twenty-First Century Librarianship

The present century, also known as the 21st century is an era that is characterized by unprecedented technological advancements and the rapid proliferation of digital information, leading to the profound transformation of many fields of the human enterprise. It is the century of innovation, development and ideation (British Council, 2024). Librarianship and allied disciplines are not left out in these transformations because the once-traditional repositories of knowledge have metamorphosed into dynamic hubs of innovation, information access, and dissemination. According to El-Kalash, Mohammed and Ahmed (2017), many view the 21st century as the beginning of the knowledge age, sequel to the new patterns of work and business practices that sprang up

in the century, leading to a variety of jobs with different sets of skills being required. The authors affirmed that the century has redefined the library's role and changed the meaning of knowledge.

However, librarianship of the 21st century is beyond the provision of textual information resources to library users. It entails the provision of an array of satisfactory services that are offered to users across diverse locations, including the use of technology. Some features of 21st-century librarianship include managing digital collections alongside traditional materials and organizing and providing access to e-books, journals, and multimedia resources. It also entails the teaching of information literacy skills through workshops and one-on-one assistance, and helping the library users to navigate the digital landscape effectively. Additionally, 21st-century librarianship encompasses the integration of technology to enhance services, while engaging with communities through diverse programming, advocating for open access, and preserving cultural diversity in their collections amongst others.

Nigeria as a Developing Nation

As a country, Nigeria is a birth of an involuntary amalgamation of various ethnoreligious, geo-regional and political nationalities that occurred on January 1, 1914 (El-Kalash, Magaji and Saba, 2014). The name was suggested by British journalist Flora Shaw in the 1890s, who referred to the area as Nigeria, after the Niger River, which dominates much of the country's landscape (Dumka, n.d). Her rich natural and cultural endowment makes her a regional powerhouse in Africa (El-Kalash, Mohammed and Aniki, 2016). While Nigeria is seen as a regional powerhouse in Africa, the country is characterized by a range of weak socioeconomic factors, including lower GDP per capita, inadequate power supply, high levels of poverty, limited access to healthcare and education, environmental degradation, inadequate infrastructure, and endemic corruption. In addition, the country is experiencing food insecurity, and rapid population growth, leading to issues like overcrowding, inadequate housing, and strained public services amongst others. As such, the country is said to be a developing country.

In a statistical annexe by the Economic Analysis and Policy Division (EAPD) of the United Nations (2020), the world is divided into three categories namely; developed economies, economies in transition, and developing economies. DigitalLearning (2020) stated that the World Bank defines developing countries as the ones associated with low and middle threshold levels of Gross National Income (GNI) per capita. However, developing nations like Nigeria also possess potential for growth and development, with opportunities for investment, technological advancement, and sustainable development initiatives. The country is rich in natural resources and has a young and dynamic workforce that can be leveraged for economic progress through effective governance, investment in education and healthcare, and fostering innovation and entrepreneurship. Mamuli (2020) have argued that in developing countries education, significantly higher education is recognized as the critical force for human capital development and economic wellbeing. Higher education is held accountable for the formation of human capital through teaching and learning, disseminating knowledge, facilitating global collaborations, and fostering quality education (Sharma, Jain and Mogaji, 2020).

The Meaning and Areas of Infopreneurship Practice

The term 'infopreneurship' is unarguably an extension of two distinct fields as the term has its etymology from the words: 'information' and 'entrepreneurship' (El-Kalash, Mohammed and Aniki, 2016). The concept is an emerging business model in mainstream information practice that is profit-oriented in nature, based on a vision and passion for using the internet medium to create and or develop, package and sell quality information products and services to generate income (El-Kalash, Mohammed and Aniki, 2016). Similarly, Lahm and Stowe (2011) averred that infopreneurship entails the widespread practice of developing, selling, and (reselling) information products.

Infopreneurship practice involves the identification of information/ knowledge deficiency gaps, creating/generating factual data/ results and selling them to a target audience. Infopreneurs create value by way of channelling information resources into areas of demand for higher productivity and greater economic gains (El-Kalash and Fakandu, 2018). In the view of Chew (2010), the exciting term 'infopreneur' is becoming a hit among today's entrepreneurs who want to capitalize on the sea of opportunities available on the internet because infopreneurs explore the uncharted "blue oceans" of internet business to define their niche markets.

However, the Corporate Affairs Commission in Nigeria (2014) highlighted that some graduates from many disciplines such as library and archival / record management, computer and information and communication technology, computer science, information science, mass communication, marketing, telecommunications and publishing engage in infopreneurship practices. El-Kalash, Mohammed and Aniki (2016) outlined automation of records management systems, content analysis and development, data services like database development and support and data analysis, freelance writing, graphic designing, knowledge management consultancy, marketing of company information products, paid blogging services, project publishing consultancy, records classification and indexing, records surveying, registry systems analysis and design, web design services, amongst others as some of the activities carried out by infopreneurs.

Obstacles to Infopreneurial Practice in Developing Nations

Like many other entrepreneurial activities, infopreneurship practice is facing numerous setbacks in many developing countries, hindering the growth of information-based businesses and initiatives. Amakiri and Tاتفeng Marie (2019) highlighted some of these obstacles including the high level of illiteracy, poor internet connectivity, inadequate ICT skills, high cost of running a business, inadequate awareness of business opportunities in the information sector, and over-dependence on white-collar jobs among others.

Another issue is the associated high cost of subscription, cost of technology acquisition and maintenance amongst others, which usually restrict access for individuals and small businesses, making it very challenging for aspiring infopreneurs to access online resources, market their products or services, and engage with a global audience.

Also, regulatory and legal barriers create challenges for infopreneurial practice in developing nations. For example, complex bureaucratic processes, ambiguous intellectual property laws, and restrictive regulations on online commerce can stifle innovation and deter infopreneurial initiatives. In addition, corruption and lack of transparency in regulatory frameworks may discourage investment and business development, particularly for small-scale infopreneurs who lack the resources to navigate legal complexities.

Nonetheless, economic instability and financial constraints present significant obstacles to infopreneurship in developing nations because limited access to capital, financing, and investment opportunities constrain the growth and sustainability of information-based ventures. Moreover, fluctuating currencies, inflation, and economic volatility in many developing nations create an uncertain business environment, deterring potential infopreneurs from pursuing infopreneurial ventures and investments. To overcome these challenges, however, a comprehensive strategy that includes educational and regulatory reforms, infrastructure development, and initiatives to support economic stability entrepreneurship is needed.

The Need for Infopreneurial Content in the LIS Curriculum of Nigeria

It is an open secret that the LIS field is undergoing rapid transformation globally, driven by advancements in information and communication technologies (ICTs) and the emergence of new information ecosystems. In Nigeria, like many other developing nations, the need for a dynamic and relevant LIS curriculum that reflects these changes is increasingly apparent and a very critical area that demands inclusion is infopreneurship – the practice of creating, managing, and monetizing information-based products and services. In other words, integrating infopreneurial content into the LIS curriculum of Nigeria is undisputably very essential, to prepare the would-be graduates of the profession to thrive in the evolving information landscape and contribute to national development.

Before now, the rate of the government's over-dependence on oil revenues to fund her activities in Nigeria is next to nothing. Aigbedion and Iyayi (2007) stated that Nigeria's extreme reliance on the crude oil market has triggered structural difficulties for the economy, as earnings from crude oil fluctuate along with market trends. With the ever-increasing information and knowledge-based industries however, coupled with the growing opportunities in sectors such as digital publishing, content creation, and information brokerage amongst other infopreneurial activities, infusing an infopreneurial content into the LIS curriculum of Nigeria would equip the growing population of LIS students with the required competencies to align with current market demands and empower them on how to capitalize on emerging job opportunities or create their ventures. By implication, the over-dependence on oil and diversification into the ICT sector would certainly add to revenue generation and reduce the unemployment rate in the country. This is because infopreneurship education would foster entrepreneurial mindsets, creativity, and innovation, enabling the LIS graduates to adapt to changing market dynamics and contribute to self-reliance for economic growth.

While infopreneurship practice is a business area that leverages information resources and services to address societal needs, integrating infopreneurial content into the LIS curriculum would make graduates of the field to gain the knowledge and skills to identify information gaps, develop innovative solutions, and create value-added information products and services to the society especially because infopreneurship is an ICT-driven field and according to Leadership Newspapers (2023), the ICT sector in Nigeria has contributed 15.97 per cent to the country's real Gross Domestic Product (GDP) in Q3 of year 2023. The ICT sector comprises the four activities of Telecommunications and Information Services; Publishing; Motion Picture, Sound Recording, and Music Production; and Broadcasting (Leadership Newspapers, 2023).

However, infopreneurial practice requires proficiency in information management, digital technologies, marketing, and business development. By incorporating infopreneurial content into the curriculum, LIS programs can broaden students' skill sets beyond traditional library functions to encompass digital content creation, intellectual property management, online publishing, and digital marketing strategies. This holistic approach would equip the LIS graduates with the multidisciplinary competencies that are needed to navigate the complexities of the digital age and to succeed in diverse information-based professions. In addition, infopreneurship education would instil entrepreneurial leadership qualities, such as resilience, adaptability, and strategic thinking, which are essential requirements for driving organizational innovation and sustainability.

Nonetheless, it can be summed up that the urgency of addressing this educational gap is underscored by several factors including the exponential growth of digital information that necessitates librarians to navigate, evaluate, and leverage diverse information sources effectively; the democratization of knowledge, which requires librarians to curate and disseminate information in ways that are accessible, inclusive, and culturally relevant; and, the emergence of new technologies and information platforms, which requires librarians to harness those tools that can enhance library services and outreach efforts. With the above imperatives, it is pertinent to note that a holistic reimagining of the LIS curriculum to incorporate infopreneurial content becomes imminent, especially in developing nations and the content of such a curriculum should encompass topics that include digital literacy, information entrepreneurship, intellectual property rights, data management, user experience design, and emerging technologies among others.

We believe that by collectively advocating for curriculum reform and investing in the professional development of LIS professionals, we can chart a course towards a future where libraries serve not only as repositories of knowledge but also as dynamic hubs of innovation, empowerment, and social rebirth for the collective advancement of developing economies.

Conclusion

On a conclusive note, the integration of infopreneurial content into the LIS curriculum of a developing nation like Nigeria is highly imperative especially because equipping future information professionals with certain

business skills and mindsets are sure way to drive innovation, reduce the unemployment rate in the country and contribute meaningfully to national development agendas. By implication, practising infopreneurship ensures that LIS education remains relevant and responsive to the dynamic needs of the ever-evolving world of the 21st-century economy.

Recommendations

Based on the arguments raised for the need for infopreneurial content in the LIS curriculum of developing countries like Nigeria, the following recommendations are proposed:

- LIS schools should update their curriculum content to encompass infopreneurship skills and competencies.
- Governments, international organizations, and civil society stakeholders should work hands-in-gloves to ensure that a reliable, fast and cheap internet infrastructure is available to all in developing nations.
- Governments at all levels of the educational sphere should ensure that our institutions of higher learning are adequately structured and equipped with modern facilities. By so doing, enrolment rates into those schools are likely to increase, thereby facilitating the enrolment figures of those who would want to venture into infopreneurship activities.
- Public and private institutions of higher learning should work out plans to enhance vocational training and also, encourage private business initiatives, to reduce the unemployment levels of the developing nations.
- To encourage self-reliance, regulatory procedures should be expedited, to encourage people to have much interest in the private sector.
- Start-up capital should be provided to the unemployed LIS graduates to serve as a motivator that would boost their interest in venturing into infopreneurial practices.

By addressing these challenges, developing nations can unlock the potential of infopreneurship as a driver of economic growth, innovation, and sustainable development.

Yasmany García-Ramírez

Universidad Técnica Particular de Loja, Ecuador,  <https://orcid.org/0000-0002-0250-5155>

Abstract: This study investigates the integration of AI tools, ChatGPT 3.5 and Bard (now Gemini), in the education of civil engineering students specializing in pavement design. Two groups, totaling sixty-eight undergraduate students (Group A= 28, Group B=40), enrolled in the Pavement Design course at UTPL from October 2023 to February 2024, participated. They were tasked with generating prompts covering various pavement design topics. These included Traffic, Subgrade Characteristics, Asphalt Materials, AASHTO-Flexible Design, AASHTO-Rigid Design, Interlocking Concrete Pavements Design, International Roughness Index (IRI), and Construction Systems on Pavements. Students then assessed AI-generated responses using a predefined grading scale. The results revealed Bard achieved a higher approval rate of 71.1% compared to ChatGPT's 48.5%. ChatGPT 3.5 would not meet the passing threshold for certain topics, such as AASHTO-Flexible Design, AASHTO-Rigid Design, and IRI. In contrast, Bard consistently achieved higher approval rates across all assessed topics. Students acknowledged the AI tools' significant contribution to a deeper understanding of the course material. This integration positively influenced civil engineering students' learning outcomes, highlighting the evolving role of AI in education and encouraging further exploration in academia.

Keywords: Artificial Intelligence in Education, Pavement Design Curriculum, ChatGPT, Bard, Civil Engineering Learning Experience.

Introduction

In recent years, the field of artificial intelligence (AI) has experienced unprecedented growth, marked by significant technological advancements and diverse applications. Intelligent sensing, a prominent facet combining AI with smart sensors, has garnered considerable attention for its autonomous decision-making capabilities across various domains (Sharma et al., 2022). Notably, AI techniques, especially in deep learning

and reinforcement learning, have undergone substantial advancements. This progress has resulted in the creation of more efficient and accurate systems, notably in areas such as computer vision, natural language processing, and autonomous systems (Samara, 2022). The advent of AI-generated content, exemplified by models like ChatGPT, has emerged as a focal point. These models aim to streamline and democratize content creation processes, contributing to increased efficiency and accessibility (Cao et al., 2023). Furthermore, the rise of Green AI has become a noteworthy trend, focusing on the environmental sustainability of AI models. This subfield has witnessed a surge in research interest and publications since 2020, highlighting a growing emphasis on eco-friendly AI practices (Verdecchia et al., 2023). These dynamic developments underscore the rapid progress and diverse applications of AI, with implications reaching various sectors.

Artificial intelligence (AI) has showcased its versatile capabilities in various domains, illustrating its potential to redefine conventional practices. In the medical field, AI has demonstrated notable achievements, as seen in a study where an AI candidate achieved an average accuracy of 79.5% and successfully passed two out of ten mock radiology examinations (Shelmerdine et al., 2022). Furthermore, AI-assisted tools have exhibited superiority over traditional clinical care in 77% of randomized controlled trials, with 70% of these studies reporting enhanced clinical outcomes (Lam et al., 2022). In systematic reviews, an AI tool has proven to be on par with human assessors in accurately identifying eligible references, showcasing the reliability of AI in information synthesis (Burns et al., 2021). Beyond healthcare, ChatGPT has showcased its prowess by outperforming undergraduate students in an anatomy course, highlighting its potential as an effective educational tool in higher education contexts (Talan & Kalinkara, 2023). AI's reach extends to complex problem-solving scenarios, as evidenced by tools like Larch Prover, capable of tackling challenging problems, including entrance exams at top universities, a feat beyond human capability (Jaishy et al., 2016). However, despite these interventions, there remains a noticeable gap in AI studies within the engineering field, particularly in civil engineering. This underscores the need for exploration and research in applying AI to engineering disciplines for comprehensive advancements.

The utilization of AI in engineering education is a burgeoning area, aiming to enhance students' grasp of practical applications and intricate problem-solving. Studies emphasize AI's potential for improving learning outcomes in engineering and computer science education, employing various methods like curriculum integration, online courses, tutoring systems, blended learning, and industry collaboration (Pillay et al., 2018). In software engineering practices, the integration of AI into IT student education consistently produces graduates showcasing the symbiotic relationship between AI and software engineering, yielding functional research tools (Kalles, 2016). The training of specialists in transport construction not only forms essential competencies but also addresses new relevant skills required for professionals amid the widespread adoption of AI (Levin et al., 2022). The inclusion of AI content in professional courses contributes to a profound understanding of civil engineering projects and the application of mechanical equipment in educational settings, providing a comprehensive approach to learning (Xie et al., 2020). Collectively, these studies highlight AI's potential to enrich engineering education by offering practical applications and enhancing overall learning outcomes.

The integration of AI into engineering education brings forth opportunities and challenges. Privacy, security, and potential bias concerns must be effectively addressed (Harry, 2023). A balanced approach is essential, ensuring that AI enhances learning without replacing human instructors, with a focus on maximizing benefits for all students, including those with special educational needs (Reiss, 2021). There is a potential downside as AI might inadvertently diminish analytical skills and encourage misconduct (Grassini, 2023). Despite their popularity, AI language tools like ChatGPT have encountered technical issues, emphasizing the necessity for ongoing development and improvement (Boschee, 2023).

Despite existing extensive literature, it is evident that more applications in education are needed to comprehend the utilization and potential challenges of AI, particularly in the field of civil engineering. This study seeks to fill this gap by investigating the transformative potential of AI, such as Bard (now called Gemini) (Google, 2023) and ChatGPT 3.5 (OpenAI, 2023), integration in the education of civil engineering students, focusing on pavement design. The utilization of Bard and ChatGPT 3.5 is imperative, as they have transformed learning through personalized and interactive experiences (Riyaz & Salim, 2023). Studying pavements is crucial for infrastructure development, ensuring safety, minimizing economic costs, addressing environmental considerations, fostering innovation in civil engineering, promoting sustainability, ensuring long-term durability, influencing urban planning, prioritizing user experience, and integrating evolving technologies such as artificial intelligence. The primary contribution of this article lies in its exploration of the transformative potential of integrating artificial intelligence (AI) in the education of civil engineering students specializing in pavement design. This research aims to address the existing gap in literature by investigating the practical applications and potential challenges of AI in civil engineering education, offering valuable insights into the evolving role of AI in enhancing the learning outcomes of students in this specialized field.

Method

Participant selection

Two cohorts of undergraduate students from Universidad Técnica Particular de Loja (UTPL) were chosen as participants in this study. Both cohorts actively engaged in the academic period spanning from October 2023 to February 2024. The total number of participants reached sixty eight, all of whom were pursuing studies in civil engineering and specifically enrolled in the Pavement Design course. Among these participants, 19% identified as female, while 81% identified as male. The Pavement Design course comprehensively covered vital aspects of pavement design, aligning with the core focus of this study. All participants opted into the research voluntarily, underlining a self-selecting and motivated sample.

AI tool selection

ChatGPT 3.5 and Bard were selected for their advanced natural language processing capabilities and accessibility, being free to use. Developed by OpenAI, ChatGPT 3.5 excels in generating coherent responses to

complex prompts. Bard is renowned for its proficiency in authorship recognition and detection. This deliberate selection ensures a comprehensive analysis, leveraging the distinct strengths of each tool, for a thorough evaluation of their performance in addressing a diverse range of challenges within the context of pavement design.

Task assignment

Each student group was assigned the task of crafting prompts that delved into various aspects of pavement design. These prompts were instrumental as inputs for the AI tools, forming the foundation for evaluating their responses across a broad spectrum of challenges within the field. The overarching objective was to cover a comprehensive range of challenges and intricacies inherent in pavement design.

The prompts encompassed a diverse array of pavement design topics, including Traffic, Subgrade Characteristics, Asphalt Materials, AASHTO-Flexible Design, AASHTO-Rigid Design, Interlocking concrete pavements Design, International Roughness Index (IRI), and Construction Systems on Pavements. To establish a reference and contrast knowledge for each topic, relevant literature was provided, meticulously detailed in Table 1. In Table 1, it is highlighted that for each topic, students were required to pose four questions, except for the Interlocking concrete pavements design topic, where they asked only two questions. This intentional variation in question quantity aimed to tailor the assessment approach to the specificity of each topic. The thoughtful selection of these topics aimed to ensure a well-rounded evaluation of the AI tools' capabilities, offering insights into their performance across different facets of pavement design. The deliberate inclusion of a diverse range of topics served the purpose of challenging the AI tools and evaluating their adaptability to various dimensions of pavement design. This deliberate diversity was crucial for ensuring a robust assessment of the AI tools' effectiveness in handling a broad spectrum of subjects within the field.

Table 1. Literature References and Question Requirements for Pavement Design Topics

Topic	Literature reference	N° questions asked to AI
Traffic study	Pavimentos: fundamentos, estudios básicos y diseño (Montejo, 2010)	4
Subgrade characteristics	Pavimentos: fundamentos, estudios básicos y diseño (Montejo, 2010)	4
Asphalt Materials	Pavimentos: Materiales, construcción y diseño (Reyes & Rondón, 2015)	4
AASHTO-Flexible design	Pavimentos: fundamentos, estudios básicos y diseño (Montejo, 2010)	4
AASHTO-Rigid design	Pavimentos: fundamentos, estudios básicos y diseño (Montejo, 2010)	4

Interlocking concrete pavement Design	Structural Design of Interlocking Concrete Pavement for Roads and Parking Lots (Tech. Spec. No. 4) (Interlocking Concrete Pavement Institute (ICPI), 1995)	2
International Roughness Index (IRI)	Aspectos y consideraciones en el cálculo del índice de regularidad internacional (IRI) (Vargas, 2010)	4
Construction Systems	Pocket book for road construction equipment (Indian Roads Congress, 2018)	4

Students were instructed to formulate a single prompt following the structure "Act as an expert on" + "Provide a short and concise answer about" + Topic. For example, a prompt could be "Act as an expert civil engineer on roads and pavements, and give a brief and precise answer about what existing traffic is." This prompt was to be initiated in a separate chat to ensure the AI had no access to previous knowledge or response history. Furthermore, each chat was limited to a single question, with no provision for follow-up inquiries.

Evaluation process

The evaluation process utilized a predefined grading scale, referencing literature provided in Table 1. Correct responses were awarded a score of 1, vague responses received a score of 0.5, and incorrect answers were assigned a score of 0. This standardized scale facilitated a quantifiable assessment of the AI-generated responses. The scoring system aimed to differentiate between accurate, partially correct, and incorrect responses, offering a nuanced evaluation of the AI tools' performance. Across all eight topics, encompassing 30 questions in total, the maximum achievable score was 30 points. This scoring mechanism ensured a comprehensive and standardized evaluation of the AI tools' effectiveness in addressing the varied challenges presented in the prompts.

Data collection timeline

Students interacted with both AI tools throughout the entire academic periods of October 2023 and February 2024. The data collection process was strategically synchronized with the syllabus of the Structural Pavement Design course. Prompts were distributed at intervals aligned with the course modules, ensuring that students engaged with the AI tools in a timely and relevant manner corresponding to their ongoing coursework.

Data Analysis and Interpretation

Descriptive Statistics Analysis

A comprehensive analysis of AI-generated grades was undertaken to evaluate student performance and perceptions. Students, willingly participating, shared their AI grades with the instructor, facilitating the generation of detailed descriptive statistics. This encompassed mean scores, standard deviation, minimum,

maximum, and quartiles for both ChatGPT 3.5 and Bard. The breakdown aimed to provide a nuanced understanding of student interactions with AI tools.

Approval Rate Visualization

To complement the quantitative analysis, a scatterplot was created to visually represent the distribution of assigned grades. This plot incorporated a reference line set at 70% of the grade, aiding in the identification of pass or fail status. The visual representation enhances the understanding of how ChatGPT and Bard perform in terms of test approvals.

Post-Semester Surveys

Surveys conducted at the end of the semester yielded valuable insights into students' perceptions of AI tools in the Pavements course. They were prompted to rate their familiarity with AI tools before and after usage on a scale of 1 to 10, where 1 indicated very little familiarity, and 10 denoted expertise. Additionally, opinions on the usefulness of AI in their learning were collected, utilizing response options ranging from Very useful to Not at all useful. A query aimed to measure the impact of AI integration on their understanding and reinforcement of concepts, using a scale from 1 to 10. Moreover, students were asked about their willingness to recommend the continued use of AI tools in future Pavements courses. Finally, they were encouraged to provide additional suggestions or comments to enhance the implementation of ChatGPT and Bard in Pavements teaching.

Results

Descriptive Statistics for AI Tools

Students shared their AI's grades with the instructor, facilitating a detailed analysis through descriptive statistics for each AI tool, as outlined in Table 2. It is important to note that this table encompasses the entire sample, including both student groups. The tabulated data reveals that, on average, Bard received a higher score compared to ChatGPT 3.5. It's worth noting that both tools exhibit identical maximum and minimum values, underscoring that the distinction lies in intermediate metrics like Q1, median, and Q3, where Bard demonstrates a slightly higher value. This insight offers a nuanced understanding of the comparative performance of ChatGPT 3.5 and Bard, derived from the assessments provided by the students.

Table 2. Descriptive Statistics of Student Grades for ChatGPT 3.5 and Bard

Variables	N	Mean	StDev	Minimum	Q1	Median	Q3	Maximum
ChatGPT 3.5	68	20.90	3.65	12.50	18.00	20.50	24.38	28.50
Bard	68	22.01	3.78	12.50	19.50	22.50	25.00	28.50

Figure 1 presents a scatterplot illustrating the distribution of all assigned grades. For reference, a line is drawn at

70% of the grade (equivalent to 21 points), aiding in discerning pass or fail status for exams. By using this reference line, it becomes evident that ChatGPT would pass 48.5% of the tests related to the topics asked, while Bard would attain a higher approval rate of 71.1%. This visual representation provides a clear understanding of the comparative performance of ChatGPT and Bard concerning test approvals.

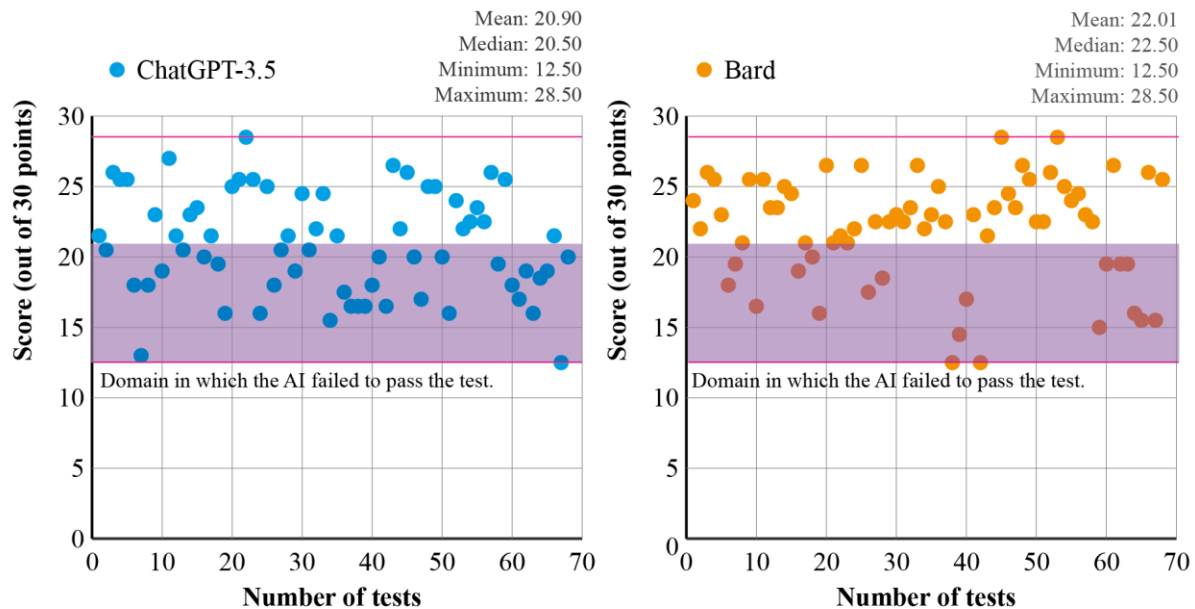

Figure 1. Scatterplot of Assigned Grades and Approval Rates for ChatGPT and Bard

Figure 2. Comparison of Average Scores and Approval Percentages for AI Tools in Various Pavement Design Topics

To conduct a more in-depth analysis of the outcomes presented in Figure 1, a bar chart (Figure 2) was generated,

illustrating the average scores for each topic and AI tool. These scores were subsequently converted into percentages. Figure 2 highlights that, on average, the scores attained by ChatGPT 3.5 would not meet the passing threshold for certain topics: AASHTO-Flexible Design, AASHTO-Rigid Design, and International Roughness Index (IRI). Conversely, Bard demonstrated passing scores in nearly all topics, with the exception of AASHTO-Rigid Design. Proportionally, Bard outperformed ChatGPT 3.5 by more than 10% in AASHTO-Flexible Design, AASHTO-Rigid Design, and IRI—these being the topics where ChatGPT 3.5 scored the lowest. Notably, ChatGPT 3.5 surpassed Bard only in the Interlocking Concrete Pavement topic. Additionally, to provide context for the previous findings, Figure 2 incorporates a table presenting the approval percentages for each individual result. ChatGPT achieved an average approval percentage of 58% (ranging from 40% to 78%), while Bard garnered an approval rating of 64% (with a range of 53% to 76%), indicating that Bard consistently achieved higher approval rates across the assessed topics.

Survey Response Summary

At the conclusion of the semester, students were surveyed to gauge their perception of using AI in the Pavements course. Initially, 72.4% rated their familiarity with ChatGPT 3.5 and Bard as 7 or above, a percentage that increased to 97% after consistent use throughout the semester. Regarding utility, 36.2% considered the tools very useful, while 58% found them useful. In terms of the impact on their understanding and reinforcement of concepts in the Pavements course (on a scale from 1 to 10), 40.6% gave a rating of 8, 24.6% gave a rating of 9, and 11.6% gave a rating of 10, indicating a positive impact on student learning. Concerning recommendations, 97.1% would suggest the use of AI tools in future Pavements courses. Finally, students shared comments and suggestions based on their experiences.

- **Integration of More AIs:** Some students suggested integrating more AI models to compare their accuracy. Some students suggested implementing another AI model, such as Llama2, for potentially better accuracy. This indicates a desire for a broader evaluation of AI tools and potentially exploring multiple AI solutions for a more comprehensive understanding.
- **Application of Emerging AI:** Students recommended applying newly emerging AI to assess its effectiveness. This reflects an interest in staying updated with the latest advancements in AI technology and exploring their potential contributions to education.
- **Challenges with AI Responses:** Students expressed challenges with both ChatGPT and Bard. They noted that ChatGPT had a lower pass rate while Bard had a higher pass rate. Additionally, concerns were raised about Bard's responses being lengthy, potentially causing confusion for beginners.
- **Use for Doubt Reinforcement:** Some students highlighted the utility of AI tools for reinforcing doubts within the class. This suggests that they see AI as a valuable resource for addressing specific questions and clarifying concepts.
- **Importance of Well-Formulated Prompts:** Several students emphasized the significance of formulating good prompts for AI to provide accurate responses. This highlights the importance of

guiding students in creating effective queries to optimize AI engagement.

- **Diverse Topics for AI Evaluation:** The inclusion of diverse pavement design topics for AI evaluation was acknowledged. Students appreciated the range of subjects, which allowed for a comprehensive assessment of AI tools' capabilities across various facets of pavement design.
- **Efficiency and Learning Impact:** Students generally viewed ChatGPT and Bard as efficient tools for learning. They recognized the positive impact of these AI tools on their understanding of the subject matter.
- **Interactive and Practical Elements:** A suggestion was made to include interactive practical exercises and relevant case studies to further enhance the learning experience. This indicates a desire for a more dynamic and hands-on approach to learning with AI tools.
- **Consideration of AI Limitations:** Some students advised considering the limitations of AI and being cautious with certain types of questions, such as true or false, where AI tools might have more challenges.

In summary, the students' suggestions highlight a keen interest in exploring and maximizing the potential of AI in the educational context. They recognize the benefits of AI tools while also providing constructive feedback for improvement, emphasizing the importance of diverse topics, well-formulated prompts, and consideration of AI limitations.

Discussion

The study investigates the transformative potential of integrating artificial intelligence (AI), specifically ChatGPT 3.5 and Bard, into the education of civil engineering students specializing in pavement design. The research aims to enhance the learning experience by assessing the efficacy of AI responses as supplementary tools within the pavement design curriculum. Two groups of sixty-eight undergraduate students (A= 28, B=40), participating in the Structural Pavement Design course, were tasked with generating prompts covering diverse pavement design topics. The AI-generated responses were evaluated using a predefined grading scale.

The study reports similar responses from ChatGPT 3.5 and Bard, with Bard receiving slightly higher ratings. : ChatGPT 3.5 achieved a 48.5% pass rate on the pavements exam, while Bard achieved a higher 72.1% pass rate. According to the previous results, ChatGPT 3.5 and Bard demonstrated similar performance in certain tasks, such as recipe adaptation and recipe detailing, while ChatGPT 3.5 outperformed Bard in recipe correction (Degerli & Tatlisu, 2023). In other domains, such as news fact-checking, both models showed moderate proficiency, with ChatGPT 4.0 slightly outperforming Bard (Caramancion, 2023). In health literacy, ChatGPT 3.5 and ChatGPT 4 produced responses at lower reading grade levels compared to Bard and Bing, which tended to produce responses at higher reading grade levels (Amin et al., 2023). In a multiple-choice question examination in endocrinology, diabetes, and diabetes technology, ChatGPT obtained slightly more marks than Bard, but both did not achieve satisfactory scores (Meo et al., 2023).

The integration of ChatGPT 3.5 and Bard as educational supplements positively influenced the learning outcomes of civil engineering students. Students perceived a significant contribution to a deeper understanding of the course material through the use of AI tools. A study comparing GenAIbots (including ChatGPT-3.5 and Bard) found that these tools functioned as agents-to-think-with, fostering critical thinking, problem-solving, and subject-matter knowledge (Thanh et al., 2023).

Another study assessed the capabilities of generative AI tools, including ChatGPT-4, and found that they perform well at lower levels of Bloom's taxonomy while maintaining a decent level of performance at higher levels, with "create" being the weakest level of performance (Santos, 2023). It is essential to consider the student's current understanding and the need for human intervention in AI-assisted learning (Thanh et al., 2023).

A positive impact on the understanding and reinforcement of concepts in the Pavements course was reported by students, with ratings ranging from 8 to 10 on a scale of 1 to 10. Also, 94.2% of students found ChatGPT and Bard either very useful or useful in their learning process. AI has been shown to positively impact the understanding and reinforcement of concepts in various educational fields, including mathematics, computer science, and language learning. For example, the use of AI-based learning materials in Calculus II improved students' conceptual understanding in Informatics Engineering (Anggraini et al., 2020).

ChatGPT has been found to enhance students' attitudes towards learning and develop their skills in computer science and IT (Sakib et al., 2023). Additionally, AI-driven adaptive learning systems have been shown to raise student engagement and academic performance in high school computer science curricula (Ezzaim et al., 2024). Overall, AI technologies have the potential to transform education by providing personalized learning experiences and improving students' understanding and motivation in various subjects.

In conclusion, a noteworthy 97.1% of students express a positive inclination towards recommending the ongoing utilization of AI tools in forthcoming Pavements courses. This consensus aligns with the perceived benefits reported in the current study. However, it's essential to acknowledge that the broader landscape of opinions on the integration of AI tools in education varies. A 2023 study focusing on introductory programming instructors revealed a divergence of opinions. One faction advocates for the exclusion of AI coding tools, emphasizing the continued teaching of programming fundamentals.

On the other side, there is a perspective favoring the integration of AI tools into courses, aiming to equip students with skills relevant to future job requirements (Lau & Guo, 2023). Another study conducted in the same year delves into the impact of AI tools on the student experience in programming courses. While recognizing significant potential benefits for students, the study underscores the need for further research to comprehensively understand the effects of these AI tools on students' learning capabilities (Maher et al., 2023). These varied perspectives highlight the ongoing discourse within the educational community regarding the optimal integration of AI tools, emphasizing the importance of a nuanced and context-specific approach.

Conclusion

In conclusion, this study underscores the positive influence of integrating ChatGPT 3.5 and Bard in the education of civil engineering students with a focus on pavement design. The outcomes reveal a substantial contribution to a more profound comprehension of course material and a favorable impact on overall learning outcomes. However, the identified challenges and variations in pass rates among the AI tools underscore the imperative for ongoing exploration and enhancement. The survey responses from students convey a predominantly optimistic perception of AI tools, accompanied by recommendations for deeper integration while remaining mindful of the limitations associated with AI. In essence, this research provides not only valuable insights into the transformative potential of AI in engineering education but also emphasizes the importance of a continuous refinement process to optimize the learning experience for students.

Acknowledgements

We want to express my thanks to ChatGPT for its invaluable assistance in crafting this article, enhancing the clarity of the content. Furthermore, we are grateful for the support and resources extended by the Universidad Técnica Particular de Loja (UTPL), which greatly enriched the research process.

Abstract: Authorship profiling is a task of revealing an author's characteristics (i.e., gender, age, personality traits, etc.) of a text based on the analysis of linguistic features. This task is not only a purely theoretical but also a practical one. Identifying the characteristics of text authors is a task of great importance in marketing, sociology, forensics, etc. The task of authorship profiling is often approached as that of text classification or clustering. Different types of features have been introduced – lexical, morphological, syntactical ones, etc. In recent years, deep learning (DL) architectures have frequently been applied, along with traditional machine learning methods. However, for AP DL approaches regularly underperform, left behind by classical machine learning approaches, which indicates the complexity of the task. Also, interpretability is the key demand for authorship profiling methods limiting the use of DL methods for AP in real life. There is a need in more sophisticated but interpretable features for AP. In this paper, we propose a completely new type of features for this task – semantic characteristics of the contexts of the most frequent content words extracted using word embedding model, semantic relation extraction method and hand-crafted set of variables reflecting different aspects of word meaning. We present the results of the experiments where we applied this type of features to the texts of two genres extracted from the RusIdiolect dataset for the detection of gender and Big-5 personality traits. We discuss the advantages of this type of features as well as their limitations and further directions of improving the proposed methodology.

Keywords: Authorship profiling, Semantics, Word embeddings, Personality detection.

Introduction

Authorship profiling is a task of revealing the characteristics (i.e., gender, age, emotions, traits, etc.) of an author of a text based on the analysis of linguistic features. This task is not only a purely theoretical but also a practical one. Identifying the characteristics of text authors is a task of great importance in marketing, sociology, forensics, etc. Although this problem is not a new one, with the emergence of a great number of texts (mostly on social media) it has become one of the most important and widely studied issues in the area of text analysis. A series of hackathons has been devoted to this task in its different aspects (PAN events, <https://pan.webis.de>) (Potthast et al., 2019). Nowadays, this specific task has gained incredible importance due to the appearance of new risks introduced by generative AI and necessity of research into its ability to mimic an author's style and characteristics as well as an urgent need in the development of the models aimed at detecting texts generated by AI.

The task of authorship profiling is often approached as that of text classification or clustering. Different types of features have been introduced – lexical, morphological, syntactical ones, etc. Very naïve features such as word unigrams and bigrams and character 3-4-5-grams are the most popular in traditional machine learning approaches (HaCohen-Kerner, 2022). In recent years, deep learning (DL) methods have frequently been applied, along with traditional machine learning methods (HaCohen-Kerner, 2022). Controversial results have been reported regarding the superiority of this or that methodology for different tasks of text classification including authorship profiling, and lots of researchers highlight the superiority of the traditional machine learning approaches (López-Santillán et al., 2023).

Also, one of the drawbacks of deep learning methods are the difficulties with the interpretability of the results they provide. For some type of tasks this is not crucial, but it is not the case when we reconstruct the authors behind the texts where we are seeking to identify not only an author's characteristics but also which features of a text are associated with them (i.e., why did the model choose to classify this text as one written by a female?). This aspect of the authorship profiling task has often been overlooked in recent papers which have used deep learning methods making the results of the constructed models less applicable in the domains where the explanation is key.

In this paper, we discuss the results of the experiments aimed at profiling the authors of texts using a new type of features, namely the semantic characteristics of the contexts of the most frequent content words. It is well known that there are some differences in word meanings in an individual's mental lexicon. Based on this fact, we extracted the contexts of the most frequent content words from a corpus of texts in Russian RusIdiolect supplied with the author metadata (Litvinova, 2020), calculated the semantic characteristics of the contexts of the selected words over a set of features using Concept Mover's Distance (Stoltz & Taylor, 2019) and pretrained a language model word2vec. Namely, we were able to measure the most frequent content words's engagement with a set of the concepts using distributional representations of the meaning of words. While

constructing a set of the concepts, we relied on the features that had been shown to represent the core modalities of information processing in the neuroimaging literature (Binder et al., 2016). For example, we calculated the engagement of the contexts of the most frequent content words with sensory and motor experiences (e.g., shape and motion) and affective experiences (e.g., happy and sad) using the pretrained language model. Then, using these features, we built the classification models to predict the gender and psychological traits of the authors of texts.

In our paper, we will discuss which content words and semantic features of their contexts of usage contributed most to the results of the predictive models for gender and personality detection. We will also look at the advantages and some limitations of this new type of interpretable features for the authorship profiling task.

Methods

Material description

Text data

Collection of the datasets for personality detection is difficult since it requires recruiting participants, processing of the results of psychological questionnaires, etc. Moreover, not only personality test data but also user-generated texts should be analyzed, which is often not the case (especially when social media data is analyzed). However, recent studies (Zhou et al., 2020) have confirmed that small high-quality datasets perform better than large low-quality ones in the model training of personality testing tasks. With this in mind, we used the carefully constructed dataset RusIdiolect (Litvinova, 2020) which contains both personality test scores and texts written by the respondents in the course of the data collection process.

We analyzed texts of two different genres – picture description and letter to a friend. Examples of both text type are given below.

Picture Description: На картине изображены две женщины. На переднем плане изображена молодая женщина с короткой стрижкой. Грустными глазами она смотрит в сторону. Как будто провожая взглядом уходящего человека. За ней стоит старушка с белыми седыми волосами, покрытыми темным платком. Правую руку она держит подперев подбородок. Глаза как будто смотрят в другую сторону. С первого взгляда лицо женщины очень страшное, все покрыто складками и морщинами. То ли она осуждает эту женщину, то ли сочувствует ей. Понять это не возможно. А если присмотреться к старушке повнимательней, то начинаешь испытывать симпатию. Милая старушка слегка улыбается. Напряженный взгляд молодой женщины провожает человека, смотря ему вслед. Но лицо остается спокойным и без эмоций. Ей все равно уйдет этот человек или нет.

The painting shows two women. In the foreground there is a young woman with short hair. She looks

away, her eyes are sad. As if watching someone leaving. Behind her stands an old woman with white gray hair covered with a dark scarf. She holds her right hand under her chin. The eyes seem to be looking in the other direction. At first glance, the woman's face is very scary, everything is covered with folds and wrinkles. Either she condemns this woman, or she sympathizes with her. It is impossible to understand. And if you take a closer look at the old woman, you begin to feel sympathetic. The sweet old lady is faintly smiling. The young woman's intense gaze follows the man she is watching leaving. But her face remains calm and without emotion. She doesn't care whether this person leaves or not.

Letter to a friend: Привет, Данил! Как дела? Я надеюсь, что все хорошо. Последний месяц был очень напряженным и интересным. Я получил права на вождение автомобиля. Я целых полгода ходил на занятия. Это было утомительно, но это того стоило. Теперь я могу управлять авто. Это помогает делать много дел в один день. Побывать в сотнях новых мест, узнать много новых людей. Я понял смысл поговорки: «автомобиль не роскошь, а средство передвижения». И это правда! Учеба дается мне легко. Наша группа очень веселая и сильная. Мы сдаем завтра зачет по информатике. Через месяц у меня сессия. Немного волнуюсь, но да ладно! Расскажи о себе, мне все интересно. Жду ответа! Я знаю, что ты не любишь писать, но надеюсь на ответ. Может, позвонишь, мне будет приятно услышать твой голос. Мы давно не разговаривали по телефону. Твой номер не изменился? Или ты пользуешься только мобильным? Не пропадай. Пока!

Hi Danil! How are you? I hope everything is OK. The last month has been very busy and interesting. I have received my driving license. I have been training for six months. It has been tiring, but it has been worth it. Now I can drive a car. This helps to do a lot of things in a day. Visit hundreds of new places, meet a lot of new people. I have understood the meaning of the saying, "A car is not a luxury, but a means of transportation." And it is true! Studying comes easy to me. Our group is very cheerful and strong. We are taking a computer science test tomorrow. I am having an exam session in a month from now. I'm a little worried, but oh well! Tell me about yourself, I'm interested in everything. Can't wait to hear back from you! I know you don't like to write, but I hope to get your answer. Maybe you'll call me, I'll be glad to hear your voice. We haven't talked on the phone for a long time. Has your number changed? Or do you only use mobile? Stay in touch! Bye!

The mean text length is 152 (sd=55.6).

Participant metadata

RusIdiolect dataset contains the personality scores obtained with a set of questionnaires. For this particular study, we used scores on the *Big-5* test as widely used in personality computing research (Gregory et al., 2015). The theoretical foundation of the questionnaire is the five-factor personality model. Five fundamental factors that help to characterize the structure of a person's personality have been identified as a result of scientific research

by psychologists over a few decades. They include extraversion, agreeableness, conscientiousness, neuroticism, openness to experience. This framework does not imply that personality can be described by merely five factors. Rather, these five dimensions represent personality at a high level of abstraction. Each of the five factors includes a large number of smaller specific characteristics.

Initially, the Big Five was created in English (Goldberg, 1981), but the authors emphasize the universality of this model for a lot of languages and cultures, which is confirmed by empirical research.

While creating RusIdiolect materials, the 5PFQ version of the “Big Five” was used which was translated and adapted in 1995-1999 to domestic conditions of the social environment by psychologists of Kurgan State University (Hromov, 2000) as the only one available at the first stage of the experiment (2006). This version was subsequently used to compare the results.

A high level of extraversion in the interpretation of this test is associated with activity, dominance, sociability, and the search for new experiences; a low level is associated with passivity, subordination, isolation, and avoidance of impressions and attention. Extraversion in this version of the test carries a more significant connotation of dominance than in the other adaptations.

According to the second factor, agreeableness contrasts warmth, cooperation, trustfulness, understanding, respect for others, on the one hand, and indifference, suspicion, misunderstanding, self-respect. There is a more pronounced collectivist attitude in the 5PFQ construct where a greater emphasis is placed not on the test taker, as such but rather on their actions in relation to group members.

The third factor includes components such as accuracy, perseverance, responsibility, self-control, forethought, which are contrasted with sloppiness, irresponsibility, impulsiveness, carelessness, and lack of persistence. High scores on the fourth factor are associated with such characteristics as anxiety, depression, self-criticism, and emotional lability; low scores are associated with carefree, relaxed, emotional comfort, self-sufficiency, and emotional stability.

High scores on the fifth factor are associated with curiosity, daydreaming, artistry, sensitivity, and plasticity; low scores are associated with conservatism, realism, lack of artistry, insensitivity, and rigidity.

The minimum number of points scored for any main factor is 15, the maximum number is 75. Conventionally, the points can be divided into high (51-75 points), average (41-50 points) and low (15-40 points). In accordance with this, we initially divided the respondents into 3 classes. However, in total for each factor, the number of respondents with low and average ratings was lower than or approximately equal to that of the respondents with high ratings. Therefore in order to make our dataset more balanced, which allows for higher accuracy, we combined individuals with low and average scores into one LowMedium group. The composition of the dataset is shown in Table 1.

Table 1. Participant metadata

Variables/Register		Picture description	Letter to a friend
Gender	Male	95	75
	Female	166	128
Extraversion	LowMedium	108	86
	High	153	117
Agreeableness	LowMedium	101	69
	High	160	134
Conscientiousness	LowMedium	89	66
	High	172	137
Neuroticism	LowMedium	132	106
	High	129	97
Openness	LowMedium	48	35
	High	213	168
Total		261	203

Feature construction

At the first stage of analysis, texts were lowcased and lemmatized using udpipe package R. We also used special token for emoji and left it for further analysis. After that, we selected the most frequent content words whose contexts to be analyzed further. We set the minimal document frequency (for each register) where such word occurs to 50 (i.e. in no less than in 20 % of the text).

The resulting list of selected words for picture description: всё_PRON “all”, мочь_VERB “can”, дочь_NOUN “daughter”, лицо_NOUN “face”, девушка_NOUN “girl”, бабушка_NOUN “granny”, парень_NOUN “guy”, человек_NOUN “human”, жизнь_NOUN “life”, мужчина_NOUN “man”, я_PRON “me”, мать_NOUN “mother”, свой_DET “own”, возможно_ADV “possible”, смотреть_VERB “see”, сторона_NOUN “side”, взгляд_NOUN “sight”, думать_VERB “think”, время_NOUN “time”, очень_ADV “very”, хотеть_VERB “want”, мы_PRON “we”, весь_DET “whole”, женщина_NOUN “woman”, молодой_ADJ “young”.

Resulting list of selected words for letter to a friend: человек_NOUN “man”, я_PRON “me”, свой_DET “own”, очень_ADV “very”, думать_VERB “think”, жизнь_NOUN “life”, весь_DET “whole”, время_NOUN “time”, хотеть_VERB “want”, всё_PRON “all”, новый_ADJ “new”, уже_ADV “already”, мой_DET “my”, любить_VERB “love”, надеяться_VERB “hope”, давно_ADV “longago”, много_ADV “many”, писать_VERB “write”, 😊 “emoji”, ждать_VERB “wait”, your “твой_DET”, друг_NOUN “friend”, последний_ADJ “last”, видется_VERB “see”, учеба_NOUN “study”, хорошо_ADV “nice”, скоро_ADV

“soon”, день_NOUN “day”, хотеться_VERB “want2”, учиться_VERB “learn”, соскучиться_VERB “miss1”, скучать_VERB “miss2”, работа_NOUN “job”)

As a unit of our analysis, we used the contexts of the selected word. We experimented with different window sizes but for the final experiments $n=3$ (i.e., 3 words before and after key word) were chosen taking into account the length of the documents.

To construct our feature set, we used methods for semantic relation extraction from the texts using word embeddings. Semantic relations are modeled as vector translations in a word embedding space (Stoltz et al., 2024).

Namely, we used text2map function CMDist() (Stoltz & Taylor, 2019) which document-term matrix (DTM) as input, a matrix of word embedding vectors, and concept words or concept vectors. The function uses word counts from the DTM and word similarities from the cosine similarity of their respective word vectors in a word embedding model. The "cost" of transporting all the words in a document to a single vector or a few vectors (denoting a concept of interest) is the measure of engagement, with higher costs indicating less engagement. For intuitiveness the output of CMDist() is inverted so that the higher numbers will indicate more engagement with a concept of interest.

It is possible not only to specify single words from the word embeddings, but also a list of them. In this case the function (get_centroid) takes a vector extracted from the embedding space in the form of a centroid (which averages the vectors of several words). It is possible to use the offset of several juxtaposing words using a function get_direction() to extract the engagement of a text with this or that pole of the scale. A widely used example is the gender spectrum, from more feminine to more masculine. Therefore, this method has been used extensively to measure the extent target terms are biased toward man or woman. The words need not be in the DTM, but they must be in the word.

As was shown in a number of papers, different types of psycholinguistic relations could be extracted from word embeddings, e.g., abstractness, sentiment, etc. (see Stoltz et al., 2024). Therefore, we might construct, using existing psycholinguistic databases, a concept consisting of words with a high/low level of abstractness, sentiment, etc. and extract the level of abstractness of the texts.

A different set of concept words was tested, and their particular content was dependent on the task the researcher was solving (more on that: Litvinova & Panicheva, 2024). We propose a novel approach for the construction of these feature set. As our task is to perform complex analysis of the contexts, we set the task to describe them over the comprehensive set of features however theoretically motivated. To do this, we relied on the data from neurobiology about the processing of different type of words depending of their semantics. Specifically, we used the data from Binder et al. (2016) where a brain-based semantics consisting of conceptual primitives defined in terms of the modalities of neural information processing proposed.

This study aimed at developing a representation that captured the aspects of the experience that are central in the acquisition of concepts. The authors organized human experience in 13 different domains - each one corresponding to a variable number of features for which some specialized neural processor has been identified and described in the neuroscientific literature (Binder et al. 2016). In this work, an example of the words rated high on these features was proposed. We used both translations of these words to construct our dimensions and also the data from psycholinguistic databases. E.g., for constructing the dimensions which are related to the visual modality we used the database with a human rating of different words for this modality from database created by Miklashevsky (Miklashevsky, 2018), Russian version of LIWC thesaurus (Pennebaker et al., 2015) was used (Panicheva & Litvinova, 2020), etc.

We also preliminary constructed the list of basic semantic oppositions. They were constructed based on the word meaning components presented in Binder et al. 2016, lists of semantic differentials presented in literature (see Litvinova & Panicheva 2024 for more on this) as well as using a dictionary of Russian antonyms aligned with the set of the most frequent Russian words.

The resulting feature set is presented on github (<https://github.com/Litvinova1984/ICRES2024>).

We used a pretrained model ruwikiruscorpora_upos_cbow_300_10_2021 which was trained on Wikipedia and NCR in late 2021.

DTM on the contexts of the selected words was constructed using quanteda package. Thus, for each contexts of the selected words, 46 features were extracted. Resulting matrix for PIC dataset was 261x1159, for LETTER dataset – 203x1527.

Exploratory analysis and classification approach techniques

As our major goal is not only to obtain high quality classification/regression models, but also to search for the most significant features, taking into account the situation when the number of features is greater than that of the samples, as well as possible multicollinearity of the features (which is typical for linguistic features), we used a set of multivariate methods analysis implemented in the mixomics library and specifically designed for such a data set.

We performed PCA for exploratory analysis using both mixomics and Factominer packages and functions of this package allowing us to establish connections between the selected combined features (components) and the qualitative and quantitative characteristics of respondents (which, according to the terminology adopted by those who designed the package, are called additional qualitative (quantitative) variables, i.e., they serve to interpret the results, but are not directly used in the analysis itself). Supplementary variables have no influence on the principal components of the analysis. They are going to help to interpret the dimensions of variability. We can add two different kinds of variables: continuous ones and categorical ones. To facilitate interpretation, we used functions `dimdesc` and `catdes` of **Factominer**.

The *dimdesc()* function calculates the correlation coefficient between a variable and a dimension and performs a significance test. These tables give the correlation coefficient and the p-value of the variables which are significantly correlated to the principal dimensions. Both active and supplementary variables whose p-value is smaller than 0.05 appear.

For both text types, as supplementary continuous variables, we would like to add the variables linked to the scores on 5 personality traits from Big 5 and age. As supplementary categorical variable, we used gender.

For the classification (in the case of a binary variable - the gender of the author of the text), we used the algorithm Partial Least Squares – Discriminant Analysis (PLS-DA) which operates efficiently over large dataframes and is not negatively influenced by collinearity.

While evaluating the classification performance of (s)PLS-DA models, repeated cross-validation is used. We used 5-fold cross-validation with 50 repeats for each model as recommended by the package developers.

We used a balanced error rate (BER) as a measure for the model efficiency. All the tasks (both gender and personality traits detection) were approached as a binary classification problem for the purpose of the comparison with SOTA approaches in other languages and with the aim of constructing more balanced datasets.

Results and Discussion

PIC dataset

Fig. 1. PCA on PIC dataset

PCA was performed to summarize the data with a multivariate approach and to provide a visual representation of the distances between the texts. Preliminary analysis with elbow method and showed that 5 components were optimal and was used for further experiments. One-way ANOVA models were constructed including the Principal Components as the response variables and gender and personality traits as the explanatory variable; coefficients of determination (R^2) and related p-values were calculated as well as the categories coefficient estimates, tested for significant differences from zero ($\alpha = .005$). Fig. 1 shows the tendency of division of the texts by male and female authors over Dim. 1, which is proved by statistical test ($R^2 = 0.0543$, $p=0.0001$; estimates for gender: Female = 1.976211, $p= 0.0001$, Male = -1.976211, $p= 0.0001$).

The following features were positively correlated (0.5 and higher, $p<0.000000001$) with Dim 1: motherSocialSelf, motherSocialLIWC, motherGustNorms, motherSpatialProx, motherVisLIWC, motherAudLIWC, motherSomatNociception, motherCausal, motherVisBody, daughterSocialSelf, daughterSocialLIWC, daughterSpatialProx, daughterSomatNociception (according to estimate, this values are higher in female texts). Negative correlations are registered for motherEmoAngry, motherGustTaste, motherSocialGender, motherEmoSentiment, motherDrive, motherMotorPractice, motherEmoDisgust, daughterSocialGender, daughterEmoAngry, daughterMotorPractice, motherAttentionArousal, motherAudIntens, daughterGustTaste, motherCognitionImage, motherEmoHappy, canSomatTexture (these features have higher levels in texts which are located to the left on Dim 1, i.e. most texts by male and some female texts).

Gender classification

For the classification, initially we performed PLS-DA with 10 PCs. For each component, repeated cross-validation (10 \times 5-fold CV) is used to evaluate the PLS-DA classification performance (overall and balanced error rate BER), for each type of a prediction distance; max.dist, centroids.dist and mahalanobis.dist). The smallest error rate (both overall and balanced) was obtained for centroids.dist (0.39) and comp=3. They were used for the final model.

Fig. 2. Visualization of PLS-DA on PIC dataset

Then we constructed a sparse model with the aim to reduce the feature size in mind . We set `list.keepX <- seq(50, 200, 10))`. We estimate the classification error rate with respect to the number of the selected variables in the model with the function `tune.splsda()`. The tuning is being performed on one component at a time inside the function and the optimal number of variables to select is automatically retrieved after each component run.

Previously, we determined the number of components to be `ncomp = 3` with PLS-DA. Here we set `ncomp = 4` to further assess if this was be the case for a sparse model, and use 5-fold cross validation repeated 10 times. We also choose the centroid prediction distance. A model with `comp = 1` and 200 variables were automatically selected with `$BER = 0.401`. It is interesting that the female authors were detected at a lower level than those by males (0.512 and 0.273, respectively) which is supported by the visualization (the male texts are more homogeneous) (see Fig. 2).

In the plot in Fig. 3, the loading weights of each selected variable on each component are represented. The colours indicate the group in which the expression of the selected features is maximal based on the mean value.

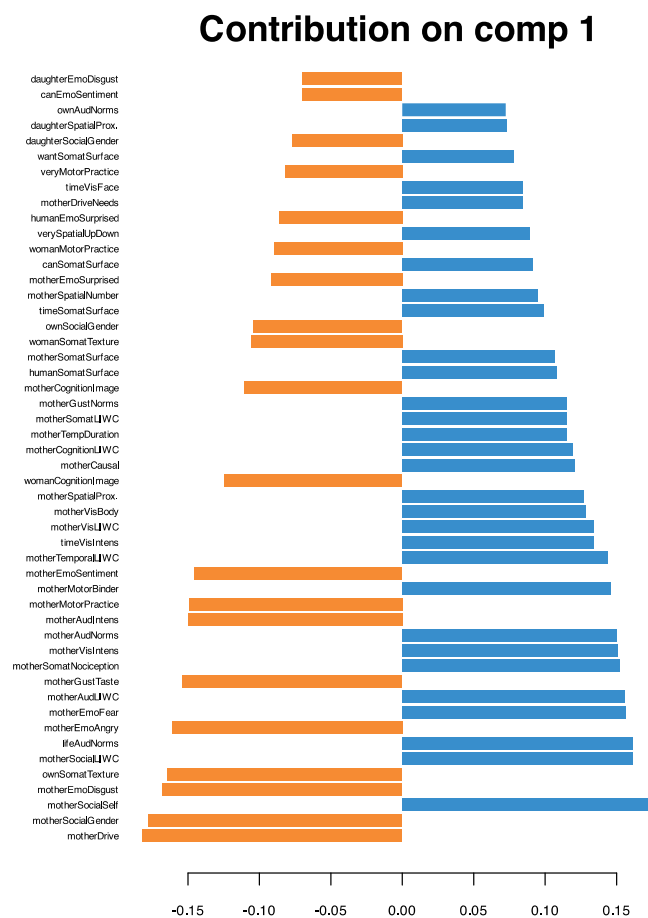

Fig. 3. Feature importance for Gender, PIC dataset
(blue lines indicate the female texts, orange lines indicate the male texts)

We can see that the most important features related to the differences in the meaning of words mother, own, life, time, can, daughter.

Big 5 classification

At the first stage of the analysis, we calculated the correlations ($p < 0.05$) between the Big 5 scores and features. The extraversion scores are correlated with Openness at a rather high level (0.58), Agreeableness (0.36) and Conscientiousness (0.25). Among linguistic features different components of the meaning of word me are positively correlated with the scores on extraversion (meDriveNeeds, meCausal, meSocialLIWC, meTemporalLIWC, meCognitionLIWC, meSomatNociception, meVisBody, meSocialSelf, meAudLIWC, meEmoFear), side (sideGustNorms, sideSpatialNumber, sideSocialSelf, sideSomatProprioception, sideTemporalLIWC, sideEmoPleasant, sideCausal, sideSpatialProx, sideSomatLIWC, sideVisColor, sideCognitionLIWC), very (veryOlfacNorms, veryVisColor), as well as life (lifeEmoSentiment), while negative correlations were observed for life features lifeVisFace, lifeEmoPleasant, lifeEmoBenefit, lifeEmoHappy, side features sideDrive, sideAttentionArousal, sideEmoAngry, sideGustTaste, me meCognitionImage, meEmoAngry, very veryAudNorms.

For all the models related to psychological traits, we set ncomp=10, then tuned the models using the procedure recommended in mixOmics tutorial.

The lowest BER for extraversion = 0,35 was obtained with max.dist and comp=1 (Fig. 4).

Fig. 4. Feature importance for Extraversion, PIC dataset

Agreeableness correlated positively with Openness (0.45), Conscientiousness (0.41), Extraversion (0.36). Linguistic features positively correlated with Agreeableness are the characteristics of mother (motherSomatNociception, motherTemporalLIWC, motherEmoFear, motherAudLIWC, motherCausal, motherSocialLIWC (negatively with motherMotorPractice, motherDrive, motherEmoAngry, motherEmoSurprised, motherEmoBenefit), can (canEmoFear, canSocialLIWC, canSocialSelf, canGustNorms) (negatively – canEmoAngry, canDrive, canEmoSentiment, canAttentionArousal), as well as different characteristics of want (VisSize, wantVisIntens, wantDriveNeeds, negatively – wantMotorPractice), *human* (EmoHappy), *own* (ownSpatialUpDown, ownVisIntens, negatively – ownMotorPractice), *whole* (wholeAttentionArousal; negatively – wholeEmoBenefit, wholeCausal), granny (grannyDriveNeeds), face (faceAudNorms), guy (guyVisMotion), life (lifeTempDuration) (negatively – lifeSomatNorms).

As for Agreeableness, the minimum BER using centroid.dist and mahalanobis.dist was 0,36. The best results are obtained with ncomp=2 (Fig. 5).

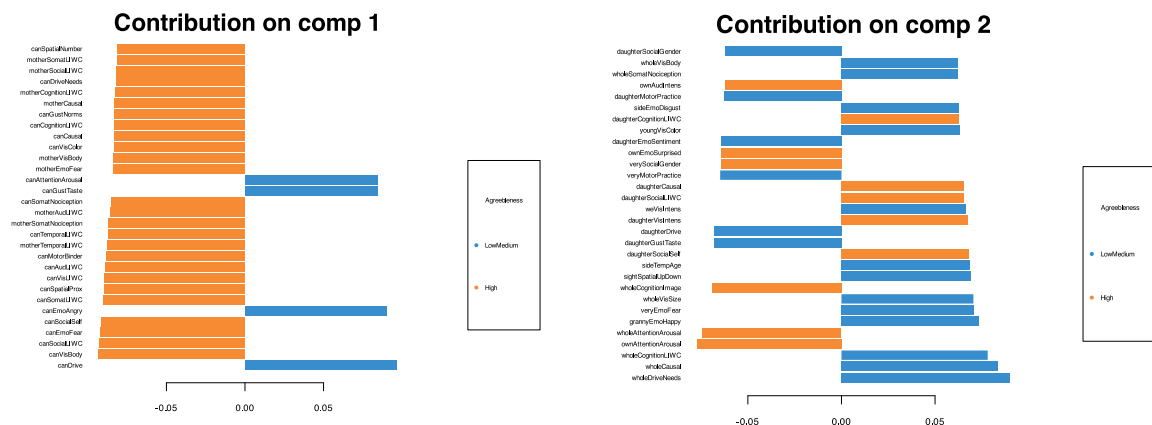

Fig. 5. Feature importance for Agreeableness, PIC dataset

Conscientiousness correlated positively with Agreeableness (0.41), Extraversion (0.25), Openness (0.23). Positive correlations are revealed for *time* timeEmoBenefit, timeEmoPleasant, timeSocialSelf, timeVisLIWC (negatively – timeEmoAngry, timeEmoDisgust, timeDrive), *own* ownVisIntens, ownEmoPleasant, ownSomatSurface (negatively – ownSomatNorms, ownEmoSentiment), *young* youngVisFace, youngVisIntens, youngVisNorms (negatively – youngEmoDisgust, youngCognitionAbstract), *human* humanVisFace, humanSomatSurface, *man* manVisSize, manSomatProprioception, manCognitionLIWC, manSocialSelf, manDriveNeeds, manEmoPleasant (negatively – manMotorPractice, manEmoAngry, manEmoSentiment). The error rate was high for Conscientiousness was 0.4 with ncomp=5 (Fig. 6).

Neuroticism positively correlated with Openness (0.24) and humanTempDuration (negatively – humanVisColor, humanVisNorms, humanEmoSurprised), weEmoSentiment, weEmoDisgust, weTempDuration (negatively – weVisColor, weEmoPleasant, weEmoHappy, weEmoBenefit), motherVisSize,

openness is detected much better, with an individual ER per class 0.12) (Fig. 8).

Fig. 8. Feature importance for Openness, PIC dataset

Letter dataset

Exploratory analysis

An exploratory analysis via PCA on letter dataset, after a preliminary check, was performed with 4 components (Fig. 9).

Fig. 9. PCA on Letter dataset

The first dimension is related to the factor “Gender” ($R^2 = 0.2026373$, $p < 0.00000001$), the same is true for Dim 2 ($R^2 = 0.0244$, $p = 0.026$). Among the features with the highest (among 0.5, $p < 0.000001$) positive correlations with Dim 1 are different characteristics of the word very from RuLIWC (very_TemporalLIWC, very_EmoFear, very_SocialSelf, very_SocialLIWC, very_SomatNociception, very_AudLIWC), whole (VisLIWC, SomatLIWC, SomatNociception, whole_AudLIWC, whole_VisBody), love (love_VisColor, love_MotorBinder, love_VisLIWC).

Negative correlations are registered for such characteristics of *very* as *very_MotorPractice*, *very_GustTaste*, *very_EmoAngry*, *very_EmoSurprised*, *very_Drive*, *very_EmoSentiment*, *very_SocialGender*), *whole* (*whole_EmoAngry*, *whole_GustTaste*, *whole_MotorPractice*), *love* (*GustTaste*, *EmoAngry*, *EmoDisgust*, *SocialGender*, *EmoSentiment*, *Drive*). This observation highlights the necessity to take into account not only simple count of words of some semantic groups (LIWC feature, etc.) but also their meaning for individual which could be assessed using the analysis of its contexts.

We can say that, just as for the for PIC dataset, the differences in the meaning of several words are crucial for gender identification.

Lowest BER for Gender was 0.25 (comp=5). The first component highlights the differences in the meaning of words *very*, *whole*, as well as *miss*. Component 2 highlights differences in the use of word *all*, *hope* and *emoji* (Fig. 10).

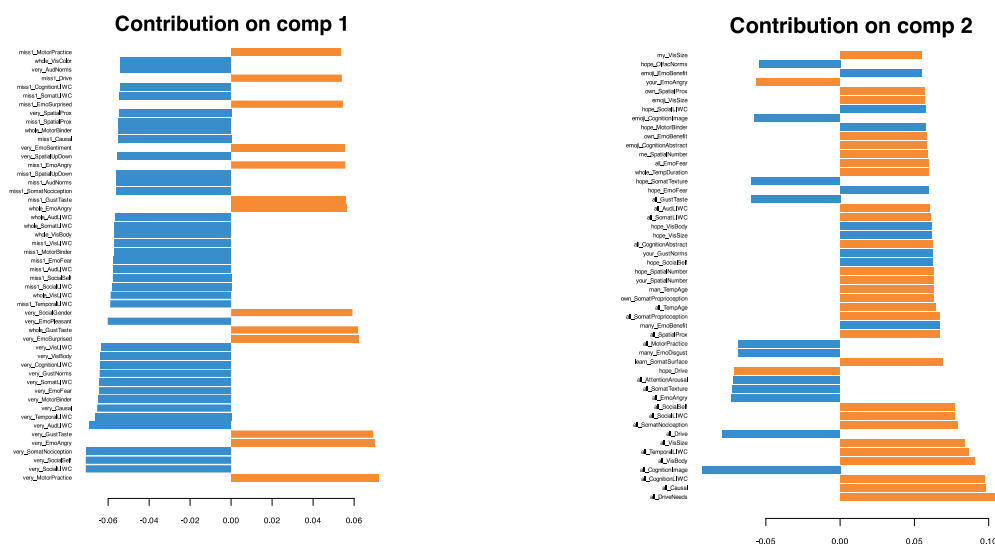

Fig. 10. Feature importance for Gender (Letter dataset)

The best sparse model with 200 features yields BER 0.29 which is a worse result than the one obtained on the full feature set. Interestingly, the sparse model selects the characteristics of very, whole, miss1, miss2, all, my, longago, job, miss2.

Let us move to personality trait prediction. The minimal BER for extraversion was 0.35 with ncomp=1.

Extraversion is correlated with emoji features (positively – with SocialLIWC, SomatNociception, AudLIWC, MotorBinder, TemporalLIWC, AudNorms, EmoFear, negatively – with EmoSurprised, EmoAngry, Drive, SocialGender), miss1 (positively – VisBody, SomatLIWC, AudLIWC, EmoHappy, SpatialProx, MotorBinder, negatively – EmoAngry, GustTaste, AudIntens, EmoSurprised, EmoSentiment), very (positively –

very_EmoPleasant, very_EmoBenefit, very_SocialSelf, very_AudLIWC, negatively – with very_GustTaste, very_Drive, very_EmoSentiment, very_EmoDisgust). The characteristics of these words as well as life, think, learn, study, see contribute most to the classification model (Fig. 11).

Fig. 11. Feature importance for Extraversion (Letter dataset)

The lowest BER for the agreeableness trait was 0.31 (ncomp=2). The most important words for these features (both in terms of correlation and classification) are already (EmoBenefit, DriveNeeds, MotorBinder), job (EmoHappy), life (VisColor), friend, love, think, see (Fig. 12).

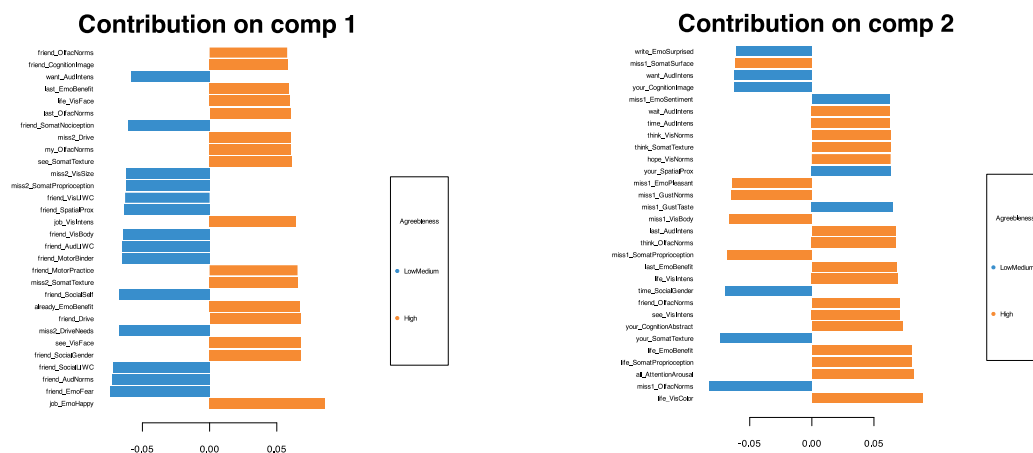

Fig. 12. Feature importance for Agreeableness (Letter dataset)

Conscientiousness is hard to predict with the overall BER = 0.41 (ncomp=3). Different words contribute to this trait detection with no clear pattern (friend, already, hope, think, man, life), with friend_VisMotion, life_VisMotion, already_AttentionArousal, myEMoHappy, friend_MotorPractice among characteristics of high

Conscientiousness, high values of manTemporalLIWC, manCognitionLIWC, lifeTempduration characterize low Conscientiousness (Fig. 13).

Fig. 13. Feature importance for Conscientiousness (Letter dataset)

The lowest BER for Neuroticism was 0.36 and obtained with ncomp=1. Among the features with the highest correlation with this feature are the semantic features of whole (whole_VisLIWC, whole_MotorBinder, whole_VisBody, etc.), longago, see, miss1, day. This feature contributes to the classification, with a high level of day_VisMotion, day_MotorPractice, see_EmoSentiment indicates low to medium levels, longago_TempDuration, see_EmoPleasant, see_GustNorms – high levels (Fig. 14).

Fig. 14. Feature importance for Conscientiousness (Letter dataset)

The lowest BER for openness = 0.45 with ncomp=2, overall ER=0.21. All models detected a high level with a low ER (up to 0.13). Among features with the highest positive correlation with Openness are the features of

write (OlfacNorms, VisNorms, CognitionImage), emoji (GustNorms, SomatSurface, SomatNociception – positively, EmoSentiment, EmoSurprised, VisMotion - negatively), very, nice, think, time, love. These features contribute to the classification (especially *write*) (Fig. 15).

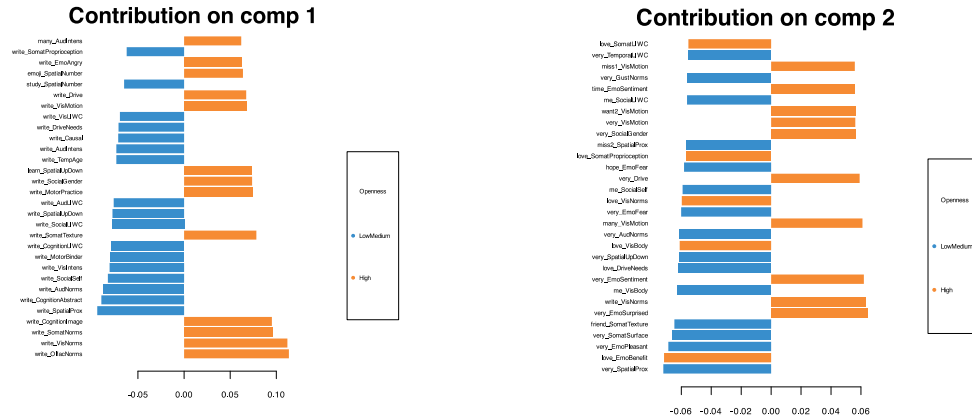

Fig. 15. Feature importance for Conscientiousness (Letter dataset)

The metrics of the constructed models (in terms of weighted accuracy, 1 - BER) are summarized in Table 2.

Table 2. Accuracies of the classification models

Genre	Extraversion	Agreeableness	Conscientiousness	Neuroticism	Openness	AVR	Gender
PICTURE	0.65	0.64	0.6	0.65	0.52	0,612	0.61
LETTER	0.65	0.69	0.59	0.64	0.55	0.624	0.75

Discussion

Gender

A great deal of research is devoted to inferring an author's characteristics from a text. Gender is the most popular factor which has been exhaustively studied in authorship profiling. However, as one of the latest reviews shows (HaCohen-Kerner, 2022), the gender accuracy results vary from 52% to 91% (most are less than 85%). The author of the above-mentioned finds these results “quite surprising” and expects “to see higher results when it comes to seemingly relatively simple types of classification especially by gender (only 2 categories) when a large number of teams have competed over the years”.

We claim that, in text-based gender detection, there is a strong need to take into account genre characteristics, i.e., such an important factor as the need for construction of the addressee and therefore necessity to play a corresponding gender role which dramatically affects the accuracies of the model and could potentially explain the diversity of the obtained predictive model metrics.

In recent years, DL methods have become widely used for gender classification tasks, however, contradictory results were obtained regarding their superiority over the classical ML methods (e.g.; SVM, LR, and RF) (Lopez-Santillan et., 2023, HaCohen-Kerner, 2022). The current SOTA for Russian informal texts (Sboev et. al., 2020) was obtained with such features as morphological binary vectors, FastText vectors, textual dependency tree structure fed to graph convolution network and LSTM resulting in f1-score 84%. A drawback of such models is the difficulty in assessing the features. For the other models obtained on the same data Rectified Linear Unit (ReLU, 1 Hidden Layer) was the most efficient algorithm, with an accuracy of 0.74+/-0.05 using the imp_quarter feature selection technique.

The most popular features which are used as input for traditional machine learning algorithms, are word unigrams and bigrams and character 3–4-5 grams and number of words from predefined dictionaries (LIWC is the most popular one). However, in most cases, the authors did not explain why the combinations of these features were the most successful for the classification tasks under discussion. In case of using the LIWC-like features, the efficiency of the models is heavily dependent on the presence of such a word in text and on text length. Our approach, being highly interpretable, allowed us to obtain good results for the texts which imply the construction of the addressee and playing a gender role and does not have such drawbacks as those described above.

Personality traits

Text-based personality traits prediction is also a popular direction of research, however, the list of the datasets for this task is limited due to the difficulties in obtaining the appropriate metadata. One of the closest to ours is PAN2015 dataset (Rangel et al., 2015) as having the shortest texts from 294 users Twitter tweets annotated with their Big Five scores. The best results (from 0.646 for consciousness to 0.713 for neuroticism) for this dataset was obtained by Yangfu et al. (2022) who also tackled this problem as a binary classification one and constructed a lexical psycholinguistic knowledge-guided graph of a neural model. They learn personality-aware word embedding that encodes psycholinguistic information in the continuous representations of words.

The authors claim the extraversion and neuroticism can be effectively extracted from a text, because people with neuroticism and extraversion traits often use modal particles and adjectives, while agreeableness personality trait in the text information is not obvious. As they constructed the lexicon to enrich the features with information on a sentiment, their approach is highly dependent on the overall text sentiment level and its content as they are focusing on particular words, on the one hand, and the connection of the predicted personality trait to emotions. However, their results are similar to ours in terms of the established connection of particular words and personality traits, but our approach is more sophisticated as we focus not only on the words themselves but also on their individual meanings. Our approach is not connected to sentiment detection as we analyze word meanings over the whole set of features.

For Russian, research in text-based Big-5 personality prediction is scarce. For example, Stankevich et al. (2018) predicted Big 5 traits (as 3-class problem) from a dataset of 165 VKontakte profiles. However, due to the sparseness of user-generated texts in their dataset, they used only very basic textual features (average numbers of words and sentences, use of punctuation and uppercase). Their reported F1 scores range from 36% for Conscientiousness to 53% for Agreeableness.

Similarly, Ignatiev et al. (2019) used both SVM and Random Forest approaches for a two-way classification of Big 5 traits from the dataset of 1,020 VKontakte profiles. They used lexical features, an aggression lexicon, user profile information, repost data, and reported F1 scores ranging from 61.75% on Openness to Experience to 73.75% on Extroversion. These approaches, however, are not comparable to ours since, first, their dataset consists of mostly non-user generated content, secondly, they also use non-linguistic features.

One of the largest dataset in Russian was gathered by Hull et al. (2021). It consists of 149K VKontakte posts from 288 consenting participants, with a total of 3.8M word tokens. They used BERT architecture as well as a traditional classifier with a traditional set of features (emoji, the most frequent words and char n-grams, function word to token ratios; NRC emotional lexicon tokens; frequency of morphological features, frequencies of top 100 (RNC) unigrams, etc.) and found out the superiority of the latter.

One trait where the advantage of the set of formal characteristics they used is particularly large is the Agreeableness trait, which might be explained by the usefulness of emoji, emoticons, and/or emotional words for these trait Agreeableness which pretrained model may be ignoring since such “words” may not have appeared in its original training data content. However, the problem of a great amount of non-user generated content which is typical for VKontakte is not discussed in either of the reviewed works.

Conclusions

Despite a huge amount of research, the task of inferring an author’s attributes from a written text remains challenging. This is especially true for text-based personality trait detection. Recent works have applied deep learning techniques to this type of tasks, however, with limited success. A lot of works have reported the superiority of traditional algorithm over DL. The difficulties in interpretability also hinder the use of DL for AP tasks. However, traditional approaches usually involve using very basic, linguistically naïve features which adds little to our understanding of individual differences in language usage. Moreover, they are highly dependent on the context (the most frequent n-grams, words and so on).

In this paper, we propose a new approach for AP feature construction which is theoretically motivated and related to the analysis of individual word meanings which is assessed through the analysis of the contexts of the most frequent (mostly) content words of the corpus. Using the methods of semantic relation extraction and a neurobiologically motivated set of word meanings, we constructed a set of features which describes the

contextual meaning of words. Using this methodology, we were able to achieve the accuracies of the models which are close to SOTA despite the fact that our dataset is quite small both in terms of the text length and the number of texts.

However, our aim was not predicting but gaining the interpretable features. Our approach could be applied to a text of any length and does not depend on the presence in the texts themselves of the words which are used to extract the semantic features.

Regarding the constraints and limitations of our approach, we conducted the experiments using only texts which were created in experimental settings. Therefore, experiments on the other datasets containing texts of different types will help to further improve the methodology. We also tested only one language model trained on the general corpus. Testing of the other types of language models is the next step of our exploratory study.

The Big Five personality traits are not independent, which is proved in our correlation analysis. In this study, we only predict each personality trait individually. In the future, we will design experiments for joint personality detection tasks.

Using another coding scheme for Big 5 scores as well as working with different questionnaires will also help to increase the validity of the proposed methodology. We also have plans to refine some categories with the appearance of new psycholinguistic databases as well as to test different context window sizes depending on the task at hand and text length. As we used only one classifier, an obvious direction of future research is testing the other algorithms.

Despite a rather exploratory nature of the present study, we believe that using a novel feature set which describes the characteristics of individual word meanings will contribute to theoretically-driven authorship profiling. This work is only the first step in this direction. Future studies will be related to the collection of the databases of the typical (average) characteristics of the meaning of the most frequent content words (i.e.. key words of the culture) using the proposed methodology for different discourses with a known genre and an author's characteristics and incorporating this information into the predictive models.

Abstract: On the one hand, the rapid progress of science and technology today means that learning can no longer be delivered using just one learning model. Blended learning is a necessity to be implemented in the learning system. On the other hand, each country has criteria for the profile of graduates to be achieved in education, where in the Indonesian context the Pancasila student profile is what is expected. Therefore, with this context, this research aims to show how significant the influence of lecturer competence in delivering project-based learning and Citizenship Education is on the formation of Pancasila student profiles through blended learning. This research was designed using quantitative methods by distributing questionnaires to Bina Nusantara University students in Jakarta who had taken Citizenship Education courses. From the results of data processing, it is known that lecturer competence in delivering project-based learning and Citizenship Education has a very significant influence on the formation of Pancasila student profiles. So, it can be concluded that the more competent the lecturer is in delivering project-based learning in Citizenship Education, the greater the influence on forming the Pancasila student profile through blended learning, and vice versa.

Keywords: lecturer competence, project base learning, citizenship education, pancasila student profile, blended learning

Introduction

In this era of rapid progress in science and technology, learning that only relies on a one-way traffic learning system is no longer adequate where the teacher is everything and the only source of learning. Apart from learning having to be more interactive and making students a source of learning as well, a mixed learning system is needed which is better known as blended learning. Mixed learning or blended learning is not enough to only be carried out in the classroom, but also needs to be supported by learning outside the classroom. Wikipedia offers the the definition of blended learning or hybrid learning as an approach to education that combines online educational materials and opportunities for interaction online with traditional place-based classroom methods. According to Thorne, blended learning is a mixed system that combines two components and methods at once. The combination of these methods is e-learning and multimedia.(Thorne, 2003) Meanwhile, the learning implemented is in the form of virtual classes, streaming videos, online animated texts, and so on. According to Dwiyogo, blended learning is learning that combined or mixed in nature. This method comes by mixing face-to-face learning with technology-based learning.(Dwiyogo, 2021) According to Rusman, blended learning is a combination of two main elements. These two elements are learning in class and online, or learning by utilizing internet networks and website-based. Apart from that, there are several media technologies that are applied. For example email, video streaming, virtual classes, and so on.(Rusman, 2011)

So now citizenship education, which is one of the mandatory curriculum subjects in Indonesia, needs to be held not only with a classical tutorial system, but also with project-based learning, where students are invited to be able to learn by doing projects. For example, in the Indonesian context, the citizenship project course focuses on two big problems, namely intolerance and corruption, because these are the two issues that really undermine unity and integrity as citizens of the Indonesian nation. Therefore, lecturers in delivering citizenship education learning are required to master this project-based learning. Apart from project-based learning, blended learning also requires interaction between students and lecturers through online activities in the Discussion Forum format where the lecturer invites students to explore certain topics through interaction in online discussion forums. Blended learning also assumes that learning is carried out independently through assignments both personally and in teams. For this reason, remembering that citizenship education must also support the achievement of the Pancasila student profile, in this research we want to highlight how or to what extent the competence of lecturers, especially in delivering project-based learning and citizenship education, contributes significantly to the formation of the Pancasila student profile in learning with a mixed system or blended learning.

Education in Indonesia aims to develop the potential of students to become human beings who have the skills, desires and good morals as stated in the National Education System Law.(Nasional, 2003) Education prepares students to become individuals who have knowledge, skills, attitudes, values and behavior that will have a positive impact on students' daily lives in society.(Idris et al., 2012) Meanwhile, according to Mali Benyamin (Mikhael & others, 2016), Citizenship Education must bring students awareness to increasingly participate in realizing the Indonesian nation and state as a dignified and sovereign nation and state. These include actively

participating in realizing more democratic elections, law enforcement and human rights, better community welfare, for more advanced education, better health services, fairer infrastructure, and so on. To truly become an independent, dignified and sovereign, just and prosperous country, Indonesia is still facing problems including widespread corruption, forest destruction, moral decline, religious intolerance or fundamentalism, terrorism, as well as the continued strengthening of capitalism, identity politics, political oligarchy, discrimination, as well as the weakening of the Pancasila ideology, hoaxes, fake news, and so on. Regarding the condition of the nation, students are invited to care about threats to the ideology of the nation and state. If these challenges and obstacles are not overcome, Indonesia could fall into ruin.

The conditions needed for the Indonesian state to truly become an independent, sovereign, just and prosperous country are honesty, justice, kindness, hard work, cooperation (mutual cooperation), law enforcement and human rights, transparent and accountable state administration, competition, healthy politics. Citizens' commitment to maintaining state ideology and upholding multiculturalism is not immediately embedded in their citizens, especially in this case students. Instilling these values can be done through an institutionalized educational process. Higher education is the most strategic place to instill these values systematically and institutionally.

Law Number 12 of 2012 concerning the State requires every university to systematically and institutionally teach Citizenship Education in order to form students who have values such as honesty, fairness, kindness, love of the country, patriotic, innovative, responsible, with integrity, and have integrity respect. (Pohan, 2021) The state is aware that it can be formed through the educational process. Therefore, the state has made Citizenship Education a stand-alone subject and must be studied by every student, including students at Bina Nusantara University, Jakarta, Indonesia.

Meanwhile, learning effectiveness certainly cannot be separated from the influence of lecturer competence in delivering courses. According to Spencer and Spencer, competency includes motives, traits, self-concept, knowledge and skills. These are the fundamental characteristics that lead to effective performance in a job or situation. (Spencer & Spencer, 2010) Competency thus also concerns the lecturer's ability to carry out their duties based on the skills, knowledge and work attitudes required by them. (Irawati et al., 2022) Meanwhile Michael Zwell defined competence as an enduring trait that determines performance, including initiative, influence, teamwork, innovation, and strategic thinking. Competence is also often described as a combination of knowledge, skills, and attitudes. (Zwell, 2000).

Susilo expands competence by considering it as a person's ability to achieve, which includes elements such as imagination, knowledge, experience, emotions, passion, character, attitudes, skills and health. (Susilo & Sarkowi, 2018) Simamora defines competence as the skills, knowledge and abilities required for active work performance. (Simamora, 2015) Steven and Mary Ann explain that competency involves skills, knowledge, talents, values, directors, and personal characteristics that contribute to superior performance. (McShane et al., 2009).

Competency is very important for job performance in all fields, and job competency standards are needed to determine the required abilities. (Benawa & Silverius Lake, 2019) For lecturers, it is important to internalize and have pedagogical competence, personal competence, social competence and professional competence. (Krisnamukti et al., 2020) These competencies include mastery of learning materials, implementation of evaluations, empathy, social sensitivity, responsibility, honesty, discipline and objectivity. (Alouw et al., 2021).

Lecturers' pedagogical competence, especially in the context of learning citizenship education courses, is related to their ability to deliver project-based learning. According to Saefudin (Berdianti & Saefuddin, 2014), project-based learning itself is a learning method that uses problems as the first step in collecting and integrating new knowledge based on experience with real life activities. This project base learning is carried out to help, encourage and guide students to focus on collaboration by involving group work and helping students to focus on their development in capturing problems and finding solutions to the problems they face.

Meanwhile, Goodman and Stivers (Goodman & Stivers, 2010) stated that project-based learning can be interpreted as a teaching approach that is built on learning activities and real tasks that provide challenges to students related to daily needs to be solved in groups related to the problems they face.

Thus, project-based learning emphasizes student-centered learning, because it is the students who carry out in-depth investigations of a topic, both the problem and the solution. Constructively, students explore or deepen their learning by taking a research-based approach to problems and questions that are meaningful, real and relevant. Project-based learning according to Grant (Tamim & Grant, 2013) is a learning model that can be applied by facilitators who want to create an active learning environment and ask students to focus on their development so that they don't just dwell on problems but look for solutions to the problems found. So, the benefits of project-based learning are that it improves problem solving skills, can improve collaboration skills, allows students to engage in active learning, improves students' critical and reflective thinking skills, helps students develop more complex problem solving skills, students are more involved and motivated in learning, thereby enabling lecturers to act as facilitators or companions in learning, improving the reputation of universities in society, and providing direct benefits to society. (Yustinus Suhardi Ruman Dian Anggraini Kusumajati, 2015).

Definition of The Pancasila Student Profile is a number of characters and competencies that are expected to be achieved by students, which are based on the noble values of Pancasila. (A., 2022) This is also in line with the Regulation of the Minister of Education and Culture Number 22 of 2020 concerning the Strategic Plan of the Ministry of Education & Culture. (*Definition of The Pancasila Student Profile*, 2023) More explicitly, the use of the establishment of the Pancasila Student Profile by the Ministry of Education and Culture of the Republic of Indonesia is (1) as translation of the goals and vision of education into a format that is more easily understood by all education stakeholders, (2) as a compass for Indonesian educators and students, and (3) as the ultimate goal of all learning, programs and activities in educational units. The Dimensions and Elements of the Pancasila

Student Profile are (1) Have faith, fear God Almighty, and have a noble character, (2) Global diversity, (3) Independent, (4) Team Work, (5) Critical thinking, and (6) Creative. (*Dimensi, Elemen, Dan Subelemen Profil Pelajar Pancasila*, 2023).

Have faith, fear God Almighty, and have a noble character mean that Pancasila students believe in and practice the values and teachings of their religion/belief. This is manifested in good morals towards oneself, fellow human beings, nature and the Indonesian state (nationalism).

Global diversity means that Pancasila students know and love their culture and country (nationalism), respect other cultures, and are able to communicate and interact between cultures. They also reflect on their experiences of diversity, so they can harmonize cultural differences to create an inclusive, just and sustainable society.

Independent means that Pancasila students must have an understanding of themselves and the situation they face, as well as self-regulation to achieve their goals and improve their quality of life.

Team Work means that Pancasila students carry out collaborations that are built on the basis of humanity and concern for the nation and state, so they can share with others.

Critical thinking means that Pancasila students who think critically analyze and evaluate all information and ideas well obtained. They are also able to evaluate and reflect on their own reasoning and thinking.

Creative means that Pancasila students are students who can produce original ideas, works, and actions. They also have the flexibility of thinking in finding alternative solutions to problems.

So, it can be mentioned several reasons for the importance of realizing the Pancasila Student Profile in this 21st century learning era which tends to apply a distance learning system:

1. The students have a strong mentality and character that are not easy falling into negative things;
2. Facilitate students to compete and adapt to changes that are fast and dynamic;
3. Preserving and passing on the noble values of Pancasila;
4. The way of thinking becomes more open and willing to accept any differences;
5. Familiarize students to have independent, critical and creative characters;
6. Have global abilities and skills, but still have character according to local values;
7. Preserving the spirit of team work, mutual respect and deep cooperation in every learning activity..

Method

The research method used in this analysis is linear regression, 150 respondents were involved in this research by distributing questionnaires by random sampling method. All statistical calculations, including regression analysis, were performed using SPSS 22. The results of the SPSS analysis stored in Ms. Word consist of

Descriptive Statistics, Tests of Normality, ANOVA Table, and Coefficients Table. The measurement of variables in this research used a Likert scale that was adjusted to the needs of the study. Research variables measured using this scale have a gradation from negative (lowest) to positive (highest), and the target population in this research were students at Bina Nusantara University, Jakarta. The 150 respondents were asked to fill out a questionnaire regarding the two independent variables, namely Lecturer Competence and Citizenship Education and dependent variable, namely the Pancasila Student Profile.

After the data was collected, the data were analyzed using path analysis with SPSS 22 software to determine the magnitude of the significance influence of Lecturer Competence in delivering Problem base Learning (X_1) and Citizenship Education (X_2) on the Pancasila Student Profile (X_3).

Results

From data processing with the SPSS 2022 program, the following results can be presented descriptive data as seen in Table 1.

Table 1. Descriptive Statistics

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance
VAR00001	150	62.00	154.00	216.00	186.3400	13.81558	190.870
VAR00002	150	31.00	129.00	160.00	144.1600	7.49683	56.202
VAR00003	150	46.00	119.00	165.00	143.2533	11.05276	122.164
Valid N (listwise)	150						

Based on the table 1 descriptive statistics above, it is known that the minimum score of X_1 variable (Lecturer Competence) is 154, the maximum score is 216, the mean is 186.3400, the standard deviation is 13.81558, and the variance is 190.870; meanwhile the minimum score of X_2 variable (Citizenship Education) is 129,00 the maximum score is 160,00 the mean is 144.1600, the standard deviation is 7.49683, and the variance is 56.202; and minimum score X_3 variable (Pancasila Student Profile) is 119,00 maximum score is 165,00 Mean = 143.2533, Standard deviation = 11.05276, and variance = 122.164.

To show the validity result of using the parametric statistics such as path analysis requires three things to be fulfilled, namely the data has a normal distribution, linear regression, and significant regression as described follow.

Table 2. Tests of Normality

	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
VAR00001	0.050	150	0.200*	0.990	150	0.366

VAR00002	0.061	150	0.200*	0.983	150	0.065
VAR00003	0.066	150	0.200*	0.983	150	0.062

*. This is a lower bound of the true significance.

a. Lilliefors Significance Correction

From Table 2, the result test of normality, it is known that the two variables are normally distributed, because the significance value in the Kolmogorov-Smirnov column is greater ($>$) than 0.050, such as X_1 (Lecturer Competence) is 0.200* X_2 (Citizenship Education) is 0.200* and X_3 (Pancasila Student Profile) is 0.200*.

To test linearity, there is information, that if the value of Deviation from Linearity Sig. $>$ 0.05, there is a significance linear relationship between the independent variable and the dependent variable. On the other hand, if the value of Deviation from Linearity Sig $<$ 0.05, there is no significant linear relationship between the independent variable and the dependent variable.

The results of the linearity test can be seen in Table 3.

Table 3. ANOVA Table

			Sum of		Mean		
			Squares	df	Square	F	Sig.
VAR00003 *	Between	(Combined)	5705.966	53	107.660	0.827	0.774
VAR00001	Groups	Linearity	542.501	1	542.501	4.168	0.044
		Deviation from Linearity	5163.465	52	99.297	0.763	0.857
Within Groups			12496.407	96	130.171		
Total			18202.373	149			

From Table 3, the Deviation from Linearity Sig value is obtained. of 0.857 is greater than 0.05. So, it can be concluded that there is a significant linear relationship between variable X_1 (Lecturer Competence) and variable X_3 (Pancasila Student Profile).

Table 4. ANOVA Table

			Sum of		Mean		
			Squares	df	Square	F	Sig.
VAR00003 *	Between	(Combined)	4530.428	31	146.143	1.261	0.188
VAR00002	Groups	Linearity	13.879	1	13.879	0.120	0.730
		Deviation from Linearity	4516.549	30	150.552	1.299	0.163

Within Groups	13671.946	118	115.864
Total	18202.373	149	

From Table 4, the Deviation from Linearity Sig value is obtained. of 0.163 is greater than 0.05. So, it can be concluded that there is a significant linear relationship between variable X_2 (Citizenship Education) and variable X_3 (Pancasila Student Profile).

To test the significance, there is information, if the significance value (Sig) is smaller ($<$) than the 0.05 probability, it means that there is an influence of X (independent variable) on Y (dependent variable). On the other hand, if the significance value (Sig) is greater ($>$) than the probability of 0.05, it means that there is no effect of X (independent variable) on Y (dependent variable).

The following are the results of the significance test which can be seen at Table 5 in the ANOVA^a table.

Table 5. ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	17961.144	1	17961.144	11019.575	0.000 ^b
	Residual	241.230	148	1.630		
	Total	18202.373	149			

a. Dependent Variable: VAR00003

b. Predictors: (Constant), VAR00001

From Table 5, it is known that the significance value (Sig) of 0.000 is smaller than the probability of 0.05, so it can be concluded that there is a significant influence of X_1 on X_3 .

Table 6. ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	18098.383	1	18098.383	25757.674	0.000 ^b
	Residual	103.991	148	0.703		
	Total	18202.373	149			

a. Dependent Variable: VAR00003

b. Predictors: (Constant), VAR00002

From Table 6, it is known that the significance value (Sig) of 0.000 is smaller than the probability of 0.05, so it can be concluded that there is a significant influence of X_2 on X_3 .

Table 7. Coefficients^a

Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.
-------	-----------------------------	---------------------------	---	------

		B	Std. Error	Beta		
1	(Constant)	-56.668	3.577		-15.840	0.000
	VAR00001	0.155	0.043	0.193	3.592	0.000
	VAR00002	1.187	0.079	0.805	14.964	0.000

a. Dependent Variable: VAR00003

From the Table 7 above means that there is a positive direct effect of Lecturer Competence (X_1) and Citizenship Education (X_2) on the Pancasila Student Profile (X_3) with a coefficient of 0.998. That means that Lecturer Competence variable and Citizenship Education variable together effect 99.8% on the formation of the Pancasila Student Profile, while the remaining 0.2% is effected by other variables which are not discussed in this research. Based on the table 7 above as the result of the data processing, a structural equation can be made as follow:

$$X_3 = 0.193 X_1 + 0.805 X_2 + \epsilon_1$$

The equation showed the significance direct influence of Lecturer Competence in delivering Problem Base Learning (X_1) = 19.3% and Citizenship Education (X_2) = 80.5% on Pancasila Student Profile with a coefficient totally of 99.8% and only 0.2% was influenced by other variables which were not discussed in this study.

Discussion

From the results of the data processing, it was revealed that Lecturer Competence and Citizenship Education had a significant influence on the formation of the Pancasila student profile. These result are understandable considering that Lecturer Competence is oriented towards the lecturer's pedagogical competence in delivering project-based learning to help the students be able to deepen and apply noble values as citizens, so that it is conducive to realizing the Pancasila student profile. While Citizenship Education is oriented towards deepening and applying noble values as citizens, which are closely related to the dimensions of the Pancasila student profile, such as (1) Faith, devotion to God Almighty, and noble character, (2) Global diversity, (3) Independent, (4) Teamwork, (5) Critical thinking, and (6) Creative.(R & A.A., 2022; Tahsya Noer Oktafiyani Anissa Windarti, 2022)

Tahsya Noer Oktafiyani, Anissa Windarti, and Masruroh (Tahsya Noer Oktafiyani Anissa Windarti, 2022) in their research entitled The Effect of Lecturers' Competency on Students' Academic Achievement showed that there is a significant influence of lecturer competence on student academics achievements.

Garnis Maulidya in her research entitled Motivation and Competence of Lecturers in Improving Students Learning Achievement Elementya showed that lecturers have a high key role in improving the quality, relevance, efficiency and achievement of student learning.(Maulidya, 2023) Lecturers must optimally prepare theirs competence, because after all the competence of lecturers will reflect good performance as well. Lecturers who have competence must be able to motivate students with a variety of the latest knowledge and relevance in real life.

Sudarjo and Suyitno in their research entitled The Effect Of Student Learning Motivation And Lecturer Competence On Student Achievement In Commerce Correspondence Learning also stated that student learning motivation and lecturer competence have a positive and significant effect on student achievement.(Sudarjo & Suyitno, 2023) Even though the context is different, it is clear that lecturer competence does have a big influence on the achievement of learning objectives, which in citizenship education is the formation of a Pancasila student profile.

Conclusion

From the results of the research above it can be concluded that the influence of Lecturer Competence in delivering Project Base Learning and Citizenship Education through Blended Learning are very significance to the formation of The Pancasila Student Profile as shown from the result of research data processing, namely that Lecturer Competence and Citizenship Education have significant positive direct influence (99.8%) on the formation of Pancasila student profile. Although there are other factors that also effect it, but it too small (just only 0,2%). Therefore, apart from going through formal Citizenship Education in schools, the values of Citizenship Education as well as those contained in the Pancasila student profile need to be further developed in everyday life as informal and non-formal education by role model of the Lecturers.

So, Lecturers' competence in delivering citizenship education courses using a project-based learning approach must continue to be improved in a blended learning system which involves assisting in the implementation of project-based learning, online learning through discussion forums and independent learning through personal and group assignments.

Hopefully this conclusion triggers the world of education to accelerate changes in innovation and creativity in terms of systems, methods, and learning content, that the Pancasila Student Profile continues to be built among the students, especially through increasing lecturer competency in delivering project-based learning in citizenship education courses which are also held in blended learning without excluding the informal or non formal education factors by distance learning..

Recommendations

Therefore, it is recommended that training on project-based learning be important for lecturers who teach citizenship education. Apart from that, it is also necessary for lecturers to understand the urgency and relevance of citizenship education which must be directed to build Pancasila Student Profile.

Acknowledgement

Thank you very much for Bina Nusantara University that has given supporting us to finished this research. This

research was made possible thanks to moral and material support through an internal grant from Bina Nusantara University, Jakarta, Indonesia.

“Who Said We Are Politically Inactive?”: Exploring Incentives to Political Participation Among Youths in Malaysia 15th General Election

Wan Rohila Ganti Wan Abdul Ghapar

Universiti Sultan Zainal Abidin, Malaysia,  <https://orcid.org/0000-0001-6729-9244>

Abstract: In the lead-up to the 15th general election, political observers predicted low electoral turnouts among youth, particularly within the 18-24 age cohort, attributed to a pervasive sense of political fatigue borne from unrestrained political and economic developments between 2018 and 2022. The perception of politics as corrupted and politicians as insincere had ostensibly alienated young voters. Contravening these expectations, not only did young voters exhibit high turnout rates in the 15th general election, but they also actively participated in vote canvassing, challenging the narrative of youth disengagement. This study, anchored in the General Incentives Model (GIM), draws on in-depth interviews with 26 youth party activists to explore the catalysts behind their distinct engagement and the incentives they received when participating in politics. It uncovers that young activists leveraged TikTok to create impactful campaign content that not only addressed criticisms of their parties but also cast a spotlight on the failings of their adversaries, reaching a broad audience without the expectation of material compensation. Their involvement was driven by a blend of collective, altruistic, and expressive incentives, marking a departure in both form and motivation from older activists. This investigation into the resurgence of youth participation offers critical insights into the changing landscape of political engagement, underscoring the innovative strategies and intrinsic motivations propelling young voters to the forefront of electoral politics.

Keywords: Young voters; UNDI18; General Incentives model; Malaysian 15th general election

Citation: Wan Rohila Ganti, W.R.G. (2024). “Who said we are politically inactive?”: Exploring incentives to political participation among youths in Malaysia 15th General Election. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1937-1947), Antalya, Turkiye. ISTES.

Introduction

The Parliament of Malaysia in the year 2021 has unanimously approved a constitutional amendment to (i) lower the country’s voting age from 21 to 18, (ii) allow automatic voter registration and (iii) make 18 the minimum age for elected representatives. Popularly known as the Undi18 Bill, it is a manifestation of Malaysia's commitment to empowering the voice of the youth and widening the democratic space in the country.

The recently concluded Malaysia 15th General Election (GE15) witnessed 2 million new voters age 18-21 years

were allowed to vote for the first time. This cohort of voters were mainly school leavers. Almost 1 million of them are now pursuing their studies at degree level at the government or private universities, meanwhile the other half is doing short vocational courses at government polytechnic or training centers. The rest are doing odd jobs as they just have a basic secondary school certificate. All of them are still dependent on their parents and unmarried since the youths in Malaysia culturally get married after they finish their tertiary education, around the age of 24.

Background of Study and Statement of Problems

While Undi18 Bill was applauded as a bold decision taken by the newly elected Pakatan Harapan (PH) government, many were skeptical on the ability of youth age 18-21 to make political decision. Studies on Malaysian youth found that they have lack of interest in topics related to elections, democratization, the selection of quality leaders, and current issues (Zulkifli, Mokhtar & Mohd Zain (2023). In addition, the findings from the World Value Survey - Malaysia Chapter (2010-2014) found that there was a wide gap between youth political participation (65.4%) and adults (92.5%). This data is further strengthened by the turnout rate of the youth cohort (21-35 years old) in GE14 that scored much lower compared to the 40-59, 60-79 and 80 and above cohorts. The Malacca and Johor state elections in November 2021 and March 2022 also recorded low turnouts at the youth polling streams (21-35 years old); only 5 percent of turnouts respectively.

Political apathy among the youths worried Malaysian political stakeholders. Hypothetically, if the youth cohort age 21-35 years old scored low level of voting turnouts, the new youth from cohort 18-21 years old would score even lower. Previously, elections results would be easily expected by political pundits as the voting trends and voters' tendencies were straightforwardly influenced by bread-and-butter issues, religious sentiments and ethnic polarization. With the presence of significant number of young voters age 18-21, political observers expected massive change in the Malaysian voting trends. These very young voters have just left secondary schools, are not burdened by the country's economic downturn as they are fully dependent on their parents, never go to market and not aware of the rising price of the basic goods, never fuel a car, and never experienced low wage treatments at workplace. Their main focuses are securing university placement and suitable university courses that match their A-level results. Their political inclinations and demands are unclear. Studies found that the youths are not only having low level of political interests, they also have no knowledge on how a political system in Malaysia works. In fact, only 27% percent of university students in Malaysia registered as voters prior to GE14 (Kasmani, 2023).

Contrary to prevailing perceptions, new voters emerged as the decisive "kingmakers" in Malaysia's 15th General Election. They exhibited high voter turnout and played active roles in campaigning, notably utilizing platforms such as TikTok. Supplanting older party activists who traditionally relied on conventional campaign methods, they generated influential campaign content that not only addressed criticisms of their parties but also highlighted the shortcomings of their opponents, thereby reaching a wide audience. This phenomenon has prompted the initiation of this study to scrutinize the catalysts driving their distinctive engagement and the

incentives they receive when participating in politics.

Theoretical Framework of the General Incentives model

The general incentives model of political participation refers to the individual's motivation to participate in political activities beyond a narrowly cast economic analysis of incentives and resources (Haute & Gauja, 2015). Prominent party membership researchers, Whiteley & Seyd, (2002) proposed seven incentives that motivate individuals to be actively involved in political parties.

The first incentive is selective process incentive. It is known as the psychological satisfaction derived from the process of participation itself. The entertainment values benefitted from being involved in political activities such as gaining an opportunity to meet like-minded people, participating in various political activities, learning about the political process at first hand and having access to better political information. The second one is selective outcome incentives. These are the positive outcomes of being a loyal voter, eventuated in the form of materialistic such as gaining politically appointed positions in the executive and legislative branches, developing a full-time career in party politics and acquiring government projects or contracts (Whiteley & Seyd, 2002).

The next incentive is collective incentive. People have a greater incentive to be active if their party is pursuing policies which closely congruence with their own policy preferences. They participate not only because they want to promote particular policy goals but also because they oppose the policy goals of other parties (Whiteley & Seyd, 2002). Collective incentives are always equated with ideological incentives. The ideology, manifestoes and directions of the party are the factors that motivate voters to be more engaged compared to those who have low attachment to the party policies. In contrast, the normative incentives are focusing at the compliance with social norms and the perceived opinions of significant people whose opinions they respect and value. Some voters receive a pressure that forces them to win the respect or approval from their circles, such as family tradition and the influence of educational institution, religious institution and peers (Back, Teorell, & Westholm, 2011). Some may choose to be politically active due to the obligations they feel towards the action, since being politically active is normal and it provides them with an opportunity to express their values and loyalties to the social norms (Gallagher, Liston, Marsh, & Weeks, 2002).

Individuals are also motivated by altruistic incentives in which they are bound by their emotional attachment to the party which has little to do with the policy positions it espouses, and they contribute without considering the costs and benefits of their actions (Young & Cross, 2002). Altruistic concerns are expressed in terms of idealistic goals, such as the desire to create a more compassionate and tolerance society (Young & Cross, 2002).

Finally, the expressive incentives can be described in relation with the act of publicly expressing one's perceived psychological, ideological and moral values attached to the party without fear. They proudly wear shirts with party logo, hung posters at the windows, posting, sharing and re-tweeting political statements at

social media and joining rallies. Thus, by getting involved with party activism, it provides a way of expressing their loyalty to the party (Back et al., 2011) and supporting the party's stand on certain values including ethnic supremacy, religion, human rights, economic justice, political equality or supremacy of the constitution.

Review of Literatures on Forms of Political Participation

Political party activists engage in high-intensity political activities that are not performed by normal members and supporters. They take part in conventional and unconventional political activities like joining lawful public demonstrations, boycotting certain products to show their protest, signing petition, becoming a representative links to the community that is necessary for party interest aggregation and articulation, contacting party officials, representatives, and government officials to raise community issues, and facilitating political education. Political party needs participation at the grassroots level to convey its ideas, its traditions, stance, and its commitments. Having a durable base of party activists has helped parties win elections and stay connected with voters in between elections and has kept up voters to continuously support the party, as they might otherwise have stayed out of politics. As legal and registered party members, they have the rights to decide and choose party leadership, policies, and directions during the branch meeting or provincial convention.

When elections are around the corner, they recruit new party supporters and provide a base of possible volunteers for election campaigns, canvass potential voters, and conduct voter registration drives, define the image of the party, mobilize voters to the ballot, and oversee polling stations. In addition to sleepless nights, they also prepare, and coordinate election works like political rallies, political talks, candidate walkabouts and meet-and-greet sessions between candidates and voters. They hang-up party flags and posters, prepare foods and drinks to party force, distribute flyers, and hold flash mob campaigns near busy junctions.

Moreover, they become the administrator for party websites and other social media platforms by posting and tweeting the party's current programs and responding to visitors' comments. They openly wear or display a campaign badge or sticker related to the party on their clothing and/or vehicles. Since many political parties are almost reliant upon their activists, these political party activists also donate money to fund party programs. Furthermore, they organize fund-raising events like dinner, carnivals, and auctions (Haute & Gauja, 2015; Vecchione et al., 2015).

The leftist members are more active compared to right-wingers. They are more likely than right-wing citizens to contact officials, campaign, persuade others, cooperate, and protest; yet, they are less likely to cast a ballot. The activists that perceive themselves as ideologically distant from the government in power are more likely to engage in any mode of political action (Meer, Deth, & Scheepers, 2009). Conversely, Wauters, (2018) found that the party activists from pro-government parties are more likely to participate in what he calls 'direct actions' like boycotts and petition signing. Of all direct political action activities, joining street demonstrations is the most chosen activity among the party activists.

Notes on Methodology

This qualitative study adopts an in-depth face-to-face interview. The informants were recruited based on a purposive sampling method, which a deliberate choice of informants was due to the qualities the informants possessed. The researcher browsed political party official Facebook accounts to trace potential young party activists, and approached the youth who were active and constant in giving comments and ‘likes’ over party posts, photos and posting their pictures of joining various party programs. Private messages were sent to more than 50 potential informants, yet only thirty –five potential informants responded, and only twenty-six of them fit to proceed with the interview. They included sixteen male party supporters and ten female party activists, ranging from 21 years old until 30 years old.

In order to establish credibility, the research data were analyzed following the six steps underlined by Ritchie, Spencer, & O’Connor, (2003). The first step was transcribing the interview transcripts into a written text. The transcripts were then manually labelled based on main themes and codes, based on six classifications of high – intensity political activities underlined by (Whiteley & Seyd, 2002). The codes were continuously ‘define’, ‘refine’ and ‘revise’ during the coding process. New codes were created when new themes emerged, and codes deemed no longer useful were deleted or merged with other codes. The next step validating the coding scheme, by checking the coding consistency based on the researcher’s understanding of the themes. The fifth step was the most critical step. Its success relied almost wholly on the researcher’s reasoning abilities. This step involved making sense of the themes or categories identified, making inferences, and presenting the researcher’s reconstructions of meanings derived from the data, exploring the properties and dimensions of themes, identifying relationships between themes, uncovering patterns, testing themes against the full range of data, and crossing-referencing case analysis to discover similarities and differences between participants. Lastly, the research findings were presented.

Results and Discussions

The results are organized according to two main themes identified: forms of political participation, and political incentives to boost motivation of party activists. All informants have an account on social media; Facebook, Twitter, Instagram and Tik Tok. They mentioned that apart of personal postings, most of their postings are related to political issues, their involvement in party programs, and their social media friends are mostly from the circle of their political party. This is congruent with the findings of Taru, (2016) and Velasquez & LaRose, (2014) that social media users openly and publicly express their political beliefs and party affiliations within the context of their online activities. They join an online political party's group like Friends of BN (Barisan Nasional) (<https://www.facebook.com/frensofmalaysia/>) or Friends of PAS (<https://www.facebook.com/groups/Friends.of.pas/>) or becoming Facebook friends with political figures like Members of Parliament, party leaders, and party candidates can be likened to the political act of placing a party's sign in one's front yard. Smeltzer & Keddy, (2010) commented that it is also possible for social media users to

self-identify political leanings and party affiliations on their personal Facebook profiles, which can be used to locate others with similar views. Through an increased realization that others also share common political views, it may become possible to further normalize counter-hegemonic political activities and help neutralize government propaganda and media control.

“As my daily activities are mostly related to party, most of my IG postings are related to politics. I posted up political statuses, shared postings from other activists, shared the statuses from party leaders, shared e-posters, tagged my friends, gave my comments on others’ posts. Even most of my social media friends are mainly political figures and political activists.” (Informant#7)

The narratives of the posting, the double-meaning photos, the exposures of political scandals are the soft-power of social media, capable of influencing one’s political perception. The informant revealed:

“Using social media does not entail you to become an IT saver. It is the fastest, easiest, cheapest and most impactful medium of campaign. So the cyber troopers, mostly the party activists have to fully utilize this medium. We utilize social media to the maximum. We share the Live Videos of political talks, lives from Parliament, and other video taken from PAS IT Center. I think the main factor PAS won the votes from the youth because of our fully utilization of social media.”(Informant#10)

Other than social media, Tik Tok has become another medium of cyber activism. The Digital News Report 2021 by the Reuters Institute for the Study of Journalism at Oxford University found that 51% of news consumers in Malaysia use Tik Tok to find, share or discuss news in a given week. It permits election propaganda like messages and videos to be spread speedily. Unlike Facebook or Instagram, Tik Tok does not entail users to follow others. The Tik Tok videos will be automatically shared on Facebook, Reels and, Shorts platforms. The informants mentioned that they utilized Tik Tok extensively during the campaign period. They mentioned:

“Tik Tok is more reachable, the audience is wider. It is free. Mostly, the Tik Tok videos are simpler, shorter and easy to digest. But I have to try to avoid hatred videos, intimidation, spread slanders, fake news.” (Informant#20)

Social media also witness party activists from different political parties bickering and saying harsh words to each other just to defend their political parties and their leaders. The debates became worst when they started using dirty words and playing the religion and race cards. The informants mentioned:

“That is common to have hot debates on social media. I myself would defend the party to my level best when they are accusing Tok Guru, for example. Usually, I encounter back with e-posters and facts provided by the IT men in PAS. I can say I have to study a little bit and understand the issue to speak to the opponents. If not, I will be bashed by them, and sometimes, if I give wrong statements, they would print screen it and become their credit” (Informant#10)

It is concluded that PAS youths were more aggressive and became the pioneer in using social media to disseminate political information, and give awareness and understanding to the public about the mess that had been done by the government. Later, it was fully utilized by all political parties, until a cybertrooper team is formed to simplify political information in the form of e-posters, catchy graphs and charts, and animated chronology of political cases. Nevertheless, social media has also become a place for party activists to refute their opponents and discredit others who do not agree with them.

The interview data on what motivates young political party activists to engage in party works yielded that they were motivated by three main themes: collective ideology, altruistic and expressive incentives. Everyone subscribes to a set of political beliefs and values that guide their behavior, either consciously or unconsciously. An individual's political ideology is shaped by his/her socialization when helping to form the attitudes and beliefs of other party members. Differences in age, gender, social class, and income are all associated with differences in socialization and life experiences, and consequently in attitudes and beliefs. The level of youth's attachment and loyalty to the party also determines ideological beliefs. Strongly attached activists are more ideologically driven than the weakly attached ones. Inflexible party activists, those who uphold party principles strongly, are much more ideologically driven than pragmatists (Whiteley, Larsen, Goodwin, & Clarke, (2021).

All pro-UMNO informants mentioned that they are attracted by UMNO's ideology to protect and empower the rights of the Malay. UMNO's ideology is comparable with informants' political conviction to see the superiority of the Malays. They mentioned:

"We got independence because of UMNO. Without UMNO, Malaysia would be destined differently. In Malaysia, even though Malays are majority, Chinese are rich. They control our economy. They slowly want to claim their rights. I cannot imagine if UMNO is not existed, the fate of the Malays, who is going to fight for our rights? Malaysia will be Singapore. May be the 13 May riot will happen again." (Informant#13)

The data above yield three glaring points. Firstly, the informants are grateful to UMNO as it had struggled for the independence of the country. The perception that all affairs related to the country's independence should be indebted to UMNO, has increased the spirit of nationalism among UMNO supporters, but indirectly belittling the supporters of other parties (Mohd Faidz et al., 2011). Secondly, UMNO envisioned a Malaysia ruled by Malays, so naturally, Malays would be granted special rights and privileges. The concept of the Malay supremacy has been manipulated by the UMNO elites to preserve the hegemony of the party and their positions in Malaysian politics. From the perspective of the Malays, the increase in Chinese electoral victory would be a disaster, as political control is deemed a counterbalance (i.e. consolation) to the Malays' own impoverished economic situation. The UMNO elites have chosen to capitalize on the fear that the special rights of the Malays and their religious superiority are under threat by mobilizing ethnic and religious sentiments to gain more Malay votes. UMNO precisely targets rural Malay constituencies to make use of the situation and to instill the fear of losing special rights and religious superiority among Muslim-Malays (Hamayotsu, 2013).

The third point mentioned by the informants is the domination of Chinese, especially DAP, in economy and politics. The Malays are worried they would be left behind, and become the second-class citizens in their own land. UMNO's campaign narrative always emphasizes that DAP has the real power in the opposition pact, portrayed as no more than a proxy for anti-Malay and anti-Islamic forces bent upon destroying Malay-Muslim hegemony with financial help from pro-regime change movements like Open Society Foundation.

Meanwhile, all pro- PAS informants mentioned that PAS' ideology to establish an Islamic state in accordance with the framework of the Quran and Sunnah has become the utmost attraction over their activism with PAS. Their political convictions seemed to be parallel with what PAS upholds. The interview data yield that the surface of the party is secondary as its substances matter. They mentioned:

"Our ultimate goal in this life is to enter Paradise, to get Allah's blessings. Allah clearly said that there is no separation between Islam and politics. There is no such thing as separating Islam and politics. That is secular. That is *taghut* (one who does not rule by that which Allah has revealed). That is what UMNO is doing. They don't trust the capability of Islam in ruling the country. They are afraid of Islamic state. In PAS, Islam is the main reference. Islam leads. We are proud to tell other countries that Malaysia is an Islamic state."(Informant#4)

Extracting the verbatim response above, two main points are worth a ponder. Firstly, PAS informants are motivated by the ideology of PAS because only PAS is seen serious and effortful in implementing the teachings of the Quran and Sunnah in the state. All informants were able to synthesize the symbiosis among electoral politics, ibadah, and the attainment of Allah's blessing. Secondly, they believe that their involvement and activism with PAS is to attain the blessing from Allah and thus, be rewarded. They mentioned:

"Performing daily ibadah like five times – a day prayer, paying zakat and performing hajj is relatively easy. But Islam is beyond that. It covers law, economy, politics, crime and other social systems. We need an Islamic state to ensure all these aspects are running in a way Allah orders."(Informant#12)

In the context of incentives to political participation, scholars agreed that political parties provide collective goods, which potentially affect everyone regardless of whether or not they are members or supporters of a political party. It is assumed that youth party activists receive particular private incentives over their activism, as they are not that naïve in spending their valuable time, money, and energy just for the sake of collective goods. Scholars argued that they receive 'selective incentives' or inducements to participate. These selective incentives are private goods, in the sense that anyone who does not join will not receive them. Selective incentives must be important enough to overcome the problem in situations where the temptations to free ride are great (Poletti et al., 2019).

Fiorina (2002) comically described that finding motivation through the selective process can be considered as being hungry for fame. The chance to meet and greet party leaders, to take photos with them, and to upload those photos on social media to be praised by family and friends is truly a rewarding experience. Other than that,

becoming among the first to get the scoop on political information like the election date, the list of election candidates, the probability of cabinet reshuffling, and the political scandals involving high profile figures, is fulfilling and exciting, as others would be amazed with one's 'accurate' political predictions. Being recognized by everyone in the streets over one's activism with a political party allows an activist to feel important and valuable. One's capability in taking action and solving other people's problems makes an activist popular, consequently being invited to community feasts, being interviewed by reporters over local issues, and being able to expand social network deemed important for business. These informants shared their exciting experience:

"I can say, high fever would be recovered when I join party programs [Laughing]. When I am doing party works, time flies so fast, sometimes up to 2 – 3 am in the morning. Apart from spending my free time with my family, I can mostly be found at party office. My wife really understands my commitment to party. Not to mention election period, it will be double triple busy. I surely sleep at party office." (Informant#9)

The verbatim statements above yield similarities between any party informants, where they found emotional satisfaction to be with the party. Psychologically, Maslow's Hierarchy of Needs describes that people crave the social needs of love, acceptance, inclusiveness, and the sense of belonging. The informants would feel safe and secure when surrounded by like-minded people, as they felt that they could support each other. Even the small gesture of supporting friends on their Facebook timeline is meaningful enough:

"Whenever I put up any political status on my social media, of course I would be teased, or challenged by friends from rival parties. But simply reading comments from my friends that support my status, it is more than overwhelming." (Informant#8)

Similarly, the chance to mingle with political figures and to be recognized by them cannot be simply enjoyed by anyone in order to emphasize that laymen rarely have such an opportunity to meet political figures. Therefore, it is understood why others would be amazed when party activists upload their photos with prominent political figures like the Prime Minister and the Chief Minister. Observation on the social media accounts of 19 informants showed that all of them had uploaded personal photos with political figures. For example, they uploaded their photos with Prime Minister Ismail Sabri, Chief Minister Dr. Samsuri, PAS figure Haji Abdul Hadi, and PAS celebrity Ustaz Azhar Idrus, whom they met during their party's annual general meeting and closed-door party programs. The photos generated positive comments from their social media followers, with most comments expressing envious remarks over the informants' encounters with highly prominent political figures; some commenters hope to get similar opportunities in the future.

Conclusion

Contrary to popular opinion that individual's main intention to involve in politics is to gain material rewards and promising positions, this study found that the ultimate motivations towards political party activism among

young party supporters were the ideology of the party and the satisfaction and contentment they receive by joining and mingling around with politically like-minded people. Hierarchically, party supporters are at the lowest rank of the party yet they are the most committed and devoted to party principles and offered the hardest jobs since they need to attend lengthy evening meetings and help with canvassing and electioneering. They are more concerned with ideological purity than electoral popularity. In terms of political participation, they chose to use social media as the best and most impactful platform to campaign. These two findings clearly proved that the way young party supporters play politics are far different with old party workers.

Recommendations

Attracting young party activists can be challenging as they often tend to remain neutral or undecided. However, an examination of youths who opt to actively engage in political activities reveals that they can serve as valuable assets to political parties. Their adeptness at conveying political messages through various accessible methods underscores their potential significance. Therefore, political parties ought not to underestimate the capabilities and capacities of young individuals and should incorporate them into the formulation of party strategies.

Acknowledgements

The researcher wishes to express gratitude to all informants who generously participated in interviews and openly shared their political perspectives. Additionally, acknowledgment is extended to the Faculty of Law and International Relations at Universiti Sultan Zainal Abidin, Malaysia, for their support of this research endeavor.

Influence of Financial Intermediation Institutes on The Welfare of The Population in The Western European Countries: A Comparative Analysis

Karen Turyan

National Polytechnic University of Armenia, Armenia,  <https://orcid.org/0009-0009-8578-7888>

Abstract: Throughout the history of the origination and development of the economy, financial intermediation has served to reduce transaction costs, which has had a stimulating effect on the economic system. On the other hand, financial intermediation at certain stages, replacing the real sector of the economy, could cause economic crises, unjustifiably inflating the money supply. The period after World War II was a period of prosperity and development of the economies of Western Europe. The struggle and unity of opposites, which manifests itself in the synergy of capitalism and social justice, leads to the formation of a new society. All the difficulties of this period undoubtedly affected the well-being of the population. In such difficult conditions, financial intermediation could play an important role in developing the economic potential of Western European countries. Was this really the case? The article makes an attempt to find an answer to this particular question. The purpose of this study: - to determine the impact of the financial intermediation institutions on the well-being of the population in Western European countries. We use the methodology of chrono-discrete monogeographic comparative analysis proposed by Demichev (2019) for legal institutions.

Keywords: Economic growth, financial intermediaries, population welfare, life expectancy at birth, human capital index

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 1948-1969), Antalya, Turkiye. ISTES.

Introduction

The article submitted on consideration is the result of arguments from another article of the same author (Turyan, 2023) the "Influence of financial intermediation institutions on the welfare of the population in the post-Soviet countries: A comparative analysis". Many colleagues noted that it would be desirable to conduct a comparative analysis of the impact of financial intermediation institutions and also on the example of developed economies. This article is the first in a series. In it, the author attempts to review statistical data and carry out an empirical analysis of the above topic. Since the statistical data of the countries considered in the study have high reliability and a 50-year history, the author will consider conducting a regression analysis based on the results of this study in the future. The purpose of the study will be identifying the mathematical connection between the

influence of financial intermediation and the well-being of the population.

Financial intermediation represents both an economic tool and a domain of economic activity with the primary objective of addressing the needs of the population. In this context, the needs take precedence as fundamental factors, while the activity itself assumes a secondary role. Evaluating the effectiveness of economic growth involves considering the dynamics of gross income and per capita income. However, a more comprehensive assessment is reflected in social efficiency, which is judged by the extent to which the population's needs are satisfied, viewed through the lens of overall societal welfare. The paramount importance of the population's well-being is emphasized as a crucial factor in ensuring a satisfactory quality of life for citizens.

Certain scholars, define well-being as the satisfaction level regarding essential goods. Adam Smith (1776) regarded financial intermediation as a means of generating wealth and alleviating poverty by aligning personal and public interests. This definition underscores the correlation between financial intermediation and wealth levels, as it has been established that these intermediaries reconcile the interests of various stakeholders. Consequently, consumers experience a heightened level of satisfaction when utilizing financial services that contribute to increased income and acceptable investment risks for the population.

Notably, T. Campanella (2009) and E.G. Morelli (1953) associate well-being with an equitable distribution of goods in society, emphasizing the role of financial intermediation in enhancing overall well-being by facilitating the flow of excess of resources to the shortage. The United Nations (UN) employs a comprehensive diagnosis spanning various aspects, including employment, health, nutrition, demographic conditions, education, and human freedom, to assess the well-being of a population. Additionally, the UN highlights socioeconomic sustainability as a critical element, contingent upon the development of financial markets.

Financial intermediation enhances the well-being of individuals both materially and spiritually. In material terms, these intermediaries contribute to the growth of savings for a segment of the population, reduce transaction costs, and secure more income with less risk through investments. This enables meeting future needs, sustaining the standard of living for the elderly and people with disabilities. For participants in the financial market who are borrowers, financial intermediaries expand possibilities for immediate needs, facilitate quality medical treatment, assist in acquiring real estate, and support access to paid education. Without financial intermediaries, the current consumption level of borrowers would be lower.

From a moral standpoint, financial intermediaries, by increasing investment reliability, instill confidence in the future and better health. The time saved through intermediary services can be redirected to fulfilling other needs, such as recreation. Empowerment through borrowing allows people to feel more comfortable in the current period.

Financial intermediaries, as value-generating organizations, play a crucial role in increasing GDP and ensuring overall economic growth. These institutions, generally taxpayers, contribute to expanding state budget revenue,

enhancing the state's ability to meet the population's needs. Additionally, financial institutions enable the financing of innovations from a country's internal reserves, fostering opportunities for future economic development.

However, it's important to acknowledge the associated risks with financial intermediation. Overestimating one's capabilities when using borrowed funds can lead to an inability to fulfill obligations and a noticeable deterioration in financial situations. Dishonest behavior by financial intermediaries, aggressive service imposition, and citizens lacking information on the cost of credit products are potential risks. Addressing these issues requires state regulations and the promotion of financial literacy among the population.

The correlation between the activities of financial intermediaries and economic growth is a debated topic in the scientific community. Supporters, like Bagehot (1920) and Hicks (2003), emphasize the importance of capital markets in stimulating economic growth, citing historical examples. On the contrary, Robinson (2000) points to the inverse relationship between economic growth and financial institutions. Qualitative assessment, considering customer satisfaction, reputation building, and global financial market competition, is crucial in evaluating the growth rate and development of financial intermediation.

Global economic trends significantly impact financial intermediation due to its association with the international movement of funds. Therefore, developing a system to reduce risks and dependence on international counterparts is essential.

Economists also highlight the dependence of financial intermediation on inflationary trends. Rising inflation reduces the activity of financial intermediaries, leading to an increase in "financial disintermediation" when investors and savers engage in transactions directly. To foster the development of financial intermediaries, controlling the inflation rate becomes imperative.

To study the general trends in the development of Western European countries, it is necessary to clarify the object of analysis. The concept of Western Europe is usually interpreted in two meanings - political and scientific-geographical.

From a political perspective, the term "Western Europe" is a relatively recent construct that gained prominence following the division of European countries into two distinct camps, namely socialist and Atlantic, in the aftermath of World War II. The active utilization of this term commenced during this post-war period.

The states of the first block fell into the zone of influence of the USSR. Geographically, they were located closer to the Soviet Union, which was located to the east, and therefore the region they represented soon began to be called Eastern Europe. If you look at the map of the continent, the geography of the socialist bloc included the GDR, Czechoslovakia, Poland, Yugoslavia, Romania, Albania, Bulgaria, and Hungary.

The states of the Atlantic bloc - the bulk of the rest on the continent - fell into the zone of US influence. Located to the west of the socialist countries, they began to be called Western Europe.

There is also a scientific and geographical context in which the term in question can be revealed. Based on one of the interpretations, we should talk about the division of Europe:

- to the northern part, which is represented by the Scandinavian and Baltic countries, Finland and Iceland;
- to the central part, represented by Germany, Austria, Liechtenstein, Hungary, Poland, Slovakia, Slovenia, the Czech Republic and Switzerland;
- to the eastern part, which is represented by the European part of Russia and Kazakhstan, Ukraine, Belarus, Moldova;
- to the southern part, which is represented by the Balkan states, Romania, Italy, Spain, Portugal, Cyprus, Malta, and the European part of Turkey;
- to the western part, which is represented by France, Great Britain, Ireland, Holland, Belgium, Luxembourg, Gibraltar, Andorra, Monaco.

Thus, in a scientific and geographical sense, Western Europe is significantly inferior in scale to that determined on the basis of political criteria.

According to the author, "Western Europe" should be understood as a group of European states united along political or cultural-geographical grounds. From this point of view, for the purpose of research, when we say Western Europe, we mean countries and territories that during the Cold War were in the zone of influence of the United States, and were also the founders of the European Community (Belgium, Great Britain, Denmark, Iceland, Spain (since 1982), Italy, Luxembourg, the Netherlands, Norway, Portugal, France, Germany (since 1955)).

The purpose of this study: - to determine the impact of the financial intermediation institutions on the well-being of the population in Western European countries.

Tasks:

- Conduct a comparative analysis of economic development indicators of Western European countries.
- Perform a comparative analysis of the well-being of the population.
- Trace the relationship between the level of development of financial intermediation and the well-being of the population in Western European countries.

Method

We propose employing the Chrono-Discrete Monogeographic Comparative analysis methodology introduced by A.A. Demichev for legal institutions (2019) in examining the dynamics of socio-economic processes. This

adapted methodology for economic objects encompasses the utilization of various methods, approaches, and theoretical concepts to analyze diverse economic phenomena occurring in the same geographic region, characterized by changes in economic formations over time. In our specific case, we are focused on the geopolitical shift that transpired in the economic foundation of Western European countries post-World War II, marked by the rise of socialist tendencies and the integration of central planning elements into government administration. This transformative period gave rise to a mixed economic model in Western European countries.

The concept of Chrono-Discrete Monogeographic Comparative Analysis (CdMCA) involves a nuanced approach to comparative analysis, departing from traditional methods. In traditional comparisons, institutions, ideas, or concepts are typically assessed across different countries or similar constructs within the same historical period. However, CdMCA introduces unique elements:

Monogeographic: This term implies that the comparison is made within a single country, focusing on state institutions, ideas, concepts, etc., that existed within that specific geographical boundary.

Chrono-discrete: "Chronos" (time) and "discreteness" (separation, division) highlight that the institutions being compared experienced a time gap in their existence due to various reasons. This temporal separation is not merely a pause but signifies a distinct break in tradition. CdMCA compares not the evolution of the same institution over time but rather similar institutions that emerged in different historical periods, lacking direct continuity.

The concept draws inspiration from the "challenge-and-response" law formulated by the English historian A.D. Toynbee (1939). According to this law, civilizations must respond adequately to internal and external challenges; failure results in decline, while successful resolution allows for continued development.

The CdMCA methodology encompasses scientific approaches, principles, and methods for studying elements of historical and modern reality within a single country, wherein interruptions in legal traditions occurred.

Results

Dynamics of main indicators of economic development.

Comparative analysis of GDP.

Here, we examine the fluctuations in the primary gauge of economic advancement, namely GDP. We endorse the perspective put forth by M.Yu. Golovin and R.S. Greenberg (2021) that GDP retains its paramount status as an indicator of economic progress, facilitating cross-country comparisons of economic growth dynamics. Employing statistical data, we conducted a comparative evaluation (Table 1) to juxtapose the standings of different nations. The timeframe selected for analysis spans from 1970 to 2022, as this period encompasses pertinent data for all countries involved.

Table 1. Rating of Western European countries in terms of GDP in US dollars at current prices

Place	Countries	1970	Place	Countries	2022	Dynamics

Source: World Bank, statistics of main indicators of economic development

Throughout the examined period, there were alterations in the ranking: Great Britain moved from third place to second, overtaking France; Norway sharply increased its GDP, moving from 9th position to 7th, which is primarily associated with the oil crisis of the 70s; Belgium and Denmark dropped one position in the rankings.

Table 2 presents a comparison of share volumes within the structure. Germany occupies the largest share in the GDP structure, but over the past period 1970–2022 its contribution decreased by 3.54%. A strong reduction occurred in the share of Italy – by 2.66%. France reduced its share by 2.55%. At the same time, the share of the following countries increased: Spain (plus 3.17%); Norway (plus 1.87%); Great Britain (plus 1.58%); Netherlands (plus 1.04%); Portugal (plus 0.48%); Luxembourg (plus 0.31%); Denmark (plus 0.17%) and Iceland (plus 0.1%). The increase in Belgium's share was 0.02%.

Table 2. Shares in the total GDP of Western European countries

Countries	1970	2022	Change
Germany	28.62%	25.07%	-3.54%
France	19.68%	17.14%	-2.55%
United Kingdom	17.33%	18.91%	1.58%
Italy	15.03%	12.38%	-2.66%
Spain	5.44%	8.61%	3.17%
Netherlands	5.06%	6.10%	1.04%
Belgium	3.54%	3.56%	0.02%
Denmark	2.26%	2.43%	0.17%
Norway	1.70%	3.57%	1.87%
Portugal	1.08%	1.55%	0.48%
Luxembourg	0.19%	0.51%	0.31%
Iceland	0.07%	0.17%	0.10%

Source: World Bank, statistics of main indicators of economic development

In general, the contribution of Western European countries for the period 1970–2022 decreased by 9.01%, and as of 2022, it amounts to 16.15% of world GDP.

Looking at GDP growth in Western European countries from 1970 to 2022 at current prices, it can be noted that it increased the most in Luxembourg (55.4 times), Iceland (51.8 times), the smallest increase was observed in France (17.7 times) and Italy (16.7 times) (Table 3).

Table 3. Rating of Western European countries by GDP growth rates from 1970 to 2022 at current prices
(according to WB methods)

Countries	GDP at current prices, USD billion		Growth in 52 years %
	1970	2022	
Luxembourg	1.46	82.27	5,543.89
Iceland	0.53	27.84	5,186.01
Norway	12.81	579.27	4,420.51
Spain	40.99	1,397.51	3,309.14
Portugal	8.11	251.95	3,007.28
Netherlands	38.16	991.11	2,496.94
United Kingdom	130.68	3,070.67	2,249.72

In the modern period from 2015 to 2021, all countries experienced GDP growth (calculated based on constant local currency) from 2015 to 2019.

In 2020, GDP contracted in all Western European countries. The decline in GDP was caused by the virus pandemic and global trends (Table 4).

Table 4. West-European' GDP growth (annual, %) (according to the WB methodology)

Countries	1990	1995	2000	2005	2010	2015	2016	2017	2018	2019	2020	2021	2022

Dynamics of GDP per capita.

Now, we will evaluate the dynamics of GDP per capita in constant 2015 US dollars. Over the 52 years from 1970 to 2022, the indicator increased maximum in Luxembourg (by 203.15%), Norway (197.87%); the minimum growth rate was in Italy (109.09%), France (121.03%) (Table 5). Iceland is not included in the collection because it began publishing statistics in 1995.

Table 5. Ranking of GDP per capita growth rates (constant 2015 US\$) in West-European countries

Countries	1970	Place	Countries	2022	Place	Rate of increase 2022/1970
Luxembourg	35,513.80	1	Luxembourg	107,660.14	1	203.15%
Denmark	26,927.96	2	Denmark	60,113.09	3	123.24%
Norway	26,735.83	3	Norway	79,638.75	2	197.87%
Netherlands	21,362.85	4	Netherlands	49,979.85	4	133.96%
United Kingdom	19,722.86	5	United Kingdom	47,232.27	5	139.48%
Germany	17,894.30	6	Germany	43,032.14	7	140.48%
Belgium	17,849.49	7	Belgium	44,075.86	6	146.93%
France	17,605.64	8	France	38,913.94	8	121.03%
Italy	15,736.18	9	Italy	32,902.67	9	109.09%
Spain	11,436.03	10	Spain	27,434.88	10	139.90%
Portugal	7,658.74	11	Portugal	22,112.74	11	188.73%
World	4,918.17	12	World	1,287.15	12	129.50%

Source: World Bank, Statistics of Key Economic Development Indicators

The following changes have occurred in the ranking of countries: Denmark moved from 2nd to 3rd place; at the end of 2022, the highest GDP per capita indicators were noted in Luxembourg - 107,660.14 US dollars, Norway - 79,638.75 US dollars, Denmark - 60,113.09 US dollars; Norway increased its place in the ranking by 1 position and took 2nd place in terms of GDP per capita, overtaking Denmark; Belgium's position rose from 7th

place to 6th position. The remaining countries maintained their positions.

The dynamics of the growth rate of GDP per capita before 1999 varied significantly across countries, but after the introduction of a single currency (euro) the indicators smoothed out (Figure 1, 2).

Figure 1. GDP per capita growth rate from 1971 to 2022

Source: World Bank, Statistics of Key Economic Development Indicators\

Figure 2. GDP per capita growth rate from 1999 to 2022

Source: World Bank, Statistics of Key Economic Development Indicators

In 2020, all Western European countries showed a decline in the indicator, the maximum in Spain (by 11.76%) and the UK (by 11.36%), associated with restrictions introduced to combat COVID -19. In 2021, the dynamics corrected; in all Western European countries, the indicator increased by an average of 4.9%.

Dynamics of public debt.

Systematized and standardized statistics for Western European countries have been available since 1980. The growth of GDP in the countries under consideration was accompanied by an increase in the share of government borrowing in GDP. In general, for the period in all countries the dynamics of public debt is unstable, with a growing trend (Figure 3).

Figure 3. Dynamics of general government gross debt in GDP in West-European countries from 1980–2022.

Source: <https://countryeconomy.com/national-debt/>

Across the duration of the period, public debt experienced a rise in all the countries under examination (refer to Table 6). The growth rate is strikingly different across countries: the growth was almost 43 times in Spain (42.52 times), in France (21.23 times); Public debt increased more than 10 times in the UK (12.26 times). In other countries, the growth rate of public debt is much less: from 9.55 times in Luxembourg (it should be noted that data for the country are available from 1995) to 1.17 times in Denmark (data from 1992).

Table 6. Dynamics of external debt in West-European countries, in millions of US dollars

Country name	Year	Data	Year	Data	Growth rate, times
Belgium	1980	94.827	2022	608.701	6.42
Denmark	1992	102.102	2022	119,606	1.17

France	1980	146.271	2022	3,105,646	21.23
Italy	1988	858.635	2022	2,911,298	3.39
Germany	1991	731.202	2022	2,711,576	3.71
Luxembourg	1995	2.115	2022	20,192	9.55
Norway	1980	30,727	2021	209.371	6.81
Portugal	1990	47,832	2022	292,884	6.12
Spain	1980	37,213	2022	1,582,453	42.52
United Kingdom	1980	257.102	2022	3,151,536	12.26
Netherlands	1980	84,513	2022	506,017	5.99

Source: <https://countryeconomy.com/national-debt/>

Looking at the volume of public debt as a share of GDP, significant changes can be noted in most countries (Table 7).

Table 7. Dynamics of public debt in GDP in West-European countries from, %

Country name	1995	2021	Change
Belgium	131.30	108.00	- 23.30
Denmark	73.20	36.00	- 37.20
France	56.10	112.90	56.80
Germany	54.90	69.00	14.10
Iceland	58.07	75.58	17.51
Italy	119.40	147.10	27.70
Luxembourg	10.10	24.50	14.40
Netherlands	73.20	51.70	- 21.50
Norway	32.74	42.70	9.96
Portugal	62.20	124.50	62.30

Source: <https://countryeconomy.com/national-debt/>

Let's consider the period between 1995 and 2021, for which statistics are available for all countries under consideration. In Belgium, the volume of public debt in the structure of GDP decreased by 23.3% and amounted to 108% of GDP. In France, Italy and Portugal, the share of public debt increased (by 56.8%, 27.5% and 62.3% respectively) significantly exceeding the limit of 100% of GDP at 112.90%, 147.10% and 124.50%. In other countries, the share of public debt ranges from 24.50% in Luxembourg to 69% in Germany in the structure of GDP.

Development dynamics for financial mediation institutions

Account ownership at a financial institution or with a mobile-money-service provider (% of population ages 15+).

The development of financial intermediation in Western European countries can be analyzed, inter alia, by examining the dynamics of account holders in financial institutions. In general, for the period from 2011 to 2021 (data for earlier periods are not available), the percentage of people holding accounts in financial institutions mostly remained stable (Figure 4).

Figure 4. Dynamics of account ownership at a financial institution or with a mobile-money-service provider (% of population ages 15+).

Source: World Bank, Statistics of Key Economic Development Indicators

In the period under review, growth was observed in Italy (from 71% in 2011 to 97.3 in 2021) and Portugal (from 81% in 2011 to 92.6% in 2021).

Taking into account the changes in the evolution of Private and public credit bureau coverage (% of adults), the following trends can be noted in the number of individuals or firms listed in private and public credit bureaus with current information on repayment history, unpaid debts or outstanding credit: in France the figure increased by 282% from 12.30% in 2004 to 47% in 2019, in Italy by 101.69 from 65% in 2004 to 131% in 2019; in Belgium, the growth rate was 79.36% - from 53.30% in 2004 to 95.60% in 2019; in Spain 65.80% from 45.90% in 2004 to 76.10% in 2019; in the Netherlands there was an increase from 64.50% in 2004 to 98.70 in 2019 (53%); in Portugal there was a sharp increase in the indicator from 2010 (83.40%) to 2013 (123.20%), but then the situation stabilized and as of 2019 the indicator was 107.90% (Figure 5).

Figure 5. Dynamics of Private and Public Credit Bureau Coverage (% of adults).

Source: World Bank, Statistics of Key Economic Development Indicators

Dynamics of overdue debt

Next, we will evaluate overdue debt, which shows the efficiency of lending (Figure 6).

Figure 6. Share (%) of overdue debt in total lending.

Source: World Bank, Statistics of Key Economic Development Indicators

During the period from 2008 to 2021, the following changes occurred:

1. The share of overdue debt increased from 2008 to 2015 in Italy and Portugal, reaching 18% and 16.74% respectively in 2015, followed by a decrease to the 2008 level, and in Italy to 3.35%. During this period, there was an increase in overdue debt in Spain. However, we note that Spain began publishing statistics in 2012, which makes its data less indicative.

2. In other Western European countries, the share of overdue debt fluctuated in the two percent range and remained largely stable.

The ranking of countries by the share of overdue debt for 2021 is presented in Figure 7.

Figure 7. Ranking of countries by the level of overdue debt as of 2021, % of total debt

Source: World Bank, Statistics of Key Economic Development Indicators

As can be seen from the figure, Portugal has the largest share of overdue debt – 3.68%; Italy is in second place - 3.35%, followed by Spain - 2.92% and France - 2.42%. The group of countries with medium level of debt reduction is formed by Iceland, Belgium and the Netherlands. Reduced levels of overdue debt were observed in Luxembourg and Denmark. In Norway the figure is the smallest and is 0.53%.

Assessment of welfare dynamics

Human capital index

Let's explore the primary indicators of the population's well-being in Western European countries and perform a comparative analysis of key factors that delineate the well-being of the populace. An encompassing measure of human development is the Human Capital Index (HCI), which encompasses life expectancy, educational components, and health status. Figure 8 illustrates the ranking of Western European countries based on their Human Capital Index levels.

Figure 8. Human capital index in the West-European countries, as of 2020

Source: World Bank, Statistics of Key Economic Development Indicators

As can be seen from the figure, the first position is occupied by the Netherlands with an HCI of 0.7899. The UK is in second place with an indicator of 0.7829. Next, with a noticeable difference, comes Norway with an HCI of 0.7711. This is followed by a group of countries with approximately the same values: Portugal (0.7689); France (0.7627); Belgium (0.7604). Denmark (0.7551) and Germany (0.7512) are slightly less. Next comes Iceland with an indicator of 0.7453 and Spain and Italy with indicators of 0.7283 and 0.7278, respectively. Luxembourg closes the ranking with 0.6861.

Table 8 shows the dynamics according to the World Bank.

Table 8. Dynamics of changes in the human capital index

Country name	2010	2017	Growth rate,	2018	Growth	2020	Growth	Growth
Belgium	0.7527	0.7570	0.57	0.7628	0.76	0.7604	-0.31	1.02

Source: World Bank, statistics of main indicators of economic development

Considering the dynamics over 10 years from 2010 to 2020, it can be noted that in 5 countries there was a decrease in the HCI: in Italy by 3%, Luxembourg by 2%, Iceland - 1.31%, Germany - 1.26%, the Netherlands - 0.9%. Strong growth was observed in Portugal (3.54%). The indicator increased in Spain by 2.28%, in the UK - 2.28%. In Belgium the growth was 1.02%, Denmark 0.85% and France 0.77%. A slight increase was observed in Norway (0.06%).

Positive dynamics of the index in all countries, with the exception of Iceland and Luxembourg, was noted in 2017 compared to 2010 - the maximum increase was in Spain (4.90%) and Germany (4.50%), the minimum in Norway - 0.06%.

In 2018, compared to 2017, negative dynamics were observed in seven countries: Germany (3.97%), Italy (2.10%), France (1.18%), Spain (0.92%), Great Britain (0.51%), Norway (0.32%) and Denmark (0.41%).

In 2020, compared to 2018, there were negative dynamics in 8 countries - the index decreased from 0.31% in Belgium to 3.33% in Italy. An increase in HCI was recorded only in France (0.90%), Great Britain (0.77%), Norway (0.33%) and Iceland (0.25%).

Life expectancy at birth.

Let us next consider the individual components of the welfare assessment by estimating the life expectancy at birth. Table 9 analyzes the dynamics over 60 years.

Based on the results of 2021, the leaders in terms of life expectancy at birth are Spain, Norway and Iceland, where the indicator varies from 83.18 years to 83.12 years:

- Spain ranks first with an indicator of 83.18 years, since 1960 this indicator has grown by 20.36%, the country has risen from 9th place to 1st in the ranking of Western European countries;
- in second place is Norway with an indicator of 83.16 years, over 61 years there was an increase of 13.07%, the country remained in the same position;
- Iceland is in third place with an indicator of 83.12 years, during the period under review there was an increase of 12.68%, in the ranking the country dropped by 2 positions, in 1960 it was the leader in life expectancy (73.76 years).

Italy lags slightly behind the leading countries: at the end of 2021, it is in 4th place with an indicator of 82.80, during the period there was an increase of 19.78%, the country rose 2 positions in the ranking (Figure 9).

Note that the largest increase in life expectancy at birth was noted in Portugal – 26.66%, Luxembourg – 20.64%, and Spain – 20.36%. The smallest growth was observed in the Netherlands – 10.99%.

Discussion

Currently, the Western European economy is evolving amidst substantial external and internal pressure, with crisis phenomena affecting the socio-economic systems of integration group countries. The advancement of financial intermediary institutions holds the potential to expedite recovery from the crisis and foster an

improvement in the well-being of the population. If appropriately supported, financial intermediation can serve as a catalyst for financial market development. It is crucial, at this economic stage, to articulate universal principles and algorithms for the growth of financial intermediary institutions applicable in markets to enhance economic security.

O.B. Tikhomirova (2013) highly values the role of financial intermediaries, viewing financial intermediation as a driver for innovation and the development of the service sector. Presently, various theories define financial intermediation differently and assess the relationship between financial market structure and population well-being in diverse ways.

The debate over the ratio of banking to non-banking sectors in the financial intermediation market persists. Norden L. (2015) underscores the role of banks in the development of the SME lending market. Simultaneously, the correlation between financial instrument development and population welfare growth is highlighted by many researchers (Beck T., Demirgüç-Kunt A., Levine R. (2004), Glotova (2019), Musabeh A., Alrifai K., Kalloub M. (2020), Haan J., Pleninger R., Sturm J. (2021), Wesley E, Peterson F. (2017)). The significance of the Central Bank in financial intermediation development is widely recognized, considering interactions between various financial intermediaries such as banks and insurance companies, as well as banks and pension funds.

Claessens S. (2009) contends that competition in the financial sector, as in other sectors, matters for allocative, productive, and dynamic efficiency. We align with V.M. Pishchulov's (2021) perspective, asserting that the type and specifics of financial intermediaries' specialization can impact transaction speed in the economy, influencing economic growth and population well-being. Financial and insurance intermediaries play a crucial role in enhancing economic security by mitigating operational risks, particularly in regional financial markets (Kozminykh (2020)).

We advocate for a comprehensive development of financial intermediary institutions, encompassing investment funds, financial cooperatives, pension funds, and more.

Based on the results of the study, it can be noted that countries with high indicators in the field of economic development and well-being of the population (Luxembourg, Iceland, and Norway) also demonstrate a high degree of use of financial instruments. These countries are experiencing dynamic growth in GDP per capita. The most backward countries in terms of this indicator are Portugal, Spain, and Italy. However, participation in a single socio-economic space has a positive effect on the growth of the quality of life in these countries. The consequence is an increase in life expectancy and a leveling off of this indicator.

The Human Development Index highlights the identified trends - Portugal, Spain and the UK show the highest indicators. The Netherlands was and remains the leader in the indicator throughout the entire publication period of the indicator (from 2010 to 2020) with a level of 0.79. The minimum is in Italy (the figure has decreased by 3% since 2010) and Spain (the rate has increased by approximately 3%).

The dynamics of overdue debt does not show a direct relationship with development indicators, but the dynamics themselves are similar across countries: the most favorable situation is observed in Norway and the UK.

Conclusion

Financial intermediation serves as a catalyst for economic development and contributes to improving the overall welfare of the population by better meeting needs and increasing national income. Considering the dynamics of economic development of Western European countries after the Second World War, one can clearly note that:

- The GDP of Western European countries increased significantly from 1970 to 2022, but their share in world GDP decreased due to the rapid industrial development of Asian countries. At the same time, we must also consider the transfer of industrial production from developed countries to developing countries that began in the 70s and sharply intensified in the 80s.
- Public debt of Western European countries has also increased, in some cases exceeding 100% of GDP, which, together with the next point, appears to be one of the consequences of the consumer economy and the stimulation of consumer demand by governments.
- Account ownership and credit bureau coverage indicators showed the development of financial intermediation in Western European countries, but also highlighted some risks and challenges.
- The human capital index and life expectancy at birth reflect the well-being of a population, which varies across countries and over time.

Throughout this exploration, we have delved into amidst substantial external and internal pressures, the Western European economy is currently undergoing significant evolution. Crisis phenomena are impacting the socio-economic systems of integration group countries. Financial intermediary institutions play a decisive role in this context, as they have the potential to expedite recovery from the crisis and enhance the well-being of the population. When appropriately supported, financial intermediation can act as an accelerator for the development of financial markets.

Some researchers highly value the role of financial intermediaries, viewing financial intermediation as a driver for innovation and the development of the service sector. Currently, various theories define financial intermediation differently and assess the relationship between financial market structure and population well-being in diverse ways. The debate over the ratio of banking to non-banking sectors in the financial intermediation market persists. Simultaneously, many researchers highlight the correlation between financial instrument development and population welfare growth. The significance of the Central Bank in financial intermediation development is widely recognized, considering interactions between various financial intermediaries such as banks and insurance companies, as well as banks and pension funds.

Based on the study results, it is evident that countries with high indicators in economic development and population well-being (such as Luxembourg, Iceland, and Norway) also exhibit a significant utilization of

financial instruments. These nations are currently experiencing dynamic growth in GDP per capita. Conversely, the least advanced countries in terms of these indicators include Portugal, Spain, and Italy. However, participation in a unified socio-economic space has a positive impact on the overall quality of life in these countries, leading to increased life expectancy and stabilization of this indicator.

The Human Development Index sheds light on these trends. Portugal, Spain, and the UK display the highest HDI indicators. Notably, the Netherlands consistently maintains its leadership position in the HDI throughout the entire publication period (from 2010 to 2020), with a score of 0.79. In contrast, Italy has experienced a 3% decline since 2010, while Spain's rate has increased by approximately 3%.

Regarding overdue debt dynamics, although there is no direct relationship with development indicators, the patterns remain similar across countries. Notably, Norway and the UK exhibit the most favorable situations in this regard.

The article concludes that financial intermediation has both a positive and negative impact on the well-being of the population, depending on the level of development, regulation, and innovativeness of the financial sector. The article also suggests some directions for future research, such as conducting regression analyzes to establish the causal relationship between financial intermediation and well-being and comparing the results with other regions of the world.

It should be noted that due to the paucity of data on the Human Development Index (data are available for only three years), it is necessary to carry out lengthy preparatory work to retrospectively obtain the above-mentioned data.

Abstract: Fuzzy logic control systems have gained widespread use in motor drives due to their effectiveness in managing intricate and nonlinear systems. However, the implementation of such systems can present computational challenges when dealing with extensive fuzzy rules, demanding significant resource allocation. To address this issue, a simplified fuzzy logic speed controller has been developed to reduce computational complexity and hardware requirements while preserving high performance. This article introduces a simplified Fuzzy Logic (FL) Controller that integrates vector control and space vector pulse width modulation (SVPWM) for regulating an inverter-fed induction motor. Evaluations and comparisons were conducted among simplified standard rule controllers, including 25-rule, 9-rule, and 7-rule variations, alongside the simplified 5-rule FL controller. The experimental validation employed hardware components like an induction motor, controller, inverter, current and voltage sensors, and a DSP board. The experimental findings indicate that the optimised membership functions (MFs) of the 5-rule controller exhibited a recovery from load disturbances 10ms faster than those of the 7-rule counterpart, performing nearly as well as the 9-rule controller. This suggests that the proposed controller shows promise for deployment in high-speed motor applications like traction systems and electric cars, demonstrating a robust ability to swiftly overcome load disturbances.

Introduction

The development of vector control technology allows induction motors (IM) to be used for variable speed drives and motion control (Biswal & Satpathy, 2021). The vector control method makes use of the dynamic mathematical model of the induction motor and allows for separate flux and torque management. An induction motor can be regulated similarly to an independently stimulated dc machine (Mudigondla et al., 2023). Due to its difficulty, nonlinearity, and inaccuracy, the Fuzzy Logic Controller (FLC) has demonstrated its effectiveness as a recognition controller because to its challenging quantifiability in scientific plant regulation. Several studies (Zidani et al., 2019) proposed using the FLC to control speed in vector control of induction motor drives. Researchers (Dems & Komeza, 2022) proved that FLC can provide good dynamics and resilience of drive performance. An AC induction motor may consume more energy than necessary. The use of FLC can lower the amount of energy expended by the induction motor during starting or when operating at less than full load (Menghal & Jaya Laxmi, 2016).

However, due to the high operational complexity and considerable memory requirements in either hardware or software, the FLC implementation in motor drives is limited in various ways. Researchers (Farah et al., 2021; Salleh et al., 2017b) used several approaches, including scaling factor modification, rule set adjustment, and editing the membership function. Because of the numerous characteristics, FLC adjustment is more difficult than traditional PI controller adjustment (Krishna Veni et al., 2019). Several researchers have investigated FLC parameter tweaks that could have a significant impact on overall performance (Talib et al., 2018).

Adjusting scaling factors is crucial for enhancing the effectiveness of the FL Controller, significantly impacting FLC performance (Farah et al., 2019). Scholars, employing the trial-and-error method, have sought to refine scaling factor values (Maheswari & Shanthi, 2018). Calibration is vital since alterations in scaling factors can influence system stability, oscillation, and damping (Farah et al., 2021). Strategies for reducing FL controller rules in vector control of induction motor drives often involve lowering the number of rules through decreased membership function (MF) numbers. Experts commonly create rule sets with MF columns to derive the output of the controller from MF input or output relationships. (Fahassa et al., 2017). Investigating reduced MFs, (Talib et al., 2017) explored 7x7, 5x5, and 3x3 FLCs, producing 49, 25, and 9 rules, respectively. These approaches offer insights into optimizing FLC systems, acknowledging the multifaceted impact of scaling factors and rule reduction on performance.

Researchers also discovered that decreasing MFs and rules affects drive performance while improving computational efficiency. In contrast, pushed for a simplified FLC approach that would reduce the processing overhead for high-performance IM drive control. Some researchers used 5x5 MF matrices with seven rules, ensuring operation across the range. However, no consideration was given to the optimization of membership functions for the robust speed controller.

Therefore, this research has focused on a new optimised MFs 5-rule FL controller to lessen the high computational burden and maintain robustness and high-performance standards. Both the inputs and outputs for the FLC were scaled with three different factors; speed error, G_e , change in speed error, G_{ce} and change in output, G_{cu} . The adjusting of the G_{ce} was chosen since it has greater impact on dynamic responsiveness.

Method

Fuzzy Logic Controller Design

An accurate model of induction motor is essential in designing high-performance drive systems. A consideration of the steady state as well as the dynamic mode is essential. The proposed system as shown in Fig. 1 consists of three main components: the motor and mechanical load, the inverter, and the controller.

Fig. 1. Fuzzy Logic controller applied to an electrical drive

The FL controller structure can be illustrated in Fig. 2. Speed error, e , and change of speed error are considered the input linguistic variables and the current component torque, i_{qs}^* is considered the output linguistic variable.

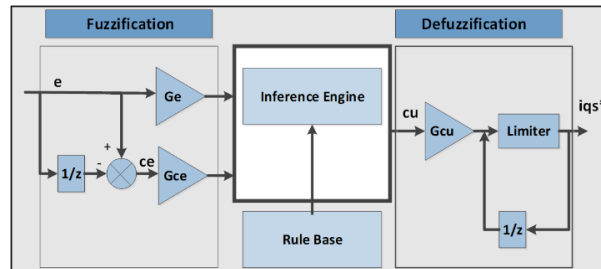

Fig. 2. Structure of Fuzzy Logic Controller

Therefore, the relationship function of FLC can be written as:

$$i_q(n) = \int_{discrete} \Delta i_q(n) = f(\Delta e(n), \Delta \omega_m(n)) \quad (1)$$

change in speed error is

$$\Delta e(n) = \Delta \omega_m(n) - \Delta \omega_m(n-1) \quad (2)$$

speed error is

$$\Delta \omega_m(n) = \omega_m^*(n) - \omega_m(n) \quad (3)$$

$\omega_m(n)$ is actual speed, $\omega_m^*(n)$ is speed reference and f denotes a nonlinear function.

Scaling factors

For appropriateness, the inputs and the FLC's output were scaled with three factors: G_e , G_{ce} , and G_{cu} . The G_e and G_{ce} factors are selected to stabilise the error signal, e and the change of speed error, Δe_n respectively. So that these remain within the limit of -1 to +1. G_{cu} is the output scaling factor for change in output fuzzy. If the value of Δe is small, then G_{cu} need to be reduced, and if Δe is big, then G_{cu} need to be increased.

By using the method in (Salleh et al., 2017a). G_{ce} and G_e are computed using known motor data. The rated speed of the motor, 184.3rad/s, is assumed to be the maximum speed error, ω_{emax} of the motor. Therefore, the scaling factor G_e for the motor is determined using the following calculation:

$$G_e = \frac{1}{2\omega_{emax}} \quad (4)$$

$$G_e = 0.002713$$

Meanwhile, the G_{ce} is determined based on the change of speed, $\Delta\omega$. Thus, G_{ce} can be determined by the following equation (Talib et al., 2017):

$$G_{ce} = \frac{1}{ce} = \frac{1}{\Delta\omega} \quad (5)$$

The change of speed $\Delta\omega$ for forward-reverse motor operation can be calculated by an equation ((5) based on the rated inertia, $J_n = 0.008217$ and the maximum torque, $T_{max} = 19.794$ given by the manufacturer. The sampling time is 20 μ s.

$$T_{max} = \frac{2J_n}{p} \left(\frac{\Delta\omega}{T_s} \right) \quad (6)$$

Therefore, Equation (5) is calculated as:

$$Te_{max} = \frac{2J_n}{p} \left(\frac{\Delta\omega}{T_s} \right)$$

$$\Delta\omega = \frac{pTe_{max}}{2} \left(\frac{T_s}{J_n} \right)$$

$$\Delta\omega = \frac{4(19.794)}{2} \left(\frac{20\mu}{0.008217} \right)$$

$$\Delta\omega = 0.0964$$

Therefore,

$$G_{ce} = \frac{1}{ce} = \frac{1}{\Delta\omega} = \frac{1}{0.0964} = 10.373$$

The drive's optimum performance can be achieved by tuning the G_{ce} because it has more impact on the dynamic response. By tuning the G_{ce} , the coefficient can be expressed as.

$$\text{Tuned } G_{ce} = \beta G_{ce} \quad (7)$$

Where β represents the tuning factor within the band of values.

$$0 < \beta < 1$$

The initial scaling factors used in this study are $G_e=0.002713$, $G_{ce}=10.373$, and $G_{cu}=2$. (Increase G_{cu} to value 2 for this investigation to limit the system's rapid defection from the desired operating point and speed up the system's recovery to the desired operating point). G_e and G_{cu} remain as constant parameters. The influence of G_{ce} is investigated by increasing or decreasing the G_{ce} by measured for every 10% change in the input scaling factor.

Reducing Fuzzy Rules and Optimizing Membership Functions

The rule base is a matrix that determines the controller output based on the input(s) since it stores the input/output relationship. This work employs Mamdani's type rule to create a natural structure for transforming personal data into fuzzy 'IF... THEN' rules. In this level, the inference engine, which executes the rule base, handles the input variables e and ce . Researchers typically use the 49-rule foundation to achieve fully digital speed control for ac motors. The linguistic variables utilized for input and output parameters are specified as: NL is Negative Large, NM is Negative Medium, NS is Negative Small, ZE is Zero Error, PS is Positive Small, PM is Positive Medium, and PL is Positive Large.

In this investigation, the simplifying method is used to nine rule bases. The error must use all the MF function groups. Meanwhile, the error change has dramatically altered in a short period of time throughout the speed command change; in most other instances, the signal is based on modest and zero values. Consequently, only the PS, NS, and ZE of the MFs are important while designing the rules. The use of ZE for change of error will stabilise performance in steady-state conditions.

Additionally, NS and PS are utilised to achieve steady-state conditions and endure disturbances in load during the transition time. However, NL and PL functions to prevent or decrease overshoot but are not used in this design system. By taking this strategy, only 5- rules Table 30 is utilised in the simplified technique rather than the 9-rule. for 3x3 MF rules-based matrix as follows:

1. Rule 1: If e is NS and ce is ZE, then cu is NS
2. Rule 2: If e is ZE and ce is NS, then cu is NS
3. Rule 3: If e is ZE and ce is ZE, then cu is ZE
4. Rule 4: If e is ZE and ce is PS, then cu is PS
5. Rule 5: If e is PS and ce is ZE, then cu is PS

The membership functions can be refined through adjustments made to FLC at the peak of the MFs in the motor system to boost the system's resilience. The drive system's appropriate response can be made when the MFs converge e and ce but are divergent for the cu .

To optimise the ZE rule, modify its length and raise the upper limit value of all membership functions (MFs) associated with the variables error ($e(t)$) and change of error ($ce(t)$), $\mu_{ZE}(e(t)) = [-0.098, 0.098]$ and $\mu_{ZE}(ce(t)) = [0.09, 0.09]$ will make the speed controller more responsive to small changes in the speed error, resulting in broad control.

To guarantee the drives encompass different speeds from forward to reverse execution, the merit of the third NS and PS rule's base must be less than the $\mu_{ZE}(e(t))$ and $\mu_{ZE}(ce(t))$ specified in Fig. 5. This method will be used to apply three different simple rules: 5, 7, and 9. Fig. 3, Fig. 4 and Fig. 5 show the optimised MFs of 9-rule, 7-rule, and 5-rule.

Outline of the Experimental Configuration

Induction motor drives

The hardware configuration (Fig. 6) involves DSP TMS320F28335, Texas Instruments' high-voltage Digital Motor Control (DMC), auxiliary circuit, hall effect current sensor, and encoder input interface. The computer, serving as the host during program debugging, connects to the DSP through the parallel port. Code Composer Studio (CCS) version 8.0 translates field-oriented control into "C" language code. Currents i_a and i_b from two induction motor inputs are measured using a current sensor. An encoder tracks rotor speed, transmitting data to the DSP board via analogue-to-digital converters. Code Composer captures and stores the data on the computer.

Induction Motor

The motor used in this experiment is a 1.5 horsepower squirrel cage induction motor, 415V, 3 phase. The motor

parameters are listed in. Table 31. A classical no-load test and a locked rotor test are carried out to obtain the motor's parameters.

Table 31: Induction Motor Parameters

Parameter	Value
Stator resistance, R_s	4.3 Ω
Rotor resistance, R_r	2.9 Ω
Stator inductance, L_s	0.3 H
Stator leakage inductance	0.01H
Rotor inductance, L_r	0.3 H
Rotor leakage inductance	0.01H
Mutual inductance, L_m	0.29 H
Moment of inertia, J	0.008217 Kg m^2
Number of poles	4
Max load	6Nm

Three-phase Voltage Source Inverter

The drive circuit used in the experimental work is a flexible inverter (Flexi-inverter) integrated with the Digital Motor Control board from Texas Instrument. This Flexi inverter board allows development to be done with an AC induction motor by this inverter. The features of Flexi-inverter, as shown in Fig. 7.

Results and Discussion

Operation of the drive without load

The speed response for the step speed reference in the experimental results is illustrated in Fig. 8 to Fig. 10. The PI speed controller exhibited the fastest response compared to the optimised MFs 9-rule, optimised MFs 7-rule, and the proposed optimised MFs 5-rule FLC. However, it took longer to achieve a steady state compared to the three optimised FLC simplified MFs, resulting in a shorter settling time.

The PI speed controller produced over 50% overshoot, with oscillations during the settling time, worsening at lower step speed commands. Conversely, the optimised MFs 9-rule, optimised MFs 7-rule, and optimised MFs 5-rule FLC showed excellent speed tracking for various commands. At the rated speed of 1760 rpm in Fig. 8, optimised MFs 5-rule and 9-rule had a 2.4% overshoot, and optimised MFs 7-rule had 1.3%. At half the rated speed (880 rpm) in Fig. 9, optimised MFs 7-rule showed a faster response with 6.25% overshoot, compared to optimised MFs 9-rule and 5-rule with 11%, maintaining the same settling time at 0.09s. At a low speed of 220 rpm as shown in Fig. 10, optimised MFs 7-rule showed a 1.36% overshoot, compared to 6% for optimised MFs 5-rule and 9-rule. All three achieved a steady state at nearly the same time, at $t=0.07s$.

Fig. 8. Results for speed response 1760 rpm, no-load

Fig. 9. Results for speed response 880 rpm, no-load

Fig. 10. Results for speed response 220 rpm, no-load

Operation of the drive with load

Experimental results for half-rated load (3 Nm) in Fig. 11 to Fig. 13 reveal that the proposed controller, optimised MFs 5-rule, matches the performance of optimised MFs 9-rule. In Fig. 11, load disturbance rejection times are 10ms for optimised MFs 5-rule and 20ms for optimised MFs 7-rule. Both controllers exhibit a speed drop from 1760 rpm to 1757 rpm, with approximately 0.51% and 0.57% overshoot for optimised MFs 5-rule and optimised MFs 7-rule, respectively. Oscillations occur for 8ms at the start of optimised MFs 7-rule speed command.

At 880 rpm in Fig. 12, optimised MFs 5-rule recovers from load disturbance in 5ms compared to 35ms for optimised MFs 7-rule. Consequently, the speed drops to 860 rpm for optimised MFs 5-rule and 865 rpm for optimised MFs 7-rule, with overshoot at 11.8% and 6.6%, respectively.

For low speed (220 rpm) depicted in Fig. 13, the proposed optimised 5-FLC performs well. Load disturbance causes a slight speed drop to 215.5 rpm for optimised MFs 5-rule, recovering in 7ms. In contrast, optimised MFs 7-rule undershoots to 213.9 rpm, requiring 24ms to settle, with overshoot at 6.4% and 2.27%, respectively.

Fig. 11. Results for load (3 Nm) at speed 1760rpm

Fig. 12. Results for load (3 Nm) at speed 880 rpm

Fig. 13. Results for load (3 Nm) at speed 220 rpm

The experimental results for a 6Nm load are detailed in Fig. 14 to Fig. 16. Fig. 14 depicts the outcomes of a 1760 rpm speed response with a 6N load disturbance for both controllers, optimised MFs 5-rule, and optimised MFs 7-rule FLC. The motor speed decreased from 1760 rpm to 1753 rpm for optimised MFs 5-rule and to 1754 rpm for optimised MFs 7-rule. Both controllers displayed a return time to speed control, with optimised MFs 5-rule and 7-rule taking 13ms as well as 15ms, respectively.

For the half-rated response of 880 rpm, Fig. 15 shows a significant drop in speed from 880 rpm to 859.5 rpm for optimised MFs 5-rule, but disturbance elimination took only 7.8ms. In comparison, optimised MFs 7-rule took 43ms to recover. Fig. 16 demonstrates a potential application of low speed with the proposed optimised MFs 5-rule. When a full-rated load of 6 Nm is applied, the controller effectively readjusts the motor speed control. The speed command of 220 rpm slightly decreased to 212.9 rpm, with a rapid recovery in 7ms. In contrast, with optimised MFs 7-rule, the speed undershoots to 209.5 rpm and requires 23ms to diminish disturbance.

Fig. 14. Results for a 6Nm load at rated speed 1760 rpm

Fig. 15. Results for a 6Nm load at rated speed 880 rpm

Fig. 16. Results for a 6Nm load at rated speed 220 rpm

Conclusion

The experiment looked at motor drive performance in both no-load and loaded settings. The PI speed controller, while the quickest, had more than 50% overrun and oscillations. In comparison, the suggested optimal MFs 5-rule FLC, which included optimised MFs 9-rule and 7-rule, demonstrated greater speed tracking and balanced performance. Under loaded conditions, the proposed controller (optimised MFs 5-rule) matched the optimised MFs 9-rule. At 880 rpm, optimised MFs 5-rule recovered faster than optimum MFs 7-rule, demonstrating its efficiency. At low speeds (220 rpm), the suggested optimised 5-FLC outperformed the optimised MFs 7-rule in terms of recovery time. The use of hardware to demonstrate the proposed controller's capacity to manage ever-changing motor dynamics and non-linear load disturbances more well across a wide speed range, including rated speed, half-rated speed, low speed, and reverse forward rotation.

Recommendations

The new simplified algorithm has shown improvements in speed performance across various speed ranges. However, there are opportunities for further enhancement and future research. Recommendations include:

1. Utilizing optimization techniques such as particle swarms, genetic algorithms, and neural networks to fine-tune scaling factors.
2. Implementing online tuning of fuzzy logic controller parameters, which involves adjusting the height and width positions of membership functions to optimize the system.

Abstract: In the current panorama of higher education in Ecuador, the Reglamento de Régimen Académico del Consejo de Educación Superior (RRA) establishes several alternatives to get a university degree, one of them is the comprehensive exam. This mode of evaluation is based on the comprehensive review of the knowledge acquired by students during their professional training, through a case study and a theoretical evaluation. This scientific article details the methodology adopted by the Logistics and Transportation Engineering program of the Universidad Técnica Particular de Loja (UTPL) to implement the comprehensive exam. The methodological strategy of the Logistics and Transportation Engineering career involves the integration of the specific academic domains of the career, followed by the practical application in the resolution of problems relevant to the field of study. These academic domains allow students not only to acquire key competencies, but also to demonstrate their knowledge in the real field. Following the implementation of this methodology, an evaluation of its effectiveness was carried out, considering the academic results, the percentage of students who passed versus those who did not, and a survey aimed at collecting the students' perception of the methodology employed.

Keywords: Comprehensive, Education, Engineering, Exam.

Introduction

Nowadays within university organizations and institutions there are several components to measure and evaluate students' knowledge, one of the most commonly used components are the comprehensive exams, which aim to measure and evaluate the knowledge, skills and experiences of students (Raj Adhikari, 2010). Universities coincide that passing the comprehensive exam is a fundamental requirement for getting a university degree (W. P. Anderson et al., 1984). Likewise, another use given to comprehensive exams is to filter students who present weaknesses in specific topics of knowledge, thus seeking, through the identification of the weakness, create activities that reinforce and improve the student's understanding in a specific topic (M. S. Anderson & Swazey, 1998).

Comprehensive exams have been used since the 1930s as a method either to enter an educational institution (college, university) or in order to get a degree (bachelor's, master's, PH.D.) (Estrem & Lucas, 2003). This prolonged use has meant that its format has changed over time and varies according to the disciplines (Ashrafi-rizi et al., 2023). Across engineering fields, this exam has been implemented in several universities and countries, e.g. the Fundamentals of Engineering exam (FE). It is a nationwide exam in the United States that is designed to measure and evaluate the knowledge of engineering students and professionals (Malani & Koehn, 2005). At the University of Toronto, the Faculty of Applied Science and Engineering offers the opportunity for students to get a degree through a comprehensive exam (Gollish et al., 2018). Moreover, the Federation of State Medical Boards (FSMB) uses comprehensive exams for medical licensure in the United States (Gesundheit, 2020).

Comprehensive exams vary from institution, university, faculties and departments to others, there is no structure or format for their application or institutions that regulate their use (Van Ackeren et al., 2012). In general, the application of comprehensive exams can range from passing a subject to passing a degree (bachelor's, master's, PH.D.) (Al-Doughmi et al., 2006). Also, the modality of the exam could be either online or face-to-face, according to the knowledge that the students are intended to be assessed, hence it can include different disciplines with different learning aims (Shachar & Neumann, 2010). Therefore, this scientific article, through a survey, aims to collect information on the perception that students have about the methodology used in the comprehensive exam in the career of logistics and transportation engineering.

Method

This research focuses on assessing the comprehensive exam and its impact on the competencies of students in the Logistics and Transportation program at the Universidad Técnica Particular de Loja (UTPL). According to

Altamirano Vaca & Rodríguez (2018), this modality of graduation emerges as a viable alternative, integrating both practical and theoretical aspects in its assessment, with the aim of optimizing the terminal efficiency rate. To achieve the proposed objectives, a quantitative methodology was adopted, focusing on exploring the perceptions and experiences of students regarding the entire comprehensive exam process.

The study covered two regular academic periods, evaluating the comprehensive development of the exam. During these periods, students were involved in activities related to the exam, collecting data through a survey specifically designed to measure their experiences and perceptions.

The research highlighted three fundamental aspects: 1) the development stage, which includes workshops on the specific academic domains of Logistics and Transportation and the development of a practical case according to Mora Aristega et al. (2017), this practical case or graduation project is based on research processes; 2) the evaluation stage, which contemplates both theoretical and practical components, as established by the Higher Education Council (2013); and 3) the reflection and valuation after the exam, a crucial stage to discuss and validate the effectiveness of comprehensive exams in verifying learning, skills, and competencies (Ponce Ruiz et al., 2022).

Furthermore, a mixed methodological approach was implemented, integrating quantitative and qualitative elements in a research design that allows for a deep understanding of the student experience. This approach seeks to evaluate the effectiveness of the exam in terms of academic outcomes and student perceptions. The study population included students from the Engineering in Logistics and Transportation at UTPL who participated in the comprehensive exam, with an analysis focused on 34 students distributed over two academic periods.

Development of the Comprehensive Exam

The development stage of the comprehensive exam was divided into two regular academic periods. In the first regular academic period, four workshops focused on essential academic domains for the Logistics and Transportation career were held. These workshops addressed topics such as supply chain optimization, reverse logistics strategies, and transportation optimization, including route and cost optimization. The methodology of these workshops combined the literature review of the topics addressed with the current reality of the country and was carried out in groups, culminating in a group oral presentation. In the second regular academic period, the focus shifted to the individual development of a practical case, aimed at solving a real problem related to the career, based on literature review and specific methodologies for problem-solving or implementing optimizations.

Evaluation of the Comprehensive Exam

As established by the Consejo de Educación Superior, the evaluation of the comprehensive exam comprises two

components: one theoretical and one practical. The theoretical evaluation consists of a written exam, while the practical is based on the oral defense of the practical case before a panel. The weighting of the grades is distributed as follows: activities carried out during the regular academic period represent 30% of the final grade, the written exam 35%, and the evaluation of the practical case along with its oral defense another 35%.

Reflection and Valuation of the Comprehensive Exam

The valuation of the comprehensive exam was based on two fundamental aspects: first, the conduct of a survey targeted at students; Participation was 70.50% of the student body, as their participation was not mandatory, which provided a confidence level of 90% and a margin of error of 10%. The purpose of this survey was to collect students' perceptions regarding the exam. The data collection methods included surveys that contained both open and closed questions, distributed after the completion of the exam.

Topics covered included the demographic profile of the participants, their motivations for choosing this graduation modality, their level of involvement in the proposed activities, the clarity of the instructions received, the relevance of the exam for their professional development, and a self-assessment of their preparation to face the exam. The second aspect considered focused on analyzing the average grades achieved by the students, as well as the overall percentage of those who passed.

This detailed methodological approach allowed for a comprehensive evaluation of the implementation and effectiveness of the comprehensive exam, highlighting the importance of the development and evaluation phases in the educational process of the Engineering in Logistics and Transportation students. It also provided valuable insights into how these phases contribute to their professional development.

Results

The evaluation of the comprehensive exam revealed significant results in several aspects. First, regarding the age distribution of the students who participated in the survey, 41.7% were in the range of 26 to 30 years, followed by 16.7% in the range of 20 to 25 years. Likewise, the age groups of 40 to 45 years and 56 to 60 years each accounted for 16.7%, while students aged 31 to 35 years made up 8.3%. The diversity in the age of participants highlights the accessibility and appeal of the career in a distance learning modality, considering this analysis important for a better understanding of the dynamics of the comprehensive exam (see Figure 1).

Regarding gender, 83.3% of the participants were male, and 16.7% were female. Motivation for choosing the comprehensive exam as a graduation option was also analyzed, finding that 58.3% chose it for being a direct assessment of knowledge, 41.7% for the flexibility in preparation, 33.3% for personal preference, and 25% for personal or professional circumstances, as well as confidence in their mastery of the topic. 8.3% selected it for involving a lower workload (see Figure 2).

Figure 1. Age range of students

Figure 2. Motivation for choosing the complex exam

Figure 3. Participation in comprehensive exam activities

As for the level of participation in activities, 50% of the students attended 100% of them, including tutorials, reviews, and assignment submissions, among others. 41.7% participated in 80% of the activities, and 8.3%, in 60%, thus highlighting the high student involvement during the process of the comprehensive exam (see Figure 3).

Regarding the clarity of the methodology of the comprehensive exam, 33.3% considered it very clear, another 33.3% clear, while 8.3% found it somewhat confusing, and 25% very confusing. This suggests that, despite the complexity of the activities, a majority of the students understood the methodology from the start (see Figure 4).

Figure 4. Clarity of the comprehensive exam methodology

Concerning whether the content and development of the exam adequately reflected what was learned during training, 50% of the students rated it a 5 on a scale of 1 to 5, 25% a 4, 8.3% a 3, and 16.7% a 2, showing high satisfaction with the content of the comprehensive exam (see Figure 5).

When asked about the contribution of the workshops to reinforcing the academic domains of the career, 41.7% of the students gave a rating of 5, 50% a 4, and 8.3% a 3. This indicates that the workshops were effective in reinforcing the knowledge acquired during the career (see Figure 5).

Regarding the development of practical cases, 66.7% of the students considered that they enriched their academic training and provided them with useful tools for their professional future, giving a rating of 5, 25% gave a 4, and 8.3% a 3 (see Figure 5), evidencing the added value of this graduation modality in their education.

Finally, regarding the selection of the type of questions in the written exam to evaluate their knowledge and skills, 33.3% of the students rated with a 5, 25% with a 4, 8.3% with a 3, another 8.3% with a 2, and 25% with a 1 (see Figure 5). This result shows mixed opinions, reflecting some dissatisfaction regarding the type of essay

questions selected and the orientation of the questions towards practical cases.

Figure 5. Students' perceptions of the comprehensive exam.

The comprehensive analysis of the survey conducted among students reflects a generally positive perception towards the comprehensive exam. Students positively valued the contents addressed during the exam, as well as its contribution and reinforcement to the knowledge acquired in the program, highlighting that these elements enriched their academic training in preparation for their professional future. The only area with more neutral results related to the format and type of questions of the written exam used for evaluation.

Regarding the academic results of the comprehensive exam, notable achievements are observed, especially during the first academic period, where workshops were conducted in groups. At this stage, students achieved a 100% pass rate, with an average grade of 8.52 out of 10, a median of 8.53, the highest grade recorded was 9.29, and the lowest was 7.66.

During the second academic period, performance varied, as not all students initially passed the comprehensive exam. Out of 34 students, 10 needed remediation, and after this, 50% managed to pass. Therefore, the average for this period was 7.92 out of 10, with a median of 7.96, the highest grade was 9.24, and the lowest was 5.55. Overall, 85.3% of the students passed the comprehensive exam. It's important to mention that 29.3% required remediation, and 14.7% did not manage to pass.

This analysis reveals that the comprehensive exam had a positive impact in academic terms, especially notable during the first academic period due to the high grades obtained. However, in the second period, the averages decreased, which could be attributed to the complexity of the practical cases to be solved and the written exam, highlighting areas of opportunity to improve the evaluative process and ensure uniformly high performance at all stages of the exam.

Discussion

The study on the methodology and impact of competencies evaluated through the comprehensive exam in the Logistics and Transportation Engineering program at the Universidad Técnica Particular de Loja (UTPL) underscores the importance and effectiveness of the comprehensive exam in higher education. This approach is particularly relevant in specialized areas such as logistics and transportation engineering. The findings concur with other research, such as that conducted by Ponce Ruiz et al. (2022), which examines academic management for graduation through comprehensive exams at the University Uniandes Quevedo – Ecuador. This research highlights the marked interest of students in participating in this new mode of graduation and finds similarities in grade averages, observing high academic performance with an average above 8/10. Additionally, it points out that the comprehensive exam offers a more integrative, creative, and effective graduation process.

The implementation of this type of exam, which amalgamates theoretical and practical components, addresses the need for a more holistic evaluation system that surpasses traditional methods, limited to written tests. This methodology represents a step forward towards a more applied education and relevant for the needs of the professional field, crucial in disciplines with a strong emphasis on the practical application of knowledge. Bernardes Carballo et al. (2018) also emphasize that the comprehensive exam integrates theoretical and practical components, applying them to the development, analysis, and discussion of practical cases related to the professional field. The discussion highlights the need for a comprehensive educational approach that evaluates not only theoretical knowledge but also the ability to apply it in practical situations. Moreover, it underlines the importance of continuously reflecting on evaluative practices to ensure their inclusiveness, equity, and alignment with the professional competencies required in the students' future careers.

The research also indicates a significant increase in the terminal efficiency rate, aligning with other studies, such as that of Romero-Ortega & Sanz-Cabrera (2017), who underline the importance of this increase. However, they emphasize that research training is crucial and should be considered as a highly significant element.

Nevertheless, certain challenges and areas for improvement are identified, based on students' perceptions and academic outcomes. One of the main challenges is the design and selection of questions for the written exam, suggesting a need for their continuous review to ensure they are representative of the desired competencies and aligned with the students' learning experiences.

Conclusion

The study on the methodology and the effect of the competencies evaluated through the comprehensive exam in the Logistics and Transportation Engineering program at the Universidad Técnica Particular de Loja (UTPL) reveals several fundamental aspects. It highlights the effectiveness of the applied methodology in the assessment of student competencies, underscoring the vital importance of including theoretical and practical elements in the

evaluative process. Workshops and the development of practical cases are recognized as effective tools to consolidate learning during professional training and prepare students for their future work, showing a positive impact on their academic education.

Students' perception of the comprehensive exam is predominantly favorable, particularly highlighting the content and methodology used. This reflects the significance of such planning in their professional growth. However, areas for improvement have been identified regarding the type and focus of questions in the written exam, pointing out the need for a review and adjustment of the evaluations to better meet the expectations and abilities of the students.

Academically, the results was positive, especially during the first academic period, achieving a 100% pass rate compared to the second academic period which had a lower pass rate of 85.3%, indicating challenges with handling practical cases and the written evaluation. This highlights the need for continuous refinement of the comprehensive exam methodology to ensure consistent and high performance throughout all phases of the exam, with the aim of improving the terminal efficiency rate.

Recommendations

To optimize the comprehensive exam process in the Logistics and Transportation Engineering program, a series of strategic actions are recommended. It is essential to improve the design of the written exam questions, ensuring their alignment with the desired competencies and the students' learning experiences. There should be an increase in practical application by integrating theoretical and practical components in the evaluative process, applying them in the development, analysis, and discussion of practical cases relevant to the professional field. Encouraging reflection and continuous improvement is crucial to ensure evaluative practices are equitable and aligned with future professional competencies. It should be considered that research training must be emphasized as a crucial component, aligned with the increase in the terminal efficiency rate. Optimizing academic support is fundamental, ensuring that instructors provide the necessary support, especially for the preparation of practical cases and written evaluations. Promoting active student participation in all activities related to the exam will improve their understanding and performance. Finally, it is important to conduct a systematic review of the exam methodology, based on student perceptions and academic outcomes, to identify and address areas for improvement, thereby ensuring a more effective and beneficial exam process for all involved.

Abstract: Christians and Muslims are other religious groups, and Hindu natives inhabit Siliguri. The study investigates religious settlement segregation and bias in service provision using Census data, the Dissimilarity Index, and a primary survey. Wards (labelled as zones), similar to tracts in the America, have been selected at a macro level through electoral data, and intra-zone habitat clusters are zoned at a micro level using electoral boundaries. It presents the mapping of native population distribution through transcripts using people's narratives, images, and stories. This is the first micro-level religion-based settlement study of a Tier II city in India, as ethnic data is unavailable in the Census and has remained undocumented previously. We have strained to fill in the gap-related studies due to a lack of data, using electoral data and primary surveys, which essentially become tedious to validate. It is a case example of partiality in differently composed zones within the city corporation boundary, leading to group exclusion and deprivation of the few on the ground. The study contributes to understanding SDG goal 11, aiming towards an "Inclusive City", which should be underscored as an imperative realm for policy framing and execution.

Keywords: Inclusive city; Service provision; Right to the city; Dissimilarity index; Primary survey

Introduction

Urban segregation is a globally acknowledged concern in terms of service provision. One of the primary components of the sustainable development goals (SDG) is creating equitable, secure, environmentally sound urban areas and communities. India lies somewhere in between compared to the countries globally (Roland Hodlera, 2021). A myriad of literature has revealed the existence of Segregation across the globe. Boundaries and differences pertain to tangible and intangible inter and intra-connections between communities. As already proven in earlier studies, an eminent division exists between the haves and have-nots (Kempen, 1994). Developing an interdisciplinary capacity allows the formation of a social place in ways that link the visible, communal, monetary, ecological, and traditional magnitudes of growth. In addition to all these, focusing on the linking of public unity, communal attachment, and struggle firmness leads to cohesion (Morrison, 2011).

Segregation appears to be in tandem with Sassen's argument that even if some borders of society get removed, some intangible borders remain that become immensely tedious to penetrate into (Sassen, 2012).

Moreover, storytelling plays a vital role in implementing the planning process. A paper titled "Storytelling as a Method in Spatial Planning" by (Maartje Bulkens, 2014) mentions that stories assist people to be informed and elaborately comprehend their surroundings. It discusses narrative interviewing and its analysis of how stories help make a better sense of the surrounding world. Furthermore, the paper has used "storytelling" as a substitute for better know-how of how participation in the planning process is evident in Wageningen Eng, Netherlands. These talks have an on-ground application about the physical paradigms of the city landscape as well as the capability of the stories to influence the entire planning exercise. Another paper, "Out of the Closet: The Importance of Stories and Storytelling in Planning Practice" by Leonie Sandercock, discusses how vital storytelling is in planning. She emphasises that stories form the core of any planning procedure. It takes in the inferences from society and humankind about their dwellings and methods of behaving in that place (Sandercock, 2011). She also states that storytelling would be vital in analysing the policies and researching them further. Most vitally, through the talks and analysis of the questions, the people's interest comes to the foreground as to what should be considered in the planning process.

On-ground knowledge gives planners the required awareness about how the public understands participation in planning and how they tend to tackle such issues (Allmendinger & Haughton, 2012). Thus, it establishes the need for the planner to delve into the quantitative analysis method for measuring the issues on the ground. A participatory approach would help in better documentation of the issue. Zitcer, mentions that planner-authors should question the way of story-telling in order to be sure of the fact that they do not elevate the risks that incur in the process of communication (Zitcer, 2017). The paper structure involves, firstly, comprehending spatial Segregation at a global level through literature study and, secondly, understanding the relation between homophily and spatial Segregation. Thirdly, zone selection in the city was followed by a primary survey for ground truthing. Finally, we draw on the discussions and conclusion.

Urban Segregation and its Implication

Urban segregation has had varying impact on a city's evolution and existence. For instance, Helsinki's Housing and Land Use programme for 2012-2015 targets making houses for myriad social groups with different tenures. Thus providing a better quality of life for all residents. It even suggests that the mix of social groups must happen at the block level. Fig. 1 shows the spatial concentration of the different regions' different races. Sample 1 shows the stark agglomeration of Blacks in one region and whites in others, and sample 2 shows the settlements of both groups at certain intervals. Sample 3 shows an almost even distribution of both the communities in the settlement and sample 4 shows an intermediate transition zone between the settlements of both communities, where the mix of both can be seen. Sample 5 offers a repetitive pattern of sample 4. Pattern 5 is the most desirable form for any city among all the sample patterns. Also, in terms of crime, it has been observed that diverse cities have a lesser crime rate.

Fig. 1. Sample Patterns 1-5
adapted from (Denton, 1993)

Fig. 2. Sample Patterns A and B, adapted from (Denton, 1993)

Fig. 2 shows the composition of two groups in a hypothetical city. Part A shows an even distribution of both groups and Part B shows an uneven distribution. The various segregation methods give a specific value to the zone or the city for which the calculation is done. However, when the Segregation exceeds a specific limit, it is further termed as Hyper-segregation. Such a method for defining Hyper-segregation was given by Massey and Denton in 1993. They gave a cut-off for the various indices used for quantifying Segregation. If the index crosses the cut-off, the study area is said to be Hyper-segregated. For metrics of evenness, 0.7 was the cut-off, for metrics of isolation and concentration, 0.8 was the cut-off, and so on. Later, various modifications were made to the cut-off, and a simplified general cut-off of 0.6 was adopted for all the indices. This was given by Massey and Denton in 1993. This rule can be followed only when the indices range from 0 to 1. (Denton, 1993). Furthermore, complying with the SDG, "Sustainable Development Goal" No.11 (Sustainable cities and communities), points out that making cities inclusive, safe, resilient, and sustainable for all makes the need to look into the issue a global concern.

Segregation/ Homophily in Urban Planning

Homophily is a gradual process that emerges and local behaviour results in a global structure. Planners could be assumed to be writers who write the story of the city fabric, and it can be seen in the city structure (Throgmorton, 1992). Planners play a transitional role in the forming of the social geography of a city. Regulation of space in terms of its Governance as well as usage adds to its intrinsic value to be dominated or to dominate (Bhide, 2017). If some borders of society get removed, some intangible borders remain that become immensely tedious to penetrate (Sassen, 2012). There is a need to understand and analyse not just how the space

is built for the public but also how the public is built in space (Ramsbotham, 2005). Developing an interdisciplinary capacity allows the formation of a social place in ways that link the visible, communal, monetary, ecological, and traditional magnitudes of growth (Morrison, 2011). Urbanism in India expands more than boundaries to understanding the structure formed from individual and group efforts that are collectively done on domains of power and dominance (Coelho, 2021). Homophily is the theory that people tend to be similar to those they associate with. The fractured social network structure reflects the forces that intensify social Segregation. Social Segregation is also strengthened by geographical barriers like distance and formal or informal boundaries. However, little is known about how urban geography, inequality, and social network structure are related. Homophily is the theory that people tend to be similar to the people they associate with. Due to mechanisms of social ties that form clusters, social networks magnify inequalities. The social network in diverse structure reflects the forces that intensify social Segregation.

Segregated cities globally

If we delve into spatial justice and how the spaces have been used to direct or deject people, the concept emphasises the social production of social space. It states how a space can be used to harass, exploit and dictate to bring about social regulation and correction (Frédéric Dufaux, 2017). A space can be used to exploit and dictate to bring about social regulation and correction. For planners, being able to plan in a multicultural setting ought to be essential. (Friedmann & Kuester, 1994).

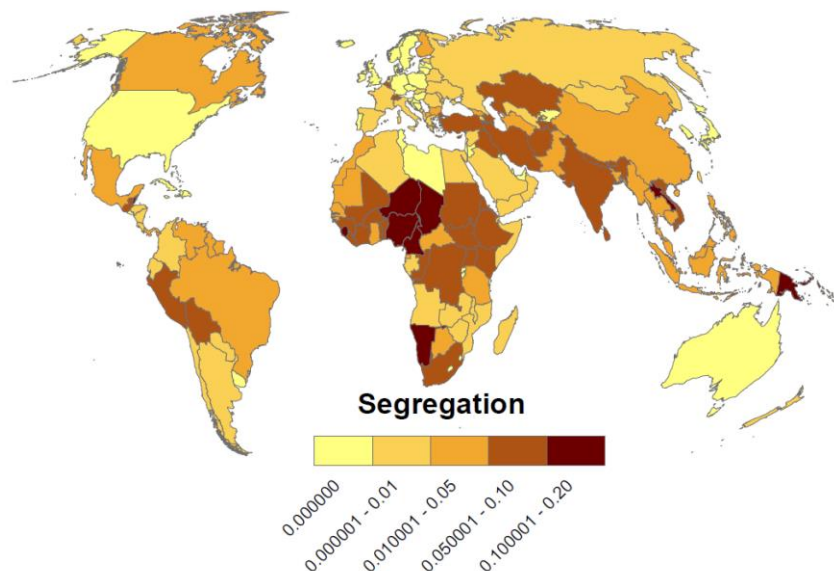

Fig. 3. Segregation across the world (Hodler et.al, 2021)

Segregation in India

India is widely known for its diverse demographic composition. "Spatial Inequalities in Big Indian Cities" by Pranav talks about spatial Segregation based on caste. It elaborates on the methodologies that can be used for the

quantifying of Segregation at a particular place. (Sidhwani, 2015). It mentions the "index of segregation", which is a better-modified version of the "index of dissimilarity", in which the index of dissimilarity is the measure of evenness. It is the most widely accepted method across the world. The paper compares the degree of Segregation in the 10 largest cities of India. It was found that Ahmedabad and Kolkata had higher Segregation by caste than Segregation due to the availability of other services. Sidwani extensively used the Gorard Index of Segregation (S) in this paper to measure the degree of Segregation comparatively in the cities (Sidhwani, 2015).

The above index of Segregation uses the population of a particular category in the zone, the total population of that category, the total population in that zone and the city's total population. The following ten cities were ranked for Scheduled caste/scheduled tribe population using the Gorard Index of Segregation. It was found that Kolkata ranked highest, followed by Surat, Ahmedabad, Chennai, Delhi, Jaipur, Pune, Hyderabad, Bangalore and Mumbai as least. Kolkata had a value of 0.350, followed by Surat, which had a value of 0.288, and Ahmedabad, which had a value of 0.282.

Ahmedabad is among the top three cities having Segregation due to caste. Furthermore, it was also found that Segregation due to caste differences was more than Segregation due to socio-economic status in these cities. (Sidhwani, 2015). A correlation was also established between the population belonging to ST/SC and their access to In-house drinking water, In-house latrines and Two-wheelers. It was found to have a significant relation between the caste composition and the provision of amenities.

Furthermore, more research has compared the various states of India for religious Segregation. It is found that Ahmedabad is the most segregated, followed by Hyderabad, Delhi, Bangalore, Aligarh, Hyderabad, Bangalore, Bhopal, Cuttack, Lucknow, Kozhikode, and Jaipur as the least segregated cities (Suswind, 2017). However, what remains to be studied is Segregation at a micro level. We have attempted to study at this level and to quantify Segregation in the provision of amenities, if any. There are indices of evenness, indices of concentration, and clustering. The concentration index considers the relative density of the settlement, but it does not give the real scenario of Segregation in the place as a region with a high density might have a minority group residing with less interaction. However, the above indices consider only the population or density in the calculation of the index value.

In Indian context, the studies mentioned and researches have been done at State level or District level, data unavailability being one of the prime reasons. The only macro level study carried in Indian context, quantitatively measures segregation at State level. However, the qualitative aspect remains ignored. Studies has been carried out for ST, SC, OBC and General category. The religion of the sample population remain unemphasised due to unavailability of data in census. The studies carried out in Illinois, Chicago and America has emphasised on social production of a space, how story-telling in urban planning and place-making alters the inclusive outlook of a city. Though, division due to caste is diminishing in India. However, it is observes same for religion as well in many parts of India.

Study city

Siliguri City is located in West Bengal, India. It is the gateway to the east part of the country and is known for its diverse habitats. It ranges from migrants to natives as well as tourists. The city jostles with business and trade activities that bring people to the city. Siliguri forms the most evident city for the entrance to North Bengal and Sikkim. It is a subdivision with 47, including Matigara, Naxalbari, Phansidewa and, Kharibari C.D. Blocks and Siliguri Municipal Corporation. Forming the gate to North East India, Siliguri is a transit hub and a tourist catchment area. Siliguri Municipal Corporation, with a population size of 2,94,546, consists of 151535 males and 143011 females. The community population comprises 91% Hindu, 5% Muslims, 0.9% Christians and 0.2% Sikhs, with the Muslim population mainly concentrated towards the city centre and the Majority Hindu population widely spread in the city. With the neighbouring district capital of Jalpaiguri, the city forms a "Twin Cities" partnership. The city encompasses parts of the Indian state of West Bengal's Darjeeling and Jalpaiguri districts. Three things that make India's northern region famous are beverage, wood, and travel. It is located on the shores of the Mahananda and Teesta rivers in the the base of the Himalayas. Siliguri is the third-biggest city in West Bengal, behind Kolkata and Asansol. West Bengal's Siliguri is strategically significant because it is easily accessible from four foreign borders: Bangladesh, China, Nepal, and Bhutan. Additionally, it connects mainland India with the Northeast. Nestled in the Eastern Himalayan foothills, Siliguri serves as a central hub for trade and transportation. Thus, serving as a route for domestic as well as international migrants.

Quantifying segregation: Dissimilarity Index

The index has been used to study three wards (zones) in Siliguri. Zone 2 having a mixed composition and economically moderate, zone 6 having Bihari Muslims and economically weak and zone 26 comprising Bengali Hindus and are economically strong. Segregation or Dissimilarity index is the measure of the evenness of the communities' distribution within the study area. A higher dissimilarity index represents a highly unequal representation of both communities. A lower dissimilarity index represents an almost equal representation of both communities. The formula used in the segregation index has been elaborated in the literature study above, As proposed by Duncan and Duncan in 1955: Segregation Index.

$$D = 0.5 \times \sum |b_i/B - w_i/W|$$

w_i = % of the Majority in the zone.

B Total number of minorities in the city.

W = Total number of Majority in the city.

Dissimilarity Index for Hindu, Muslim and Mixed ethnic composition zones in Siliguri- a tier II city

The strong, moderate, and weak economic conditions were obtained from the ownership of assets in the zone based on household census data in 2011. When compared with weak and strong zones, it is observed that the

moderate zone is highly segregated in terms of the location of drinking water, electricity, LPG connection and availability of assets. The reason is that a section of the zone is well attached to the main road with commercial shops and good connectivity to the periphery, and the other section of the zone retains good intra-connectivity. The weak zone has the presence of all eminent infrastructures within the zone: *Dargah*, *Madarsa* in the vicinity, Girls high school, *Qureshi mohalla*, *Darbhangha tola* and *Sultan Fateh* burial ground.

Table 4. Dissimilarity Index and Ranks for the three zones

Zones	Community composition	Location of drinking water within premises	Electricity	Latrine facility within premises	LPG/PNG	Scooter/Motorcycle/Moped
S value and Rank (R)	S Value R	S Value R	S Value R	S Value R	S Value R	S Value R
Zone 26 (Bengali Hindus and Economically Strong)	0.039 2	0.023 1	0.038 1	0.045 1	0.036 1	0.027 1
Zone 6 (Bihari Muslims and economically weak)	0.105 1	0.002 3	0.001 3	0.010 3	0.005 3	0.004 3
Zone 2 (Mixed composition and economically moderate)	0.004 3	0.014 2	0.008 2	0.019 2	0.020 2	0.022 2

Zone 2: Mixed composition (Bengali, Bihari and Nepali) zone and Context

Moderate zone, compared with its surrounding zones, is observed to be most segregated in terms of Latrine facilities, LPG provisions and asset availability. The reasons are its well-planned prime location in the city, community diversity in the zone and good connectivity to its adjoining zones.

Table 5. Dissimilarity Index and Ranks for Moderate Zone 2

Mixed composition and	Community composition	Location of drinking water	Electricity	Latrine facility within	LPG/PNG	Scooter/Motorcycle/Moped
-----------------------	-----------------------	----------------------------	-------------	-------------------------	---------	--------------------------

economically moderate with Context	on		within premises		premises									
	S	R	S	R	S	R	S	R	S	R	S	R	S	R
	Value		Value		Value		Value		Value		Value		Value	
S value and Rank (R)														
Mixed zone (2)	0.039	2	0.023	1	0.038	1	0.04	2	0.036	1	0.027	1		
Surrounding zones	1	0.161	1	0.013	3	0.029	2	0.083	1	0.032	2	0.016	2	
	3	0.009	3	0.019	2	0.018	3	0.011	3	0.013	3	0.013	3	

Zone 6: Bihari Muslim Zone and Context

A weak zone, when compared with surrounding zones, is observed to be not segregated compared to others in terms of drinking water, electricity, latrine provision, LPG supply, and availability of assets. The reasons identified are good intra-connectivity, dominance of one particular community, and a common livelihood for all.

Table 6. Dissimilarity Index and Ranks for weak zone 6

Bihari Muslims & Economically Weak Context		Community composition		Location of drinking water within premises		Electricity		Latrine facility within premises		LPG/PNG		Scooter/Moped	
S value and Rank (R)		S	R	S	R	S Value	R	S	R	S	R	S	R

Zone 26: Bengali Hindu Zone and Context

A strong zone, when compared to the surrounding zones, is observed to be least segregated in terms of community composition but significantly segregated in terms of electricity provision, LPG connection, and asset availability. The reason is the presence of two dominant occupations of the residents: one being involved in "goshala", cow rearing and milk supply, and the other is dominated by tuition centres and other educational clubs.

Table 7. Dissimilarity Index and Ranks for Strong Zone 26

Bengali Hindus & economically Strong with Context	S value and Rank (R)	Community composition		Location of drinking water within premises		Electricity		Latrine facility within premises		LPG/PNG		Scooter/Motorcycle/Moped	
		S	R	S	R	S	R	S	R	S	R	S	R
		Value		Value		Value		Value		Value		Value	
Bengali Hindus and Economically Strong zone 26		0.004	2	0.014	4	0.008	5	0.019	3	0.0	3	0.022	4
Surrounding zones	8	0.004	2	0.012	5	0.011	3	0.013	5	0.0	4	0.020	5
	9	0.005	1	0.023	3	0.018	2	0.018	4	0.0	3	0.030	3
	27	0.005	1	0.031	2	0.028	1	0.028	2	0.0	2	0.032	2

Primary survey

The survey was conducted within the zone premises in and around the residences, as the focus was to elicit responses in a natural setting. The empirical observations are drawn from conversations with 50 respondents from zone 2, 40 from zone 6, 40 from zone 26. Survey was carried on weekends between 9:30am to 4pm and evening time during work days, between 3 pm to 6 pm. Survey was conducted at varied locations within the zone: At the centre, residences near the roads, near community clubs and community institutions. Some questions that were characteristically asked to all respondents was about: the ease of accessibility to public places, duration and ownership of their stay in the residence, places where they belong to, reasons for staying in the locality, activities that they share, reasons for safety and satisfaction in the specified area, stay experiences around the zone, provision of water supply, electricity and solid waste disposal, reasons of attachment with a particular.

Fig. 4. Primary Survey outcomes, Author 2024

It is observed that zone 2 has the highest number of owned houses with the least issues in getting a house as it is well planned with fewer or no crimes in the vicinity. The number of rented houses in Zone 26 is more as the built-up area in the zone is almost saturated with more dwellers as landlords. In Zone 6, the issues of getting a house are highest due to poor economic conditions and thefts in the locality. Residents of wards 2 and 26 use parks more often as compared to wards. All wards have a good electricity supply. Ward 2 and Ward 6 are well connected with transport provision compared to Ward 26. Solid waste disposal was a concern forward six as the

residents were involved in collecting and segregating waste. Wards 2 and 26 had a good water supply in contrast to Ward 6. Theft was highest in Ward 6, followed by Ward 26 and Ward 2. There are no parks in Ward Six, nor do they lie in a buffer of 500m, making it difficult for the residents to access them. Ward 26 lies in the 500m buffer of the surrounding parks, which is well connected for usability. Ward 2 has a centrally located park, making it easy for the residents to commute. No threats have been imposed by any group in all the wards.

Residents of Zones 2 and 26 use parks more often than residents of Zone 6. All zones have a good electricity supply. Zones 2 and zone 6 are well connected with transport provision compared to zone 26. Solid waste disposal was a concern for Zone 6 as the residents were involved in collecting and segregating waste. Zones 2 and 26 had a good water supply in contrast to Zone 6. Theft was highest in zone 6, followed by zone 26 and zone 2. There are no parks in Zone 6, nor do they lie in a buffer of 500m, making it difficult for the residents to access them. Zone 26 lies in the 500m buffer of the surrounding parks, which is well connected for usability. Zone 2 has a centrally located park, making it easy for the residents to commute. No threats have been imposed by any group in all the zones and the residence remains a matter of choice to the inhabitants.

Discussion and Conclusion

Though segregated cities had their origin during apartheid in Africa, their reflection can still be seen in the present scenario. The above cases and conclusions would help in better analysing the spaces to be studied in the identified study area. Place-making and area-based initiatives include urban regeneration, creating a sense of belongingness and focusing on promoting cultural activities in the public realms. Creating social mix policies would help in mixing housing types, such that priority is given to people belonging to myriad communities. Housing similar to Helsinki could be adopted in Government housing provision in certain contexts in the study area as well. Appointing think tanks would involve a group of people working exclusively to address such issues. Moreover, the adoption of participatory Governance, such as providing platforms where citizens can propose ideas or vote for the chosen proposal for an area or recommendations for any scheme or policy, would aid in the process. Adopting crime prevention through environmental design would help reduce crime through urban and environmental design, which could also be an alternative to the integration of people belonging to myriad religious groups in the city.

Residential building typology, boundary wall, the transition spaces between the immediate public and private, and the use to which the space is put to, play a vital role in enhancing socialisation or reducing acute segregation. Adopting measures that integrate or rather create a gradual transition boundary between the myriad ethnic community settlement patterns would be a step towards forming inclusive cities. Thus, not merely connectivity, proximity or even community composition but also Streetscape planning and design, place-making, equitable provision of services and amenities and adopting strategies that create culturally appropriate spaces would keep people riveted in the diverse city. This study would assist in identifying parameters that promote segregation or cause inclusivity in a city and as a planner how could we contribute towards it.

The methods and procedures to be adopted in the analysis of the study can be aided by the tools and techniques used in the paper. This would help attain a good spatial analysis required to carry out a relevant study agenda. Relating the services with the specified parameters in the Ghettos formed and the derivation of the Segregation or inclusion in the parts of the city will give a clear picture of the on-ground situation. Moreover, in addition to the Index of Segregation, the Urban Equity Index could be used to better assess city segregation. This would aid in foreseeing its prospects that need to be dealt with. Moreover, an intense survey and people's opinions on the social geography of the place would assist in concluding the final proposal and suggestions. A bottom-up approach can be used in the study methodology and opinion building. This would leave fewer lacunas in the authenticity of the study undertaken and render it as an exercise to be undertaken in other cities to come up with more intriguing outcomes and insightful conclusions.

The Centrality of Soft Skills in Higher Education: Theory, Methodology and Practice

María del Pilar García-Chitiva

Tecnologico de Monterrey, Mexico,  <https://orcid.org/0000-0001-6776-3422>

Abstract: The Global Agenda 2030 has set out a common pathway that delineates the type of vocational training that higher education institutions (HEIs) should provide to respond to the challenges it sets. Rankings and other metrics are concerned with examining the quality of higher education in terms of research standards or international accreditation. However, leave aside the quality of education offered in HEIs from the perspective of teaching and developing soft skills in line with labor market needs. This paper aims to analyze how soft skills are developed and researched in higher education based on two types of analysis. In the first, a content review of research articles published between 2010 and 2022 that examined the formation of soft skills in students was conducted. The second used text mining techniques and modeling based on bipartite networks. The results showed that the competencies most addressed in the studies were intrapersonal competencies, such as critical thinking and adaptability; interpersonal competencies, such as team leadership; and transversal competencies, such as oral and written communication. In addition, it was found that the preferred pedagogical methods for training them were courses to teach the competencies, the use of open educational resources (OER), guidance materials for learning the necessary competencies, and teaching models. Finally, role-play activities and self-report questionnaires were often used to explore and analyze soft skills.

Introduction

Global commitments to mitigate the world's problems involve training professionals with robust disciplinary training, who also have competencies that allow them to make effective and strategic use of that knowledge to solve problems, which is one of the challenges of the current era (Brauer, 2021). Achieving these goals implies developing an education designed for the future (World Economic Forum, 2023), which not only contemplates main courses focused on disciplinary and transversal training but also incorporates the development of soft skills (Tang, 2019), better known as soft skills, at the same level of importance. According to Dell'Alquila et al. (2017), soft skills have an integrative character, allowing individuals to interact with others daily. For example,

in interaction with others, when they work collaboratively, lead work teams, or in their personal tasks by self-regulating or persistently developing their commitments.

The study on soft skills or essential competencies, as defined by the OECD (2019), has been approached from diverse understandings and perspectives, such as generic competencies, transferable competencies, or key competencies. Hence, Bisquerra & Pérez (2007) consider the competencies concept as one polysemic concept. Within this diversity, some approaches recognize soft skills as the intersection between cognitive, emotional, and social competencies with emotional intelligence. (Boyatzis, 2008).

For Scheerens et al., (2020), soft skills can also be recognized as social and emotional competencies. This approach coincides with seminal work such as that of Goleman (2010), who argues that socio-emotional skills come from a combination of intra- and interpersonal competencies that allow people to adapt and effectively interact with others. Under this understanding, soft skills must be part of the educational agendas at all levels of training. This inclusion is fundamental because one gap that arises between the professional training acquired at university and the entry into the labor market is related to the lack of soft skills in graduates to perform optimally in the labor market (Sharvari & Kulkarni, 2019).

Previous studies have examined the importance of training in socio-emotional competencies, or soft skills, as addressed in this study. For example, Zins et al., (2004) developed a teaching model based on systematic and structured orientations in educational processes to train socio-emotional or soft skills. The principles of this model, called Social-Emotional Learning (SEL), focus on shaping the student's emotional development from intrapersonal to interpersonal aspects.

In a subsequent study, through a review of the educational model of higher learning institutes in Malaysia, Shakir (2009) examined the characteristics that comprise a model favorable to the development of human capital in higher education students in Malaysia. In this analysis, Shakir found that these key aspects are part of soft skills that comprise capabilities in different domains, including: 1) competence to communicate, 2) competence in critical thinking and problem-solving, 3) competence to work in, 4) lifelong learning, 5) information management, 6) business and ethical competencies, and 7) leadership competencies, moral and professional. The results showed that one of the main challenges faced by higher education institutions in Malaysia is the lack of resources to train teachers in soft skills so that, in turn, they can be mentors and guides in developing these competencies in their students.

On the other hand, Häfner et al. (2013) designed a four-phase practical course focused on learning virtual reality by simulating industrial projects aimed at university students from different undergraduate and graduate careers. In the first phase, students were introduced to virtual reality using lab lectures and demonstrations. In the second, laboratory exercises were carried out using task-specific software. In the third, they conducted the practical work of developing a project in small groups. In the fourth and final phase, they socialized the project results. The findings of the measurement of students' perceptions about students' performance in the execution

of the task revealed the favorability of employing this teaching sequence with the support of virtual reality.

Subsequently, Mokwa-Tarnowska et al. (2018) designed online teaching modules in which they used 2.0 tools such as Moodle wiki, Thinglink, mural, Quip, and Easel.ly to improve students' soft skills such as critical thinking, collaborative and reflective thinking. The study was carried out with civil engineering students during three stages. These stages were developed in three different academic periods, in which the students had to plan a project and arrange the information on a poster (stage 1), describe through the Moodle wiki the equipment created by the teams, and advertise them (stage 2), and explain in formal technical terms their product, using some of the defined tools. The results showed that using technological tools that enable collaborative work favors the development of this competence.

In another study, Abdullah et al. (2012) analyzed the gap between the soft skills training acquired by graduates of an electronic engineering program and the competencies required by the labor sector for these professionals based on the perception expressed by participants in a questionnaire about the subject. Representatives of employers such as company directors, human resources managers of the industry in that area, production managers, and test managers participated in the study. The results revealed that all participants perceive a mismatch between the competencies acquired by graduates in electronic engineering and the soft skills required by the labor market. Finally, these authors concluded that the higher education system should take drastic measures to close the gap between higher education and employment.

In a more recent study, Joie-La Marle et al. (2023) analyzed the effects of a soft skills metacognition training program on self-efficacy and adaptive performance among company employees through a training course on interpersonal skills metacognition training. The results revealed that knowing the soft skills that one possesses and those that do not allow us to appropriate strategies to develop the competencies that are lacking and strengthen others, such as self-efficacy and adaptation.

Given the above, it is clear that soft skills are part of the foundations that allow people to develop personally, socially, and professionally. It is also necessary to understand that training in Higher Education requires the development of these competencies. For this reason, it is essential to understand the characteristics of studies that have examined how to develop soft skills in professionals in training. Within this framework, the following research questions were addressed in the present study: What understandings of soft skills have the studies addressed? What soft skills are privileged in teaching and learning in vocational training in Higher Education, and to what typology do they belong? What are the pedagogical conditions conducive to fostering the development of soft skills in higher education? What mechanisms have been used to measure and analyze soft skills development in higher education?

Considering the above, this study aims to examine the comprehension concept of soft skills and identify how they are taught, developed, and evaluated in higher education. In what follows, the conceptualization of competencies is presented, where the inter- and intrapersonal perspective is emphasized as a framework for

developing and understanding this concept. The method and results are then presented. The results section is organized within the framework of the 5 defined categories, derived from the research questions here: 1) understanding of the concept of soft skills, 2) soft skills that are developed, 3) dimension of the competencies that are developed (Intrapersonal/interpersonal), 4) pedagogical methodologies used to teach soft skills and 5) how soft skills are examined and evaluated. Finally, it closes with the discussion and the conclusions section.

Conceptualization of soft skills

Among the training requirements identified as essential competencies for social progress (OECD, 2015) are those recognized as soft skills. These competencies have been approached from different perspectives, explaining traits or aspects inherent to people that are crucial to their social and professional development.

It is clear that definitions of competencies are generally not based on single approaches (Bisquerra & Pérez, 2007) since various classifications have been formulated under polysemic understandings. Soft skills are no exception since they are known under different names such as: "participatory competencies, personal competencies, basic competencies, key competencies, generic competencies, transferable competencies, relational competencies, life skills, interpersonal competencies, transversal competencies, basic life competencies, social competencies, emotional competencies, socio-emotional competencies, etc." (Bisquerra & Pérez, 2007, p. 65).

From other studies, soft skills are understood as integrative, which contain qualities of individuals to self-manage, make decisions, solve problems, and interact with others, among other inter- and intrapersonal aspects (Dell'Alquila et al., 2017). They are also recognized as the result of the integration and development of underlying competencies, such as cognitive, emotional, and social competencies, in conjunction with emotional intelligence (Boyatzis, 2008).

Among the studies that analyze soft skills from a socio-emotional perspective is the one proposed by Goleman, (1998). This approach raises the need to encourage the development of emotional competencies, such as empathy, emotional self-regulation, self-motivation, and self-awareness, as well as social competencies, such as empathy and leadership. For Goleman, generating literacy of these skills is essential, as this can answer many societal problems (Scheerens & van der Werf, 2020, p.4).

In a later development, Zins et al. (2004) raised the need to include systematic and structured guidelines in educational processes for developing socio-emotional competencies. For this reason, they propose training in soft skills using a people-centered socio-emotional learning model based on the idea that guiding teaching by strengthening student-centered psychological principles allows one an integrative sense of what is taught and learned and to know oneself to know how to manage one's decision-making with personal and collective implications. that is, in which socio-emotional competencies are strengthened from the intra and interpersonal levels.

From a perspective close to socio-emotional competencies, Boyatzis (2008) presented the relevance of soft skills for the performance of people in the different roles they must play in society, particularly in the organizational environment. This author argues that social, cognitive, and emotional competencies, along with the development of emotional intelligence, self-awareness, and self-regulation, among other individual aspects, are components of soft skills and that developing them positively impacts people's performance. Although this perspective is inclined to value soft skills in the work environment, it is clear that developing them during vocational training contributes to that purpose from the world of work.

Finally, Cinque (2016) and Vera & Tejada (2020) reported that soft skills enable individuals to perform adequately in individual and collective tasks and to help access the labor market. These competencies empower them for life since they involve ethical behaviors, effective communication, critical thinking, and the ability to work with others in collaborative environments.

Pedagogical and Assessment Approaches to Soft Skills: A Network-Based Approach

Networks are organized systems with nodes connecting with links (Luke, 2015). A network is an organized system because it allows the organization of entities or objects in a set and the relationship between them. Such a relationship is established between pairs of nodes and can describe different types of relationships (Pinheiro, 2022). There are various types of networks. For example, one unipartite network is one in which nodes connect within the same network. For example, if we examine the type of soft skills that are analyzed in each of the 36 research articles examined in a review, 36 unipartite networks could be generated with their nodes (Soft skills) connecting based on the relationship criterion that has been set. This criterion could be the pedagogical approaches used in these works to develop and evaluate soft skills. Another type of network is bipartite networks. These networks illustrate the links between nodes of different sets that are part of two sets (Luke, 2015; Pinheiro, 2022). In the case of this article, they are used to illustrate the relationship between competencies and the dimensions of competence, the most relevant competencies with the pedagogical approach used to develop them, and the ways to examine or measure them in the 36 articles analyzed. Centrality measures allow you to identify how important a node is in the network based on its centrality metrics: degree centrality, closeness centrality, betweenness centrality, and eigenvector centrality. In this study, only the eigenvector centrality measure that measures the transitive influence of nodes is taken. This measure lets us know how many significant nodes (i.e., competencies) are connected and how much they vary between them (Christian et al., 2015).

Method and materials

The network analysis methodology used Degree centrality (DC) metrics to identify the most relevant competencies, according to their centrality, in the 36 studies examined. Degree centrality represents the number

of connections a node has to other nodes. This network metric is quite helpful in understanding how popular or connected a node is to others. (Pinheiro, 2022).

Data were obtained with the *query* that included the terms "*soft skills*," "higher education," and "teaching and learning," which appeared in the title, abstract, and keywords of the documents in the SCOPUS database. From this search, 48 documents were obtained, including articles, editorials, reviews, and book chapters. Only articles on research results (23) and articles on conference proceedings (13) were included to answer the defined research questions. The other types of documents were discarded. In total, the sample consisted of 36 documents.

Data analysis

For the literature review analyses, the metadata of the 36 selected documents were organized in a double-entry matrix on the format. Xls. The rows corresponded to each of the documents, and the columns to the aspects observed in each one, such as authors and year of publication, title, scope in which the study was carried out, methodological aspects of the study (type of study, sample, instruments used, main results), competencies that are analyzed and type of document. Subsequently, a second review of the documents already organized in the matrix was carried out, analyzing them according to their content in the categories presented in Table 1. These categories were defined based on the research questions addressed in the study.

What mechanisms have been used to measure and analyze the development of soft skills in higher education?

Categories	Categories description	Research questions
The concept of soft skills addressed in the study	The concept of soft skills was addressed in the studies analyzed.	What understandings of soft skills have the studies addressed?
Soft skills addressed in the different pedagogical approaches developed in the studies	Most relevant soft skills and competencies are approached from different pedagogical approaches.	What soft skills are privileged in teaching and learning in vocational training in Higher Education, and to what typology do they belong? What are the pedagogical conditions conducive to fostering the development of soft skills in higher education?
How soft skills are tested and evaluated	Characteristics of the ways approached in the studies to assess and examine soft skills.	What mechanisms have been used to measure and analyze soft skills development in higher education?

For the network analysis, a matrix was structured in .csv format in which the 36 documents were arranged in rows. Two columns contain the types of studies carried out based on the objectives outlined in each work and the soft skills examined in each. Subsequently, the data was processed in R Core Team (2023) to generate the

edges list. The edges list was necessary to create the two networks and the Eigenvector centrality measurements. The first edge list had the variables Competencies (*e.g.*, Etic, Moral, Teamwork, Entrepreneur, Techonlógical Knowledge, Digital) and category of competencies (*i.e.*, Intrapersonal, Interpersonal, Tranversal, Specific). The second edge list had the type of pedagogical proposal and/or approaches for developing competencies (*e.g.*, Teaching material, Models, Methods, Resources, and Perceptions) and Competencies (*e.g.*, Teamwork, Critical thinking, Problem-solving, Communication). Finally, the edge lits trachea had the forms or modalities in which competencies (*e.g.*, survey, interview, evaluation with rubrics, questionnaire, Perform of evaluation) and competencies (*e.g.*, Teamwork, Critical thinking, Problem-solving, Communication).

Results

This section shares the results of the categories mentioned in the method.

The concept of soft competence that is addressed in the studies analyzed

Concerning the definitions presented in the documents about the concept of soft skills, it was found that only 12 of the 36 documents analyzed presented an explicit definition of soft skills. These definitions emphasize that these types of competencies do not have a particular disciplinary affiliation (Daley & Baruah, 2021). They also referred to the fact that soft skills result from the interaction between knowledge, attitudes, and abilities that favor professional performance (Sbardella et al., 2019). Therefore, their development favors the performance of people in different spheres of personal/individual and social life (Esteves et al., 2018; Idrus et al., 2012). Additionally, they mentioned that soft skills have to do with people's qualities (Pazil & Razak, 2019), intrapersonal and interpersonal aspects (Bastos et al., 2020; C. Carvalho & Almeida, 2022; Gonzalez et al., 2013), as well as problem-solving skills (Peres & Azevedo, 2010), leadership and teamwork (Khalid et al., 2014), which have a significant impact on entry into the world of work and optimal performance in it (Hadiyanto et al., 2021). Therefore, soft skills need to be learned and developed, as they are not innate (Tan et al., 2021).

This set of definitions underpins the polysemic nature of the concept of competence that Bisquerra & Pérez (2007) use from a general perspective, particularly in soft skills.

This is reflected in the definitions of four of the studies analyzed, in which soft skills are linked to associated concepts such as ability in general (Osman et al., 2012), interpersonal ability (Awang-Hashim et al., 2022) or interpersonal competence (Noah & Aziz, 2020). Only one of the works involves other types of statements, including habits, abilities, and relationships (Ragusa et al., 2022).

The remaining 24 documents did not address the concept of soft competition directly for several aspects of their conceptual approach; they focused on:

- Examine the relevance of the development of critical thinking and how to enhance it through the use of technological mediations based on collaborative structure (Carvalho et al., 2019).
- Analyze the competitiveness and quality measurement tools of countries such as Singapore, Malaysia, Thailand, Indonesia, the Philippines, among others, based on the Global Competitiveness Index report of 2015-2016 (Hamzah et al., 2018).
- Reflect on the relevance of the development of soft skills for the personal growth of individuals and interaction in their environment (Horváth, 2020).
- Identify the implications of the didactics used in STEM education to enhance students' competencies for the 21st century (Lavi et al., 2021).
- Analyze teaching-learning strategies mediated by gamification and didactic strategies mediated by technologies, such as the Escape Room, to enhance soft skills such as critical thinking and collaborative work (Mudure-Iacob, 2021).
- Propose a teaching proposal based on the flipped classroom method to enhance intrapersonal competencies such as self-regulation and interpersonal competencies such as teamwork (Bui et al., 2022; Cai, 2022).
- To design a teaching-learning proposal incorporating didactic strategies and tools to strengthen the pedagogical competencies of students being trained as teachers. This proposal favored the development of intrapersonal competencies (Razak et al., 2022; Trust et al., 2022).
- Establish the benefits of the implementation of the B-learning modality to enhance soft skills that favor entrepreneurship and innovation in university students (Pisoni, 2019).
- Implement a teaching strategy to enhance critical thinking, problem-solving, communication, and leadership competencies (Idrus, 2017).
- Generate a model for teaching leadership and teamwork competencies and a gamification-based module for the development of soft skills for teamwork (Rich et al., 2019).
- Develop a system for automatically assessing teamwork soft skills based on criteria identified in observed sessions and teachers' perceptions ((Montero et al., 2014).
- Develop an inventory of competencies that need to be included in the curriculum, identified from surveys and information collected from professors, students, and graduates (Idrus, 2015).
- Strategies for the development of soft skills incorporating Problem-Based Learning (PBL) (Felgueiras et al., 2020), Gamification-Based Learning (GBL) (Amara & Saberi, 2018) and Collaborative Project-Based Learning (PBL) (Osipov et al., 2023).

Most relevant soft skills and competencies approached from different pedagogical approaches

Types of competencies analyzed in the studies reviewed

The identification of the competencies most analyzed in the reviewed studies, as well as their typologies, showed that the studies developed intrapersonal competencies such as Problem-Solving (DC=17), Critical Thinking (DC=16), Ethical (DC=6), Moral (DC=5), Creativity Thinking (DC=5), Lifelong-learning (DC=5) and Innovative Thinking (4). Interpersonal competencies include teamwork (DC=15), leadership (DC=7), and

collaboration (DC=5). In the transversal competencies, the most relevant for their DC was Communication (DC=17) (i.e., oral and writing), and the Specific or disciplinary competencies were Entrepreneurship (DC=5) (See Figure 1).

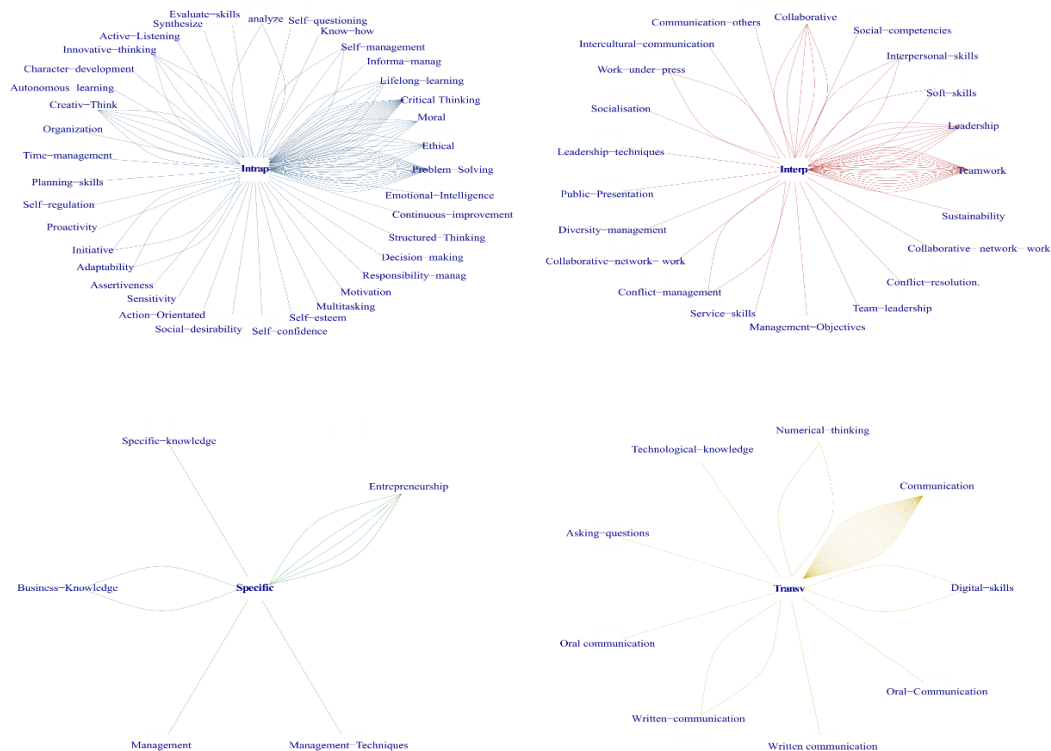

Figure 1. Egocentric networks of competence typologies are addressed in the reviewed studies.

Soft skills addressed in different pedagogical approaches

The 36 studies examined addressed five types of pedagogical approaches for the development of soft skills: Creation of educational resources (CreatResour), Perceptions and alternatives for the teaching and learning of soft skills (PercepteachLearn), Implementation of methods for the development of soft skills (ImplemMethod), Proposals for educational models for the development of soft skills (ModelPropos) and Teaching materials for the development of soft skills (TeachMater). The most frequent pedagogical approach was PercepteachLearn, which accounted for 30.5% of the studies. These works examined previous work and experiences that allowed them to determine the best educational practices for developing soft skills. They also explored teachers' and students' perceptions of the soft skills that must be created. The next approach was TeacherMater (27.5% of the studies), where they developed teaching materials that allow the development of competencies (e.g., guides for the development of oral communication and development of study things). The next pedagogical approach was ModelPropos (19% of the studies), in which they proposed models to assess competencies for developing

engineering competencies, teaching soft skills, and their evaluation. The remaining two approaches, CreatResour (11%) and ImplemMethod (12%) created gamified resources for learning, open resources for collaborative learning, and technological developments for competency assessment (CreatResour). The latter, ImplemMethod, implemented methodologies such as B-Learning, collaborative learning, and project-based learning to measure their impact on developing soft skills.

The most analyzed competencies in the different pedagogical approaches were problem-solving (DC=17),

Figure 2. Pedagogical approach to analyzing soft skills.

Communication/Oral and Written with DC (DC=17), Critical Thinking (DC=16), and D Teamwork (DC=15). On the other hand, other competencies, such as less, are also addressed in some types of approaches. This shows the variety of disciplinary studies, e.g., for the development of business (DC=1), linguistic (DC=1), synthesis (DC=1), and self-structuring (DC=1) competencies.

Assessment of competencies

Figure 3 presents the assessment methods used by the studies reviewed to assess competencies. The most frequently used evaluation methods in the studies were questionnaires (30.7%), surveys (27.7%) and performance evaluations (25%), rubrics (11.1%), and interviews (5.5%) were the least used. In questionnaires, surveys, and interviews, teachers and students were generally asked about perceived competencies and those they consider desirable for professional performance. In the performance evaluations and the soft skills evaluation rubrics, indicators were incorporated to determine the level of competence development (e.g., levels of effective communication, levels of self-management, etc.).

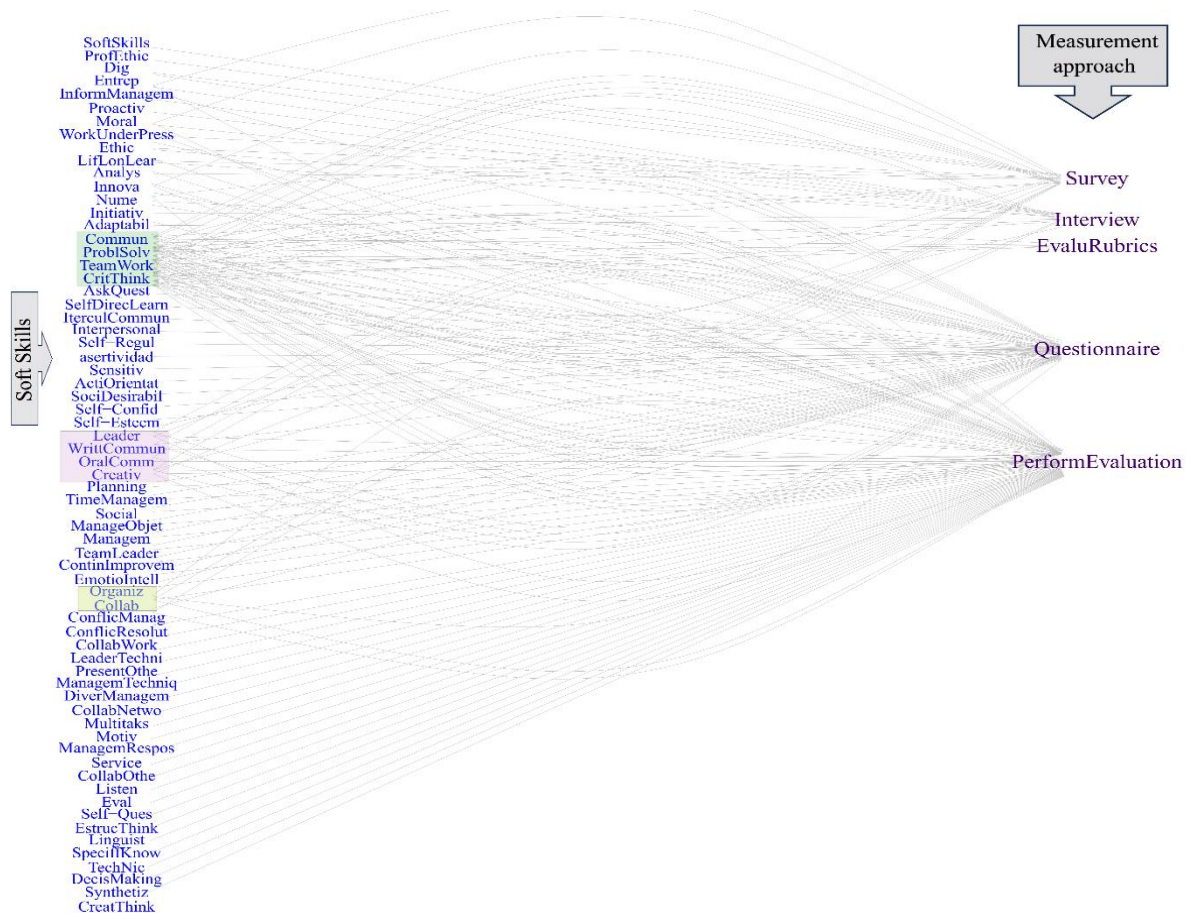

Figure 2. Measurement approach to analyzing soft skills.

This result shows that the most relevant competencies are due to their levels of DC, such as problem-solving (DC=16), critical thinking (DC=15), communication (DC=14), and teamwork (DC=14). This indicates that the analysis of soft skills is carried out from an integrative approach, in which intrapersonal soft skills, such as problem-solving, are linked with interpersonal competencies, such as teamwork and transversal competencies such as communication, with others such as e.g., self-regulation, time management, adaptability (intrapersonal competencies), leadership, diversity management, conflict management, public presentation (interpersonal skills), DNA, oral communication, digital skills (transversal skills), entrepreneurship, management, SEPCIFICS

knowledge (specific skills).

Discussion

This study aimed to examine the concept of soft skills and identify how they are taught, developed, and evaluated in higher education. Two types of analysis were addressed, which allowed us to determine that there are many definitions of soft skills given the diversity and application of soft skills in the different disciplinary areas. However, in most cases, they identify soft skills as one of the characteristics that enable people to perform effectively in work, academic, and personal environments. In other words, from an understanding close to that proposed by Scheerens and van der Werf (2020), soft skills are part of a socio-emotional dimension, which can be the answer to the solution of societal problems.

Under the second analysis, it was possible to identify a core of soft skills, such as problem-solving, critical thinking, and teamwork, which, in addition to being addressed in most jobs, are examined in parallel or conjunction with others. This reflects the growing interest of the different disciplinary areas in developing soft skills in response to the calls for studies that identify the gap between the training of soft skills in higher education and those required in the labor market (Didier, 2024), or the need to expand the framework for the development of soft skills, as proposed by (Garcia-Chitiva & Correa, 2023).

Finally, a richness in the variety of pedagogical and assessment approaches for developing and revising competencies was identified. In these approaches, the traditional analysis of perceptions predominated. It is a fertile field for future work to expand approaches that create resources that allow them to be evaluated in addition to teaching soft skills.

Conclusion

The studies' analyses revealed the importance of soft skills in students' personal and professional growth. These competencies, which encompass intrapersonal, interpersonal, and transversal skills, play a vital role in achieving success in various areas, particularly in the professional field.

The diversity and variety of pedagogical techniques and strategies for fostering and assessing soft skills range from developing educational materials to applying educational frameworks and using technological tools. This variety shows soft skills' complex and multifaceted nature, implying that a singular approach may not be comprehensive enough to encompass all aspects of these skills.

Recommendations

Other research can also delve into the methods employed to train soft skills by knowledge areas in technical,

bachelor's, and postgraduate programs.

In this study, only articles from one database (Scopus) were analyzed due to researchers' ease of access to this information source. Future studies can use Web of Science, Redalyc, Scielo, and Lens databases.

Abstract: Multiplayer Online Battle Arena (MOBA) is one of the Internet gaming genres that has not been adequately examined. The present study aims to examine the roles of three gaming motivations (i.e., achievement, social, and immersion) and depression on Internet gaming disorder (IGD) among MOBA players in the Malaysian context. The mediating role of depression in the associations between the three gaming motivations and IGD was also examined. In the present study, 1,175 MOBA players were recruited through MOBA online groups on social media. The sample was predominantly males which accounted for 75.20% ($n = 808$) and their age range was between 18 and 35 years old ($M_{\text{age}} = 22.19$ years, $SD = 3.30$). The results showed that three gaming motivations and depression as positive predictors of IGD. Depression was a significant mediator for the associations between three gaming motivations and IGD. A large proportion of IGD variances were explained by these key predictors. The findings provide a preliminary understanding of the underlying predictors of IGD in this inadequately examined context. Future studies should expand the examination to obtain more research evidence to benefit the development of prevention, intervention, and treatment.

Keywords: MOBA players, Gaming motivations, Depression, Youth, Internet gaming disorder

Ozturk (Eds.), *Proceedings of ICRES 2024- International Conference on Research in Education and Science* (pp. 2023-2037), Antalya, Turkiye. ISTES.

Introduction

User-centred approach specifically focused on players' motivations and feelings during game development has been constantly applied in designing Internet games nowadays. The adoption of this approach is to enhance players' immersion in gaming (Ng et al., 2012). In recent years, Internet gaming has become one of the most popular worldwide leisure activities, however, there is a growing concern that excessive and prolonged involvement in this activity may lead to several adverse consequences, such as poor academic performance, social relationships, family cohesion and physical health (Kuss, 2013). In the Diagnostic and Statistical Manual of Mental Disorders, fifth edition and fifth edition text-revised (DSM-5, DSM-5-TR), Internet gaming disorder (IGD) has been documented in Section III Emerging Measures and Models. In general, IGD refers to persistent or recurrent gaming behaviour which causes one's clinical impairment or psychological distress. American Psychiatric Association (APA, 2013) warrants more studies to be conducted to provide stronger empirical support for the nine diagnostic criteria of IGD. Gaming disorder (GD) has also been highlighted in the Eleventh World Health Organization's classification (IGD 11, WHO, 2019) which is classified as one of the addictive disorders. APA (2013) and WHO (2019) both agreed that gaming disorder should be diagnosed clinically if gaming activity deteriorates one's life functioning. Therefore, it is imperative to support the growing effort in establishing a clearer conceptualization of IGD which serves as a significant reference for researchers and clinicians.

To date, most of the empirical studies extensively examined Massively Multiplayer Online Role-Playing Games (MMORPG) and reported the addictive nature of this genre (e.g., Billieux et al., 2013; Hussain et al., 2015). However, Multiplayer Online Battle Arena (MOBA) has been rapidly thriving in the gaming market and became the most popular genre worldwide after the launching of *Mobile Legends: Bang Bang* and *League of Legends* (LoL), surpassing the popularity of MMORPG. Comparing these two genres (i.e., MMORPG and MOBA), they share similarities and differences. Both genres require continuous advancement and frequent social interaction, however, MMORPG games are typically designed with a never-ending world but MOBA games stop evolving after withdrawal from the game. Popular MOBA games provide daily updates of world rankings, portraying their competitive nature as compared to MMORPG (Nuyens et al., 2016).

This online gaming phenomenon is prominent in Malaysia, where it has been found in a major part of our lives nowadays. A global market research provider of games and Esports analytics – Newzoo (2023) reported that the latest data on video game consumption reveals about 3.38 billion players worldwide and growing by +6.3% year-on-year. Asia-Pacific region accounts for more than half of the players worldwide, contributing 84.1 billion out of the total of 184 billion. Forde (2019) also reported that the gaming industry in Southeast Asia (including Malaysia) has been recognized as “the world's fastest-growing (mobile) games region/market”. According to the Malaysia Youth Council (2019), individuals aged between 18 and 35 are categorised as youth. The suggested age range was introduced by referring the international standards (i.e., United Nations, Commonwealth). It is important to highlight that program implementations should focus mainly on youth to

strengthen the development of the nation. Sussman and Arnett (2014) emphasized that individuals in this stage are also more vulnerable to developing addictive behaviours, signifying greater scholarly attention should be given to this group of population. To the best knowledge, few studies have examined the determinants of IGD among MOBA players, and the present study is also pioneering the examination of motivations of gaming, depression, and IGD in the Malaysian context.

Gaming Motivations and IGD

It is suggested that IGD is highly associated with misdirected motivations with greater focus channelled to virtual reality than the physical world (Dong & Potenza, 2014). A model of motivations in the gaming context has been proposed by Yee (2006) which aims to understand the collective patterns of gaming motivations while assessing the individual differences among players. From the findings, three core motivations were discovered: achievement, socialisation, and immersion. Achievement motivation is defined as an urge to obtain greater power, have fast progression, collect more in-game wealth, and enjoy the competition. Next, players who are motivated by social needs enjoy forming long-term meaningful relationships, seeking social support, and collaborating in a team. As for immersed players, they use gaming as a platform to avoid or escape from real-life problems. They also place greater emphasis on the quality of experience in gaming by exploring hidden objects and/or customising an online character. As such, different players are driven by motivations even if they play the same game, implying that online gaming may lead to different meanings and outcomes for different players. Moudiab and Spada (2019) suggested that the examination of motivations is crucial as it provides a framework to differentiate among players meanwhile establishing a clearer picture of the usage patterns and behaviours. Williams et al. (2008) also reported that these three motivational factors accounted for 60% of the overall variance in online gaming, emphasizing their influential roles in the etiology of IGD.

Beard and Wickham (2016) collected data from a sample of MMORPG players and it was found that advancement motivation (which is conceptually equivalent to achievement motivation) significantly contributes to problematic gaming behaviour. Xu et al. (2012) examined 623 Chinese adolescents and found that players' desire to obtain greater mastery and advancement did not predict problematic Internet use. These empirical findings have restricted a clearer understanding of achievement motivation in the development of IGD among MOBA players in Malaysia, implying more studies have to be conducted. In another perspective, inconsistent findings were also reported by past studies regarding the roles of social motivation and problematic online gaming. For example, Xu et al. (2012) and Zhong and Yao (2013) revealed that social motivation reinforced players to have more intensive gameplay which may substantially increase their likelihood of experiencing IGD. In contrast, Kneer and Rieger (2015) described that social interaction did not predict problematic gaming behaviour possibly due to socialisation contributing to better psychological well-being which serves as a protective factor to refrain players from experiencing IGD. The mixed findings have presented an unclear role of social motivation in the etiology of IGD, particularly across different cultural contexts.

Additionally, Ballabio et al. (2017) reported that escapism (one of the core elements of immersion motivation) has a positive association with IGD. It allows players to temporarily escape themselves from any frustrations of the physical world meanwhile providing a platform to experience game enjoyment (Snodgrass et al., 2013). A literature gap has to be addressed as it is assumed that different game genres attract players with different motivations. MMORPG and MOBA genres both involve the use of online characters, however, MMORPG games emphasize more on creation and customisation of online characters and they can be played solo, whereas MOBA games require intensive team collaboration to compete with a rival team. Therefore, the inadequate scholarly focus on the MOBA genre has provided a strong impetus for the present study to be conducted.

Depression and IGD

Individuals with more severe psychopathology are more vulnerable to have addiction due to deterioration of psychosocial functioning and weaker intention to dissociate themselves from emotional difficulties (Wu et al., 2016). A recent study by Liu et al. (2018) reported a positive connection between depression and IGD. Specifically, depressed individuals are at higher risk of experiencing IGD than their counterparts. Kardefelt-Winther (2014) explained that cyberspace provides a platform for players to compensate for their dissatisfaction with the physical world through excessive involvement in online gaming. The anonymity in the virtual world allows depressed individuals to share their personal life difficulties as having an undisclosed identity allows them to feel safe and less threatening. Therefore, online gaming produces immediate positive psychological effects which can substantially reduce their depressive moods or emotional disturbances, leading them to overly rely on the use of the Internet (Caplan & Turner, 2007). Nevertheless, temporary compensation may further deteriorate several life aspects such as neglecting daily responsibilities and jeopardizing interpersonal relationships (Stavropoulos et al., 2016). In return, the existing symptomology of depression is likely to be reinforced and intensified to a greater extent (Ko et al., 2012).

The Present Study

The overall aim of the present study was to investigate the predictive effects of three gaming motivations (i.e., achievement, social, and immersion) and depression on IGD among MOBA youth players in the Malaysian context. The present study was therefore guided by two general research objectives. Firstly, the present study aims to investigate the direct effects of three gaming motivations and depression on IGD. Secondly, the mediating role of depression in the associations between the three gaming motivations and IGD was examined.

Method

Participants and Procedure

A total of 1,175 MOBA players were recruited in the present study. Qualtrics online survey link was posted in 28 randomly selected Malaysia MOBA online groups on social media platforms. The online groups were typically named according to popular MOBA games such as *League of Legends*, *Mobile Legends*, and *Defense*

of the Ancients 2 (DOTA 2). Ethical approval was obtained from the research team's university. Permission was obtained from the group's administrator before the recruitment process. The participants were required to provide an electronic copy of the consent. Their right to withdraw from the study and the confidentiality of the provided data were clearly stated. The present study did not focus on online players in general (including players from different age groups or different game genres), therefore, four inclusion criteria have to be met: (1) being MOBA players, (2) aged between 18 and 30 years old, (3) at least one-year experience in playing any MOBA game(s), and (4) being a non-professional player. Although the above inclusion criteria were specified in an online post and online survey, 100 sets of responses (8.51%) were removed due to disqualified of age (below 18 or above 35 years old). As for the participants' demographical profile, most of the participants were males ($n = 808$, 75.20%) with mean age = 22.19 years old ($SD = 3.30$). More than half of the participants were single ($n = 784$, 74.70%) and students ($n = 687$, 65.50%). Most of the participants spent an average of 2 to 4 hours in online gaming per day ($n = 641$, 61.10%). The largest group of gaming experience (in years) was 2 to 4 years ($n = 330$, 31.5%), followed by 5 to 7 years ($n = 245$, 23.4%).

Measures

Internet Gaming Disorder Scale – Short Form (IGDS9-SF)

This scale was created by Pontes and Griffiths (2015) to measure the symptoms of IGD over the past 12-month period. This scale is not intended for diagnostic purposes and it is a unidimensional scale. It consists of nine items that are matched with the nine diagnostic criteria of DSM-5. It is administered by a five-point Likert scale (1 = “never”, 5 = “very often”). The higher the score, the greater the severity of the symptoms of IGD. In the present study, this scale was found highly reliable with Cronbach's $\alpha = .81$.

Online Motivation Gaming Scale

This scale was developed by Yee (2007) with 39 items in total. It is comprised of three subscales: achievement (14 items), socialisation (11 items), and immersion (14 items). It is administered by a five-point-construct-specific scale, for example, 1 (*not important at all*) and 5 (*extremely important*); 1 (*never*) and 5 (*always*). The higher the score, the greater one's motivation in online gaming. It is expected that players are not motivated by a single motivation, they may be motivated by multiple motivations, and the highest score would be considered as the dominant motivation. The scale reflects good reliability with $\alpha = .87$ for achievement, $\alpha = .81$ for socialisation, $\alpha = .85$ for immersion, and the overall scale with $\alpha = .93$ in the present study.

Montgomery-Asberg Depression Rating Scale

This scale was developed by Montgomery and Asberg (1979). This is a unidimensional scale and it consists of nine items to measure nine depressive symptoms. It is assessed by a four-point Likert scale with 0 = “no depressive symptoms” and 3 = “worst depressive symptoms”. This scale is not used for diagnosis purposes. The

higher the score, the more severe the depressive symptoms are. Good reliability has been found on this scale with Cronbach's $\alpha = .82$ in the present study.

Data Analyses

In the present study, IBM SPSS Statistics version 26 was used for preliminary analysis specifically examining univariate and multivariate normalities of the collected data. As for inferential analysis, SmartPLS version 4.0.9.2 by Ringle et al. (2015) has been applied. This statistical software adopts partial least squares–structural equation modelling (PLS-SEM) which is statistically appropriate for exploratory studies or studies which are at an initial theoretical stage. PLS models are constituted by two sets of linear equations, which are known as measurement model and structural model. Model fit indices are not applicable in the PLS model, however, they are mandatory for confirmatory studies which are analysed by covariance-based structural equation modelling (CB-SEM) (David Garson, 2016). Therefore, the model fit indices are not applied in presenting the results of both measurement and structural models. A measurement model was used to examine its psychometric properties, such as validity and reliability. Upon the examination of the measurement model, a structural model was built to examine the direct effects and indirect effects between the key variables.

Results

Preliminary Analyses

Preliminary analyses were applied to examine univariate and multivariate outliers. There were no univariate outliers given the standardized composite scores for all items were within ± 3.29 standard deviations across each case, signifying that 99.9% of the cases were normally distributed (Field., 2013). Mahalanobis distance and the critical value of cases based on chi-square (χ^2) distribution were used to detect multivariate outlier(s). The results showed there were 26 cases of multivariate outliers. Therefore, 1,049 sets of responses were utilised for the subsequent statistical analyses.

The Measurement Model

The present study has first analysed the psychometric properties of the measurement model which consists of convergent validity, discriminant validity, and composite reliabilities. In Table 1, the average variance extracted (AVE) of the latent constructs ranged from .357 to .440 after deleting six items (two items from each gaming motivation construct respectively) with below .50 factor loadings and/or non-significant p -value. The present study is considered an exploratory study, leading to the AVE of the constructs being slightly below the .50 cut-off point. Nevertheless, most of the constructs were found to have .40 and above.

Fornell and Larcker (1981) suggested that convergent validity of a construct is acceptable with AVE below .50 with the conditions that it is an exploratory study or less theoretically sound model and composite reliability has to be more than .60. In the present study, the composite reliabilities are excellent with each construct between

.855 and .903 (refer Table 1). As for discriminant validity, Henseler et al. (2015) suggested applying the heterotrait-monotrait ratio of correlations (HTMT). The present study adopted the most stringent cut-off value (HTMT_{.85}) for examining discriminant validity. In Table 2, each latent construct exhibits excellent discriminant validity with all values below the .85 cut-off point.

Table 1. Composite Reliabilities and Average Variance Extracted

Latent Construct	Composite reliability	Average variance extracted (AVE)
AM	.903	.440
SM	.855	.397
IM	.868	.357
DEP	.866	.419
IGD	.860	.407

Note: AM = achievement motivation; SM = social motivation, IM = immersion motivation; DEP = depression; IGD = Internet gaming disorder

Table 2. Discriminant Validity with Heterotrait-Monotrait Ratio Of Correlations (HTMT)

	AM	SM	IM	DEP	IGD
AM	-	-	-	-	-
SM	.809	-	-	-	-
IM	.774	.722	-	-	-
DEP	.111	.193	.190	-	-
IGD	.402	.278	.559	.409	-

Note: AM = achievement motivation; SM = social motivation, IM = immersion motivation; DEP = depression; IGD = Internet gaming disorder

The Structural Model

Figure 1 displays that the strongest predictor of IGD is immersion motivation ($\beta=.353$), followed by depression ($\beta=.262$), achievement motivation ($\beta=.153$), and social motivation ($\beta=.085$) at p -value $< .01$. Each predictor reflects the positive predictive effect on IGD. As for the mediating effects, depression mediates the associations between (1) achievement motivation and IGD, (2) immersion motivation and IGD, and (3) social motivation and IGD at p -value $< .01$.

Achievement motivation has a negative predictive effect on depression. However, social motivation and immersion motivation show a positive predictive effect on depression. The adjusted R^2 of IGD accounts for 32.8% of variances explained by all the predictors. According to Cohen (1988), f^2 effect size's formula ($R^2/(1-R^2)$), values greater than .02 as small, .15 as moderate, and .35 as large. Therefore, Cohen's f^2 in the present study is .488, signifying moderate-to-large effect size.

Discussion

The present study developed a research model to examine the predictive effects of achievement motivation, social motivation, immersion motivation, and depression on IGD among MOBA players in the Malaysian context. The statistical analyses comprised direct effects and indirect effects of the selected key variables. Achievement motivation was found as a significant positive predictor of IGD in the present study and this finding has also been supported by past studies (e.g., Carlisle, 2017; Hussain et al., 2015; Khan & Muqtadir, 2016; King et al., 2017; Zhong & Yao, 2013) consistently. Players who are motivated by achievement needs have a strong urge to obtain greater mastery in the virtual gaming world, they are required to develop better knowledge of the game structure and figure out more powerful strategies in pursuing their set goals. They are also expected to invest more resources (e.g., time, money, and effort) through intensive gameplay which subsequently triggers the symptomology of IGD easily (Kuss et al., 2012). Additionally, it can be further explained that players with strong achievement needs are likely to feel uneasy or dissatisfied by leaving the targeted goals unattained (Kaptis et al., 2016).

Figure 1. Structural Model of Three Gaming Motivations, Depression, and Internet Gaming Disorder among MOBA Players

Note: The thicker the bolded path, the more significant the path coefficient is. The figure in the bracket next to the path coefficient reflects the *p*-value. AM = achievement motivation; SM = social motivation, IM = immersion motivation; DEP = depression; IGD = Internet gaming disorder

In the context of MOBA games, individual performance and overall group performance are highly connected. The peer pressure in a group drives MOBA players to devote more resources to produce desired milestones meanwhile it increases their high need for achievement over some time. It is also postulated that achievement in the virtual gaming world is more appealing and attainable as compared to the physical world. There is no

denying that players who have encountered more failures or unsuccessful attempts in various life aspects may seek online games to compensate for their need for achievement.

Furthermore, empirical studies (e.g., Beard & Wickham, 2016; Blinka & Mikuška, 2014; Khan & Muqtadir, 2016; Zhong & Yao, 2013) revealed that social players were more vulnerable to developing IGD than their counterparts. The explanation of this finding could be that collective play (the nature of MOBA) substantially reinforces players to be more socially active. They are expected to play for a longer duration than what they have initially planned (Blinka & Mikuška, 2014). Therefore, the likelihood of experiencing IGD is expected to intensify if social players perceive online gaming as a pleasant platform to develop a new form of human relationships. A study by Rehbein et al. (2016) also described that social motivation was typically higher among MOBA players given the nature of this game genre involves numerous social interactions. The finding has also been supported by Cole and Griffiths (2007), suggesting that in-game social interaction is one of the core elements that boost players' enjoyment which benefits their long-lasting friendships. The in-game social interactions substantially strengthen the symptomology of IGD and it also appears to be prevalent among non-problematic players. It is important to highlight that intensive socialisation and group collaboration are the prerequisites for players to progress in a game (Barnett & Coulson, 2010). Therefore, the role of socialisation in the MOBA genre should be emphasised.

Subsequently, immersion motivation was found to be a significant predictor of IGD in the present study. This finding has also been supported by past studies (e.g., Cross, 2016; Laconi et al., 2017; Šporčić & Glavak-Tkalić, 2018) consistently. As immersed players place greater emphasis on the quality of experience in gameplay, they are more easily attracted by the appealing features of the online gaming world. They choose to withdraw themselves from stressful real-life problems to drain their frustration or dissatisfaction in the virtual world. They enjoy using online gaming to relax, kill monsters, discover hidden objects, and customise online characters (Yee, 2006). The excessive involvement in online gaming has produced positive outcomes which leads to greater immersion in the virtual gaming world. The greater immersion contributes to undistinguishable boundaries between the online and offline worlds even arriving at a state of "losing self" (Yee, 2007). The positive outcomes do give immersed players a temporary escape, however, it may even trigger more adverse effects (i.e., IGD's symptoms).

In another perspective, depression was found as a significant predictor of IGD. Most of the depressed young people choose not to seek professional assistance but they prefer to adopt adaptive or maladaptive self-help methods (Castaldelli-Maia et al., 2012). Addiction is always perceived as an attempt to regulate unpleasant emotions through external methods. In other words, addiction is conceptualised as a maladaptive strategy in mood regulation. (Griffiths, 2005; Stavropoulos et al., 2015). Ha et al. (2006) reported that depressed individuals are likely to use cyberspace to get rid of negative emotions and they perceive stronger emotional support from cyberspace. Additionally, Liu et al. (2018) suggested that depression emerges from a sense of inadequacy about human relationships. Emotional distress can be alleviated through excessive gameplay.

However, a vicious cycle can be activated easily given that problematic online gaming amplifies the deterioration of other life aspects.

The mediating effect of depression on the associations between gaming motivations and IGD has been explored in the present study. Depression was found as a significant mediator for the above associations. Overlooking the mediating effect of depression may lead to a misleading conclusion which may reduce the usefulness of intervention. Having a significant mediating effect implies that depression functions as a potential mechanism by which gaming motivations produce changes in IGD. For instance, achievement motivation was found to have a negative predictive effect on depression. The possible explanation could be that accumulated achievements cultivate a positive sense of self (e.g., feeling superiority) which substantially refrains players from experiencing depressive symptoms. In other words, players with higher achievement needs are found to lower the severity of depressive symptoms, subsequently, the risk of developing IGD will also be lowered. Depression was also found to positively mediate the relationship between social motivation and IGD. Social players perceive social interaction in the virtual gaming world as appealing (Griffiths et al., 2004). They are prone to maintain good quality social relationships by showing more compliance, however, conflicts can be triggered easily in balancing the social demands between the in-group and out-group (e.g., family members and/or peers who are not in their gaming team), leading to the occurrence of depressive symptoms which initiates the development of IGD more intensely.

The present study also discovered that players who are motivated by immersion needs in online gaming are likely to experience depression. This possibly explains that having a greater level of immersion in online gaming leads to more deterioration in several life aspects such as neglecting societal obligations or hampering social relationships. The uncontrollable and worsening life aspects trigger the emergence of depressive symptoms (including a sense of helplessness). Consequently, these intolerable depressive symptoms motivate players to seek a pleasurable way to counterbalance their negative moods. Therefore, the motivation to escape from real life resembles a “push” effect in which online gaming promotes better short-term psychological well-being (Chang et al., 2018). The examination of the mediating effect is vital as it unveils a clear understanding of the interaction between gaming motivations and IGD.

Implications

The results of the present study are essential to provide useful insights for scholars to have a wider understanding of IGD. Nevertheless, it is unrealistic to tailor an intervention that aims to attain full abstinence from online gaming among at-risk players. Mental health practitioners are urged to create an intervention to assist players to re-discover or re-formulate new purpose of life by setting up more attainable short-term as well as long-term targets. The present study discovered immersion motivation as the strongest predictor of IGD. The great immersion in online gaming may reflect the maladaptive coping skills of youth in dealing with negative emotions that are derived from stressful life events. Cultivating a strong and adaptive coping skill among youth is crucial to promote psychological well-being. Specifically, cognitive-behavioral therapy would be useful for

understanding the gaming motivation and the specific desired outcomes that are expected by the client (high-risk players) in a psychotherapy setting. It is also essential to guide a client to seek alternative activities to compensate for their negative emotions or attain the desired outcomes which are rewarded by online gaming. In general, intensive collaboration between the client and psychotherapist would help reduce a client's craving and tolerance effect of online gaming.

Limitation and Recommendations

Although the present study is the first to examine the predictive effects of gaming motivations and depression on IGD among MOBA players in Malaysia, its interpretation and conclusions are still restricted by limitations. For instance, AVE of the latent constructs is below the .05 cut-off value, the convergent validity would be considered "provisional". From another perspective, it is believed that gaming motivations are not limited to these three gaming motivations suggested by Yee (2006, 2007). However, the present study has chosen these three motivations given that they are highly related to the competitive nature of online gaming and they are widely applied by past researchers. The present study adopted a self-report measure in which participants may not report the actual gaming behaviour possibly due to high social desirability. As participants of the present study were MOBA players, the findings may not apply to other game genres. Future studies are recommended to incorporate a qualitative approach, experimental approach, or longitudinal observation in measuring the roles of gaming motivations and depression on IGD. It is also recommended to include various age groups (i.e., adolescents) to make a clearer comparison of the prevalence of IGD. Future researchers may also consider examining personality traits that are predicted to influence gaming motivations and depression. The results of the present study would be considered preliminary and in need of replication, particularly involving more diverse and cross-cultural groups.

Conclusions

The findings of the present study highlighted the significant roles of gaming motivations and depression on IGD which are essential to understand problematic gaming behaviour. It is believed that playing online games for a recreational purpose is acceptable, however, if the daily functions of an individual are impeded, this may draw the attention of family and mental health professionals. Next, the conceptualization of IGD should be continuously developed as online games evolve rapidly and penetrate globally. The present study would also suggest players to seek healthier alternatives to compensate for their excessive involvement in online gaming. The selection of activities should also include social support from relevant parties. Clinicians are advised to explore the faulty thinking of high-risk players which leads to the formation of problematic online gaming. The present study provides preliminary findings that may articulate new ideas and stimulate new thinking about the phenomenon of online gaming. Future studies in the field of problematic online gaming or disordered gaming, in general, should gather more empirical evidence for evaluating the need to make this disorder with an official diagnosis.

Abstract: Atrial fibrillation (AF) is one of the most common arrhythmias among adults in economically developed countries of the world. This research *aim* was to study changes of contractile function of the myocardium in patients with AF during restoration of sinus rhythm (SR). *Methods:* In a one-center prospective study patients with AF received propafenone or aethacizinium for 6 months after conversion to SR by planned or acute electrical cardioversion (ECV). Symptoms and safety were evaluated. *Results:* Of the 62 patients enrolled in the study, 57 completed it per protocol. 25 patients (44%) were admitted for ECV by emergency service, 32 (56%) were referred by a cardiologist or general practitioner. All 57 patients were followed up for 6-month period; 49 (86%) maintained SR group. The rest – 8 patients (14%) experienced ≥ 1 AF paroxysm (AF group) within the follow-up time. Between AF group and SR group echocardiographic data, early diastolic atrial myocardial velocity, and strain - no significant changes were found. No safety parameters changed significantly. Recurrence rate of AF in aethacizinium group compared to propafenone group (55,6% vs 72,5%) ($p=0,05$). Aethacizinium, propafenone may be safe in patients with persistent form of AF and have no negative impact on inotropic function of myocardium.

Keywords: atrial fibrillation, propafenone, aethacizinum, inotropic function

Introduction

Atrial fibrillation (AF) is one of the most common arrhythmias among adults in economically developed countries of the world (Morillo et al., 2017). AF leads to a deterioration in the quality of life, increases morbidity and mortality, decreases life expectancy (Sankaranarayanan et al., 2015). According to available data (MMWR Morb Mortal Wkly Rep, 1999), mortality among patients with AF is twice as high as in the general population.

The main mechanisms of development of AF which should be considered when choosing therapy. Various etiological factors (diabetes, heart failure, obesity, coronary artery disease, hypertension, aging, genetic predisposition, chronic kidney disease) cause a complex of pathophysiological changes in the atria, including the formation of fibrosis in response to chamber distension, fatty infiltration, inflammation, vascular remodeling, ischemia, ion channel dysfunction and disturbances in the transport of Ca^{2+} ions (Krishnan et al., 2022). In addition, AF can independently accelerate and maintain many of the listed pathophysiological mechanisms, which largely explains the progressive nature of the arrhythmia.

Many associated factors (structural pathology of the heart, hypertension, diabetes), as well as, mainly, AF itself, appear to contribute to the slow but continuous progression of structural remodeling of atrial tissue. A distinctive feature of the process is the activation of fibroblasts, increased formation of connective tissue and the progression of fibrosis. In addition, in patients with AF and comorbid conditions that predispose to its development, fatty infiltration of atrial tissue cells, inflammatory infiltration, hypertrophy of cardiomyocytes, necrosis and amyloidosis may be detected. Structural remodeling also leads to electrical dissociation of cardiomyocytes and local conduction disturbances, which favors the establishment and maintenance of arrhythmia.

The cause of the phenomenon of electrical remodeling of the atria, apparently, is an increase in the content of intracellular calcium, leading to a reduction in calcium current, the duration of the action potential of cardiomyocytes and a shortening of atrial refractoriness. All this creates a substrate for the preservation of arrhythmia, contributes to the stability of AF and reduces the possibility of its spontaneous termination, as well as reducing the effectiveness of pharmacological and electrical cardioversion (Kokina et al., 2021).

In recent years due to the increasing prevalence of AF, as well as the high incidence of thromboembolic complications, the problem of the optimization of strategy for the treatment of AF has become especially relevant [Steinwender et al., 2015]. Atrial fibrillation is accompanied by progressive contractile dysfunction of atria due to the development of electrical remodeling processes with a shortening of the effective refractory period of the myocardium and atria. These, as well as other electrophysiological processes, such as an increase in the trigger activity or automatism of atrial myocytes, a decrease in the speed of impulse conduction through the atria (conduction dispersion), heterogeneity, atrial refractoriness, hypersensitivity to catecholamines and acetylcholine contribute to the maintenance of existing or the development of new AF attacks - "atrial fibrillation causes atrial fibrillation" (Daoud et al., 1999). As a result, with an increase in the duration of AF, the effectiveness of pharmacological and electrical cardioversion decreases and the likelihood of recurrence increases. Lack of synchronicity of atrial contractions, excessively high frequency, and randomness of ventricular contractions in AF leads to dilatation of the left ventricular cavity and progression of the cardiac insufficiency (Offut C., 2004), which is explained by the possible development of cardiomyopathy due to cardiac arrhythmias (Brugada et al., 1993; Crijns et al., 2000), however, the mechanisms of this process are still poorly understood.

Among IC class antiarrhythmic drugs with proven effectiveness that can be assigned part orally to restore proper heart rhythm, a special place is occupied by propafenone (Epstein et al., 1991).

The pharmacodynamics of each of the antiarrhythmics of subclass IC has its own characteristics, which should be considered before starting therapy. Aethacizinium due to its mild sympathomimetic effect, it can increase heart rate and increase dromotrope effect of the atrioventricular node (Gritsenko et al., 1986).

At the same time, the changes of myocardial inotropic of the left and right ventricles in patients with AF during restoration of sinus rhythm has not been practically studied (Sokolova E. et al. 2021).

Methods and materials

Study design and patients

This prospective study included 62 patients undergoing ECV for persistent form of AF in the Latvian Centre of Cardiology, Pauls Stradins Clinical University Hospital from September 2019 to June 2020. The study was approved by the local Committee of Ethics at the Riga Stradins University (study protocol No.6-2/6/15) and Paul Stradins Clinical University Hospital and performed according to good clinical practice.

The inclusion criteria were as follows: atrial fibrillation paroxysm (not longer than 48 hours), patient have not received any antiarrhythmic drugs before (except amiodarone and beta blockers). At the time of the study, all patients received anticoagulants. Patients were excluded from the study if they met any of the following exclusion criteria: acute coronary syndrome or extensive surgery, or major trauma during last month, history of

ischemic heart disease or decreased left ventricular (LV) function (ejection fraction <50%), New York Heart Association Class III to IV, acute inflammatory disease, rheumatic or congenital heart disease, heart rhythm disorders (sinus node dysfunction, second degree atrioventricular blockage, prolonged QT syndrome, WPW syndrome, Brugada syndrome), chronic obstructive lung disease, severe kidney and hepatic pathology, anemia, obesity (third stage), oncological disorder or any disease associated with poor prognosis, thyroid gland disease, diabetes, uncontrolled hypertension, pregnancy, known intolerance of antiarrhythmic drugs or previous use of class I antiarrhythmic drugs, excessive consumption of alcohol, known or suspected poor compliance.

All patients received beta blockers (bisoprolol 5 mg daily), amiodarone (200 mg daily), propafenone 300 mg daily or aethacizinum 100 mg daily for 6 months from the day of admission to the hospital.

Data collection

After a baseline visit, two following visits were planned: at 3 months (± 7 days) and at 6 months (± 7 days). At the first visit as well as on the last follow-up patients were asked to report a level of everyday physical activities as low (<3 metabolic equivalents, METs), moderate (3-6 METs) and intensive (>6 METs) measured in hours/week. The following investigations were performed during first visit and after 6 months during last follow-up: rest ECG, exercise electrocardiography test (veloergometry) assessing load in watts (W), baseline and maximal heart rate in beats per minute (bpm), total ST segment depression sum in millimeters (mm), time until 1 mm ST segment depression in seconds (s), heart rate/ST transthoracic echocardiography, full blood count, plasma and biochemical parameters (BNP, troponin I [TnI], thyroid stimulating hormone [TSH], free triiodothyronine [FT3], free thyroxine [FT4], alanine amino transferase [AlAT], aspartate amino transferase [AsAT], conjugated bilirubin, unconjugated bilirubin, glucose, glomerular filtration rate [GFR] calculated according to Cockcroft-Gault formula, potassium, sodium, chloride, high-sensitivity C-reactive protein [hs-CRP]. All the echocardiographic studies were performed <2 hours before ECV. During echocardiographic examination we analyzed: interventricular septum [IVS] in the end-diastole, LV end diastole, posterior wall [PW] end-diastole, LV ejection fraction, LV mass index, left atrium [LA] size, LA maximal volume, atrial myocardial velocity, strain. The following investigations were performed at 3 months follow-up: Holter monitoring, previously described blood sample tests.

Statistical analysis

Statistical analysis was performed with IBM SPSS (version 23.0). For quantitative data mean value and standard deviation were calculated. Categorical data was described by amount and percentage. For comparison of two groups were used several tests, t test for independent samples, Mann-Whitney U test, chi-square test and Fisher exact tests were used as appropriate. Repeated measures ANOVA were used to test significance of changes in quantitative variables during study period. Quantitative data with non-normal distributions was tested with non-parametric Friedman's test for repeated measures. Statistical significance was defined as $p < 0.05$.

Results

Baseline characteristics

Of the 62 patients (21 men and 36 women) enrolled in the study, 57 completed it per protocol. 25 patients (44%) were admitted for ECV by emergency service, while 32 (56%) were referred by a cardiologist or general practitioner. All 57 patients were followed up for 6-month period; 49 (86%) maintained sinus rhythm (SR group). The rest – 8 patients (14%) experienced ≥ 1 AF paroxysm (AF group) within the follow-up time.

Three patients withdrew informed consent during the study. Two patients were unable to attend 6 months follow-up due to moving abroad (Figure 1).

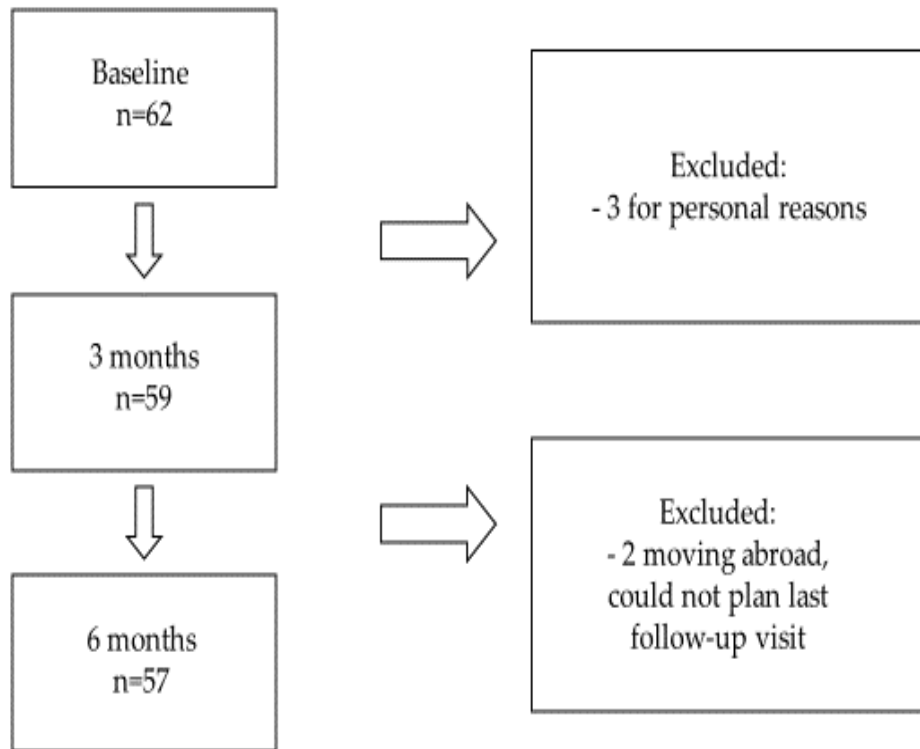

Figure 1. Study flow scheme.

General characteristics of the study patients are presented in Table 1.

Table 1. Baseline characteristics of the study patients.

Characteristics	Per protocol group (n=57)	Excluded (n=5)
Female gender, n (%)	36 (63,2%)	3 (60,0%)
Age, years (mean \pm SD)	62,56 \pm 6,77	63,60 \pm 6,07
Body mass index, kg/m ² (mean \pm SD)	26,57 \pm 2,97	25,86 \pm 1,46

Smoking, n (%)	25 (43,86%)	2 (40%)
Hypertension, n (%)	27 (47,4%)	2 (40,0%)
Systolic blood pressure (SBP), mmHg (mean \pm SD)	134 \pm 14	135 \pm 19
Diastolic blood pressure (DBP), mmHg (mean \pm SD)	87 \pm 10	82 \pm 13
Physical activities, h per week (mean, SD)		
Mild	25,21 \pm 8,55	29,12 \pm 10,00
Moderate	5,18 \pm 4,43	6,45 \pm 4,29
Intensive	3,55 \pm 3,21	2,20 \pm 1,55

Safety

No safety parameters changed significantly in per protocol group. The summary of the relevant data is reported in Table 2.

Table 2. Characteristics of biochemical tests.

Characteristics	Per protocol group (n=57)	Excluded (n=5)
BNP, pg/ml	159,21 \pm 12,56	221, 51 \pm 11,11
TSH, mU/mL	1,58 \pm 1,24	2,25 \pm 1,56
AlAT, U/L	26,81 \pm 11,67	31,24 \pm 7,87
AsAT, U/L	31,25 \pm 13,00	24,33 \pm 5,56
Creatinine, μ U/mL	72,20 \pm 16,92	92,31 \pm 24,63
GFR, mL/min	88,31 \pm 20,62	97,65 \pm 43,12
Potassium, mmol/L	4,55 \pm 0,69	4,71 \pm 0,44
Glucose, mmol/L	5,12 \pm 0,74	5,45 \pm 1,06
Hs-CRP, mg/L (medium, IQR)	1,17 (0,97-2,47)	1,07 (-)

None of the patients experienced major adverse events for 6 months. No statistically significant changes were observed in blood tests and ECG or Holter parameters.

Efficacy and clinical outcomes

All patients underwent echocardiographic examination (n=57) (Table 3). Between AF and SR group echocardiographic data no significant changes were found (Table 3). Early diastolic atrial myocardial velocity and strain showed no significant difference between groups. In our research, duration of AF was not predictive value of maintenance of SR at follow-up after 6 months from ECV. Recurrence rate of AF in aethacizinium

group showed close to statistically significant superiority compared to propafenone (55,6% vs 72,5%)($p=0,05$).

Table 3. Echocardiographic characteristics of SR and AF group patients at the inclusion and after 6 months after successful cardioversion.

	SR patients (n=49)	AF patients (n=8)	p value
IVS end-diastole, cm	$1,0 \pm 0,2$	$1,2 \pm 0,1$	0,85
LV end-diastole, cm	$4,8 \pm 0,5$	$5,0 \pm 0,4$	0,91
PW end-diastole, cm	$1,1 \pm 0,1$	$1,0 \pm 0,1$	0,90
LV ejection fraction, %	55 ± 5	54 ± 4	0,81
LA, cm	$4,2 \pm 0,4$	$4,4 \pm 0,6$	0,52
LA volume, mL/m ²	39 ± 15	37 ± 17	0,45

Discussion

Atrial fibrillation remains the main cardiac arrhythmia which is frequent cause of hospitalization and changes the course of arterial hypertension and coronary heart disease (Sankaranarayanan et al., 2015). The occurrence of AF paroxysms significantly reduces the quality of life of patients (Fuster et al., 2001). Most patients with recurrent AF described the effect of arrhythmia on daily life as “devastating” due to the suddenness and unpredictability of the onset of an attack, but their sensations did not correlate with either the frequency of attacks or their duration (Jenkins et al., 2005). The progression of heart failure in patients with recurrent AF is primary due to changes in intracardiac hemodynamics at the time of the arrhythmia episode. After the restoration of sinus rhythm, the parameters of the diastolic function of the myocardium remain reduced, which leads to the emergence of early stages of the development of chronic heart failure (Takagaki et al., 2002).

In a study by Nagahama Y. et al. (2001) showed that an increase in heart rate in patients with AF significantly reduces the left ventricular ejection fraction. With irregular artificial stimulation of the heart in an experiment on dogs, Naito M. et al. (1983) for the first time proved a significant decrease in cardiac output. Thus, the high frequency and irregularity of ventricular contractions, lack of synchronicity of atrial contraction during AF paroxysm led to a decrease in the inotropic function of the heart.

Previously was described negative impact of propafenone on left ventricular ejection fraction. Still, we have no data about efficacy on rhythm maintenance and safety of widely used aethacizinium on myocardial function (Barbier et al., 1994). This was first our attempt to study myocardial response to Ic class drugs using echocardiography, continuous Holter monitoring. Echocardiographic measurements during early diastole after ECV did not show significant changes in both patient groups. It can be explained by cardiac cycle – during the diastole of ventricles atria are emptying passively (Strēlnieks A. et al., 2014; Kokina et al., 2021). As a result, left ventricle has a strong influence on function of atria during early diastole. Patients with higher atrial strain have better opportunity to maintain sinus rhythm.

Conclusion

Antiarrhythmic medications of Ic class may be safe in patients with persistent form of atrial fibrillation and have no negative impact on inotropic function of myocardium. The most used drug in Latvian population from Ic class is aethacizinum. The observed efficacy provides the rationale for a larger, double-blind controlled study with different antiarrhythmic medications in different daily dosage.

Abstract: Today Mexico is an important nearshoring location. Nearshoring refers to the relocation and regionalization of supply chains. It impacts varied aspects of the Mexican socio-economic reality and represents an opportunity as well as a challenge. For educational institutions, upskilling and reskilling students on needed knowledge and skills is an urgent matter. Inside this scenario, STEM innovative knowledge and developing comprehensive soft skills become essential. What's more, providing a promising future and equal opportunities to succeed regardless graduates' gender is an imperative. In Mexico, more than half of professionals who graduate from higher education institutions are women. Nevertheless, the number of employed women is low compared to the number of men. A mismatch between the labor market demand and the offer of women talent is evident. Therefore, our research's objective was two-fold. First, we examined the current participation of women in leading nearshoring sectors, comparing these results to educational indicators. Then, we formulated potential explanations and recommendations to found disparities. Proposed solutions included the provision of pertinent career information and training; changes on labor schemes, inclusion policies and work conditions that pay attention to women's particular needs; updates on legal and fiscal frameworks and the promotion of new nearshoring sectors.

Keywords: Mexico, nearshoring, reskilling, upskilling, women

Citation: Hernandez-Pozas, O., & Garcia-Chitiva, M.D.P. (2024). Women's Participation in Mexican Nearshoring: Challenges and Recommendations. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2047-2056), Antalya, Turkiye. ISTES.

Introduction

According to McKinsey & Company (2024), today Mexico is an important nearshoring location. Nearshoring refers to the relocation and regionalization of supply chains. Mexico can become a larger player in United States (US) imports due to competitive advantages such as strategic closeness, abundant free trade agreements, a

robust manufacturing sector, a low-cost work force, as well as experienced cross-border logistics and industrial networks (Huerta & Pous, 2022).

Recently, companies from 30 countries announced their relocation of supply chains to Mexico, half of this foreign direct investment (FDI) is going to the manufacturing sector and most of these ventures come from American and Chinese companies (McKinsey & Company, 2024). According to Daniel Zaga (2023), chief executive from Deloitte, more than 100 projects in Mexico relate to nearshoring, with an estimated FDI of more than 30,000 millions of US Dollars, being the states of the North of Mexico (i.e. Nuevo Leon and Coahuila) the most profited ones.

As expected, these relocations have an impact on various aspects of the Mexican socio-economic reality. That's why nearshoring represents indeed an opportunity, but also a challenge for all actors in the economy: citizens; the government at federal, state and city levels; the private sector including industrial clusters; the NGO's, and of course the universities and other education institutions. Nearshoring is promising but it is not a panacea, uncertain issues include the following: enough supportive public policies, sufficient infrastructure capacity (i.e. energy & water supplies, roads and customs), debatable confidence on the regulatory frameworks and doubtful guarantees on the security of operations.

Indisputably, if Mexico wants to thrive, nearshoring makes the searching, training and keeping of competent professionals a priority and an urgent matter, including working women. Previous studies on nearshoring needs recommend strong training on STEM and soft skills (Consejo Nuevo León & Escuela de Gobierno y Transformación Pública del Tecnológico de Monterrey, 2023).

In this scenario, we aimed to examine the current participation of women in the Mexican labor market. Particularly, in those sectors linked to the dynamics of nearshoring, such as manufacturing and energy. We compared these results to educational indicators. Then, we formulated potential explanations and recommendations to found disparities. We also inquired in the possibilities women could have on upcoming nearshoring opportunities in new sectors. Our paper ends providing recommendations to capitalize momentum.

Method

This study used a quantitative approach, with a comparative descriptive design. It analyzes Mexican indicators of employability and education, and compares data by gender, by industry, and by occupation.

Data Collection

The Mexican indicators of employability and education correspond to the last three years of 2021 to 2023. These were collected from the official web page of Mexico's National Institute of Statistics and Geography

(INEGI). The sample corresponds to data from three official databases: General Employability data, Educational data, and Occupational data (job positions). The occupation data corresponds to employed people living in Mexico's 32 states (see Table 1).

Table 1. Samples from INEGI data bases.

INEGI Database	Total employed people	Women	Men
General employability data	23,093,224	9,003,965	14,089,259
Educational data	24,136,454	12,649,940	11,471,514
Occupational data (job positions)	4,775,435	2,803,678	1,971,757

The data were downloaded in Excel (i.e. .xlsx) format, then preprocessed, and cleaned. Data out of the scope of this investigation were deleted. Totals were obtained and then a comparison by gender, industry, and occupation was made. When necessary to better understand the figures, other sources of data were consulted too. These included The UN Economic Commission for Latin America and the Caribbean, the National Association of Universities and Higher Education Institutions (ANUIES in Spanish), and reports from Consejo Nuevo Leon and the school of Government from Tecnológico de Monterrey.

Results

When examining the INEGI's total employed population in Mexico, adding the last three years (from 2021 to 2023), we found that there were more employed women (52%) than there were employed men (48%) who completed their Higher Education (see Figure 1).

Figure 1. Mexican employed population who completed Higher Education 2021-2023.

During these three-year period, the number of employed women who graduated from Higher Education increased every year, in contrast to men who have not riched figures of 2021(see Figure 2).

Figure 2. Yearly Mexican employed population who completed Higher Education.

Despite these positive women's achievements on education, men (61%) continue to outnumber women (39%) during the same period of time in regards to occupation levels (see Figure 3).

Figure 3. Occupation levels by gender 2021-2023.

Table 2. Employed Mexican people by industry.

Total Employed Mexican People (2023) 59,403,947		
Employed Mexican People, Compared by gender		
Women	24,241,480 (40.80%)	
Men	35,162,467(59.19%)	
Employed Mexican People, Compared by industry and gender		
	Women	Men
Extractive and electricity industry	68,671(16%)	348,212(83%)
Manufacturing Industry	3,911,062(40%)	5,870,762(60%)
Other (Agriculture, Construction, Commerce, Restaurants and accommodation services, Transportation, communications, mail and warehousing, Financial and corporate professional services, Social services Miscellaneous services, Government and international organizations and Unspecified)	20,261,747(41%)	28,943,493(59%)

Figure 4. Distribution of positions in occupations by gender

Moreover, when we examined in depth those leading nearshoring sectors, such as the electricity and manufacturing industries, disparity between employed women and men increases. While women represent

only 16% of employed personnel in the extractive and electricity industry and 40.8% in manufacturing industry, men represent 83% in the extractive and electricity and 60% in the manufacturing one. Then, when we examined other sectors, where most Mexicans are employed, the relative disparities by gender stay 41% to 59% (see Table 2).

The distributions by occupational positions show important differences between women and men. Regarding subordinate and salaried workers, men occupy a more significant proportion, with a total of 1,518,322, compared to women, who reach a total of 837,31. Women represent considerable less than men in the category of employers too. Nevertheless, it isn't the case of self-employed workers where the difference is not that big. Regarding unpaid workers, although not for much difference, women outnumber men (see Figure 4).

Regarding education indicators, this time from ANUIES (2024), we found that during the period of 2022-2023, most Mexican women chose to study Education, Social sciences and Law, while most men preferred Engineering, Manufacturing & Construction as well as Technology. No much difference in preferences were found by gender in fields such as Services, Math and Statistics (see Figure 5).

Figure 5. Chosen education fields by Mexican students.

Discussion

The objective of this study was to examine the current participation of women in leading nearshoring sectors in Mexico, comparing these results with educational indicators. The findings revealed four points of necessary analysis: 1) low women's employability compared to men and associated factors, 2) the need for innovative

solutions, and 3) possible solutions and points for reflection.

Low women's employability compared to men and associated factors.

Results show that many educated women in Mexico do not work after they graduate. Their investment in education, by ways of putting in time, money and effort, is not appropriately paying off to them when compared to indicators of employability. On top of that, it is worrisome that the labor market, suffering of a shortage of talent, is not entirely making the most of such women's achievements either. Women's capacities seem to be wasted by the labor market. Why so?

Our results reporting lower women's employment rates are aligned with those reported by ECLAC (ECLAC & ILO, 2022). Could it be that educated women are not attracted to available job postings for reasons such as low salaries, bad and unsafety work conditions, tight schedules, or lack of growth opportunities? Could it be that the labor market is not interested in hiring some of these educated women because they lack of needed knowledge & skills, or because employers avoid to adjust to specific women's needs? Could it be a combination of both reasons? To what extend? What else is causing this disparity? Cultural factors, such as traditional gender roles most likely impact results. In Mexico, as in many other countries, most women have to take care of their children, the elder and the house chores. Thus, effective remedies, such as good legal frameworks and policies are needed.

Need for innovative solutions

Current and upcoming shortage of labor, unfair gender gaps in employability, and nearshoring opportunities justify the pursue of innovative solutions. Educated women, who are not currently working, can add value to the market place if these were supported and knew better about labor market trends and future opportunities. However, it isn't clear to what extend women would choose differently when selecting their field of higher education studies and line of work after knowing this. Thus, research should continue to test and follow up on proposed solutions.

One aspect that we identified as a part of the solution is that universities and vocational centers fully understand the real context of the Mexican labor market. Joint and well-articulated efforts of the labor market sector and education institutions must be in place to achive this objctive. The main factor of unemployment in varied jobs in the manufacturing sector is due to the lack of trained personnel (Hernandez, 2024). This is an important indicator to analyze the routes that should be activated between the education and industrial sectors.

Possible solutions and points for reflection

Reducing inequality and gender gaps in employment opportunities in Mexico and in Latin America requires systemic, scalable, and chain actions. Systemic actions are needed because joint and intertwined efforts should

come from the government, businesses, and the education sectors. Scalable actions start at a young age, when girls are in elementary and secondary school. At this point, girls can be influenced by female models sharing their successful experiences in STEM careers, in such a way that such stories positively impact girl's career choices and expectations. (González-Pérez et al., 2020). Finally, chain actions, because when the industry shares its needs of upskilling and reskilling, as well as required job profiles; solutions and appropriate decisions can be made by other actors in the economy. By the same token, when higher education institutions identify educational gaps and contrast found solutions on global challenges (e.g., inequality) using comparative studies (UNESCO, 2021); strategies implemented in Mexico can be enriched.

Conclusions

Mitigating gender inequalities and ensuring women's fair access to the labor market requires the articulation of policies, effective legal frameworks, and better coordination between higher education and industry to establish the needs of the current labor sector. Comparing the context of this phenomenon in Latin America can enrich the strategies that have been addressed so far on this subject in Mexico.

The visible employability gap between educated men and women in Mexico and Latin America highlights the need to generate innovative and systematic solutions to reduce gender employment inequality. For this reason, joint work between higher education, technical-vocational training centers, and industry is crucial to understanding and meeting the labor market's current and future demands. Comparative research on this phenomenon at the Latin American level is essential to identify common points and learn from best practices.

Recommendations

Based on found results, our recommendations include the following:

Informative & educational programs for women. The focus should be on communicating and training on STEM career paths and needed competencies, as well as on available job postings. We recommend training programs that focus on upskilling and reskilling competencies to cover nearshoring opportunities. It is key to assess competencies that can be transferable to more promising, better paid, and needed career paths.

Flexible labor schemes. Alternatives such as home office options and adjustable working hours may work as win-win solutions. The labor market wins because this has more available talent and women win because they have access to better jobs.

Inclusion of labor policies to empower women. Adaptation of facilities & urbanization solutions, considering women's needs too. Assess the availability of restrooms, safety transportation, child care, mobility alternatives, and closeness to work. Adjustments should keep in mind that the needs of men and women are different.

Fiscal incentives & adapted legal frameworks. It is key not only to create and approve but also enforce them. Since self-employment of women is a promising solution where women have shown interest, fostering innovation and training on entrepreneurship become essential. Identification and promotion of novel needed occupations where women can rapidly and naturally progress, for example, in sectors such as information technologies and health.

Create and support an observatory of the future of women's work and foster comparative studies in the Latin American region.

Acknowledgments

The authors would like to acknowledge the financial support of Writing Lab, Institute for the Future of Education, Tecnológico de Monterrey, Mexico, in producing this work.

Abstract: This paper aims to create actionable insights that bridge the gap between academic achievements and internship performance, recognizing the significance of aligning theoretical knowledge with practical experiences. Acknowledging the observed weak correlation between academic and internship performance within HEIs, this study proposes actionable insights as a solution to narrow this gap, facilitating a more seamless transition from academic success to professional readiness. The methodological approach involves a comprehensive literature review, the creation of a research tool encompassing actionable insights, and its distribution to experts for validation. A thematic approach is then employed to analyze the qualitative data collected, ensuring a robust and verified foundation for the derived insights. Findings from the study indicate a positive impact of the proposed actionable insights on students' internship and job performance, fostering a transformation into well-prepared individuals who excel both academically and professionally.

Keywords: Qualitative Analysis, Weak Relationship, Academic Performance, Internship Performance, Actionable Insights.

Academic-to-Professional Transitions: A Transformative Approach. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2057-2066), Antalya, Turkiye. ISTES.

Introduction

The synergistic relationship between academic skillfulness and hands-on experience forms the fundamental foundation of holistic student development in the ever-shifting terrain of higher education [1]. Merging classroom knowledge with the applied expertise gleaned through internships reflects a growing commitment to equipping graduates with not just theoretical competency, but also the agility to navigate the dynamic complexities of their chosen technological domains [2]. This multifaceted approach acknowledges that true professional preparedness transcends mere theoretical understanding, necessitating an immersive learning experience that mirrors the real-world challenges and intricacies encountered in practice [3].

As we delve deeper into the evolving academic landscape, the intertwined nature of academic excellence and practical experience has become an increasingly essential consideration, particularly within the realm of technology [4]. Internships serve as a crucial bridge between classroom learning and the demands of the professional sphere, offering students a tangible platform to translate theoretical knowledge into practical applications within real-world scenarios. However, the intricate dynamics governing the correlation between academic performance and internship success within technological higher education institutes (HEIs) remain a compelling area for investigation [5].

his study embarks on a data-driven exploration to unravel these intricacies, aiming to not only identify the existing performance discrepancies but also to delve into the underlying factors that influence this crucial relationship. Fueled by a compelling curiosity, the study delves into how the academic journey aligns with the specific skill sets demanded by the contemporary technology job market. In this pursuit, the research seeks to unearth actionable insights that not only acknowledge the existing gap but actively contribute to its mitigation.

By employing qualitative and statistical analysis, the research endeavors to provide a comprehensive understanding of the factors that either enhance or hinder the seamless transition from theoretical knowledge to practical application within diverse technological fields. This exploration is underscored by the recognition that the demand for well-rounded tech professionals is on a perpetual ascent, with employers seeking individuals who excel not only in theoretical rigor but also possess the adaptability and practical acumen to thrive in dynamic and diverse professional landscapes.

In essence, as the educational landscape continues to evolve, addressing the disconnection between academic success and professional readiness in technology fields emerges as a critical imperative [6]. This study, therefore, aims to contribute meaningful and evidence-based insights that go beyond mere acknowledgment of

the existing disparities, actively paving the way for a more integrated and harmonious journey from academic accomplishments to the multifaceted demands of the flourishing technological world.

Related Literature and Studies

The education of ethical and professional tech talents faces a crucial hurdle: bridging the gap between abstract academic understanding and practical application. Industry integration becomes paramount, shaping programs that cultivate well-rounded professionals equipped to navigate the complexities of their field.

Mentorship programs, championed by Smith-Ruig (2014), offer an invaluable crucible. Pairing students with industry professionals immerses them in real-world ethical scenarios, honing their decision-making skills within their chosen technological domain. Garousi et al. (2019) propose aligning grading criteria with industry standards, ensuring students are assessed on the skills and behaviors valued in professional settings, preparing them for the realities of the tech workforce.

Franco et al. (2017) propose a harmonious symphony between faculty and industry. By fostering dialogue, curriculum design can be informed by current industry expectations, equipping students with knowledge and skills relevant to the evolving job market. Khosrow-Pour (2018) suggests a more structured approach, advocating for integrating a problem-solving subject specifically tailored for IT professionals. This equips students with the critical skills to tackle complex issues prevalent in the tech industry.

Adaptability emerges as a key theme, championed by Pulakos et al. (2002) and Griffin et al. (2007). Infusing course content with real-world scenarios, guest speaker insights, and alumni success stories can cultivate this crucial attribute in aspiring tech professionals. Darling-Hammond (2010) champions curriculum integration as essential for 21st-century preparation. Encouraging cross-disciplinary coursework broadens students' perspectives, allowing them to explore connections between their technology expertise and other relevant fields, fostering a holistic problem-solving mindset.

Beyond textbooks and lectures, Buckley (2021) underscores the significance of workshops and extracurricular activities. These provide safe spaces for students to practice and refine their ethical and professional skills, gaining valuable hands-on experience in a supportive environment. Martínez León (2019) views capstone projects as a bridge between academic learning and internship experiences. By applying theoretical knowledge to real-world scenarios, students gain practical insights and hone their professional skills in a meaningful context.

Finally, understanding industry preferences is crucial. Ng et al. (2009) suggest exploring these desires. By understanding the desired academic qualifications and work experience, students can tailor their preparation and align their skills with employer expectations.

This multifaceted approach, informed by the insights gleaned from the literature, lays the groundwork for cultivating ethical and professionally adept technology professionals. By integrating these strategies into the educational landscape, we can empower students to thrive in the dynamic and demanding world of technology.

Methodology

This study utilizes a rigorous and iterative methodology to develop and validate actionable insights. A meticulously crafted research instrument serves as the cornerstone of this approach. The following sections explore the key components of the methodology, specifically focusing on the research instrument's development, expert engagement, data collection procedures, and data analysis strategies.

Data Collection

The research embarked on a journey to gather expert insights. A meticulously crafted instrument, designed to delve into the complexities of academic and internship evaluation, was distributed to a targeted group of experts. These individuals, carefully chosen for their diverse perspectives and extensive experience in higher education and student development, held the key to unlocking valuable knowledge.

The instrument itself was a finely tuned piece of machinery, containing nuanced inquiries meant to explore various facets of evaluation. Think ethics and professionalism under the microscope, practical skills put to the test, problem-solving approaches dissected, and even generic attributes given a thorough examination – all crucial elements in the context of both higher education and professional development.

To ensure a meticulous and comprehensive data collection process, the research team adopted a multi-pronged approach. Each question was meticulously crafted to elicit the richest, most insightful responses possible. Clear instructions accompanied the instrument, guiding the experts and fostering a comfortable environment for thoughtful participation.

But the journey didn't end there. Throughout the process, open communication was encouraged. Any questions or concerns raised by the experts were promptly addressed, creating a collaborative atmosphere that further enriched the data. This meticulous attention to detail, both in crafting the instrument and engaging with the experts, aimed to ensure the robustness and reliability of the gathered insights, ultimately strengthening the foundation of the study.

Development of the Research Instrument

The research instrument was meticulously and iteratively developed, with a refined refinement process yielding eleven essential findings that served as the instrument's foundation. In order to improve its usefulness, the instrument underwent a collaborative refining process in which it was carefully distributed to two seasoned specialists for their invaluable feedback.

The specialists for this critical phase were carefully chosen, assuring a wide and complete perspective that reflected the study's aims. The interaction with these experts was marked by a deliberate and purposeful process, emphasizing the importance of patience and perseverance in negotiating the many intricacies of expert engagement. Clear and straightforward communications were used to allow a fruitful exchange of ideas, and the feedback received helped greatly improve the instrument.

This collaborative approach not only increased the research instrument's validity, but also ensured that it was in line with the sophisticated understanding of field experts. The iterative nature of this refinement process emphasized the importance of precision and thoroughness, resulting in a strong and effective tool for the study's later stages.

Expert Engagement

The engagement with expertise was a deliberate and purposeful approach, engaging two notable experts who provided vital insights into the presented ideas. Expert 1 is a seasoned Technologist Doctor with over 20 years of expertise specialising in visual information systems and computer networking. Meanwhile, Expert 2, an esteemed Associate Professor of Informatics and Analytics, contributed more than two decades of experience in academic and university management, with a particular emphasis on Network Simulation and Performance Modelling.

These experts' distinct viewpoints and extensive backgrounds not only increased the depth of insights, but also contributed diversity to the overall comprehension of the research findings. Their extensive experience in various aspects of technology and academics greatly aided the validity and applicability of the study's suggestions, resulting in a well-rounded and thorough analysis.

Data Analysis

Rigorous qualitative analysis, employing thematic analysis, was utilized to analyze the responses. Thematic analysis, a systematic approach to data analysis, facilitated the extraction of meaningful themes from expert responses. This methodological approach ensured that the proposed actionable insights were not only theoretically sound but also practically feasible and relevant to the immediate needs of Higher Education Institutions (HEIs). By incorporating diverse voices and perspectives, the study elevated the robustness and

credibility of its findings.

Thematic Analysis Approach

Thematic analysis involved a systematic process, encompassing familiarization with data, generating initial codes, searching for themes, refining and mapping of themes, writing a report, and finalizing the analysis. Expert responses were closely examined, and codes and features were extracted to identify specific themes encapsulating their insights. The outcomes were organized in tables to visually illustrate the relationships between themes and responses, enhancing the clarity and transparency of the analytical process.

In adopting this comprehensive research methodology, the study aimed to contribute valid and applicable insights to the field of higher education and student development, ensuring the reliability and relevance of the proposed recommendations.

Results And Discussions

The analysis findings aimed at offering practical insights to bridge the gap between academic and internship performance, have been categorized and explored thematically. The study delved into actionable insights across various domains, including Ethics and Professionalism, Practical Skills, Problem Solving, and Generic Attributes. Here a detailed discussion of the results for each category is presented.

Ethics and Professionalism

Bridging Theory and Practice - The theme of "Ethics and Professionalism" underscores the importance of connecting theory with practice. Insights 1 and 4 emphasize mentorship and workshops as vital mechanisms for equipping students with essential skills for professional settings. Fostering mentorship relationships and engaging in hands-on workshops emerged as key strategies to enhance practical understanding and foster ethics and professionalism among students.

Collaboration and Feedback - Effective communication between faculty and supervisors ensures alignment and provides valuable feedback for student improvement. Building trust through confidentiality fosters an environment conducive to open and valuable feedback. These insights underscore the critical role of collaboration and feedback in promoting ethical and professional practices within educational settings.

Continuous Improvement and Assessment - Continuous improvement in educational practices, advocated by the experts, ensures ongoing enhancement of initiatives. The significance of continuous review and adjustments in areas like grading criteria and workshops based on feedback was emphasized. These insights highlight the pivotal role of continuous improvement and assessment in maintaining ethical and professional standards within

educational frameworks.

Practical Skills

Bridging the Gap Between Theory and Practice - Bridging the Theory-Practice Gap involves applying learned skills through capstone projects and industry collaboration. Capstone projects and industry feedback emerged as effective strategies for narrowing the theory-practice gap, contributing to more confident and skillful graduates.

Industry Relevance and Employability - The theme of Industry Relevance and Employability emphasizes the importance of career guidance, workshops, and curriculum alignment with industry trends. Proactive career guidance and industry-aligned curriculum were identified as critical factors in promoting the employability of graduates.

Skill Development and Personalization - The theme underscores the significance of customized project options and tailored career guidance. Personalization in education, both through projects and guidance, plays a pivotal role in fostering effective skill development and aligning students with their desired career trajectories.

Collaboration and Stakeholder Engagement - The positive impact of industry involvement in capstone projects and collaborating with diverse stakeholders in career guidance programs was evident. Collaboration and stakeholder engagement were identified as significant in enriching practical skill development and career guidance initiatives.

Problem Solving

Enhancing Industry Readiness and Employability - The theme highlights the crucial role of structured problem-solving skills in improving performance in practical scenarios, enhancing employability. Aligning the curriculum with industry demands through structured problem-solving methodologies ensures graduates acquire directly relevant skills.

Bridging the Theory-Practice Gap - Introducing structured problem-solving methodologies as a subject prepares students for real-world IT challenges by connecting theoretical knowledge with practical application. Integrating industry feedback and real-world problem-solving approaches into the curriculum was underscored as crucial for narrowing the theory-practice gap.

Developing Essential Skills beyond Problem-Solving - The versatility of structured methodologies serves as a framework for cultivating critical thinking, analysis, and digital literacy skills crucial in diverse IT contexts. Instructors with expertise in these methodologies extend beyond technical skills to provide valuable insights and practical guidance to students.

Generic Attributes

Industry Awareness and Career Readiness - Understanding industry preferences and industry involvement through advisory boards, guest speakers, and research enhances students' employability. These insights underscore the significance of industry awareness and engagement in preparing students for successful and informed career trajectories.

Developing Adaptability as a Key Skill - Fostering adaptability through diverse course content and real-world exposure equips students to handle various situations and challenges. Regular assessment and personalized feedback on adaptability skills, along with alumni mentorship, provide valuable examples and inspiration for cultivating adaptability as a fundamental skill.

Cross-Disciplinary Learning and Workplace Preparedness - Integrating knowledge from various disciplines and collaborating with faculty and experts from different backgrounds equip students with diverse perspectives and robust problem-solving skills. These insights advocate for a comprehensive approach to education, promoting cross-disciplinary learning as a means to enhance workplace preparedness.

Conclusion

This research offers important insights for bridging the gap between academic theory and professional practice. By weaving together theory and practice through mentorship, hands-on projects, and industry engagement, educators can equip students with the ethical compass, practical skills, and problem-solving prowess needed to thrive in their chosen fields.

Personalization emerges as a central theme throughout the study. Customized projects, career guidance tailored to individual pathways, and diverse learning opportunities empower students to become active architects of their own success. Cross-disciplinary learning and engagement with different stakeholders further enrich this journey, fostering adaptability, critical thinking, and the ability to navigate complex challenges with confidence.

Ultimately, these findings pave the way for a transformation in the educational landscape. By embracing collaborative, personalized, and industry-connected learning, institutions can cultivate graduates who are not just knowledge-bearers, but skilled, adaptable, and ethically grounded individuals ready to make a mark on the world. This shift has the potential to redefine the very meaning of success, ensuring that academic journeys truly prepare students for the dynamic tapestry of their future careers.

Abstract: Developments in data transmission made it possible to communicate information around the world in real-time. As information is communicated instantaneously, implementing data security technology like asymmetric cryptography secures transmissions and ensures confidentiality, integrity, and authentication of the message. However, a trade-off existed between the total execution time and the security of the cryptographic algorithm: a higher security level meant a slower execution time, and a faster execution time meant a lower security. In this research, a modified RSA algorithm called random bit-stuffing insertion algorithm with modified RSA (RBMRSA) algorithm was enhanced to improve execution time and strengthen security. RBMRSA strengthened classical RSA algorithm with random bit insertion and increasing the number of primes in generating keys. This study enhanced RBMRSA by increasing the number of primes used, increasing key length to 2048-bit key length, and utilizing Extended Euclidean Algorithm (EEA) and Chinese Remainder Theorem (CRT) to enhance computational complexity and optimize execution time. Assessment of the algorithm included Big O Analysis and Avalanche Effect as metrics and results were analyzed and compared with 1024-bit key length RBMRSA. Results showed that modified RBMRSA with CRT and EEA optimized the encryption and decryption computational complexity and further improved the security performance.

Keywords: Asymmetric cryptography, Modified RSA algorithm, Extended Euclidean algorithm, Chinese remainder theorem

Introduction

Exchange of data has evidently progressed throughout the years, evolving from analog to digital means. Individuals and organizations around the world can access, send, and receive information from people across borders which emphasizes the essentiality of data-in-motion. This kind of data encompasses various network types may it be data transfers from internet-capable device, web-facing service, cloud services, private or public networks, and shared applications and integrations (Gillis & Fitzgibbons, 2021). Yet, data transmitted are vulnerable to various threats such as unauthorized access, information disclosure and modification, manipulation, or corruption that may lead to information and network security disruption (Shea, 2022). As technology continues to progress, data security shall also be continuously fortified by various organizations and professionals, aiming to maintain confidentiality, integrity, and availability of data (Pratt, 2022).

Presently, there exist numerous data security technologies aiming to safeguard information. One of these is data encryption, considered to be one of the building blocks of cybersecurity, which is a concept under the science of cryptography that transforms data's semantic content through cryptographic algorithms such as symmetric cryptography, asymmetric cryptography, and hash functions (NIST, 2019). Based on various research, asymmetric cryptography is more secure than that of symmetric cryptography especially when dealing with transit data (Zhang, 2021).

One of the most widely used asymmetric algorithms in encryption and digital signature standards is the RSA algorithm due to its prime factorization complexity of large numbers (Al-Kaabi & Belhaouri, 2019; Lin & Li, 2021). RSA generates a pair of keys, a public key to encrypt and a private key to decrypt data, based on two prime numbers. Yet, standard RSA algorithm is susceptible to common cryptosystem attacks such as modulus factorization, basic elementary attacks, and weak public/private exponent attacks (Mumtaz & Ping, 2019; Hermawan et al., 2021).

There exist various attempts to address the vulnerabilities of RSA such as substitution of a new functionality as modulus for encryption and decryption processes (Sarjiyus & Garba, 2021), increasing the number of prime numbers, utilizing Chinese Remainder Theorem (CRT) to improve decryption time (Kumar & Ali, 2019), using

four prime numbers to improve multiplicative complexity (Kumar & Shafi, 2020), adding Random Bit-Insertion Algorithm to provide additional layer of security on the standard RSA implemented in a 1024-key length (Mojisola et al., 2022), to name a few.

One of the current studies in RSA, the RBMRSA, proved that the algorithm had shown to resist common modulus attacks, timing attacks, and known-plaintext attacks. RBMRSA also showed higher order of complexity and higher encryption and decryption time due to the added security of randomly inserting bits within the data, which is one of its drawbacks in return of improving its security strength (Mojisola et al., 2022).

Objectives of the Study

The main objective of this study is to modify and further improve the developed Random Bit-Insertion Algorithm with Modified RSA (RBMRSA) by Mojisola et al. (2023) to meet current security requirements, enhance its computational complexity, and improve its overall execution time. The algorithm could then be used to improve the present email text encryption schemes.

Furthermore, this study encompasses the following specific objectives:

Implement the RBMRSA algorithm in a 2048-key length, which meets the minimum-security requirements to ensure security against factorization attacks.

Incorporate the use of four randomly generated prime numbers from the current three random prime numbers used in RBMRSA algorithm to further strengthen its overall multiplicative complexity.

Enhance the current computational complexity with regards to key generation in the encryption process, and the decryption process time of RBMSA algorithm using Extended Euclidean Algorithm (EEA) and Chinese Remainder Theorem (CRT).

Scope and Limitations

This study specifically focused on the modification and enhancement of the current RBMRSA by Mojisola et al. (2023), a variant of the original RSA algorithm, in terms of computational complexity, execution time, and security level. Modification encompassed the utilization of four randomly generated prime numbers to enhance computation complexity and security level, and additionally, the implementation of its keys in a 2048-bit key length. Enhancement involved the usage of EEA to improve its private and public key solving time, and CRT to improve its decryption execution time.

Implementation of the modified RBMRSA algorithm is only limited to plain text and does not encompass other file types such as image files. This research used the technique of randomly generating four prime numbers to generate 2048-bit private and public keys. Additionally, this study strictly involved the current RBMRSA algorithm and the mentioned mathematical theorems for enhancement purposes. The security and performance

evaluation metrics adopted in this study are the same metrics utilized in evaluating the existing RBMRSA algorithm.

Review of Related Literature and Studies

RSA Algorithm

RSA algorithm is an asymmetric cryptographic algorithm developed by Ron Rivest, Adi Shamir, and Leonard Adleman that provided secured transmission of information over insecure networks. The classical RSA algorithm used two large prime numbers in creating the keys for encrypting and decrypting the message, wherein the public key was used by the sender to encrypt the message and the private key was used by the receiver to decrypt the message (Rivest, Shamir, & Adleman, 1978).

Enhancements and Modifications of RSA Algorithm

Throughout the years, several modifications and addition to the traditional RSA algorithm have been studied to further strengthen the security and optimize the algorithm. Several studies had proposed modifying the algorithm to implement four primes to improve the security of the algorithm (Panda & Chattopadhyay, 2017; Al-Kaabi & Belhaouri, 2019; Ranjan & Gupta, 2020; Hermawan et al., 2021). Upon evaluating the security of the algorithm, the results had shown that the usage of multi-prime improved the security of the algorithm due to increased complexity in factoring the keys, resulting in greater time required for brute-force attack (Al-Kaabi & Belhaouri, 2019). Authors Khairina and Harahap (2019) and Khairina et al. (2019) used cubic congruential generator and quadratic congruential generator, respectively, to generate the prime numbers to be used in getting the values of private and public keys. The algorithms were then evaluated and were shown to resist cryptanalyst attacks and brute-force attacks.

Further enhancements also included the use of triple keys to increase the security and complexity of the algorithm, as well as implementing alpha-numeric scrambled randomization technique to the message. Al Barazanchi et al. (2019), in addition to triple keys, also used a new formula to calculate the value of d . The results had shown that while RSA-2K (two keys) had shown faster execution time, RSA-3K (three keys) had higher security upon evaluation. Osamor and Edosomwan (2021) replaced each character in the message (plaintext) with a corresponding letter in the alpha-numeric scrambling sequence and then padded with cryptographic message syntax. The algorithm was found to provide an extra level of security and resistance to several cryptographic attacks.

Application of RSA Algorithm in the Modern World

In addition to the enhancements of the algorithm, the RSA algorithm was also applied to a variety of applications. Several studies had applied modified RSA algorithms in ensuring secured transmissions as well as encrypting images and audio. Ambika et al. (2020) had applied their modified RSA algorithm in an instant cloud

messaging and broadcasting platform they had developed. This resulted in the application exhibiting backward and forward-based secrecy, meaning that hackers cannot access, edit, or tamper with both earlier and later messages. In the study by Bobba and Surapaneni (2020), the researchers applied the modified RSA algorithm in online card payments, specifically in encrypting the encrypted card information to be sent over the public network of the bank. This additional layer of security reduced the intensity of distributed guessing attack and data breach. Furthermore, Durafe and Patidar (2022) had applied modified RSA algorithm to safely transmit confidential, medical images such as X-rays, CT reports, and MRI reports while withstanding statistical tool-based steganalysis attacks. The algorithm had shown to competently resist possible security threats of AI intelligence-based steganalysis tools.

Moreover, authors Gong et al. (2019) and Abouelkheir and El-Sherbiny (2022) applied their modified RSA algorithms to encrypt images and audio, respectively. In Gong et al.'s study (2019), the algorithm combined optical image compression and encryption techniques like RSA, which resulted in good compression performance, high degree of randomness, and resistance to cryptanalysis attacks. Abouelkheir and El-Sherbiny (2022) used multiple prime numbers and used dynamic keys for data encryption, enhancing the complexity time and security of RSA for audio encryption.

RBMRSA

In the study by Mojisola et al. (2022), the researchers modified the classical RSA algorithm by using three prime numbers, implementing random bit stuffing insertion, and testing the modified algorithm against common RSA cryptosystem attacks. Moreover, the researchers limited the key length size to 1024-bits to retain the length of time required to process the classical RSA algorithm. Upon encrypting the plaintext (ciphertext) with the public key, the ciphertext was then converted to binary string and its binary counterpart underwent bit stuffing based on three patterns (101, 01, and 1) and sent over the unsecure network. The receiver then destuffed the bit-stuffed message and decrypted the message with the private key.

The researchers then evaluated the results of the comparison of the algorithm with the classical RSA, which revealed that RBMRSA had shown higher computational complexity due to usage of three prime numbers and the triple random bit stuffing insertion, had exhibited greater avalanche effect which meant that it has higher security level, had demonstrated resistance against common modulus attacks, timing attacks, and known plaintext attacks that easily penetrate the original RSA algorithm, and had revealed to require more time in brute-force attack compared to its parent algorithm.

Due to the algorithm having higher computational complexity, computing the algorithm was more CPU intensive compared to classical RSA. Hence, the proponents recommended improving the speed of the execution time of the algorithm. Additionally, based on the standards set by NIST (2020), the keys to be used in RSA algorithm should have at least 2048-bit key length, whereas RBMRSA algorithm used only 1024-bit key length.

Extended Euclidean Algorithm

The Euclidean algorithm (EA) is commonly known as the oldest proper algorithm to compute the greatest common divisor (GCD) of two numbers, whereas the Extended Euclidean algorithm (EEA) computes the GCD of the two numbers more efficiently than EA, particularly in large numbers. Authors Diko and Ibraimi (2023), Dheekksha et al. (2021), Nguyen (2023), and Chandravathi and Lakshmi (2019) all had implemented EEA in their respective modified RSA algorithms. Diko and Ibraimi (2023) implemented EEA to help process large numbers of data in a short time and mentioned that while Euclidean algorithm is feasible for computing large numbers, EA alone takes longer time to compute in comparison to EEA. Similarly, the study by Dheekksha et al. (2021) also concluded that RSA with EEA had shown better encryption and decryption time upon comparison with RSA alone. Moreover, the study by Nguyen (2023) also used EEA to overcome the limited minimum length of bits the standard RSA and was used to generate the private key that will be used for the decryption process. In the study conducted by Chandravathi and Lakshmi (2019), the proponents originally used EA to generate the private keys but found the security to be lacking and instead used EEA to generate the private key. Upon evaluation, the researchers concluded that not only did EEA improve the security of the private key but also optimized the decryption time of the algorithm.

Chinese Remainder Theorem

Chinese Remainder Theorem (CRT) is a prominent theorem in mathematics that is widely used in the fields of cryptography and digital signal processing. This theorem states that there is a way to uniquely solve every pair of congruences having relatively prime moduli. Several studies have implemented CRT with RSA algorithm to improve or optimize the decryption time of the message sent. Hermawan et al. (2021) used multiple prime numbers in generating the keys and utilized CRT to shorten the decryption process, and the evaluation of the algorithm had shown that having multiple primes increases key generation speed as well as the decryption process. Moreover, in the study conducted by Kamardan et al. (2018), both EEA and CRT were utilized by the proponents and results showed that the algorithm had faster decryption process and greater security compared to the classical RSA.

In the study by Wardoyo et al. (2018), the researchers modified the RSA algorithm with CRT (RSA-CRT) by breaking the decryption time process into smaller modular exponentiations. This resulted in optimization of the security and successfully improving the decryption-verification process. Then, Somsuk and Thakong (2020) conducted a comparison study with the modified RSA algorithm by Wardoyo et al. (2018) and found that RSA-CRT was still secured and still up to par with their own proposed modified RSA algorithm. It was recommended that the RSA-CRT algorithm be used for smaller sub exponents while their proposed algorithm be used for larger sub exponents. Furthermore, Abdeldaym et al. (2019) proposed a modified RSA algorithm with two public keys and used CRT to decrypt the ciphertext to improve the decryption speed and security of the message. Upon evaluation, using CRT was shown to improve the algorithm by optimizing the speed of the decryption and strengthening the security of the message.

Method

RBMRSA Algorithm

The current Random Bit-Insertion Algorithm with Modified RSA Algorithm (RBMRSA) is a branch of the traditional RSA algorithm which aimed to strengthen the security of the traditional algorithm through converting a plaintext into a more complex ciphertext using additional randomly inserted bits of data. Keys are implemented in a 1024-bit key length and the algorithm utilized the use of three randomly generated prime numbers (Mojisola et al., 2022).

The algorithm's process is divided into three main phases, which are as follows and are illustrated (see Figure 1):

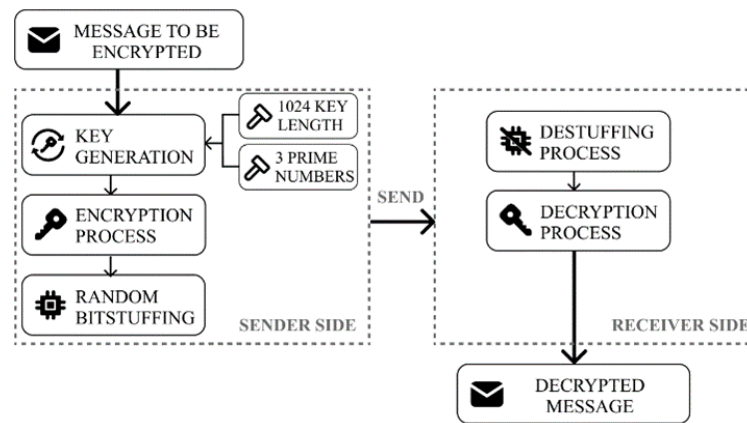

Figure 1. RBMRSA Algorithm Process Flow

Key Generation and Encryption Process

Generate three random prime numbers p, q, r and test for primality.

Calculate $N = p * q * r$.

Calculate Euler's totient function $\phi(N) = (p - 1)(q - 1)(r - 1)$.

Choose e such that $1 < e < \phi(N)$, where $\text{g.c.d}(e, \phi(N)) = 1$.

Calculate for d such that $d \equiv e^{-1} \pmod{\phi(N)}$.

Return N, d, e .

Private key is (d, N) and public key is (e, N) .

Encrypt data using $E(M) = \text{Ciphertext } (CT) = M^e \pmod{N}$

Bit Stuffing Process

Convert the ciphertext to binary format $\text{Ciphertext } (CT) \rightarrow \text{BinaryE}(M) \rightarrow BCT$.

Randomly bit stuff into the scanned patterns of 101, 01, and 1. $BinaryE(M) + RB \rightarrow RB(EM)$.

De-Stuffing and Decryption Process

Remove the randomly inserted bits using the reverse method of insertion, resulting to the de-stuffed $BinaryE(M)$.

Convert the binary encrypted message to its cipher text, $BinaryE(M) \rightarrow CT$.

Decrypt the message using $M = (CT)^d \bmod(N)$.

Proposed Modified RBMRSA Algorithm

This section systematically introduces the proposed modification and enhancement of the current RBMRSA algorithm. The algorithm is explained in five phases which consists of pre-processing phase, modified key generation phase, encryption phase, bit-stuffing phase, de-stuffing phase, and modified decryption phase. The first phase encompasses the utilization of four randomly generated prime numbers ($p, q, r, \text{ and } s$) instead of three prime numbers to further strengthen its multiplicative complexity. Next under the modified key generation phase, the proposed utilization of Extended Euclidean Algorithm (EEA) for improving the solving time of private key d and Chinese Remainder Theorem (CRT) to solve the needed additional values to improve the algorithm's decryption computation time. There are no notable modifications under the encryption phase, bit-stuffing phase, and de-stuffing phase. The last phase encompasses the modified decryption process using CRT, wherein the ciphertext message is divided into four smaller blocks and then later recombined to find the deciphered message (M) or plaintext. Further discussion is made as follows and illustrated (see Figure 2).

Pre-Processing Phase: Random Four Prime Generation

Selection of prime number is vital for this RSA based algorithm since the security of this algorithm relies on the prime factorization of the large prime numbers. The modified algorithm implements its keys in a 2048-bit key length for both private and public keys. Hence, 512 bits are expected to be generated for each random prime number.

Modified Key Generation Phase

In this modified algorithm, the application of EEA takes place in the computation for secret key d value. The modified key generation is as follows:

Compute for N using $N = p * q * r * s$

Calculate totient value as $\phi(N) = (p - 1)(q - 1)(r - 1)(s - 1)$.

Choose a natural number e such that $1 < e < \phi(N)$.

If $\gcd(e, \phi(N)) = 1$, then compute for the value of d , using EEA, such that $d \equiv e^{-1} \pmod{\phi(N)}$.

EEA utilizes the equation $[\phi(N)]x + ey = \gcd(\phi(N), e)$. Where the values of $\phi(N)$ and e is computed from the above steps. The values of x and y are computed as follows:

A table can be constructed with the values of $a, b, \phi(N), e$, like as shown below:

Table 1. Extended Euclidean Algorithm (EEA) Table

ROW	a	b	$\phi(N)$	e
1	1	0	$\phi(N)$	-
2	0	1	e	e_1
3	a_3	b_3	d_1	e_2
\vdots	\vdots	\vdots	\vdots	\vdots
i	a_i	b_i	d_{i-2}	e_{i-1}
\vdots	\vdots	\vdots	\vdots	\vdots
k	$a_k \rightarrow x$	$b_k \rightarrow y$	1	e_{k-1}

The values of $a_3, a_4, a_5, \dots, a_k$ is computed by using the equation: $a_n = a_{[(n-1)-1]} - a_{(n-1)} [k_{(n-1)}]$.

The values of $b_3, b_4, b_5, \dots, b_k$ is computed by using the equation: $b_n = b_{[(n-1)-1]} - b_{(n-1)} [k_{(n-1)}]$.

Table is continuously computed until the value of $\phi(N) = 1$.

Once, $\phi(N)$ becomes 1, values of x and y can be obtained.

Substitute the values of x and y in the given equation of EEA. The resulting value is the private or secret key, d .

Conditions must be met when selecting the value of d :

If $d > \phi(N)$, then $d = d \pmod{\phi(N)}$

If $d < 0$, then $d = d + \phi(N)$

Public and Private Keys are obtained. Public Key = (e, N) , Private Key = (d, N) .

Calculate the additional values of $dp, dq, dr, ds, pInv, qInv, rInv, sInv$ to be used for the application of CRT.

$$dp = d \pmod{p-1}$$

$$dq = d \pmod{q-1}$$

$$dr = d \pmod{r-1}$$

$$ds = d \pmod{s-1}$$

$$pInv = \text{modInv}\left(\frac{N}{p}, p\right)$$

$$qInv = \text{modInv}\left(\frac{N}{q}, q\right)$$

$$rInv = \text{modInv}\left(\frac{N}{r}, r\right)$$

$$sInv = \text{modInv}\left(\frac{N}{s}, s\right)$$

Encryption Phase

Convert plaintext to corresponding ASCII value.

Calculate C as $\text{Ciphertext}(M)$ using the original, $E(M) = \text{Ciphertext}(CT) = M^e \bmod N$.

Convert the $\text{Ciphertext}(M)$ into its Binary equivalent.

Bit-Stuffing Phase

Generate a random binary string (RB) at random length.

Find the string pattern $X = 101$. If found, add RB . Else, continue traversing.

Find the string pattern $Y = 01$. If found, add RB . Else, continue traversing.

Find the string pattern $Z = 1$. If found, add RB . Else, continue traversing.

De-Stuffing Phase

Find the string pattern $Z = 1$. If found, remove RB . Else, continue traversing.

Find the string pattern $Y = 01$. If found, remove RB . Else, continue traversing.

Find the string pattern $X = 101$. If found, remove RB . Else, continue traversing.

Modified Decryption Phase

In this modified algorithm, the decryption process is modified using the Chinese Remainder Theorem (CRT).

Convert binary text to get $\text{Ciphertext}(M)$.

Using the computed additional values from key generation phase. Decipher the $\text{Ciphertext}(M)$ using CRT which divides the message to four parts and recombined to get the M (message) in its ASCII equivalent code.

$$m1 = (C^{dp} \bmod p) \cdot qrs \cdot pInv$$

$$m2 = (C^{dq} \bmod q) \cdot prs \cdot qInv$$

$$m3 = (C^{dr} \bmod r) \cdot pqs \cdot rInv$$

$$m4 = (C^{ds} \bmod s) \cdot pqr \cdot sInv$$

$$M = (m1 + m2 + m3 + m4) \bmod N$$

Convert back the ASCII code to plain text to get the final M (message).

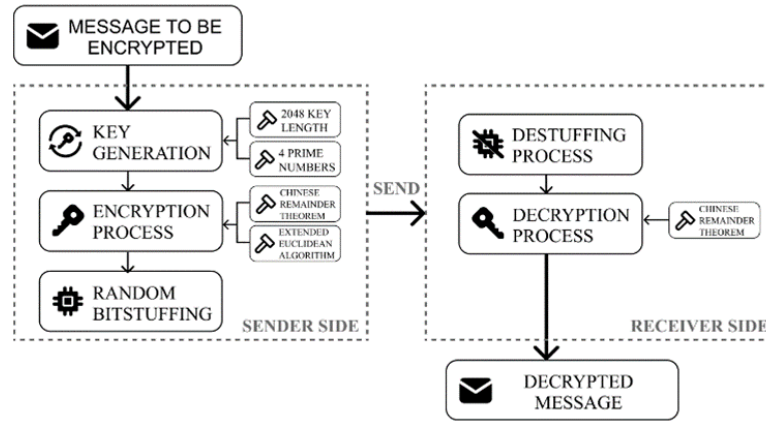

Figure 2. Modified RBMRSA Algorithm Process Flow

Results

Security Analysis

The analyzation and evaluation of improvements in the security level of the algorithm is called a security analysis. The original RBMRSA algorithm by Mojisola et al. (2022) were evaluated against two cryptanalyst attacks that the classical RSA is not secured against: Common Modulus Attack (CMA) and Known Plaintext Attack (KPA).

A common modulus attack (CMA) decrypts an encrypted plaintext with two different public keys of the same modulus, such that the greatest common denominator of the two public keys is congruent to one. The process of common modulus attack in RSA algorithm is as follows:

Let $N = pq$, (e_1, N) , (e_2, N) are the public keys such that $\gcd(e_1, e_2) \equiv 1$.

Suppose that message M is encrypted with keys e_1, e_2 , resulting to $(CT)_1 = Me_1 \bmod N$ and $(CT)_2 = Me_2 \bmod N$.

Proof:

f, g and e_2 are known.

Obtain two $\mathbb{Z}^+ f, g \ni f \cdot e_1 + g \cdot e_2 \equiv 1$.

Calculate $(EM)_1^f \cdot (EM)_2^g \equiv M^{(f \cdot e_1)} \cdot M^{(g \cdot e_2)} \equiv M^{(f \cdot e_1 + g \cdot e_2)}$.

Recall that $f \cdot e_1 + g \cdot e_2 \equiv 1$, then $M^{(f \cdot e_1 + g \cdot e_2)} \equiv M^1 \equiv M$.

In the evaluation of classical RSA, the message can be easily captured and decrypted by attackers. This proof explains that should the attacker get the value for both keys e_1, e_2 and access $(EM)_1, (EM)_2$, the attacker will be able to decrypt the encrypted plaintext M for all intended receivers of the message.

In the same manner, Mojisola et al. evaluated the original RBMRSA algorithm with common modulus attack and found it to be resistant against it. Mojisola et al. formulated a theorem which states that the message BCT_1 accessed by the attacker is not the real message CT_1 due to the bit-stuffing process that occurred before the message was sent over the network.

Let $BCT_1 = EM_1 + R$ and $BCT_2 = EM_2 + R$.

Proof:

e_1 and e_2 are known.

Obtain two $\mathbb{Z}^+ f, g \ni f \cdot e_1 + g \cdot e_2 \equiv 1$.

Recall that $f \cdot e_1 + g \cdot e_2 \equiv 1$.

Calculate: $(BE)_1^f (BE)_2^g \equiv E_1 \cdot R^f (E_1 + R)^g \equiv (mod + R)^f (mod + R)^g$

The results also showed that the attacker will get message BM , which is neither BCT_1 and BCT_2 nor the actual message. With this, it is then concluded that RBMRSA algorithm is secured against CMA. The modified RBMRSA algorithm, having inherited the bit-stuffing process from the original algorithm, is also secured against CMA.

Lastly, a known plaintext attack (KPA) exploits a known plaintext and a newly captured message to crack the encryption system and decrypt a newly captured message. KPA can retrieve the message by creating a prebuilt set W containing a pair of plaintext and encrypted message. The process of known plaintext attack in RSA algorithm is as follows:

Let $P_1, P_2, P_3, \dots, P_n$ are the plaintext, $EM_1, EM_2, EM_3, \dots, EM_n$ are the encrypted message.

Suppose that $P_n \in P$ and $EM_n \in EM$.

Proof:

$W = ((P_1, (EM_1)), ((P_2, (EM_2))), ((P_3, (EM_3))), \dots ((P_n, (EM_n)))$

In the evaluation of classical RSA, encrypting several plaintexts using similar keys produces similar ciphertexts and with the prebuilt set, the attackers can use the information to generate a new plaintext P_{n+1} and provide the equivalent EM_{n+1} .

In the same manner, Mojisola et al. evaluated the original RBMRSA algorithm with known plaintext attack and found it to be resistant against it.

Let $P_1, P_2, P_3, \dots, P_n$ be the plaintext, $EM_1 + R_1, EM_2 + R_2, EM_3 + R_3, \dots, EM_n + R_n$ be the corresponding ciphertext BCT .

Proof:

$W = ((P_1, (EM_1)), ((P_2, (EM_2))), ((P_3, (EM_3))), \dots ((P_n, (EM_n)))$

$R_1 \neq R_2 \neq R_3 \dots \neq R_n$

Upon evaluation, the authors stated that the process of bit-stuffing the encrypted message allows each bit-stuffed ciphertexts to be different from each other, such that the attacker cannot build a set of plaintexts with the given known data. As such, it is then concluded that the RBMRSA algorithm is secured against CMA. The modified RBMRSA algorithm, having inherited the bit-stuffing process from the original algorithm, is also secured against KPA.

Execution Time

The performance of any data encryption and decryption technique is determined by the execution time, this measures how slow and fast a said algorithm is (Mojisola et al., 2022). The modified RBM RSA aims to speed up the solving time of the private key d and the computational time of the decryption phase of the receiver's end by incorporating the Extended Euclidean Algorithm (EEA) and Chinese Remainder Theorem (CRT).

The results of the encryption and decryption time of the modified RBM RSA are shown in Table 2 and the results of the RBM RSA are shown in Table 3. Table 2, which contains the result of the modified RBM RSA, has shown that the encryption and decryption time is comparatively longer than the encryption and decryption time for the RBM RSA. This indicates that the encryption and decryption for the modified RBM RSA has an improved complex algorithm and security against attackers.

Table 2. Encryption and Decryption Time of 2048-bit Modified RBM RSA

Message Size (byte)	Encryption time (ms)	Decryption time (ms)
5	13.10	19.96
10	23.83	37.78
25	52.06	89.70
40	84.49	139.65
60	123.88	205.53
80	163.98	274.07
100	196.61	340.24

Table 3. Encryption and Decryption Time of 1024-bit RBM RSA

Message Size (byte)	Encryption time (ms)	Decryption time (ms)
5	6.24	17.82
10	9.00	36.71
25	22.90	88.71
40	35.02	143.80
60	54.20	204.00
80	71.26	279.73
100	89.26	363.21

The modified RBM RSA and RBM RSA encryption and decryption time results are illustrated in Figure 4 and Figure 5. From the graphical illustration found in Figure 6, it shows the visual comparison of the encryption time of RBM RSA and the modified RBM RSA adjacent to the message size in byte. Figure 7 shows the graphical comparison of the decryption of the modified RBM RSA and RBM RSA adjacent to the message size in byte. The decryption time graph shown in Figure 7 shows that by the 100-bit message, the modified

RBMRSA is significantly faster than RBMRSA even with the bit difference of the key generation.

Figure 7. Decryption Time Comparison between Modified RBM RSA and RBM RSA

Avalanche Effect

The avalanche effect is a result of a small change in a plaintext message that produces a significantly different ciphertext (Mojisola et al., 2022). The security of the modified RBM RSA and RBM RSA uses the Avalanche Effect to measure the sensitivity of the algorithm by calculating the produced original ciphertext and the single bit difference ciphertext. This result supports the hypothesis that the avalanche effect on the algorithm will make it difficult for an attacker to successfully run statistical analysis on the ciphertext.

$$\%AE = \frac{CbCT}{ToCT} \times 100 \quad (1)$$

The Equation (1) with avalanche effect in plain text (AE), count of changed bits in ciphertext (CbCT), and total bits in ciphertext (ToCT), is the formula to get the percentage result of the avalanche effect of the algorithm. Table 4 shows the avalanche effect percentage of both the modified RBM RSA and RBM RSA using the same data input for both the algorithms.

Table 4. Avalanche Effect of Modified RBM RSA and RBM RSA

Algorithm	Avalanche Effect (%)
Modified RBM RSA (2048-key length)	38.60%
Modified RBM RSA (1024-key length)	38.58%
RBM RSA	38.40%

A graphical visualization of the avalanche effect (%) of the modified RBM RSA in 2048-key length and 1024-key length and RBM RSA (see Figure 8).

Figure 8. Avalanche Effect (%) of Modified RBM RSA and RBM RSA

Computational Speed

As suggested by Mojisola et al. (2022), the computational speed of the algorithm has been shown to be dependent on the execution time of its computational complexity. The execution time of the algorithm shown in Table 2 and Table 3 is a comparison between the modified RBM RSA with 2048-key length and RBM RSA with 1024-key length. The key length contributed to the difference of the execution time, particularly on the encryption time. Table 5 provides the execution time of the modified RBM RSA with 1024-key length and with the same message size as Table 2 and Table 3 for the computational speed test between the modified RBM RSA and RBM RSA.

Table 5. Encryption and Decryption Time of 1024-key Modified RBM RSA

Message Size (byte)	Encryption time (ms)	Decryption time (ms)
5	5.89	7.49
10	11.13	14.21
25	21.21	28.30

40	36.22	43.22
60	53.28	62.80
80	68.05	80.25
100	85.56	98.24

The encryption time for Table 5 compared to the encryption time of RBMRSA in Table 3 shows that the gap in execution time between the modified RBMRSA and RBMRSA when on the same key length is significantly small. A graphical presentation of the comparison of encryption time (see Figure 8) and decryption time (see Figure 9) between the modified RBMRSA in 2048-key length, RBMRSA, and modified RBMRSA in 1024-key length to visually illustrate the difference of the computational speed.

Figure 9. Encryption Time (1024-key and 2048-key Modified vs RBMRSA)

Figure 10. Decryption Time (1024-key and 2048-key Modified vs RBMRSA)

Figure 9 shows the considerable encryption difference of 2048-key Modified RBMRSA with the 1024-key RBMRSA, but the RBMRSA has almost the same execution time as the 1024-key modified RBMRSA. Indicating that the 2048-key length modification of the modified RBMRSA affects the computational speed difference if compared with the 1024-key RBMRSA. If the same key length size is applied for both algorithms,

results showed there exists minimal computational speed difference despite the additional security applied to the modified RBMRSA. The decryption time difference for both key lengths of the modified RBMRSA in Figure 10 showed that the modified algorithm offers significant computational speed advantage over the current RBMRSA.

Computational Complexity

The degree of the computational complexity of the algorithm can be analyzed with the use of Big O notation. The time for the computer to produce an output based on a specific input is a determining factor of the efficiency of the cryptological algorithm. The complexity of the modified RBMRSA and RBMRSA will be calculated using the polynomial equation:

$$Y = F(X) = ax^6 + bx^5 + cx^4 + dx^3 + ex^2 + fx + g$$

The coordinates can be derived from Table 2 for modified RBMRSA and Table 3 for the RBMRSA algorithm, where (x) is the message size as the independent variable and a, b, c, d, e, f, and g as coefficients.

$$y = -4.37 \times 10^{-9}x^6 + 1.27 \times 10^{-6}x^5 - 0.000139x^4 + 0.007112x^3 - 0.007112x^2 + 3.697211x - 1.926982 \quad (2)$$

Equation (2) shows the mathematical structure of the encryption measured in milliseconds (y) as the dependent variable for the modified RBMRSA in 2048-key length encryption.

$$Z = -2.20 \times 10^{-10}x^6 + 4 \times 10^{-8}x^5 - 1.97 \times 10^{-6}x^4 + 4.99 \times 10^{-5}x^3 - 0.005885x^2 + 3.646586x + 1.869475 \quad (3)$$

Equation (3) presents the mathematical structure of the modified RBMRSA decryption where (z) is the decryption measured in milliseconds. The mathematical equation for y and Z replaced by the corresponding equivalent for each variable produces computational complexity with the help of Big O analysis. This result showed that the trendline for the Big O encryption is within the degree of 3 and the decryption trendline is within the range of 1. The same mathematical equation will be used to determine the complexity of the RBMRSA with the data from Table 3 and of the modified RBMRSA in 1024-key length with the data from Table 5.

$$y = 3.45 \times 10^{-9}x^6 - 1.01 \times 10^{-6}x^5 + 0.000112x^4 - 0.005929x^3 + 0.152614x^2 + 0.89153x + 7.557534 \quad (4)$$

Equation (4) presents the mathematical structure for RBMRSA encryption with (y) as the dependent variable which is the encryption time measured in milliseconds for RBMRSA algorithm.

$$Z = -8.75 \times 10^{-9}x^6 + 2.44 \times 10^{-6}x^5 - 0.000250x^4 + 0.011815x^3 - 0.263159x^2 + 6.081909x - 6.081909 \quad (5)$$

Equation (5) presents the mathematical structure of the decryption of the RBRMSA algorithm where (z) is the decryption time measured in milliseconds. The results for the RBMRSA Big O analysis show that the trendline for RBMRSA Encryption is within the degree of 4 and the Decryption is within the degree of 3.

$$y = -4.03 \times 10^{-9}x^6 + 1.23 \times 10^{-6}x^5 - 0.0001415x^4 + 0.007629x^3 - 0.1929x^2 + 2.849x - 4.403 \quad (6)$$

Equation (6) shows the mathematical equation of the encryption of the modified RBMRSA in 1024-key length where (x) is the independent variable that contains the message size bit and (y) as the dependent variable encryption time results from table 5.

$$Z = -1.59 \times 10^{-9}x^6 + 5.13 \times 10^{-7}x^5 - 6.39 \times 10^{-5}x^4 + 0.003819x^3 - 0.1126x^2 + 2.474x - 2.499 \quad (7)$$

The mathematical equation of the decryption time of the modified RBMRSA in 1024-key length is shown in equation (7) where the dependent variable (z) is the decryption time results from the 1024-key length of the modified RBMRSA. The results of the polynomial equations from equation (6) and equation (7) suggest that the degree of both encryption and decryption time for the 1024-key length modified RBMRSA is best at degree 3.

Attack Step Analysis

Additional security metric involved is attack step analysis, which encompasses the analysis of the steps involved to run a successful attack through specific processor without actually performing the said attack on the algorithm.

$$\text{Attack Step} = 2^l \text{ where } l \text{ is the key length} \quad (8)$$

Equation (8) presents the formula for attack step analysis which is also based on the study conducted by Mojisola et. al (2022).

$$\text{Attack Step} = 2^{(1024)} + N \text{ Steps} = 1.7978 \times 10^{308} \text{ Steps} \quad (9)$$

Equation (9) shows the attack step analysis for the RBMRSA presented by Mojisola et. al (2022), where l is 1024-key length and the additional step which is presented as N shows the presence of the additional bit brought upon by the integrated random bit stuffing algorithm.

$$\text{Attack Step} = 2^{(2048)} + N \text{ Steps} = 3.2317 \times 10^{616} \text{ Steps} \quad (10)$$

Equation (10) presents the attack step analysis of the modified RBMRSA, where l is 2048-key length and the additional step due to the random bit stuffing is presented as N.

$$\text{Attack Step} = 2^{(1024)} + N \text{ Steps} = 1.7978 \times 10^{308} \text{ Steps} \quad (11)$$

Equation (11) presents the attack step analysis of the modified RBMRSA in 1024-key length, where l is the 1024-key length and the additional step due to the random bit stuffing is presented as N.

Discussion

The computational and time complexity of the modified RBMRSA and RBMRSA was studied using the Big O analysis as metrics. The execution time shown in Table 2, Table 3, and Table 4 are the data that was used for the Big O analysis to produce the computational and time complexity difference of the modified RBMRSA in 2048-key length, 1024-key length modified RBMRSA, and 1024-key length RBMRSA with message sizes in byte. The avalanche effect in percentage which is shown in Table 4 is the security metric for the sensitivity of the produced ciphertext based on the single change of the plaintext.

The implementation of the 2048-key length, four randomly generated prime numbers, EEA, and CRT on the modified RBMRSA results in a significantly slower encryption time in different message byte compared to the 1024-key length RBMRSA. The 2048-key length is divided into four to produce an equal key length between the four randomly generated prime numbers. This key length generates the public and private keys which produce long strings of RCB, X, Y, and Z of the ciphertext.

The key length bit is relevant to the computational speed of the algorithm as it affects the execution time of the algorithm, and the larger the key length bits results in the larger the bits of data the algorithm must solve as shown in Figures 9 and 10. The implementation of the EEA on the encryption process of the modified RBMRSA helps with shortening the execution time of solving for the private key d for 2048-key length N as suggested by the results on Figures 9 and 10. The same goes for the implementation of the CRT on the encryption and decryption process of the modified RBMRSA as seen on the decryption time difference on Figure 10. CRT improves the computational speed of the decryption process by dividing the ciphertext bits into four parts using the generated keys from the encryption process which significantly shows to be much more efficient when entering large bits of data.

The summary of the results for the metrics used for the comparison of the performance of the modified RBMRSA in 2048-key length and 1024-key length and RBMRSA in 1024-key length is shown in Table 6. This metrics comparison uses the same data input key length and formula for both the Modified RBMRSA (in 2048-key length and 1024-key length) and RBMRSA.

Table 6. Summary of Metrics Results Table

Algorithm	Avalanche Effect (%)	Computational Complexity of Encryption	Computational Complexity of Decryption	Attack Step Analysis
Modified RBMRSA (2048-key length)	38.60%	$O(n^3)$	$O(n)$	$2^{(2048)} + N$
Modified RBMRSA	38.58%	$O(n^3)$	$O(n^3)$	$2^{(1024)} + N$

(1024-key length)

RBMRSA	38.40%	$O(n^4)$	$O(n^3)$	$2^{(1024)} + N$
--------	--------	----------	----------	------------------

Table 6 presents the result for the avalanche effect in percentage and the Big O analysis of the modified RBMRSA (in 2048-key length and 1024-key length) and RBMRSA. The avalanche effect (%) for the modified RBMRSA in 2048-key length is 0.20% higher than the RBMRSA which signifies that the modified RBMRSA is more enhanced than the RBMRSA when it comes to the slight changes of the plaintext. The enhanced avalanche effect of the modified RBMRSA demonstrates to have 0.20% increase of security against attackers using statistical analysis on the plaintext message compared with the RBMRSA. The modified RBMRSA in 1024-key length shows a 0.18% difference with the RBMRSA in 1024-key length which suggests that the additional prime number increased the security of the modified RBMRSA compared to the RBMRSA. Lastly, the table also shows the attack step analysis comparison of the two algorithms wherein the modified RBMRSA utilizes a greater key length than the current RBMRSA algorithm which leads to added exhaustion time for running a successful attack.

The computational complexity comparison between the modified RBMRSA and RBMRSA derived from Equation (2) and Equation (3) for the encryption and decryption of the modified RBMRSA in 2048-key length, Equation (4) and Equation (5) for the RBMRSA, and from Equation (6) and Equation (7) for the encryption and decryption time of the modified RBMRSA in 1024-key length. The study by Danziger (2010) suggests the Big O notation is commonly used to analyze the efficiency of the algorithm by comparing the orders or the degree. Moreover, the study presents the hierarchy of the notation and the degree of the computational complexity of the algorithm in relation to its execution time.

The result of the computational complexity of the encryption for the modified RBMRSA in 2048-key length compared to the RBRMSA shown in Table 6 suggests that the modified RBMRSA in 2048-key length encryption time is significantly faster than the RBMRSA as the size of the input increases, having a complexity of $O(n^3)$. The decryption time of the modified RBMRSA in 2048-key length with a computational complexity of $O(n)$ which suggests a linear relationship with message size in byte and decryption time. For this reason, the modified RBMRSA in 2048-key length indicates that the decryption time increases linearly with the message size in byte which suggests being much more optimal and efficient for larger size input in comparison with RBMRSA.

The computational complexity for both encryption of decryption time appears to be more efficient and optimal on the modified RBMRSA in 2048-key length when handling larger data. Additionally, as shown in table 6, the computational complexity of the encryption time of the modified RBMRSA in 1024-key length is $O(n^3)$ which suggests that the implementation of EEA optimized the encryption process which is an improvement from the current RBMRSA with 1024-key length. The computational complexity of the decryption of the modified RBMRSA in 1024-key length is $O(n^3)$ which compared to the computational complexity of the decryption time

of the modified RBM RSA in 2048-key length suggests that the incorporated CRT on the decryption process is much more efficient when implemented on larger key lengths.

Conclusion

This research study is a variant of the well-known asymmetric cryptography, RSA Algorithm, which is geared to enhance the developed Random Bit Stuffing Insertion Algorithm with Modified RSA (RBM RSA) algorithm by Mojisola et al. (2022). The modified RBM RSA algorithm is implemented in Python programming language and is simulated using a simple developed web application. Aiming to enhance the computational complexity and security performance and adherence of RBM RSA, mathematical processes were incorporated such as Extended Euclidean Algorithm (EEA) and Chinese Remainder Theorem (CRT) to help optimize the algorithm's computational and time complexity, the algorithm is then strengthened through the use four randomly generated prime numbers and is implemented in a 2048-bit key length. The modified algorithm went through performance evaluation to analyze its execution time, computational complexity, security and sensitivity to changes with its plaintext.

Execution time results showed that the modified RBM RSA in 2048-key length has higher encryption execution time, due to the additional prime numbers and higher key length involved. Results also showed that the modified algorithm performed better in terms of its decryption execution time compared to the referenced 1024-bit RBM RSA algorithm. Utilizing the Big O Analysis as metric for its computational complexity, results showed that the modified RBM RSA is lower in degree than the RBM RSA algorithm even though the modified algorithm incorporated additional security and higher key length. This infers that the modified RBM RSA shows optimization in its computational complexity in terms of both encryption and decryption, concluding that there is improvement brought upon by the utilization of EEA and CRT in the algorithm's encryption and decryption processes. In terms of aiming to enhance further the security of the RBM RSA, results generated from the Avalanche Effect showed that the modified RBM RSA contributed an additional 0.20% of security from 38.40% of the current RBM RSA algorithm. Hence, the modified RBM RSA is much more sensitive to a small change made in the plaintext resulting to a changed ciphertext. Additionally, through attack step analysis it can be seen that although each algorithm possesses the same level of steps, the modified RBM RSA encompasses a greater key length which can add up to exhausting the time needed to perform a successful attack on the said cryptographic algorithm. Furthermore, the modified RBM RSA is built upon the security analysis made by Mojisola et. al (2022) to RBM RSA which theoretically proved that the said algorithm is resistant to Common Modulus Attack and Know Plaintext Attack because of the added security layer through the Random Bit Stuffing Algorithm.

This modified RBM RSA algorithm offers a new methodology to answer the lapses of RBM RSA in terms of offering security while optimizing its execution processes. Based on the overall results, the modified RBM RSA algorithm encompasses improved processes that can offer great performance in securing data exchange over vulnerable networks even under the consideration of large message size.

Recommendations

The capabilities of the modified RBMRSA cryptographic algorithm can be further tested out on other file types like image files or audio files, and in digital signatures. Future works can encompass testing the algorithm on larger data size and use additional security metrics to analyze the effectiveness of the modified algorithm. Further optimization of the algorithm can be studied to enhance the random bit insertion algorithm scheme or its encryption and decryption computational and time complexity.

Acknowledgements

The authors would like to extend their greatest gratitude to their adviser, thesis panels, and coordinators from the University of the City of Manila (*Pamantasan ng Lungsod ng Maynila*) for their continuous guidance and insightful critiques towards the completion of this research study. Additionally, the authors would like to thank Mojisola et al. for their initiative towards the creation of RBMRSA algorithm. Lastly, the authors would like to express their love and thanks to their respective families, friends, colleagues, and sponsors for their unwavering support.

School Leadership Experiences of Secondary School Principals in a VUCA Environment: Development of a VUCA Leadership Theory

Melvin Damaolao

Bronx International High School, USA,  <https://orcid.org/0000-0002-0344-055X>

Narro Navarro

National University, Philippines,  <https://orcid.org/0000-0002-6200-5005>

Abstract: The exploration of leadership within the educational domain has been a longstanding pursuit. Research consistently establishes a connection between the effectiveness of schools and the quality of leadership. This qualitative study aimed to delve into the experiences of secondary school principals, particularly in the context of a volatile, uncertain, complex, and ambiguous (VUCA) environment. Employing a narrative inquiry approach, principals were interviewed to articulate the core of effective leadership, emphasizing their experiences as leaders navigating the challenges of the VUCA world. Additionally, they were queried about their ongoing learning needs as leaders. In essence, this study sought authentic insights from the perspectives of secondary principals, unraveling the experiences that significantly shaped them, delineating the essential elements characterizing effective leaders in the VUCA world, and elucidating the perceived developmental needs of secondary school principals as they continually evolve in their leadership roles. A VUCA Leadership Theory was created based on the findings of this study.

Keywords: leadership experiences, VUCA world, narrative inquiry, effective leadership, VUCA solutions

Citation: Damaolao, M. & Navarro, N. (2024). School Leadership Experiences of Secondary School Principals in a VUCA Environment: Development of a VUCA Leadership Theory. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2093-2157), Antalya, Turkiye. ISTES.

Introduction

Principalships in schools encompass a multitude of facets. In the context of the Philippines, the roles include strategic leadership, operational and resource management, emphasis on teaching and learning, personal and professional development, and networking (Government of the Philippines, Department of Education, 2020). The significance of leadership in schools, second only to classroom instruction, in shaping students' learning experiences underscores the complexity and importance of the role (Abrego, 2019; Gordon, 2018; Sammons, Day, Gu, and Ko, 2010). Grissom and Loeb (2011) highlight the effectiveness of principals who prioritize instructional leadership alongside organizational management and interpersonal skill development for enhancing

school performance. Effective leadership practices are pivotal in enhancing organizational efficiency, teaching quality, and student outcomes (Poloncic, 2016).

Various inquiries surround the concept of leadership, including its origin, whether it's inherent or acquired, and its transformative role in society. Evidence suggests that leaders inspire and influence others, articulate visions, and uphold ethical standards (Greer, 2011). They foster positive change and encourage the growth of individuals within the organization (Banutu-Gomez, 2004; Poloncic, 2016).

In the rapidly changing landscape of 21st-century education, leaders encounter unprecedented levels of volatility, uncertainty, complexity, and ambiguity (VUCA) (Johansen & Euchner, 2013). Understanding the dynamics of VUCA is crucial for leaders to navigate through evolving challenges effectively (Deaton, 2018). Globalization and technological advancements further amplify VUCA dynamics, requiring leaders to adapt to innovation and interconnectedness (Horney & O'Shea, 2015).

This study aims to provide secondary school principals with a deeper comprehension of their leadership context and the efficacy of their leadership styles in promoting continual improvement. Additionally, it seeks to contribute to the understanding of VUCA dynamics in educational leadership, aiding leaders in adapting to current realities.

The following specific research questions will be addressed in this study:

What are the leadership experiences of Cebu City North District secondary school principals?

What experiences are important to secondary school principals in terms of operating in a volatile, uncertain, complex, and ambiguous school environment?

What does effective leadership in the VUCA world mean to the Cebu City North District secondary school principals?

What needs do secondary school principals have to further develop as effective leaders in the VUCA world?

Literature Review

Leadership development for school principals remains a multifaceted subject requiring continuous academic inquiry beyond existing studies. Previous research has extensively examined various leadership theories, effective leadership qualities, and the impact of leadership on student achievement. However, there is a need for further investigation into this complex area.

The landscape of leadership theories is vast, with numerous theoretical trends identified in recent research. Dinh et al. (2014) identified 66 different leadership theories in this millennium alone, signaling the richness and diversity within this field. Leadership is increasingly perceived as a collaborative endeavor, emphasizing

teamwork and shared responsibility rather than a traditional top-down approach. Despite the breadth of research, a unified theory of leadership remains elusive (Polincic, 2016; Dinh et al., 2014).

The relationship between leadership theory and the role of school principals is pivotal. Principals exhibit distinct behaviors and interactions in their duties, shaping their leadership styles. As educational environments evolve, principals must adapt their leadership styles to meet emerging challenges effectively.

Leadership Theories

Transformational leadership theory stands out as a prominent framework in educational leadership research. This theory emphasizes leaders' ability to inspire and elevate followers' aspirations, motivations, and maturity levels (Abu-Hussain, 2014). Initially introduced by Downton (1973) and further developed by Burns (1978) and Bass (1985), transformational leadership focuses on fostering idealized influence, inspiration, intellectual stimulation, and individualized consideration (McCleskey, 2014). Research suggests that transformational leaders motivate their subordinates to surpass performance norms through charismatic influence (Bass & Riggio, 2006).

Transformational leadership fosters a symbiotic relationship between leaders and followers (Abu-Hussain, 2014). Leaders who embody transformational qualities cultivate organizational visions, promote reflection, nurture leadership potential, and foster a culture of collaboration and innovation (Hauserman & Stick, 2013).

Visionary leadership complements transformational leadership by emphasizing leaders' ability to articulate compelling visions that imbue organizational work with meaning and purpose (Nanus, 1992; Sashkin, 1992). Visionary leaders inspire action by effectively communicating their vision, fostering cohesion, commitment, and trust within the organization (Zhu et al., 2005). Effective visionary leadership enhances organizational performance and promotes positive outcomes for constituents (Hogan and Kaiser, 2005).

Instructional leadership, characterized by expertise and influence, plays a crucial role in improving teaching and learning outcomes (Heck & Hallinger, 2014; Leithwood, Harris & Hopkins, 2008; Sebastian & Allensworth, 2012). Scholars predominantly utilize the conceptualization put forth by Hallinger and Murphy (1985) to explore the dynamics of effective instructional leadership.

Empowered leadership, whether at the individual or group level, has garnered increasing attention for its motivational benefits (Houghton, Neck, and Manz, 2003; Pearce and Sims, 2002). Empowerment enhances autonomy, self-efficacy, and shared leadership practices, contributing to improved performance and outcomes (Liden, Wayne, and Sparrowe, 2000; Ensley, Hmieleski, and Pearce, 2006).

Finally, followership theory, though less studied compared to leadership theory, plays a crucial role in understanding leadership dynamics. Followership theory explores how followers influence leadership processes

and outcomes, highlighting the reciprocal relationship between leaders and followers (Uhl-Bien et al., 2014).

Defining VUCA: A Historical Overview

The inception of the term VUCA dates back to the 1990s, originating from the U.S. Army War College amidst a transition from conventional warfare to what was termed NextGen warfare. This new form of warfare was characterized by unprecedented levels of volatility, uncertainty, complexity, and ambiguity (Tint, McWaters, & Raymond, 2015; Fry, 2016; Elkington, Pearse, Moss, Van, & Martin, 2017; Cousins, 2018). Unlike the preceding era marked by identifiable adversaries and conventional strategies, NextGen warfare introduced novel challenges such as asymmetrical tactics employed by agile and elusive opponents, evident in conflicts like 9/11 and the Syrian conflict (Fry, 2016). This shift prompted a reevaluation of military strategies and necessitated the development of adaptive approaches to address the evolving landscape.

In the educational context, VUCA principles find resonance in the challenges faced by school principals amidst dynamic and unpredictable environments. For instance, the sudden implementation of new policies or budget cuts can thrust school leaders into volatile and uncertain situations, demanding swift adaptation and strategic decision-making (Palacios, 2018; Tudorache & Ispas, 2018). Similarly, initiatives like technology integration in schools introduce complexities that require nuanced leadership to navigate effectively (Bartscht, 2015). Moreover, the ambiguity inherent in ambiguous directives or novel frameworks underscores the need for interpretative leadership capable of guiding stakeholders through unclear terrain (Bennett & Lemoine, 2014).

In addressing these challenges, leaders across various domains have sought innovative strategies informed by VUCA principles. The AGILE model proposed by Horney and O'Shea (2002) offers a structured framework for assessing leaders' ability to anticipate and respond to VUCA threats, emphasizing competencies such as change anticipation and agile decision-making (Horney & O'Shea, 2015). Additionally, Johansen (2009) advocates for a holistic approach encapsulated in the VUCA acronym, where each element is met with a corresponding strategy: vision for volatility, understanding for uncertainty, clarity for complexity, and agility for ambiguity. This comprehensive framework provides leaders with a practical toolkit to confront the multifaceted challenges of VUCA environments, guiding them towards adaptive and effective leadership. In essence, the evolution of VUCA from its military origins to its application in diverse sectors underscores its enduring relevance in navigating contemporary complexities. As leaders grapple with the uncertainties of an ever-changing landscape, embracing VUCA principles offers a strategic imperative for fostering resilience, innovation, and success in an unpredictable world.

Understanding Effective School Leadership

Scholars have delved into the essential traits and competencies that define effective school leaders, aiming to distinguish between mere recognition of their impact on school success and identifying the specific qualities and skills that drive positive outcomes (Grissom & Loeb, 2011). Research indicates that effective instructional

leadership is paramount, encompassing not only administrative tasks but also a focus on improving teaching quality and addressing instructional needs (Grissom & Loeb, 2011). Principals are thus encouraged to dedicate significant attention to initiatives aimed at enhancing instruction, including needs assessment, resource allocation, and personnel management (Grissom & Loeb, 2011).

The perception of an ideal school leader varies among stakeholders, influenced by individual beliefs, experiences, and priorities (Costellow, 2011). While superintendents may prioritize instructional leadership, parents may emphasize safety and quality instruction, teachers may seek support and morale-boosting, and students may prioritize social-emotional needs (Costellow, 2011). However, a shared culture of open communication, emphasis on essential aspects, discipline, and visibility emerged as universally valued qualities among teachers and principals (Costellow, 2011).

High school principals play a critical role as instructional leaders, with responsibilities extending to hiring effective teachers and ensuring appropriate class assignments (Clabo, 2010). Teachers emphasize the importance of principals providing resources and professional development opportunities to enhance instructional quality and academic achievement (Clabo, 2010). Similarly, research on instructional leadership underscores its significant impact on school performance, with practices such as improving teaching methodologies, setting academic goals, and empowering stakeholders contributing to academic success (Sammons et al., 2010).

A comprehensive review of effective school leadership identifies key practices that positively influence student learning and organizational success (Leithwood et al., 2006). Notably, effective leaders prioritize visioning, appreciation of subordinates, organizational restructuring, and management of the teaching-learning process (Leithwood et al., 2006). They involve staff in decision-making processes to achieve a shared vision and direction, fostering motivation and commitment among teachers to enhance student achievement (Leithwood et al., 2006). Distributed leadership, characterized by diverse leadership teams and capacity-building, emerges as a powerful strategy for organizational improvement (Leithwood et al., 2006).

Furthermore, effective principals excel in various domains, including vision development, creating conducive learning environments, professional development, instructional improvement, people management, and data-driven decision-making (Wallace Foundation, 2012). Standards for Professional Practice for school principals contribute to reflective practice, professional development, recruitment, and evaluation, thereby enhancing leadership effectiveness and promoting school improvement (Dinham, 2011).

Method

Research Design

This study employs a qualitative methodology, specifically narrative inquiry, to comprehensively explore the

experiences of secondary school principals. The focus is on understanding their definition of effective leadership from their unique perspectives and unraveling the more elusive characteristics of their leadership and personal development as learning agents in the VUCA world. The choice of the narrative inquiry approach is driven by the desire to delve into the experiences of school principals and their ongoing development as leaders within the dynamic VUCA environment. Data was collected from eight (8) secondary school principals within the Cebu City North District through individual semi-structured interviews. These principals have at least five (5) years of experience leading their respective schools. A semi-structured interview protocol was used to delve deeply into the topic and grasp the information completely. In conducting semi-structured interviews, the researcher was able to avoid missing issues which could be critical to the completion of the study.

Sample and Sampling Design

The sampling was done according to Creswell's criterion sampling approach, which involves identifying secondary school principals who have experienced the phenomenon (Polincic, 2016; Creswell, 2018). In this study, the North District secondary school principals of Cebu City were considered. A detailed email explaining the study, confidentiality, informed consent, and interview details were sent to eight (8) qualifying participants after they have been identified.

Context and Participants

This study takes place in the North District of Cebu City, where the researcher endeavored to explore the leadership experiences and perspectives of secondary school principals within that district. The inclusion criteria for the study involve selecting principals with a minimum of five years of experience. Table 1 contains the summary of the participants.

Table 1. Research Participants and Years of Experience as Secondary School Principal

No.	Participant's Pseudonym	Years of Experience as a Secondary School Principal
1	Mary	11
2	Richard	5
3	Angela	21
4	Frank	5
5	Esther	20
6	Beatrice	10
7	Sheila	5
8	Nate	10
Total Number of Participants:		8

Research Instrument

In this study, the research methodology employed revolves around a semi-structured interview protocol, which is designed to elicit insights into the experiences of secondary school principals in the VUCA world. Semi-structured interviews, known for their openness and flexibility, present a set of questions that provide a loose framework. While maintaining the ability to compare responses systematically, the semi-structured format also allows for a degree of adaptability. This flexibility is particularly advantageous as it permits a nuanced exploration of the experiences, revealing patterns that might be overlooked in a more rigid structure. Striking a balance between structure and openness, this approach enables a comprehensive understanding of the nuances within the narratives of different respondents.

Data Gathering Procedure

Three major steps were involved in the collection and analysis of data: planning, data collection, and data analysis.

The Planning Process

Research planning included creating questions for semi-structured interviews, refining the questions, and communicating the questions to the principals prior to the interviews. In addition, I coordinated with the principals to schedule interviews at a time and location that would allow for deeper conversations and information sharing. The final step was to ensure that all the necessary materials for conducting the interviews were in place, such as recorder, notes, etc.

The Data Collection Process

Several days were spent meeting with the principals to conduct the interviews. Interviews were expected to take place in the principals' schools at a time convenient to their schedules. Telephone and email communication helped to establish a good working relationship and provided valuable information throughout the research process.

Data Analysis

The interviews were transcribed, organized, and coded at the first level after they were conducted. As part of the analysis, I read and reread each interview transcript to refresh my memory, and then began coding the data using Quirkos. The transcribed responses were added to the Quirkos platform and codes were initially assigned to text or examples of ideas in transcriptions in the first phase of coding.

In phase one, Rubin and Rubin (2005) explain that the transcripts are prepared; concepts, themes, and events are

identified, refined and elaborated; and then the interviews are coded to retrieve what the interviewees had to say regarding the identified concepts, themes, and events are identified.

During the second phase, I examined the codes in greater depth and looked for themes related to the coded text and examples. Specific parts of the transcription were highlighted and coded in Quirkos, concepts were compared across the coding, themes were identified that grouped codes into more meaningful groups, a picture of the data was formulated, and a description of it was provided. This is the inductive data analysis part. According to Creswell (2005), “inductive data analysis establishes patterns or themes.” A pattern began to emerge because of the lists of notes and codes.

Validation Strategies

The rigorous validation of the study was integral to ensuring the reliability and credibility of the research findings. The researcher employed a multifaceted approach, drawing on diverse methods to establish the study's robustness. Peer review and member checking, as endorsed by Creswell (2018), were pivotal components of this validation process. Peer review involved subjecting the research methodology, data analysis, and findings to scrutiny by experts in the field. This external evaluation served to identify potential biases, refine the research design, and enhance the overall methodological integrity.

Member checking, another crucial aspect of the validation strategy, involved seeking feedback directly from the participants involved in the study. This participatory verification process aimed to ascertain the accuracy and authenticity of the research findings from the perspective of those intimately acquainted with the research context. Providing participants with rough drafts containing detailed descriptions ensured their active engagement in the validation process. Their insights, reflections, and corrections contributed significantly to refining the interpretations and conclusions drawn from the data.

In addition to these participant-centric approaches, the researcher implemented corroboration techniques by consulting a variety of research sources. This broader literature review and engagement with existing scholarship served as a form of triangulation, enriching the study by situating it within a broader academic discourse. The inclusion of diverse perspectives and insights from the literature not only reinforced the credibility of the study but also provided a nuanced context for interpreting the findings.

Furthermore, recognizing the complexity of qualitative research, the research process underwent critical evaluation by a qualitative research expert. This external critique by a seasoned professional in qualitative methodologies served as an invaluable checkpoint. The expert's insights into methodological choices, data analysis procedures, and interpretation of findings offered a constructive lens to identify potential biases, refine research strategies, and enhance the overall quality of the study.

Results

Each participant shares their thoughts on the essential characteristics of effective leaders, elucidating the pivotal role effective leadership plays in enhancing school effectiveness. They articulate their vision for an effective school environment, deliberating on whether leadership is perceived as an art or a craft. Moreover, the principals candidly recount experiences that have significantly shaped their growth in their roles, offering a firsthand account of the challenges and triumphs they've encountered. Their narratives also extend to the VUCA landscape, exploring how they navigate and overcome the unique challenges posed by volatility, uncertainty, complexity, and ambiguity. Ethical and professional standards come under scrutiny as they discuss the impact of these principles on their daily practices. To ensure accuracy and depth, these insights were gleaned from both initial face-to-face interviews and subsequent follow-up interviews, providing a comprehensive and nuanced understanding of each principal's journey, reflections, and aspirations for personal and professional growth.

The Preconceived Codes

In the realm of qualitative research, specifically in the context of narrative inquiry, the researcher embarks on a journey laden with the intricacies of interpretation and meaning making. As the study unfolds, it is inevitable that the researcher enters the process with preconceived codes, shaped by the overarching themes deduced from the research questions. In the case of this study, these preconceived codes serve as the foundational pillars that guide the initial coding process, particularly at the first level in Quirkos.

The preconceived codes in this narrative inquiry represent the broader themes encapsulating the essence of the research questions. These codes act as a lens through which the researcher begins the interpretative journey, framing the initial understanding of the data. The first level coding in Quirkos is informed by these preconceived codes, each representing a significant facet of the research focus.

General Impactful Experiences

The first preconceived code delves into the broader spectrum of impactful experiences. This encompasses a wide array of narrative elements that hold significance in the stories shared by the participants. It acts as a receptacle for overarching impressions and noteworthy incidents that contribute to the overall narrative texture.

VUCA Experiences and Challenges

As VUCA constitutes a central theme, this preconceived code encapsulates experiences and challenges characterized by volatility, uncertainty, complexity, and ambiguity. It serves as a specific lens through which the researcher seeks to understand the nuanced narratives surrounding the VUCA environment in the context of the participants' experiences.

VUCA Solutions

This preconceived code shifts the focus towards the solutions and strategies employed by the participants in response to VUCA challenges. It serves as a repository for narratives detailing innovative approaches, adaptive strategies, and resilience in the face of VUCA-related complexities.

Role of Ethical and Professional Standards

Ethical considerations and adherence to professional standards represent a crucial aspect of the study. This preconceived code captures narratives that shed light on the ethical dilemmas faced by the participants and how they navigated these challenges while upholding professional standards.

Definition of Effective Leadership

One of the foundational preconceived codes revolves around the participants' perspectives on effective leadership. This code serves as a conduit for narratives that articulate their understanding of what constitutes effective leadership in the context of secondary education.

Definition of Effective School Environment

Complementary to the code on effective leadership, this preconceived code explores the participants' articulations of an effective school environment. It encompasses narratives that delve into the elements contributing to a positive and conducive educational setting.

Effects of Effective Leadership

This code encapsulates narratives that unfold the ripple effects and tangible outcomes resulting from effective leadership. It serves as a thematic container for stories that illuminate how effective leadership contributes to positive transformations within the educational landscape.

Perceived Needs of Secondary School Principals

The final preconceived code pertains to the perceived needs expressed by the participants. It serves as a platform for narratives that articulate the requirements and aspirations of secondary school principals, providing insights into their professional and personal needs.

Impactful Leadership Experiences

The first research question of the study was: What are the leadership experiences of Cebu City North District

secondary school principals? The interview questions were designed to learn about the personal experiences of secondary school principals in the North District of Cebu City. After coding the respondents' responses, themes began to emerge (see Table 2).

The participants were asked about their experiences that had influenced or impacted their growth as leadership practitioners in their respective schools. Four themes emerged from their responses: (a) Learning from and interacting with other school leaders, (b) Dealing with challenging and difficult teachers and staff members, (c) Dealing with classroom shortages and shortages of resources in general, and (d) Leadership training and experiential learning.

Theme 1.1.1. Learning from and interacting with other school leaders

The participating principals valued learning from and interacting with other school leaders because they promote professional growth, collaboration, innovation, and support within the educational community. For example, Sheila said,

There were many seminars I attended but the most significant ones are those I spent with other leaders outside Cebu City. During those times, I was able to work with other school leaders and learn from them. I also got to enjoy and explore different places.

Sheila added that the experience she had with other school leaders gave her “valuable insights, knowledge, inspiration, and networking opportunities”.

Nate expressed that,

I soon realized that working closely with other principals opened up a world of possibilities for my own professional growth and the betterment of my school. Through regular meetings, workshops, and collaborative problem-solving sessions in a span of two (2) weeks... this was over the summer... I developed a strong relationship with the other principals. We shared triumphs and challenges, exchanged best practices, and supported one another in navigating the complexities of educational leadership. I was blessed to be in a community of like-minded professionals who understood the joys and struggles of being a principal.

Angela also valued working with other school leaders when she said,

My engagement and involvement in doing tasks with other school leaders shaped me to become who I am today as a leader. I journeyed with them in the implementation of the different programs and projects at the Division, Region, and even National levels. Every time I am with other leaders, I mentally take note of the things that I find worth emulating about them. I also take note of the things I do not like about them (laughs), of course. Also, I share with my school whatever I learned from those projects and activities.

Lastly, Frank mentioned that even during the pandemic where the meeting is virtual, he was still able to learn from other school leaders as he described the meetings as “a great learning platform where everybody

contributed ideas and shared personal experiences and collaborated to create a curriculum that schools can use during the pandemic.”

Table 2. Leadership Experiences of the Cebu City North District Secondary School Principals

	Mary	Richard	Angela	Frank	Esther	Beatrice	Sheila	Nate
Experiences that had influenced or impacted their growth as leadership practitioners in their respective schools								
1.1.1. Learning from and interacting with other school leaders	x	x	x	x		x	x	x
1.1.2. Dealing with challenging and difficult teachers and staff		x			x		x	
1.1.3. Dealing with classroom shortages and shortages resources in general	x	x			x			
1.1.4. Leadership training and experiential learning		x		x		x	x	
The role of ethical and professional standards								
1.2.1. Model and guide	x	x	x	x	x	x	x	x
1.2.2. Foundation for success	x	x		x			x	
1.2.3. Developing integrity			x		x	x		x

Research indicated the importance of educational leaders engaging in professional learning communities as Theme 1.1.1 suggests. According to Huber (2013), it is becoming more and more common for educational leaders to engage in professional learning communities and networks that allows for the expansion of their understanding of leadership. Green et al. (2011) highlighted the importance of mentoring, which can happen when principals interact with each other, because mentioning “accounts for the most common learning method where a mentor models appropriate professional behaviors and actions to the student”. The crux of leadership development lies in day-to-day practice (Day et al., 2014). When leaders have the opportunity to experience these day-to-day experiences with a coach, they can utilize the coach’s feedback to help in the development of

important skills and abilities. Voluntary engagement in coaching sessions will likely impact school principal's practices (Goff, Guthrie, Goldring, & Bickman, 2014).

Theme 1.1.2. Dealing with challenging and difficult teachers and staff

Another theme that influenced principals' growth is dealing with difficult teachers and staff members. According to Esther,

I learned how to deal with critical teachers and staff and those who wanted to challenge my authority and decisions by attending seminars around that topic. I remembered that our superintendent invited us to attend a seminar, and if I remember correctly, the title was "How to Deal with Difficult People: Taking the challenge Head On".

Sheila narrated her experience in dealing with teachers who tried to challenge her leadership. She quipped, *Managing from a small integrated school with 26 teachers and hundreds of learners as a school head for a brief period of time to leading a very large school having more than a hundred teachers with thousands of learners presented me with different challenges. I have encountered teachers with different personalities in the field. Some are questioning and challenging my knowledge, abilities, and capabilities because I am younger than them and yet I was tasked to lead them.*

Sheila added,

But nothing beats the experience of leading the school in times of pandemic where COVID-19 vaccine is a must to open the school with limited face-to-face classes. Some teachers were unvaccinated, and they threatened to sue me if they were forced to get vaccinated. I also must solve conflicts among teachers due to professional jealousy.

Theme 1.1.2 highlights some of the challenges encountered by school principals. Reeves (2006) described educational institutions as those that "provide avenues for people to show bravery or weakness, industry or laziness, loyalty or treachery, and to be deacons and demons." Indeed, the leadership of school principals is a more controversial, intricate, situated and evolving subject matter than formerly thought (Dinham, 2011). Managing schools combines technical and adaptive work. Due to their complexity and dimension, adaptive challenges are often difficult to address (Fullan, 2005).

Theme 1.1.3. Dealing with classroom shortages and shortages of resources in general

The third theme that emerged under research question number 1 highlights another challenge that principals must deal with on a day-to-day basis. Richard, for example, had this to say:

When I was a teacher, I always knew that the Department of Education does not have all the resources for all the schools in the country. This is the reason why I had to buy my own classroom resources for my students. However, this problem was magnified when I became a principal. I had teachers constantly complaining about the lack of resources and asking for help and support. As a leader, experiencing this constant and seemingly

never-ending problem helped me to grow and become someone who is resourceful enough to address the current needs of every classroom, the needs of the school, and especially the students' needs in their classroom.

Mary also highlighted this problem and considered it as something that helped her become an effective principal when she expressed,

The problem that is still true to this day is lack of teachers and classrooms, and this is a challenge for school leaders like me. Since this is something bigger than me, I have to adjust and live with it. Learning must continue even with the mentioned shortages.

Esther, on the other hand, underscored the fact that the Department of Education in itself has a problem of providing schools with adequate resources. Esther said,

DepEd lacks resources and that is a fact. Operating with very limited resources while being expected to produce the best output is a challenging and demanding situation. However, it had also presented me with an opportunity for creativity, innovation, and resourcefulness.

Effective school leadership involves finding creative solutions to maximize the impact of available resources and advocating for equitable access to quality education for all students. Research indicates that in addition to effective instructional leadership, it is equally important to pay attention to the organization's management, including budgeting and maintaining facilities (Grissom & Loeb, 2011). Therefore, principals should also spend a considerable amount of energy on allocating resources to address identified needs, enlist the best personnel for the job, and maintain a smooth school operation (Grissom & Loeb, 2011).

Theme 1.1.4. Leadership training and experiential learning

A few of the participants interviewed cited leadership training and experiential learning as having an impact on their professional growth in leadership. For instance, Frank said,

My experience being with different school principals with different abilities and leadership styles has influenced me a lot. I have attended seminars and trainings in management and leadership with them and these helped me in my journey as a school principal.

Beatrice highlighted her experiences as well regarding this theme when she narrated that “here was also a workshop where situations were given, and we tried applying the skills being learned or given”. Additionally, she said,

In terms of the significant professional trainings and seminars I have attended, I consider The School Heads Academy for Performance Excellence (SHAPE) and the Enhancement Training Programs for Senior High School Principals: Deepening Instructional Leadership as two very meaningful professional seminars/training-workshops I attended. They cover the whole area of school leadership.

Mary shared that she learned “core values of discipline, humility, resourcefulness, and all other positive values through experiential learning”. She went on to say,

It was a life changing experience for me. I realized that as a leader, I have to be aware of the realities in life. I have to be proactive and not reactive.

Angela also underscored the importance of leadership and experiential trainings when she narrated, *I have had meaningful experiences with seminars, trainings, and workshops where the facilitators asked participants to work on a project or output together, share them to everybody through presentations, and most importantly, asked the participants to implement what they have learned back to their respective school communities.*

Engaging in leadership training and experiential learning is crucial for personal growth, skill development, adaptability, collaboration, and organizational impact. It equips leaders with the necessary tools, knowledge, and confidence to navigate complex challenges, inspire others, and drive positive change. By investing in their own development, leaders can make a lasting impact on their teams, organizations, and the wider community. As pointed out by Polincic (2016), leadership as a process and not as a position as quoted by Greer (2011). By taking the time to engage in leadership training, school principals examine how their experiences help influence, shape, and hone their sense of purpose and contribute to their success (Greer, 2011).

In terms of the role of ethical standards and the Philippine Professional Standards for School Heads (PPSSH), three themes emerged from the principal's responses: (a) model and guide, (b) foundation for success, and (c) developing integrity.

Theme 1.2.1. Model and guide

All the participants consider both the ethical standards and the PPSSH as their model and guide in the conduct of their duties and responsibilities as school leaders. For instance, Richard said that the ethical standards “govern the school leaders do what is right and recognize what is not right in managing a school”. He added that the Philippine Professional Standards for School Heads (PPSSH) “serves as the principals’ guide to become effective school leaders in their school community”.

Sheila revealed,

I strongly believe that the values and virtues that's within us greatly affect the leadership styles and practices of a school leader. And in order to develop good values and virtues, we, as leaders, need guidance. With the ethical standards for principals laid down for us, we can always use those as our guiding principle.

Nate mentioned that the ethical standards “provide a moral compass for principals, guiding their behavior, decision-making, and interactions within the school community. By upholding ethical standards, principals foster integrity, trust, equity, and responsible stewardship, contributing to a positive school culture and promoting the well-being and success of students and staff.”

Beatrice expressed,

Ethical standards for school principals affect me in a more positive way because I need to walk the talk. Modeling or showing a good example is very important - not only for people or subordinates to emulate me, but at the same time to gain the trust and confidence of the people around me.

Additionally, Beatrice said that the PPSSH helps her to “realize what competencies I need to improve, and it is also my blueprint as a school head that guides me to do better”.

For her part, Mary likened the PPSSH as her “bible” when she said,

The PPSSH is our bible. It serves as our guide on how we will carry out our tasks. It provides us with the key result areas in the realization of the vision-mission statements of the Department of Education.

Angela agreed with Mary because she said,

The PPSSH is basically our ‘bible’ because it delineates our duties and responsibilities and sets high standards of practice to make us the best school leaders there are.

On the other hand, Esther had this to say about the ethical standards,

It helps me to be always at my best, to be careful in my choice of words, even my manner of dressing, level of commitment and how I project myself in terms of my body language in everything that I do.

Frank underlined the importance of ethical standards as he explained that “the job of leading a school is big and the ethical standards affect my duties as a principal in the sense that I must act as a role model to everybody. I must set an example to all.”

The findings of this study as exemplified in Theme 1.2.1 are supported by Apilada (2020) when he discussed about DepEd Order No. 24, s. 2020 titled National Adoption and Implementation of the Philippine Professional Standards for School Heads (Government of the Philippines, Department of Education, 2020). Apilada (2020) emphasized DepEd’s commitment to “support school heads so they can better perform their roles in schools, including the improvement of teacher quality, and, through this, learner achievement.”

Theme 1.2.2. Foundation for success

Another theme that emerged from this study in relation to ethical and professional standards is that both can be used as a foundation for success. Sheila said,

Ethical standards are a foundation to drive positive change, support student achievement, and create a conducive learning environment for both students and staff.

Nate’s response was in consonance with that of Sheila’s because according to Nate, the “PPSSH can lead us to achieve our goals for school when we use it properly”.

The ethical and professional standards serve as the foundation for school success by creating a positive school culture, enhancing student well-being, building trust and credibility, ensuring equity and fairness, promoting

professionalism, instilling ethical behavior in students, and upholding legal and regulatory requirements. When school principals operate within these ethical boundaries, they create an environment conducive to effective teaching, learning, and overall success.

Theme 1.2.3. Developing integrity

The third theme that emerged as a significant role of ethics and professional standards is developing integrity among leaders. For example, Beatrice said,

... But at the same time to gain the trust and confidence of the people around me, that I have the integrity of being a leader.

Richard spoke about ethical standards as something that “govern the school leaders do what is right and recognize what is not right in managing a school.” This statement describes an important quality of effective leadership – to delineate between doing right and wrong.

The findings of this study show that the principals were aware of the role the ethical standards and the Philippine Professional Standards for School Heads (PPSSH) play in their growth as school leaders. They expressed that ethical standards guide their ways while the PPSSH defines their practice to become effective in their field.

Secondary School Principals' VUCA Experiences

Respondents were asked the following question regarding research question 2: "What experiences are important to secondary school principals when it comes to operating in a volatile, uncertain, complex, and ambiguous school environment? The participants discerned various aspects pertaining to their unique experiences in a VUCA (Volatility, Uncertainty, Complexity, Ambiguity) environment, and proposed corresponding solutions to address these challenges (refer to Table 3).

In the interview, respondents were asked about their experiences and challenges in relation to the VUCA world. According to their responses, three themes emerged: (a) the COVID-19 pandemic, (b) the challenges presented by the pandemic, and (c) the solutions each principal attempted to mitigate.

Theme 2.1.1. The pandemic

The respondents unanimously mentioned the COVID-19 pandemic when asked about their experiences when it comes to operating in a volatile, uncertain, complex and ambiguous environment. Richard, for instance, said, *If there is one thing that to me fits the definition of a volatile, uncertain, complex, and what's the other one? Ambiguous? Okay – that would be COVID-19. I had been a principal for a year when it happened. It was a complete shock to me personally because suddenly, DepEd ordered school lockdowns.*

Table 3. VUCA Leadership Experiences of the Cebu City North District Secondary School Principals

	Mary	Richard	Angela	Frank	Esther	Beatrice	Sheila	Nate
2.1. VUCA Experiences of Secondary School Principals								
2.1.1. The COVID-19 pandemic	x	x	x		x	x	x	x
2.2. VUCA Challenges								
2.2.1. Modules and lack of resources to produce them	x	x	x			x	x	x
2.2.2. Social distancing		x	x		x	x	x	x
2.2.3. Fear of the illness	x		x	x	x		x	
2.2.4. Uncooperative stakeholders		x		x		x	x	
2.3. VUCA Solutions								
2.3.1. Resourcefulness	x	x			x		x	x
2.3.2. Adaptability			x	x	x		x	x
2.3.3. Asking for help and guidance	x	x			x	x	x	
2.3.4. Resilience	x	x	x		x			
2.3.5. Flexibility and Agility	x	x		x	x	x	x	
2.3.6. Creativity			x	x	x			x
2.3.7. Collaboration	x		x	x	x			

Sheila had this to say,

When the news about the COVID-19 broke out, I was not so worried at all. I was thinking back then that the first cases in China would be contained easily. However, when the first case in the Philippines happened and it was mentioned that the woman was in Cebu, that's when I started to panic. Then, suddenly, after 2 months, if I am not mistaken, the lockdowns happened. And of course, schools were closed.

Nate narrated shared about what happened in Cebu City schools during COVID-19. He quipped,

As the pandemic swept across the country and around the world, schools in the Cebu City and the whole country were forced to close to ensure the safety of students and staff.

Beatrice had this to say when asked about her VUCA experience,

VUCA. *The thing that I can think of right now is the pandemic. Oh my God! It was really difficult. In my years as a teacher and principal, I never expected such a thing to happen, but it did. I was struggling and my teachers were struggling, too.*

For her part, Mary also spoke about the COVID-19 pandemic in response to the question about VUCA when she said,

First of all, I do not think anyone was prepared to handle the pandemic. It created a very volatile environment for us, definitely uncertain times as DepEd grapples with the sudden situation of school lockdowns.

Angela considered her VUCA experience as both challenging and transformative when she spoke about the COVID-19 pandemic. She quipped,

As a principal during the COVID-19 pandemic, my experience was challenging and transformative.

Esther summed up her experience when she said,

We are still in the pandemic, aren't we? When the pandemic hit us, I was sad to have witnessed such a far-reaching horror. The pandemic brought rapid and unpredictable changes to the education landscape, not only locally but globally. Schools experienced sudden closures and shifts between remote, hybrid, and in-person learning models.

Based on their responses, the respondents considered the COVID-19 pandemic as something that exemplifies VUCA (Volatility, Uncertainty, Complexity, and Ambiguity) due to its rapidly changing circumstances, unpredictable outcomes, intricate global interdependencies, and the ambiguity surrounding the virus, its transmission, and effective containment strategies. The COVID-19 pandemic resulted in organizational volatility because a disruption of operations happened due to unexpected events as posited by Horney & O'Shea (2015). It is suggested from the respondents' responses that the COVID-19 pandemic caused uncertainty so that leaders showed lack of confidence and control, which causes inaction, indecisive actions, or sluggish reactions (Horney & O'Shea, 2015). Also, the pandemic enabled simple elements to merge and intertwine in that led to information overload, convolutions, and disruptions (Bennett & Lemoine, 2014; Bartscht, 2015; Heinonen et al., 2017; Cousins, 2018) and thus presenting itself as a complex situation. Lastly, the COVID-19 pandemic presented leaders with the difficulty of knowing which information is valuable in situations they were in when confronted with a high level of information and this aptly describes the ambiguity aspect according to Bennett and Lemoine (2014).

In terms of the challenges that the principals encountered in relation to VUCA, four themes emerged as follows: (a) modules and lack of resources to produce them, (b) social distancing, (c) fear of illness, and (d) uncooperative stakeholders.

Theme 2.2.1. Modules and lack of resources to produce them

During school closures as a response to the COVID-19 pandemic, schools were required to produce modules to give out to their students. Producing these modules became a huge challenge for principals and teachers because most of the Cebu City schools did not have the needed resources. To wit, Richard said,

When schools were locked down, students were not allowed in school buildings and most of them had their books and other things in their classrooms. Principals were mandated to have all teachers create modules for students who do not have the capability to do virtual learning.

Sheila also narrated her experience during the pandemic when all schools were required to produce modules. She quipped,

DepEd wanted schools to produce modules for our learners during the pandemic. As a school, we encountered multiple problems. First, we had to ask teachers to come up with modules. This is where the issue of uncooperative teachers arose. Anyways, once the modules were finally done, we had to have them printed and sent to the students. The Division office offered to help but with so many schools and students, they could not simply print for us. We had to print them ourselves. But we did not have enough ink or bond papers. We tried appealing to our external stakeholders but as I have mentioned a while ago, they were unsupportive...

Nate also mentioned the mandate to mass produce modules when he said,

We devised a plan to shift to online learning, ensuring that every student who had access to a device and an internet connection will benefit from it. For those who lacked the necessary resources, we had to create modules for them. DepEd mandated us to mass produce modules.

Beatrice, on the other hand, highlighted the issue of lacking ink and paper to print out the modules. She had this to say,

The biggest challenge that we had, to me, is asking teachers to mass produce modules. We did not have ink and papers. We also had limited printers.

Mary also underscored her school's problem with producing modules when she narrated that,

As a school, we were already grappling with the lack of teachers and when DepEd asked schools to reach out to our learners by producing modules, which by the way means creating and printing them in huge quantities, I was already thinking that it would present a huge challenge for us.

For her part, Angela said that it was important for her to work closely with teachers to produce modules for their learners. She stated,

Added to this is the fact that most teachers had to create and produce modules for students who did not have access to gadgets. As a principal, I had to work closely with my teachers to provide them with the necessary resources and support to navigate this new virtual landscape.

The respondents' narratives surfaced a familiar problem all public schools seem to have in the Division of Cebu City – lack of resources to produce the modules. Furthermore, these narratives highlighted each school

principal's role as both an instructional leader and administrative manager to ensure that goals for quality education are met and shall be assisted by an office staff for administrative and fiscal services (De Guzman and Guillermo, 2007; Sutherland & Brooks, 2013) even in the VUCA environment.

Dealing with a lack of resources embodies the uncertainty aspect of VUCA because it involves navigating unpredictable changes, managing complexity, and making strategic decisions in an environment where information is often incomplete or unavailable. In the case of resource constraints, schools may lack clear visibility into future funding, resource allocation, or other factors that affect resource availability. Schools that can effectively address uncertainty in resource management are better positioned to thrive in VUCA conditions.

Theme 2.2.2. Social distancing

Another challenge that the principals faced is following protocols related to social distancing. For instance, teachers were required to provide modules to their students and yet, they cannot physically hand them the modules due to social-distancing requirements. Richard explained that "there was a mandate for social distancing." Nate also highlighted this challenge when he said,

Together, we brainstormed ideas on how to continue delivering quality education despite the limitations of physical distancing.

Nate further narrated other complications as a result of social distancing when he said,

The challenge that we got from the pandemic was enormous. Not only did we lack resources, but the social distancing also did not allow us to do our job any easier. There were times when we had to drop and leave modules in specific locations so that students could get them but then it would rain and naturally, our modules would get damaged. Then, we had to reprint.

Esther, on the other hand, mentioned the fact that her school had to conduct virtual and remote classes. She said, *Educating students during the pandemic involved navigating a complex set of challenges. Our school had to address various factors simultaneously, including health and safety protocols, technology infrastructure, remote learning platforms, producing learning modules, equitable access to resources and the lack of it, and support for diverse student needs, to name just a few.*

Similarly, Angela also spoke about remote instruction as a way of avoiding close contact with individuals. She said,

One of the first challenges was transitioning from in-person to remote learning. All DepEd schools had to close their doors overnight, and teachers had to embrace online platforms to deliver lessons.

These stories exemplified a particular challenge that the respondents had to navigate – adhering to social distancing guidelines and holding virtual/remote classes in an attempt to stop the spread of the COVID-19 virus. There is a high degree of uncertainty during a pandemic. Many aspects of the virus, such as its transmission

patterns, long-term effects, and the effectiveness of various interventions, may not be fully understood. That is why the government issued guidelines for social distancing. But even the timeline of the duration of the social distancing protocol was uncertain.

Social distancing, as a preventive measure, introduces ambiguity in terms of how people should adjust their behaviors, how schools should operate, and how communities should function. The ambiguity is further compounded by the need to balance public health with educational considerations and individual freedoms.

Theme 2.2.3. Fear of illness

Some principals expressed that another challenge presented itself during the pandemic – fear of illness. Mary, for example, said,

And then, there was the fear of the virus itself. How many teachers are really willing to risk their lives getting in contact with the students?

Angela also talked about this particular challenge when she said, “the pandemic brought a sense of fear, uncertainty, and isolation.”

The fear of the COVID-19 virus poses a challenge for school principals as they need to navigate concerns among students, parents, and staff, balancing the physical well-being of the school community with the educational needs and maintaining a positive learning environment. Managing anxieties, implementing safety measures, and adapting to evolving health guidelines add complexity to their leadership responsibilities.

During the early stages of an illness outbreak, information about the nature of the illness, its transmission, symptoms, and long-term effects may be limited and evolving. This lack of clear information contributes to ambiguity, as individuals and communities may not have a complete understanding of the risks and necessary precautions.

The consequences of an illness, particularly a novel or rapidly spreading one, can be unclear. People may be uncertain about the severity of the illness, its potential impact on different demographics, and the long-term effects. This uncertainty contributes to ambiguity in decision-making and response efforts.

Public health guidelines and recommendations during a pandemic may change as more information becomes available. This can lead to ambiguity in terms of what actions individuals should take to protect themselves and others. Guidelines may evolve based on emerging evidence and the dynamic nature of the situation, creating a sense of ambiguity.

Theme 2.2.4. Uncooperative stakeholders

Compounding principals’ challenges is having uncooperative stakeholders. According to Sheila,

Then, I have to deal with various external stakeholders who are being unsupportive of our school activities and operations, and I had to encourage them to work with us knowing that education is a shared responsibility.

Beatrice had a similar experience with Sheila when she narrated,

I was having a hard time convincing indifferent parents and community members to help us during the pandemic. Or maybe because everybody was struggling, too? The school reached out to our officials and parents through our PTCA but barely got any support. I mean, we have some well-to-do families in our school and I was personally expecting them to help but, wala. Those who have little to give were the once who shared.

Education stakeholders should support school principals' initiatives because principals play a crucial role in fostering a positive and effective learning environment. Supporting their initiatives enhances overall school performance, promotes a healthy school culture, and contributes to the well-being and success of students. It also reinforces a collaborative approach, aligning efforts toward common educational goals. Papaku Malasa (2007) deduced that not only should an effective school leader demonstrate, establish, and espouse a set of values and beliefs, they must also convey these to their constituents and stakeholders.

Stakeholder relationships are inherently complex. Schools often deal with a variety of stakeholders, each with different interests, perspectives, and levels of influence. Managing these relationships and navigating the complexity of competing priorities can be challenging, especially when some stakeholders are uncooperative.

The respondents also shared what they thought were needed to address the challenges brought about by the volatile, uncertain, complex and ambiguous (VUCA) environment especially during the COVID-19 pandemic. Responses to the question, "how did you overcome those challenges?" brought about seven different themes as follows: (a) resourcefulness, (b) adaptability, (c) asking for help and guidance, (d) resilience, (e) flexibility and agility, (f) creativity, and (g) collaboration. These themes will be discussed in detail.

Theme 2.3.1. Resourcefulness

In discussing about how resourcefulness helped their school, Richard had this to say,

I learned to reach out to the PTCA for help. I helped the PTCA to initiate projects to raise funds for their children's education. I learned to reach out to local politicians about projects they can fund to address the needs of the school. I also learned to be resourceful and at the same time practice generosity. I did not mind having to reach out to others for help when it comes to printing the modules. As I've said before, my teachers and I used our own money to buy resources for our students.

Richard narrated further,

Now, we have our own rain-catcher with an accompanying water storage facility, we have male and female comfort rooms in all floors of our buildings, we got our school fully fenced, our library fixed. We were able to solicit books and computers for our library. The parents also raised funds through their bake sales and they

donated the funds to help pay for the expenses of our graduating seniors.

Sheila also spoke about being resourceful in the face of the pandemic when she said,
I had to reach out to people I know from abroad to ask for donations. Luckily, some of them responded and came to the rescue.

Mary underscored the significance of being a resourceful principal when she said,
As a principal, I have to be resourceful. I had to use discretionary funds wisely – only using them for what we really need at that moment. I also had to rely on the help of the community and my staff and teachers.

Furthermore, Mary explained,
The school also had to rely on the community to help them with some of the resources through a donation drive for paper and ink. They also had to create a schedule for synchronous and asynchronous learning for those students who were able to join through Zoom or Google Meet.

Esther summed up her experience about being resourceful when she narrated that,
When resources are limited, it's crucial that as a school, we identify and prioritize the most essential aspects of our work. We allocate resources to priorities that we believe will help us achieve our goal. By concentrating on key priorities, you can allocate limited resources effectively and maximize their impact.
Theme 2.3.2. Adaptability

One of the things that the respondents highlighted is the value of adaptability in addressing VUCA challenges. For example, Nate narrated this,
As the pandemic continued, I remained vigilant and adaptable. I closely monitored the situation, staying updated on health guidelines and adjusting school policies according to what DepEd would say. I facilitated regular communication with parents and community stakeholders, keeping them informed about the school's plans and addressing their concerns.

Esther, on the other hand, had this to say,
The volatility of the situation meant that plans and policies had to be constantly adjusted and adapted to accommodate changing circumstances. The pandemic definitely brought out certain capabilities in me that I thought I never had or was not even thinking about. I had to be agile and develop adaptability to respond quickly to changing circumstances. I had to be open to new ideas, which is hard given my advanced age... I had to embrace innovation – technology and online platforms to be precise, and I had to be willing to adjust strategies and plans as needed on a day-to-day basis.

Angela also quipped,
One of the most rewarding aspects of being a principal during this challenging time was witnessing the resilience and adaptability of the school community. Students, teachers, and parents supported one another,

demonstrating remarkable determination and creativity. We celebrated virtual achievements, organized virtual graduation ceremonies, and found new ways to foster community despite physical distancing.

Frank also spoke about the importance of adaptability when he said that “school leaders must foster a culture of adaptability and encourage their school community to embrace change.”

As exemplified in our respondents’ stories, adaptability is critical in addressing challenges in a VUCA (Volatility, Uncertainty, Complexity, and Ambiguity) environment because it enables individuals and organizations to respond effectively to rapidly changing circumstances. The ability to adjust strategies, embrace innovation, and learn from experiences is vital for navigating uncertainties, complexities, and ambiguities. Being adaptable fosters resilience and enhances the capacity to thrive amid dynamic and unpredictable situations.

Theme 2.3.3. Asking for help and guidance

The third theme to surface out of the respondents’ responses is the idea of asking for help and guidance from experts and supervisors. For example, Richard expressed that,

I relied on the guidance of the supervisors and the superintendent. We do not know what is going to happen to our students’ education and our job. One day, DepEd would release guidance, the next day, it would change because the Department of Health has a different recommendation. The situation we were in was as volatile as can be.

Richard added,

I also relied heavily on my superiors for guidance. I made sure that I was aware of all pertinent guidelines and if there was something I was not clear about, I did not hesitate to ask for clarification.

Sheila also highlighted the importance of seeking guidance from supervisors. She said,

I was fortunate to have been given very useful and effective advice from my supervisors. With their help, those teachers finally budged and did their work.

Beatrice, for her part, also underscored how she had to rely on DepEd supervisors’ guidance when she said,

Then, we also have to rely so much on the guidance of the Division Office on what to do. So many memos to read and I had to attend many virtual meetings.

Relying on superiors for help and guidance during difficult times is significant because they often possess experience, perspective, and organizational knowledge that can provide valuable insights. Seeking their support fosters a sense of collaboration and ensures that decisions are well-informed. Additionally, it can contribute to a more effective problem-solving process and help build a supportive work environment.

Theme 2.3.4. Resilience

The respondents have identified resilience as one of the characteristics leaders must possess to be able to address VUCA challenges. Esther had this to say,

I also developed resilience and improved my emotional intelligence. In building resilience, I had to cultivate a positive mindset, maintain well-being, and effectively manage stress. Everybody was stressed out and I mean everybody. I felt emotionally drained but little by little, I was able to overcome it by understanding and managing my emotions and those around me – my family, and virtually – my teachers, staff, and students. I tried to promote effective communication through text, messenger, and virtual office space in Zoom so they can always talk to me. I learned to empathize with others, too.

Angela also spoke about resilience when she said,

Despite the immense challenges, I am grateful for the resilience of my school community and the valuable lessons learned during this experience.

Additionally, Angela also mentioned resilience as a quality she saw in her school. She quipped,

One of the most rewarding aspects of being a principal during this challenging time was witnessing the resilience and adaptability of the school community.

The snippets of the respondents' stories showed how resilience is critical in a VUCA (Volatility, Uncertainty, Complexity, and Ambiguity) environment as it empowers individuals and organizations to bounce back from setbacks, adapt to changing conditions, and persevere in the face of challenges. The unpredictable nature of a VUCA setting requires the ability to recover quickly, maintain focus, and continue moving forward despite uncertainties. Resilience is, therefore, a key attribute for effectively navigating and thriving in dynamic and complex situations.

Theme 2.3.5. Flexibility and Agility

One of the solutions to VUCA Success is agility as proposed by Johansen (2009) as part of his "VUCA" solution. Johansen (2009) believes that ambiguity yields to agility. For her part, Sheila expressed that,

Understanding and agility work together. Understanding provides the leaders with the knowledge and insight to navigate the VUCA situation or environment, while agility enables us, principals, to effectively respond to and take advantage of the challenges and opportunities that arise.

Esther supported this concept by saying,

The pandemic definitely brought out certain capabilities in me that I thought I never had or was not even thinking about. I had to be agile and develop adaptability to respond quickly to changing circumstances. I had to be open to new ideas, which is hard given my advanced age... I had to embrace innovation – technology and online platforms to be precise, and I had to be willing to adjust strategies and plans as needed on a day-to-day

basis.

Richard spoke about how he became a flexible leader during the pandemic. He said,

One other thing that I learned to do during the pandemic was to be a flexible leader. The pandemic brought chaos into our lives and into our work and everything was just unknown to us but as a leader, I cannot insist on doing things my way. I had to abide by what is mandated to us, what the situation called for and what made the most sense at that moment. I think it helped me a lot that I was flexible enough.

Beatrice also spoke about being flexible as a leader when she quipped,

And connected to this is flexibility. I have to be flexible enough to go with the flow. I cannot insist what I wanted to do because I am under DepEd and the pandemic brought all those things on us.

For her part, Mary said,

Most of all, I had to be flexible enough and I also told my teachers to be flexible enough. The pandemic presented us with a curve ball, and we had to deal with it one way or another.

Theme 2.3.6. Creativity

Another theme that emerged from the respondents' responses is in the area of creativity. For instance, Frank said,

School leaders must possess strong critical thinking skills and be open to innovative approaches. We can do this by fostering a culture of creativity, where experimentation and learning from failure are valued. We also need to encourage our school community to think outside the box, embrace ambiguity, and adapt to changing circumstances.

Esther also expressed the need to be creative in the face of the pandemic when she said,

As a principal, also become creative and innovative to overcome resource limitations. I encourage my head teachers and teacher-teams to think outside the box and explore alternative solutions.

Highlighted in these narratives about creativity is the fact that creative thinking enables individuals and organizations to adapt quickly to changing circumstances. It allows for the generation of innovative solutions in response to unforeseen challenges, helping to navigate and thrive in a volatile environment.

Theme 2.3.7. Collaboration

According to the respondents, being able to collaborate with other people in the VUCA world is necessary to hurdle the challenges brought about by volatile, uncertain, complex and ambiguous situation. According to Angela,

I worked closely with the local health authorities led by the City Health Office, constantly monitoring the

evolving guidelines and adjusting our protocols accordingly.

Similarly, Esther expressed that as a leader, she had to collaborate with others to strengthen their community linkages. She said,

Together, we look for ways to leverage community partnerships or collaborations to help us realize our goals or projects. As a school, we are strengthening our community linkages to build networks with other individuals, especially the businessmen, local and city government officials, and other community organizations who may have complementary resources or expertise.

Frank spoke about the importance of collaborative decision making when he explained,

I believe that collaborative decision-making and seeking input from various stakeholders can help us gain a comprehensive understanding of the complex issues at hand.

Collaboration is a powerful tool for addressing problems in a VUCA environment. It leverages the strengths of diverse individuals, fosters innovation, promotes adaptability, and enhances the overall problem-solving capacity of teams and organizations.

The Experiences of Secondary School Principals

The analysis of the data unveiled profound insights into the experiences of principals, encompassing their encounters within a volatile, uncertain, complex, and ambiguous (VUCA) environment, along with the influence of ethics, as delineated by the Philippine Professional Standards for School Heads (PPSSH), on their career trajectories. These discernments and themes are visually depicted in Figure 2. The figure encapsulates a comprehensive summary of the themes derived from the participants' reported experiences as secondary school principals in the North District of Cebu City.

Upon comparing the findings of the participants with the elusive and intricate aspects outlined in the literature review, numerous concepts from the literature were found to resonate in the participants' experiences. As previously mentioned, the intricacies of leadership, as expounded in the literature, manifested prominently in the experiences of the secondary school principals in the North District of Cebu City. Challenges such as the development of modules amid resource constraints, adherence to social distancing protocols, the fear of illness, and uncooperative stakeholders surfaced in the principals' narratives.

A compelling revelation from the research is that the complexity and elusive nature of the job significantly impacted practicing secondary school principals. In their reflections on the most impactful aspects of their experiences, participants consistently cited the challenges and setbacks inherent in the job, grappling with its complexities, and navigating major changes, especially amidst the COVID-19 pandemic. Notably, the individuals who exerted the most influence were their co-leaders, collaborators who supported them through the intricacies of their roles.

The overarching theme that emerged was the courage required to persist in the face of daily challenges, particularly within the volatile, uncertain, complex, and ambiguous environment of the COVID-19 pandemic. The principals' experiences were propelled by a continuous cycle of undertaking the job, reflecting on their solutions, and addressing the effects of the VUCA conditions.

Figure 2. Experiences of Cebu City North District Secondary School Principals

The school principals regarded the Philippine Professional Standards for School Heads (PPSSH) as a paramount model and compass in executing their duties and fulfilling their responsibilities. Acknowledged as the bedrock for the success of schools, the PPSSH holds a central role in guiding their professional conduct. In the literature review, the Department of Education (DepEd) underscores the significance of professional standards in the ongoing development and progression of supervisors, emphasizing the importance of career-long learning (Government of the Philippines, Department of Education, 2020; Llego, M. A., and Gallares, R., 2022). Moreover, the literature review elucidates that the PPSSH serves as the framework delineating the professional standards incumbent upon supervisors (Government of the Philippines, Department of Education, 2020; Apilada, 2020). These standards were meticulously crafted to serve as a foundational resource for effective practice among school leaders. The feedback obtained during this research unequivocally affirmed that the principals not only possessed a keen awareness of these professional standards but also attested to their tangible impact on their daily practice.

In summary, the experiences narrated by the secondary school principals in the Cebu City North District closely mirror the elusive characteristics and intricate nature associated with school leadership, aligning with established research on leadership dynamics. From the vantage point of the school principal, the challenges, and complexities inherent in their role significantly influence their approach to problem-solving, with their responses fundamentally shaped by the ethical dimensions embedded within their leadership responsibilities.

Effective Leadership in the VUCA World

The third research question was, “What does effective leadership in the VUCA World mean to the Cebu City North District secondary school principals?” The sub-questions asked of the participants touched on their definition of effective leadership, the characteristics of an effective school environment, and how effective leadership contributes to school effectiveness. Several themes emerged from the participants’ responses as shown in Table 4.

Six themes surfaced from the respondents’ responses in relation to the definition of effective leadership. These themes are: (a) leadership as both an art and craft, (b) visionary leadership, (c) leading by example, (d) competent, committed, and caring leaders, (e) instructional leadership, and (f) empowered leadership.

Theme 3.1.1. Leadership as both an art and craft

Several respondents consider leadership as an art. According to Richard,

For me, leadership is an art since it involves passion, commitment and dedication. A leader has to have the passion to lead teachers, students and the whole school for without passion, he or she will not have to drive to continue leading... Being dedicated to what you do is an art. That is why I consider leadership as an art.

Esther also believed that leadership is an art. She explained,

This one is tough, I mean, choosing whether leadership is an art or craft. Hmmm... Well, I consider leadership as an art because it involves the ability to inspire, motivate, and guide teachers and teams toward a shared vision. As an artist, a leader possesses a style and approach that allows them to create something meaningful and impactful. Effective leaders are creative, intuitive, and have the ability to adapt to various situations and personalities. Also, leaders use their interpersonal and communication skills to build relationships, inspire trust, and influence others.

Angela agreed with Richard and Esther in their view that leadership is an art. She expressed,

My view about leadership is that it is an art. Definitely an art. You know, in this profession, one must be an artist. I always remind my teachers that they are artists. Even more for us, school leaders. Leadership as an art requires involvement and engagement of the people under our care to achieve the desired outcome or good results. In leading this school, I have to learn so many tricks to get everybody on board in everything I want to achieve. It is not an easy feat. But that is what great leaders do.

Sheila, on the other hand, believed that leadership is a craft. Sheila explained,
I would say that leadership is a craft. It is a craft because it entails a lot of skills in planning, acting, and evaluating all programs, activities, and projects of the school.

Frank believed that leadership is also a craft when he said,
Leadership is a craft, for me, because becoming a leader has to be learned and practiced. As an example, you gain respect because you respect others. In the area of management, you must hone or practice management skills before you can effectively put it into practice.

Nate offered a leadership view that considers effective leadership as both an art and craft. Nate explained,
To me, leadership is both art and craft. While leaders are expected to be strategic and tactical in dealing with issues and concerns in their workplace, they must also be tactful and sensitive to the people they work with so that they can generate optimum cooperation from them and ensure success of any organizational endeavors.

Overall, the interviewed principals held the consensus that leadership embodies both art and craft. They shared a common belief that not everyone possesses inherent leadership capabilities, as some individuals naturally exhibit qualities that contribute to exceptional leadership. However, there was a prevailing sentiment among them that leadership is a skill set attainable by anyone through continuous improvement, learning, and deliberate refinement of one's abilities.

The responses of the principals are in line with what McCleskey (2014) posited when he stated that many believe leadership can be both innate and learned – a skill is learned while a behavior demonstrates that skill. According to Doh (2003), to cultivate the skill of strategic thinking, one must be able to think analytically and conceptually.

Theme 3.1.2. Visionary Leadership

The participants gave importance to the concept of visionary leadership. For example, Richard said,
A principal should be visionary and open-minded. It is the vision of the principal that guides his actions. When a principal communicates this vision to the school community and the school agrees, that vision creates a clear path of the direction the school is heading towards.

Mary supported the idea that a leader should be visionary when he posited that “one has to envision things in order to make everything happen and possible.”

Esther considered effective leaders as “those who are visionaries and possess people skills.” She added,
The first thing I was tasked to do by the Superintendent was to craft a vision for the school when he appointed me to this position. ... having a vision helps leaders have a clear direction and purpose for any organization they are managing. A vision is a roadmap to an organization's success.

In essence, visionary leadership provides a roadmap for the future, instills a sense of purpose and direction, and inspires individuals and organizations to achieve their full potential. It is a key factor in driving positive change, fostering innovation, and ensuring long-term success. In the literature review, we learned that visionary leaders develop their own personal vision and integrate it into a shared vision with their colleagues. The communication of this vision is what empowers people to act. According to Heath and Heath (2010), when people fail to act, it is often because the vision has not been effectively communicated, leading individuals to spend their time trying to determine the right direction, resulting in fatigue and unresponsiveness.

Theme 3.1.3. Leading by example

Leading by example is a leadership approach where a leader sets a positive and influential precedent through their own actions, behavior, and work ethic. Instead of merely instructing or directing others, a leader who leads by example actively demonstrates the values, work ethics, and standards they expect from their team or followers. According to Sheila,

Being a positive role model and demonstrating desirable behaviors and qualities to inspire and guide teachers and students and other staff member.

Nate narrated that he leads by example. According to him,

I lead by example. In other words, I walk the talk and I firmly believe that this action contributes to school effectiveness.

Frank described his experience with a former principal who led by example. Frank had this to say,

... and she leads us by example. She is always visible in schools through visits - giving technical assistance to teachers who need help in delivering instructions.

Leading by example is about embodying the principles and values one expects from others. It goes beyond words and theories, emphasizing the importance of consistent and visible actions in leadership. This approach tends to create a positive and productive work environment while fostering a strong sense of trust and mutual respect within the team or organization.

Leading by example is related to Followership Theory. As discussed in the literature review, the significance of Followership Theory within the realm of leadership cannot be emphasized enough. While the study of leadership provides valuable insights into the dynamics of guiding and influencing others, a comprehensive understanding is incomplete without a parallel exploration of followership. Uhl-Bien et al. (2014) aptly encapsulate followership theory as the examination of how followers influence and interact with leadership processes. Although a predominant portion of leadership research centers on the behaviors and attributes of leaders, it is crucial to recognize the equally pivotal role played by followers and the reciprocal impact they have on leadership dynamics.

In the pursuit of a nuanced comprehension of leadership, delving into followership theory offers a holistic perspective. Understanding followership involves unraveling the intricacies of how individuals contribute to and shape the leadership landscape. It encompasses the examination of followers' behaviors, motivations, and responses within the context of leadership influence. By scrutinizing followership dynamics, scholars and practitioners gain valuable insights into the collaborative and reciprocal nature of the leader-follower relationship.

While the spotlight has historically been on leadership, an evolving paradigm in leadership studies recognizes the symbiotic relationship between leaders and followers. Acknowledging followership as a distinct and influential aspect of organizational dynamics enriches our understanding of leadership effectiveness. Incorporating followership theory into the broader discourse on leadership fosters a more balanced and comprehensive perspective, ultimately contributing to the development of more adaptive and effective leadership practices.

Theme 3.2.1. Child-friendly and safe

The majority of the respondents considered an effective school environment as being child-friendly and safe for students. Sheila explained,

First, a school should be child-friendly and safe. That is our top priority. We want that our students are not harmed physically and mentally. We want them to love school and stay in school.

Mary also considered an effective school environment child friendly. She quipped,

I also think that it has to be a child-friendly school, where learners, parents, and external stakeholders cooperate with one another and participate meaningfully in the school programs and projects.

Esther believed in having a safe and hazard-free school environment. She said,

It would also be good to have a school that is safe and free of hazards. Afterall, we do not want anybody to get harmed... In addition, and this became very important because of COVID, ventilation. I want to have well-ventilated classrooms so that we feel safe.

Angela agreed with the other principals when she explained that,

Students need to be safe first and foremost. After we got devastated by Yolanda, I asked the volunteer workers to secure the areas we deemed unsafe. I had people stationed near the area to warn students not to get close. Second, I do not want our students to get distracted by any unnecessary activities or noise. They need to concentrate and be focused on the lesson. When the repair of our building was done, I asked the City government if possible they do it when the school is no longer in session or during the weekends. Luckily for us, only a few of our classrooms were damaged so the repairs went quickly.

For his part, Frank said,

An effective school environment is an environment where learning can happen and is child- or learner – friendly. The school should be free from hazards and danger.

A child-friendly and safe school environment is of paramount importance for several reasons, as it contributes significantly to the well-being, development, and academic success of students.

Theme 3.2.2. Conducive to learning

An effective school environment that is conducive to learning is essential for fostering academic success, cognitive development, and overall well-being of students. Richard described an effective school environment as follows.

So, an effective school environment is something that is conducive to learning, meaning, it is free from distractors and is safe for all. When classrooms are free from distractors both “external and internal” and “safe for all”.

Richard explained that,

Safety should be a priority in all schools because we cannot afford to subject students and teachers to anything that threatens their physical and mental well-being.

Nate mentioned how effective school leadership helps in creating a school environment that is conducive to learning when he said,

Definitely, effective school leadership shapes the conditions and environment that is conducive for teaching and learning process. Good leadership results in creating a conducive learning environment where teachers support students' engagement, motivation, and achievement. This environment encourages active participation, critical thinking, and a lifelong love of learning. It recognizes the diverse needs and strengths of students and provides them with the necessary support and opportunities to reach their full potential.

According to Beatrice, she was able to make a difference in her school. To wit,

I made a difference for I transformed the school's environment into a more conducive one with facilities and instructional materials being improve.

Angela defined an effective environment as conducive to learning, too. She said,

I consider an effective school environment as one where it is conducive to learning. An environment is conducive to learning if it is child-friendly, hazard-free, and secure.

A conducive learning environment is crucial for creating the conditions necessary for effective teaching and learning. It goes beyond the physical space and encompasses factors that contribute to a positive, supportive, and engaging atmosphere, ultimately enhancing the educational experience for students.

Theme 3.2.3. Adequate resources and learning spaces

Another theme that the respondents gave importance is the availability of classroom resources and learning spaces. Richard, for example, said, “Classrooms should be with equipped visual and audio facilities.” Nate narrated that,

There must be available or adequate equipment and materials for classroom teaching... if not complete, at least there should be some available.

Beatrice highlighted the importance of providing technology and other tools for student use. She said,

An effective school environment should also afford students with technology or tools to enhance and make learning an enjoyable experience. In addition, an effective school environment should also provide teachers with resources and support so that they are fully equipped with necessary skills and abilities to provide high quality instruction and experiences for our students.

Esther emphasized the importance of having adequate learning spaces or classrooms for students. She explained, *I would describe an effective school environment as having adequate classrooms for students. I do not want to see jam-packed classrooms because that is detrimental to students' learning. I also want my teachers to have faculty rooms in each department because that will allow them to have space to plan and work together. Another thing is access to internet. Only a few of our classrooms have Wi-Fi connectivity and students rely on their phone's data to access the web.*

Schools should have resources and adequate classrooms for several reasons, as these elements play a crucial role in providing a quality education and creating an environment conducive to learning.

Theme 3.2.4. Engagement of stakeholders

School leaders should engage all stakeholders because it is essential for building a collaborative and supportive educational community. Stakeholder engagement involves actively involving individuals or groups who have an interest or stake in the school's success. This includes teachers, students, parents, staff, community members, and other relevant parties. Beatrice had this to say,

Teachers' participation and cooperation in different school activities are more observable, and the parents' involvement in school activities also increase.

Mary also thought that schools should engage all stakeholders. She explained,

I also think that it has to be a child-friendly school, where learners, parents, and external stakeholders cooperate with one another and participate meaningfully in the school programs and projects.

Engaging all stakeholders is crucial for creating a collaborative and supportive school community. It leads to better decision-making, improved communication, and a positive culture that benefits everyone involved in the

educational process.

Theme 3.2.5. Responsive to students' needs

An effective school environment should be responsive to students' needs because it directly impacts their learning experiences, well-being, and overall development. For instance, Nate said,

First, an effective environment must have nurturing teachers and supportive school staff for all students' endeavors.

Beatrice stated her belief in support of the idea that an effective school environment should be responsive to students' needs when she stated,

It is my belief that an effective school environment is responsive to the students with diverse need socio-economically, and culturally. It should also be an environment where students come first, and where the emphasis is on active learning.

Responsiveness to students' needs is fundamental to creating an effective and inclusive school environment. It ensures that education is student-centered, promotes holistic development, and prepares students for success in a dynamic and diverse world.

Theme 3.2.6. Supportive stakeholders

The respondents also stated that an effective school environment should have supportive stakeholders. Nate narrated that,

There should be supportive parents, community, and other stakeholders for students' holistic education. External stakeholders bring diverse perspectives, expertise, and experiences that enrich the educational process inside a school. They can provide insights and knowledge from different fields, industries, or community contexts that may not be readily available within the school. This diversity of perspectives helps students develop a more comprehensive understanding of the world around them. Additionally, in terms of augmenting the resources of the school, external stakeholders can be a big help. The collaboration between the school and external stakeholders enhances the support system for students and creates opportunities for shared resources, mentorship, and community involvement in education.

Supportive stakeholders are essential in schools for several reasons, as they play a vital role in contributing to the overall success, well-being, and positive development of the educational community.

Theme 3.2.7. High quality instruction

A school that offers high-quality instruction creates a dynamic and supportive learning environment that prioritizes the individual needs of students, values effective teaching practices, and is committed to continuous improvement. Esther quipped,

Lastly, I would say that an effective school environment is one that fosters high quality instruction. There is high quality instruction when teachers commit to improving student learning using evidence-based effective practices. The school community should also have a deep understanding of how to engage and support all learners. That is the reason why we have schools in the first place, agree? In a school that values high quality instruction, teachers strive to create meaningful and impactful learning experiences that empower students to achieve their full potential.

High-quality instruction is fundamental to the success and well-being of students. It lays the foundation for lifelong learning, personal development, and societal contributions, ensuring that education serves as a transformative force in the lives of individuals and communities.

In response to the sub-question regarding the contribution of effective leadership to school effectiveness, the participants' answers can be categorized into three themes as follows: (a) school success, (b) quality graduates, and (c) teacher development.

Theme 3.3.1. School success

Most of the respondents identified school success as a result of effective leadership. Beatrice mentioned that effective leadership helped improve the school's performance to a little notch higher. Nate, on the other hand, narrated,

Definitely, effective school leadership shapes the conditions and environment that is conducive for teaching and learning process.

Mary said that,

In terms of effective leadership, I believe that it contributes greatly to the success of school operations... The school has become more active and participative, not only in our own school programs and activities, but in all DepEd's programs.

Angela also explained that,

Effective leadership directly impacts school success. It helps shape the right conditions and environment of the teaching and learning process. Effective leaders in fact put everyone under their care on the right path towards success. Therefore, if at the end of a school year the school is underachieving, you can blame it on leadership. That is why I have to give my all to this job.

Additionally, Frank stated that,

An effective school environment can lead to the success of the school. He said that students being safe helps in their learning and "contributes to improving their performance in the National Achievement Test."

Effective leadership directly impacts school success because school leaders play a crucial role in shaping the vision, culture, and overall functioning of the educational institution. Leadership influences every aspect of a

school community, from teaching and learning to organizational effectiveness.

Theme 3.3.2. Quality graduates

Schools should aim to produce quality graduates for various reasons, as the quality of education directly impacts the personal, academic, and professional development of students, as well as broader societal and economic outcomes. Richard stated that,

If the school leader is effective in managing the school, then he or she will be able to transform the school and produce quality graduates. Quality graduates means that they can attain the standards set by the Department of Education. They should be able to compete globally in terms of their academic skills and abilities, including technical skills.

Producing quality graduates is not only essential for the individuals themselves but also for the prosperity and well-being of communities, nations, and the world. Quality education is an investment in the future, shaping individuals who can contribute meaningfully to society and address the complex challenges of the 21st century.

Theme 3.3.3. Teacher development

School leaders should actively promote teacher development for several compelling reasons, as investing in the professional growth of educators has a direct and positive impact on both the individual teachers and the overall success of the school. It is Esther's belief that teacher development primarily impacts their effectiveness. She stated,

By creating a supportive and nurturing environment, providing guidance and resources, and fostering a culture of continuous learning, school leaders can significantly impact the development and effectiveness of their teachers.

Esther further explained,

Well, an effective teacher goes beyond the transmission of knowledge. They inspire, motivate, and empower their students to become lifelong learners, critical thinkers, and responsible citizens. They make a lasting impact on their students' lives, shaping their future and igniting a love for learning that extends far beyond the classroom.

Promoting teacher development is a strategic investment that benefits not only individual educators but also contributes to the overall success and effectiveness of the school. It aligns with the evolving needs of the educational landscape and fosters a culture of continuous improvement and excellence.

Effective Leadership defined by Secondary School Principals

The themes discerned in the analysis of effective leadership, as perceived by school principals, originated from (a) the criteria defining an effective school environment, (b) the articulation of effective leadership

characteristics, and (c) the impact of an effective leader on cultivating a conducive school environment. Figure 3 illustrates the interconnected themes encapsulating the perspectives of principals in each of these thematic categories.

As per the insights garnered from the literature review, the emerging cadre of school principals embodies the intricate interplay of leadership theories, a perspective corroborated by the findings of this research. The exploration of leader influence and the definition of effective leaders draws from diverse leadership theories, with the literature review succinctly acknowledging that there is currently "no unified theory of leadership" (Dinh et al., 2019). Conversations with secondary school principals brought forth elements from various leadership theories, including components of transformational leadership emphasizing the development of leadership capacity, servant leadership grounded in ethical and caring behavior, invitational leadership founded on respect and trust, and followership theory accentuating the significance of the teacher-principal relationship. Importantly, no single theory emerged with more prominence in delineating the characteristics of an effective leader than another.

In the study, as principals articulated their definition of effective leadership, the predominant themes that surfaced are visually encapsulated in Figure 2 under the banner of effective leadership. Notably, many of these themes closely align with what was delineated in the literature review. Empowered leadership and instructional leadership emerged as the most recurrent themes, resonating both among the perspectives of the principals and the insights gleaned from the literature. Principals emphasized the crucial aspect of effective leadership, akin to the literature review, which expressed this as the comprehension and development of individuals, motivation, and adept people management.

Fostering a collaborative vision-building process and implementing systems to align actions with that vision facilitates the establishment of transparent expectations for everyone involved. This shared approach was identified as a common thread between the literature review and the insights from school principals. Principals underscored the personal attributes they deemed crucial for effective leadership, including competence, commitment, care, and visionary qualities. Correspondingly, the literature introduced descriptors like flexibility, resilience, and optimism (Leithwood et al., 2006).

A noteworthy revelation from the principals' viewpoint, underscored in the literature review, revolves around the concept of followership, epitomized by what the principals termed as "leading by example." The principals frequently emphasized the significance of not just articulating principles but embodying them through action, portraying a compelling model for others. The notion of "walking the talk" emerged prominently, reflecting the conviction that being a positive exemplar is integral to the definition of an effective leader.

Upon conducting a comprehensive literature review, the study delved into the pivotal role of school leadership. Notably, various studies by Seashore Louis et al. (2004), Suber (2011), and Grissom and Loeb (2011) underscore the direct impact of the principal on the overall effectiveness of the school. This impact is

particularly palpable in the direct influence principals exert on teachers within the school (Gordon, 2006). Principal perspectives on the influence of effective leaders reiterated the critical nature of this impact. What stands out as a significant contribution from the principal perspective, augmenting the insights from the literature, is the identification of specific behaviors deemed essential for contributing to the effectiveness of schools. These behaviors are elucidated in Figure 2 under the heading of "effective leader influence." Noteworthy among these common behaviors, as perceived by the principals, are engaging in activities focused on teacher development, fostering the production of quality graduates, and ensuring overall school success.

The exploration of whether leadership is an innate trait, or a learned skill was a central focus in the interviews with school principals. Consistent with the findings in the literature review, the prevailing belief among most principals is that leadership encompasses both inherent dispositions and acquirable skills that can be cultivated or enhanced over time. Additionally, there was alignment with the literature's assertion that specific tactics or processes related to leadership could be taught (Greer, 2011). However, principals emphasized that intentional effort is necessary for leaders to actively learn and refine their natural skills, highlighting the importance of proactive engagement in the learning process.

Figure 3. Effective leadership as defined by the Cebu City North District secondary school principals.

The viewpoint of the principals in this study aligns with several concepts from the existing leadership literature, yet their insights contribute authentic additions to the discourse. According to the perspective of the secondary school principals in the Cebu City North District, both knowledge and experience are deemed crucial attributes for an effective leader, and they identify specific behaviors associated with the influential impact of effective leaders on a school's overall effectiveness.

The Perceived Needs of Secondary School Principals

A fourth research question was posed to the study, which explored the perspectives of Cebu City North District secondary school principals regarding effective leadership. What do secondary school principals need to develop to become effective leaders in a VUCA environment? It was specifically asked of the principals what information they contained in their own personal development plans. It was noted that each principal had a variety of personal goals, whether these were connected with their professional evaluation as a principal or separate. The three themes that emerged from their goals are (a) conducting action research and data-driven leadership training, (b) developing effective leadership skills in the context of the VUCA world, and (c) providing mentoring and coaching support to leaders (See Table 5).

Theme 4.1.1. Conducting Action Research and data-driven leadership training

Conducting action research and engaging in data-driven leadership training are important for teachers for several reasons. These practices contribute to ongoing professional development, enhance instructional effectiveness, and promote a culture of continuous improvement within the educational environment. Sheila explicitly wanted to conduct action research in the future. She said,

I would like to conduct action research. It is the “in thing” now, right? My plan is to publish the result of our research internationally.

Table 5. Perceived Needs of Cebu City North District Secondary School Principals

	Mary	Richard	Angela	Frank	Esther	Beatrice	Sheila	Nate
Research Question 4: On the Perceived Needs of School Principals								
4.1.1. Conducting Action Research and data-driven leadership training	x					x	x	x
4.1.2. Developing effective leadership skills in the VUCA world		x	x	x	x		x	x
4.1.3. Mentoring and coaching support for leaders	x	x	x	x		x		

Mary also expressed a desire to engage in a training seminar about action research. She stated,

I would like to attend leadership seminars and training about developing action research. Being emerged in the various duties and responsibilities as a school leader, it is so easy to forget about the other components of my

personal professional growth plan as a school principal which is to conduct action research. I have to engage in this practice and so should my teachers. But I cannot give them what I do not have that is why I believe I need to be trained or exposed to action research first.

Nate, on the other hand, underscored. The importance of using assessment and data to solve problems. He quipped,

... and find better assessment tools that I can use to learn more about problems encountered and how to resolve them.

Although Beatrice identified several things that she wanted to learn, she mentioned data-driven leadership in her statement. To wit, she said,

I would like to learn more about the other components of my professional growth as a secondary school principal which are adaptability – how to adapt to situations, productivity – producing quality results, data-driven leadership, being accurate in making decisions and speech improvement or communication skills enhancement.

Conducting action research and engaging in data-driven leadership training are critical components of effective professional development for teachers. These practices empower educators to continuously improve their teaching practices, make informed decisions, and contribute to the overall success of their students and schools.

Theme 4.1.2. Developing effective leadership skills in the VUCA world

Due to the challenges that the VUCA world presented our principals, they expressed that they wanted to attend training-seminars on developing leadership skills in the VUCA World. One of them is Sheila when she said,

I also would like to attend various trainings and seminars around effective leadership, especially in around VUCA, and how to handle difficult people.

Nate stated that he wants to develop several skills including developing his leadership strengths. He stated, *My personal growth plan involves developing my strengths in leadership, improving potential, learning new skills, improving self-awareness and self-knowledge, renewing identity, and improving my career.*

Developing leadership skills in a VUCA world is essential for leaders to navigate complexity, drive innovation, and lead organizations toward sustained success in the face of constant change and uncertainty. Leadership development equips individuals with the capabilities needed to thrive and excel in dynamic and challenging environments.

Theme 4.1.3. Mentoring and coaching support for leaders

School leaders benefit significantly from coaching and mentoring for several reasons, as these support structures contribute to their professional growth, leadership effectiveness, and overall success in leading educational

institutions. Richard, for instance, stated,

I also would like to learn more about how to effectively mentor teachers or provide them with mentors that can help them grow as professionals through proper coaching so that teachers can overcome some difficulties in the teaching and learning process.

Frank said that he needs mentoring and coaching. Frank stated,

The biggest need I have right now is for me to be able to get mentored and coached because I am still learning. Umm... I think that with a coach and mentor, I would be guided, supported, and offered needed insights about the different tasks of a school principal. I also need someone to remind me to reflect on my practices because I seldom do that due to my busy schedule. You know, I can easily get overwhelmed with so many things I do every day.

Coaching and mentoring play a vital role in supporting school leaders throughout their careers. These structures offer personalized guidance, foster continuous learning, and contribute to the overall effectiveness, well-being, and success of educational leaders in their pivotal roles.

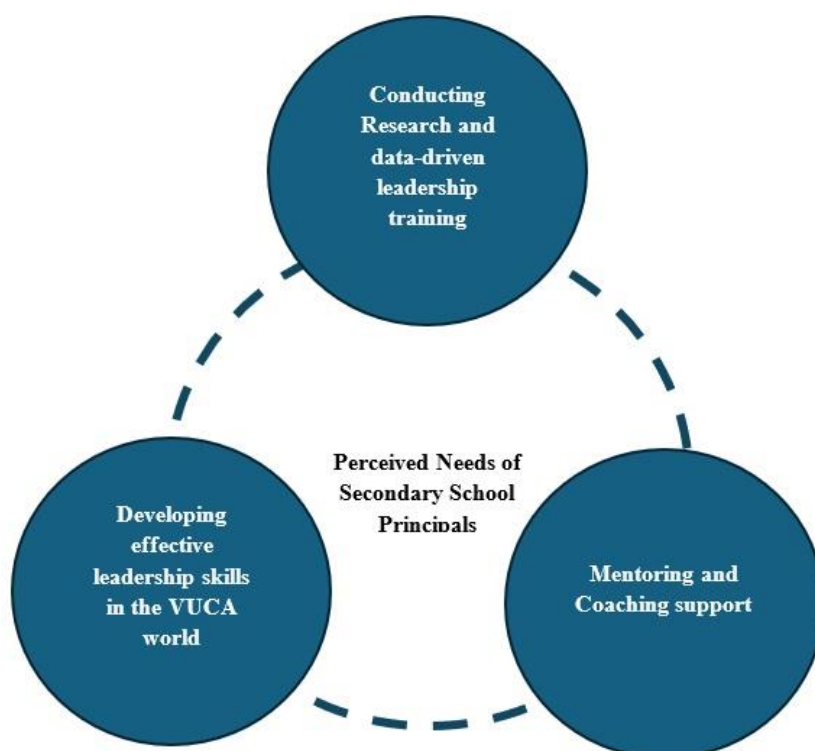

Figure 4. Perceived Needs of the Cebu City North District Secondary School Principals

The literature review highlighted continuous learning as a personal pursuit for a leader, and the insights from the school principals substantiated this concept. Each principal articulated personal pursuits they had identified for their own development. These pursuits were centered around three primary themes: engaging in action research and data-driven leadership training, cultivating effective leadership skills within the context of VUCA, and

seeking mentoring and coaching support.

The literature review emphasized that purposeful learning for leaders involves self-knowledge and the integration of new information gained from experiences into addressing new challenges (Day et al., 2014). The perspectives from school principals in this research study provided concrete examples pertinent to professional development and learning. Every interviewed principal expressed a preference for learning from others. In line with the literature review, the popularity of professional learning communities or networks and on-the-job training was underscored (Huber, 2013). The principal viewpoint on meaningful learning experiences revolved around learning from others and applying acquired knowledge through coaching and mentoring. Additionally, principals expressed a desire for training in areas such as conducting action research and refining data-driven leadership skills. Figure 4 encapsulates the secondary school principals' perspectives on their perceived needs within the continuous cycle of learning.

The Integral VUCA Leadership Framework for Secondary School Principals

This Integral VUCA Leadership Framework (see Figure 5) emerged from the responses of the Cebu City North District Secondary School Principals aimed at unraveling the intricate tapestry of their experiences, particularly focusing on their general impactful encounters, volatile, uncertain, complex, and ambiguous (VUCA) experiences, leadership perceptions, and perceived needs. This research delved into the multifaceted realm of educational leadership, recognizing that secondary school principals play a pivotal role in shaping the learning environment, fostering academic excellence, and navigating the challenges inherent in the modern educational landscape.

As stewards of educational institutions, secondary school principals face a dynamic and ever-evolving set of circumstances that demand astute leadership. The study at hand seeks to illuminate the nuanced interplay between the general impactful experiences encountered by these leaders and the specific challenges posed by the VUCA nature of the educational ecosystem. By exploring the landscape of leadership perceptions, the research aimed at unveiling the lenses through which principals interpret their roles, responsibilities, and the overarching educational mission.

Furthermore, the investigation extended its purview to the perceived needs of secondary school principals. Understanding the gaps and requisites in their professional toolkit is fundamental for enhancing leadership effectiveness and ensuring the cultivation of a thriving educational community. The Integral VUCA Leadership Framework thus endeavors to provide a structured and insightful approach to leadership in secondary education, grounded in the empirical findings of this research.

Through an in-depth exploration of these key dimensions, the Integral VUCA Leadership Framework not only seeks to shed light on the challenges faced by secondary school principals but also endeavors to offer practical insights and strategic guidance for educational leaders. In doing so, this framework aims to contribute to the ongoing discourse on effective educational leadership, offering a roadmap for principals to navigate the

complexities of their roles and foster environments conducive to the holistic development of students.

In the contemporary educational landscape, secondary school principals face the formidable task of leading in a VUCA environment. These challenges are not merely external forces but shape the very fabric of their leadership experiences. Navigating through the intricacies of a VUCA context requires a keen awareness of the dynamic forces at play, compelling principals to evolve their leadership styles to remain effective.

A crucial aspect of this evolution is the integration of ethical and professional standards into the decision-making processes of secondary school principals. These standards serve as a moral compass, guiding leaders to make principled choices even in the face of ambiguity. Ethical considerations become paramount in fostering trust within the school community and ensuring that decision-making aligns with a broader commitment to integrity and social responsibility. Professional standards complement ethical principles by setting benchmarks for competence, creating a framework that underscores the importance of continuous improvement and adherence to best practices. Ethical and professional standards act as guiding beacons amid the turbulence of the VUCA environment. They provide a structured approach to decision-making, ensuring that leaders adhere to established norms and values. Principals guided by these standards are better equipped to balance competing priorities, maintain transparency, and foster a culture of accountability within their schools. The integration of these standards into leadership practices contributes to the formation of a resilient and ethically grounded leadership approach.

The experiences within a VUCA environment contribute significantly to shaping principals' perceptions of effective leadership and an effective school environment. Volatility necessitates a leadership style that is agile and responsive. Uncertainty requires leaders to exhibit foresight, preparing for a range of potential scenarios. Complexity demands a nuanced understanding of the multifaceted challenges facing schools, and ambiguity calls for a level of comfort with making decisions without complete information. Through the crucible of these experiences, principals develop a multifaceted understanding of what it means to be an effective leader in a VUCA environment.

As secondary school principals grapple with the challenges presented by a VUCA environment, they inevitably find themselves identifying the unique needs of their schools. These needs may range from academic support for students to professional development opportunities for teachers or enhancements to the overall school infrastructure. The experiences within the VUCA paradigm sharpen principals' ability to discern between urgent and important needs, allowing them to prioritize interventions that will have a lasting impact on the school community.

Simultaneously, the process of identifying needs within a VUCA environment prompts secondary school principals to seek out and implement appropriate supports. Whether through collaboration with educational stakeholders, leveraging community resources, or fostering partnerships with external organizations, effective leaders understand the value of a network of support. Ethical considerations continue to play a role in these

endeavors, ensuring that support mechanisms align with the overarching values of the school community.

The cyclical nature of the relationship between experiences, ethical and professional standards, effective leadership perception, and the identification of needs and supports creates a dynamic framework for continuous improvement. Principals, informed by their experiences and guided by ethical principles, refine their understanding of effective leadership over time. This evolving understanding, in turn, informs their ability to identify and address the evolving needs of their schools, fostering a responsive and adaptive educational leadership model within the VUCA paradigm.

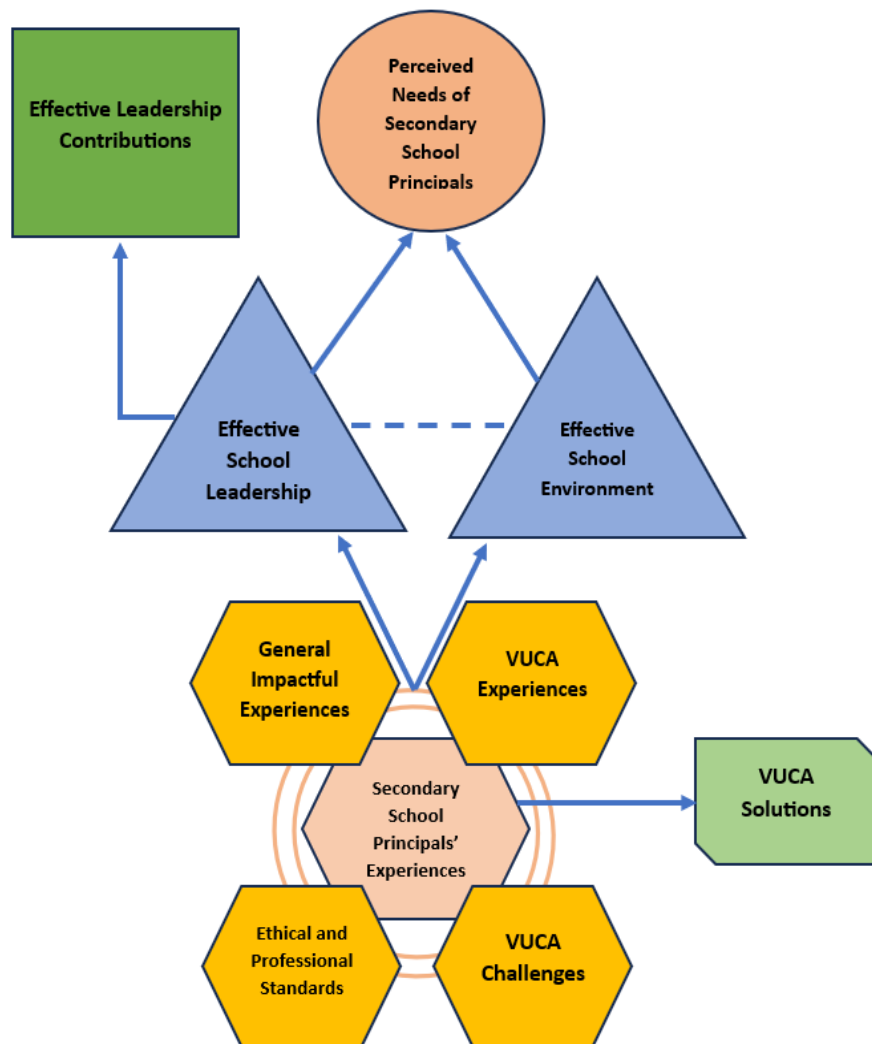

Figure 5. The Integral VUCA Leadership Framework

The Nationalian Theory on Secondary School VUCA Leadership

In conjunction with the Integral VUCA Leadership Framework for Secondary Principals, a groundbreaking theory known as the *Nationalian Theory on Secondary School VUCA Leadership* emerges, providing a comprehensive perspective on the pivotal role of secondary school principals in navigating the volatile,

uncertain, complex, and ambiguous (VUCA) educational landscape. This innovative theory posits that “the effectiveness of secondary school principals within a VUCA environment is intricately linked to their ability to leverage personal strengths and abilities while actively pursuing continuous learning and development of leadership skills”. By placing a deliberate emphasis on their inherent strengths and abilities, secondary school principals can significantly enhance their leadership impact, effectively addressing challenges and fulfilling the evolving needs within their educational institutions.

A tenet of the *Nationalian Theory on Secondary School VUCA Leadership* is centered around the idea that cultivating a culture of continuous learning and development tailored to individual needs is essential for empowering secondary school principals. This tailored approach not only equips them with the necessary tools to navigate the complexities of the VUCA world but also facilitates the transformation of poor decision-making habits and undesirable leadership styles. The theory recognizes the dynamic nature of educational leadership, acknowledging that principals must adapt and evolve to meet the ever-changing demands of the educational landscape.

In practical terms, the *Nationalian Theory on Secondary School VUCA Leadership* advocates for the implementation of targeted professional development programs that align with the unique strengths and growth areas of each secondary school principal. These programs should not only address immediate challenges but also foster a mindset of lifelong learning, encouraging principals to proactively seek opportunities for self-improvement and skill enhancement.

Furthermore, the theory underscores the importance of fostering a collaborative and supportive environment within secondary schools. Principals are encouraged to engage in knowledge-sharing initiatives, creating a community of practice where experiences, insights, and successful strategies can be exchanged. This collaborative approach not only enriches individual leadership journeys but also contributes to the overall resilience and adaptability of the entire educational ecosystem. *The Nationalian Theoretical Framework on Secondary School VUCA Leadership* is developed to capture the essence of the *Nationalian Theory on Secondary School VUCA Leadership* (see Figure 6).

The theoretical framework encompasses several dynamic components, each playing a crucial role in guiding secondary school principals through the intricate landscape of VUCA challenges they encounter daily. Illustrated as an intricate structure, the outermost circle delineates the pervasive realm of VUCA, representing the multifaceted environment that demands the attention and adeptness of school leaders.

Moving inward, the framework unfolds into a rectangular configuration divided into four distinct quadrants. While analyzing the emerging themes from the responses, the researcher drew parallels with the Johari Window Model—a four-pane model designed to enhance self and interpersonal understanding. Leveraging their background in mathematics, the researcher deliberately integrated quadrants into the framework. Drawing inspiration from the Cartesian coordinate system in mathematics, the four quadrants typically represent different

combinations of positive and negative values for both the x and y coordinates. These quadrants include the first quadrant, where both x and y values are positive; the second quadrant, where x values are negative and y values are positive; the third quadrant, where both x and y values are negative; and the fourth quadrant, where x values are positive and y values are negative. By incorporating this mathematical analogy, the researcher aimed to provide a structured framework in creating a theoretical framework about leadership in the VUCA world. The upper two quadrants form the Area of Positivity, while the lower two compose the Area of Focus. Within the Area of Positivity, Quadrant 1 (Q1) is dedicated to Learning and Development, while Quadrant 2 (Q2) centers around Strengths and Abilities. In Quadrant 1, the comprehensive study illuminated a compelling revelation. Participants articulated a shared aspiration to refine their VUCA leadership skills. They expressed a strong desire to engage in action research, facilitated through effective coaching and mentoring methodologies. This explicit desire stands as a testament to their unwavering commitment to continuous learning and development as leaders. By actively seeking opportunities to enhance their skills and knowledge, they position themselves strategically to navigate the dynamic challenges inherent in the VUCA landscape with greater agility and confidence. This proactive stance reflects their recognition of the imperative to evolve as leaders in an ever-changing and unpredictable environment, demonstrating their readiness to embrace complexity and drive positive change within their organizations.

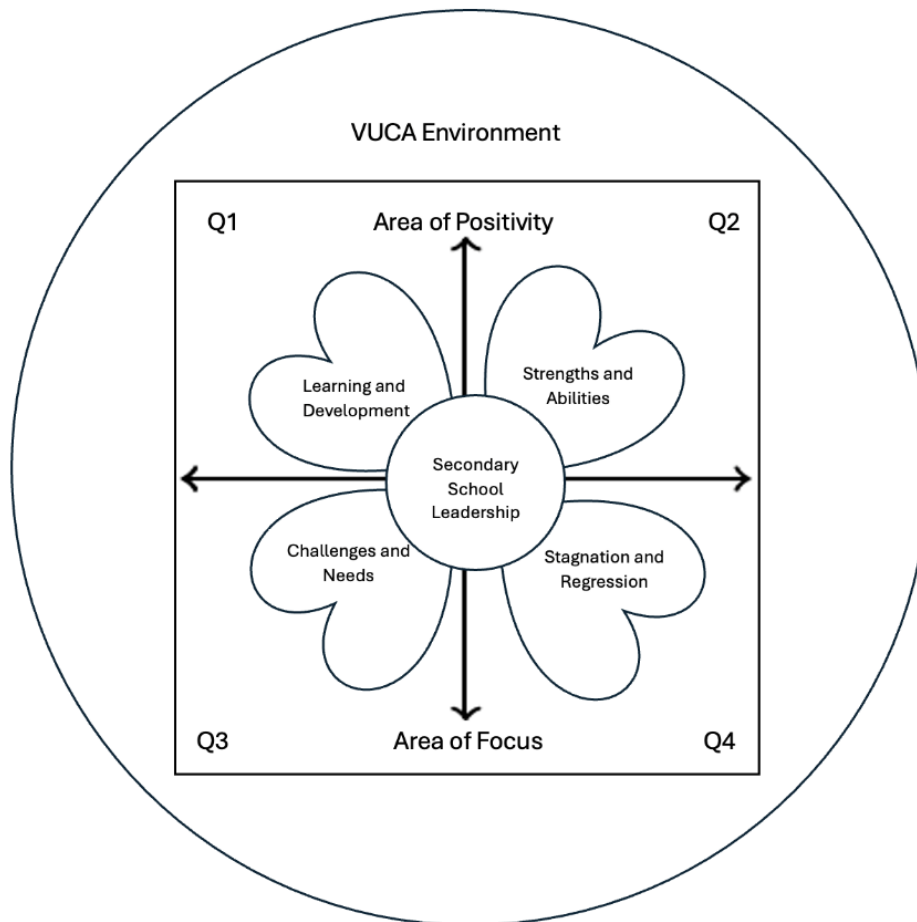

Figure 6. The Nationalian Theoretical Framework on Secondary School VUCA Leadership

In delving into the Strengths and Abilities quadrant (Q2), participants in the study undertook a thorough exploration of the fundamental attributes deemed indispensable for effectively addressing the multifaceted challenges inherent in a VUCA environment. Through introspective reflection and collaborative dialogue, they identified a spectrum of key characteristics that are not only desirable but crucial for navigating the complexities of such a dynamic landscape.

At the forefront of these attributes lies adaptability—the ability to swiftly adjust one's approach and mindset in response to evolving circumstances. Participants emphasized the importance of being resilient in the face of adversity, possessing the mental fortitude to withstand setbacks and emerge stronger from challenges encountered along the way. Flexibility emerged as another vital trait, enabling individuals to embrace change with an open mind and a willingness to explore alternative pathways to success.

Moreover, the participants underscored the significance of agility—the capacity to move with speed and precision in a rapidly changing environment. They recognized creativity as a powerful force for innovation and problem-solving, emphasizing the need to foster a culture that encourages out-of-the-box thinking and novel approaches to addressing complex issues.

Resourcefulness emerged as a cornerstone attribute, equipping individuals with the ingenuity and resourcefulness to effectively utilize available resources and overcome constraints. Collaboration was highlighted as essential for leveraging collective intelligence and diverse perspectives to tackle challenges collaboratively, emphasizing the value of teamwork and shared goals.

Furthermore, participants acknowledged the importance of seeking guidance from authorities and subject matter experts when confronted with unfamiliar or complex situations, recognizing the wisdom in drawing upon external expertise to inform decision-making and problem-solving efforts.

By recognizing these strengths and abilities as critical tools in their arsenal, participants demonstrated a heightened awareness of their capacity to navigate the intricacies of the VUCA landscape with confidence and resilience. Through intentional cultivation and continuous refinement of these attributes, they position themselves not merely as passive observers but as proactive agents of change, poised to thrive amidst uncertainty and volatility.

Transitioning to the Area of Focus, Quadrant 3 (Q3) encapsulates Challenges and Needs while Quadrant 4 (Q4) delves into Stagnation and Regression. Within Quadrant 3, aptly labeled as "Challenges and Needs," participants articulated a rich tapestry of experiences and insights, shedding light on the myriad obstacles and constraints encountered within the ever-evolving landscape of VUCA (Volatility, Uncertainty, Complexity, and Ambiguity). Through candid discourse and reflective dialogue, participants underscored the profound impact of disruptive forces such as the global pandemic, resource scarcity, and uncooperative stakeholders, among other formidable challenges that loomed large on the horizon.

The seismic shockwaves unleashed by the pandemic reverberated across all facets of organizational life, thrusting school leaders into uncharted territories fraught with unprecedented levels of uncertainty and ambiguity. Participants recounted the Herculean task of navigating the rapidly shifting terrain of remote work, virtual collaboration, and digital transformation, grappling with the dual imperatives of ensuring business continuity while safeguarding the health and well-being of their teams.

Resource scarcity emerged as another formidable adversary, compelling leaders to reconcile competing priorities amidst finite resources and escalating demands. From budgetary constraints to talent shortages, participants confronted the sobering reality of doing more with less, wrestling with the intricate calculus of resource allocation and optimization in the face of mounting pressures.

Moreover, the specter of uncooperative stakeholders cast a shadow of uncertainty, presenting leaders with the formidable challenge of managing divergent interests, conflicting agendas, and competing demands. Participants lamented the fractious nature of stakeholder relations, navigating treacherous waters fraught with political intrigue, power struggles, and interpersonal dynamics.

In response to these formidable challenges, participants articulated a resolute commitment to harnessing their identified strengths and abilities as a bulwark against the tempestuous winds of VUCA. They embraced a proactive stance, leveraging their collective ingenuity, resilience, and adaptability to address and mitigate the impact of VUCA-related difficulties head-on.

Drawing upon their reservoir of strengths—including adaptability, resilience, creativity, and collaboration—participants charted a course of action characterized by strategic agility, innovative problem-solving, and collaborative leadership. They recognized the imperative of fostering a culture of continuous learning and experimentation, embracing failure as a steppingstone to growth and innovation.

Quadrant 4, encapsulating the realm of Stagnation and Regression, unfolded as a pivotal area of exploration within the study, shedding light on participants' nuanced perspectives and aspirations regarding leadership dynamics in the face of VUCA challenges. Participants articulated a multifaceted understanding of leadership paradigms, emphasizing the critical importance of visionary, instructional, empowered, and transformational leadership approaches in fostering organizational resilience and growth.

Central to their discourse was a profound appreciation for Visionary Leadership—a forward-thinking, aspirational approach that inspires individuals to rally behind a compelling future vision. Participants recognized the transformative potential of leaders with the vision to anticipate and navigate the complexities of the VUCA landscape, steering their organizations toward sustainable success amidst uncertainty.

Instructional Leadership emerged as another cornerstone concept, characterized by leaders' commitment to fostering a culture of continuous learning and professional development. Participants underscored the pivotal

role of instructional leaders in equipping their teams with the knowledge, skills, and resources necessary to thrive in a rapidly evolving educational landscape.

Empowered Leadership resonated deeply with participants, reflecting a paradigm shift towards decentralization and empowerment within organizational structures. Participants expressed a keen desire for leaders who empower their teams to take ownership of their roles and responsibilities, fostering a sense of autonomy, creativity, and accountability in pursuit of shared goals.

Transformational Leadership, renowned for its ability to inspire and motivate individuals toward collective action and meaningful change, was also a focal point of discussion. Participants recognized the transformative impact of leaders who lead by example, embodying authenticity, empathy, and a commitment to organizational values.

Notably, participants expressed a conscientious avoidance of emulating any undesirable leadership traits or styles observed in their former school leaders. Drawing upon past experiences and insights from successes and failures, they articulated a collective commitment to cultivating leadership practices prioritizing ethical conduct, inclusivity, and integrity.

Furthermore, participants articulated a pressing need to learn and adopt effective strategies to confront the challenges brought about by VUCA. They emphasized the importance of resilience, adaptability, and strategic foresight in navigating turbulent times, highlighting the value of collaborative problem-solving and a willingness to embrace change as catalysts for organizational renewal and growth.

It is crucial to underscore the dynamic nature inherent in the *Nationalian Theoretical Framework on Secondary School VUCA Leadership*. Within this framework, a compelling interplay of opposing elements, which concurrently complement and compensate, is evident in both the Area of Positivity and Area of Focus. Specifically, Quadrant 1 (Learning and Development) and Quadrant 3 (Stagnation and Regression) exemplify this synergistic relationship, as do Quadrant 2 (Strengths and Abilities) and Quadrant 4 (Challenges and Needs).

The essence of this framework lies in the reciprocal influence between these paired quadrants, where enlarging one results in a proportional reduction in its opposing counterpart, and vice versa. For instance, the act of cultivating and expanding strengths and abilities in Quadrant 2 (Q2) possesses the transformative power to mitigate the challenges and needs articulated in Quadrant 4 (Q4), thereby substantially diminishing the magnitude of these inherent difficulties for school principals. However, it is imperative to recognize the converse scenario – neglecting the cultivation and development of strengths and abilities may lead to a proliferation of overwhelming challenges and needs. The study uncovers a compelling nexus between effective leadership practices and the fulfillment of participants' expressed needs. For instance, leaders who adeptly lead by example, demonstrating both competence and unwavering commitment, not only inspire trust and confidence but also set a precedent for excellence within their organizations. By embodying the principles they espouse,

these leaders cultivate a culture of accountability and integrity, laying the groundwork for sustained organizational success.

Furthermore, the participants' profound desire for strong instructional leadership aligns seamlessly with their aspirations for continuous professional development and growth. Leaders who prioritize the enhancement of teacher skills and competencies through targeted research and leadership training, mentoring, and coaching initiatives not only foster a supportive and nurturing environment but also empower their teams to thrive amidst the complexities of the educational landscape. Through these transformative interventions, leaders can equip educators with the tools and resources necessary to excel in their roles, ultimately enhancing student learning outcomes and fostering a culture of excellence.

Moreover, the study underscores the paramount importance of developing effective leadership skills as a cornerstone for addressing the multifaceted challenges inherent in the educational ecosystem. Leaders who invest in their own professional development, honing their strategic acumen, communication prowess, and interpersonal skills, are better equipped to navigate the turbulent waters of change and uncertainty. By cultivating a cadre of visionary and adaptive leaders, organizations can fortify their resilience and agility, positioning themselves for sustained growth and impact in an ever-evolving landscape.

In essence, framework illuminates a symbiotic relationship between effective leadership practices and the fulfillment of participants' expressed needs. By harnessing the power of exemplary leadership, fostering a culture of continuous learning and development, and prioritizing the enhancement of leadership competencies at all levels, organizations can chart a course toward sustainable success and enduring impact in the dynamic and challenging realm of education.

A nuanced interplay emerges between Quadrant 1 (Learning and Development) and Quadrant 3 (Stagnation and Regression), illustrating a dichotomy that underpins the fabric of organizational growth and resilience within the volatile landscape of VUCA (Volatility, Uncertainty, Complexity, and Ambiguity). Quadrant 1 embodies the ethos of perpetual growth and evolution, where the relentless pursuit of continuous learning and development serves as a potent antidote to the insidious specter of stagnation and regression lurking within Quadrant 3.

In Quadrant 1, leaders and organizations embark on a journey of self-discovery and professional enhancement, leveraging learning opportunities to expand their horizons, refine their skills, and stay abreast of emerging trends and best practices. This relentless quest for improvement not only fosters a culture of innovation and adaptability but also imbues individuals with the resilience and agility needed to navigate the turbulent waters of VUCA with confidence and poise.

Conversely, Quadrant 3 embodies the antithesis of growth—a realm characterized by complacency, inertia, and resistance to change. Here, the reluctance to embrace new ideas or challenge the status quo engenders a sense of stagnation, impeding progress and eroding organizational vitality. Leaders who succumb to the allure of inertia

risk being blindsided by the rapid pace of change inherent in the VUCA landscape, leaving their organizations ill-equipped to confront the myriad challenges that lie ahead.

The symbiotic relationship between Quadrant 1 and Quadrant 3 underscores the delicate balance required for effective VUCA leadership. While Quadrant 1 propels individuals and organizations towards a future defined by innovation and resilience, Quadrant 3 serves as a cautionary tale—a stark reminder of the perils of complacency and stagnation. By navigating the tension between these opposing forces, leaders can cultivate a dynamic equilibrium that fosters sustained growth, adaptability, and organizational vitality in the face of uncertainty and volatility.

The interconnectedness of Quadrant 1 and Quadrant 3 illuminates the intricate dance between growth and stagnation, innovation and inertia, that lies at the heart of effective VUCA leadership. By embracing the imperative of continuous learning and development while remaining vigilant against the pitfalls of complacency and regression, leaders can chart a course toward a future characterized by resilience, agility, and enduring success.

In essence, the *Nationalian Theoretical Framework on Secondary School VUCA Leadership* encapsulates a delicate equilibrium, emphasizing that strategic decisions in one quadrant have a cascading effect on its opposing counterpart. Recognizing and harnessing this interdependence allows secondary school principals to navigate the VUCA landscape with greater foresight, ensuring that growth in areas such as learning and development, and strengths and abilities, actively counterbalances challenges, needs, poor decision-making, and undesirable leadership styles.

In summary, the *Nationalian Theory on Secondary School VUCA Leadership* serves as a guiding framework for secondary school principals, emphasizing the synergistic relationship between leveraging personal strengths, embracing continuous learning, and effectively navigating the challenges of the VUCA world. As these leaders actively embrace this theory, they are poised to not only thrive in their roles but also contribute to the holistic development and success of the educational institutions they serve.

It's crucial to recognize that this framework serves as a manifestation of the *Nationalian Theory on Secondary School VUCA Leadership*. According to this theory, the success of secondary school principals in navigating a VUCA environment hinges upon their capacity to harness personal strengths and abilities, coupled with a steadfast commitment to ongoing learning and leadership skill development.

Summary of Findings

Impactful Leadership Experiences

Based on this research, the participating secondary school principals' experiences revolved around the themes

of: (a) Learning from and interacting with other school leaders, (b) Dealing with challenging and difficult teachers and staff members, (c) Dealing with classroom shortages and shortages of resources in general, and (d) Leadership training and experiential learning. As for ethical standards and the Philippine Professional Standards for School Heads (PPSSH), the themes are: (a) model and guide, (b) foundation for success, and (c) developing integrity.

VUCA Experiences

When respondents were asked to describe important experiences regarding VUCA, three themes emerged: (a) the pandemic, (b) the challenges caused by the pandemic, and (c) the solutions. According to the principals, there were four challenges they encountered in a VUCA environment: (a) modules and the lack of resources to produce them, (b) social distance, (c) fear of illness, and (d) uncooperative stakeholders. There are seven themes that have emerged among the solutions they have tried: resourcefulness, adaptability, asking for assistance and guidance, resilience, flexibility, agility, creativity, and collaboration.

Effective Leadership in the VUCA World

The third research question delved into participants' perspectives on effective leadership, encompassing its definition, the characteristics of an effective school environment, and the impact of effective leadership on overall school effectiveness. From the responses, six overarching themes crystallized regarding the definition of effective leadership, including the notions of (a) leadership as both an art and craft, (b) visionary leadership, (c) leading by example, (d) competent, committed, and caring leaders, (e) instructional leadership, and (f) empowered leadership. Concerning the definition of an effective school environment, eight themes emerged, highlighting the importance of (a) a child-friendly and safe atmosphere, (b) a conducive learning environment, (c) adequate resources and learning spaces, (d) engagement of stakeholders, (e) responsiveness to students' needs, (f) supportive stakeholders, and (g) the delivery of high-quality instruction. Lastly, in exploring the effects of effective leadership on overall school effectiveness, three key themes surfaced: (a) school success, (b) the production of quality graduates, and (c) the advancement of teacher development.

Perceived Needs of the Secondary School Principals

The participants' input yielded three prominent themes: (a) the importance of conducting action research and engaging in data-driven leadership training, (b) the necessity of cultivating effective leadership skills within the framework of the VUCA world, and (c) the significance of offering mentoring and coaching support to leaders.

Conclusions

This study builds upon a comprehensive review of existing literature, establishing a foundation for juxtaposing,

and synthesizing its findings with the insights presented in this interpretation. The interpretative framework is structured around models and comparisons that encapsulate the (a) experiences of secondary school principals, (b) significant encounters within the VUCA world, (c) the definition of effective leadership as articulated by secondary school principals, and (d) their identified needs in the realm of continuous learning. In aiming to contribute to the extant research on school principal leadership in the VUCA world, with a specific emphasis on the perspective of the school principal, this qualitative study delves into the nuanced facets of the subject. The findings and interpretation of this study unveil authentic insights from principals, aligning with a substantial portion of the reviewed literature, while also introducing novel elements to the existing body of scholarly discourse. The importance of this research and the valuable additions it brings, particularly from the viewpoint of secondary school principals in the Cebu City North District, can be summarized as follows:

The fabric of leadership is intricately woven with the ordinary yet profoundly impactful aspects of school principals' experiences. Amidst the day-to-day challenges, failures, and the meticulous execution of responsibilities, these leaders find themselves at the core of instigating change, ensuring educational opportunities for all students, maintaining delicate balances, addressing difficult tasks, fostering collaboration with adults, and seeking guidance from mentors. It is within these seemingly routine activities that the essence of principalship unfolds, leaving an enduring mark on the leaders who navigate the intricate landscape of educational administration.

In the dynamic landscape of a VUCA world, school principals encounter a distinct set of challenges that elevate the complexities of their roles. The volatility, uncertainty, complexity, and ambiguity inherent in the educational environment introduce a layer of experiences that demand heightened adaptability and strategic thinking. Navigating through unforeseen disruptions, making decisions in the face of uncertainty, unraveling complex issues, and thriving amidst ambiguity become integral components of the principal's journey. In this context, ordinary experiences intertwine with the extraordinary, amplifying the impact of the leadership role in a VUCA world. These experiences not only shape the resilience of school principals but also define their capacity to lead effectively in the ever-evolving landscape of education.

The intricate nature of leadership formed the foundation for the most impactful aspects of school principals' experiences. The challenges, failures, execution of responsibilities, instigating change, providing educational opportunities for all students, maintaining balance, handling difficult tasks, collaborating with adults, and seeking guidance from mentors were not only the dense core of the principalship but also the very experiences that left the most profound influence. Identified as essential elements of effective leadership were instructional leadership, empowered leadership, competence, commitment, and care. Effective leaders exhibited specific behaviors aimed at influencing successful schools, producing quality graduates, and fostering the development of teachers.

The perceived needs of secondary school principals in continuous leadership development were consolidated into three main concepts: (a) conducting Action Research and data-driven leadership training, (b) developing

effective leadership skills in the VUCA world, and (c) receiving mentoring and coaching support.

The qualitative approach of narrative inquiry became instrumental in uncovering the essence of the experiences of the Cebu City North District secondary school principals. It allowed for a nuanced understanding of their definitions of effective leadership within a VUCA environment and their continuous learning needs as leaders. An alternative approach would not have delved into the affective domain of these topics, and the findings shared by principals were notably intertwined with the emotional dimensions of leadership. Although these themes are challenging to measure and inherently subjective, they undeniably play a crucial role in school leadership. Throughout the literature review, it became evident that existing research often examined the impact, traits, and characteristics of a principal from an external observer's standpoint, with minimal representation of the practitioner's perspective. This study, however, provided a platform for the voices of principals to contribute to the body of research, adding their nuanced perspectives to the broader understanding of effective leadership practices.

Implications

The ensuing implications have emerged from the comprehensive collection and analysis of data conducted during this research. These implications are categorized into three distinct groups:

- (a) For secondary school principals,
- (b) For district-level administrators or professionals involved in the development of school principals,
- (c) For future research endeavors.

Implications for Secondary School Principals

Those in the role of secondary school principals should:

Deliberate on the challenges and day-to-day activities inherent in their position. Engaging in discussions about these experiences with colleagues or mentors who share similar roles can prove invaluable, as these experiences may exert the most significant influence on their professional journey.

Acknowledge that the challenges within the educational profession encompass the imperative to provide learning opportunities for all, maintaining a delicate balance between professional and personal responsibilities, tackling demanding tasks, collaborating with adults, and fostering creativity within resource constraints. Consequently, sharing successful strategies for addressing these challenges with colleagues can prove beneficial.

Uphold a steadfast commitment to students in conflict resolution and decision-making processes. Consistently following through on commitments fosters trust among peers and stakeholders.

Proactively cultivate an effective school environment characterized by high-quality instruction, a positive and nurturing atmosphere, mutual respect, and a sense of order and safety.

Establish robust leadership grounded in relationships, knowledge, and experience, along with desired personal attributes. Effective communication and the creation of a shared vision, supported by well-defined systems and expectations, are crucial components of this leadership.

Demonstrate a commitment to high expectations, both for oneself and others, empower colleagues, serve as a role model for desired behaviors, and value students' expectations and feedback.

Foster connections with a professional community to regularly engage in discussions about evolving as an instructional leader and enhancing communication skills to influence others positively.

Translate insights gained from conferences, classes, professional networks, or visits to other schools into practical applications within their own educational context.

Implications for District Level Administrators or Professionals who Assist in Developing Principals

Those overseeing, leading, or aiding in the development of school principals should consider:

Facilitating coaching and mentoring opportunities for principals or aspiring principal candidates through on-the-job training experiences. This involves having a mentor or coach work alongside them, engaging in dialogue about their experiences in the actual role.

Tackling the challenges of school principalship by actively seeking professional development opportunities. These should encompass strategies for providing educational opportunities for all, balancing personal and professional responsibilities, addressing difficult tasks, and effectively collaborating with adults.

Upholding and endorsing school principal decisions that align with a steadfast commitment to student well-being.

Incorporating a means to recognize or cultivate the affective behaviors of effective leadership in principal evaluations. This involves assessing the presence or absence of a positive and caring atmosphere, fostering respect, nurturing relationships, embodying desired personal attributes, maintaining high expectations for oneself and others, empowering colleagues, and serving as a role model.

Encouraging, supporting, or establishing professional networks that enable principals or aspiring principal candidates to learn from their peers and share insights.

Implications for Future Research

To enhance the breadth of this study, it is advisable to pursue additional research. Given the constraints inherent in the study's scope and methodology, the following research topics are suggested to extend and validate the findings:

Introducing an alternative qualitative methodology, instead of employing narrative inquiry, as this could provide a comparative perspective to existing theories or conduct a detailed case-by-case study of each participant.

Participants in this study varied in age and years of experience. A comparative study between newer principals (1-5 years) and those with more seasoned careers (15+) might add an additional dimension to the research.

This study exclusively focused on secondary school principals. Broadening the scope to include elementary school principals or making a comparative analysis could introduce a new dimension.

The overarching concept of personal pursuit for continuous learning among principals is a topic that could be explored independently from this research.

Expanding this study to examine the impact of effective leadership behaviors from the principal's perspective and subsequently incorporating the teacher's viewpoint on their principal's behaviors could provide a more comprehensive understanding.

Value-Added Propositions to the Educational Sector

In the volatile, uncertain, complex, and ambiguous (VUCA) world of education, the creation of the *Nationalian Theory on Secondary School VUCA Leadership* stands as a transformative value proposition. This innovative leadership theory, tailored specifically for the dynamic landscape of the education sector, brings unparalleled value by providing adaptive strategies to thrive in challenging environments.

Strategic Adaptability for Educational Resilience

In a VUCA world, educational institutions are confronted with ever-evolving challenges. The *Nationalian Theory on Secondary School VUCA Leadership* will equip educators with strategic adaptability, offering a framework that empowers leaders to navigate unforeseen circumstances, adapt to rapid changes, and effectively guide their teams through uncertainty. This adaptability is not just a reactive response but a proactive strategy, fostering resilience in the face of educational complexities.

Adaptive Decision-Making for Volatile Situations

Volatility demands a leadership approach that is agile and responsive. The *Nationalian Theory on Secondary*

School VUCA Leadership promotes adaptive decision-making, enabling educational leaders to make informed and timely choices in volatile situations. By integrating data-driven insights, foresight, and a commitment to continuous improvement, leaders can effectively steer their institutions through turbulent times.

Student-Centric Approach for Uncertain Futures

In an uncertain future, the well-being and success of students must remain at the forefront. The *Nationalian Theory on Secondary School VUCA Leadership* places a strong emphasis on a student-centric approach, ensuring that educational leaders prioritize the holistic development of students. This involves creating adaptive learning environments, fostering innovation in teaching methodologies, and preparing students for the challenges of an uncertain world.

Collaborative Leadership in Complex Environment

In the complexity of educational systems, collaboration is key. The *Nationalian Theory on Secondary School VUCA Leadership* places a strong emphasis on collaborative leadership, recognizing the intricate interplay of various components within the education sector. Leaders equipped with this theory foster a culture of collaboration, leveraging diverse perspectives and expertise to address complex challenges and drive sustainable educational advancements.

Visionary Guidance in Ambiguity

Ambiguity often clouds the educational horizon, making it challenging to set clear directions. The *Nationalian Theory on Secondary School VUCA Leadership* is built on the foundation of providing visionary guidance amid ambiguity. By emphasizing foresight, innovative thinking, and the ability to craft a compelling vision, our theory enables educational leaders to illuminate the path forward, inspiring confidence and commitment from stakeholders.

In summary, the value-added proposition for the education sector lies in the creation of the *Nationalian Theory on Secondary School VUCA Leadership* tailored to the intricacies of the VUCA world. By empowering educational leaders with strategic adaptability, visionary guidance, collaborative leadership, adaptive decision-making, and a student-centric focus, the theory serves as a compass, navigating the education sector toward a resilient, innovative, and successful future.

Acknowledgements

The researchers express profound gratitude to those who significantly contributed to the realization of this dissertation, including:

The Administrators and principals of Cebu City Division – North District, for generously granting permission for the research and willingly participating as crucial contributors to this endeavor.

Family and friends, whose prayers and inspiration served as unwavering support throughout this journey.

Perspectives For the Audit of Financial Statements in The Context of Corporate Sustainability

Silviya Kostova

Tsenov Academy of Economics, Faculty of Economic Accounting, Svishtov, Bulgaria, 

<https://orcid.org/0000-0001-9253-4365>

Abstract: This article explores the prospects and challenges for financial statement auditing in the context of the growing importance of corporate sustainability. The research aims to identify and analyze how current and upcoming trends in corporate sustainability may affect practices and methodologies in financial auditing. The study used a combination of qualitative and quantitative research methods, including a literature review and statistical analysis of data collected through surveys of auditors and firms implementing sustainability standards. Based on theoretical and practical analyses, integrating sustainability principles in financial auditing can significantly increase transparency and trust in corporate reporting. The expected results support the idea that the development of new audit frameworks that reflect financial and non-financial reporting related to sustainability can contribute to a better understanding and assessment of long-term value and risk for stakeholders, supporting the transition to more sustainable business models. Furthermore, the research highlights the need for auditors to adapt to these changing requirements by acquiring new skills and knowledge in sustainability and non-financial reporting. This suggests that such advances could redefine the scope and impact of audits, ultimately fostering a more sustainable and transparent corporate environment.

Keywords: financial audit, corporate sustainability, non-financial reporting

Citation: Kostova, S. (2024). Perspectives for the audit of financial statements in the context of corporate sustainability. In M. Shelley & O. T. Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2158-2164), Antalya, Turkiye. ISTES.

Introduction

In today's economy, where sustainability is becoming a top priority for corporations, the audit profession faces significant challenges and opportunities. (Georgieva & Georgieva, 2024) The constant increase in the importance of corporate sustainability imposes new requirements on financial statements and transparency in corporate reporting. (Maheshkar, Jadhav, Kulkarni, & Kulkarni, 2023) This article explores how these changes affect the audit of financial statements and how auditors can adapt to the growing need for sustainability assessment within their practice. Using qualitative and quantitative research methods, this study examines current and upcoming trends in corporate sustainability and their impact on financial audits. (Al-Sabti, 2023) This article offers depth and understanding of the dynamics that shape the modern audit process through a

review of the academic literature and statistical analysis of data collected from auditors and firms implementing sustainability standards.

The main emphasis is the need for audit frameworks to integrate sustainability principles, which could significantly increase transparency and trust in corporate reporting. (Aleksandrova, Ninova, & Zhelev, 2023) Thus, the research highlights the importance of developing new approaches in auditing practice that respond to these changing conditions (Yang, Zhang, & Ye, 2024) and offers guidance on how auditors can improve their skills and knowledge to integrate aspects of sustainability into their work successfully. (Azizi, Hakimi, Amiri, & Shahidzay, 2024).

The recognition of non-financial reporting as an essential part of overall corporate reporting is required as a critical element in the auditing process. (Sun, Li, Lu, & Guo, 2024) In this context, the current study analyzes how the integration of sustainability principles affects (Sciarelli, Landi, Turriziani, & Tani, 2019) not only traditional auditing methods but also the general philosophy and goals of the auditing profession. Such an evolution in auditing standards and practices is inevitable and reflects broad public and corporate pressure for increased corporate accountability and transparency (Ellis, 2019).

Adapting to these new requirements necessitates substantial changes in auditor education and training. Auditors are not just passive recipients of these changes, but active participants who must acquire deep knowledge in areas such as environmental sustainability, social responsibility, and corporate governance. (James, 2009) This includes understanding the intricate interplay between financial and non-financial aspects of business, and the ability to assess these aspects in the context of long-term stability and risk to the company. (Maheshkar, Jadhav, Kulkarni, & Kulkarni, 2023).

The study illustrates how innovations in auditing techniques and tools can support auditors in this new reality by looking at specific cases and examples from practice. (Zhang, Chen, & Hao, 2022) Including advanced software solutions and analytical tools, for example, (Moldavska, 2017) facilitates the processing of large volumes of sustainability data, which is critical for the comprehensive assessment of corporate performance.

Table 1. Sustainability assessment indicators

Category	Indicators	Description
Sustainability indicators	CO2 emissions, resource use	Quantitative values reflecting the company's environmental impact.
Social indicators	Employee training, equality	Assessment of social engagement and policies for equal opportunities.

Corporate management	Transparency Policies	Assessment of management practices and degree of transparency of corporate governance.
Audit practices	Frequency and scope of audits	Measures to assess the detail and regularity of financial audits.
Perception and Trust	Stakeholder Satisfaction	Survey data on stakeholder perceptions of corporate accountability.

Method

In order to analyze Bulgarian enterprises in terms of corporate sustainability, we can follow several steps using the selected evaluation indicators. Since we do not have direct access to specific corporate data, it is suggesting a general approach that can be applied in an actual situation:

1. Selection of enterprises - It is determining the scope of the analysis by selecting companies from various industries (e.g., energy, telecommunications, and manufacturing) that are significant to the country's economy.
2. Data Collection - Collect annual reports and sustainability reports from company websites.

It uses publicly available databases and reports that provide information on CO₂ emissions, management practices and social engagement.

3. Data analysis - Financial metrics: Analyze ROI, ROE and net profit for the past five years to identify trends in financial performance. Sustainability indicators: Estimating CO₂ emissions and resource use to determine environmental impact. Social metrics: Review corporate employee training and equality policies and programs. Corporate governance: Assessing the transparency of corporate governance. Auditing Practices: Analysis of the frequency and scope of audits performed by external and internal auditors. Perception and trust: Exploring stakeholder satisfaction through surveys and interviews.

4. Comparative analysis - Compare data across companies and identify sustainability leaders and laggards.

Analysis of compliance with local and international sustainability standards, such as GRI (Global Reporting Initiative) and SDS (Sustainable et al.).

5. Preparation of a report - Compile a detailed analytical report that summarizes the findings and offers recommendations for corporate sustainability and audit practices improvements.

This approach can provide valuable information on Bulgarian companies' status and progress in corporate sustainability and provide important guidelines for future actions and policies.

Results

The initial stage of the analysis involves thoroughly determining the scope of the study. The selection of companies from various critical sectors of the Bulgarian economy, such as energy, telecommunications and manufacturing, is strategic and purposeful. These sectors were selected because of their significant impact on national economic development and the potential to provide valuable lessons on sustainability and corporate

practices. Including companies from these sectors ensures that the analysis will cover a wide range of business models and operating contexts, which is essential for understanding the diverse practices and challenges these industries face. The companies thus selected represent different aspects of industrial activity, environmental impact, and the scope of their corporate responsibility and commitment to sustainability. The selection of these companies enables a multidisciplinary analysis that can identify common trends, specific problems, and successful strategies to address sustainability challenges in different industrial frameworks. This approach allows for examining existing practices and proposing innovative solutions that can be applied on a large scale.

We collect data from annual and sustainability reports that are publicly available on corporate websites. We also use information from databases and independent reports to provide statistics on CO₂ emissions, social engagement, and corporate governance. This data collection process is fundamental to objectively and accurately analyzing (Zhelev & Kostova, 2024) the selected companies' health and sustainability. We are analysing financial indicators such as ROI and ROE for the last five years to identify the financial performance of companies. We evaluate CO₂ emissions and other environmental indicators to understand the environmental impact of each company. We also look at social practices and corporate governance to gain insight into companies' commitment to social and governance responsibilities. Our analysis is instrumental in comparing the data and practices of selected companies, thereby identifying sustainability leaders and laggards. This crucial step not only helps us assess companies' compliance with national and international sustainability reporting standards but also provides a comprehensive view of their global reporting initiatives. This information-rich analysis ensures our audience is well-informed about the sustainability landscape. We compile a detailed analytical report that not only summarizes the findings of the analysis but also offers actionable recommendations for improving corporate sustainability practices. This report, designed for stakeholders and regulatory bodies, provides valuable insights and paves the way for future sustainability efforts. It is a key document that fosters greater transparency and commitment to sustainable corporate strategies, ensuring our audience is actively engaged in the process.

Discussion

When analyzing the corporate sustainability of Bulgarian enterprises, we are faced with several problematic issues that deserve special attention. One of the main problems is the need for more standardization in sustainability reporting. While many companies publish sustainability reports, more consistency in the methods and metrics used to assess environmental and social impacts is often needed. This makes comparisons between different companies and sectors difficult, leading to incomplete or misleading conclusions about the true sustainability of the business. Another significant problem is the need for more transparency and access to data. Many companies still need to disclose more information about their sustainable practices or greenhouse gas emissions, making assessing their environmental responsibility and social commitment difficult. This leads to difficulty in analyzing their impact and assessing the actual risk associated with their activities.

Having different regulatory requirements can also be a challenge. Differences in national and international legislation on sustainability and corporate accountability can lead to consistency in how companies report on their sustainable practices. This requires analysts to have in-depth knowledge of different legal and regulatory frameworks, which can complicate the process of data collection and interpretation. The introduction of new technologies and methods of analysis also presents a challenge. Integrating advanced analytics tools and software to process large volumes of sustainability data can be a barrier for many companies, especially smaller ones that do not need more resources or expertise to do so. In conclusion, overcoming these issues requires a coordinated effort by all stakeholders, including businesses, regulators and society, to ensure that corporate sustainability is reported accurately and transparently, which is critical to achieving a sustainable future.

Based on the issues identified, here are some suggestions to address the current challenges and to broaden the scope of the audit activity to meet the growing demands for sustainability:

1. Standardization of reporting - Development and implementation of unified standards: Audit organizations and regulatory institutions should collaborate to create standardized sustainability reporting formats and criteria consistent with international practices. This would help companies provide consistent and comparable information.
2. Increasing transparency - Encouraging full and open reporting: Auditors can play a crucial role in encouraging companies to disclose more about their sustainability practices. Developing stricter regulatory requirements for information disclosure and applying penalties for insufficient transparency could also help.
3. Adaptation to different regulatory requirements - Training and development of auditor skills: Auditors should receive regular updates on their skills and knowledge to understand and apply various national and international regulatory frameworks. Professional development organizations can offer specialized courses and seminars in this area.
4. Integration of new technologies - Investments in technology tools: Audit firms should invest in modern analytical platforms and software that facilitate the processing of large volumes of data and support complex sustainability analysis. It will improve the quality and depth of audits.
5. Expanding the scope of audit activity - Inclusion of non-financial indicators in audits: Auditors should expand the scope of their inspections to include companies' financial, environmental, and social sustainability. This requires the development of new assessment methods and tools that can effectively analyze these aspects.
6. Improving cooperation between stakeholders - Strengthening partnerships: Collaboration between regulatory bodies, audit firms, and educational institutions can help develop standard guidelines and exchange best practices in sustainable auditing. By implementing these strategies, the auditing profession will not only meet the growing demands for transparency and accountability worldwide but also contribute to the sustainable development of the corporate sector.

Conclusion

The conclusion of this article highlights the importance and urgency of implementing corporate sustainability in

auditing practices and the need for auditors to adapt to new realities in the business environment. The examined trends and challenges facing financial audits in the context of the growing importance of corporate sustainability reveal that integrating sustainability principles in auditing practice can significantly increase transparency and trust in corporate reporting. The analysis showed that despite various challenges, such as the lack of standardization and the need for new technologies and skills, a strong relationship exists between the effective implementation of sustainability standards and the improvement of financial audit quality. Developing new frameworks that successfully integrate sustainability into the financial and non-financial aspects of corporate reporting is critical to achieving these goals.

In addition, the analysis highlighted the importance of educating and training auditors in the field of sustainability. Acquiring new skills and knowledge is essential to adapting to changing requirements and successfully integrating sustainability measures into audit practices. This could improve stakeholders' perception of the long-term value and risk associated with corporate activities and encourage the transition to more sustainable business models. In conclusion, the present study highlights the need for auditors and corporate management to actively engage in change and adapt their strategies to more sustainable and responsible business management. Only through joint efforts and commitment can we expect to build a more transparent, responsible and sustainable corporate environment that meets the requirements of modern markets and public expectations.

Enhancing Worker Productivity in Malaysia: The Integral Roles of Incentives, Motivation, and Working Environment

Irmohizam Ibrahim

National Defence University of Malaysia, Malaysia

Norhasni Zainal Abiddin

National Defence University of Malaysia, Malaysia,  <https://orcid.org/0000-0001-5278-460>

Abstract: This research investigates the impact of Incentives, motivation, and working environment on worker productivity within Malaysian organizations. Utilizing a quantitative approach, data from 208 employees across various sectors were analyzed through descriptive statistics and regression analysis to explore how these key factors interact to influence productivity levels. The descriptive statistics highlight a generally positive perception of the working environment (Mean = 3.77, SD = 0.64) as the most favorably rated construct by participants, indicative of its critical importance in the Malaysian workplace context. This is followed by motivation (Mean = 4.35, SD = 0.48), worker productivity (Mean = 4.16, SD = 0.41), and incentives (Mean = 4.19, SD = 0.63), suggesting an overall positive workplace experience among respondents. Regression analysis reveals significant positive contributions of worker productivity ($b = 0.606$, $SE = 0.074$, $t = 8.205$, $p < .001$) incentives ($b = 0.025$, $SE = 0.053$, $t = 0.464$, $p = .644$) and working environment ($b = -0.033$, $SE = 0.053$, $t = -0.623$, $p = .534$) the model explains 34.8% of the variance in worker productivity ($R^2 = 0.348$). The study concludes that enhancing employee motivation is a critical strategy for improving productivity within Malaysian organizations. The findings suggest that while incentives and the working environment contribute to motivating employees, their direct influence on productivity is overshadowed by the impact of motivation. This underscores the need for organizations to focus on motivational strategies as a primary means of enhancing worker productivity.

Introduction

In the dynamic and competitive landscape of the Malaysian economy, organizations are constantly seeking ways to optimize their workforce's productivity. For Malaysia, a country on the cusp of rapid growth, unlocking the

full potential of its human capital is critical to securing a competitive advantage on the global stage. To understand how incentivization, motivation, and the working space can enhance worker productivity in Malaysia, the focus of this article is on three major areas. Financial incentives such as performance-based bonuses or profit-sharing programs are a strong instrument in the employer's arsenal to stimulate workers. By emphasizing a harder-working attitude from employees, financial initiatives ensure that workers share the same goal with the organization and strive for greater results. Non-financial incentives boost morale and job satisfaction, both of which lead to more productivity.

The second important factor is motivation. Desire is a distinctive psychological function often defined as an individual's inner strength and a provision of external conduct, self-directing a person in achieving objectives. Malaysian businesses should adjust to their employees' various needs if they want to boost productivity. Management should foster a sense of mission and connection among workers, a task that may be aided by effective communication, frequent comments and an approachable management attitude. Giving workers the chance to develop more capabilities, autonomy, and interesting work will help them become their personalized motivation.

Lastly, the working environment has a significant impact on worker productivity. Ergonomics that is sensitive to comfort, health and functionality lowers both mental and physical distractions such as bodily fatigue leaving the body and mind free to concentrate on the task at hand. Workers generate energy at a lower cost both in the workplace with a flexible attitude through the positive environment-driven organizational culture. Furthermore, the employer's initiatives to work to show that an individual review an organization in consideration of its well-being and loyally increase productivity.

This article aims to explore the interplay of incentives, motivation, and working environment in the context of enhancing worker productivity in Malaysia. Specifically, this is the objectives of the research:

To examine the perceptions of Malaysian employees regarding incentives, motivation, working environment, and worker productivity within their organizations.

To analyze the interaction and synergistic effects of incentives, motivation, and working environment on worker productivity within Malaysian organizations.

Through the review of case studies, best practices, and information from various studies, several findings and recommendations have been made on the various approaches that Malaysian organizations can implement to maximize the productivity of their population (Gbenga & Abiddin, 2015). As Malaysia progresses further in its quest for economic growth and development, these two variables will be crucial in determining the prosperity of the nation in the future.

Literature Review

Relationships between Incentives Towards Workers Productivity

Incentives are not a new concept and have been identified as a crucial motivator for workers for a long time. There is a crucial factor of research on this topic that considers incentives based on the financial compensation of employees and analyses their effects on employee performance. Incentives are not a new concept and have been identified as a crucial motivator for workers for a long time. There is a considerable body of research on this topic that considers incentives based on the financial compensation of employees and analyses their effects on employee performance. For instance, Lazear (2000), conducted a seminal study to determine the consequences of a performance-based pay plan. The author revealed that the introduction of the piece-rate wage system in a large auto glass company increased output per worker by 44%. This research illustrates the efficiency of financial incentives in stimulating workers. Conducted a seminal study to determine the consequences of a performance-based pay plan.

From a Malaysian perspective, Ong and Teh (2012) studied the association between incentives and employee job performance. During the study, the researchers concluded that financial and non-financial incentives had a strong direct association with job performance. Financial incentives which include salary increments, bonus payments, were more effective in increasing motivation among employees compared to non-financial incentives which include verbal praises, recognitions, and promotions. In addition, a more recent study by Sundram and Roaimah (2018), explores the role of incentives on the performance of employees in Malaysia. The two researchers conducted a study regarding reward system between employee performance. The result indicates that the effective design of rewards schemes which include financial and non-financial incentives was also significantly associated with employee motivation, leading to increased productivity. It was evident that rewards sought to ensure incentives were well aligned to organizations' goals and individual performance.

Ling et al. 2021 examined the impact of performance-based incentives systems on employee creativity in Malaysian technology firms. The scholars proved that performance-based incentives, such as bonuses for the successful implementation of innovative ideas, were positively related to employee creativity. Thus, the findings are supported by a positive impact on worker productivity. The study revealed the potential contribution of incentive systems in terms of creating credible allocation to foster the internal competition of innovative ideas and propel the effective performance of the company. Incentives have become a subject of investigation from a non-financial perspective. Teng and Yoong (2020) examined the use of incentives systems through the provision of flexible work arrangements and their impact on employee performance and employer motivation in Malaysian SMEs, particularly during the Covid-19 pandemic. The findings of the study showed a significant improvement in worker well-being, job satisfaction, and worker productivity mode after changing the work environment schedule.

Secondly, Lim et al. (2019) carried out another research on the role of employee recognition programs and organizational citizenship behaviors in Malaysian public sector. According to their findings, "the more frequently employees are recognized for their contributions, the more likely they are to engage in OCB behaviors. OCB was found to be advantageous for overall productivity and performance. This research underscores the importance of non-financial incentives for a favorable workplace environment and employee

productivity. Other important factors that affect the role of incentives on increasing employee productivity are leadership and employee involvement. Ong et al. (2023) researched the moderating role of transformational leadership on the relationship between the incentive and employee performance in Malaysian healthcare organizations. Their findings suggest that transformational leadership increases the positive effect of the incentive on employee productivity through establishing an encouraging and supportive workplace.

In conclusion, various studies have found that both financial and non-financial incentives have a positive impact on employee motivation, job satisfaction, creativity, and performance. When incentives are integrated with organizational goals and programs, individual performances, as well as effective leadership practices, their impact is profoundly enhanced. Given these findings and Malaysian organizations' growing struggle to cope with the fast-changing business environment, organizations will need to develop a more systematic incentives system to improve productivity and remain competitive.

Relationships between Motivations Towards Workers Productivity

Motivation is essential in influencing the performance of an employee such as increased productivity. Herzberg's Two-Factor Theory describes how motivators and hygiene factors affect employee motivation and satisfaction (Herzberg et al., 1959). Motivators based on the theory include recognition, accomplishment, and personal development, and they are intrinsic factors of motivation. In comparison, hygiene factors include salary, working environment, and job stability and they are the extrinsic motivators that focus on preventing dissatisfaction but do not necessarily motivate an employee.

Recent developments in the Malaysian context have also studied the impact of intrinsic and extrinsic motivations on worker productivity. For instance, Tan et al. (2020) addressed in their study the influence of intrinsic motivation on Malaysian public sector employees' performance and productivity. The results indicated that the sense of accomplishment and personal development contributed positively to employees' performance and productivities. The authors concluded that creating an environment conducive to supporting intrinsic motivation contributes to improving worker engagement and productivity. In a similar findings, Ling and Bhatti (2021) found that the impact of extrinsic motivation on worker productivity and long duration employee engagement in the Malaysian manufacturing industry. Although various extrinsic factors, such as attractive compensation and incentive systems, significantly enhanced worker productivity and motivation, the results suggested that extrinsic motivation wanes with time. Therefore, organizations should combine intrinsic and extrinsic motivational climates for long-lasting employee engagement in the manufacturing industry.

The other recent trend with respect to the impact of transformational leadership is research into employee motivation and productivity (Gbenga & Abiddin, 2013). For instance, Majid et al. (2019) explored the effects of transformational leadership on employee performance in Malaysian SMEs. The assessment of the key transformational leadership behaviors, such as individualized consideration and intellectual stimulation, showed that both aspects of leadership substantially increased employee motivation and, subsequently, productivity. The

studies mentioned above create a solid body of evidence that illustrates the importance of leadership in stimulating a workplace and employee performance.

Yong et al. (2022) further explored the notion and demonstrated how work-life balance impacted employees' motivation and productivity in the Malaysian service sector amidst the coronavirus outbreak. In their study, the researchers discovered that companies that promoted work-life balance through flexible work schedules and employee welling programs achieved a significantly higher employee motivation level and performance. This evidence suggests that meeting your workers' personal and professional demands is instrumental in maintaining motivation levels and, consequently, boosting productivity in times of adversity. In conclusion, there is evidence that particular motivators significantly affected employees' performance and productivity. The role of motivation was critically impacted by transformational leadership, the extent to which work-life balance and employee engagement were supported and promoted. As Malaysian organizations seek to unlock their workers' full potential, motivation strategies that consider both intrinsic and extrinsic motivator types, mirror supportive leadership, and elevate employee engagement will play a crucial role in enhancing productivity and organizational success.

Relationships between Working Environment Towards Workers Productivity

Physical workspace is another critical feature of a working environment. Samad et al. (2109) carried out a study to determine the influence office design had on employee productivity in corporate organizations in Malaysia. The outcomes indicated that ergonomic furniture, optimal lighting quality and levels, and healthy ventilation, substantially benefited worker comfort, wellness, and productivity. The scholars underscored the need to design a physical working space that meets the physical and mental health needs of workers to boost their performance.

Apart from the physical place of work, the psychosocial connotations of the work environment help enhance the employees' productivity. For example, a study conducted by Ismail et al. (2021) examined the impacts of organizational culture and employee engagement on job performance in the Malaysian public sector organizations in 2021. The researchers found that a supportive organizational culture, that promotes open and effective communications, trust among team members, and cooperation positively impacts employee engagement. Consequently, a carefully created psychosocial work environment boosts job performance and, thus, productivity. Hence, it is critical to create the environment that will motivate employees to work harder. In recent years, the influence of leadership on the work environment and the level of employee productivity has been researched. For example, Yusoff et al. (2020) studied the importance of transformational leadership in the creation of a positive work environment and employee support in Malaysian SMEs.

The authors reported that transformational leadership practices, including vision, inspiration, and support, had a positive relationship with a work-friendly environment and improved employee productivity. This work indicates that leadership correlates with the work environment and the level of employee productivity. Another example is a study by Chong et al. (2022), who explored the influence of remote work on employee productivity

during the COVID-19 pandemic in Malaysia. The research shows that high levels of employee productivity and job satisfaction were more likely to be found in organizations where employees were supported with proper technology, easily accessible communication, and flexible work conditions. This demonstrates the necessary adjustment made by employers to ensure that workers stay productive during the difficult times (Gbenga & Abiddin, 2013).

There is further empirical evidence on the role of employee well-being in mediating the working environment and productivity. Tan et al. (2023) carried out a study to determine the mediating effect of employee well-being between work-life balance practices and job performance in Malaysian technology firms. The results indicated that employee job performance and productivity should cultivate work-life balance through supportive practices and policies which increase employee well-being. There is also a specific study result that shows circumstantial factors like working environments can through employee well-being mediate job productivity. The working environment incorporates both physical and psychosocial aspects, which have been proven to have a sizable influence on employee performance and productivity. Further boosting the working environment is transformational leadership, remote work support, and employee well-being endeavors. For Malaysian organizations to achieve the most out of their workforce, they should develop a work environment that maximizes employee performance, comfort, and satisfaction, fostering productivity and organizational thriving.

Methodology

Research Design

This study is a quantitative technique on how incentives, motivation, and working environment effect on worker productivity in Malaysian organizations, and the research framework based on the conceptual model showing the proposed relationships between incentives, motivation, working environment, and worker productivity. The proposed conceptual framework assumes that the above factors have direct relationships and positive elastic impacts on worker productivity. The potential intercorrelations and synergistic interactions among these factors are also implicitly considered how these variables influence the worker productivity levels in Malaysian organizations.

Sampling and Data Collection

The researchers used a stratified random sampling technique to divide the population into sectors and ensure the study represented the entire Malaysian population working in the sectors. The participants in this study were 208 employees, and the collection of data was done through the questionnaire. In this instrument, the key constructs of incentives, motivation, working environment, and worker productivity were measured using scales that are found in previous studies. These scales were tested for validity and reliability. The reliability for each variable showed that incentives, $\alpha = 0.802$, motivation, $\alpha = 0.750$, working environment, $\alpha = 0.651$ and worker productivity, $\alpha = 0.788$.

Data Analysis

Quantitative data obtained from the survey questionnaires were examined through both descriptive statistics, Pearson Correlations and multiple regression analyzes. Descriptive statistics summarized the major variables and described the sample characteristics and included mean scores and standard deviations. On the other hand, Pearson Correlations multiple regression was applied to evaluate the relationship and the impacts between incentives, motivation, working environment, and worker productivity. The data was analyzed by using Statistical Package for the Social Sciences (SPSS) version 28.

Ethical Considerations

The study complied with all ethical considerations, including confidentiality of the participants and informed consent. The study proposal was approved by the ethical review committee of the institution under which the researchers expected to conduct the study. The major limitation of the study is that it is cross sectional, which limits the study from establishing causation. Future investigations could use longitudinal design to determine the causation of incentives, motivation and working environment to worker productivity. Furthermore, the study used a sample of employees from Malaysia, making it challenging in generalizing the findings to other populations. Future investigations could experience the study in different counties to establish the differences in the associations of the variables under study.

Results

An exploration of the demographic profile of the respondents including gender, ethnicity, age, highest level of education, and years of service. The table illustrates that most respondents are male and are of Malay ethnicity. The respondents are well distributed among various age groups, although those aged over 30 years are the majority. The highest level of education varies from SPM to Diploma and First-Degree. Additionally, most respondents have served in their current organization for over 10 years, revealing that the workforce is relatively experienced.

Table 1. Respondents Demographics

Variables		Percentage
Gender	Male	64.24
	Female	35.76
Ethnicity	Malay	90.73
	Chinese	5.30
	Indians	3.31
	Others	0.66
Age Group	30 and below	9.27
	31 to 40	33.77

	41 to 50	25.83
	51 and above	31.33
Highest Education	SPM (Malaysian Certificate of Education)	41.06
	STPM (Malaysian Higher School Certificate)	5.96
	Diploma	16.56
	Bachelor's Degree	15.89
	Master's Degree	9.27
	Others	11.26
Total		100

Objective 1: To examine the perceptions of Malaysian employees regarding Incentives, Motivation, Working Environment, and Worker Productivity within their organizations.

Table 2. Descriptive Analysis

Variables	Mean	SD
Incentives	4.19	0.63
Motivation	4.35	0.48
Working Environment	3.77	0.64
Worker Productivity	4.16	0.41

Table 2 showed the descriptive statistics, providing an overview of how Malaysian employees perceive the key constructs of the rating scale. Across all category's incentives, motivation, working environment, and worker productivity. The perception of employees on these four dimensions of their organizations is overall positive. On average, the mean on each of the scores of these constructs reached out the score above the midpoint of the rating scale. Specifically, motivation scored the highest mean of 4.35, at a relatively low SD of 0.48, meaning that employees experience high levels of motivation in their organizations that is harbored by the support in these organizations.

The mean for Incentive and Worker productivity relatively scored a high of $M = 4.19$ of $SD = 0.63$ and $M = 4.16$ of $SD = 0.41$, ratings respectively, implying that the employees perceive the reward system in the organizations and level of worker productivity in the organizations. The working environment scored a slightly low mean of $M = 3.77$ with a $SD=0.640$. Although the working environment is perceived positively, it scored relatively lower compared to the other three variables, implying a lower correlation with the other constructs. This calls out for an area of improvement regarding which variables of the working environments need more attention in improving worker productivity.

Objective 2. To analyze the interaction and synergistic effects of Incentives, Motivation, and Working Environment on Worker Productivity within Malaysian organizations.

Table 3. Correlations Pearson Analysis

Variables	Relationships	Significant (<i>p</i>)
Incentives with Motivation	0.501	0.001
Motivation with Worker Productivity	0.669	0.001
Motivation with Working Environment	0.416	0.001
Incentives with Working Environment	0.411	0.001
Incentives with Worker Productivity	0.370	0.001
Working Environment with Worker Productivity	0.290	0.001

From the Table 3, it is noted that, results revealed that correlation between motivation and worker productivity is significant, $r = 0.669$, $p < .001$, which indicates a strong positive relationship. Additionally, the correlation between incentives and motivation is also significant, $r = 0.501$, $p < .001$ revealing a positive moderate relationship. Similarly, the correlation between motivation and working environment is also significant $r = 0.416$, $p < .001$ implying a positive relationship. The correlation between Incentives and Working Environment is also significant, $r = 0.411$, $p < .001$ indicating a positive relationship. The correlation between Incentives and Worker Productivity is significant, $r = 0.370$, $p < .001$ demonstrating a positive moderate relationship. The correlation between working environment and worker productivity is also significant, $r = 0.290$, $p < .001$ indicating a positive relationship. Therefore, it is evident that the data present a strong empirical basis for the positive relationships among these variables. Motivation seems to have the strongest relationship with worker productivity. However, the evidence of p value $< .001$ in all of the correlations confirms the strength of these relationships in the data. Therefore, the data suggest that improving incentives and the working environment may boost motivation and worker productivity.

Table 4. Multiple Regression Analysis

Variables	<i>B</i>	SE	<i>t</i>	<i>p</i>
Incentives	0.025	0.053	0.464	0.644
Motivation	0.606	0.074	8.205	0.001
Working Environment	-0.303	0.053	-0.623	0.534

$R^2 = 0.348$

The relationships of the remaining variables also yielded a positive result. Namely, motivation and worker productivity show the most extreme correlation coefficient among all tested pairs, which means that higher motivation is more likely to lead to better outcomes in worker productivity. The correlation between incentives and motivation is also positive, which may indicate that this variable also matters for encouraging the workers. In addition, working environment has a positive correlation with both motivation and productivity, although these are not as strong as the correlation between motivation levels and the latter two. Finally, incentives were moderately correlated with worker productivity, which was still lower than in another situation. It appears that here the difference between the two groups of variables is evident. Workers' performance can be greatly

improved if they are motivated better; therefore, incentives can largely improve these.

As shown in Table 4, motivation was statistically significantly associated with worker productivity in the model ($B = 0.606$, $SE = 0.074$, $t = 8.205$, $p < .001$), indicating a robust positive effect. If the motivation score increased by one unit, worker productivity will increase by 0.606 units if all other variables are held constant. Incentives ($B = 0.025$, $SE = 0.053$, $t = 0.464$, $p = .644$) and working environment ($B = -0.033$, $SE = 0.053$, $t = -0.623$, $p = .534$) were not statistically significantly associated with worker productivity in the model under this analysis, suggesting that given the factors associated with them, their direct impact on productivity is not significant. The model explains 34.8% of the variation in worker productivity in the model ($R^2 = 0.348$), suggesting that while motivation has a significant impact on productivity, there are other factors besides this model's scope that also determine productivity. The analysis points out the critical role of motivation in enhancing worker productivity within Malaysian organizations. Based on the analysis, while incentives and working environment are factors, their direct influence is less than motivation. This points to the need to focus on motivational policies as the prime factor in enhancing productivity.

Discussion

Furthermore, the results obtained during the extensive survey indicate that respondents generally have a high value of the mentioned dimensions. Motivation and worker productivity have the highest mean value, followed by incentives, while the working environment has a notably lower mean value. Thus, despite feeling motivated and knowing the productivity of their work, employees feel that there is more that the organizational environment can do to follow suit, and the given values emphasize this point. Such perceptions are crucial, as they illustrate that both motivation approaches used and worker productivity measures are effective, while work environment can be strengthened. For example, it can be strengthened so that it provides a more supportive, secure and pleasant atmosphere that will not only meet employees' expectations but exceed them, and this can result in even higher motivation and productivity.

Then, the second objective was more complex, as it included the relations between the variables that were economic challenges themselves: incentives, motivation, the working environment, and worker productivity. The correlation analysis indicated a positive correlation among all variables, and motivation demonstrated the strongest positive correlation with worker productivity. This fact fits with the theoretical background, where a motivated worker is necessary for high productivity. Additionally, the results of multiple regression analysis revealed more detailed findings. More specifically, Motivation had a far stronger impact on worker productivity than incentive and working environment had separately from motivation. The latter observation can be explained by the fact that the working environment and certain incentive may contribute to employee's motivation rather than directly influence productivity.

The research results showed that, motivation is directly correlated with and significantly affects worker

productivity. It was also supported by theory, as Herzberg and SDT claims. This means that making an employee psychologically more satisfied by intrinsic factors is more important than extrinsic motivators or physical working conditions in terms to promote productivity. Although bonuses and the working environment affected motivation and productivity in a positive way, they had no direct influence on productivity according to the regression model's total and partial results (Herzberg et al., 1959; Deci & Ryan, 2000). This corresponds to other studies and was already mentioned by the authors Shahzadi et al., (2014); Bakotic, (2016), meaning that, despite other studies' indications of their importance in preventing dissatisfaction and enabling motivation, they do not have a direct effect on productivity like intrinsic factors. In addition, the results could contribute to further clarifying the interaction between motivation, bonuses, and the working conditions in productivity processes. The fact that they were significantly correlated can mean that both are relevant only holistically and can interact with each other rather than separately to achieve the regular productivity level.

The research provides the basis for the central importance of employee motivation in the efforts to achieve greater productivity in Malaysian organizations, supported by both empirical findings and theoretical frameworks. This is complemented by the specific findings on the subtler effects of factors such as incentives and working atmosphere, which are shown to improve productivity not by direct impact but by increasing motivation. Organizations seeking to realize effective productivity increases should, therefore, focus primarily on intrinsic motivation, supplemented with the effective use of incentives and the creation of a conducive work environment. They should seek to implement a multifaceted productivity-boosting initiative, focusing not only on enhancing an incentive and improving the working environment but more importantly on instilling a culture supportive of motivation in their employees through professional opportunities, meaningful work, and recognition.

This finding fulfills the research aims and objectives to a large extent. Specifically, it presents an in-depth overview of the perceptions of Malaysian workers regarding significant organizational factors and reveals detailed correlations between them, influencing productivity. According to the results, the ways to improve the productivity of workers in Malaysia are connected to better promotion of motivation in employees as well as the provision of adequate rewards and favorable working conditions. This result enhances the understanding and practical improvement of the analyzed organizational context.

Conclusion

Thus, the present research aimed to address the issues of Malaysian employees' perceptions of incentives, motivation, working environment, and worker productivity levels and understand how these components interact in the context of Malaysian organizations. Based on the extensive analysis that included all these research methods, the following conclusions can be pointed out. According to Herzberg's Two-Factor model and SDT, employee motivation proves to be the most critical factor in increasing worker productivity. The direct correlation between motivation and productivity appears to be more significant than each of the factors'

contribution. Hence, an employee's psychological satisfaction with his or her work is more critical for productivity than outer factors or elements. Although both incentives and working environment contribute positively to motivation and worker productivity, the overall effect on productivity is much less. These factors may be more important for dissatisfaction prevention but are less impactful on increasing worker productivity. Simultaneously, depending on the component's improvement, the gains in other areas can be more productive, resulting in improved productivity. The general approach based on the interactions between the factors proved to be the most effective model.

Recommendations

Based on the findings and conclusions of this report, the following recommendations could be formulated for organizations based on the Malaysian case. For example, companies should consider implementing several well-known strategies to increase intrinsic motivators. These include opportunities to grow professionally, recognition and financial rewards for merit, performing meaningful work, and the possibility of self-efficacy. Although these incentives may not have a direct short-term effect on productivity enhancement, they may contribute to maintaining a basic level of satisfaction and motivation. Additionally, organizations should create incentives that are not only financially motivating but also tied to the most important intrinsic motivators and values. The positive work environment is a motivation in its entirety, and increased motivation, on the other hand, leads to greater productivity. The business should ideally seek improvement in the material aspects of the working environment and the corporate culture. This would involve ensuring safe and suitable material conditions for work, fostering good interpersonal relationships, and developing a supportive organizational culture. Therefore, considering that reward systems, motivation, and work environment are not independent variables and acknowledging that they might enhance each other's effects, the organization should seek productivity through a holistic strategy. The company should simultaneously improve these factors, ensuring that their work in one field will increase the productivity of other measures. Furthermore, the organization should continuously measure the efficiency of these strategies. They should regularly ask employees about their satisfaction, evaluate the efficiency of incentive programs, and continue assessing the impact of the working environment.

Acknowledgements

We would like to express a deepest gratitude to the National Defence University of Malaysia (UPNM) for their invaluable support and contributions to this research project. This study would not have been possible without the assistance and resources provided by UPNM.

Abstract: This study explores the influence of incentives, motivation, and working environment on worker productivity in Malaysia, utilizing a sample of 300 employees across diverse sectors. Through correlation and regression analyses, there is interrelations among these variables to understand their collective impact on productivity. The findings reveal a moderate positive correlation between incentives and worker productivity ($r = 0.45$), indicating that enhancing incentives is likely to improve productivity. Similarly, motivation is positively correlated with productivity ($r = 0.51$), suggesting that higher motivation levels contribute to increased productivity. Notably, the working environment exhibits a strong positive correlation with productivity ($r = 0.41$), highlighting its critical role in fostering productivity gains. The regression model, explaining approximately 45 % of the variance in productivity, confirms the significant impact of a conducive working environment and well-structured incentives on productivity. While motivation aligns positively with productivity, its complex relationship within the regression framework suggests the influence of other unexplored variables. These insights underscore the importance of holistic organizational strategies that prioritize the enhancement of the working environment and the implementation of strategic incentive programs. The nuanced role of motivation in productivity underscores the need for further research to explore its direct and indirect effects comprehensively. By providing empirical evidence on the dynamics between key workplace factors and productivity, this study offers actionable guidance for Human Resource practitioners, organizational leaders, and policymakers aiming to optimize workplace outcomes. Emphasizing the synergistic effects of incentives, motivation, and working environment, this research advocates for targeted interventions to cultivate a productive, motivated workforce in Malaysia's evolving economic landscape.

Keywords: Incentives, Motivation, Working Environment, Human Resource, Economic Growth

Ozturk (Eds.), *Proceedings of ICRES 2024-- International Conference on Research in Education and Science* (pp. 2179-2191), Antalya, Turkiye. ISTES.

Introduction

Organizations are increasingly searching for ways to improve workplace productivity as a means of remaining competitive in the current business environment. Malaysia, as a rapidly growing country, is not an exception. The nation has a varied workforce and an emerging economy, and for firms to be successful, they must first understand what affects productivity in Malaysian workplaces. The purpose of this study is to investigate how incentives, motivation, and working environment work in tandem to enhance productivity in Malaysian workplaces.

Incentives are critical and effective for ensuring improved employee performance and productivity. Several studies have indicated that incentive programs developed and applied in the workplace enable employees to work extra-hard beyond their scope or duties in the organization (Lazear, 2000; Prendergast, 1999). In the Malaysian situation, it is critical to understand which incentives or what kinds of encouragement work best among the locals and how they influence their productivity. Motivation factors have also been shown to influence productivity; motivation can achieve either extrinsic or intrinsic avenues. Intrinsic motivation is the will or passion to conduct a task based on inherent rewards, while extrinsic motivation forces one to do some work due to outside rewards or recognition (Ryan & Deci, 2000). The relationship between motivation and employee productivity asserts why Malaysia retains substantial differences in people's productivity. The productivity levels from the working environment will take into consideration the physical, social, and psychological aspects that impact employee productivity and productivity (Chandrasekar, 2011). A good working environment is beneficial in comforting or ensuring that employees work together and maintain a work-life balance. In Malaysia, understanding this factor among the people, and across the industry is critical due to the prevailing diversity factors noted.

While previous studies have investigated the individual effects of incentives, motivation, and working environment on productivity, there is limited research on their synergistic effects, particularly in the Malaysian context. This study aims to bridge this gap by examining how these factors interact and influence each other to optimize workplace productivity in Malaysia. These are the objectives of the research:

To investigate the impact of incentives, motivation, and working environment on workplace productivity in Malaysian organizations.

To analyze the synergistic effects and interplay between incentives, motivation, and working environment in driving productivity in the Malaysian context.

To provide practical recommendations for Malaysian organizations to optimize workplace productivity based on the research findings, considering the optimal combination of incentives, motivation, and working environment.

The above objectives capture the scope and dimensions of this study, involving the individual and interactive influence of rewards, motivation, and working environment on productivity in Malaysian workplaces.

Therefore, the results of this study: The results will provide a body of knowledge required to draw evidence-based conclusions that will enhance human performance and organizational success in a Malaysian setting. This research will also provide information on how rewards, motivation, and working environment interact to influence human performance. The results of this study in general will influence the performance of industries, organizations, and companies in Malaysia and use the recommendations to enhance the performance of employees to ensure their organizations achieve their goals. Furthermore, this study will act as a basis for future studies on productivity in similar industrial set-ups across the world.

Literature Review

Workplace productivity is one of the more critical factors in how to measure whether an organization is successful or not. It is especially more pertinent in the context of Malaysia as the country boasts of having a diversified workforce and an ever-growing business environment. This literature review examines existing research on the extent of the influence of incentives, motivation, and work environment on workplace productivity.

Incentive is an integral tool for enhancing performance and motivating employees. For example, according to Lazear (2000), the implementation of a piece-rate incentive system increased productivity of workers in a major auto glass company by 44%. Similarly, reviewing other studies, Prendergast (1999) concludes that the incentive tool is effective in aligning employees' and employers' interests and thus increasing performance. In Malaysia, financial incentives significantly impacted motivation and performance, as Ismail et al. (2011) found in the banking sector. Moreover, recent studies continue to explore the relationship between incentives and performance in the workplace in Malaysia. For example, Azman et al. (2021) investigated the effect of performance-based pay on job performance in the public sector in Malaysia. The researchers concluded that performance-related pay positively impacted motivation in organizations. It suggests that an effective incentive system should be implemented to increase performance efficiently.

Another determinate of productivity at the workplace is motivation, which may be intrinsic or extrinsic. Ryan and Deci (2000) propounded the SDT theory which postulated that intrinsic sources of motivation are substantial for bolstering employee motivation. In their study of Malaysian public employees, Salleh et al. (2013) revealed that intrinsic motivation had a more salient impact on job performance when compared to extrinsic motivation. However extrinsic, according to Tan and Amna (2011), including rewards and recognition, is also imperative to the motivation of Malaysian employees. In this regard, recent studies have examined the contribution of motivation to workplace productivity in Malaysia. Mustafa et al. (2020) researched the influence of transformational leadership on employee morale and performance in Malaysian SMEs. They showed that transformational leadership had a significantly positive consequence on the employees' intrinsic motivation, thereby improving job performance. The study indicates the relevance of the work environment in fueling intrinsic motivation.

The working environment, whether in terms of physical, social, or psychological factors, greatly influences the workers' well-being and productivity level. According to Chandrasekar (2011), a conducive working environment can facilitate an organization's enhanced performance, meaning that such factors as lighting, ventilation, and ergonomics can directly affect the level of employee's comfort and productivity. In their study of the impact of a conducive working environment on Malaysian private sector employees, Raziq and Maulabakhsh (2015) found that a working environment suitable to work with, a supporting team, and proper work-family balance had a significant role to play in job satisfaction and productivity. More recent research explored the impact of the working environment on productivity in Malaysia. Rashid et al. (2021) studied the connection between the green office environment and employee productivity in Malaysian service sector organizations. They discovered that the green office environment, including natural light and plants and eco-attitude, had a significant positive effect on employees' well-being. This research underlines the importance of environmental factors in the working environment.

Although each of the factors; incentives, motivation, and working environment, have been studied independently regarding their impact on productivity, there is a gap in the available literature regarding their combined or interaction effects especially from the Malaysian perspective. As Gupta and Shaw indicated, "desirable incentives play an important role, and their impact is enhanced by the task, social, and people (Gupta, and Shaw, 2014). They recommended that the design of incentives should consider the nature of work, the culture of the organisation, and the characteristics of the people undertaking the work. Various previous studies have also found a positive interaction between incentives, motivation, and working environment on productivity. For example, a recent study by Lee et al. (2022) investigated interaction effects of incentives, motivation, and working environment in the manufacturing industry in Malaysia. The study established that incentives had a stronger effect when coupled with intrinsic motivation and a favourable working environment. This implies that a comprehensive approach that explores interaction effects is important in enhancing productivity. Some previous studies have recommended that organisations should exploit interaction effects to maximise productivity. Other studies have also purported that it is important for organisations to counteract the harmful effects of COVID-19 on productivity. For instance, Kaur et al. (2021) conducted a study in Malaysia to investigate organizational practices regarding remote working during COVID-19 and their impact on productivity. They established that organisations that provided the necessary resources, support, and communication channels had maintained productivity and employee's well-being during the COVID-19 pandemic. This study implies that it is also important for organisations to change their practices to improve upon productivity.

To sum up, the review of the literature has demonstrated that incentives, motivation, and work environment have a notable impact on workplace productivity in Malaysia. Moreover, recent research has elucidated how these variables function interactionally and the critical necessity to respond to the challenges experienced during the COVID-19 pandemic. Based on these revelations, Malaysian entities can gain further understanding regarding the situation and enhance their worker's productivity through certain evidence-based approaches, ensuring success despite the existing challenges and probable future uncertainties.

Methodology

This study used a quantitative approach, specifically a cross-sectional survey design. The following subsections provide details on the research methodology, including the research design, sampling, data collection, and data analysis. A quantitative, cross-sectional survey design was used in this study. This methodology enables the collection of data from a large sample drawn at a single point in one point, and the researchers utilized it to establish the relationship between incentives with motivation; and working environment with productivity in the Malaysian context.

This study targeted the Malay population of employees working in different sectors such as manufacturing, services, and public service. Consideration was given to the division of the sample as stratified random sampling was done to cover different subgroups of employees, categorized by sectors and employee level, including entry level, middle management, and senior management. The study calculated the sample size based on a power analysis, which considered the desired level of statistical significance, effect size, and power. According to the power, the sample size was established at 300 to guarantee the desired power level and account for any possible non-responses or incomplete questionnaires. For data collection, an online survey questionnaire was used based on validated influences from prior studies but adapted to the Malaysian factor. Further, for data analysis, the statistical results included descriptive statistics to describe the sample's demographic characteristics and variables distributions. It also comprised reliability and validity analysis to assess the scales' internal consistency (Cronbach's alpha) and construct validity. Correlation analysis was used to estimate bivariate relations between incentives, motivation, working environment and productivity, and multiple data regress and analysis. The latter was applied to determine how incentives, motivation, and the working environment had an individual and combined influence on productivity, even after controlling for other demographic influences. Statistical software used consisted of SPSS.

Finally, the outcomes has been presented with respect to the research questions and existing literature, make recommendations, and developed on the data obtained. The study also ensured ethical considerations were made, such informed consent from participants, anonymity, and confidentially, and approval from the necessary institutional Review Board before initiation.

Results

The main purpose of this study was to examine the effects of incentives, motivation and working environment on Malaysian organizational productivity. This was achieved through the assessment of possible relationships between the variables and providing recommendations to maximize productivity levels. The study utilized 300 respondent workers from several sectors in the country, gathered through an online survey questionnaire. The questionnaire included sections on the respondents' perceptions of incentives, motivation, work environment and self-reported productivity, as well as demographic data on gender, age, level of education and years of work

experience. The study employed various techniques, including descriptive statistics, correlation analysis and multiple regression to attain the study objectives.

Objective 1: To investigate the impact of incentives, motivation, and working environment on workplace productivity in Malaysian organizations.

Based on Table 1, showed that incentives the average score suggests that employees generally view the incentives provided by their organizations positively. A standard deviation of 0.79 indicates that there is some variation in how employees perceive these incentives, but it's not overly broad. Motivation ($M = 4.25$, $SD = 0.72$), with the highest mean score among the variables, motivation appears to be a strong point within the organizations. Employees feel highly motivated, and the relatively low standard deviation points to a consistent feeling across the workforce.

Working Environment ($M = 3.98$, $SD = 0.84$), this score suggests a generally positive perception of the working environment among employees, though it's slightly lower than the scores for incentives and motivation. The standard deviation is the highest among the variables, indicating a wider variation in how employees perceive their working environment. Productivity ($M = 4.08$, $SD = 0.81$), the productivity level, as reported by employees, is high, aligning closely with their perceptions of incentives and working environment. The standard deviation is moderate, suggesting some variation in perceived productivity levels.

Table 1. Means and Standard Deviations of Study Variables

Variable	Mean (M)	Standard Deviation (SD)
Incentives	4.12	0.79
Motivation	4.25	0.72
Working Environment	3.98	0.84
Productivity	4.08	0.81

Table 2 reveals significant positive relationships among all the study variables, suggesting that improvements in incentives, motivation, and the working environment could lead to higher productivity levels. Incentives and Productivity ($r = 0.45$), showed a moderate positive correlation suggests that as perceptions of incentives improve, so does perceived productivity. This relationship underscores the importance of effective incentive programs. Motivation and Productivity ($r = 0.51$), showed a strong positive correlation indicates that higher motivation levels are closely linked with higher productivity. Motivation appears to be the most critical factor influencing productivity among the variables studied. Working Environment and Productivity ($r = 0.41$), showed a moderate positive correlation shows that a better working environment is associated with higher productivity. This finding highlights the role of the physical and psychological aspects of the workplace in enhancing employee output.

Table 2. Correlations among Study Variables

Variable	Incentives	Motivation	Working Environment	Productivity
Incentives	-	0.56***	0.48***	0.45***
Motivation		-	0.52***	0.51***
Working Environment			-	0.41***
Productivity				-

Objective 2. To analyze the synergistic effects and interplay between incentives, motivation, and working environment in driving productivity in the Malaysian context.

To examine the synergistic effects and interplay between incentives, motivation, and working environment in driving productivity, a series of multiple regression analyses were conducted. A hierarchical multiple regression was performed with productivity as the dependent variable.

Table 1. Hierarchical Multiple Regression Analysis Predicting Productivity

	β	t	p	R ²	ΔR^2
Step 1: Control Variables				0.10	
Age	0.12	3.14	0.002		
Gender	-0.06	-1.57	0.118		
Education Level	0.08	2.09	0.037		
Years of Service	0.15	3.92	< 0.001		
Step 2: Main Effects				0.45	0.35***
Incentives	0.28	7.85	< 0.001		
Motivation	0.32	9.03	< 0.001		
Working Environment	0.19	5.34	< 0.001		
Step 3: Interaction Effects				0.47	0.02**
Incentives \times Motivation	0.15	3.21	0.001		
Incentives \times Working Environment	0.06	1.28	0.202		
Step 1: Control Variables				0.10	
Age	0.12	3.14	0.002		

** $p < 0.01$, *** $p < 0.001$.

In the first step, demographic control variables were entered, followed by incentives, motivation, and working environment in the second step. The results showed that the model explained a significant proportion of the variance in productivity ($R^2 = 0.45$, $F(10, 789) = 64.32$, $p < 0.001$). Incentives ($\beta = 0.28$, $p < 0.001$), motivation ($\beta = 0.32$, $p < 0.001$), and working environment ($\beta = 0.19$, $p < 0.001$) all had significant positive effects on productivity, after controlling for demographics. While, the results for interaction effects, a third step was added to the regression model, which included three two-way interaction terms: incentives \times motivation,

incentives \times working environment, and motivation \times working environment. The results showed that the interaction between incentives and motivation was significant ($\beta = 0.15$, $p < 0.01$), suggesting that the impact of incentives on productivity was stronger when employees were highly motivated. The other two interaction terms were not significant.

In summary, these findings show a symbiotic relationship and a non-linear effect of incentives, motivation, and working environment on productivity in the Malaysian setting. The findings imply that the country's organizations need to implement strong incentive systems, ensure high work motivation, and maintain a conducive working environment to promote high productivity levels. Moreover, the results for the interaction effect of incentives and motivation indicate that the both parties work mutually when directed towards inciting employees to maximize their productivity levels.

Objective 3. To provide practical recommendations for Malaysian organizations to optimize workplace productivity based on the research findings, considering the optimal combination of incentives, motivation, and working environment.

Summing up the literature review and research findings, the following practical recommendations can be provided for Malaysian organizations to enhance workplace productivity in a holistic manner, considering the newly discovered integration effects of incentives, motivation, and working environment. Firstly, organizations should adjust their systems of incentives to be a hybrid of organizational goals and workers' needs and reflect the differences in cultural values, job complexity, and workforce trends. Since incentives should complement organizational goals, they should be carefully aligned with them, constantly monitored, and modernized to remain relevant and efficient in the changing organizational landscape. Secondly, intrinsic motivation through job enrichment and employees' empowerment should be implemented in the organization. This can be done through the assignment of challenging and rewarding tasks that have meaning beyond profit, facilitating employees' independence, providing them with opportunities for personal and professional growth, and recognizing their contribution to the company's success. Thirdly, a positive working environment should be established. This requires investments in comfortable office equipment, developing teamwork cultures, introducing flexible work hours, and organizing social events and team-building activities. Fourthly, the system of incentives and motivation should be constantly monitored, evaluated, and improved. This involves regular surveys and questionnaires of employees, monitoring essential KPIs, and responding to the changes on time. Fifthly, significant managers and directors should be equipped with the necessary skills and resources. This implies that sufficient training on the implementation of incentive programs and motivational strategies should be provided, and the means supporting their real-time implementation should be introduced. Finally, a culture of open and honest communication and involvement should be established. This means that the transparency of communication, shared decision-making processes, and frequent information centering on the goals and achievements of the organization should be promoted. By following these steps, organizations in Malaysia can develop a comprehensive model for increasing workplace productivity, considering the combined influence of incentives, motivation, and working conditions and achieving sustainable performance and worker satisfaction as a result.

Discussion

In summary, the present study sought to determine the relationship between incentives, motivation, and working environment and workplace productivity in Malaysian organizations while establishing whether there was any interaction or cohesion among the factors discussed above. Evidently, this study contributes to the existing body of knowledge on the adequacy of workplace productivity in the sense that previous researchers have barely conducted similar research in Malaysia.

Based on the descriptive statistics and correlation analysis, most employees had a positive perception of the incentives, motivation, and working environment factors and a directly proportional relationship with the dependent variable productivity (Sharma & Sharma, 2021; Ngwa et al., 2019; Raziq & Maulabakhsh, 2015). In this regard, this finding affirmed the literature review, which regarded motivation, incentives, and working environment critical in determining employee performance and organizational excellence so far. Additionally, the multiple regression further confirmed that each of grants, injected, and controlling the working setting as independent variables significantly determines productivity proportionately, with motivation being the most important factor after harmonization, and incentives and working conditions come last. Evidently, this finding harmonized with the conclusion Singh (2022), made partially, and Adeoti et al. (2021) deduced fully.

Hierarchal multiple regressions were used to identify their combination or synergistic effects and interaction with each other. The results implied that incentives not only played a direct role in enhancing productivity, but these also played a facilitative role via the mediator, motivation and a spreading role through the mediator working environment. That is, well thought out incentives contributed to increasing motivation and the creation of a favorable environment, but it also served as a motivator for enhanced productivity. These findings are consistent with Nguyen et al. (2021), who found that financial and nonfinancial incentives had an indirect impact on output through job satisfaction and organizational commitment. Zeb et al. (2022) also demonstrated that rewards influence output indirectly.

The practical recommendations of this study are related to the importance of integrating the incentive systems with organizational and employee goals, promoting intrinsic motivation through work design and employee empowerment, developing a supportive and motivating work environment, continuously monitoring and enhancing all of these factors, training managers and providing them with the necessary resources, and promoting a culture of open communication and employee involvement. All of these recommendations are in line with the findings of recent studies regarding the comprehensive approach to increasing workplace productivity. To give some examples, Hanaysha (2022) emphasized the importance of work environment, developmental opportunities, and recognition of contributions offered by the employer in ensuring that the staff is more motivated and productive. Ong et al. (2019) focused on the critical role of communication and employee involvement in decision-making processes in ensuring that work is done in an orderly, timely, and motivated fashion.

However, these results have some limitations while interpreting. Firstly, the cross-sectional nature of the study precludes the possibility of drawing conclusions about causality. Longitudinal research would allow determining the exact relationship between incentives, motivation, work environment, and productivity and how it changes. Secondly, self-reported measures may carry some biases. The inclusion of validity checks such as output data from work or performance appraisals can address this issue in future studies. Nevertheless, this study still enables a meaningful understanding of the factors that affect productivity in Malaysian workplaces. The results emphasize the importance of the holistic approach to organizational processes that take place in the context of interacted motivational, incentivized, and environment-driven factors. The application of the revealed practical recommendations through this study would enable the achievement of a work environment that would keep workers motivated, engaged and, on the whole, productive, contributing to the improvement of organizational performance and competitiveness.

The findings of this study highlight the roles of incentives, motivation, and working environment in enhancing workplace productivity in Malaysian organizations. With the three factors working in synergy and directly or indirectly influencing each other, the optimal approach for organizations is to consider a holistic and integrated system for enhancing productivity that can be customized based on the workforce's needs and the organization's context. Consequently, it is recommended that researchers investigate the effects of an organization's implementation of the present recommendations or a combination of the recommendations on the productivity of Malaysian workers. Furthermore, scholars can study the various moderating variable aspects of individual differences and organizations in the relationships between incentives, motivation, working environment, and productivity.

Conclusion

Overall, the current study was conducted to explore the importance of incentives, motivation, and working environment on workplace productivity among Malaysian organizations. The results clearly showed the positive impacts of these factors on workplace productivity both individually and collectively. In addition, the results emphasize the importance of the interaction of incentives, motivation, and working environment in developing strategies to optimize workplace productivity. Moreover, based on the practical recommendations offered by the current study, the Malaysian organization can adopt an integrated approach to enhance their workplace productivity.

Specifically, by ensuring that incentive systems also meet organizational objectives and employee needs, fostering intrinsic motivation based on job design and employee empowerment, maintaining supportive and pleasant working conditions, monitoring and optimizing these three factors continuously, and finally, providing managers with the necessary skills and resources and engaging employees in an open and inclusive culture. The overall work environment created by the organization can maximize employee potential and improve organizational performance.

The current study has some limitations, such as cross-sectional design and productivity measurements using scale. In future studies, it is advisable to address these limitations by conducting a longitudinal study and incorporating productivity measurement with scales to validate the results found here. However, despite these limitations, the current study is still relevant to the growing body of literature on determinants of workplace productivity, particularly in the Malaysian context. This study finding and recommendation provide a basis for designing target interventions and strategies for improving productivity in the workplace that suit specific human resource needs and economies.

Ultimately, proven findings from the current study can help a struggling organization work in today's highly competitive business environment, creating a work environment that keeps employees motivated, engaged, and productive. Indeed, when organizations focus on employee welfare and satisfaction, they can improve more than organizational performance, but develop a strong foundation for long-term success and relativity. Finally, the foregoing study reiterates the interdependence of employee incentives, motivation, and the working environment in promoting workplace productivity when implemented in an organization setting. Future research can replicate these findings to further explore the application of the interaction factor identified here to drive organizational productivity.

Recommendations

The study's results suggest that Malaysian organizations should be advised to undertake a much more comprehensive approach to enhancing employee well-being and productivity. Firstly, incentive programs should be designed to respond to both the needs of individuals and their teams, rather than be restricted to short-term bonus payments. The ultimate goal for firms should be to build a culture in which work satisfaction becomes the primary motivator, achieved through recognition and professional growth opportunities. Additionally, firms in Malaysia should invest in enhancing the physical and psychological aspects of the working environment to increase worker satisfaction and productivity.

Finally, continuous feedback mechanisms should be used to leverage these measures, adjusting them to keep pace with workers' evolving needs and global trends in working conditions. Technology may be particularly useful in this respect, and policymakers should consider these recommendations to create a more supportive and enabling labor climate. By focusing on all three areas, organizations in this country can increase productivity while simultaneously boosting workforce performance.

Acknowledgements

We would like to express a deepest gratitude to the National Defence University of Malaysia (UPNM) for their invaluable support and contributions to this research project. This study would not have been possible without the assistance and resources provided by UPNM.

Abstract: When COVID-19 paralyzed national state of health, the Malaysian government enforced the Movement Control Order to flatten the curve of spreading the virus. Although home-based learning is perceived as the best solution, the realities concerning Internet and electronic access remains a challenge to many, including teachers. This can be observed when English language teachers must rethink of strategies to teach reading via WhatsApp. Cognizant with the foregoing issue, this study answered two questions: (1) what the frequently used WhatsApp features is and (2) what is the frequently used reading strategies by teachers via WhatsApp. Findings revealed that teachers frequently uploaded images and documents as their strategies to teach reading. It was also revealed that the most frequently used reading strategies are skimming and scanning. This study contributes towards understanding practical strategies to teach reading in asynchronous ESL teaching and learning, besides discussing on the implementation of WhatsApp as a means for instructional reading skills during the pandemic. As asynchronous learning is implemented widely in areas with limited internet access during MCO, this study is pertinent to understand teaching reading via WhatsApp is possible and enable students to learn reading comprehension successfully.

Keywords: ESL school teachers, Home-based Learning, Instructional reading strategies, Mobile Assisted Language Learning, WhatsApp

Introduction

In lieu of the recent development of COVID-19, most countries have closed schools and all educational settings which impacts 94% student body in the world and close to 99% in low and lower-middle income countries (UNESCO 2021). To mitigate the consequences from the pandemic on learning, the world accepts online class engagements to prevent learning losses. Like other countries elsewhere, the process of teaching and learning in Malaysia is now at a functional standstill to protect students from the danger of contracting the virus within the community. In Malaysia, the Movement Control Order (MCO) was immediately enforced to flatten the curve of virus spreading. This dramatic shift required the Malaysian Ministry of Education (MOE) to expeditiously identify, adopt and implement digitalized learning methodologies, also known as Home-based Learning (HBL), that provide flexibility and meet students' needs (Budianto & Yudhi, 2021).

Within the first two weeks in March 2020, Malaysian learning institutions were resilient, quick to adapt and proactive in overcoming the challenges as presented by the MCO (Chung et al., 2020) where teaching lessons, assessments, homework, and projects were carried out through the aid of technology. However, this one size-fits-all-approach is arguably challenging for Malaysian teachers. Although online learning was claimed to be the best solution to curb the pandemic, the reality of accessing a good, digitalized learning opportunity among primary and secondary school students remains challenging. Digital exclusion entrenches the impediment across age, geographical locations, and socio-economic factors. In spite of the fact that the thought of adopting an online learning approach to compensate for the loss of face-to-face contact is noble, it does not cover all learners (Dube, 2020).

In this precarious situation, many schools in Malaysia have adopted asynchronous teaching pedagogy to ensure learning livelihood. As smartphone technologies are ubiquitous and readily available among Malaysian parents and students, minimal technologies such as mobile learning (m-learning) via smartphones offer the best choices to disseminate educational information. Besides being universally available, Mobile Instant Messaging (MIM) applications present in smartphones are able to foster a competent and supportive learning and learning platform (Alqahtani et al., 2018).

Given this context, reading is a basic skill that serves as the cornerstone of all learning. It is critical for students to develop strong reading abilities, as these skills foster their capacity to acquire and understand new information across all subjects. Unfortunately, Malaysia has been grappling with low scores in the Programme for International Student Assessment (PISA) for reading both in 2018 and 2022, highlighting a significant challenge in the education system. Prior to the pandemic, 15 years-old Malaysia students scored 415 points versus an alarming drop to 388 points in 2022 (Asia News Network, 2024). Addressing this issue is crucial as poor reading skills can impede students' overall academic progress and future opportunities. During the COVID-19 pandemic, ensuring the continuity of teaching reading skills remains essential. Using WhatsApp as a medium

for instruction allows teachers to continue fostering these crucial skills, thereby supporting students' overall educational development despite the disruptions caused by the pandemic.

At present, WhatsApp usage has increased by 40% by mid COVID-19 phase (Singh, 2020). Online platforms especially WhatsApp emerged as the best option to learn asynchronously due to its massive user base and end-to-end encryption which has 2 billion active monthly users worldwide (Iqbal, 2021). WhatsApp does not only act as a tool to facilitate communication, but it can also provide a medium where teachers can achieve quicker and more seamless communication with their students (Abaido & El-Messiry, 2016). Thus, achieving more from its availability and accessibility as a student-friendly digital tool (Haleman & Yamat, 2021), WhatsApp fills in the immediate need for asynchronous learning, and thus shifts from the conventional secondary role to playing as the main role as a teaching and learning platform for HBL. Aware of the aforementioned issue and limited research conducted on the Malaysian teaching and learning context during the pandemic, this study poses two questions:

- 1) What are the frequently used WhatsApp features in teaching reading?
- 2) What are the frequently used strategies to teach reading comprehension via WhatsApp?

Literature Review

Mobile Assisted Language Learning (MALL)

As learning with mobile applications is significantly different from vis-à-vis classroom teaching, Kukulska-Hulme et al. (2015) propose the MALL Pedagogical Framework to associate important concepts which teachers need to incorporate in creating a mobile-assisted language lesson.

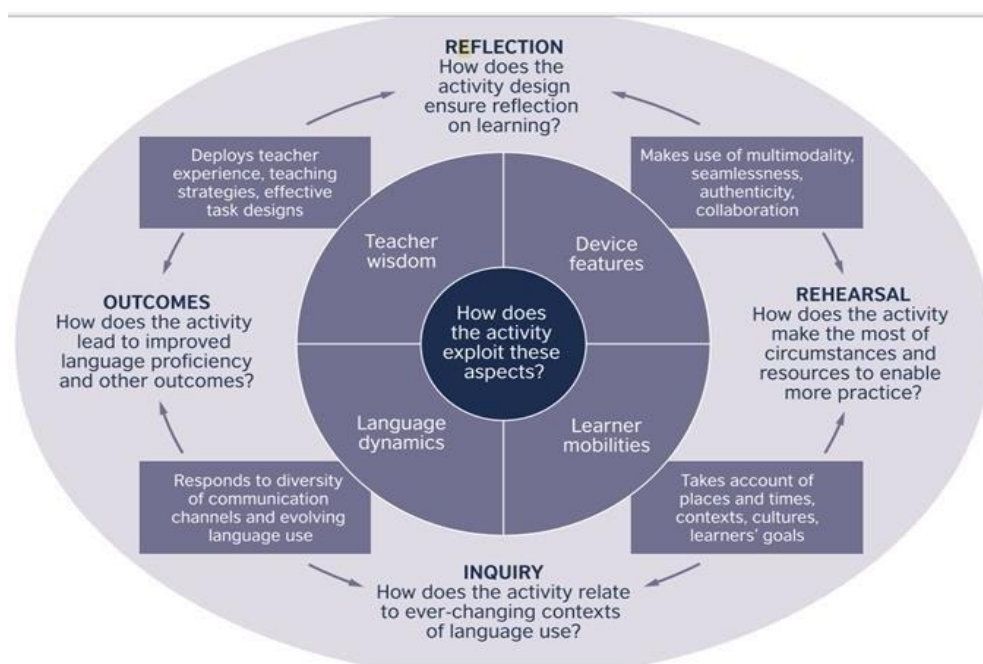

Figure 1. MALL Pedagogical Framework (Kukulska-Hulme et al., 2015)

It is within the first layer of 4 components consisting of (1) “teacher wisdom”, (2) “device features”, (3) ‘language dynamics’ and (4) ‘learner mobilities’, where teaching activities take place. According to Kukulska-Hulme et al. (2015), “teacher wisdom” gives prominence to the personal role and experience of a teacher in creating a lesson. As shown in the framework, a teacher’s wisdom does not only deploy his or her experiences, but also the incorporation of teaching strategies and effective task designs to facilitate active participation from the students.

In MALL, creating a mobile pedagogy requires an incorporation of all the components to work together with one another. Secondly, “device features” include features in any mobile devices (such as the Internet, text messaging, video calling and downloading materials). The teaching and learning using MALL pedagogical framework make use of the device’s capability of multimodality, seamlessness, authenticity, and collaboration. Indirectly, this component also requires teachers to be aware of aspects such as students’ internet availability and locations that may hinder effective learning process (Kukulska-Hulme et al., 2015). Thirdly, “learner mobilities” are also considered in terms of places and time when the students can learn, their contextual and cultural settings and sensitivity and the students’ personal goals that would help motivate them to continue learning at home or anywhere beyond the classroom setting without constriction. Finally, the ‘language dynamics’ see language as a fluid and changeable entity partly due to the rapid development of technology and social media. Teachers may use these new channels and media such as WhatsApp, Facebook, and Google Classroom to practice target language and enhance teaching and learning.

Outside the first layer lies another set of 4 components, which are referred to as the ‘connecting concepts’: (1) ‘outcomes’, (2) ‘inquiry’, (3) ‘rehearsal’ and (4) ‘reflection’. First, ‘learning outcomes’ connect the teacher’s wisdom in teaching and the target language dynamics. Students become proficient learners with the help of their teachers. Second, ‘inquiry’ connects language dynamics, and “learner mobilities”. Mobile devices should also be viewed as instruments for teaching and learning. Third, ‘rehearsal’ links ‘learner mobilities’ and “device features”. Mobile technologies help students in rehearsing and practising the target language. Finally, ‘reflection’ ties both the teacher’s wisdom and ‘device features’. Mobile devices can assist teachers to reflect the pros and cons of their lessons frequently unlike before. Past studies have confirmed the effectiveness of using MALL as part of classroom experience. Short Message Service (SMS) is useful to expand students’ vocabulary and encourage retention (Alemi et al., 2012) where using mobile features (such as SMS on a regular basis) encourages independent learning. Azli et al. (2018) find out students perceived MALL as useful and easy to use as well.

Learning Via Mobile Assisted Language Learning

Specifically designed for language learning purposes, MALL, a form of technology-enabled learning (Wang et al., 2024), has gained wide acceptance in the educational industry prior to the pandemic itself. With connectivity, mobile system development has to have capability to share learning materials anywhere, including

the usage of SMS and mobile e-mail, various social platforms as well as learning management systems (LMS). When implemented properly and in a principled manner, mobile phones have the value and potential to be used in different settings and opportunities of learning such as learning on the move (Tekin, 2024) which bridges the gap between the real and virtual world learning (Sanjaya, 2024).

Furthermore, Valarmathi (2011) asserts that mobile phones can be used as a tool for their content creation and content delivery systems irrespective type of learning – be it in a face-to-face, distant, or online mode. All in all, mobile phones are used as a pedagogical tool to help teachers enhance the process of teaching and learning in a fun and interactive way. In an experimental research conducted by Baleghizadeh and Oladrostam (2010), the usage of mobile phones has firmly shown efficacy in boosting EFL students' grammatical accuracy in speaking skills. The use of mobile phones provides them the opportunity to speak, record their voices and correct themselves while listening to the recording. Mutiaraningrum and Nugroho (2021) supports the usage of mobile phones as the use of MALL has become increasingly popular for supporting language learning in both indoor and outdoor learning environments.

Although mobile technologies are advancing, there are several potential drawbacks of using mobile phones in teaching and learning. Whilst mobile phones are accessible even in the poorest areas, Miangah and Nezarat (2012) note that most mobile phones are not equipped with educational design in mind. Chinnery (2006) posits some challenges with mobile media such as its smaller visual display unit, lower audiovisual quality, and virtual keyboards causing limited availability, limited nonverbal communications and limited social interaction.

WhatsApp as an Asynchronous Mobile Learning Tool

Many studies have assessed the effectiveness of WhatsApp for teaching and learning purposes. Abaido & Messiry (2016), for instance, investigates the impact of using the application on the quality of education. Samples showed a positive attitude towards integrating WhatsApp as a learning tool where they could easily construct and share knowledge through the social networking application. Annamalai (2019) also discovers that WhatsApp interactions provide bite-size learning where students are empowered positively, which allows for knowledge concretization and consolidates learning further. WhatsApp messaging also works to improve interactions between teachers and students during the creating, sharing, and exchanging of information and ideas online. While it acts as a leverage to expedite collaboration among learners, it also encourages communication between learners and instructors on the other hand (Awada, 2016). WhatsApp is effective for teachers to share language learning ideas, strategies, or techniques which in turn improves teaching and learning and allows for an easier acquisition of lesson learning objectives.

Reading Strategies Through a Three-Phase Approach

Strategy training is important in developing reading skills. Reading strategies help in understanding a text, which include comprehension supports, teacher modelling, reading aloud, making connection of words and phonics and multisensory activities including audio books or video clips (Moughamian et al., 2009; Wiseman,

2011; Cisco & Padrón, 2012; Al Raqqad et al., 2019). Strategies are planned and used strategically to help read better. Brown (2007) describes 2 broad categories of strategies: learning and communication strategies. Learning strategies correlate to input while communication strategies relate to output (in terms of writing or speaking). Since reading is considered a receptive skill (Karami, 2008), learning strategies are given importance here.

Effective reading involves three main phases: pre-, while- and post-reading (Saricoban, 2002). Each phase has its own functionalities. Pre-reading activities pique students' interest in the topic, foresee early information (through guessing and activating schema theory) and prepare them for the context of the text (Saricoban, 2002; Ajideh, 2003; Mihara, 2011; Nordin et al., 2013). While-reading activities help students to understand linguistic and sociolinguistic elements in the text, understand the passage, make use of contextual clues, and develop abilities to judge, summarise, skim and scan (Janzen, 2002; Saricoban, 2002; Nordin et al., 2013). Meanwhile, the post-reading stage helps students use the knowledge acquired to interpret information, extract main and supporting ideas, summarize main points as well as integrate readings with listening, speaking, and writing skills (Saricoban, 2002; Hamidon et al., 2013).

Weaker and struggling students benefit from the rich and diversified teaching methodologies that allows for comprehensive reading skill development with the subject content taught. By combining reading strategies with the teaching of various subjects, teachers can create a more holistic learning experience. This approach helps in improving students' literacy and boosts their confidence to read more independently especially during the pandemic COVID-19. Brown (2007) and Saricoban (2002) enumerate strategies for an efficient reading comprehension as according to phases of reading (Table 1).

Table 1. Three Phases of Reading Strategies (Brown, 2007; Saricoban, 2002)

Phases of reading	Strategies
Pre-reading	Identifying the purpose in reading
	Giving opinions before reading
	Predicting or guessing the main ideas
While-reading	Using graphemic rules and patterns to aid in bottom-up decoding
	Using efficient silent reading techniques for improving fluency
	Skimming the text for main ideas
	Scanning the text for specific information
Post-reading	Using semantic mapping or clustering
	Guessing when you are not certain
	Analyzing vocabulary
	Distinguishing between literal and implied meanings
	Capitalizing on discourse markers to process the relationships
	Reading extensively beyond the given text

With the use of instructional reading strategies, teachers allow students to interpret, evaluate and appreciate a reading text. Students will be able to draw upon their prior knowledge, cognitively interact with the author by thinking from their point of view as well as understand the language structure (syntax, sentence structure, graphics, and imagery) (Afflerbach et al., 2008). This in turn, allows the students to have a clearer picture and motive in reading. These strategies enable their minds to think rationally and extensively to find an answer to given questions about a particular text.

Methodology

Research Design

This study utilized a quantitative descriptive research design, gathering data through a series of questionnaires. The aim is to investigate two primary aspects related to the use of WhatsApp in educational spaces. First, the study examined which WhatsApp features are most commonly employed by teachers when teaching reading. Second, the research delved into the strategies frequently used to teach reading comprehension through WhatsApp. By analyzing these aspects, the study provided a comprehensive overview of how WhatsApp can be effectively integrated into reading instruction as a primary tool of teaching and learning.

Research Sample

The samples were selected among in-service teachers who continue their part time study in a Master programme on Teaching as a Second Language (TESL) at a public university in Malaysia. They were conveniently selected because they have been teaching reading through WhatsApp. The participants are primary and secondary school teachers from various states in Malaysia. The survey was distributed to 40 enrolled students, and 25 responses were received, yielding a 62.5% response rate. This aligns with Finham's (2008) recommendation that survey research should aim for response rates around 60%. Table 2 presents the demographic information of the participants based on the questionnaire results.

Table 2. Participants' Demographics

Demographics	Frequency (n)	Percent (%)
a) Gender		
Male	2	8
Female	23	92
b) Education Background		
Graduate (Masters)	7	28
Graduate (Degree)	17	68
Undergraduate	1	4
c) English Teaching Experience (years)		
0-10	21	84

11-20	2	8
21-30	2	8
d) School Type		
Primary	14	56
Secondary	11	34
e) School Location		
Urban	12	48
Suburban	6	24
Rural	7	28
f) Work from home		
Yes	25	100
No	0	0

Research Instrument and Procedures

This research employed a questionnaire to identify the WhatsApp features and strategies used to teach reading comprehension employed by teachers during the pandemic. There are 27 items across three sections: demographics, strategies to teach reading comprehension and features of WhatsApp used for teaching reading. Section A contains 6 items on demographics: gender, education background, English teaching experience, school type, school location, and whether they are working from home or not. Section B contains 14 items on strategies that teachers use to teach reading comprehension. This section mainly states the activities that students need to do as a part of their learning. Section C contains 6 items on the WhatsApp features that are used by teachers to disseminate and enhance their teaching. Table 3 lists these descriptions.

Questions in Section B were modified from the 10 reading comprehension strategies proposed by Brown (2007), whereas questions in Section C were adapted based on the technical considerations of WhatsApp outlined in the research conducted by Bouhnik et al. (2014). Both sections B and C were created based on 2 notions of the MALL theory: “teacher wisdom” and “device features” These two sections consist of statements that require samples to choose appropriate responses on their choices in teaching strategies and WhatsApp features that appear in a 5-point Likert scale, ranging from 1 (Never used) to 5 (Always). These statements were scrutinized using face and content validity where two experts’ opinions were referred to.

Table 3. Cronbach’s Alpha

Reliability Analysis	
Cronbach’s Alpha	Number of items
0.951	20

In addition to running face and content validity checks, another commonly employed measure of internal consistency is the Cronbach Alpha coefficient (Taherdoost, 2016). The data gathered from the Google form was exported to Excel and thereafter, imported into the SPSS Version 26 system. As shown in Table 3, the Cronbach alpha exceeds the recommended threshold of 0.70 (Md Yunus et al., 2021), thus indicating reliable survey items.

The data collection procedure was administered through Google Form due to COVID-19 where a link was shared via Telegram and Whatsapp. Participants who voluntarily took part in the survey clicked on the link to answer the survey questions. They could easily answer the questionnaire with the help of the internet and mobile phone accessibility. To reduce the possibility of skipped questions, the 'required' function in Google form was used to allow complete responses from the participants (Md Yunus et al., 2021). Data from the questionnaire was analyzed in Excel and SPSS versions.

Findings and Discussion

Frequency of Using WhatsApp Features in Teaching Reading

This study investigated 14 strategies used by teachers to teach reading comprehensions and 6 features of WhatsApp that are used to teach reading comprehension. The findings are presented in Table 4.

Table 4. Descriptive Analysis of WhatsApp Features

Items	Never used	Occasionally (1-2 times per week)	Frequently (3-4 times per week)	Most of the time (4-5 times per week)	Always (more than 5 times)	Mean score (M)
B1 Uploading/receiving video or audio recordings	8% (2)	4% (1)	20% (5)	40% (10)	28% (7)	3.76
B2 Uploading document files	4% (1)	0% (0)	16% (4)	48% (12)	32% (5)	4.04
B3 Uploading images	0% (0)	8% (2)	12% (3)	52% (13)	28% (7)	4.00
B4 Sharing activity links from other educational platforms	4% (1)	4% (1)	20% (5)	44% (11)	28% (7)	3.88

B5	Discussion or commentary sessions	12% (3)	12% (3)	16% (4)	44% (11)	16% (4)	3.40
B6	Voice or video calls with students	20% (5)	16% (4)	8% (2)	44% (11)	12% (3)	3.12

Based on 25 responses, Section B reveals a notable pattern in responses whereby the most frequent answers are ‘3 to 4 times per week’, ‘4 to 5 times per week’ and ‘always’ with the majority leaning towards 4 to 5 times per week. This shows that most (40% to 52%) teachers used all the WhatsApp features mentioned in the questionnaire frequently every week. With regards to mean score, however, some features were used more often than others. Teachers were observed to teach reading the most by uploading document files (M=4.04), followed by uploading images (M=4.00); sharing activity links from other educational platforms (M=3.88); uploading/receiving video or audio recordings (M=3.76); having discussion or commentary sessions with students (M=3.40); and finally voice or video calling sessions with students (M=3.12). This indicates that 48% to 52% of primary and secondary school teachers frequently used the uploading feature in WhatsApp. Data shows that images and document files were uploaded in a higher frequency with a combined total of 80% of teachers using each of these two features from “4 to 5 times” to “always” in teaching reading.

Thus, with WhatsApp, photos can be sent quickly even with a slow connection as WhatsApp applies lossy compression algorithms that decrease the size of media files before being uploaded (TechieDip, 2020) . This makes giving a reading activity with instructions in the captions easier for teachers and students. One advantage of using WhatsApp is the capability of sending documents such as PDF, Doc, XL, PPT and JPG files, including audio and video files which renders it possible for teachers to upload reading materials, and recorded video lessons through WhatsApp. Materials such as reading texts and worksheets can be shared easily without the hassle of email or separate file sharing apps. As WhatsApp helps students and parents to download materials faster and even with low internet data, uploading them seem to be the best choice there is in this pandemic.

Academically, similar to teaching and learning in the classroom, sharing images and texts mimics vis-à-vis learning whereby students mostly learn with visuals and texts. A consensus in research is that visuals facilitate reading comprehension. Within the context of these studies, learners become more attentive and engaged in the reading comprehension tasks that are given as it becomes real, contextualized, and easy to understand the reading text.

With a margin difference of only 0.12, the results of the study also show closer mean scores between 2 WhatsApp features. 44% of teachers shared links from other educational platforms while 40% of teachers uploaded video or audio recordings or links and/or received students’ video or audio recordings 4 to 5 times per week. 28% of teachers used both these features on a regular basis as well. This shows that teachers did not confine their instructional reading to visuals and texts. These findings show that ESL teachers were able to utilize potentially useful technology, promote learner autonomy and create stimulating lessons. In this instance,

WhatsApp is being used for resource sharing from other websites such as Youtube, Prezi, Animoto together with dynamic language activities such as Quizizz, Doodle, Storybird and SurveyMonkey (Raw and Ismail, 2021).

The findings also indicate a major mean difference for discussion or commentary sessions and voice or video calling via WhatsApp. Both these features were used the least in comparison to the other features. Nevertheless, 60% of teachers held discussion sessions and 56% of teachers had video or voice calling sessions with their students more than 4 times per week. These findings reiterate Susanti and Tarmuji (2016), Wijaya (2018) and Wirayuda (2019) that most successful WhatsApp group discussions conducted are designed with one WhatsApp group with one class of students where the teacher can manipulate the WhatsApp features to create interactive lessons. These findings also corroborate with Ahmad et al. (2020) that WhatsApp is essentially used as a flexible communication medium whereby sharing of information, collaboration and cooperation between students and teachers happens.

The Frequency of Using Strategies to Teach Reading Via WhatsApp

Section C (C1 to C14) reveals a notable pattern in responses whereby the most frequent answers are between '3 to 4 times per week' and '4 to 5 times per week'. A variety of 24% to 52% of the answers are edging towards '4 to 5 times per week'. Focusing on the second research question of the study, Tables 5 to 7 describe the primary and secondary school teachers who are inclined towards using strategies to teach reading in a certain order. Overall, they preferred giving activities on skimming and scanning ($M = 3.44$), followed by comprehension based on a text ($M = 3.40$); identifying keywords ($M=3.28$); making inferences ($M=3.28$); recognize words by saying it aloud ($M= 3.24$); reading aloud ($M= 3.20$); rereading aloud ($M= 3.16$); read a timed text ($M= 3.12$); summarize ($M= 3.08$); match pictures to new words ($M= 3.04$); and read similar topics to activate prior knowledge ($M= 3.00$).

The data also shows that teachers were not inclined on certain strategies as much as others. They seldom asked students to act and perform after reading a text ($M= 2.88$) or read extensively ($M= 2.80$). The most under-utilized strategy is reading at a set pace ($M= 3.68$). The strategies to teach reading comprehension are divided into 3 sections: pre-reading, while-reading and post-reading. Each strategy will be discussed individually.

Table 5. Descriptive Analysis of Strategies to Teach Pre-Reading

Items	Never used	Occasionally (1-2 times per week)	Frequently (3-4 times per week)	Most of the time (4-5 times per week)	Always (more than 5 times)	Mean score (M)
-------	---------------	---	---------------------------------------	--	----------------------------------	----------------------

	www.icres.net	April 27-30, 2024	Antalya, Turkiye	www.istes.org		
C1	Read similar topics to activate prior knowledge	8% (2)	28% (7)	24% (6)	36% (9)	4% (1)
						3.00
C2	Identify keywords	8% (2)	16% (4)	24% (6)	44% (11)	8% (2)
						3.28

Table 5 shows that teachers ranged between 24% to 36% in giving similar topics to activate students' prior knowledge. The majority of 36% of teachers gave topics to activate students' schemata 4 to 5 times a week. Similarly, 44% of teachers asked students to identify keywords prior to reading texts 4 or 5 times a week. Nevertheless, it should be noted that the both C1 and C2 pre-reading strategies have comparatively lower mean score than while- and post-reading strategies.

Table 6. Descriptive Analysis of Strategies to Teach While-Reading

	Items	Never used	Occasionally (1-2 times per week)	Frequently (3-4 times per week)	Most of the time (4-5 times per week)	Always (more than 5 times)	Mean score (M)
C3	Skim and scan	8% (2)	12% (3)	24% (6)	40% (10)	16% (4)	3.44
C4	Match pictures to new words	12% (3)	24% (6)	16% (4)	44% (11)	4% (1)	3.04
C5	Recognize words by saying it aloud	8% (2)	16% (4)	28% (7)	40% (10)	8% (2)	3.24
C6	Read aloud	8% (2)	24% (6)	20% (5)	36% (9)	12% (3)	3.20
C7	Read a timed reading text	16% (4)	16% (4)	16% (4)	44% (11)	8% (2)	3.12
C8	Read at a set pace	24% (6)	20% (5)	20% (5)	36% (9)	0% (0)	2.68

On the aspect of while-reading strategies, findings from items C3 to C8 in Table 6 reveals that the most utilized reading strategy overall were the skimming and scanning of texts. 24% use it 3 to 4 times, 40% used it 4 to 5 times and 16% used it all the time. 44% of the respondents used 'matching pictures to new words' strategy 4 to 5 times a week, while only 24% used it 1 to 2 times a week. Regarding the strategy of recognizing words by

saying it aloud, 40% used it 4 to 5 times per week and 28% 1 to 2 times per week.

With minimal margin of difference, teachers preferred to provide activities related to skimming and scanning, identifying keywords as well as recognising words by saying it aloud. These activities show that the teachers provided “supported reading” (Bassiri, 2012) for their students. These while-reading activities help students to focus on specific parts of the texts without being overwhelmed with the idea of reading an entire text passage with unknown words. To further support reading in a HBL environment, teachers also use strategies such as matching pictures with new words to reinforce the learning. Similarly, 36% of teachers used the reading aloud strategy 4 to 5 times per week and 24% used it 1 to 2 times per week. Interestingly, 44% of teachers gave a timed reading text to their students, however, 16% each can be seen to range from never used the strategy at all, to 1 to 2 times or 3 to 4 times per week.

Moreover, in comparison to items C3 to C6, item C7 had 24% of teachers to have never used the strategy before, while the rest have used it in a range of 1 to 5 times per week. The application of pace reading, where the teacher regulates the allotted time and signals specific points in the text by tapping on the desk (Bell, 2001), is not suitable or applicable in a HBL setting. Teachers using asynchronous teaching may find it time consuming to focus on each student individually. Besides, students may not feel comfortable reading with a controlled pace as it invokes anxiety and hinders full comprehension of words being read (Bell, 2001).

Table 7. Descriptive Analysis of Strategies to Teach Post-Reading

Items	Never used	Occasionally (1-2 times per week)	Frequently (3-4 times per week)	Most of the time (4-5 times per week)	Always (more than 5 times)	Mean score (M)
C9 Read for comprehension	8% (2)	12% (3)	24% (6)	44% (11)	12% (3)	3.40
C10 Summarize	12% (3)	16% (4)	32% (8)	32% (8)	8% (2)	3.08
C11 Make inferences	8% (2)	16% (4)	20% (5)	52% (13)	4% (1)	3.28
C12 Act and perform the text	16% (4)	24% (6)	20% (5)	36% (9)	4% (1)	2.88
C13 Reread aloud	12% (3)	12% (3)	36% (9)	28% (7)	12% (3)	3.16

C14	Read extensively	20%	20%	28%	24%	8%	2.80
		(5)	(5)	(7)	(6)	(2)	

Items C9 to C14 as tabulated in Table 7 measured the post-reading strategies used by the teachers, which indicated mixed frequencies. On reading for comprehension strategy (C9), 44% used it 4 to 5 times per week, which is higher than skimming and scanning (C8) strategy even though the mean score inverted between those 2 strategies. The findings also indicate that reading comprehension strategy is the most used in contrast to other strategies in pre-, while- and post-reading. Reading comprehension is a set of activities designed to check students' understanding of a text in terms of word identification, decoding, and phonological awareness (Perfetti et al., 2005)..

In comparison to the other strategies, the strategy to teach reading comprehension encapsulates the entire reading process. This is evident as reading comprehension encompasses mastery of a number of key skills to fully understand what one is reading. It is easy to assess students with comprehension questions because the product of reading comprehension (what is comprehended) is gauged by eliciting externalised measures (CEFR, 2016). Moreover, teachers' preference in reading comprehension strategy directly corroborates to the School Based Assessment (SBA) in Malaysia. This assessment provides teachers a way to check on students' ability to search and select, infer, visualize, organize and clarify for answers from a passage.

There is a dispersion of similar percentage value for acting and performing the text. Ranging from 24% to 36%, majority teachers used this strategy from 1 to 5 times per week. Coincidentally, the highest number of teachers also did not use this strategy in contrast to the rest of the post-reading strategies. A total of 40% of teachers have used the rereading strategy either 4 to 5 times a week or always Lastly, regarding extensive reading, it should be noted that 20% teachers never used it as a reading strategy via WhatsApp. However, there are 28% teachers who used extensive reading strategy 3 to 4 times per week.

Overall, there are not notable differences between while- and post-reading frequencies. Some strategies are used more than the others in both stages. Nevertheless, mean score comparison noted that strategies used in while- and post-reading stages are given more importance than the pre-reading stage. Uploading document files is the most used WhatsApp feature and skimming and scanning is the most used reading strategy taught by teachers via WhatsApp.

Conclusion

As HBL takes precedence, many challenges occur in teaching students online. Ranging from the lack of mobile devices, internet data, working parents, the synchronous mode of teaching seems to suggest its ineffective nature in some cases in Malaysia. Thus, some teachers and school authorities have considered teaching and learning asynchronously, especially with the use of WhatsApp. Reading skills among L2 learners proved to be important

as many students do not make use of their time to read and develop their knowledge schema, thus requiring teachers to help especially in this pandemic. This study aimed to identify the most used instructional reading strategy and WhatsApp feature while teaching from home. The inclusion of elements of MALL: ‘teacher wisdom’, “‘device features’”, language dynamics and “‘learner mobilities’” strongly prevail as the basis of this study. The results of the study showed that skimming and scanning is the most used instructional reading strategy. The most used WhatsApp feature is uploading document files.

As such, this research proposes that instructional reading can be conducted via WhatsApp by primary and secondary school teachers by choosing suitable strategies for their students. Furthermore, the approach of using WhatsApp to teach is not only effective during the current pandemic, but also proves to be useful for other forms of emergency crises, such as natural disasters, political unrest, or other public health emergencies. By adopting this method, educational pedagogy remains relevant, and teachers can stay connected with their students, ensuring continuity of learning regardless of the situation.

Recommendations

In light of the findings in this study, the following recommendations seem pertinent and apt for future research. Since the study is done using a small sample, the study does not generalise to all Malaysian school teachers’ reading instructional strategies. A study with a bigger sample is needed for better understanding. The use of WhatsApp as a supplementary ESL teaching and learning tool before and primary ESL teaching and learning tool during the pandemic can be studied to gauge for its effectiveness in teaching and learning. Future research should also focus on the use of WhatsApp as a primary tool to teach listening, speaking, and writing which can be further studied within the Malaysian context. Similarly, the effectiveness of WhatsApp in helping students’ reading comprehension can be explored in the future. As this research did not consider other variables such as ESL teachers’ challenges and motivations in using WhatsApp as a teaching tool during the COVID-19 outbreak, they can be researched as well. Finally, future research might also consider the correlation between the location of the school, socioeconomic status of students and the use of WhatsApp in ESL teaching and learning.

Implications

This study has led to several implications to the MOE and ESL primary and secondary school teachers who are currently teaching from home. At the ministry level, this paper recommends two: one, for the policy of asynchronous teaching using WhatsApp to be further strengthened; and two: modifying reading strategies to suit HBL and allow better assessment of students’ skills. At the teachers’ level, this study encourages teachers to realise that there are many strategies that can be used to teach reading asynchronously. It is suggested for teachers to avoid using only one or two strategies only to avoid students’ oversaturation and loss of interest and motivation in learning. Teachers should also try to use all the WhatsApp features for variety and to not let the challenges of online learning hinder them from helping their students on enhancing reading skills

Abstract: Studies on social media usage have indicated that the use of social media has now become a norm with many educators utilizing social media applications as an approach to teaching and learning. This is because social media affordances have made this platform a versatile medium in the acquisition of language skills such as speaking which has been acknowledged as one of the most difficult skills to master. Thus, this study was designed to investigate ESL learners' practices in using social media chat functions to improve speaking skills. A total of 30 students in a secondary school responded to a set of questionnaire using a 5-point Likert Scale and the data was analysed using SPSS Version 26. Furthermore, a semi-structured interview and a speaking log were also used to triangulate and strengthen the data from the questionnaire. The findings revealed that the ESL learners increased their self-confidence and motivation to speak in English as well as improve in their pronunciation, grammar command and range of vocabulary. Finally, further research can be conducted on secondary school ESL learners to explore different ways of using the chat function for a longer period of time. Another area of interest could focus on the challenges learners face while using the social media applications.

Keywords: Social media, Chat function, Teaching and learning, Speaking skill, Practices

Introduction

With the emergence of Education 4.0 and the evolving nature of technology, the use of social media as a medium of instruction and learning has become more prominent (Alamri et al., 2020; Rwodzi, 2020; Lambton-Howard et al., 2020). This has led to an increase in the utilization of social media applications for teaching and learning via face-to-face interaction as well as utilising instructional approaches that integrate technology (John & Yunus, 2021; Yunus et al., 2019). Consequently, the role of social media not only includes the various methods of communication but has evolved and expanded to include a variety of affordances in the way

educators teach and the way learners acquire knowledge (Devi et al., 2019). In the arena of global opportunities offered by technology, the use of social media provides additional aid to learning and helps educators bring the language lesson beyond the boundaries of the classroom where learners can communicate, engage, and collaborate via various categories of social media platforms (Faizi et al., 2013).

Another issue that is highlighted by many educators is that speaking is perceived as one of the most difficult skill to master. There are many reasons cited for the difficulty in learning speaking which included inhibition, lack of motivation in speaking English, low or very little confidence in speaking as well as not having enough practice in using the language (Azlan et al., 2019, Suchona & Shona, 2019; Dincer & Yesilyurt, 2017). In addition to that, speaking anxiety was also seen as one of the main factors in the inability of students to speak well (Rajitha & Alamelu, 2020). This was the scenario as seen in the Malaysian context in several studies (Badrasawi, et al. 2020; Hashim et al., 2019; Chin et al., 2016) which also revealed that anxiety was detrimental in learning speaking skills. According to the Cambridge Baseline Study which was conducted in Malaysia in 2013 (Cambridge English, 2014), among the four skills; students' performance in speaking skill was the weakest. Robinson et al. (2014) concurred with the findings of the baseline study, that students had difficulties in mastering the speaking skill due to lack of practice within the language class and beyond the classroom boundaries. Moreover, it was discovered that there was a decidedly higher emphasis on reading and writing skills and a lack of attention for speaking and listening skills.

With an understanding of the problems encountered by students in learning to speak in English there was an urgent need to provide students with engaging and authentic learning experiences whereby they could speak in English without the fear of repercussions in any form. This was evident in the emphasis on speaking skills in the national language policy for English language as seen in the implementation of the CEFR-aligned syllabus for Malaysia which included levels of mastery for speaking skills. Furthermore, the change in the 'Sijil Pelajaran Malaysia' (SPM) or the Malaysia Certificate of Education examination format for Malaysia in 2021 saw the inclusion of a Speaking test which carries an equal weightage of 25% of the total exam marks together with reading, writing, and listening skills (Lembaga Peperiksaan Malaysia, 2020). Therefore, educators need to plan more activities which can provide students with speaking practices that would encourage them to practice speaking outside the language classroom.

The objective of this study is to investigate ESL learners' practices in using chat function on social media applications to improve speaking skills. This is in line with the emergence of the COVID-19 pandemic that culminated in the education system's move to online teaching which included the use of social media for teaching and learning (Ya, 2020). With the closing of educational institutions globally, the need for an alternative method of reaching out to students beyond the classroom walls was viewed as extremely vital and necessary. This was also evident in Malaysia where English is a second language and many learners do not use the language outside the classroom. Here, social media chat function is seen as a viable and easily available tool to utilize for the teaching and learning of speaking skills (Hashim et., 2018). As social media platforms were ubiquitous, many learners were already familiar with the use of social media albeit more for entertainment thus

making the platforms easily accessible and convenient for them to utilize for the study. As teaching and learning had moved online, learners were already involved in activities using social media platforms such as WhatsApp and Telegram. Thus, it was easy to encourage learners to use chat functions as they were already using it for their communication with peers and family members.

Literature Review

Constructivism and Sociocultural Theory

Constructivism looks at the learners as the main entity in the process of learning and acquiring knowledge. One important aspect of constructivism is the practice of collaboration among learners as they create meaning and acquire information from experiences that are shared (Schulte, 1996). Moreover, constructivism views the teacher as a facilitator who guides rather than the person who provides all the information or answers. In addition to that, Vygotsky's Sociocultural theory looks at the Zone of Proximal Development (ZPD) and the process of scaffolding in explaining the process of knowledge acquisition by learners (Vygotsky, 1978). For this study, the participants worked in pairs to complete six speaking tasks based on themes taken from the Malaysian English language syllabus. Here, the learners collaborated with each other using the knowledge or prior experiences that they had to help them in the process of improving their speaking skills. In addition, scaffolding was also provided via Speaking Cards to guide them as they conversed in English. The teacher was also readily available to assist the learners if they faced any problems. Furthermore, the learners used social media applications which were familiar to them to complete the speaking tasks (Hashim et al., 2018).

Speaking Skill

Le (2019) described speaking as a process where learners interacted with each other in order to build meaning from the information that is produced and received by them. This information can be derived from the learners themselves, their surroundings, their prior knowledge, and the reason for their speech. These descriptions of speaking highlight the fact that speaking is extremely important for learners to acquire so that they would be seen as competent users of the language. Furthermore, speaking is perceived as a difficult skill to master due to factors such as shyness, not having anything to say, lack of participation and the interference of the mother tongue (Ur, 1996). Consequently, the lack of motivation and self-confidence as well as speaking anxiety leads to an adverse effect on a learner's ability to speak well. Furthermore, in order for a learner to be able to speak confidently in a language, it is noted that it is equally important to have some background knowledge regarding a subject-matter (Hanifa, 2018). A number of studies conducted on speaking problems and speaking anxiety (Badrasawi et al., 2020; ElNaggar, 2020; Rajitha, 2020; Hashim et al., 2019; Miskam & Saidalvi, 2019) reiterates the fact that speaking is a skill that many learners struggle with, and this hinder them from being able to speak well. Another aspect of the teaching and learning of speaking skills are the practices and beliefs that learners employ in the course of mastering the language. According to Saha (2021), learner beliefs can be categorized into three aspects: person, task, and strategy. These beliefs then influence the practices that are used

to learn the language effectively. This fact is confirmed by Dincer (2017) who states that by understanding the learner's beliefs; educators were given an insight on assessing successful language practices in the classroom.

As indicated by the above studies on speaking and the difficulties encountered by learners in the process of acquiring speaking skills, educators have a major challenge ahead of them in providing adequate speaking practices which would encourage learners to speak English without feeling anxious or apprehensive of making mistakes. Hence, the Speak English Everyday (S.E.A) Quest speaking project is one practical solution that provides authentic and meaningful speaking practices for students to improve their speaking skills.

Integration of social media in education

According to Yunus et al. (2019), social media's viable nature has made teaching and learning activities more significant and interesting to learners who have been exposed to the Internet and electronic media especially with its timeless and flexible aspects. Moreover, the various social media applications can also be utilized to practice speaking and to connect to other speakers such as peers, teachers, and native speakers of the language (Kuning, 2020). The advantage that social media offers is also reaffirmed by Teoh and Yunus (2019) who explained that learners will benefit from the interactive nature of social media which assists with the language learning process. In addition to that, the use of technology is also enhanced as using this approach gives learners opportunities to practice self-paced learning as well as improve collaborative skills (Rafiq et al., 2021).

In addition to this, a review conducted by John and Yunus (2021) revealed that previous studies have been conducted on the use of social media to teach speaking via the various applications such as Facebook, Telegram, Instagram, WhatsApp, and many others. The studies conducted varied in the utilization of a variety of social media platforms as well as the approaches of using the social media platforms to teach speaking where among the highly used social media platform was YouTube; followed by WhatsApp and Instagram (John & Yunus, 2021). Moreover, some of the studies conducted on the integration of social media to teach speaking focused on a specific social media application (Carolinaliwati et al., 2021; Utomo & Bastiar, 2020) and some looked at a combination of different social media (Baron, 2020; Poramathikul et al., 2020). Nevertheless, these studies focused more on adult learners (Rahim et al., 2023; Carolinaliwati et al., 2021; Akkara et al., 2020; Abbasi & Behjat, 2018) and secondary school learners in a foreign context (Zaitun, et al., 2021; Meinawati et al., 2020).

However, studies on the use of social media chat function to teach speaking are lacking and only a few were carried out by researchers (Ainun et al., 2020; Susilawati & Salam, 2015; Tahir, 2015). In the research conducted by Ainun et al. (2020), the researchers investigated the use of WhatsApp chat function which showed the participants' positive feedback about chatting using a social media application. In the local context of Malaysia, studies were also conducted on social media integration, but the studies looked at other language areas such as reading, writing, grammar, and vocabulary (Sivagnanam & Yunus, 2020; Yunus et al., 2019; Baharudin & Yunus, 2018; Yunus et al., 2012). The studies also focused on adult learners and primary school learners. This clearly indicates a need for more studies to be carried out to discover how social media can be

integrated to teach speaking skills especially for secondary school ESL learners.

Methodology

Research Design

The aim of this research was to discover the practices used by ESL learners in their effort to improve their speaking skills via social media chat function. Therefore, this study employed a mixed method research design which included quantitative and qualitative data. The quantitative data was obtained from a Google Form questionnaire which looked at the learners' practices while carrying out the speaking tasks. In addition to that, qualitative data was collected using a semi-structured interview which explored in detail the learners' experiences during the speaking sessions. Moreover, a speaking log was also utilized to record the learner's personal experiences and challenges while carrying out each speaking task. The speaking log was adapted from a study conducted by Ellsworth (2017) with a group of Japanese students learning English. According to Cresswell (2011), having a combination of both quantitative and qualitative data helps in providing a better understanding of the research question. Consequently, using a mixed method design gave a better understanding of how social media chat function can be utilized to enhance speaking proficiency.

Participants and Research Setting

The study was carried out in an urban national secondary school in Penang, Malaysia and consists of 30 participants who were 16 and 17 years old. Purposive sampling method was employed to choose the respondents who came from different ethnic groups, Malay, Chinese and Indian as well varying proficiency levels ranging from weak, average, and high. In addition to that, the respondents' School Based Assessment (SBA) results for speaking were also considered when choosing the sample group. These learners mainly came from a background where English is not spoken at home, and they rarely used English outside the language classroom. Another important point to note is that these students were from average to low socio-economic background with very little exposure to written materials in English.

Research Procedure

The S.E.A (Speak English Always) speaking project was carried out for a period of eight weeks covering six speaking topics taken from the English language Malaysian syllabus for Form 4. Among the topics chosen were: 1) shopping, 2) sports, 3) music, 4) food, 5) movies and 6) travelling. All interactions for the speaking project took place online as face-to-face interaction was not allowed due to the COVID-19 pandemic. Furthermore, the participants were also given freedom to choose any social media chat applications to be used for the recordings and their speaking practices. For each topic, participants had to send either two or more recordings of conversations based on the topics given. In addition to this, after each recording, the participants were also required to complete a speaking log related to their speaking experiences.

Research Instrument

For the purpose of getting a clearer picture of how social media chat function was used by the learners to improve their speaking ability; a questionnaire, a semi-structured interview and a speaking log were used to collect data for this study. The questionnaire used a 5-point Likert Scale from ‘Strongly Agree’, ‘Agree’, ‘Neutral’, ‘Disagree’ and ‘Strongly Disagree’. The questionnaire was given to the respondents after completing all six speaking tasks at the end of the project. In addition to the questionnaire, a semi-structured interview was created with a pre-determined list of open-ended questions which allowed the researcher to probe for a deeper understanding of the respondents’ experiences as well as provide new insights (Szombatová, 2016).

For the semi-structured interviews, the participants of the study would be given codes from A to F to maintain the participants’ anonymity. For the speaking logs, participants were given a link to a Google Form where they had to answer a series of questions about their experiences while completing the tasks. Questions 1 – 3 were focused on the social media application used and the content of the conversations. Question 4 looked at the new words or phrases which they learnt during their conversations. The next, Question 5 required the participants to reflect on their speaking experiences and also about their feelings throughout the process of completing the tasks. Question 6 looked at the challenges or problems faced by the participants and finally Question 7 was to enable learners to ask their teacher any questions. This question may address a problem or challenge faced by the learner or just to clarify a matter with the teacher.

Data collection and data analysis

A modified questionnaire was designed to elicit the relevant data pertaining the learners’ experiences and practices while completing the speaking tasks. The items in the questionnaire consisted of 25 items, divided into two sections. Section A gave the demographic details about the respondents which included age, gender, speaking rank and other relevant information about using social media. Then, Section B was subdivided into two parts; Part 1 which looked at the learners’ speaking experience and Part 2 which investigated the use of social media chat function.

To support the quantitative data collected from the questionnaire, a group of six students or three pairs were selected to be interviewed using a semi-structured interview after completing all the speaking tasks. The interview was conducted with six respondents (3 pairs) via Telegram Voice Chat and recorded at the same time. Each respondent was given a code from A to F to maintain anonymity. The quantitative data from the questionnaire was then analysed using the IBM Statistical Package for the Social Sciences (SPSS) Version 26 where descriptive statistics were utilized looking at frequency, mean score, and percentages. The qualitative data from the interview were analysed by looking at common themes that emerged due to the learners’ experiences and feelings while carrying out the speaking tasks. To support the data from the questionnaire as well as the interview sessions, the speaking logs were also analysed to look for common patterns, examples of vocabulary learnt as well as the challenges or problems faced.

Findings

Questionnaire

The findings from the questionnaire revealed that the use of social media chat function to enhance speaking skills was viewed positively by all thirty respondents of the study. The data obtained was analysed looking at frequency, mean and standard deviation. The interpretation of the mean level was based on Nunnally and Bernstein's (1994) level of mean interpretation as shown in Table 1.

Table 1. Mean Score Level of Interpretation

Mean value	Level of interpretation
1.01 – 2.00	Low
2.01 – 3.00	Medium low
3.01 – 4.00	Medium high
4.01 – 5.00	High

The data from the questionnaire was divided into two sections. Section A was a detailed description of the demographic details as related to the methodology of the study. Then, Section B was divided into two parts which focused on the analysis of the students' experience with speaking and looked at the students' experience with social media chat functions. The analysis done on the students' experience with speaking showed that a majority of the learners realized the importance of speaking skills and viewed speaking as an essential skill needed for communication.

Table 2. High Level of Mean for Speaking

No.	Item	SD n (%)	D n (%)	N n (%)	A n (%)	SA n (%)	Mean	Level
A1	I believe that speaking is an important skill in communication.	0	0	0	7 (23.3)	23 (76.7)	4.77	High
A2	I like to learn English speaking skills.	1 (3.3)	0	3 (10.0)	11 (36.7)	15 (50.0)	4.30	High
A3	I try to use new English words that I have learnt when speaking.	0	1 (3.3)	8 (26.7)	10 (33.3)	11 (36.7)	4.03	High
A4	I pay attention when someone is speaking English.	0	0	5 (16.7)	14 (46.7)	11 (36.7)	4.20	High

SD = Strongly Disagree, D = Disagree, N = Neutral, A = Agree, SA = Strongly Agree

Table 2 gives a summary for the items with a high level of mean for speaking. For item A1 with the highest mean of 4.77, all thirty respondents ‘strongly agree’ (76.7%) or ‘agree’ (23.3%) that speaking is vital for them and they needed speaking skills in order to be viewed as competent users of the language. Following this, three other items on the questionnaire also had high mean levels. These items looked at students’ interest in learning English speaking skills (Item A2: mean = 4.30) with 15% who strongly agreed and 11% who agreed, using new English when speaking (Item A3: mean = 4.03) with 36.7% who strongly agreed and 33.3% who agreed and the last item, paying attention when someone is speaking in English (Item A4: mean = 4.20) with 36.7% who strongly agreed and 46.7% who agreed.

Table 3. Medium-high Mean Level for Speaking

No	Item	SD n (%)	D n (%)	N n (%)	A n (%)	SA n (%)	Mean	Level
A5	I like to have conversations in English with my friend to improve my speaking skill.	0	2 (6.7)	12 (40.0)	8 (26.7)	8 (26.7)	3.73	Medium high
A6	I try to relax whenever I feel afraid of speaking in English.	1 (3.3)	2 (6.7)	5 (16.7)	14 (46.7)	8 (26.7)	3.87	Medium high
A7	I like taking part in speaking activities that encourage me to use English.	2 (6.7)	3 (10.0)	10 (33.3)	9 (30.0)	6 (20.0)	3.47	Medium high
A8	I feel more confident and excited to be able to speak in English.	0	0	9 (30.0)	13 (43.3)	8 (26.7)	3.97	Medium high
A9	I like to practice speaking English outside the classroom.	2 (6.7)	2 (6.7)	7 (23.3)	10 (33.3)	9 (30.0)	3.73	Medium high
A10	I have no problem in exchanging information on topics of interest in English.	0	2 (6.7)	9 (30.0)	11 (36.7)	8 (26.7)	3.83	Medium high

SD = Strongly Disagree, D = Disagree, N = Neutral, A = Agree, SA = Strongly Agree

Table 3 gives an overview of the mean score for medium-high items for speaking. The 6 items were found to be in the medium-high range with the highest mean level at a level of 3.97 for item A8 which indicated that twenty-one respondents (70%) were more confident and excited to be able to speak in English. The lowest item in the medium-high range was A7 which looked at students’ interest in taking part in speaking activities that encourage the use of English. Here only fifteen respondents (50%) indicated that they strongly agreed (n = 6, 20%) and agreed (n = 9, 30%) with taking part in speaking activities using English. The other items in the medium-high range looked at having conversations in English with a friend (Item A5: mean = 3.73), relaxing when feeling afraid of speaking in English (Item A6: mean = 3.87), practicing using English outside the class (Item A9: mean = 3.73) and not having problem in exchanging information on topics of interest in English (Item

A10: mean = 3.83).

Table 4. High-mean Level for Social Media Chat Function

No.	Item	SD n (%)	D n (%)	N n (%)	A n (%)	SA n (%)	Mean	Level
B1	I believe social media is a useful learning tool.	0	0	1 (3.3)	13 (43.3)	16 (53.3)	4.50	High
B2	I use social media chat function to communicate with my friends.	0	0	2 (6.7)	11 (36.7)	17 (56.7)	4.50	High
B3	I believe there are many social media chat functions on different applications that are easy to use.	1 (3.3)	0	2 (6.7)	11 (36.7)	16 (53.3)	4.37	High
B4	I see social media platforms as convenient tools for promoting speaking performance in general.	0	0	4 (13.3)	17 (56.7)	9 (30.0)	4.17	High
B7	I see the social media chat function as a fun and engaging way to practice speaking skills.	0	1 (3.3)	3 (10.0)	15 (50.0)	11 (36.7)	4.20	High

SD = Strongly Disagree, D = Disagree, N = Neutral, A = Agree, SA = Strongly Agree

Part 2 of Section B of the questionnaire focused on the use of social media chat function to improve speaking. Table 4 gives an overview of the high mean revealed by the analysis. There are five items which scored high mean levels. Items B1 and B2 scored the highest with a mean of 4.50 each. For item B1, twenty-nine respondents (96.7%) agreed and strongly agreed that social media is a useful learning tool. Meanwhile for item B2, twenty-eight respondents (93%) agreed and strongly agreed that they utilized social media to communicate with their friends. The other three items: B3, B4 and B7 also showed a high mean score with item B3 (social media chat function is easy to use) leading with a mean score of 4.37. This was followed by item B7 (social media chat function is a fun and engaging way to practice speaking) with a mean score of 4.20. Finally, item B4 (social media chat platforms as convenient tool for speaking) was the last on this list with a mean score of 4.17. All of these three items had percentages of more than 50% of the respondents who either agreed or strongly agreed with the items. B3 had twenty-eight respondents (90%) who agreed and strongly agreed while B4 and B7 both had twenty-six respondents (87%) who agreed and strongly agreed.

Table 5. Medium-high Mean Level for Social Media Chat Function

No.	Item	SD n (%)	D n (%)	N n (%)	A n (%)	SA n (%)	Mean	Level
-----	------	----------------	---------------	---------------	---------------	-------------	------	-------

B5	I believe that chat function in social media provide low-pressure opportunities for students to practice speaking.	1 (3.3)	0	8 (26.7)	11 (36.7)	10 (33.3)	3.97	Medium high
B6	I believe that using chat functions in social media platforms reduces my anxiety in speaking.	1 (3.3)	0	11 (36.7)	10 (33.3)	8 (26.7)	3.80	Medium high
B8	I like using the chat functions in social media as I can have more opportunities to practice speaking with my friends.	0	1 (3.3)	6 (20.0)	15 (50.0)	8 (26.7)	4.00	Medium high
B9	Using the social media chat function has increased my interaction with my peers in English.	1 (3.3)	1 (3.3)	8 (26.7)	12 (40.0)	8 (26.7)	3.83	Medium high
B10	Using social media chat function has increased my confidence in speaking in English.	0	1 (3.3%)	7 (23.3)	13 (43.3)	9 (30.0)	4.00	Medium high
B11	Using social media chat functions has encouraged me to practice speaking English outside the classroom.	1 (3.3)	1 (3.3)	8 (26.7)	12 (40.0)	8 (26.7)	3.83	Medium high
B12	I believe that social media chat function provides an authentic speaking experience for me.	1 (3.3)	1 (3.3)	9 (30.0)	11 (36.7)	8 (26.7)	3.80	Medium high
B13	I am able to use new vocabulary and phrases after using social media chat function for speaking activities.	0	2 (6.7)	8 (26.7)	10 (33.3)	10 (33.3)	3.93	Medium high
B14	I am less shy and anxious about speaking in English when I interact with my peer on social media chats.	1 (3.3)	0	12 (40.0)	8 (26.7)	9 (30.0)	3.80	Medium high
B15	I am more interested to speak in English after using social media chat function for speaking activities.	0	3 (10.0)	9 (30.0)	8 (26.7)	10 (33.3)	3.83	Medium high

SD = Strongly Disagree, D = Disagree, N = Neutral, A = Agree, SA = Strongly Agree

Table 5 shows positive feedback from the respondents on the use of the social media chat function. These items were all within the range of medium high mean interpretation. Item B8 has the highest mean with a mean of 4.00 and showed that using the chat function had given the twenty-three respondents (76.7%) more

opportunities for them to speak with their friends. This is followed by item B10 with a similar mean of 4.00 where twenty-two respondents (73.3%) felt that using social media chat function had increased their confidence in speaking English. Next, B5 showed a mean of 3.97 and looked at how social media gave the learners low-pressure chances to practice speaking. A total of twenty-one respondents (70%) either agreed or strongly agreed on this point. The remainder of the six items for part two were also found to be in the medium-high range. Item B9 had the mean of 3.83 with twenty respondents giving positive feedback that their interactions with their peers improved with their use of social media chat function. This positive feedback was also seen for item B11 which also carried a mean of 3.83. Again, twenty respondents (66.7%) were more inclined to chat in English outside the class via social media chat. Next, for item B15, the mean was also 3.00. For this item, eighteen respondents (60%) agreed and strongly agreed that there was improvement in their interest to speak in English after completing all the six speaking tasks.

The final three items also showed positive results where item B6 had eighteen respondents (60%, mean = 3.80) who said that using social media reduced their anxiety in speaking. This was followed by item B14 with seventeen respondents (56.7%) who mentioned that they felt less shy and less anxious in speaking with their peers on social media chats. Lastly, item B12 which had nineteen respondents (63.4%) revealed that the respondents felt that using the chat function provided an authentic speaking experience for them. As a whole, the analysis of the questionnaire confirmed that practicing speaking via social media chat function, helped the learners in this study to improve tremendously in many areas such as self-confidence and motivation to speak, increased interactions between peers, more engagement in speaking activities, a better pronunciation skills and improved grammar knowledge as well as a wider range of vocabulary.

Semi-structure interview

The purpose of carrying out the semi-structured interviews was to gain an in-depth understanding of how the practice of using the social media chat function assisted learners to improve in their speaking skills as well as to triangulate and strengthen the data analysed quantitatively. As a result of the COVID-19 Standard Operating Procedure for schools, the interviews were conducted online. The interviews were then transcribed and analysed to reveal three main themes or ideas: 1) improvements in confidence and motivation, pronunciation, vocabulary, and grammar; 2) feelings about social media use and 3) challenges encountered during the speaking project.

The interview session revealed that as a whole, all six respondents gave positive feedback on all three themes. Respondent A said that *“it's improved my pronunciation and also being a self-motivation to speak in English”*. This was echoed by respondent B who agreed that by working with her partner she felt more confident in speaking in English and it helped to *“increase my self-motivation”*. Respondent F also mentioned that the tasks improved her motivation to speak in English and made her more confident when speaking in English. Another improvement that was revealed was in the respondents' pronunciation of words and phrases in English. For instance, the respondents explained that they have learnt how to say the words correctly either from their partners, from their siblings or even from Google. Respondent F said *“The difficulties for me is some words*

were really difficult to pronounce for me. But then it has become better ...". She added that she had also sought her siblings' help in learning how to say the words correctly and thus was able to use the words for the speaking tasks.

Apart from that, the respondents gave feedback that they recognized improvements in their vocabulary and grammar after practices using social media chat function. Respondent A said that she liked *"using social media chat function to carry out speaking activities because it's one of the easier ways to look up meaning for words"*. Respondent C added that by practicing speaking through the chat function, she will *"practice with other people, and then I can use the new vocabulary"*. This helped her to learn and remember the new words learnt during the conversations. Her command of grammar also improved as she learned from her mistakes and self-corrected. These results indicate that the learners accepted that using social media chat function had helped their overall command of vocabulary and grammar. Next, the interviews also showed that the respondents felt happy taking part in the speaking project and felt less anxious when speaking in English. Respondent A explained that once speaking in English had become a habit, she felt *"less stressed and nervous on speaking English"* and felt that it was a *"chance to improve, my English and speak with my friend"*. In addition to this, the learners also felt that using social media chat allowed them to practice speaking in an authentic and engaging manner with their peers.

Although the respondents were able to complete the speaking tasks successfully, they still had to face some challenges during the speaking project. Among the problems were Wi-fi issues and disturbances from notification sounds as well as speaking anxiety and pronunciation problems. Respondent D resolved her connectivity problem by changing the time for the recording from night-time to daytime, she said *"Because morning is really can work"*. The feeling of anxiousness was also reduced by respondent C who practiced before recording.

To sum up, the analysis of the semi-structured interviews reaffirmed the analysis of the questionnaire which showed that the participants' speaking skills improved as a result of speaking practices via social media chat functions. The practice of speaking with their partners via the chat function also helped to increase their confidence as well as their motivation to use the language. This clearly indicates that using social media chat is something that should be explored and utilized further for the teaching and learning of speaking skills.

Speaking Log

A speaking log was also used throughout the entire study by the participants to record their individual experiences, feelings and any problems or challenges that they may have faced during their speaking sessions. The purpose of the speaking log was to ensure continuous monitoring of the participants for the duration of the study. Besides that, the speaking log also enabled the teacher to assist the learners or to clarify as well as answer any questions posed by the learners. Thus, the speaking log helped in strengthening the results of the questionnaire and the interviews. As the speaking log was shared via a Google form link, it was easy for the teacher to respond quickly once the form is submitted and address any issues faced by the participants.

The results of Speaking log revealed three major themes, similar to the semi-structured interviews which were 1) the content knowledge of the speaking tasks, 2) improvements in speaking related skills and 3) feelings about the tasks and the problems encountered. The findings showed that the learners were able to expand on the topics based on the support given through guiding questions and phrases or words shared. They were also able to use new words and phrases learnt while preparing for the tasks such as 'luxurious', 'compulsive shopper', 'strenuous', 'physique', 'marinating', dairy products', 'composition', 'box-office hit', 'domestic' and 'enriching experience'. At the same time, with constant practice, the learners were able to improve their pronunciation also. They were also able to increase their proficiency in grammar by learning from their mistakes while carrying out the activities and correcting their grammar mistakes. One particular area of difficulty was present and past tense usage. As the speaking activities were carried out in pairs, the participants were able to assist each other as well and help to correct errors made while speaking. Ultimately, they were more willing to speak in English.

In addition to this, the data from the speaking log also revealed that participants were very positive and motivated to use chat functions to improve their speaking skills. They were also very happy to take part in the speaking activities and felt more confident to speak in English. Some of the response from the speaking log include '*I feel confident about this conversation*' and '*I feel good. My speaking skill is better, and I can see the difference.*' These statements show that the response to the speaking project was very positive and many of the learners would love to take part in such activities again.

Discussion

The overall results from the questionnaire, semi-structured interviews and the speaking logs showed that using social media chat function was viewed positively and was welcomed by the participants of the study. The mean score for all the items were within the mean range of medium-high to high (3.00 – 5.00). This indicated that by using the chat function in social media applications, the participants' speaking skills had improved. The first part of the questionnaire looked at the participants' speaking experience and how they felt about speaking in English as well as their anxiety in using English. The results revealed that the participants in this study believed speaking skills is important for them as they knew that to master the language, they also had to be viewed as competent speakers of the language. These findings were also supported in the data collected in the semi-structured interviews where the results indicated a rise in motivation and confidence to speak. This fact was emphasized by Naibaho (2019) who confirmed that it cannot be denied that speaking is an extremely vital skill to master. Goh (2017) also reaffirmed the fact that speaking is a skill which is challenging socially and that it is necessary for the learners to be able to understand the context as well as to be ready to react in suitable ways according to the discourse scenarios.

In addition to this, the results from the semi-structured interviews reiterated that the learners had incredibly

positive experiences practicing speaking via social media chat function. The participants were aware that they needed to use certain strategies to improve their speaking skills. For instance, having conversations in English with a friend to improve speaking skills, paying attention when someone is speaking in English and using new English words learnt when speaking. Another item that the participants agreed on is relaxing whenever they feel afraid to speak in English. Therefore, the students had very encouraging perceptions about social media use for learning the language. Furthermore, the use of the speaking logs gave the learners an avenue where they could express their feelings and address any doubts or pose questions to their teacher. This positive perception of using social media to improve speaking skills is also supported by previous studies (Rahim et al., 2023; Carolinawati, 2021; Zaitun, et al., 2021; Ainun et al., 2020; Poramathikul et al., 2020).

Apart from that, the results also indicated that social media integration in teaching speaking was successful as the learners felt they were more self-confident and motivated to speak in English after going through the all the speaking tasks using the chat functions. Furthermore, the analysis done for the second part of the questionnaire on social media chat function also showed a mean rating of medium high to high which confirmed that the learners found the chat functions advantageous to them. The findings indicated that all the participants agreed that social media is a useful learning tool as well as easy to use, and it is a convenient tool in helping to improve their speaking skills. These findings are supported by previous studies which showed improvements in confidence and motivation to speak in the target language (Zaitun et al., 2021; Akkara et al., 2020; Noni & Basri, 2019). In the study carried out by Noni and Basri, (2019), the findings also showed that by practicing via WhatsApp chat group using audio and video recordings helped the learners to develop confidence and motivation to speak in English.

Next, the findings of the present study also showed that using the chat function to practice speaking skills allowed the learners to collaborate with their peers or their friends outside of the classroom and thus improve their speaking skills. Here, collaboration among the participants is a form of scaffolding which is part of the socio-cultural theory which allows the learners to be more responsible for their own learning and they can assist each other to build on their knowledge (Polly et al., 2017; Solomonidou, 2009). In addition to that, as constructivism encourages student-centered learning, these learners were also able to work at their own time and pace. As such, the learners helped each other when they faced issues with pronunciation, grammar, or meaning of words and felt less intimidated, less anxious or worried about making mistakes as they were collaborating with a friend or someone they know. Furthermore, the learners agreed that their command of vocabulary, grammar and pronunciation had also improved due to practicing speaking via social media chat functions. These facts are supported by previous studies which showed improvements in various aspects of speaking. One such study was conducted by Ainun et al. (2020) who showed how collaboration among learners outside the classroom for oral interactions via voice chat helped to improve learners' speaking skills. Another study which looked at improvement in vocabulary is the study conducted by Sivagnanam and Yunus (2020) which showed improvement in the command of students' vocabulary due to social media integration.

Another crucial point highlighted by the participants of the current study was that using social media chat

function gave them an authentic experience in speaking English out of the confines of the language classroom using speaking cards as a guide. This encouraged them to look for more content points for their discussion which again lent itself to more authentic interactions between participants. This helped to widen their vocabulary as they learnt new words and phrases related to the speaking topics which was recorded in the speaking logs submitted after each speaking practice. As a result of the constant practice with their speaking partners, these learners showed improvement in grammar. This result coincides with previous studies which also showed how the use of social media provided authenticity to the teaching and learning whether it is the medium, the environment or the materials used. This is emphasized in Mulyono and Suryoputro's (2020) study where the use of social media applications was believed to provide an authentic learning environment for learners. This idea of authenticity was also highlighted in Sevy-Biloon and Chroman's (2019) study which employed the use of video chat as a medium for learners to engage in authentic and meaningful discourse to improve their speaking skills.

As a whole, the findings from the questionnaire and the interviews showed that by practicing speaking using social media chat functions, the learners in this current study improved their speaking skills in various aspects including pronunciation, vocabulary and grammar as well as self-confidence and motivation to speak.

Conclusion

To conclude, this study set out to investigate ESL learners' practices in using social media chat function to improve their speaking skills. It is evident from the study that social media chat functions can be used effectively to cater to speaking tasks in a variety of methods. The findings of the study showed that by practicing speaking via the chat functions, the learners were able to gain self-confidence and motivation to speak English. From the constant speaking practices and working with their peers, the learners were not afraid of making mistakes and learning from their mistakes. Therefore, the results revealed that the learners were able to improve their pronunciation and grammar as well as widen their vocabulary knowledge due to their speaking practices via the chat functions. Overall, this study strengthens the idea that social media chat function should be considered as a viable tool for the teaching of speaking skills. Learners are already familiar with a variety of social media platforms and needed guidance for the speaking skills.

Moreover, this study also contributes to our understanding of how chat function can be used effectively especially with secondary school students who have weak or average proficiency in speaking skills. As the learners carried out the speaking activities on their own without the teacher's presence, there was less inhibition and more willingness to make mistakes while carrying out the speaking tasks. Nevertheless, the study was limited by the time duration which was for eight weeks and the small number of participants in the study. Notwithstanding these limitations, the study suggests that further research to be conducted to explore the use of social media chat functions for younger learners especially in secondary school contexts and also on different ways chat function can be utilized for speaking activities.
